WINTER-FLOWERING BEGONIAS.—If these plants have been properly treated, a good show of bloom will be obtained towards the end of the year. To show off Begonias in the best manner, they should be placed thinly in a well-lighted glass-house, raising them somewhat over a carpet of Maiden-hair Fern. The temperature of the house should not be lower than 56° by night, nor higher than 68° to 70° by day. Gloire de Sceaux is admitted to be one of the finest varieties, and groups of it look well if bordered with B. Gloire de Lorraine. These winter-blooming Begonias require water in abundance, when the pots are filled with roots, and growth is active. A top-dressing of some kind of mild fertilizer will benefit them. Neatly stake and tie each plant; use the syringe in bright weather, and keep the air of the house moist. If aphid appear on these plants, fumigate the house with tobacco, or better still, vaporise it with X.L. All, a very safe and effectual remedy.

FUCHSIAS.—If Fuchsias have been used in bedding-out, shoots fit for making cuttings will be plentiful on the plants, and a good number should be made. They strike readily under hand-lights at this season, and when rooted they should be potted into 60's, and placed on the greenhouse shelf. If potted on in the early spring, these will make fine plants for summer decoration. [In cooler parts of the country than that in which our correspondent resides, bottom-heat will be needed in the striking of Fuchsias at this late part of the season. Ed.]

THE KITCHEN GARDEN.By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

GENERAL WORK.—Endive and Lettuce will now require constant attention in regard to blanching. Lift the Endive, and transplant into frames for protection. If a mild autumn occur, Endive may be kept good outside up to Christmas by the protection afforded by mats, and the plants may be lifted and transplanted into boxes, and put into the Mushroom-house, where they will soon blanch, and be ready for use. Lettuce should be carefully looked over on warm, moist mornings, for slugs, and a dusting of soot or lime given in their haunts. Where a few Peas and Beans are still sown in the autumn, the ground should be got ready, choosing a warm situation, usually a south border, and ground that is well drained, lies high, and is fairly dry. See that dwarf Beans in frames receive plenty of air, and on all favourable occasions the lights may be taken off entirely. Water them when dry, and do not let them get overcrowded. Damp the soil occasionally during suitable weather with soot-water, as a preventative against red-spider. Make sowings of Beans at regular intervals from now onwards, if they are grown in pots, afford a not higher night temperature than 60°. The bulk of the late Celery will require another earthing-up, for it will not be safe much longer, but do not cover it up too much at once. That it may keep well through the winter, the last earthing-up should be left as late as possible, but the leaves should not be exposed to sharp frost before this is done. A few mats thrown lightly over the plants will prevent this, in the event of a sharp frost occurring before the work is done. The same remarks will apply to Leeks, except that frost is not so harmful to them. If the Leeks are full-grown, they should be earthed-up forthwith. Carrots will now be ripening, especially in early districts, and may be lifted, choosing a nice dry day for the purpose. Do not cut the tops closer than 1 inch from the crown. In a good root-house, built nearly, or entirely, underground, and one not subject to influx of water, roots do not require so much sand or ashes for covering them; all risk from frost is avoided, and the roots are always ready for use. If sand or ashes be used in such a house at all, very little indeed will be required between them. Roots will keep much better stored in this way than in a clump, where often they are allowed to grow. Beetroot should be removed before sharp frosts occur. Lift with care, and twist the tops nicely off instead of cutting them. No roots, so Beet in particular, should be bruised or broken. Overgrown Beet should be rejected, as being not worth storing. Hedges of Holly, Box, Hornbeam, or Q. tick, still found in many gardens, where they have been planted for shelter, if given a final trimming now, will not grow again, and frost will not disfigure them, as in the case of those which make young growths late in autumn. Abundance of

work will be found in clearing away exhausted crops of Peas, Beans, &c. New Pea-sticks should be saved for use next year. If it is desired to save any particular variety of Peas or Beans, take advantage of dry days to pick the fully-matured pods without delay; and expose them in a vinery or shed to harden before shelling or thrashing them.

FRUITS UNDER GLASS.By RICHARD PARKER, *Gardener, Gortwood, Chichester.*

FRUIT TREES GROWN IN POTS.—The repotting or top-dressing in accordance with the requirements of the trees, should now be finished off, and the trees placed in their winter quarters shortly afterwards. These fruit trees will be benefited by having the fullest exposure, provided the pots are protected from frosts, which would cause the latter to bare. The pots should be plunged above their rims in coal-ashes, but failing this, protection may be afforded by using tree-leaves, bracken, or long stable-litter; and a quite open position is best for them, away from the drip of trees, and where water does not collect. The trees should at this season be examined for the "brown scale," American blight, or other pest, and the proper remedies applied. For the first-named, nothing is safer or more effective than repeated syringing the trees with water at a temperature of 130°; and for American blight, the infested branches should be well cleaned with a stiff brush, the tip of which should be moistened with petroleum. The main stems and branches may also be painted over with whitewash made from freshly-elaked lime. Trees which have occupied the same pots for several years may be planted out-of-doors with advantage, younger ones being potted-on to take their places. The present is a good time for potting-up new trees; and in making a selection of varieties, preference should be given to small healthy trees. On receiving these from the nursery, the strongest roots should be shortened somewhat, and the plants placed in rather small pots for the first season. Good drainage is an essential point, and good maiden loam as the basis of the soil used in the potting; to this should be added a relatively small quantity of wood-ashes and crushed bones. The potting must be firmly done, using a wooden rammer 2 inches in diameter at the butt end. The pots containing these young trees may be plunged with the rest of the orchard-house trees for the winter. Trees potted at about this date soon push roots into the new soil, and make early growth the following season.

STRAWBERRIES.—Before the end of the present month, potted plants should be placed in such a position that the pots are not likely to be split by the action of frost. The general stock and late successions may be plunged anywhere in the open, as severe weather does not harm them, providing the pots can be protected, and plants which get covered with snow often go through severe frosts with less injury than others placed in orchard-houses or other cool glass structures. Those plants which are required for forcing early may be placed in pits and frames, where they can receive thorough protection from frost, and where the plants can be taken out of the plunging material at any time during the winter.

POT VINES.—The canes have ripened well since they were stood outside, and the foliage should be allowed to remain on them, and allowed to fall naturally. At the approach of frost the pots should be stood close together and protected by bracken or long litter. Those intended for early work will be none the worse for exposure to frost, as it ensures thorough rest in the plants. The canes may be shortened back to the required length some time before they are brought into the forcing-pit, and those intended for "cut-backs" may be cut-back at any time while growth remains dormant. In pruning these Vines (cut-backs), three buds must be left at the base of the vine-rod, the strongest shoot which results from these buds being selected, the two others being then removed.

DISTRIBUTION OF PLANTS AT THE LONDON PARKS.—Arrangements have been made for the distribution to the public on the days named of any surplus bedding plants there may be at the following places:—At Chessold Park, on the 8th inst.; Dulwich Park, 14th; Ravenhurst Park, 15th; Finsbury Park, Myatt's Fields, Victoria Embankment Gardens, and Southwark Park, 16th; Battersea Park, 18th; Royal Victoria Gardens, North Woolwich, 21st; Waterlow Park, 22nd; Kennington Park, 23rd; at Brockwell Park there are no surplus plants this year.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, Oct. 15 { Royal Horticultural Society's Committee, at the Drill Hall, James Street, Westminster.
Horticultural Club.

SALES.

MONDAY, Oct. 14 { Dutch Bulbs, at Protheroe & Morris' Rooms.
Sale of Nursery Stock, at the Arboretum Nurseries, Wood Lane, Isleworth, by Order of Messrs. C. Lee & Son, by Protheroe & Morris.

TUESDAY, Oct. 15 { Dutch Bulbs, at Protheroe & Morris' Rooms.
Sale of Roses, Fruit Trees, and Rhododendrons, at Arches Farm, Framfield, near Uckfield, by Order of Messrs. Wm. Paul & Son, by Protheroe & Morris.

WEDNESDAY, Oct. 16 { Dutch Bulbs, at Protheroe & Morris' Rooms.
Clearance Sale of Nursery Stock, at the Nurseries, Putney, by Order of Messrs. Mahood & Son, by Protheroe & Morris.
Sale of the Collection of Orchids of the Firs, Lawrie Park, Sydenham, by Order of C. Dorman, Esq., on the Premises, by Protheroe & Morris (two days).

THURSDAY, Oct. 17 { Dutch Bulbs, at Protheroe & Morris' Rooms.
Important Clearance Sale of Nursery Stock and Fruit Trees, at the Nurseries, Bracebridge, near Lincoln, by Order of Messrs. Pennell & Sons, by Protheroe & Morris (two days).

FRIDAY, Oct. 18 { Sale of Live and Dead Farming Stock, at Rose Cottage Farm, Eufield Highway, by Order of Mr. J. J. Wilson, Junr., by Protheroe & Morris.
Linden's First Great Orchid Sale, at Stevens' Rooms, Covent Garden.

SATURDAY, Oct. 19 { Dutch Bulbs, at Protheroe & Morris' Rooms.
Clearance Sale of Nursery Stock, at the Loughborough Park Nurseries, Brixton, by Order of Messrs. Ponsford & Son, by Protheroe & Morris.
Orchids, from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—50°.7.

Sexuality of Flowers.

A PAPER on "Physiological Researches on the Sexuality of the Flowers of *Pinus densiflora*," by KENJIRO FUJII, Rigakushi, Post-graduate Student in Botany, Imp. Univ., Tokyo, Japan, has been sent to us, and shows that the interesting subject of the origin of the sexes in plants is being studied in the far east, as it has been in Europe and America; but at present the problem is not solved, and the question arises, is it ever likely to be? We think not, because we cannot fathom the phenomena of life, nor the immediate causes of its various physical manifestations. We know that plants can be bisexual or unisexual, monoecious or dioecious; we know that in the latter cases the plant may return to bisexuality, and that, as far as all angiosperms are concerned, it is pretty evident that bisexuality preceded unisexuality. But how does the latter arise? We see that trees and plants can change their sexes in different years and in different climates. We even see bisexual plants become

unisexual late in the season, all the flowers, e.g., of some Umbelliferae being male. But what is the cause? One general reply to this question is, that it depends upon varying degrees of nutrition. Mr. MEEHAN and others have observed that, speaking broadly, the more vigorous trees or branches of a normally bisexual character tend to produce female flowers; the less vigorous, males. Thus, *Castanea*, *Hop*, &c., have been exemplified, so that any cause which can bring about an increase or decrease of nutriment may have the effect of producing female or male flowers, respectively. Again, it has been observed, as by KNIGHT, that a high temperature tends to the development of male flowers, as in Melons; a relatively lower temperature, the production of fruit. Again, fresh Melon seeds produced plenty of male flowers, but old seed an abundance of female. HOFFMAN and others have found that if the seeds of a bisexual plant, as *Spinach*, *Mercurialis*, &c., be sown thinly or thickly, the proportion of male plants is greater in the latter case.

Hence a great number of coincidences of the above kinds have been noted from time to time; but still this does not bring us one whit nearer to the solution of the question—what determines the sex? or why does the sexless embryo grow up into a male or female plant? We may know something of the external conditions requisite, but we can only see that the protoplasm or living substance of the plant responds to them and gives such or such result.

The late Mr. CROLL wrote a pamphlet entitled, "What Determines Molecular Motion?—The Fundamental Problem of Life." He observes that there is always an "object" in all the results of life action; and that not one of the known properties of physical forces can throw the slightest light upon the immediate cause of this "object." In the question before us this object is either a stamen or a carpel. Why does the sexless papilla on the floral receptacle grow into one rather than the other of these two organs? No microscopical examination throws the smallest light upon it whatever. The fact is, we neither know the nature, nor understand the powers of life. At this point the biologist is brought up sharply to a dead halt!

If we must be contented with knowing only the external influences, then it is here that the practical or experimental part of the subject comes in. Taking a local increase of nourishment as a primary cause of the production of a female flower, the author of the paper mentioned above finds that this can easily be effected in spring-time if the young shoots of *Pinus densiflora* are cut, as is usually done in Japan, by an annual pollarding. A second method is by keeping only one or two shoots, and breaking off all the other adjacent young shoots at the top of the last year's shoot; thirdly, by combining these two processes.

The author supplies a table showing that "out of forty-five branches experimented on, nine produced female or hermaphrodite flowers in the positions proper to male flowers; that out of twenty-one branches with marks of previous injuries, the shoots of five branches produced female or hermaphrodite flowers in the positions proper to male flowers. And that out of 2283 branches which were neither pollarded nor had any marks of previous injuries, the shoots of only seven branches produced female or hermaphrodite flowers in the positions proper to male flowers. The ratio $\frac{9}{45}$ or $\frac{5}{31}$ " is very small when compared with $\frac{9}{45}$ or $\frac{5}{31}$."

He observes in a summary that "the sex of the flowers of *Pinus densiflora* is not determined by their morphological positions on the shoot. The

sex is undetermined until a certain stage of their development. A flower which will otherwise develop into a male has a tendency to become a female when local increase of nourishment takes place at a certain stage, or during certain stages of its development."

These experiments corroborate those of MAUZ, who found that male plants repeatedly pruned gave rise to female flowers. Others have met with similar results. Thus, Mr. A. HENRY succeeded in inducing the formation of female plants only by removing two out of the three stigmas of *Begonias*, and in fertilising by the third stigma alone. HOFFMAN experimented on dioecious plants by fertilising them early and late in the season and with fresh and old pollen; though his results were in some degree contradictory, one, however, was interesting. Experimenting with *Lychnis vespertina*, which he regards as the same species with *L. dioica* (white), when the period of impregnation was more or less delayed, it seemed to have an influence upon the colouring of the flowers. The "precocious" impregnation favoured the production of the rose tint, for the proportion of red flowers to 100 white was 146 male and 147 female plants. Of those impregnated late, the proportion was about seventy male and fifty-six female. This result tallied with that of CARRIER, who found that by crossing *Amaryllis vittata* with *A. pulverulenta* and *A. brasiliensis* (plants with red flowers, being varieties, not species), he obtained a very great quantity of red flowers like those of the male plants, some few only were nearly white. This result followed from the impregnation by freshly-collected pollen.

How far florists experiment in this way with fresh or old pollen we do not know; but since different and important results followed on the above occasions in the colouring of flowers, there would seem to be some opening for experiments in this direction. With regard to the subject of the paper, however, on the origin of sex, further investigations are wanted to discover, if ever it be possible, the immediate cause of sex.

GROUP OF CATTLEYS AT BURFORD (see Supplementary Illustration).—*Cattleya* are amongst the most gorgeous of Orchidaceans plants, and highly appreciated accordingly. The centre plant of the group in our Supplementary Illustration is the magnificent specimen of *Cattleya Lawrenceana*, which was exhibited before the Orchid Committee of the Royal Horticultural Society on April 9 of the present year, which was justly awarded a Silver Flora Medal as a mark of good culture. This superb plant measured over 3 feet across, and bore thirteen spikes of bloom, the number of flowers on the largest spike being eleven. It may be of some interest to those who had the opportunity of observing the plant when shown, to learn that at the present time it is sending up eighteen strong growths with fifteen flower-sheaths, which promise well for a good show of bloom next spring. The cultural treatment required by *C. Lawrenceana* is of the simplest kind. Usually the plant is late in starting into growth, and the bulbs are only half formed when the dull days of autumn are upon us; it therefore requires to be placed in the warmest and lightest part of the house, so as to complete its growth quickly. This point is an essential one. As regards affording water at the roots, resting, &c., the course to follow is the same as is found suitable to its congeners. To the right-hand of the illustration is the delicately-tinted *C. Schroderae*, its sweetly-scented and perfect-shaped blooms of great attractiveness. The left-hand specimen is a noble plant and grand variety of the popular *C. Mendeli*, but unfortunately the brilliant colouring of the lip cannot be reproduced by photography.

GROUP OF ORCHIDS IN SIR TREVOR LAWRENCE'S GARDEN, BURFORD, DORKING.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Fruit and Floral Committees will be held on Tuesday, October 15, in the Drill Hall, James Street, Victoria Street, Westminster, at 12 o'clock; and at 3 P.M. a lecture on "Nut Culture in England" will be given by Mr. J. OMER COOPER.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The secretary of this excellent gardening institution informs us that Mr. F. MILLER, gardener to J. T. FRIEND Esq., of Northdown House, Margate, has paid over to its funds the sum of 10 guineas, being the proceeds of an exhibition of two large American Alces or Agaves, flowering specimens, as mentioned in our columns.

CHRYSANTHEMUMS IN SOUTHWARK PARK.—We are requested by Mr. COULE, the Superintendent of this new park, to state that the display of Chrysanthemums in the conservatory will be opened on Saturday, October 12.

"BOTANICAL MAGAZINE."—*Anthurium Gustavi*, Regel, figured at t. 7437, is a New Guianan species, with long-stalked cordate ovate green leaves, 3 feet across, slender purplish cylindrical spathes only slightly shorter than the spadix. *Mormodes Rolfeanum*, t. 7438 (see *Gardeners' Chronicle*, 1892, i., p. 203, f. 30).

Polygala Galpini, Hook. fil., t. 7439.—A very distinct shrubby species from Natal and Swaziland, with shortly stalked lanceolate hirtulous leaves and terminal racemes of pale rosy-lilac flowers. It flowered in the Temperate-house at Kew in 1874.

Tulipa violacea, Boissier.—A Persian species with relatively small red or violet flowers with filaments hairy at the base. Kew.

Sternbergia Fischeriana, Romer, t. 7441.—Like a fine form of *S. lutea*, but flowering in spring instead of in autumn. Kew.

"INTRODUCTION."—The name of *Introduction* has been given to a new journal avowedly devoted to "instruction, entertainment, and general social topics," and which is to be published every Saturday at 30, Newcastle Street, Strand. The contents are indeed light and miscellaneous, to judge from the first issue of the paper, and among them must be something to suit the taste of everyone. This variety is the more comprehensible and praiseworthy when we hear that the journal is intended for colonial and American as well as for European circulation.

DEATH OF MR. ANDREW JAMIESON.—The *Kew Bulletin* for September announces the death at the General Hospital, Madras, on August 17, of Mr. ANDREW JAMIESON, Curator of the gardens and parks at Ootacamund, Nilgiris. Mr. JAMIESON was fifty-three years of age, and had been connected with the Ootacamund Gardens for nearly twenty-seven years. He was formerly a member of the gardening staff at Kew, and was appointed to Ootacamund in September, 1868, being in sole charge of the gardens on the Nilgiris for many years, until they were placed under the control of the present Director, Mr. M. A. LAWSON, who spoke most highly of Mr. JAMIESON'S skill and perseverance in all his duties.

VIOLA CONFERENCE.—The proceedings of the second conference, held at Birmingham, on May 29 of this year, were duly noted in our columns at the time. We have only to mention that the complete report is now published, and may be had from Mr. R. DEAN, Ranelagh Road, Ealing. The papers read and published in full are the following:—"The Genus *Viola*," by Prof. HILLHOUSE; "Older Varieties of *Viola*," by Mr. RICHARD DEAN; "*Viola* that do well in Surrey," by Mr. E. BURRELL; "Newer Varieties of the *Violetta* Type," by Dr. STUART; and "Winter Treatment of *Viola*," by Mr. A. J. ROWBERRY.

STOCK-TAKING: SEPTEMBER.—The optimist who, during the past year or two, expressed continued confidence in the pluck and energy of his fellow countrymen, and in the return to common-sense views of things commercial on the part of many of our

best customers, has had, and is having, his reward in the increased revenue of the country, and the extension of trade. Thus, the increase in the Exchequer receipts for the first six months in the current financial year is placed at £3,916,837 over those for the same period last year; the gain in the imports for September is represented by the figures £378,393, the decrease for the nine months having been reduced to some £662,301. Of the exports, which make a fine show, more anon. Here may be given our usual excerpt from the summary table of imports:—

IMPORTS.	1894.	1895.	Difference.
Total value of imports	£ 30,210,461	£ 30,618,854	£ +378,393
(A.) Articles of food and drink—duty free	10,664,372	10,792,959	+108,587
(B.) Articles of food and drink—dutiable	2,282,725	2,099,457	-183,268
Raw materials for textile manufactures	2,247,273	2,023,436	-223,836
Raw materials for sundry industries and manufactures ..	4,262,855	4,379,668	+53,813
(A.) Miscellaneous articles	1,026,074	1,140,909	+114,835
(B.) Parcel Post ...	61,667	69,129	+7,462

Taking note of the word "Hops," in the general figures, we are forcibly reminded of some changes going on in France, on the matter of viticulture. Within the past few weeks an English official travelling through Burgundy, was amazed to see long extending lines of Hop-poles; and on inquiring found that the wretched little vermin, the Phylloxera, had effected the transformation; the Vines had been grubbed up, the planting of American stocks being too expensive, and the beautiful Hop plant substituted. A fine light ale, we are told, was manufactured for market; but one of the upper-class merchants of the district insisted that our rejected Local Veto Bill would have to be introduced into the Chamber of Deputies, and passed into law! It is an easy step from Vine culture to our fruit, root, and vegetable imports, concerning which we give the following figures for the month just ended:—

IMPORTS.	1894.	1895.	Difference.
Fruits, raw:—			
Apples bush.	567,117	202,331	-364,786
Cherries "
Plums "	148,407	125,502	-22,905
Pears "	394,400	89,191	-305,209
Grapes "	191,702	170,043	-21,659
Unenumerated "	134,128	138,254	+4,126
Onions "	693,206	621,439	-71,767
Potatoes ewt.	29,470	66,104	+36,634
Vegetables, raw, unenumerated value	£ 106,533	£ 113,308	£ +6,778

This is the most encouraging array of facts in this direction we have printed for years past, and they read their own lesson. As to prices obtainable for the home product, an evening journal very recently reported, on the authority of a correspondent, that a Somersetshire fruit-grower having sent on a ton of good Apples to a salesman in London, received in return stamps for less than a shilling! Something wrong here, surely.

EXPORTS

deserve brief notice at our hands. The figures for the past month show an increase over those for September last year amounting to £1,862,620, the increase for the nine months past being represented by the figures, £5,157,866. This increase is spread over all, excepting three, of the classes usually specified, and these three are (1) raw materials; (2) metal and articles manufactured therefrom; and (3) chemicals, &c. It has been suggested that we shall find a strong competitor for our Eastern trade in little Japan. The Japanese are taking steps to greatly increase the output of coals, and to start a big thing in shipbuilding

and repairing. Surely, however, there is room enough and to spare among the Celestials and adjacent countries. Formosa will require a lot of looking after and expenditure, and as we learn that China is negotiating a treaty of commerce with Japan, a splendid opening for everybody's exports may shortly be found where twelvemonths since no such thing was expected. We do not observe, however, that our exports to the East are at present very much affected by our supposed competitor.

CANADIAN FRUIT.—We are informed that arrangements have been completed by which a firm of London ship-owners will convey Apples and all other fruits grown for commercial purposes in Nova Scotia, from that favoured colony, *via* the Ship-canal to Manchester. By this means travelling expenses may be lowered, and the price per barrel reduced to the consumer.

H. WITTE.—Forty years ago, on October 1, 1855, the well-known curator of the celebrated Leyden Botanic Garden, Mr. H. WITTE entered into the position, which he still occupies in perfect health, with the exception of deafness. Under Mr. WITTE'S management the Botanic Garden at Leyden has attained a very high standard of perfection, and Mr. WITTE is the friend of all the horticulturists, botanists, and gardeners of Holland, and of a large number abroad, who appreciate him as a man, as the best Dutch author on horticultural subjects, and as a promoter of horticulture in all branches. On the 1st inst. a splendid banquet and concert was offered to the hero of the day, who had been complimented in the morning by the *employés* of the Botanic Garden, a reception held in the afternoon enabled the curator's numerous friends to congratulate him. The mayor of the City of Leyden handed the cross and ribbon of a knight of the royal order of Orange Nassau, a distinction which has never before been bestowed upon a horticulturist; the jubilee committee offered a valuable gift with a nice album containing autographs of the subscribers; the old pupils supplied a highly interesting album containing autographs, photos, and other souvenirs of former pupils, who are now in all parts of the world; Professor SURINGAR, the Director of the Botanic Garden, made a most cordial speech; the Leyden section of the Royal Netherlands Horticultural and Botanic Society appointed Mr. WITTE a honorary member; the Councils of this and other societies read letters of congratulation; and the new *Tydschrift voor Tuinbouw* published a special "Witte" number, with an excellent portrait and extracts from the curator's oldest press work. In fact, it was a splendid festival, and a day which Mr. WITTE and those who were present will never forget.

ENGLISH AMBER.—Professor CONWENTZ had some interesting facts to state at the meeting of the British Association concerning the formation of amber in different parts of the world. It seems that Baltic amber—succinite—is the most esteemed variety; whilst English amber, which is also succinite, is found mostly on the coasts of Norfolk, Suffolk, and Essex, and contains insects, wood, flowers, &c., which indicate the oldest Tertiary formations. From the fact that some specimens of amber contain fragments of Magnolia and Cinnamon, it seems probable that the flora of the amber period was entirely different to that of modern Europe. *Pharmaceutical Journal*.

WHAT OUR FRIENDS THINK OF US.—A dispatch from London to the *Sun*, of this city, states that this year there has been such an enormous crop of Plums in Great Britain that the price of the fruit has fallen to 2*l.* a pound, which is so little that it does not pay the cost of gathering and freight. One would naturally have supposed that the growers would have made haste to dry the fruit, since England pays annually two million dollars for dried Plums imported from France. English farmers are extremely conservative, however, and they sat still and allowed the fruit to fall on the ground and rot. It may be, that these Plum-growers can give some reasonable excuse for their failure to meet such an

emergency. Farmers and fruit-growers are often accused of a lack of enterprise, when in reality it is practically impossible to solve offhand the problems which suddenly confront them. *Garden and Forest*.

"EVERGREEN."—This is the name of a book issued in parts, and published simultaneously in Edinburgh, London, and America. The second issue, now ready, is sub-titled "The Book of Autumn," and, according to the prospectus, "will be divided into four correlated parts:—I., Autumn in Nature; II., Autumn in Life; III., Autumn in the World; IV., Autumn in the North." The publication is to contain biology, sociology, fiction, poetry, and other very diverse kinds of contributions, all from practised pens, and many of them illustrated. Further information may be obtained from PATRICK GEDDES and colleagues, Lawnmarket, Edinburgh.

VEGETABLE PRODUCTS IN PORTO RICO.—Besides Sugar and Coffee, both of which are intimately associated with Porto Rico, Tobacco also holds an important position, but though already cultivated to a very large extent, it is stated that its growth might be extended almost indefinitely if it were not for the old question of excessive taxation. The soil is of the very best for Tobacco growing, and quite equal to the best of the Cuban plantations, but as a rule, there is some carelessness in the process of curing. Good Tobacco requires no great labour in its cultivation, but considerable care and attention, especially as regards insect pests, and when the leaf is stripped, selected and dried. In all these matters the native of Porto Rico is exceedingly careless, and this it is that prevents so good a final product being obtained as in Havana. Still, a considerable quantity of Porto Rico cigars find their way to the States, Spain, France, and England; but the Tobacco trade is one which ought to be largely extended, if only proper facilities were given by the Government. Large quantities of Tobacco-leaf are exported to Cuba, to be made up there into the world-famed Havana cigars. On the subject of fruits, it is said that, though the Plantain, Banana, &c., are grown everywhere, and are much used as fruit in the country, the export trade is not large, nor yet of the Pine-apple, which grows to perfection when any care is taken of it. It is remarkable that the Pine-apple is not exported in larger quantities than is actually the case, seeing that it is a fruit that could easily be shipped and carried the short distance to the United States, where it can command good prices. The Cocoa-nut grows in immense quantities all around the coasts of the island, and to a considerable distance inland, but little or no use is made of it, and exports are few and far between. The contents of the green nut are much used as a beverage, but the great bulk of the crop, which has a continuous growth, is allowed to go to waste. The Mango, covered with its green and golden fruit, is common everywhere, and lines the roadsides in many parts for miles and miles. The Sevilla, or Bitter Orange, grows wild in the woods, but none of the fruit is exported, and by far the greater part goes to absolute waste.

"DICTIONNAIRE PRATIQUE DE L'HORTICULTURE."—This has now reached the letters *Nar*. As an illustration of the care taken to bring this valuable work up to date, we may instance the article *Musa*, which embodies the information recently published in the monographs of BAKER and of MORRIS.

"HANDBOOK TO THE FLORA OF CEYLON."—Dr. TRIMEN'S most useful handbook makes steady progress. The plates by which it is illustrated now number seventy-five. *Barleria Arnottiana*, with large tubular blue flowers would be a desirable introduction to our stovea. The text of the third volume has now reached the *Balanophoraceæ*. The terse descriptive paragraphs admitting ready comparison are in marked contrast to the diffuse dissertations admitting of comparison with difficulty if at all, which are employed by the laboratory school of botanists.

CEDAR OF GOA.—Among the various conjectures as to the origin of this *Capressa*, is one that it may be of Chinese extraction, and that it was taken from Macao to Goa. To obtain information on this point, we applied to Mr. TUTCHER, of the Hong-Kong Botanic Garden, who kindly informs us that from frequent, and, indeed, quite recent visits to Macao, he is able to say there are no species of *Capressa* cultivated there now, and none wild in the immediate neighbourhood.

THE TEMPERATE HOUSE AT KEW.—The erection of the south wing of the Temperate-house was sanctioned by the Treasury last year. The care required in the preparation of the detailed working drawings, and the securing the necessary contracts as soon as the supplementary estimates had been passed by the House of Commons, prevented the work being immediately taken in hand. The contractor, however (according to the September *Kew Bulletin*), commenced work on the site on August 19, and building is being pushed on with all possible speed. It is hoped that the new wing will be completed by the middle of next year.

WIRE FENCE AT KEW.—The permission of the QUEEN has been obtained for the removal of the fences, excluding the public from the Palace Meadow, and since then, according to the September *Kew Bulletin*, the First Commissioner of Her Majesty's Works and Public Buildings has authorised the removal of the wire fence which since 1844 has separated the Botanic Garden from the Arboretum. As for many years there has been no difference in the administration of the two areas, which are equally devoted to botanical purposes, the fence had become devoid of any practical object; and the four gates by which alone it could be passed had become wholly inadequate to the convenient movement of the large crowds which now frequent the Royal Gardens in fine weather.

PAY OF KEW EMPLOYÉS.—The *Kew Bulletin* for September says, that on the recommendation of the First Commissioner of her Majesty's Works and Public Buildings, the Treasury has agreed to the minimum wage at Kew being raised to 21s. In addition to this, both labourers and gardeners receive gratuitous medical attendance during sickness, sick-pay according to length of service, and extra pay when employed on Sundays. On the other hand, retirement at 60 is compulsory, and pensions in the shape of "compassionate allowances" are abolished by the Superannuation Act, 1887, which only allows a gratuity of one week's pay for each year of service. It will be interesting to trace the gradual rise of wages at Kew since 1841, when it became a national establishment:—

Year.	Labourers.		Gardeners.	
	£.	s.	£.	s.
1841	12		12	
1847	14		...	
1865	15		14	
1873	17		16	
1885		18	
1889	18—20		...	
1894	19—20		...	
1895	21		21	

IRISH AGRICULTURAL STATISTICS.—A Report has been published containing abstracts from Irish Agricultural Statistics, showing the acreage under crops, and the number and description of live stock in each county and province (in 1894-5); also reports from the superintendents of enumeration upon the state of their crops in their several districts at the time of the collection of information for the returns. These statistics, published by authority of the Government, should prove of great use to agriculturists, both present and future.

APPLE.—A correspondent sends us a ripe Apple with a small flower growing out from its side. Of course, there is nothing very extraordinary in the

presence of a flower in that situation, as that may be accounted for on morphological and anatomical reasons; the difficulty is to account for the late production of the flower from a fruit already ripe.

"THE PIG."—The first book of a series to be published under the above name has appeared, and is devoted to "Rational Pig-keeping to ensure Profit." The author is Mr. W. J. MALDEN and his practical and well-arranged treatise deserves every attention from those interested in this subject. The publisher is Mr. WILLIAM A. MAY, *Farm, Field, and Fireside* Office, 1, Essex Street, Strand, W.C.

NEW BOOKS:—*Index Kewensis*.—We have to announce the publication of the fourth and last part of this monumental work. The gratitude and sympathy of all workers in botany should be extended to Mr. B. D. JACKSON, Sir J. HOOKER, and others, connected with this useful publication. *Kerner's Botany*.—This work is now completed under the editorship of Professor F. OLIVER. We have alluded to it in its course through the press, and its completion will give us another opportunity of referring to it. Two other books lie on our table, and will demand early notice, viz., Rev. G. HENSLOW'S *Origin of Plant-structures*, a fascinating and suggestive book; and Mr. G. MURRAY'S *Introduction to the Study of Sea-weeds*, a book for which there was a great need, so great has been the progress since similar works have been published. Mr. BURBERRY has also published a second edition of his *Amateur Orchid cultivators' Guide-book*.

NEW PUBLICATIONS.—*Ten New England Blossoms and their Insect Visitors*, by CLARENCE M. WEED. (Published at Boston and New York, by HOUGHTON, MIFFLIN & Co., The Riverside Press, Cambridge.)—*Analytical Key to the Natural Orders of Flowering Plants*, by FRANZ THONNER. (London: SWAN, SONNENSCHEIN & Co. New York: MACMILLAN & Co.)—*Insects and Insecticides*, a practical manual concerning noxious insects and the methods of preventing their injuries, by CLARENCE M. WEED, D.Sc. (New York: ORANGE JUDD Co. London: KEGAN, PAUL, TRENCH, TRUBNER & Co., Paternoster House, Charing Cross Road.)—*Les Engrais Les Fermiers de la Terre*, by M. P. P. DEHÉRAIN. (Paris: RUEFF ET CIE, Editeurs, 106, Boulevard Saint Germain.)—*Handbook of West American Cone-bearers*, J. G. LEMMON, Oakland, Cal., third (pocket) edition.

BOOK NOTICE.

DAS TROCHNEN UND FARBEN NATÜRLICHER BLUMEN GRÄBER, ETC. By Heinrich Hein; published by B. F. Voigt, Weimar (2nd edition).

We have, in this manual of 163 pages, full directions in the German language for bleaching, dyeing, and drying nuts, fruit-carpals, ears of corn, Palm leaves, Fern-fronds, flowers, grasses, reeds, rushes, &c., and the preparation of natural materials for the making of bouquets. We are accustomed to see in a few shops in London and other large towns at Christmas-tide and other seasons, quantities of coloured or bleached grasses, Palm leaves, Fern-fronds, tree leaves of various species, rushes, &c., but few persons are acquainted with the methods by which these charming decorative objects are prepared, and to most gardeners and florists these remain the closest secret. And the little knowledge which some have acquired is seldom put to any useful commercial purpose either here or abroad. This absence of enterprise or initiative may be due to the extreme reticence on the part of those who have mastered these methods of manufacture, and the carefully-guarded manner in which the secrets of the trade are kept by them. Previous to the appearance of the first edition of this manual, there existed, as we learn from the preface, no book which gave competent instructions, and the booksellers knew of no work

that could supply the information that was lacking; but the business began to grow, and in certain directions wholesale manufacture was being carried on—a few successful establishments existed in the suburbs of various towns which are the centres of horticulture in Germany, which had laid the foundation of their present celebrity. To-day the business of preparing materials for, and the manufacture of dried bouquets and other objects is an important one in Germany, and seems likely to extend.

The first part of the book consists of an enumeration and concise description of the methods of cultivation, time at which to gather the blooms, and other essential information of those flowering plants found suitable for drying or bleaching, and dyeing, beginning with Compositæ, Acrocinium roseum being the first plant taken; then Ammobium, Antennaria, Helichrysum, Helipterum, Leontopodium, Rhodanthe, and Xeranthemum. Then come flowers which are not immortelles, including Delphinium, Pansy, Dianthus, Hollyhock, Sweet Pea, Roses, Atractia, Eryngium, annual Astera, Daisies, Meadow Sweet, annual Chrysanthemum, Zinnias, and many more. The same plan is followed with grasses and rushes, and this part seems to us a very useful one, these plants affording graceful materials for forming winter bouquets, mixing with flowers, either dry or freshly gathered, and other devices. The drying and colouring of mosses and moss-like plants also meet with satisfactory treatment. The second part of the book is taken up by the technique of the preparation of materials; a description of the required apparatus and appliances, and the way to use them. In this section the sun-bleaching method is fully described, and the various plants alluded to which can be subjected to it. All the various colours and the various modes of preparing them are concisely described in the last section. The manual is furnished with 162 woodcuts, and an excellent index, which meets all reasonable requirements. To those persons, male and female, especially the latter, who are desirous of engaging in business of a remunerative character, not involving hard manual labour, this modest manual supplies much valuable information, which they can put to practical purposes at a small cost. Hitherto most of the dried bouquet material sold in this country has come from abroad, but as nearly the whole of the plants mentioned are capable of being cultivated in this country, and some are indigenous, that should not be tolerated much longer. An English translation of Herr Hein's book should meet with a ready sale in this country.

SUCCULENT SEEDS.

EVERY now and then we receive specimens of ripe Grapes the skin of which bursts open to liberate a second supplementary Grape formed in the interior. Having previously only seen such Grapes in the ripe condition, we had considered them to be the result of the formation of flowers within the original ovary, such as occasionally happens in Crucifers. This season, however, we were privileged to receive specimens in the unripe stage, and the inspection of the berries in course of formation soon showed us that our previous conjecture was quite erroneous, and that the supplementary berries are in reality seeds whose coats had become fleshy (see figs. 76, 77).

This succulent condition of the seed-coat occurs in the nearly-allied Leontice, in Crinum, and some other plants, as long since recorded by Robert Brown. An analogous change takes place in the carpels of Rosa gymnocarpa, but here it is the coat of the ovary that becomes succulent. The point now to be ascertained is the cause of this production. Does some injury occur to the berry, causing it to crack? and does the seed become fleshy in consequence of exposure? or does the seed-coat swell up first, and by its force of growth cause the resisting coat of the berry to crack open?

As the subject is of much botanical interest, we append the account of Robert Brown:—"In Leontice the 'drupa stipitata' of Michaux is in reality a

naked seed that in a very early stage had burst its pericarpium." "In Pelioeanthea Teta, soon after impregnation has taken place, from one to three of these ovula rapidly increase in size, by their pressure prevent the development of the others, and rupture the ovarium, which remains but little enlarged at the base of the fruit, consisting of from one to three naked berry-like seeds." Robert Brown, "On some remarkable Deviations from the usual Structure of Seeds and Fruits," *Trans. Linn. Soc. London*, vol. xii., pp. 143, 151 (read March 5, 1816); *The Miscellaneous Botanical Works of Robert Brown*, vol. i. (1866), p. 361. M. T. M.

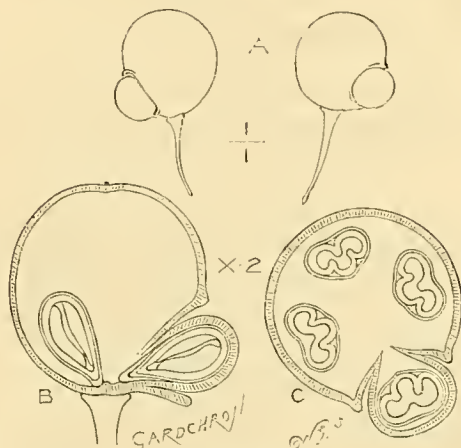

FIG. 76.—

B, C, vertical and horizontal sections, showing the origin of the supernumerary berries—magnified twice.

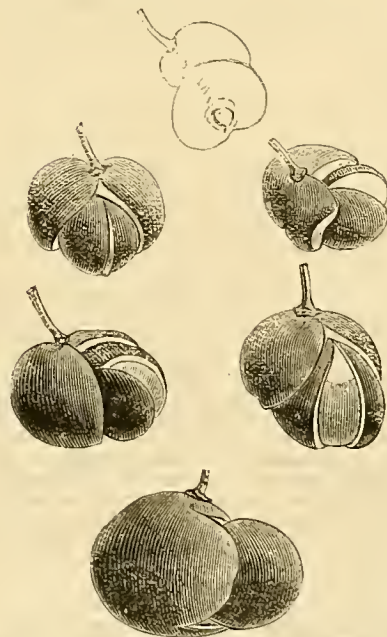

FIG. 77.—SUCCULENT BERRY-LIKE SEEDS PROTRUDING FROM RIPE GRAPES.

HOME CORRESPONDENCE.

A ROADSIDE HOUSE GARDEN.—A charming floral effect might lately be seen at the "John Bull" inn, opposite Gunnersbury Station. A balcony runs along the length of the house, and this has been utilised to produce a very pleasing effect indeed. A dark-leaved crimson-flowered form of Tropæolum Lobbianum, growing in pots or boxes, falls down over the front of the balcony in numerous graceful festoons, and has also grown upwards, and reached some distance above the balcony railing, finding adequate support there; while various plants in pots, such as Pelargoniums of different types, Petu-

nia, Fuchsias, &c., varied the arrangement, and furnish attractive patches of colour. It is pleasant to notice, as can frequently be done, that wayside public-houses are met with in the suburbs of London decorated in this way, and there is no reason whatever why Boniface should not be a gardener as well as a licensed victualler. It may be safely assumed that passers-by would stop to admire, and probably drink a glass of something in compliment to the flower-loving publican. R. D.

THE NAMING OF SWEET PEAS AND ROSES BY THEIR PERFUMES.—I was much interested by Mr. Hartland's note on this subject in a recent issue of *Gardeners' Chronicle*, and glad to hear that Emily Henderson, one of the best white Peas, had the least scent. The majority of our Sweet Peas, unlike our Roses, are overladen with odour, the latter can be tasted as well as smelt, and much good honey is ruined annually through the fulsome-ness of Sweet Peas. For this and other reasons, such as the avoidance of headaches, it may be hoped that Mr. Hartland and others will turn their attention not only to the naming of Sweet Peas by their scent, but to the reduction of the amount of the odour, or a change of their perfumes. As to Roses, it is many years ago when I first undertook to name some of these from their odours—notably, if I remember rightly, Devoniansia, the old Cabbage, Maiden's Blush, Boule de Neige, Maréchal Niel, La France, Chas. Lefebvre, &c. In my address to the Horticultural Club at the Hotel Windsor last year on the odours of Roses, reference was made to those early attempts at classification and recognition of the perfumes of Roses. The time is never likely to come when we shall say of these, as many have long been saying of the scent of Sweet Peas, "Hold, we have already more than enough." D. T. Fish.

OUT-OF-DOOR GRAPE VINES IN TOWNS.—

Passing along one of the main streets in a provincial town the other day, I found a jobbing gardener trimming a Grape-vine. The Vine was specially healthy and fruitful, and was furnished with a full crop of good-sized, well-furnished bunches. As a mere wall-clothes and a welcome relief to a long run of bricks and mortar, it was equally or more ornamental than the Ivies, Ampelopsis Veitchii, or Virginian Creeper that were almost the only climbers brought into competition with the Vine. The leading shoot of the Vine had been carefully tied-in, the laterals stopped several weeks since had broken again into sub-laterals, and not a few of the latter had broken into sub-laterals and tendrils, the whole having a rich and graceful effect. The gardener was thinning the latter without wholly removing them, and the effect of the bunches, foliage, and tendrils was most promising and refreshing. The autumnal tints of Vines, to say little of the beauty of the fruit in bunch and berry, are also very charming, and many varieties of Grape-vines are worth growing as among the very richest and choicest of fine-foliage plants. Even Lady Downes, West's St. Peter's, Alicante, and many others, that could hardly be expected to ripen their fruits in the open air, can ripen and colour their leaves to the greatest perfection on southern and western and other aspects; while among our very old-fashioned and hardiest Grapes, that ripen their fruit in the open, as well as form one of the richest contrast with their leaves, we have the Dusty Miller and the Claret, the latter finishing in a glow of crimson hardly matched by Virginian Creeper, however brilliant. But I have often advocated the use of fruiting and American species of Vines for the colouring of gardens, buildings, landscapes. The object of this note is chiefly to recommend the thinning of such fine bunches as I saw in the street the other day. Many of these averaged the length and size of average Hamburgs; and were they but moderately thinned, they would doubtless reach to average size in the two possible growing months set before them. Already the bunches are so crushed as to move in masses. Other berries are intruding each other in the fierce struggle for room. People tell us that for wine-making—the final goal of most out-of-door Grapes—it matters little; but it does, and thinning would pay even for this, as, weight for weight, far more wine is pressed from good-sized berries than a huge crush largely composed of dry skins and hard stones, with a minimum of flesh and juice. Besides, in favourable seasons, under favourable culture, and especially through liberal and timely thinning, many Grapes may be ripened efficiently in our climate to prove refreshing and enjoyable. Thousands of pounds are eaten, though jammed and crowded into solid masses through the energy of

growth, with only the mere exterior of the berries ripe. With the entire bunch ripened to a similar extent through the thinning of out-of-door Grapes, the value of the crop would be doubled for wine-making or conversion into temperance drinks, and multiplied many times for eating. *D. T. F.*

DEFECTIVE ARRANGEMENT IN THE GRAPE CLASSES at the Royal Horticultural Society's Fruit Show at the Crystal Palace. I should like to know why tables were not provided sufficient in size to hold the three exhibits in class 3 without making use of a side-table for one of them; and why the judges' attention was not called to this exhibit by the officials before the judges made their awards, and why it was left to the exhibitor himself to call the officers' attention to the oversight? Again, why did one of the officials make a suggestion that the exhibit should have a 3rd prize without the judges being called back? I may say that the judges did judge this exhibit, and after a cursory glance at it, awarded a 3rd prize. The same kind of mistake occurred in class 4, but on the exhibitor calling the official's attention to it, the judges were brought back, and they reconsidered their original awards, and gave it a 2nd prize in this class. Is it usual for judges to look at the address cards when making their awards? *John Carrill, 83, St. John's Road, S.E.*

CRABS.—Crabs are generally considered to be either a wild or a cultivated kind of sour Apple, and in Kent, not so long ago, after making the cider, the dross, or crushed Apples, was thrown away some distance from the house, as it was considered unlucky to have it anywhere near. From this not unfrequently hundreds of seedlings arose, and these were always called "Crabs," and used for stocks, when possibly there was not a true wild kind, or sharp acid Apple among them, and so it was that occasionally, if the stock and core grew as well as the scion, two kinds of fruit were on the same tree. I have seen, years ago, a "Russet" on the part growing from the stock, while the scion was the old Nonpareil. But it is not of this mode of raising stocks I purpose writing, but of the value of the "Crab" as an ornamental tree, both in flower or fruiting. Generally small, light, and not ungraceful in growth, Crabs present at all times a pleasing aspect, but in spring or September, some are beautiful in the extreme, and are well worthy of a place in every garden of any size or pretensions for decorative purposes, and as such I have used several of the varieties with much satisfaction to myself and to the delight of my friends. Few people are aware for this purpose how very useful it is. Of the kinds to use. For flowers only, *Malus floribunda* is charming in March or April, then there is a larger-fruited variety of this worth growing. On this follows closely, Chicago, deep yellow with red cheeks; Marengo, large fruit, red or yellow; Zeller, a fine colour and good bearer; as is the Yellow Siberian. The Scarlet or Cherry I do not like so well as some. Oblong is one of Mr. Rivers' bright and showy. Then of the smaller kind, is *edulis*, an abundant bearer, but uneatable. From Messrs. Cheal I get Ringo, a fine yellow, but small; and a lovely bright transparent scarlet of the Cherry size, with a sharp acid flavour, and fine for jelly, this is Cheal's New Scarlet, and is an acquisition. A trifle larger is the old red Siberian; then the larger and oblong bright coloured John Downie; larger and brighter still is the beautiful Transcendent Crab, a tree of this, carrying a large crop, is a marvel of beauty, the fruit has much the flavour of the small wild Apples one sometimes finds in the out-of-the-way hedgerows, and wants more sharpness for good jelly-making. Then the deep rich blackish-purple, the Black Crab, very handsome both in shape and colour; and last, not least, the glorious Dartmouth Crab, and when the crop is good and the season suitable, this possibly is unsurpassed, presenting as it does a gorgeous appearance, and that of a somewhat deceptive character, being often taken at first glance for a Plum tree hung about with rich coloured Plums. But all having some peculiar merits of their own, it is difficult to decide which to choose, but take any, or take all, and scatter them about the shrubbery, and the result, if judiciously done, will add both beauty, and be also of use for table and other decoration, and for culinary purposes. There may be more than those named above, but I think I have given a sufficient choice, some of which I grow, others by Mr. Rivers, and for several I am indebted to Messrs. Cheal of Crawley, who have kindly sent me to describe some of the fruit from trees not in my possession. *Harrison Weir, Sevenoaks.*

WORM-EATING SLUGS.—The present month is one of those during which the curious worm-eating slug—*Testacella*—leaves the subterranean tunnels of its victims and coming above ground may often be found under logs and stones, in the neighbourhood of rich soil. The animal is easily recognised by its exceptionally leathery skin, and by the presence of a tiny external shell on the hinder end of the body, recalling somewhat the nail on the end of a human finger. The writer would be greatly indebted to any reader of the *Gardeners' Chronicle* who could send him specimens of these slugs (from any locality, and preferably alive, or preserved in alcohol), as the information as to the distribution of the animals is still scanty. *Wilfred Mark Webb, Editor of the 'Journal of Malacology,' 'Holmesdale,' Brentwood, Essex.*

SOCIETIES.

ROYAL HORTICULTURAL.

GREAT EXHIBITION OF BRITISH GROWN FRUIT AT THE CRYSTAL PALACE.

September 26, 27, 28.

(Continued from p. 404.)

THIRD DAY'S CONFERENCE.

MR. PHILIP CROWLEY, the Treasurer of the Royal Horticultural Society, presided at the third day's Conference, when Mr. Weathers, the Assistant Secretary of the Royal Horticultural Society, read one of the two equal prize essays on the subject of

"THE COMMERCIAL ASPECT OF HARDY FRUIT GROWING IN THE UNITED KINGDOM."

The writer said, that in consequence of the agricultural depression and the difficulty of making the cultivation of land profitable, landowners and others had been at a loss to know what things they should grow in the future with a reasonable prospect of a fairly remunerative return on their investments. Foreign competition was undoubtedly a serious matter, and must be deliberately looked in the face by present and future fruit growers. We must all make up our minds that unless we improved on our present system of culture generally, also in our methods (or want of method) in packing and marketing fruit, foreign competition would become even more keen. It seemed strange that a practical and energetic nation like the British should have permitted foreigners to step in, and in a measure monopolise their own markets with produce that could be grown better in every respect—except perhaps as regards colour—at home. At the same time it should be fully understood that cultivation must be thorough, not simply sticking a tree in the soil and expecting it to grow and produce full crops every year without any further attention.

The fruit grower of the future must be a man who has had a proper education in the work; a man of untiring energy, with good business habits, and sufficient capital both to purchase his stock, and also to wait until they arrived at a bearing state. Or failing such men, capitalists could step in, buying the land and the stock, and employing a competent man to manage the business at a fixed annual salary, plus such a commission on sales or profits as might be mutually arranged. It was of the utmost importance that only a manager should be employed who could bring positive proof of his training and abilities as a fruit grower, otherwise what might be a most remunerative investment would in all probability prove the reverse.

The question was frequently asked why skilled professional gardeners did not take up fruit growing as it paid so well, instead of being content to remain as gardeners. The answer was, that comparatively few gardeners had the needful capital to enable them to do so. Some more fortunate ones did do so, and usually made a very good living.

After dealing exhaustively with the question of land suitable for fruit growing, the writer went on to speak of the fruits. The APPLE, he said, might be termed the King of British fruits, and looking at the enormous importations, there was no fruit holding a better prospect of profitable return. The soil of the United Kingdom was so admirably suited for Apple growing that if the cultural requirements were but given proper attention, we could more than hold our own against the world. But to make the cultivation of Apples the commercial success it deserved to be, we must radically alter our present system, or rather want of system, by growing the trees better, and exercising more

honesty and care in sorting and packing the fruit. The most profitable system was to grow a limited number of varieties as dwarf trees on a soil which had been proved capable of growing full crops of large Apples. The first and most important advantage of dwarf trees was the quick return given by such trees as compared with standards. Some years ago the writer planted a number of Lane's Prince Albert costing 3s. a tree or 10% per 100. They were planted at the end of October or early in November in well prepared situations. The following season a few Apples were produced, but the year after, *i.e.*, the second year from the time of planting—a crop was borne and sold at 22s. per cwt. and averaged 3s. 6d. per tree. Of course, that was an exceptional case, but it proved what could be done by planting dwarf trees carefully in suitable soil, with proper management afterwards. The trees had continued to bear heavy crops of fruit in almost every subsequent year. Another advantage possessed by dwarf trees was the ease with which all operations connected therewith could be performed from the ground level as compared with standards which required ladders, etc. They were much less injured by gales than were high trees from which Apples were blown down and spoilt for market purposes. Another advantage was that all malformed fruit could be plucked from the trees while small, so that when the fruit was gathered it could be put straight from the trees into the hampers with very little sorting, and fastened down to be sent to market at once. The less fruit was handled before reaching the purchaser the better its appearance and the higher its value. By thus gathering the fruit and putting it into the hampers as picked there was no attempt at deception, as the Apples were of a uniform size and quality throughout the package. Buyers quickly noticed this honesty, and the sender acquired a reputation that made his consignments eagerly sought after. The practice of topping the package with the finest fruit, with a mass of inferior stuff beneath, could not be too strongly condemned.

Having decided on the form of tree to be grown, it was important that early orders should be given to a nurseryman of the highest repute, who would not permit a bad tree or one not true to name to leave his nursery. Another important matter was the stock upon which the trees were worked. For standards the crabs and stocks raised from Apple pips were the best, while nothing would equal the English or broad-leaved Paradise for dwarf trees.

Among the most profitable varieties to be grown were the Ecklinville, which headed the list, fetching from £12 to £22 per ton; Lane's Prince Albert, ditto: Golden Spire, realising about £15 a ton; Worcester Pearmain, from £14 to £26 per ton; Warner's King, £16 per ton; Cox's Pomona, Cox's Orange Pippin, King of the Pippins, Lord Suffield, Pott's Seedling, Yorkshire Beauty, Stirling Castle, Tower of Glamis, and Dumelow's Seedling.

PLUMS come next to Apples in giving profitable returns when they are grown upon bush trees. Of late years one heard much of growers who had found the price of Plums so low that they did not pay for the picking, the fruit being in consequence left to rot on the ground. This clearly showed to him that something was wrong; either the size of the fruit must have been small, the varieties inferior, the soil and situation unfavourable, or the system of marketing stood in great need of improvement. As a proof of this, one season, when the wail was particularly loud as to the low prices prevailing for Plums, he had a gross return of £176 from one acre of Victoria Plums grown on bush trees, planted at 8 feet apart each way. The lowest price he had made in the past ten years had been 7s. per cwt. and the highest 24s. per cwt. for Victorias. Frost might occasionally cause the trees to be a complete failure for a season, but take one year with another, Plums were well entitled to rank next to Apples for profit. Among the profitable varieties were Victoria, Rivers' Early, sometimes fetching 25s. per cwt., and Czar, as high as 27s. Earnest attention should be paid to the manuring of Plums; and in preparing them for the market they should be properly graded—sorted out and packed in separate lots.

The PEAR—a delicate fruit—was always in at least fair demand, and many imagined, from the high prices ticketed upon them in the leading fruiterers' windows, that a magnificent profit must be made by the growers. His experience was that no hardy fruit was more uncertain. Only in particularly favoured districts could Pear culture be considered a commercial success at all. In such

localities there was no question that Pear-growing would be a source of profit. Among the profitable varieties were Louise Bonne, which had fetched 14s. per cwt.; Beurré Clairgeau, 15s. per cwt.; Clapp's Favonrite, Pitmaston Duchess; Beurré Hardy, Doyenné du Comice; Marie Louise d'Ucele, Josephine de Malines; Catillac, Uvedale's St. Germain, Verulam, and Vicar of Winkfield.

The foreign CHERRIES were so poor in quality compared with home-grown ones, that there was every prospect of this popular fruit maintaining its value and paying well in the future. The importance of growing only a few varieties of any kind of fruit held good with Cherries more than with any other kind because of the trouble with birds. For this reason, only one variety, or varieties which all ripened at the same time, should be planted in an orchard, thus enabling a man with a gun to guard the fruit for the comparatively short time it was necessary to protect it. Fixed objects to scare the birds were of little use. Early Rivers held a high position among the early varieties; then came Elton, Governor Wood, Florence, and Emperor Francis. There was a possibility of making a fair profit by planting Morello Cherries.

For a man with but limited capital, bush fruit and STRAWBERRIES offered the greatest prospect of commercial success, as the first cost in purchasing them was comparatively small, and under fairly good treatment quick returns were secured. No fruit would pay so quickly as BLACK CURRANTS, where they would grow, prices never being lower than £22 a ton.

RED CURRANTS were not in great demand.

WHITE CURRANTS must be very fine indeed to fetch good prices, and it would be rather a risk to plant any quantity.

RASPBERRIES were a profitable crop, but if pickers could not be engaged in the district, considerable loss might occur, as the fruit rapidly spoiled if not picked when ripe.

GOOSEBERRIES were a reliable and profitable fruit, and ought to be planted on every fruit plantation of any size, as they come into bearing early from the time of planting, and proved of great assistance in meeting expenses.

STRAWBERRIES. The price went up, and there was no reason why Strawberry culture should not give as good a profit in the future as in the past.

The writer dealt with the question of the care and discrimination requisite in packing, and said that the fraudulent practice of topping with the finest fruit should never, under any circumstances, be permitted. Perfect honesty in marketing was the best policy.

As to insect foes, more attention to this matter was imperative to make fruit culture profitable. These pests should be dealt with early, as it was much easier to destroy them in their infancy.

Mr. JOHN WRIGHT, who was one of the adjudicators on the prize essays, said that the paper they had listened to was a highly valuable one. He and Mr. Barron (the Superintendent of the Royal Horticultural Society at Chiswick), and the Rev. Mr. Wilks (the Secretary of the Society), had a heavy responsibility placed on them. As they had heard, the writer indicated that the subject of fruit culture was a far too serious matter for anyone who had but a little money to take up, without technical knowledge to carry it through; but, when everything was well considered, and a thoroughly practical man could be put in charge, the work would give a good return for the labour and capital invested. If they read this paper and the other prize essay which would be published in the Society's *Journal*, they would have in a small compass the most valuable production, the most sound instruction, and the safest guide on the subject which had ever appeared in the English language. He himself knew something about essay writing and the worries it entailed, and he had the pride and privilege of wearing the gold medal given by Dr. Hogg sometime since. Although Dr. Hogg had been precluded from attending that meeting, that gentleman had authorized him to say that he would give the large silver medal of the *Journal of Horticulture* to Mr. S. T. Wright and to Mr. Lewis Castle, the writers of the Essays.

Mr. LEE CAMPBELL said he was very proud to tell them that by careful work on the part of his gardener and himself, he had risen to the top of his profession. He started fruit growing as an experiment, but after a very long residence on the Continent, he was sure that we were far ahead of the foreigner. He was, however, sorry to say that the foreigner had got more than the third end of the wedge in, and he was afraid it would take a great deal to drive it out. Whether we could ever succeed thoroughly in that direction was doubtful. He had proof that our English fruit was not inferior in any respect to fruit produced abroad. A short time since he wrote to his salesman, Mr. John Mills, of Manchester, asking him to give him a faithful and candid opinion of how his fruit compared with that of the foreigner. Mr. Mills wrote that his varieties of Apples realised 30 per cent. more on the average than any other English varieties. Now 30

per cent. was a profit in itself, at least growers thought so, although, perhaps, shopkeepers were not content with it. Recently they had gone almost entirely in for barrels for conveying fruit. They thought this was much preferable to the old style, as there was a certain movement in the flats, and the ends of the withies caught against the fruit and damaged it. They put between 50 and 60 lb. in a barrel. Mr. Mills also told him that his Peasgood's Nonsuch Apples averaged 50 per cent. better price than the Canadians.

The question of foreign competition, he held, was a national matter, and the subject of railway rates and the preferential rates given to the foreigner by our English companies, would have to be seriously gone into. As an instance, he mentioned that in America five guineas a ton was charged for transit for a distance of 3,500 miles; he paid the Great Western Railway Co. 27s. a ton for 140 miles. If his goods were carried on the same basis as Oranges were carried in America, the freight ought to be about 4s. Owing to the railway companies' high charges thousands of tons of fruit had to rot, as it would not pay to place it upon the train. The French Apples had an advantage over the English Apples between Southampton and London of something like 7s. 6d. a ton. Batter again, from and to the same places, showed a preference in favour of the foreigner of 21s. per cent. Englishmen could not stand against that. With regard to fruit growing, he would warn people against indiscriminate planting, which would only be making a rod for their own backs, and, like indiscriminate dabbling in African mines, would make the victims wish they had never taken the matter in hand.

Mr. GEORGE GORDON said we should be a great deal more careful about our packing. In the case of Plums, although it might not be pleasant to Englishmen to confess it, the French cultivators were far and away in advance of us. The English method really spoils the fruit, which presented anything but an attractive appearance when it was finally shovelled into the customer's basket. Then again, if we were to take full advantage of our opportunities, we should be able to utilise our fruit in seasons of plenty by drying and preserving. There was no necessity to rely on the sun for drying—that could be done in an ordinary oven.

The CHAIRMAN mentioned that he had dried his own fruit in the oven, which answered satisfactorily. There were, however, two good drying-machines—the Mayfarth and the Wass—one of which was at Chiswick Gardens, where it might be inspected.

NATIONAL CHRYSANTHEMUM.

OCTOBER 8, 9, 10—More than usual success attended the early autumn show of the National Chrysanthemum Society, held on the above dates in the Royal Aquarium, Westminster. The quality of many of the blooms exhibited was very high, and almost equal to those generally staged at the November meeting. There were some new varieties presented before the Floral Committee, and several Certificates were awarded. Competition in the open classes was generally good, but in the limited classes rather weaker. The show gained much of its effectiveness as a display from the very numerous honorary collections of flowers and fruits from the trade.

There were two exhibitors only of a group of Chrysanthemum plants in flower, arranged with foliage plants for effect. Mr. H. J. JONES, Ryecroft Nurseries, Lewisham, was 1st. He staged a good lot of plants and placed them thinly, with a few Ferns in front and intermixed, and a background of Bambusa. Varieties most interesting were the new Mrs. Chas. E. Shea, one of the first rate Japanese blooms of last year; Mrs. R. Jones, L'ère, A. H. Fewkes, &c. The colour of several of these was rather deficient. The 2nd prize was taken by Mr. Howe, gr. to HENRY TATE, Esq., Park Hill, Streatham Common, who had a group consisting of Chrysanthemums, with Dracenas, Crotons, and other things.

For twenty-four Japanese blooms in eighteen varieties, Mr. W. WELLS, nurseryman, Redhill, Surrey, won 1st honours, and his collection was capital, indeed, for this early show. Among the varieties, the most noteworthy was Boule d'Or, an incurved variety of the present year, sent out by Calvat. As shown, the bloom is large and fairly full, petals broad, and the colour a pleasing shade of buff. A First-class Certificate was awarded. Wm. Tricker, Frank Wells, Eda Prass, Louise (very good), Madame Ed. Rey, were all of good quality. 2nd, Mr. Chas. Cox, gr. to JNO. TROTTER, Esq., Brickendon Grange, Hertford, whose collection had also very exceptional blooms. We might mention Avalanche, Mrs. Anna Hartsborn, President Borel, &c. There were several other exhibits in this class.

The best twelve blooms (Japanese), distinct, was a dozen from Mr. R. Jones, gr. to C. A. SMITH-RYLAND, Esq., Barford Hill, Warwick, who had blooms of excellent quality. Mons. Chas. Molin, which was awarded a First-class Certificate as shown by Mr. W. J. Godfrey, was represented in this stand by a first-class bloom; Madame Ed. Rey, Mrs. E. G. Hill, Wm. Seward, Rose Wynne, M. Panckoucke, were others that commanded notice.

In the 2nd prize collection, from Mr. Jas. Brookes, gr. to W. J. NEWMAN, Esq., Whetstone House, Totteridge Laue, N., were nice blooms of good colour, representing the newer varieties; Mr. W. COLLINS, gr. to J. W. CARLILE, Esq., Ponsbourne Park, Hertford, was 3rd; and there were seven or eight other exhibitors.

Six blooms of incurved distinct only found two exhibitors. Mr. W. COLLINS was 1st, and his best blooms were Refulgens

and Mons. Bahuant; Mr. R. Filkins, gr. to Miss ALEXANDER, Oakbank, Chislehurst, was 2nd.

Only two exhibits were made of twelve bunches of Pompos, and the best were from Mr. Chas. Brown, gr. to R. HENTY, Esq., Langley House, Abbots Langley, Herts, who had a stand composed of very neat blooms of nice quality. Miss DEBENHAM, St. Peter's, St. Albans, was 2nd.

Six bunches, however, were best from Miss DEBENHAM, who showed very well in this class, and was followed by Mr. T. L. Turk, gr. to T. BONEY, Esq., Southwood House, Highgate, N., and Mr. CHAS. BROWN.

Mr. T. Tullett, gr. to G. ALEXANDER, Esq., Warley Lodge, Brentwood, Essex, had 1st prize for two vases of Chrysanthemum blooms, twelve large-flowered blooms in each, with the addition of any suitable foliage. The blooms used were good, and only a little Asparagus was used in addition to the natural foliage. There were several other competitors in this class.

Amateur Classes.—Mr. H. LOVE, 1, Melville Terrace, Sandown, Isle of Wight, was 1st for twelve blooms of Japanese, in not fewer than six varieties, and showed a capital collection, blooms very fine, but lacking colour a little; G. C. Schwabe was noticeable. 2nd, Mr. W. Amies, South Ashford, Kent.

The class for six blooms was won by Mr. F. DURRANT, 4, New Road, Ware; his collection lacked colour, as the only flower with any colour was one of W. Tricker. 2nd, Mr. Ed. JONES, 25, Malvern Road, Horsey, with bright but smaller blooms; 3rd, Mr. AMIES.

Single-handed Gardeners.—The best twelve blooms of Japanese, distinct, came from Mr. J. Knapp, gr. to F. W. ANSDEN, Esq., 22, Chichester Road, Croydon; his best blooms were W. G. Newett, Eda Prass, and Mrs. F. Jameson. 2nd, Mr. T. L. TURK.

Mr. J. KNAPP was again successful for six blooms, including a good one of Annie Clibran; 2nd, Mr. A. W. Southard, gr. to H. B. KENTON, Esq., Winningwood, Sutton.

Floral arrangements.—The first class in this section was for a table of miscellaneous arrangements, illustrating the decorative value of Chrysanthemums. Mr. J. R. CHARD, Stoke Newington, won 1st for this, and showed an effective collection of bouquets, wreaths, button-holes, sprays, &c., but the whole was rather overdone with berries, and appeared to be designed to illustrate the value of berries in decorative exhibits. The best three epergues of Chrysanthemums were also shown by Mr. J. R. CHARD, and they exhibited considerable taste. Mr. D. F. CRANE was 2nd; and Mr. W. GREEN, Jr., florist, Harold Wood, Essex, 3rd. There were several other entries in this class. The class for one vase (the trade excluded), was won by Mr. D. M. HAYLER, gr. to W. HANNAFORD, Esq., Tenterden Hall, Hendon, N.W.; and Mr. D. B. CRANE was a very close 2nd.

MISCELLANEOUS EXHIBITS.

We have already described these as very numerous. Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea, had a group of Chrysanthemums, very noteworthy, the blooms being good, and the group contained plenty of colour. The plants, in our opinion, would have looked better had they been less thickly placed together. Louise, as usual in early shows, figured largely in the group. Madame Lecocq, Lady Randolph, President Armand, Commandant Blussett, and M. Auguste de Lacrivier, were noticeable.

Another group of Chrysanthemums was staged by Mr. THOS. S. WARE, Hale Farm Nurseries, near Tottenham.

From Mr. W. J. GODFREY, Exmouth Nurseries, Devon, came a large display of Chrysanthemum blooms, most of which are Mr. Godfrey's own seedlings. Mons. C. Molin was recommended a First-class Certificate. Blooms of the excellent Carnations, Miss Mary Godfrey (white), Reginald Godfrey (pink), and others, were also shown.

Mr. RONT. OWEN, Maidenhead, had blooms of Yellow Gem, a frimbriated Pompon, flowers very small, with high centre (First-class Certificate); Lady Esther Smith, a white Japanese incurved, with excellent broad petals (Certificate); and Col. Bernard, a red flower, with very pale buff reverse (Certificate).

Mr. W. WELLS, who won in the class for twenty-four blooms of Japanese, exhibited another stand containing about four dozen fine blooms in considerable variety; and Mr. SHOESMITH, Clarendon Nursery, Woking, had a stand of twelve blooms, including Louise, M. Chas. Molin, Rose Wynne, and Phœbus, a good yellow reflexed variety (First-Class Certificate).

From Mr. H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham, was a very pretty collection of Chrysanthemum blooms. At the back was a good lot of Ferns and some conspicuous blooms in stands among these. In front there were seven or eight dozen Chrysanthemum blooms in boxes. Some excellent sprays of Pelargoniums were also from Hither Green. Messrs. H. CANNELL & SONS, Swanley, had a large stand of Dahlia blooms, also of Cannas, and a few Chrysanthemums.

The large permanent fountains, one of which stands at either end of the Aquarium, were on the present occasion used for the first time as a means for making an effect in floral arrangement. Mr. THOS. S. WARE, Tottenham, decorated one of these, and made a very commendable display of all sections of Dahlia blooms, well furnishing the entire structure. The other one was capitally done by Messrs. CHEAL & SON, Crawley, who, in addition to Dahlia blooms, displayed a quantity of fruit at the base.

Mr. E. F. SUCH, nurseryman, Maidenhead, exhibited various floral arrangements of Chrysanthemums; and Messrs. W. CUTBUS & SON, Highgate, had a collection of Asters and other hardy flowers. Mr. G. GOODSON, Belle Vue Nursery, Acton, exhibited a few plants of a new yellow Chrysanthemum, with moderate-sized, very full flowers, apparently useful for decorative work. Mr. W. HIGGS, Fetcham Park Gardens, Leatherhead, showed a number of excellent plants

in bloom of *Saintpaulia ionantha*, raised from seed sown in January. Mr. E. G. REID, nurseryman, Beckenham Hill, Kent, had a few *Dahlia* blooms, Cannas, &c.

Fruit was exhibited well by several firms. Messrs. JNO. LAING & SONS, Forest Hill, London, S.E., had a first-rate collection of Apples and Pears; and Messrs. S. SPOONER & SONS, Hounslow, Middlesex, and Mr. H. BERWICK, Sidmouth, Devon, also exhibited worthy collections.

Onions and Leeks were shown by Messrs. DOBBIE & Co., Rothsay, N.B., and Onions by Mr. H. DEVERILL, Banbury.

MAIDSTONE HARDY FRUIT EXHIBITION.

OCTOBER 8, 9.—This was far the best exhibition of its kind this Society has ever held. The classes were better filled, and the fruit generally was of the highest order. The entries last year were 98, as compared with 255 on the present occasion.

For the best collection, not to exceed twenty-four dishes, grown in the county, open to landowners, tenant-farmers, or market-gardeners, there were ten exhibitors. ROGER LEIGH, Esq. (gr., Mr. Woodward), took the lead, showing superb Peasgood's, Washington, Mère de Méange, Bismarck, Alexander, Cox's Pomona, and Mother Apples; four fine dishes of Peaches, and good Pears. The 2nd prize fell to M. H. DALLISON, Esq. (gr., Mr. Legg); 3rd and 4th, to A. J. THOMAS, Rodmersham, and Mrs. FREMLIN, Teston, respectively.

The best eighteen dishes of Apples and six dishes of Pears, open to all, were from Mr. WOODWARD; 2nd, Mr. S. H. GOODWIN, Mereworth; closely followed by Mr. CHAMBERS, Mereworth. In this class nine competed, all showing exceptionally good Apples.

For nine dishes of Apples and three of Pears, each dish to consist of twelve fruits, and farm grown, six competed. The 1st prize went to Mr. THOMAS, who staged handsome fruit of The Queen, Beauty of Kent, Gloria Mundi, Bramley's Seedling Apples, and very fine Pitmaston Duchess Pears. Mr. SMITH, Loddington, closely followed with a remarkably clean lot. His best dishes were Cox's Orange Pippin, Ribston Pippin, Queen Carolae, Adam's Pearmain, Tower of Glamis, Bismarck, and Gascoigne Seedling Apples; 3-d, Mrs. FREMLIN.

The class for six dishes, four of Apples and two of Pears, twelve fruits to a dish, was won by Mr. A. T. KILLICK; 2nd, Mr. BLEST, Broomcroft, Wateringbury; 3rd, Mr. GOODWIN.

For one sieve of Apples, Cox's Orange Pippin, there were fourteen lots. Mr. T. W. STARTUP, West Ferleigh, was deservedly 1st, with large, handsome, and beautifully-coloured fruits; Mr. THOMAS and Mr. GOODWIN followed.

For any other dessert kind, Mr. GOODWIN took the lead, showing grand King of the Pippins; 2nd, Mr. MAINWARING, with the same kind.

For one sieve of Cooking Apples eighteen competed, all of which were exceptionally good. Mr. KILLICK took the lead, showing good Peasgood Nonsuch; 2nd, Mr. F. LOCKYER, with very large and well-coloured Blenheim Orange.

Mr. SMITH took 1st for four quarter-sieves of Dessert Apples, showing very good Malbot's Pearmain, Cox's Orange Pippin, Ross' Nonpareil and Ribstons; this class was strong, and several other classes were well filled, the competition being keen throughout.

MISCELLANEOUS.

F. S. W. CORNWALLIS, Esq. (gr., Mr. McKenzie), staged some fifty dishes of Apples and Pears, all of superb quality.

H. L. C. BRASSEY, Esq., Preston Hall (gr., Mr. Jarman), contributed some forty dishes of excellent fruit; and Mr. STARTUP showed a similar quantity.

Mr. S. FRONT, of the Borough and Liog Nurseries, sent a large and varied collection of Dahlias.

SCOTLAND.

LEEK AND ONION SHOW AT ROTHESAY.

WHILE most persons are ready to admit that the floral productions from Rothsay take the lead at northern shows, we are not prepared to say that Rothsay is able to cope with the growers of the more sunny South in the matter of Onions. In the seed stores of Messrs. Dobbie & Co., an exhibition of Leeks and Onions was held, which in its way is as much an international one as some of the great "international" shows. Some of the grand Onions shown from districts wide apart in England and Scotland would grace any show in the country, where size and quality combined are recognised merits. Leeks generally were such as one is accustomed to see in the North, mostly of fine form, well blanched, firm, and of large girth. It is to be hoped this interesting exhibition, promoted by Messrs. Dobbie & Co. will be the forerunner of Leek and Onion shows of greater magnitude. If vegetable roots were added to such a show, they would increase the interest very materially—we think the promoters have this idea in view, and their liberality on this occasion has done wonders by bringing together,

without any fuss, nearly eighty exhibitors for four specimen Onions, and over sixty for Leeks; and, remarking the excellence of the exhibits all round, they increased the number of prizes, which were as follows:—Leeks—1st, Mr. L. COLLINS, 108, West Wylam, near Prudhos; 2nd, Mr. D. LOGAN, Castlelaw, near Coldstream, Kelso; 3rd, Mr. J. EDWARDS, stationmaster, Stanley, Perth; 4th, Mr. James Hall, Kelso; 5th, Mr. William Laverock, 113, Grinlawa, Leslie. Other fine acknowledgments were made. Onions—1st, J. BOWERMAN, The Gardens, Hackwood Park, Basingstoke; 2nd, T. WILKINS, Inwood Gardens, Henstridge, Blandford; 3rd, Noah Knellar, Malahanger Gardens, Basingstoke; 4th, Adam Dunlope, Flowerbank Cottage, Galton; 5th, R. Fishwick, Singleton, Poulton-le-Fylde; 6th, G. H. COP, Gardens, Honest Park, Sherbourne; 7th, R. Paton, 40, Orchard Street, Galton; 8th, J. Hall, Singleton, Poulton-le-Fylde; 9th, H. Taylor, Gardener, Gredington, Whitechurch; 10th, W. Rankine, Loch Ryan, Straunraer. While there was nothing inferior in any of the exhibits, most of them were first-rate, and admitted on all hands to be the finest bulbs ever seen in Scotland at any exhibition. *M. Temple.*

NOTES FROM CULTOQUEY, PERTSHIRE.

For some years past I have been desirous to see the gardens at Cultoquhey, near Crieff, the seat of J. M. Graham, Esq., where that popular proprietor's gardener, Mr. Fender, has raised the excellent vegetables he has exhibited for some years at the great shows held at Edinburgh and Glasgow. The strong points in the Cultoquhey collections generally are cleanliness and first-rate quality, rather than grossness and large size.

At this lovely seat there are other attractions than vegetables, such as the fine specimens of Coniferæ which adorn the extensive grounds. Though in common with Ochertyre, and other places in the locality, some losses were sustained by the severe gales in November of 1893, there are still sufficient fine specimens to render Cultoquhey attractive to lovers of Coniferæ. Among Oaks, Ashes, and other large trees of the deciduous class, are to be found the following, which have recently been measured, in order to find the actual progress they are making in height and girth of trunks 5 feet from the ground. The trees are in good health, and handsome in form. *Taxus Mertensiana*, 68 feet high, and 4 feet 9 inches in girth; *Abies grandis*, 68 feet high, and 5 feet 9 inches in girth; *A. Nordmanniana*, 77 feet 6 inches high, and 7 feet 6 inches in girth; *Taxodium sempervirens*, 49 feet 6 inches high, and 7 feet 3 inches in girth; *Thuopsis borealis*, 34 feet high, in bush form; *Sequoia gigantea*, 51 feet 6 inches high, and 10 feet in girth; *Arancaria imbricata*, 50 feet high, and 5 feet 8 inches in girth (this plant measures 16 feet at ground). Many others are doing remarkably well, including *Picea Mezerisii*, *P. orientalis*, *Taxus Pattonii*, *Abies cephalonica*, *A. Lwii*, and *A. Pinsapo*.

In the vegetable garden we found abundance of excellent produce. Good soil, deep tilt, and the judicious application of manure by Mr. Fender, result in excellent crops.

A cursory inspection of the fruit crops showed the careful attention the trees receive. Pears, mostly grown on walls, are represented by William's Bon Chrétien, Marie Louise, Comte de Lamy, Louise Bonne, Sun Egg, Moorfowl Egg (still a great favourite in the North), and some others of the hardier sorts, it being useless to attempt to cultivate the fine French Pears, which require more aid from sun than they would get in mid-Perthshire. Hardy and useful kinds of Apples, Plums, and other fruits are cultivated. Hale's Early Peach was in capital condition on the walls.

I did not leave before seeing the *Maréchal Niel* Rose which has produced for years past fine prize-taking flowers. It is grafted on the *White Bankian*, is cut hard back, and trained over the roof of a greenhouse. *M. Temple, Carron, N.B.*

STREPTOCARPUS.—We have received through the courtesy of Messrs. Jas. Veitch & Sons, Chelsea, a few late flowers, in various colours, of their new hybrid *Streptocarpus*, which were noticed more fully on p. 124.

NURSERY NOTES.

ROYAL EXOTIC NURSERIES, CHELTENHAM.

THESE nurseries have been carried on by Messrs. Heath & Son for many years with considerable success and profit, and the various departments of the business are unusually extensive and comprehensive. Throughout the midland, western, and northern counties the firm has long been famous, and it is gratifying to know that their fame is well sustained at the present time. The nursery stock generally is excellent; stove and greenhouse plants are varied and well grown, as also Orchids, and the breadths of Roses, Dahlias, fruit trees and shrubs, in every instance bespeak the master hand. A good assortment of the more valued herbaceous perennials is grown in considerable numbers, and in proportion to their various merits. The cut flower trade of the nurseries is very large; the number of wreaths, crosses, and other floral designs despatched in the busy season is very considerable. To meet such a large demand, large numbers of suitable plants for flowering in the winter are grown, and among these Tea Roses in pots form a considerable proportion; and for these alone several houses are utilised, and two or three methods adopted in their cultivation, so as to meet the requirements of certain varieties grown. On the other hand, to retard or prolong the season of flowering to the very utmost, besides these pot Roses, others are planted in borders made in the houses—some of the Rose-houses having portable roofs, which admit of a thorough and complete ripening of the wood by removing the lights. Large numbers of tree Carnations are also cultivated, particularly of those shades of pink represented by Miss Joliffe. One large house contained a batch of an unnamed pink variety, evidently of a perpetual character, which at the time of my visit was pushing forward its spikes in several stages that promised a long succession of bloom during the autumn and early winter. Judging by the flowers that were expanded, it is of a somewhat deeper shade of pink than Miss Joliffe, and it is a fuller flower.

Bonvardias are cultivated on an extensive scale in all the leading varieties, planting out as well as pot-culture being adopted—those planted out being a very promising batch, notwithstanding the great heat of the past summer, the sturdy vigorous bushes showing that they had been well tended. The planting-out method for these plants was adopted some years ago, and it has been very successful. Near one of the beds of *Bonvardias* was a low span-roofed pit, filled with *Bonvardia* plants in pots, some of which were on the point of opening their flowers. These were a capital lot of plants, numbering several hundreds, vigorous, fresh-looking, and full of flower-buds.

Poinsettias form another extensive item, and were noteworthy for the dwarf sturdy character of the plants, which is in a measure accounted for by the fact that they were grown fully exposed in open frames. In the culture of these decorative plants Messrs. Heath avoid tall, leggy, leafless plants, preferring to produce quantities of plants of a uniform size, which in the long run are the more useful. From the first the plants are accustomed to a cooler treatment than is usually thought good for them, and the large batch of plants bear proof of the correctness of the treatment afforded. The plants carry their foliage down to the pots, not drawn and weak as one often sees *Poinsettias*, or rendered too delicate for ordinary decorative purposes.

Among the stove-plants, many of the leading *Codicums* (*Crotons*), in well-coloured examples, were noticed, many of them very brilliant and effective. These plants are the products of high temperatures, abundant moisture, nearness to the glass, where they receive the fullest possible sunlight for the greater part of the day. In another house, containing the *Ixoras*, I noted a fine pair of *I. Daffi*, between 5 feet and 6 feet through. These plants carried some forty or more fine growths, all showing grand traces of bloom.

Orchids are also grown largely here, particularly those best suited to cut flowers, together with many good and rare kinds too numerous for this brief note. Of those that were grown abundantly and deserved special note was a very large batch of Cypripedium insignis, which includes many forms of the fine old Orchid—there were quantities of large specimens in excellent condition. Cologyna cristata was also largely represented. Another large house was almost wholly devoted to Dendrobium Phalaenopsis Schroderianum. Of this alone there were a large number of plants in many sizes, and remarkable variety. The collection was just coming into flower at the time of my visit, and already many pleasing flowers were expanded. The great value of this Orchid is now well known, and in a large assortment of plants such as may be here seen there is almost endless variety, as well as a long-continued season of bloom.

In the hardy plant department many of the more showy and useful species were to be seen, such as shrubby Phloxes in much variety, Michaelmas Daisies, Rudbeckias, hosts of Gaillardias, perennial Sunflowers, notably H. multiflorus and varieties; Tritomas, Pyrethrams, Campanulas in variety, Enothera macrocarpa, with its large yellow blossoms fully expanded. And apart from these, Carnations, Pinks, Asters, and a host of other similarly useful material. There were also Dahlias and Gladiolus planted out in beds galore; while a plantation of the yellow Marguerite, Chrysanthemum frutescens var. Etoile d'Or, was daily expanding many hundreds of its useful flowers. J.

and west, and these conditions gradually extended to all parts of the Kingdom. Heavy falls of rain were experienced over the country generally, especially in England, S.W. and the Channel Islands. Thunder and lightning occurred in many localities about the middle of the period.

"The temperature at first continued extremely high for the time of year, but subsequently fell rapidly and became rather low, frost occurring on the ground early on the 3rd. The average values for the week, however, were again above the mean in all districts excepting Scotland, E., the excess ranging from 1° in 'Scotland, W. and Ireland, S.,' to 4° in 'England, S. and S.W.,' and 5° in the 'Channel Islands.' The highest of the maxima (registered on September 29 or 30) ranged from 83° in 'England, N.E.,' 81° in 'England, N.W.,' and from 78° or 79° in most other districts, to 74° in 'Scotland, E. and W.' The lowest of the minima were recorded towards the end of the week, when the thermometer fell to 31° in 'Scotland, N. and E. and in England, S.W.,' to 33° over central and eastern England, and to between 35° and 37° in all other districts, excepting the 'Channel Islands,' where the lowest reading was 45°.

"The rainfall was rather less than the mean in 'England, N.E.,' and just equalled it in 'England, E.,' but was in excess in all other districts, especially in the west and north, the fall in 'England, S.W. and the Channel Islands' being nearly three times the mean. The greatest fall at any individual station was 5.35 ins. at Arlington, of which 2.71 ins. fell on October 5.

"The bright sunshine shows a great decrease over the Kingdom generally, but a decided increase in 'Scotland, N.' It was, however, again in excess of the mean, the percentage of the possible duration ranging from 52 in 'England, S.W.,' 48 in 'England, E. and S.,' 47 in 'Ireland, S.,' to 33 in 'Scotland, W.,' and 30 in 'England, N.W.'"

TRADE NOTICE.

MR. JOHN CLAYTON, son of the Gardener at Grimston Park, and who for nearly eleven years has been with Messrs. Backhouse & Sons, nurserymen, at York and Harrogate, has been appointed representative of Messrs. Fisher, Son & Sibrey, Limited, of Handsworth Nursery, Sheffield, in succession to Mr. W. Atkinson, who, some time ago, was appointed Managing Director of the firm in question.

MARKETS.

COVENT GARDEN, October 10.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Arums, Azaleas, Bouvardias, etc.) and prices in s. d. s. d. format.

ORCHID-BLOOM in variety.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns for plant types (Adiantum, Aspidistra, Ferns, etc.) and prices in s. d. s. d. format.

FRUIT.—AVERAGE WHOLESALE PRICES.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table with columns for vegetable types (Beans, Cauliflowers, etc.) and prices in s. d. s. d. format.

POTATOS.

Markets continued dull, and prices generally low, inferior samples, 30s. to 40s.; medium, 45s. to 50s.; best Brightlands 70s. to 90s. J. B. Thomas.

SEEDS.

LONDON: October 9.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that French Red Clover-seeds come cheaper. There is nothing yet doing in Alsike, White, and Trefoil. Rye-grasses are also neglected. Winter Tares show some improvement, both in value and demand. There is no change in Rye. Canary-seed is decidedly stronger. Hemp-seed unaltered. Blue Peas meet an increased demand. Haricot Beans are held for higher rates. Linseed and Buckwheat also tend upwards.

FRUITS AND VEGETABLES.

BOROUGH: Oct. 8.—Quotations:—Cabbages, 2s. to 4s. per tally; Onions, 3s. to 4s. 6d. per bag; Carrots, 1s. 3d. to 2s. per dozen bunches; Horseradish, 1s. to 1s. 3d. per bundle; Apples, 2s. to 4s. 6d.; Pears, 3s. to 7s. per bushel.

SPITALFIELDS: Oct. 8.—Quotations:—Pears, 1s. to 1s. 6d. per bushel; Cabbages, 5s. to 6s. per tally; Collards, 2s. to 3s. do.; Greens, bunch, 1s. 6d. to 2s. per dozen bunches; Celery, 8s. to 10s. per dozen; Beet, 1s. 6d. per bushel; Carrots, 1s. 6d. to 2s. per bag; 2s. per dozen bunches; Sage, 2s. to 2s. 6d. do.; Marjoram, 2s. to 3s. do.; Winter Savory, 1s. 6d. to 2s. do.; Mint, 1s. 6d. to 2s. do.; Sweet Basil, 3s. to 4s. per dozen; Apples, Warner's King, 2s. 6d. to 3s. per bushel.

STRATFORD, Oct. 8.—Quotations:—Cabbages, 2s. to 3s. per tally; Savoys, 2s. 6d. to 5s. do.; Cauliflowers, 9d. to 1s. 3d. per dozen; Turnips, 1s. 6d. to 2s. 3d. per dozen bunches; do., 25s. to 40s. per ton; Carrots, household, 3s. to 35s. do.; do., cattle-feeding, 15s. to 27s. 6d. do.; Mangels, 11s. to 16s. do.; Swedes, 20s. to 28s. do.; Onions, Ghent, 2s. 3d. to 2s. 6d. per bag; Dutch do., 2s. 6d. to 3s. do.; Apples, English cookers, 2s. to 4s. per bushel; do., dessert, 2s. 6d. to 4s. 6d. per bushel; Scotch Kale, 1s. to 1s. 6d.; Marrows, 2s. to 3s. per tally; Pears, English, 2s. 6d. to 6s. per flat; Damsons, 1s. 6d. to 2s. per half-sieve; Tomatos, English, 2s. to 3s. per peck; Cucumbers, frame, 1s. to 3s. per dozen; Scarlet Beans, 1s. to 1s. 3d. per bushel, and 1s. 9d. to 2s. 6d. per bag; Beets, 2s. to 2s. 6d. per dozen bunches; Celery, 8d. to 1s. per dozen heads; Horseradish, 1s. to 1s. 2d. per bundle; Parsley, 1s. to 1s. 6d. per dozen bunches.

FARRINGTON: Oct. 10.—Quotations:—Cauliflowers, 2s. per dozen; Cabbage, 6s. 6d. per tally; Collards, 1s. per doz.; Celery, 1s. per roll; Marrows, 1s. per dozen; Parsnips, 3s. 6d. per tally; Lettuce, 1s. per score; Carrots, 1s. 9d. to 2s. per bag; Turnips, 2s. do.; Herbs, 2s. per dozen bunches; Onions, 3s. 6d. per bag; do., Oporto, 5s. 6d. per case; do., Valentias, 5s. per case; Grapes, Almeida, 13s. per barrel; English hot-house do., 1s. 3d. per lb.; Walnuts, 13s. per bag; Melons, 14s. to 21s. doz.; Apples, Blenheim, 5s. bushel; King Pippins, 4s. do.; Pears, stewing, 3s. per half-bushel; Marie Louise, 6s. per bushel; Canadian Apples, Gravenstei, 12s. 6d. per barrel.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending October 3, and for the corresponding week in last year:—1895: Wheat, 23s. 6d.; Barley, 25s.; Oats, 13s. 6d. 1894: Wheat, 18s. 2d.; Barley, 23s. 7d.; Oats, 14s.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

A THIRTY-TWO YEARS' SUBSCRIBER asks if any of the numerous readers of the Gardeners' Chronicle, will kindly inform him where he can procure, by purchase or otherwise, the following old garden plants:—Cuttings or plants of bedding Calceolaria Sparkler, Fuchsia Duchess of Lancaster (light), and Tropaeolum elegans or Crystal Palace Nasturtium, the last of which was used with such telling effect on the terraces at the Palace some thirty-six years ago!

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE, RAINFALL, and BRIGHT SUN. It contains detailed weather data for various districts.

The districts indicated by number in the first column are the following:—0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending October 5, is furnished from the Meteorological Office:—"The weather continued very fine and summerlike during the two first days of the period. On October 1, however, it became very unsettled and rainy in the extreme south-west

NOTICES TO CORRESPONDENTS.

* * Owing to the large increase in our circulation, we are under the necessity of going to press some hours earlier. Our contributors will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

AMARYLLIS: *G. H. W.* If you turn to p. 342 in our issue for September 21, 1895, you will find an answer to all of your questions regarding the treatment of Amaryllis.

AMPELOPSIS VEITCHII: *L. C., Rugby.* The lobed leaves and the trifoliate leaves are simply the result of unusual vigour. *A. Veitchii* under glass produces very large-lobed and compound leaves. The plant, as grown out of doors, has not a chance of developing to the full extent.

BOOKS—FLORAL DECORATION: *G. W. A. and I. M. C.* We believe Mr. Upcott Gill, Bazaar Office, 170, Strand, W.C., publishes a modern manual on this subject. A small one by C. C. Saward was published by the same Office late in the 60's, but this is too antiquated to be of much use. A larger work by Annie Hassard, entitled *Floral Decoration for the Dwelling House*, was published by Macmillan & Co. in 1875, and may be met with at the secondhand bookshops.—*Arboretum.* *Kemp's How to Lay Out a Garden*, published by Messrs. Bradbury, Agnew & Co., Limited, Bouverie Street, E.C.; and *Henry E. Milner's The Art and Practice of Landscape Gardening*, published by Messrs. Simpkin, Marshall, Hamilton, Kent & Co., Limited, Stationers' Hall Court, London.—*M. Gillett, Villa Gardening*, by Hobday, published by Messrs. Macmillan & Co., Bedford Street, Covent Garden, W.C., contains very good directions for cultivating vegetables in private places.—*H. W. My Gardener*, by H. W. Ward, published by Eyre & Spottiswoode, East Harding Street, London, E.C., will afford just the sort of information on Kitchen Gardening that you require.

CLUBBING IN CHRYSANTHEMUM ROOTS: *K. J. G.* The clubbing of Chrysanthemum roots has in some instances been proved to be caused by the use of unsuitable manure, and the example examined is probably so caused. Belwooms and fungi are absent. *G. M.*

DENDROBIUM, WARDIANUM AND NOBILE: *W. S.* The plants are suffering from excess of water at the root, and they have probably lost many of their roots entirely, or these have rotted from the points a short distance. An examination of the roots is very necessary. If these are found to be decayed, wash what remains after decayed portions are cut away, and insert them temporarily in pots, chiefly filled with clean crocks, and just a small amount of sphagnum-moss, keeping them in a moderately warm moist house, and lightly syringing them once or twice a week. In the spring proper potting or basketing may be done.

FASCINATION IN ANTIRRHINUM: The Surrey Seed Co. send a photograph of a plant in this condition, which is very common, as a result probably of overgrowth.

FOUR GLASS HOUSES, EACH OF 150 FEET LONG: *Cyclamen.* It is of no use attempting to cultivate French Beans by cool treatment. Nothing less than a day temperature of 70° to 75°, and night ditto of 60° will suffice. You might grow Tomatoes, but it will be necessary to obtain by purchase robust plants, and plant at once; also Cucumbers, choosing a medium-sized early prolific variety. These should now be in the beds if for very early fruiting, though for succession later plantings would do. In these forcing houses you might grow Rhubarb, Roses, Lily of the Valley, winter-blooming Begonias, early Narcissus, and other Dutch Bulbs; Gardenias, if clean plants can be obtained; Rhododendron hybridum, Eucharis, Myrsiphyllum, Lygodium, Maidenhair Fern, Mustard and Cress, &c.

GRAPES AND APPLES: *C. W. H.* The Grapes are shanked, the causes of which malady are various; such as loss of roots through a soddened, badly drained, or pasty soil; roots growing low down in a deep border away from the active agency of sunheat; overcropping; and sudden loss of much of the foliage by improper thinning of the shoots. We would advise an early examination of the roots. The Apples have probably been injured in the young state by hail.

GRAPES NOT COLOURING: *W. M. J.* Your Black Muscates are evidently doing well except but they

fail to finish. Bunch and berries are of good size. They require to be started fairly early in the season, and must be given plenty of heat. In this respect they require just the same treatment as Muscat of Alexandria.

INSECTS: *G. A.* The name of the beetle is *Olibrus æneus*. *R. McL.*

MUSHROOMS: *A Subscriber.* We do not suppose that Mushrooms would not grow on manure from horses fed largely on Thorley's Food, but the crops would not equal what would be obtained from corn-fed animals. Perhaps some of our readers will kindly state their experience.

* * PLANTS, FRUITS, ETC., TO BE NAMED.—The applications to name flowers, and especially fruit, are so numerous at this season as severely to tax our resources. They entail an expenditure of time, labour, and money, of which our readers have no idea. We are always willing to oblige our correspondents as far as we can, but the editing of the *Gardeners' Chronicle* is our business, to which everything else must give way. Correspondents are respectfully requested to observe the rule that not more than six specimens can be dealt with at a time. If more are sent, it would be a graceful act on the part of the sender, to send also a small contribution to the *Gardeners' Orphan Fund*. Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered. Leaves only, or Florists' varieties cannot, as a rule, be named.

NAMES OF FRUITS: *W. T. H.* Your second attempt is a greater failure than your first. The card-board box and Apple arrived quite flat, and the wonder is that the letter was not lost. We shall not be surprised if the Apple proves to be merely a local variety.—*J. T. O.* 1, Gloria Mandi; 2, Lord Derby; 3, not recognised, much bruised; 4, Doyenné du Comice; 5, Chaumontelle; 6, Napoléon.—*Alpha.* 2, 5, Beurré de Capiaumont; 3, Beurré Clairgeau; 1, Beurré d'Amanlis; 4, Triomphe de Jodoigne; 7, Beurré Diel (thanks for subscription to the *Gardeners' Orphan Fund*, which has been sent to the Secretary).—*E. G. Allen* Unknown to us, most probably a purely local variety.—*W. H. D.* 1, Hollandbury; 2, Emperor Alexander; 3, Hawthornden; 4, O. d. Nonpareil; 5, Blenheim Orange; 6, Kerry Pippin.—*P. J.* 4, Fearn's Pippin; 5, King of the Pippins. Others unknown, worthless.—*T. S.* 1, Stirling Castle; 2, Edmund Japp; 3, Cellini; 4, Dutch Mignonne; 5, Waltham Abbey Seedling.—*Sherrington.* Pear Chaumontelle.—*W. Fox.* Pear Fondante d'Autonne.—*J. D., Bracknell.* 1, Louise Bonne; 4, Fondante d'Autonne; 5, Jersey Gratioli; 7, Marie Louise (your box was too shallow, and the fruits were injured)—*K. J. G.* 1, Bedfordshire Foundling; 2, Queen Caroline; 3, Kerry Pippin; 4, Beauty of Kent; 5, Damelow's Seedling; 6, Doyenné Boursch.—*A. S. Harvey, Highgate.* Your Pear is a stewing variety, Uxdale's St. Germain, and never becomes melting.—*W. H. Garside.* Apple, Emperor Alexander; Pear No. 2, is Marie Louise; 3, Louise Bonne of Jersey.—*J. S.* 1, Urbaniste; 2, Col. Vaughan; 3, Marie Louise; 4, Gravenstein; 5, Pear, Althorp Crassane. *C. Harlock.* Your Apple is Fearn's Pippin.—*S. N.* 1, Beurré Diel; 2, Marie Louise.—*D. W. R.* 3, Marie Louise; 4, Maréchal de la Cour; 5, Betty Gesson; 6, Gloria Mundi; Peaches should not be packed with Apples or Pears, they were past recognition.—*W. A.* 1, Apple, Allen's Everlasting; 2, Kerry Pippin; 3, Pear, Williams' Bon Chrétien; 4, Darondeau; 5 and 6, Beurré de Capiaumont.—*Joc.* 1, Hollandbury; 2 and 12, not known; 3, Fearn's Pippin; 10, Emperor Alexander; 8, Lord Suffield; 9, Pineapple Russet; 11, Fearn's Pippin.—*G. F. F.* 1, not recognised; 2, Duke of Devonshire; 3, Hambleton Deux Ans; 4, Smart's Prince Arthur. [We wish all our correspondents would pack the fruits they send us as carefully as you have done, and enclose particulars of each variety, together with shoots and foliage.]—*G. H.* Your Plums were packed badly, and in too small a box. If you send again, you should enclose a shoot of the variety.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to consult the next number.*—*W. Maxwell.* Send another specimen; box quite smashed in transit.—*S. W.* Apparently the Champignon, but it was shrivelled. The other is the spawn of some fungus, which we cannot name in its present state.—*P. H.* *Fraxinus excelsa* mono-phylla.—*A. S.* *Cratægus coccinea*.—*N. C.* 1, Solidago virga aurea; 2, not recognised; 3, Polygonum aviculare; 4, Epilobium parviflorum.—*R. N.* 1, Farfugium grande; 2, Francoa ramosa; 3, Dieffenbachia nobilis; 4, Acalypha Macafeana

5, Anthericum lineare variegatum; 6, Fittonia Pearcei.—*E. J., Aberdeen.* 1, Pellionia Careanana; 2, Caladium Schmitzi; 3 probably Carex japonica of gardens; 4 Selaginella circinalis; 5, Selaginella denticulata; 6, Selaginella Kraussiana aurea; 7, Anthericum lineare variegatum; 8, Dieffenbachia nobilis; 9, Selaginella plumosa. The above names are correct, we believe; but the specimens sent are very imperfect.—*E. H.* The common Tree Onion. Plant in March.—*W.* *Salvia elegans.*

PAYING CROPS UNDER GLASS: *A. B.* See our answer to *Cyclamen.* In regard to your other question, everything would depend upon your having good marketable produce which you could put on the market at little cost in carriage, and in first-class condition. Some men would make a good living out of a glass-house, 100 by 9 feet, whilst others would starve. We cannot say what the returns would be from 900 square feet of Stephanotis, well-managed, and coming in early, but they would represent a large sum of money.

PERSISTENT ATTACKS OF MILDEW ON ROSES: *P. R.* There must be something amiss with the soil on which the house stands; perhaps it is not drained, and the soil being retentive holds much water, and in that way favours the spread of mildew. Mildew often attacks Roses in houses when the air is cool and moist, and again when air is admitted at or near the level of the ground. It is always prudent to ventilate as much as possible at the top of the house. On warm dry soils and situations it is of little consequence how air is admitted. The common Strawberry is a dangerous shrub to have near Roses. We would advise the constant use of sulphur as a powder wherewith to dust over affected plants, and as a watery solution to keep in broad shallow saucers placed about the house.

RATING OF TRADE GLASSHOUSES: *D. K.* The assessment on houses actually employed in the cultivation of plants, fruits, &c., for sale purposes, is one-fourth of the usual amount levied. See case of *Parser v. Worthing Local Board*, in our issues for March 26, p. 422, vol. i, 1887, and May 21, p. 650, same vol.

ROSES IN AN EXPOSED GARDEN: *H. W.* Unless you can afford the plants the best of shelter from the prevailing sea-winds, the Roses will not give satisfaction. Thick, high hedges, and narrow plantations of Maple, with Holly, Rhododendron, Laurel, Daphne Mezereum, &c., kept as low bushes, are better than walls. Given shelter, at a distance of 10 to 15 yards from the Rose-beds, any section of the Rose should do well.

SAXIFRAGA GRANULATA: *W. C.* Pot the plants firmly in a mixture of loam, broken sandstone, and a small quantity of old mortar, using small-sized pots, say, 60's, and winter them in a cold pit, in coal-ashes up to the rim of the pots. They should be planted out-of-doors in March.

VINE ROOT: *A. Roberts.* Not Phylloxera devastans, but an excrescence due to some injury that took place many years ago—probably from frost. The Vine must be very old.

VINES AND THE USE OF RICHARDS' XL ALL VAPORISER: *J. W. M.* The use of this insecticide is non-injurious to plants of every kind, if used according to the directions given, and we are not aware of any case in which Grapes have been injured by it. As a matter of prudence, however, it should not be used on Grapes approaching ripeness. When the Grapes are cleared off the Vines, there is no risk of any kind.

COMMUNICATIONS RECEIVED.—*J. W. Wilkinson.*—*R. G. B.*, letter card forwarded on day of its receipt.—*J. H. B.*—*G. M.*—*R. G.*—*J. W. W.*—*E. G.*—*R. T.*—*M. D.*, Melbourne.—*D. T.* (next week).—*Dulan & Co.*—*W. C.*—*W. & D. B.*—*W. H. S. & Co.*—*B. & M.*—*M. W.*—*R.*—*N. E. B.*—*H. H.*—*Kiesow & Co.*—*J. H. C.*—*D. L. M.*—*H. J. H.*—*W. G. H.*—*D. T. F.*—*G. P.*—*E. CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of more than 80 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

ASSISTANT SHOPMAN.—Age 23; five years' experience in good provincial house in all branches. Good references.—J. W. R., 4, Hartley Terrace, Handsworth, Sh. field.

WONDERS WILL NEVER CEASE, we are told; but it cannot be denied that HOLLOWAY'S PILLS are the greatest wonder of modern times. They correct bile, prevent flatulency, cleanse the liver, and purify the system, strengthen the stomach, increase the appetite, invigorate the nerves, promote health, and re-estate the weak to an ardent of feeling never before experienced. The sale of these Pills throughout the globe attests every body, convincing the most sceptical that there is no medicine equal to HOLLOWAY'S PILLS for removing the complaints incidental to the human race. They are indeed a blessing to the afflicted, and a boon to those who suffer from disorders, internal or external. Thousands of persons have testified that by their use alone they have been restored to health, after other remedies had proved unsuccessful.

“CADBURY’S”
 &
 COCOA

Of the highest degree of Purity & Nutritive Value

“Cadbury’s represents the standard of highest purity at present attainable in regard to cocoa.”—*The Lancet.*

“Cadbury’s Cocoa has in a remarkable degree those natural elements of sustenance which give the system endurance and hardihood, building up muscle and bodily vigour, with a steady action which renders it a most acceptable and reliable beverage.”—*Health.*

“Of absolute purity and freedom from alkali. . . . An invaluable addition to our dietetic resources in the treatment of all forms of digestive disorders.”

Braithwaite’s Retrospect of Medicine

“Cadbury’s is a preparation of genuine Cocoa, without any admixture of starch or sugar ; it is light, refreshing and invigorating to the jaded mind and body. . . . Delicious to the palate, absolutely unadulterated, and free from alkalies.”—*Family Doctor.*

“A perfectly pure Cocoa of the highest quality. The name ‘Cadbury’ on any packet is a guarantee of purity.”

Medical Annual.

“CADBURY’S”

“The typical Cocoa of English Manufacture—Absolutely Pure.”

—*The Analyst.*

Peace having been once more re-established in Colombia,

GUILLERMO KALBREYER

CAN NOW AGAIN SUPPLY THE FOLLOWING WELL-KNOWN ORCHIDS AT UNDERMENTIONED PRICES:—

ODONTOGLOSSUM CRISPUM, best broad petaled variety	... £40 per 1000
„ LUTEO-PURPUREUM	... £36 „
„ CUSPIDATUM PLATIGLOSSUM,	£36 „
PILUMNA FRAGRANS NOBILIS,	£36 „

CATTLEYA TRIANÆ, best variety,	£7 per case.
„ SCHRODERI	„ £8 „ „
„ SANDERIANA	„ £9 „ „
„ MENDELI	„ £9 „ „

The cases measure about 20 by 24 in., and contain about 50 to 60 good strong pieces of Cattleyas, of *Odontoglossum crispum* about 250, and of the other Orchids 120 good strong plants.

The plants are packed with the greatest care and best method, but under no circumstance will G. K. hold himself responsible for the state of plants on their arrival in Europe. *Conditions*:—All Consignments are shipped entirely at Buyer's risk and expense from port of shipment. Plants ordered must be paid for on receipt of bill of lading to Messrs. ROESING BROTHERS AND CO., 10, Basinghall Street, London, E.C., who will then give orders for forwarding the consignment to the Purchaser.

The best time for dispatching Orchids from here, and to establish them with the best advantage in Europe, are the months—December to April.

EARLY ORDERS INVITED.

A considerable reduction will be made on orders of 1000 and more of each kind of *Odontoglossum*, and on four cases and more of *Cattleya* of each kind.

SATURDAY, OCTOBER 19, 1895.

CLIMATE, AND THE ORIGIN OF ROOT-CROPS.

IN spite of the labours of the numerous
botanists and agriculturists of the present
day, it is not by any means clear that we know
much more about the effects of climate than
does an ordinary working farmer.

In estimating the special effect of climate on
one particular root-organ, there are two methods
open to us; we may adopt statistics, or we may
try the effect of direct experiment.

Taking statistics first, it is best to compare
the average yield per acre of our common root-
crops—Turnips, Mangels, and also Potatos—for
the years 1885—1894, as given in the *Agricultural Returns for Great Britain*, with the climate
in those years.

I therefore obtained (through the kindness of
Mr. E. Clarke) from the agricultural returns of
the Board of Trade, the following table of the
average yield per acre of Turnips, Mangels, and
Potatos, throughout Great Britain in the years
1885—1894. I have to thank Mr. Marriott of
the Meteorological Society for assisting me to
find the returns given in the right-half of the
table, which represent the total rainy days, inches
of rainfall and hours of sunshine in the months
of May, June, July, and August during the same
years:—

Table I.

Year.	Turnips, Average Tons per Acre.	Mangels, Average Tons per Acre.	Potatos, Average Tons per Acre.	Rainy Days, Four Months.	Rainfall, Four Months.	Sunshine, Four Months.
1885 ...	10.41	15.24	4.74	54	7.60	721
1886 ...	14.75	20.13	4.31	60	10.48	657
1887 ...	9.59	14.61	3.25	43	5.95	8.9
1888 ...	12.51	16.78	4.00	65	12.30	624
1889 ...	14.43	18.21	4.71	60	11.15	670
1890 ...	14.27	17.78	3.53	69	11.29	637
1891 ...	13.40	18.60	4.74	65	11.09	639
1892 ...	14.04	17.99	4.45	60	11.27	684
1893 ...	13.66	13.26	5.23	54	9.15	764
1894 ...	13.53	18.02	3.82	74	11.95	617

Now this table is at first sight only remarkable
for one thing, and that is that it is apparently
utterly impossible for human ingenuity to ex-
tract anything of the slightest service to man-
kind from its perusal. In a case of this kind it
is always advisable to draw curves representing
figures, as then the most striking features are
perceptible at a glance, but it is necessary to be
very careful how these curves are drawn, for it
is a popular fallacy that anything can be proved
by statistics.

The manner I have adopted is to take only the
deviations from a normal or average. Thus the

dotted curve in fig. 78 --- represents the variation from a normal number of rainy days. The average number of rainy days in the four months May to August is 60.3. The actual amount recorded in any year is then compared with this average number, and the difference forms the distance above or below the line a — b . The plain line represents the crop returns, or rather the average yield per acre of Turnips and Mangels combined throughout Great Britain in a similar manner. The normal crops of each root, taken from the average of the ten years, that is for Turnips 13.09 tons per acre and for Mangels 17.06, were compared with the amount in each year, and the result is given as the vertical distances. The thin line represents the Potato returns, taken in the same way for the ten years.

All three curves are made to start from the same point by choosing a proper measurement-unit.

This gives a most unexpected result; the Turnip and Mangel crops are seen to follow with extraordinary accuracy the amount of rainy days in those four months, but there is one exception. In the year 1889 there is a less than normal amount of rainy days but a very good crop. Probably this is due to some particular manner in which the days were distributed so as to give a maximum of moisture with as few rainy days as possible.

This proves what Sir John Lawes pointed out in 1855, *Journal of the Agricultural Society*, vol. iii., "the most favourable conditions of growth for our cultivated bulb-forming Turnips are a low degree of temperature, a large number of rainy days, and a large actual amount of rain."

But when we turn to the Potato crop, there is exactly the opposite result. Wherever there is a great rise or fall in the number of rainy days it is followed by the reverse in the Potato curve; this last result is probably due to the action of moisture in favouring Potato disease, for in the South of Europe, and dry countries generally, it is not found that Potatoes do particularly well, but as a rule turn out rather a failure. On the whole, the conclusion seems pretty safe that it is the number of rainy days which exercise the greatest influence on the root-crop.

The following table shows their distribution:—

	1855	1856	1857	1858	1859	1860	1861	1862	1863	1864
May ...	21	16	13	10	14	15	15	14	10	18
June ...	14	15	6	19	10	19	14	19	12	20
July ...	9	14	13	20	16	18	15	11	16	18
August ...	10	15	11	16	20	17	21	16	18	20

Leaving the statistical method, it is best to examine the result of actual experiment to see whether this result is actually borne out by independent observers, who examined the behaviour of plants artificially grown under various circumstances.

A good many are recorded in Professor Henslow's *Origins of Plant Structures*. Even in the time of Pliny the Greeks seem to have discovered that by growing Radishes in a cloggy soil, a more fleshy Turnip-like root might be obtained. This experiment has been repeated with the same result by many others; e.g., Carrière at Paris in 1869 found that from the wild Radish (*Raphanus raphanistrum*) a Turnip-like fleshy root could be obtained by growing it in clay, while only a long and narrow root appeared in a sandy soil. This method was also adopted by Backman at Cirencester, and by Bretfeld in Vienna, with quite similar results. It has also been proved that if a fleshy, Turnip-shaped Radish is grown in light sandy soil, then it will in course of cultivation become again long and narrow. It is obvious that all these experiments can be at once brought into line with the statistical experience by pointing out the simple fact that a clay soil (cloggy is an even better term) will naturally hold water, and so by keeping itself moist, act in the same way as a larger number of rainy days. Hence all these people who worked quite independently agree in this respect with the tables.

But a direct proof has been found in a curious and

quite unpractical experiment which was conducted by Birner, who cultivated a number of Potatoes in pots, which contained different amounts of water. He found that the number of tubers and the weight of each in any pot depended exactly on the amount of water in the particular case. The more water, the more and heavier were the tubers.

In a case of this kind it is always interesting to see how and why this underground store of farinaceous food has been formed. Now, every out-of-door botanist expects to find bulbs, tubers, and so on, in a dry or desert climate, not in a wet one. Thus, in Africa they are far the most abundant (that is to say, in proportion to the rest of the flora) in the Sahara, the Kalahari Desert, and Namaqualand. In such places one finds all sorts and kinds of plants taking to this habit—Pelargoniums, for instance, which usually never attempt anything of the kind, produce large bulbs.

The reason why this arrangement has been adopted is obvious to anyone who has passed through the Karroo in South Africa before and after a shower of rain. Before, everything except a few fleshy-leaved water-storing plants is dry and apparently dead; after it, the ground is covered by the rosettes of Lilies, Amaryllis, and hundreds of other bulbous plants, which only require moisture to develop with magical rapidity. As the water gets dried up, these leaves, having manufactured a certain amount of starch or sugar, die away, and perhaps in

FIG. 78.—RAIN AND ROOT-CROP DIAGRAM.

seven or eight years there will be enough food material accumulated to enable the plant to send out a stalk covered with magnificent flowers.

It seems to be the case that whenever in Africa, Asia, or America one finds these dry conditions, then there is sure to be a large number of bulbous or tuberous plants. In our own country, these forms are most common amongst the plants of early spring. Their store enables them to flower and produce leaves immediately, so that they have the soil all to themselves, and are not exposed to the congested state of things which prevails in summer—that is, they live in moist and fairly cold conditions. To point out in what manner (or how) these structures have been developed, is very much more hazardous.

Still, we may note first, that as a matter of fact, most of our common root or tuber plants have been formed in dry or hot countries. De Candolle gives the birth-place of a certain number. Thus the deserts of the Caucasus and Palestine probably produced the primordial Radish and Onion. Eastern Europe is responsible for the Horseradish, and possibly also the Turnip. The Salsafy seems a native of Greece and Algeria, and Scorzonera seems to be Spanish, while the Potato, so far as one can judge, is a Chilean species. One effect of a dry or desert climate has been proved beyond any room for controversy, and that is the tendency for the branches to become short, or in other words, for the internodes to be shortened or suppressed. This is probably because all the tissues in a desert-plant are exceedingly hard and rigid (i.e., plenty of sclerenchyma and cuticularisation), and hence it is without any wildness of speculation that one can say that the drought, by preventing the rising of the stem, tends to increase the diameter of the underground portion. Being unable to increase in length, the stem expands in thickness. This

explanation is more or less clearly given in Professor Henslow's book, and it enables us to understand the origin of bulbs in a sort of manner.

In our own country we find comparatively few bulbous plants because the climate is too moist for them to be formed naturally; and hence, if we want them, we have to get them from elsewhere. At any rate, the ancient Egyptian who began growing roots in his mud-patch at home, in order to save himself the trouble of going to the desert in time of famine to dig them up, must have been pleased when he found that they were capable of drinking a very great deal more than they ever had the chance of doing at their home in the sands, and now this habit has been improved and rendered to a certain extent hereditary. Still, even now, these plants would in England at once take to forming stems if they had the opportunity. *G. F. Scott Elliot.*

KEW NOTES.

HABENARIA SUSANÆ.—When grown in an intermediate temperature the flowers of this beautiful Orchid are quite as fine as those produced in a hot-house, but the stem is only about half as long. The leaves are less likely to fall a prey to spot in the cooler house than when kept hot and moist. There has been a good display this year of flowers upon plants of this *Habenaria* grown thus at Kew, some of the plants having had six flowers open at once, each 2 inches across, pure white, with a large comb-like lip, and we look upon it as a useful addition to summer-flowering terrestrial Orchids. According to Major-General Berkeley, in the *Orchid Review*, it has long been a favourite garden plant in the East, but always in hot moist situations. At Kew it is planted in light loamy soil, in pots, and grown in an intermediate temperature, the tubers being repotted in February at the same time as *H. carnosæ* and *H. pusilla* (*militaris*) are started.

BAUHINIA GALPINI.

This plant was described by Mr. Brown in the *Gardeners' Chronicle*, 1891, xi., p. 728, and a figure of it was published in Hooker's *Icones Plantarum*. Seeds of it were sent to Kew from the Transvaal by Mr. Galpin, after whom it was named, and who described it as an elegant shrub, with small leaves, and racemes of large bright crimson flowers. A plant of it is now flowering for the first time in the Succulent-house at Kew, where it is planted in the border amongst the Agaves. Here it receives plenty of air and sunshine in summer, and in winter it gets sufficiently dry at the root to cause all the leaves to fall. The flowers are produced on the ends of the branchlets, near the top of the principal branches; they are in short racemes, each consisting of five flowers, the stalks of which are 1 inch long; the calyx-lobes are narrow, reflexed, and the equal petals $1\frac{1}{2}$ inch long, spoon-shaped, forming a cup, which in size and colour suggests the flower of a common *Nasturtium*. The leaves are bilobed, and 2 inches across. Close to the *Bauhinia*, which is about 6 feet high, there are fine examples of *Leucadendron argenteum*, *Poinciana regia*, and *Diospyros kaki*, the latter bearing fruit, and they all receive the same treatment as the *Bauhinia*.

ARISTOLOCHIA ELEGANS.

In his note on this plant (see p. 369), Mr. Hemsley appears to have overlooked a note which was published in the *Gardeners' Chronicle* the week after the description of the species by Dr. Masters appeared (see *Gardeners' Chronicle*, September, 1885, pp. 301, 338). This note contains an extract from a letter written to the Director of Kew by Baron Capanema, of Rio, who sent plants of *A. elegans* to Kew in July, 1885. One of these plants was figured in the *Botanical Magazine*, so that the Baron and Kew may claim as much credit for the introduction of the plant into European gardens as M. Glazion and Mr. Bull. The Baron distinctly states that he raised the plant from seeds which he received a few years previously from Paraguay, and that it soon became a common garden plant in Rio. It produces

seeds freely under cultivation here, and is just the kind of plant that would soon spread wherever it got a foothold. Of course, it may have been introduced into Paraguay, but so far as is known, all the plants in cultivation of *A. elegans* are, according to Baron Capanema, from that source. *W. W., Kew.*

LESPEDEZA SIEBOLDI, MIQUEL.

This is decidedly one of the most ornamental of autumn-flowering Leguminiferous plants, and this year it is especially fine, the sunny weather during the latter half of September having aided the development of an exceptional abundance of flower. A fine autumn is, indeed, needed to show this shrub to best advantage. A large group of it in the collection of shrubby Leguminosæ at Kew has been fully in flower for the last four weeks. It is a plant of graceful habit, sending up each year from the stool strong, arching shoots 5 to 6 feet long, which on the upper part give off at each leaf-axil a slender panicle of rosy-purple flowers. The plant dies to the ground

we have, and if it never fruited at all would be well worth growing. The flowers are about 1 inch across, white, and produced in large flat corymbs, about the end of May. The leaves are amongst the largest in all the *Cratægus*, measuring 4 or 5 inches in diameter. They are broadly ovate, lobed and toothed at the margin, and covered more or less with a soft pubescence. The species is nearly related to *C. coccinea*, but the latter is readily distinguished by its glabrous leaves. The flowers of *C. mollis* are larger, and it is, as an ornamental tree, superior to *C. coccinea*. It is widely spread in the United States, and its distribution extends as far north and south as Canada and Mexico respectively. *W. J. B.*

GODDEN GREEN.

Those who are familiar with the glories of Kent, the picturesque character of the greater part of the county, its fruit orchards, and its Hop-fields, are not likely to be unacquainted with the old town of

accompanying illustration (fig. 79), and though not large, the house is very pretty. From the roof half-way to the base the walls are tiled, and below the walls are of grey stone. A grand billiard-room, and a few minor additions have been made by Mr. Hudson, and if he had been responsible for the building of the whole structure, it would most likely have been more imposing; as much is indicated, at least, by the new and excellent stables and other buildings which he has erected to the right of the photograph, which in some measure tend to belittle the house. In the garden there appear to be no favourites—no hobby-riding, but everything is done to secure general pleasure and usefulness. Almost the whole of the grounds extend from the house in west and north directions, hence there are the usual disadvantages attending a short drive from the lodge. This drive has been planted on either side with *Cedrus Deodara*, now thriving well, and one side of which may be seen in the figure. In the turf in front of the trees there are flower beds of time-honoured character; they are raised very high, and have banked edges of Ivy, *Echeverias*, and other similar plants. *Pelargonium*, tuberous *Begonias*, *Lobelias*, and other bedding plants are used in the beds with taste, and in several combinations. Especially worthy of remark were the two beds of *Heliotrope*, which had thriven so exceptionally well that we have never seen better or neater masses of this sweet and always popular flower. Whether such bedding is the best to use in this position is largely a matter of taste, but the success with which it had been followed, deserved the highest praise possible. The pleasure-grounds are decidedly pretty and attractive, partly owing to the fact that they are kept well, and neatness is observed everywhere, but also to the site itself, which has no slight influence in the same direction. From the tennis-ground and from the house windows, are obtained views of the most pleasing description, and happily, these are not obscured by trees which thwart the purpose for which they were planted, as in the case of many lovely grounds. The trees and shrubs around the house are not yet large, nearly the whole of them having been planted by Mr. Hudson, who may be credited with having done a large amount of such work; but on the other hand, there are many instances where further planting will be beneficial. Some large beds of *Rhododendrons* on the north side of the house have given unqualified satisfaction since they were overhauled by Mr. Woodward, the gardener, and plenty of good peat given them. A bank of *Ponticum* and Ghent hybrid *Azaleas*, also on a bank at the rear of the house, sloping to the south, create a magnificent display each spring. The position is just a suitable one.

Very near here is the old part of the kitchen garden, now used principally for fruit, though the *Asparagus*-beds are also here. The vegetable garden has been made in a corner at the south-west extremity of the grounds, and close to a small model farm. The garden is very small—we should think too small, but the crops showed that considerable use is made of it. Peas, Beans, Celery, Onions, and especially Brussels Sprouts looked well, but the Peas were nearly spent. Our attention was drawn to a good lot of *Asparagus-Kale*, with the remark that it was the most prized of the winter vegetables. The walks are of asphalt, edged with tarred bricks. About 170 standard fruit trees have been planted in various positions. Eighty of these form a belt a few feet from the extremity of the grounds, in a nice meadow, and these will probably thrive and bear well. Unfortunately the soil is generally very poor, and immense quantities of manure have to be applied in order to get good crops of anything.

One of the chief features of the place is about 10 acres of woodland, containing plenty of moderate-sized trees, and also a number of coppice-stools. The whole of this has been opened up with skirting and interesting paths, well made, and consequently clean during any weather. A very great deal of planting, too, has been carried out, in order to give the paths a more furnished appearance, and by the addition of

*

FIG. 79.—MR. FRANK HUDSON'S RESIDENCE AT GODDEN GREEN.

in the winter, and as it is said to do this even in milder latitudes than ours, it would perhaps be more correctly described as herbaceous. It is hardy at Kew. It is increased by dividing the old stools—an operation which should be performed at intervals of a few years, in any case. The species is found in China and Japan, and it was from the latter that it was introduced by Siebold. The plant was figured in the *Gardeners' Chronicle* for 1883 (vol. xx, p. 749), under the name *Desmodium penduliflorum*. It is also grown sometimes as *Lespedeza bicolor*, a name that properly belongs to a nearly allied, but quite distinct species, which is more truly shrubby, and flowers several weeks earlier.

CRATÆGUS MOLLIS (Scarlet Hawthorn).

This is one of the largest and handsomest of the American Thorns, forming a small spreading tree from 20 to 30 feet high. It is abundantly represented in the grounds at Kew, and several trees were heavily fruited. The haws are about five times as large as those of our English Hawthorn, and almost globular. It is unfortunate that the fruits do not remain a longer time on the tree, as they are mostly fallen by the beginning of this month. This species is, however, one of the most beautiful flowering Thorns

Sevenoaks. In the immediate neighbourhood is Wildernesse Park, one of the seats of Lord Hillingdon, and two miles from the town is Knole Park, the seat and residence of Lord Sackville. This grand old mansion, its immense park, and fine timber, its large and well-kept garden, and the ancient and historic character of the place itself, are all interesting. But turning to the particular subject of this note, we must drive from Sevenoaks, a distance of about 2½ miles, passing through the curious little village of Seale, thence through a park adjoining Wildernesse, and on to a place called Godden Green, leaving Knole about a couple of miles to the right.

Godden Green House is situate on one of the eminences common in this part of Kent, and is the residence of Frank Hudson, Esq., one of the justices for the county, and a partner in the remarkable firm of Hudson Brothers, the provision merchants. The house at Godden Green was bought by Mr. Hudson about ten years ago, and the grounds attached thereto are something like 60 acres. From photographs taken of the badly-cared-for place at that time, the amount of work that has been done under the direction of the present proprietor becomes apparent.

The south front of the residence is shown in the

Rhododendrons, Laurels, *Thojopais dolabrata*, *Abies grandis*, and other Conifers in small groups and as specimens in open spots, the wood has been made a charming retreat during hot weather in summer. Still much more of the same kind of work needs to be done, and an excellent effect would follow the further planting of Rhododendrons, Aucubas, Laurels, Kalmias, Irish Heaths, and other such dwarf and useful plants.

The glass-houses again show Mr. Hudson's regard for the usefulness of things. The most important of these is an excellent span-roofed Peach-house 72 feet long, 22 feet wide, and 18 feet high. The site necessitated the aspect running nearly north to south. Evident, here, is the good culture the trees receive, for though the crop was gathered, we could observe the healthy appearance of the wood and leaves, and they were ripening splendidly after bearing so heavily. In order to prolong the season as much as possible, the following varieties are cultivated: Waterloo—which is said to always bear a good crop of fruit here, Dymond, Hales' Early, Amsden's June, Bellegarde, Condor, Early Louise, Crimson Galaude, Stirling Castle, Princess of Wales, Warburton Admirable, Nectarine Peach, Sea Eagle, and Barrington. Among Nectarines are Humboldt, Rivers' Orange, Lord Napier, and Elruge. The trees were planted rather thickly, in order to furnish crops of fruit at once, and will now need thinning out a little. Other houses included a small lean-to rosary, and another small span-roofed house, with two divisions. In one of these are permanent Vines, and in the other pot-Vines, or Melons, according to the time of season. The pot-Vines intended for the house have been raised on the place, and they were excellent canes for the purpose. There is a lean-to vinery, and another span-roof house, used for late Vines, in addition to the above, as well as a moderately-sized greenhouse.

We were not surprised to find that a portion of the land had been retained by Mr. Hudson for meadow-pasture. Two or three, however, suffice—they are small, but in splendid condition and a few excellent Alderney cows were grazing. Mr. Hudson has studied the dairy industry thoroughly, and has done much in many ways with a view to popularising dairy culture in this country, for the free-trade principles of our hospitable host are not inconsistent with a hope that the dairy products now imported into this country in such vast measure, will give place to articles of equal quality which, it is believed, this country is capable of producing in large quantities. But the dairy question, like that of fruit-growing, has long been a much-discussed subject. In conclusion, we are convinced that the satisfactory condition of the place is the result of enthusiasm on the part of proprietor and gardener alike, each of whom seconds the other's efforts.

ORCHID NOTES AND GLEANINGS.

PLEIONE LAGENARIA.

THESE charming little plants are making a grand show here at the present time. There are about three dozen 5 inch pots containing from seven to nine pseudo-bulbs each, and which average about twenty-eight flowers in a potful; one pot with nine good bulbs has thirty-three expanded flowers, some of the bulbs measuring 5 inches in circumference. They have been grown all through the season at the cool end of the Mexican-house, close to the door, where much air enters from the outside. After they had fairly started into growth, they were watered two or three times a week with soot-water and liquid-manure made from horse-dung. To any one having to make buttonholes or sprays they are very useful flowers. The plants being deciduous like *Calanthes*, the plants should be intermixed with Ferns which show them off to advantage. *W. Hurlstone, Parkfield, Hallow.*

CATASETUM TABULARE VAR. BRACHYLOSSUM.

In the issue of the *Gardeners' Chronicle* for July 13, 1895, p. 43, an illustration of *Catasetum tabulare*

var. *rhinophorum* was given, and in the accompanying note allusion was made to other known varieties of this species. One of the most singular *C. t. brachylossum* has just flowered with Joseph Broome, Esq., Saonyhill, Llandudno (gr., Mr. Shill), who has kindly sent the inflorescence. The very singular and large flowers have the sepals and petals, the underside, and the singular upturned margin of the lip and the pouch at the base, of a creamy-white colour, with a dense freckling of rose. The large Ivory-white tongue-shaped callus is $\frac{3}{4}$ of an inch broad, 1 inch long, and nearly $\frac{3}{4}$ of an inch thick. It was the remarkably broad, short, and thick callus which induced the late Prof. Reichenbach to distinguish it by name, and evidently the peculiarity is constant in one section of the species.

HOULETTIA BROCKLEHURSTIANA.

Like many other *Ochids* of early introduction, this beautiful species attracts considerable attention when well cultivated and flowered. One of the finest specimens which we have seen is now in bloom in the collection of Sir Frederick Wigan, Clare Lawn, East Sheen. The plant bears four flower-spikes, one of which bears eight flowers, and the others seven on each. The large wax-like flowers are Indian yellow, closely marked and tinged with purple-brown. Its fragrant flowers are borne on stout erect stems, and they arrange well with the broad arching pale-green leaves. *J. O'B.*

CATTLEYA AUREA.

There is a grand form of *Cattleya aurea* in flower at A. Warburton, Esq.'s, Vine Lodge, Haslingden. The nankin sepals and petals are large, stand more in a plane than the typical form, and the lip is not only large, but is beautifully interlaced with gold lines from almost the extremity to the base; the glowing crimson that forms the ground-colour makes a most captivating setting. There are six flowers fully expanded on a well-cultivated plant, the flowers standing clear above the foliage on a sufficient pedicel. It is one of many grown here, and well grown, too, by Mr. Tom Lottmouche, Mr. Warburton's gardener. The more one sees of this fine species the more is it appreciable, because of the great variety in the distribution of the colours, particularly in the labelum. *J. A.*

THE BULB GARDEN.

BELLADONNA LILIES.

AMONG the great army of hardy bulbous plants, few can vie with these charming plants, either from a decorative point of view, or for general chasteness and beauty. Quite unlike many of the choicer bulbous plants, these always thrive best when left alone. Of course, to ensure success, all such things must have been well and properly planted, and this, too, in suitable positions; indeed, position is one of the most important items to their ultimate success. The base of a south or south-west wall is the most suitable place for them. Here they will receive that amount of sun and warmth which is so conducive to healthful progress, and protection at other times from the extremes of weather; not that they are tender by any means, for while the weather is severe they are beneath the soil. The chief element in their success lies in the original planting, which must be very deep. A trench, quite $2\frac{1}{2}$ feet deep, should be made with several inches of rough material, for drainage, in the bottom. Unless the original soil is fairly good to the required depth, other soil should be substituted. If peat and rough leaf-soil and turfy-loam, with plenty of sharp sand, to the depth of one foot, be placed beneath the bulbs, this will last them for years. The preparation of the soil, however, depends to a large extent on the nature of the original soil. Anyone who may wish to make a specialty of these handsome bulbs, will do well to start properly; this done, they need no further attention in this respect for a dozen years at least. In districts where the soil is not well drained, it will be best to raise the level of the

border rather than excavate to the required depth, as it is not desirable that the roots should be in or near to water in winter-time. Moreover, the soil would soon sour, and be unfit for the roots, and sickly plants would result. These are items, however, which all will be able to decide, according to individual circumstances. In light, warm, and gravelly soils, the use of well-decayed cow-manure will be an advantage, buried in the soil deep below the bulbs. Having the trench and drainage ready, place a sod of turf over the latter, and begin by replacing the best soil to 12 inches deep, working in plenty of decayed manure, but not in contact with the bulbs. These latter may now be placed in position, so that the top of the bulbs shall be about 8 inches below the surface. The bulbs should be well surrounded by sharp sand, and an additional supply of good, prepared soil, without manure, be placed in to the depth of the bulbs. Make all moderately firm, and fill to the surface with ordinary soil. In exceptional instances, where from any cause the depth given cannot be obtained, the bulbs may be planted nearer the surface, provided that 6 inches of short manure or leaves be given as a mulch each winter, from November to February. If good, sound, dry bulbs are obtained, these may be planted at any time, from late autumn to end of April; but the sooner root-action commences, the better the chances of success. It is surprising these fine hardy bulbs are so rarely seen in private gardens, when they give so little trouble to the cultivator. For weeks past, during August and September, some notable examples have been making a grand display at Kew. Such instances fully demonstrate their real value, and is worthy of frequent imitation. *J.*

CATTLEYA CULTURE AT STAND HALL.

THE cultivation of *Cattleyas* and *Lælias* and their various hybrids at Stand Hall, if not phenomenal, is more than ordinarily successful. One could see in periodical visits the rising importance of that genus year by year, until now it is a matter of common comment—the vigour of the plants, the quantity and quality of the flowers, and the maintenance of a sound and enduring constitution of species and varieties. Mr. Statter, the genial owner of this renowned lot, is a gentleman well known for helping forward advancing horticulture, not only in the district in which he lives, but the zeal and ardour and time which he gives in assisting the Orchid Committee of the Royal Horticultural Society in their laborious but highly useful work in rewarding sterling merit, is well known to many outside of his own committee. The collection gathered together at Stand, no matter whether it be *Cattleyas*, *Cypripediums*, or anything else, is notable, not only for its numbers of varieties of species, but for the choice character of each individual. The training experienced at the fortnightly meetings is accountable in a great measure for this, as poor quality plants are intolerable in the eyes of experts, and now we have all our best-informed orchidists going for selection; hence the appreciation in value of good Orchids. But it is cultivation that we have taken as our text in this notice, and no doubt it will be interesting matter to tell, as exactly as pen-portrayal can make it, the system as practised in this charming Orchid home.

The house in which the chief lots of *Cattleyas* are growing is about 30 feet long by 15 feet wide. It is span-roofed, standing north and south, with its perpendiculars, half brick, half wood and glass, 6 feet high. The height from floor to apex is about 10 feet, leaving, therefore, the sloping roof on either side at about an angle of 30°. This, as will be noticed by those who follow me, is a flat roof. The house is substantial, without rafters, but with strong astragals, all grooved for catching the drip, placed about 15 inches apart, running from the perpendicular sides to the apex, filled in with 26-oz. glass. There are no longitudinal openings on the roof, only apertures here and there on the western slope for roof ventilation, of which more anon. The brick walls are also fitted with

apertures covered with wooden shutters, and lined in the interior with wire-gauze. These apertures are, judging by the eye, about 5 feet apart, and are placed directly opposite the lower tier, or return-pipe, in the heating apparatus. There are four rows of 4-inch piping—two flows and two returns, which, with a useful boiler, are fully adequate, even in this very exposed locality, to do the work in stress of weather. The interior presents a stage fully 5 feet wide on either side of a 3-foot passage. The stage rests rather under the top of the brick side, and is of strong flags resting on pillars arched from pillar to pillar, so that air may not be unduly impeded in passing from the bottom ventilators below the stage and up through the house itself. It will be seen therefore by those who know anything about hothouse building, that the Stand Cattleya-house differs from most of those recently erected in not having a skeleton or double stage. On the flags are placed a few inches of what appeared to the writer to be more chippings of coal rather than charcoal. Any way, that is the covering upon which the plants in pots stand. Nearly every one on the side stages is raised on an inverted pot, and indeed this is absolutely necessary, because of the roots, which we shall advert to presently, going down like living things in search of some support to take hold of. The ground below on either side of the passage, and indeed the passage itself, is covered with a thick layer of this so-called chip-coal. The path is latticed, and accumulated water, or rather surplus-water, from watering, goes down into this black medium. The roof is shaded with a kind of lath-blinds, much broader in the lath than usual, I should say 3 inches wide, and placed proportionately wide apart, thus giving a maximum of light, and at the same time acting as a sufficient preventative to screen the gems within from scorch. That comprises the ground-work for the system in practice; and now for some of the results of the practice itself.

A few sentences, however, on the reason why top-ventilation is not more liberally provided for. Both Mr. Scatter and his accomplished orchidist, Mr. R. Johnson, aver that half the success of the culture within is attributable to free ventilation at the bottom, and little, or as little as practicable, at top. The old system was the converse of this, and hence, whenever moisture was generated within, it went out at a gallop at the top. The condensation of moisture, particularly with a down-going sun, is of the highest importance for successful Cattleya culture. These flat-roofed houses, too, are capital in respect of the sun not beating too fiercely upon them. The cool atmosphere coming in from the low ventilators makes a "sweet" home, pleasant to the olfactory nerves of an expert orchidist. Mr. Johnson says that from May to September his bottom ventilators are seldom, if ever, shut, "night or day," and when the top ventilator is used, it is only for a few hours in the middle of the day—always shut before damping down.

There are three kinds of utensils or receptacles used for culture; first, pots mostly of common make; second, square teak baskets; and third, deep cylindrical teak baskets of rather elegant form, tapering from top to bottom. In the first-named, the stronger specimens of the race are growing; in the second, the medium lot; and in the third, the choice bits of slow and dwarfish growth, and the auxiliaries—bits cut off. *Cattleya gigas* the Stand Hall variety, was producing flowers 10 inches across, and such flowers with ruby segments filled up as we like to see them; and then the lip, gorgeous in its intensity of cardinal-purple, with two great yellow eyes, one on either side, the crests lovely, a king among Cattleyas; the leaves were grand, and the roots coming over the pot-rims. Then alongside of it was a very deep-coloured variety of *Lælia tenebrosa*, one of the greatest gems in the grandis way in modern times, with nine spikes, each three-flowered—great flowers, too, in the height of exuberance. *Lælia purpurata* Statteriana is after the Hardyana type, with a lip of equal brilliancy, and the segments broader, and white as snowflakes.

There is a most beautiful hybrid between *Lælia purpurata* and *Cattleya Warneri magnifica*, from the Jules Hye collection, temporarily named *Parisiana* ×, of unusual brilliancy, and growing away like its fellows, although not yet up to Stand Hall growth. *Cattleya Johnsoni* × *C. gigas* and *Loddigesii* is very uncommon. *Lælio* - *Cattleya* × *Cannhamiana alba*, *Lælia purpurata* × *Cattleya Moesia* are gems of the first water, the roots going down quite 12 inches after filling the pot, delighting one's eye as much as the plant itself. *Cattleya Statteriana*, a natural hybrid of aurea type, is growing in this climate in a way which we do not often see aurea do; its roots are actually touching the coal, after dipping past pot and inverted pot, to a length from the base of nearly 2 feet; and what a gem that selected variety is!—more valuable even than many of our home-raised hybrids. *Lælio* - *Cattleya* × *Phœbe* *Lælia cinnabarina* × *Cattleya Moesia* is quite a strong, finely developed plant; and then how glorious the flowers! The nankin colour is emphasised, and the size of *L. cinnabarina* more than doubled. This is grand work on the part of the cross-breeder. *Cattleya superba alba* is beautifully developed, and is likely to be shown at the fortnightly meeting (it has been so since this was written)—a capital managed plant of one of the most difficult to do of all Cattleyas. Then there is × *C. eximia*, × *C. Nisa*, in which the parents, *C. gigas* and *C. crispata*, are both observable, and the roots here, too, sometimes clambering on the rim and over the side of the pot, and sometimes dipping vertically, showing abundantly to the practised eye the suitable character of the atmosphere. In houses kept in the dry order day and night this scarcely ever occurs, the roots electing to take hold of the burnt-clay pot, which is the only moist medium come-at-able for them. *C. × Macenas* is in rude growth, forming double leaves to its flowering bulb, from the centre of which the sheaths spring. *Cattleya crispata superba*, which was honoured with a first-class award at the chief seat where Certificates are given, and where few are thrown away upon even high-class articles, was showing dozens of flowers. The charming *Lælio* - *Cattleya* × *Ameisæ*, *C. crispata* × *C. maxima*, is another grand example of extra growth, and abundant root-action; indeed, many of the hybrids are freer in root-action than some of the imported species. We must always except *C. labiata*, the root-action in which is pronounced. It seems to be the easiest to transport safely, the quickest to recuperate, and freest to flower of all among the great host of sectional forms. *Cattleya Rex* is doing extraordinarily well. It was in bad repute as a doer at first, but here it is rampant in a good many plants, but not so variable in variety as its compeers. *C. Classiana* of the *C. intermedia* type differs from many in respect of making its growth in winter, like *Lælia anceps* and its brood. *C. Bowringiana* is a giant to grow in a climate of this kind; its pushing leads are as thick and prominent as one's thumb, and a glorious coloration it makes when in flower. The rather unique *C. Mendeli leucoglossa* is doing grandly; indeed, the varieties of *Mendeli* here are of pronounced good quality, and there is no subsection that commands general attention so much as this, and then the vigour of the growths and the dark green of the leaves keep one's eye upon them. *C. × Pallas* and *Lælia purpurata*, and *C. Dowiana*, with its intense velvety-purple labellum, are among the most distinct of hybrids, and the plants here show great vigour. *C. × Lord Rothschild*, *C. × Gaskelliana*, and *C. aurea* has the vigour of *Gaskelliana* imparted to it. The wonderfully broad leaves induce long roots, pushing downwards and breaking at intervals, close intervals too, with subsidiary ones like a crop of lateral buds on a dwarf Apple tree. No more remarkable growth for a rarity is visible than that of *C. Gaskelliana alba*. Looking at other albinos of similar species, this is a veritable giant, and as white as paper. But this is an emporium of rarities which we cannot linger much longer upon. It was with pardonable pride that Mr. Johnson pointed—"there are my three selected Cattleyas

that have won honours—*C. aurea* Statteriana, F.C.C., 1890; *C. Statteriana*, F.C.C., 1892; *C. Warszewiczii* Countess of Derby, F.C.C. in 1894." The last is a gem of the first water, and what in gardening phraseology is called a white *gigas*. It has been divided into two pieces, each running neck and neck, both about showing for flower (see, for description, *Gardeners' Chronicle* for September 28, p. 360). The open cylindrical raft, letting in the air in the suspended position, evidently suits this plant.

In another house, the counterpart of the one above described in detail, the *Cypripediums* and the *Lælias* divide the pride of place. *Lælia elegans* in many varieties is doing well, some pieces in rather indifferent health, bought in, have been cut up, and are gaining strength. *L. e. nobilium*, *Blenheimensis* excellens, *Chelsoni*, and one called *Statteriana*, with white segments and brilliant lip, attract attention.

The seedlings are grown here, and wonderfully well they look in their comparative initial stage. There are some promising broods of *Lælia cinnabarina* and *Cattleya Lawrenceana*, of *C. Sanderiana* and *Lælia purpurata*, and many others. The batches are in small thumbs, plunged into shallow seed-pans, and as they increase in size, they are potted on and hung up on their own account. Mr. Scatter is strongly of opinion that the best seed-bed for hybrid Cattleyas is in pots, where the plants have not been moved for two or three years, among decaying material, and where watering is of little consequence, because of the little value of the plant. Seedlings will not do, for a time, with a season of rest, only, singularly enough, I never knew them to come up unless in the peat surrounding a living plant. The little embryos in a house of this kind were getting on. We never can have too many Cattleyas; there is so much difficulty in getting a large brood from one seed-vessel—so different from *Cypripediums* and *Dendrobiums*; and Mr. Johnson would not sow a seed upon the surface of the pots where any of his choice plants are growing. Some people might say that the extraordinary exuberance of the plants was attributable to their living in an artificial atmosphere. It is not so. The system here is to have a rest and a drying, at proper seasons, and, moreover, no plant is syringed or watered overhead; the moisture necessary for leaf-feeding is obtained from evaporated and condensed moisture. The material used is two-thirds best fibrous peat, and one-third best selected sphagnum-moss—a very common mixture. In fine, they are a marvellously fine lot of plants, looking even better now than I ever saw them; they are a comparatively small lot, but everyone is worth looking at, and go when you will there is something choice in flower. A.

SCOTLAND.

MORELLO CHERRIES IN THE GARDENS OF SCONE PALACE, PERTSHIRE.

MR. WARD does well to refer to these fine trees in particular, in the *Gardeners' Chronicle*, as well as to the importance of the general culture of Morello Cherries. And as he appeals to Mr. McKinnon, who succeeded the late Mr. Holliday as gardener at Scone, Mr. Smith of the Viceregal Lodge, Dublin, and to myself, for information about these models of training and fertility, I hasten to recall a few memories about them. I do this the more readily as Mr. Ward frankly confesses that the Scone trees have been his object-lessons in Morello-growing through life. Doubtless the same feeling has largely prevailed among the many ladies and men that graduated in the gardens at Scone. It was scarcely possible for any such to plant, train, or gather Morellos anywhere without recalling the giants they had seen in their Scone days. There were other good features in the old gardens, but the Morello Cherries on the north wall of the south garden were the lions of the place.

None but the master, Mr. James Dodds, in my time, or Mr. Blackie the foreman, was allowed to

prune a single twig of these Morellos, and I shall not readily forget the violent quarrel that arose with a fresh journeyman from Dicksons, in Edinburgh, mistaking his orders to go and train and nail one of these trees, went to another, and began to prune and spur the giant Morello as if it had been a Mayduke or a Black or White-heart Cherry!—an act of vandalism which was threatened with instant dismissal.

Another rule about these trees was, that if more young wood was left than could be laid in without overcrowding, the surplus shoots were to be brought under the notice of the master or foreman before removal. Seldom was any but the most experienced journeyman, or handy apprentice in their last year, allowed to train and nail these Morello Cherry trees; and in most cases, apprentice hands were only allowed to lay in the current year's wood after all the primary, secondary, tertiary, or other older branches had been displayed. I also recollect several cases, after several days had been spent on one of these fine Morellos, some error of judgment in the equal distribution or straightness of the branches and shootlets would be revealed. The foreman and master, and occasionally a jury of journeymen, would sit in judgment on the trinning and nailing. If these were condemned, the faulty part, or the whole tree, was driven into chaos by the master, and the entire work of training and nailing begun afresh. Hence it was with fear and trembling, somewhat strengthened by professional pride, that most of us took part, for the first time, in training a part of those model Morellos on the north wall of the south kitchen garden at Scone.

But the reward was sweet, when, after a week or more labour, the tree was finished, and the leading journeymen, foreman, and master pronounced it perfect, or like cautious Scotchmen, drawled out, "Yea, that will do—George—David—Bob, but that the third tertiary from the top is not quite at the same angle all the way. No, you need not alter it again, ye've been lang enough about it, mon, it'll do gie weel." Grand technical training for eye and hand were these Scone Morello Cherry trees. Neither was fertility sacrificed to form nor symmetry. From base to summit of those 18-foot walls (I had lately remembered them as from 2 to 4 feet lower, but have no doubt of Mr. Ward being right as to height), they were studded with Cherries of unique colour, size, flavour. Others will probably have something to say as to soil, site, culture. I remember nothing special of either. The Cherry-borders were surface-cropped with vegetables in the usual order, and have probably been covered with Violets and Valley Lilies, since these have been so widely grown for the London season. The corresponding wall in the north garden used to be cropped with Gooseberries and Currants, but the Morello Cherry border in the south garden had no bushes in my time; the site was due north, as near as may be. The soil was a strong loam resting on clay, and rather imperfectly drained. I was present when a considerable portion of the garden was trenched. The manure from the stables went to the farm, and not to the garden. The chief manure for the large garden consisted of cow-manure from the large Park, stretching away miles from the Palace, and fully furnished with a stock of graziers, and leaves and leaf-mould from the miles of woods. But the art of mulching was not much practised in these days, unless in the vineries, where most of the inside roots had about a foot thick of fresh or two-year-old cow-dung annually; but I do not remember the grand old Cherry trees having any of this stingo or other stimulant.

I think these trees partly owed their general immunity from fly and all other insect pests to the heavier rainfall and moister climate of the north, to the holding loam in which they grew, and the heavy clay on which it rested; while it cannot be doubted that their enormous size, long life, and annual fertility were largely developed and mainly sustained through their skillful top-treatment. Annually every foot, I had almost written inch, of weakly or diseased wood was cut out, and a fresh supply of young healthy clean wood laid in all over throughout the trees. Their

life-vigour and fruit-bearing capacity were thus renewed every year. Some will answer shortly, "Yea, it was a Cherry-soil." No doubt it was, and is to some extent. But no other Cherry trees that I can remember in the same soil ever became models of symmetry, fertility, or longevity. *D. T. Fish.*

ROYAL BOTANIC GARDEN, EDINBURGH.

Of plants in flower recently, mention may be made of *Begonia Teuscheri*, a tall-growing species, planted out in a bed in the Palm-house. The stronger growths measure in some instances 6 feet or more in height, and bear large leaves of a dark green colour above, the under-surface suffused with a reddish colour. The plant is a rather shy flowerer, the inflorescence bearing not more than a dozen large pinkish flowers. The outer parts of the wings of the ovary are darker, while the ovary itself is white. Every flower examined was a female; the males, if any are produced, having dropped whilst still unexpanded. *B. Teuscheri* is a native of Malaya, and although it may never become a popular plant, on account of its shy-flowering habit, it is still worthy of a place in any collection of these plants.

Achimenes lanata.—This pretty little Gesneraceous plant is perhaps better known under the generic name of *Mandrola*, and, indeed, it has some resemblance in habit to the general run of garden *Achimenes*, is of a dwarf habit (not more than 4 inches high); the foliage forms a dense mass, the under-sides of the leaves covered with a woolly pubescence. The solitary axillary mauve-coloured flowers rise just above the foliage, and change with age to purple; the lip of the corolla is streaked with purple, and yellow spots cover the tube. When well grown, it is a plant that is always admired, and the treatment accorded it is that usually afforded *Achimenes*. It was introduced from Mexico some years ago.

Mustanda luteola.—A good plant of this tropical African species planted out in the stove has for more than a month past been attracting notice from visitors, it being covered with flowers, which appear in terminal corymbs, every main and lateral growth bearing flowers. The showiest feature of the plant is the large white or yellowish-white bracts, the flowers are of a bright yellow colour, contrasting well with the bright green foliage. Being a native of tropical Africa, it requires a brisk heat and needs no shade. Cuttings strike readily. The plant when grown in a flower-pot is apt to become stunted and less productive of bloom, unless accorded liberal treatment.

Plumiera alba.—The beautiful tints of the fragrant flowers of *Plumiera* are very agreeable in their season, although they have little claim when out of flower to be reckoned as decorative plants, they are worthy of space in our collections. Under cultivation the stems are usually unbranched and smooth, carrying a crown of leaves at the apex, about 1 foot long. From amongst these the inflorescence rises upon a stout peduncle, and bears from twenty to thirty flowers, which expand in succession, the plant thus continuing to flower for some time. The petals are white, shaded with yellow towards the centre of the flower, the latter being from 2 to 3 inches in diameter. A warm greenhouse is the proper place for it: after the foliage has fallen, water being somewhat sparingly afforded until signs of growth reappear. *Plumiera rosea* and *P. incarnata* are two other species grown here, the latter is a native of Peru, while the species under notice comes from India.

Jacquemontia violacea.—This is an easily cultivated, excellent stove climber, doing best when planted out and given a light position near the roof, where its slender twining stems sometimes reach a length of from 15 to 20 feet; these, however, should be restricted as to number, so as to prevent overcrowding of the foliage. The smooth green foliage is cordate and pointed in shape, and from the axils of the leaves spring the pedunculate cymes bearing a profusion of flowers, with light-blue, campanulate corollas, 1 inch in diameter. The plant continues to flower for several months during the summer and autumn. A native of tropical America; it has long been known to cultivation, having been introduced in the early part of the present century. It is figured in the *Bot. Mag.*, t. 2151, under the name of *Convolvulus pentanthus*. *R. L. Harrov.*

COLONIAL NOTES.

AUCKLAND, N.Z.

We learn that Messrs. O'Leary Bros., seedsmen and plant merchants, have lately established for themselves a business in Queen Street, Auckland. Messrs. O'Leary are starting after many years experience in a similar establishment, and as their catalogue gives evidence of enterprise, as well as of determination to succeed, we trust that the results of their essay will fully justify them in making it.

JAMAICA.

We have received the *Bulletin of the Botanical Department, Jamaica*, for August, 1895, and note that the contents include such topics as:—Rum, Jamaica yeast, Colocynth, tillage of the soil, its paramount importance; importation of selections of seeds; Report on Sugar-cane Disease; and assimilation of nitrogen by plants.

GRANADA.

The *Bulletin of Miscellaneous Information, Botanic Garden, Grenada*, May, 1895, includes papers upon:—Liberian Coffee, Grape-fruit, Kola Nut, Lemons, Logwood, and other subjects.

BRITISH NORTH BORNEO.

The *Official Gazette*, from British North Borneo, for August 1, 1895, contains the following proclamation:—

"ORCHID COLLECTING.—No permit to travel for the collection of Orchids in Province Keppel and the District of Kinabalu is to be issued until further orders. Any person travelling or collecting Orchids there without a permit is liable to a penalty of 500 dols., or to imprisonment under Proclamation VII. of 1890. Sandakan, July 9, 1895."

A BOTANICAL STATION IN CENTRAL AFRICA.

The *Foreign Office Report*, C. 7829—2, contains some interesting information on the botanical and agricultural resources and prospects of the Shiré-highlands. The writer, Mr. Alexander Whyte, who is head of the scientific department, gives an account of his successful effort to establish a botanical garden at Zomba. The results seem to show that Zomba is eminently suited for the experimental cultivation of food-plants and other plants of economic value. English Potatoes grown from seed turned out remarkably well. By constant selection, several large, well-formed, mealy varieties were obtained, equal in flavour to any English Potatoes. Happily, too, they show no sign of disease. Barley and Oats from English seeds were successful; while Wheat grown from seed obtained from the missionaries at Tanganyika, yielded at the rate of nine bushels to the acre, without manure. A series of Conifers, Cypress, Thuja, and the Milanji Widdingtonia grew to an average height of 5 feet in two and a half years, while some Eucalypti shot up 45 feet in the same period. A large terrace flower-garden made a brilliant display; Balsams, Phloxes, Zinnias, Mignonette, and others seeded so freely, that they became garden weeds. Pelargoniums grew to the height of hedges, and Sunflowers and Dahlias shot up into tall, shrub-like plants. Petunias, Pinks, Carnations, and, in fact, most of the plants experimented with were successful.

Mr. Whyte strongly advises extensive cultivation of india-rubber and gutta-percha yielding plants. The cheapness of land and labour would make the former, at any rate, a most remunerative venture. Fibre-plant cultivation would also admirably suit the natives. Unfortunately, the formidable Tsetse-fly will seriously interfere with the introduction and rearing of domestic stock, while a gad-fly (*Tabanus latipes*), the size and shape of a large blue-bottle fly, is also most harassing to horses and cattle. Though said to be a great scourge in East Africa, the latter is seldom met with in Nyassaland. As regards the Tsetse-fly, smearing the animals with a mixture of kerosene oil and cow-dung, is suggested as a most effectual preventive. The West Indian jigger, a burrowing flea, has also just reached the districts round lake Nyassa and the upper Shiré, having slowly migrated eastwards from the west coast, where it was introduced with ballast from Bahia in 1873. *Natural Science.*

THE HERBACEOUS BORDER.

TELEKIA SPECIOSA AND T. SPECIOSISSIMA.

The *Genera Plantarum* changed the name of *Telekia* to *Buphtalmum*, and as there are only four species of *Buphtalmum*, that work departs from its usual habit, and describes them all, with their synonyms. Two of them are very well known, being common garden plants. The type of the genus, *B. salicifolium* (Lin.), has narrow, lanceolate leaves, described by its name, and a forest of stalks springing from the base to about a foot high, and yellow flowers less than those of a Corn Marigold. The next generally known as *Telekia speciosa* (Bing.) is a very coarse plant, 5 feet or more high, with broad, cordate leaves, and heads several in a bunch, a large disc, and long, narrow rays, like those of *Inula glandulosa*. It is figured in *Bot. Mag.*, t. 3466. It has the habit of *Inula helenium*, and is a good plant to naturalise by the side of ponds. This is the plant which Mr. Freshfield describes as growing in such luxuriant masses in the Caucasus, as nearly to hide a man on horseback. It is often offered in catalogues as *T. speciosissima*, probably for no other reason than a fondness for superlatives in plant names. As for the true *T. speciosissima* (D.C.) which is described in the *Genera Plantarum* as intermediate between the two last-mentioned, I do not think I have seen it in cultivation, but is said to be found in the warmer parts of the Italian lake-district. The fourth species, *B. inuloides* (Moris) is a little known Sardinian plant. I may observe that in the *Hand-list of Herbaceous Plants* issued by authority at Kew, *Buphtalmum salicifolium* (L'n.), and *B. speciosum* (Schreb.), which is the same as *T. speciosa* (Bing.), are by mistake made synonymous. It is probably a printer's mistake, and the second name should have been at the same distance from the margin as the first. The two plants are certainly very distinct from one another. *C. Wolley Dod, Edge Hall, Malpas.*

INDIA.

THE NEW PUBLIC-GARDENS SUPERINTENDENT AT NAGPUR.

We learn that Mr. John Horne Stephen, formerly of Kew, and lately curator of the Lal Bagh Botanic Gardens at Bangalore, Mysore, has been appointed Superintendent of the Public Gardens at Nagpur, Central Provinces of India, in succession to the late Mr. J. R. Ward. Mr. Ward died in January last from smallpox complicated with other maladies. He had only held his post since 1883, but had already won general regard; his untimely death has cut short a career of promise. "*Kew Bulletin*," September, 1895.

TREES AND SHRUBS.

WHITE WILLOW.

The *Huntingdon* or *White Willow*, *Salix alba*, is a tree so useful for many purposes that there is great fear, according to the September *Kew Bulletin*, that the supply of it may soon fall short of the demand. The bark of *Salix alba* is used for tanning, and yields salicine. The timber is employed in turnery, mill-work, coopering, and for making cricket-bats. The charcoal is excellent for the manufacture of gun-powder and for crayons. More than one complaint has been received from bat-makers and from timber merchants, to the effect that true white Willow-wood is becoming practically unobtainable, for that, in spite of continual search for new supplies, the genuine article is rarely forthcoming, and even when found is both scarce and costly.

A NEW GOLDEN ELDER.

Under the name of *Sambucus racemosa plumosa foliis aureis*, Messrs. K. W. Zelenburg & Son, of Hazerswoude, near Leiden, have lately sent out a

new variety of *Elder* raised from *Sambucus racemosa plumosa*. This fresh introduction has pinnate leaves, the leaflets being again cut into linear or lanceolate segments. The colour of the leaves is bright yellow, the very young foliage being striped with brown. This *Elder* is quite hardy, and retains its colour until late in the autumn, so on all accounts should prove a valuable addition to our decorative shrubs.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

LÆLIAS.—In the house or division devoted to Mexican Orchids, *Lælia albida*, *L. autumnalis*, *L. Gouldiana*, *L. Marriottiana*, *L. acuminata*, or *L. peduncularis*, *L. anceps* and its varieties, are now throwing up their flower-spikes. From the present time onwards until the flower-spikes have attained their full length, it is advisable to carefully examine the plants for insects, and clear them of dirt and dust, washing the pots. If the plants should require re-arranging, this may now be done. As a rule, *Lælias* are afforded too much water during the flowering season and the winter, whereas the roots should be kept merely moist, and a temperature maintained sufficient to fully develop the blooms; but as soon as these are expanded, a very small amount of water will preserve the pseudo-bulb plump until such time as growth recommences. All species of *Barkeria* will require a similar treatment.

VANDA TERES is an Orchid that grows luxuriantly in a sunny part of the Mexican division. As regards this plant, there is nothing in the formation and completion of the season's growth to indicate the beginning of a resting season, and the grower has to be guided in this matter by the amount of growth made since the plants bloomed. If he be satisfied that sufficient growth has been made, the plant should be kept less moist than in summer, still not so dry as to cause the stems to become shrivelled, or many of the lower leaves will fall off. *Vanda teres*, if kept in a temperature of about 55° to 60°, and afforded an occasional syringing overhead on warm sunny days will offer no difficulty, and will bloom profusely.

CATTLEYA BOWRINGIANA.—At the present time this plant forms the principal attraction in the Cattleya-house. Although its individual flowers are smaller than those of most Cattleyas, their rich colour affords a fine effect, and especially by artificial light. Generally, it is a plant of easy culture, its requirements being the same as those that suit Cattleyas generally. Immediately it has finished blooming, repotting if it should be required should be attended to, because in a very short period roots will start away from the base of the flowering bulbs, and delay in potting might result in injury to these. After the flowering is over, whether the plants have been disturbed at the roots or not, they should receive only sufficient water to keep the pseudo-bulbs and leaves fresh-looking until growth recommences. *Cattleya Percivalliana* is another desirable autumn-blooming Orchid, and this plant having completed its new pseudo-bulbs, should be kept moderately dry at the root, but avoiding over-dryness, which may result in abortive flowering or deformed blooms.

SOBRALIAS have been later than usual in flowering, but this notwithstanding, growth is already well advanced, and many large roots are coming away. If repotting or division seem called for, the present is a favourable time for doing either, as establishment is rapid. A healthy specimen needs considerable pot-space, and ample drainage is very necessary. The soil used for *Sobralias* may consist of lumps of fibry peat and sandy loam, with a small quantity of sphagnum-moss, and a moderate quantity of clean crocks. In potting, keep the base of the plant below the rim of the pot, and press the soil firmly together. When in full growth and rooting freely, *Sobralias* need to be plentifully supplied with water. Towards the end of the year the breaks or stems which have flowered, on fully established plants, should be cut off at the ground-level, and the young shoots tied out clear of each other. *Sobralias* succeed well in an intermediate house the whole year.

ODONTOGLOSSUM CITROSUM.—Plants which are now forming pseudo-bulbs should be kept in the lightest available position, and afforded plenty of water at the root till growth is completed.

PLANTS UNDER GLASS.

By W. H. SMITH, *Gardener, West Dean Park, Chichester.*

STO E.—*Allamandas*, *Stephanotis floribunda*, *Bougainvilleas*, *Clerodendron splendens*, and *Dipladenias* should be looked over, and all weak shoots removed. Snading will not be needed now. Crotons and other fine foliage plants must be placed near the glass, and in as light a position as possible. As the days become shorter, it will be necessary to use more fire-heat, but it is better to allow the temperature to fall a little than to have very hot pipes, which are liable to cause insect pests to breed. A temperature of 64° by night to 75° by day is quite warm enough for the majority of stove plants. Keep plenty of moisture about, and fill the evaporating troughs regularly. *Gloxinias* should be put away in a warm dry place underneath the greenhouse stage, where drip will not reach them. *Caladiums* and *Gloriosas*, if they have been gradually dried off, may be stored in a similar situation.

CYCLAMENS.—Seedlings sown in August may now be removed from the cold frame, and any which are fit pricked off into well-drained pans or pots, containing a compost of good loam, leaf-soil, and sand, merely covering the combs with soil. Place them on a light shelf in a warm greenhouse, and keep them lightly shaded during bright weather. A sprinkling of soil should then be dusted over the seed-pans, and these pans removed to the stove to encourage the seed left still in the soil to germinate. *Cyclamens* intended for flowering during the winter and spring should occasionally be afforded weak manure-water, and weak soot-water. Maintain a temperature of about 60° by day, and 50° by night.

ROSE HOUSE.—Tea Roses in pots for early forcing should now receive attention. The drainage must be examined, and the weak shoots cut out. Top-dress the plants with rich unctuous loam, and add a small quantity of finely-broken bones. Place them in a temperature of about 50° by night and 60° by day, and if a gentle bottom-heat can be afforded them, so much the better. Syringe the plants twice a day, and avoid cold draughts, or mildew will soon appear. This must be checked at once when noticed by dusting with flowers-of-sulphur.

HERBACEOUS CALCEOLARIAS should be potted into 5 inch pots; a compost of good strong loam, leaf-soil, and decayed cow-manure in a dry state will suit them. Pot rather firmly and deeply and do not water them for a few days after potting. Place the plants in a cold frame near the glass, and afford plenty of air during mild weather. *Calceolarias* being very subject to green-fly, the plants should be lightly fumigated on its first appearance.

CINERARIAS.—Plants from late sowings should now be potted into 6 inch pots; and placed in cold frames, well covering these with mats when frost is expected. Early *Cinerarias* commencing to show flowers should receive a top-dressing of a good fertiliser, and be placed in a little warmer temperature.

THE HARDY FRUIT GARDEN.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

THE GATHERING AND STORING OF FRUIT.—Fruit gathering in all the warmer parts of the country will now generally be drawing to a close, except in the case of a few very late varieties of Apples or Pears, which, unless they come away easily from the shoot are sure to shrivel. Take advantage of every fine dry day for pushing on with the gathering, and remember that no matter how hard an Apple or Pear may be it is easily bruised, and requires as careful handling as eggs. Any fruit which may have been stored for about a week should be examined, removing any fruits that show signs of decay. When fruit is spread about on shelves in one layer, the examination is a light matter, but when two or more layers lay on the shelves, a good deal of care is necessary in searching for decayed examples. Ripening Pears require almost daily examination, as when in decay, one fruit will spoil all others touching it.

FILBERTS AND NUTS of various kinds should be stored somewhat thinly on shelves in an airy, but not too dry a room, or the kernels will shrink. The Filberts keep longest when their husks are retained, indeed, they then have the best appearance at the dessert. The fruit-room should be kept cool and dark, ample ventilation being provided at the highest part of the roof, and good use should be made of this for the first few weeks in October and November, i.e., during the time that the fruits part with a good deal of their moisture. Failure to ventilate at such time

usually leads to a great deal of loss from the excessive degree of moisture contained in the air of the room. If it can be managed, Pears should not be stored with Apples, the latter keeping longer and best at a lower temperature than suits all the varieties of Pears, except the longest keepers. If space and convenience are at command, choice Pears should be wrapped in some light sort of paper, and stored in drawers, boxes, or large plant pots, in the case of the last covering the tops with other pots or wooden covers. Nearly all kinds of Pears are improved in flavour and texture by placing them in a warm place to ripen for the table. The exceptions are varieties like Doyenné du Comice, Seckle, Louise Bonne, and similar quick-ripening ones lasting but a short time in use. The warmth to which Pears are exposed should not exceed 70°, and only enough fruits to meet the demand should be hastened in this manner.

GOOSEBERRIES AND CURRANTS.—Gooseberry and Currant-bushes covered with mats or material on purpose to keep the fruit to a late date, should be uncovered on fine days to allow the fruit and the ground beneath the bushes to get dry, and for the removal of decayed berries. Where new plantations of these fruits have to be made, or gaps in existing ones filled up, planting may at once be proceeded with if bushes are grown at home, as the early-planted stuff will get established to a certain extent before hard weather sets in. A mulching of rotten manure should be applied as soon as the planting is completed. Such early-planted bushes start into growth in the spring as if nothing had occurred.

RASPBERRY-PLANTING ETC.—If new plantations of Raspberries are to be formed, this work should also be undertaken without delay, trenching the land 3 spits deep if it be good, but not bringing the subsoil to the surface, rather incorporating with it plenty of short, rich manure, and leaving it where it is. Soft soils should be afforded a heavy dressing of coal-ashes or sand. Although an open site is the best for the Raspberry, yet partial shade will not hurt them greatly; but care must be taken that the soil is not impoverished by the roots of neighbouring trees. Of varieties, Superlative is fine and distinct, deserving of extensive planting; Baumforth's Seeding, Fastolf, and Fillbasket, are likewise excellent; and the yellow-fruited varieties should not be forgotten, as they are nice for dessert.

FRUITS UNDER GLASS.

By RICHARD PARKES, Gardener, Goodwood, Chichester.

VINES.—The Vines in the earliest house, that is, be one the forcing of which will begin in November, should have by this time lost the most of their leaves, and may therefore be pruned. After the pruning, the cleaning of the rods should be undertaken, using for the purpose hot-water and a small quantity of soft-soap. Having done this, which involves the loosening of the Vines from the trellis, it will be an easy matter to clean the woodwork and walls, the latter being afterwards washed down with lime-wash, into which a wineglassful of petroleum to each gallon may be put. The crust of the borders should be removed to the depth of an inch or two, and if the soil appears to lack water, a heavy watering should be afforded before any new soil is added in the place of that taken away. As a surface-dressing for Vines, I am now collecting the edgings from the carriage-trives, which contain a good amount of sharp grit, and to this some manure is added, the whole being mixed with fresh-cut turf, old mortar or plaster, and wood-ashes, and the mass turned over several times. These materials must not be allowed to get wet before using them. The quantity prepared may be sufficient for all the Vine-borders. In affording crushed bones to the soil of Vine-borders, I find it better to sprinkle them on the border as the work proceeds. After the Vines andinery are cleansed and the border top-dressed, theinery should be left open up to the time of beginning to force, any frosts that may occur doing good rather than harm if they do not freeze the water in the heating apparatus.

SECOND - EARLY VINERY.—In this house the Vines will require abundance of air day and night, but beyond shortening the longest shoots, no pruning should be done and no leaves removed forcibly, for so long as the leaves remain on the Vine the buds are being supplied with material for future use. The foliage of these Vines should be well syringed at least once a day. Do not place any description of plants in the house, fire-heat

being usually required at this season to protect these from injury by frost. Where a few bunches remain on the Vines, remove them, each with a long piece of the shoot attached, and place in bottles of water, and store in a dark, cool, dry room. The Vines will be greatly benefited if the roof-lights can be taken off theinery, thus affording full exposure.

MUSCATS.—Maintain a warm, dryish atmosphere to complete the ripening, for unless this be done these varieties do not keep satisfactorily. It is advisable to have a regular, gentle warmth in the pits at this season, so as to keep a temperature of about 60°. Ventilation should be carefully afforded, avoiding cold draughts which cause rusting of the berries. If the border needs water, it should be afforded on bright mornings, and at a temperature several degrees higher than that of the house. The bunches should be carefully looked over once a week, and decaying berries deftly cut out of them. Any late-formed laterals may be pinched off, and the foliage so regulated that the sun may shine on the bunches.

THE KITCHEN GARDEN.

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

SEAKALE.—The present will be a suitable time in some gardens to put the first batch of roots into heat, choosing those that are the best matured; in fact, I think it is a good plan in all gardens where this useful vegetable is much in demand, to plant a small bed of it in a warm, sunny aspect, which, if left two years before taking it up to force it, will produce shoots earlier than others in the spring, and consequently, the crowns ripen betimes in the autumn. Choose the white variety for the earliest forcing, as the first very early batches of this vegetable are never quite so nicely blanched as later ones. I have tried Seakale forcing in many different ways, and found that a mild hot-bed made of stable-manure and leaves is the best for the production of crisp, tender Seakale. Mushroom-houses and cellars are convenient places for forcing the roots throughout the winter, besides being accessible in the worst of weather. The large and small thongs of the Pearl-white variety should be saved for propagating purposes if stock be short, laying them in damp soil till they can be made some time during the winter.

VEGETABLE MARROWS.—If it be not intended to cover the plants up, and they are yet fresh and in a growing state, cut the fruits directly they are large enough for consumption. But these plants are worth the protection of cold frames so long as the day temperature is mild.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

SPRING FLOWERING PLANTS.—If the planting of the beds has been delayed by rainy weather, and a change to dry weather should have taken place, the following plants, mostly employed for edging, should be put out:—Carratum, Ajaga, Arabis of varieties Daisies, and Pansies, without delay, thus affording the plants a chance of getting established before the winter. Other plants used for furnishing the beds, viz., Wallflowers, including always B-d'ont Yellow, which is one of the best; Auriculas, Primroses, and Primrose Polyanthuses; Alyssums, Honesty, Saxoonaria cymoides, Silenes, Limnanthe, Erysimum Peroffkianum, and Myosotis should be planted.

HARDY ANNUALS.—Seeds of suitable species may be sown in sandy loam and leaf-mould in small pots, and placed in a cold frame or pit, and afforded air freely as soon as the seedlings are above ground. They need protection from severe frosts, and will be found very useful for filling up or making beds in the spring gardens. It will be very necessary to thin out the seedlings from time to time till there are not more than three to five left in each pot, and to keep the pots pretty close to the glass to avoid spindling. As these plants should not make much growth in the winter season, only enough water should be afforded as will keep the soil moderately moist. Clarkia elegans var. integriflora, C. pulchella, and Eucharidium concinnum make the most charming of early summer beds, raised and treated in the above manner, but affording them a shift into 48's or 32's early in the spring, and hedging them out in April. These plants last much longer in flower, and do not become so waxy-looking as those sown in the spring in the open ground, which flower during the hotter summer months.

GARDEN SHRUBBERIES.—With the fall of the leaf the re-arrangement and transplanting of deciduous trees and shrubs may be undertaken, and its performance carried out in mild weather during the winter months, remembering, however, that deciduous plants recover the soonest from root-disturbance the earlier in the autumn the work is done. Always wait till the soil is somewhat friable and dry, or it will not run freely in amongst the roots, and the trampling of wet soils is always injurious to them, and ought to be avoided. In soils that are light, and those which readily get dry, the planting should be done a little deeper than in those which are retentive. If the plants removed are tall or top-heavy, staking them should be done as soon as the plants are in position, always using a soft wad between the bark of the stem and the stake. Large subjects are best fixed by ties of 8 inches long, fixed to three stout stakes, as this prevents wind-waving, but allows of the settlement of the soil and the shrub, &c. As a tying material of a provisional nature, straw bands answer admirably, and later, for permanent ties, Cuba bast, Willow shoots, and soft tarred string are the best. In removing large trees, &c., it is best to take out a deepish trench at 2 to 3 feet distant from the side, and then excavate one side of the ball, and cut through any existing tap roots; the trench should then be filled in and the plant left for one year at the least, in which period of time new roots will form at the cut sides of the ball. New beds and shrubbery borders should be trenched 2 feet deep, and the sub-soil if wet left in position, but broken up well. If the home nursery can furnish the trees and shrubs, and these are prepared by frequent transplantation, the deciduous and evergreen species may be more satisfactorily planted at one and the same time; otherwise large evergreens should be transplanted in late spring. Good immediate effects are obtained by planting at from 4 to 5 feet apart. Doing this will involve the transplantation of many of the plants in three or four years, when the thinnings will be found in excellent condition for planting elsewhere. Trees and shrubs are often placed on turf by the sides of roads, and in such case they should be selected half-specimens, well prepared by digging round a year or two before. Usually it is best to plant them at a sufficient distance apart, that each may show its true character when of large size. In the planting of shrubberies intended to afford warmth and shelter, deciduous flowering plants should be but sparingly used, and common and Portugal Laurels, Hollies, Box, Cupressus, &c., more largely employed. The S-a Backthorns and the red-twigged Dogwood, double and single-flowering Deutzias and Ribes, should be planted freely, their various coloured shoots when denuded of their foliage affording pleasing colour. Lilacs should be planted thinly, as the plants soon overshadow dwarfier growers, and the roots rapidly impoverish the soil. They are more effective when planted in clumps by themselves. The pruning and thinning of the shoots of deciduous shrubs which flower on the young wood may now be commenced, the cleaning and digging of the borders following thereon. Species which flower upon spurs and the ripened shoots, should be pruned when they have ceased to flower. Only the thinning-out of shoots may be done now.

SHU-LANG ROOT.—The *Kew Bulletin* for September includes an interesting account by Dr. Augustine Henry of the Shu Lang root (*Dioscorea rhipogonoides*) of China. The species, we learn, was first discovered in Hong-Kong by Mr. Ford, and is known to occur plentifully in the mountains of Formosa, whence, brought down to the coast, it is used by fishermen for dyeing and tanning their nets. In China also it is extensively used as a dye, being known as the "dye-root," or "dye-yam," and employed for dyeing coarse native cotton cloth, fishing-nets, grass-cloth, and certain kinds of silk. Dr. Henry further remarks that:—"The lately-opened Customs station on the Kwaugsi-Annam frontier, Lungchow, is at present the seat of the trade." The Customs Trade Reports on that port for the years 1889 and 1891 also allude to *Dioscorea*:—"The principal article imported into Lungchow in 1889 was Shu-lang . . . (over 200 tons, value £1100). It is a tuberous root, growing wild in the hilly districts of Toankin. It is now to a certain extent cultivated, but cultivation, strange to say, deteriorates the quality. It is usually gathered in spring and early summer, and is sent from here down the west river to Canton, where it is used to dye cloth that peculiar reddish-black colour one so often sees in the South."

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	OCT 21	{ Highly Important Unreserved Sale of exceptionally well-grown Nursery Stock, at the Nurseries, Sunningdale, by Order of Mr. Chas. Noble, by Protheroe & Morris (six days). Dutch Bulbs, at Protheroe & Morris' Rooms. Plants from Belgium, Roses, &c., at Protheroe & Morris' Rooms.
TUESDAY,	OCT 22	{ Dutch Bulbs, at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY,	OCT 23	{ Dutch Bulbs, at Protheroe & Morris' Rooms. Ninth Annual Great Fruit Tree Sale, at Perry Hill, Cliffe, near Rochester, by Order of Mr. W. W. Horne, by Protheroe & Morris. Ornamental Shrubs, Lilies, Spireas, Roman Hyacinths, &c., at Stevens' Rooms.
THURSDAY,	OCT 24	{ Dutch Bulbs, at Protheroe & Morris' Rooms. Plants from Belgium, at Protheroe & Morris' Rooms. Great Unreserved Sale of Nursery Stock, at Hollamby's Nurseries, Groombridge, by Protheroe & Morris (two days). Orchids in Flower and Bud, Imported, and also from a Private Collection; also Dutch Bulbs, at Stevens' Rooms.
FRIDAY,	OCT 25	{ Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	OCT 26	{ Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—48°4.

Madagascar. WITH the fall of Antananarivo the French are complete masters of Madagascar, a result generally admitted, even by the enterprising traders of other nationalities, that should not only be advantageous to the islanders themselves, but also to the world at large. Wisely administered, there should be a great future for Madagascar in the development and utilisation of its natural resources, and, primarily, of its enormous vegetable wealth, which, under native government, has been sadly wasted. If early and persistently-continued exploration and investigation count for anything, then assuredly the French have a better claim to domination in the island than any other nation. After the abandonment of the island by the Portuguese, the French attempted colonisation, the first attempt dating as far back as 1642. DE FLACOURT (Flacourtia), one of the earliest governors, writing in 1658, declares that *Madagascar est un pays qui possédait tout ce qui est nécessaire à la vie et pourrait se passer de tous les autres.*

DUPÉTIT THOUARS, and COMMERSON are well-known names to botanists among the French explorers. The latter made large collections, but published nothing; whilst the former described and figured many of the curious and peculiar plants of the island, including a volume devoted to the Orchids of Madagascar, Mauritius, and Bourbon. This contains figures of upwards of 100 species, among them several of the finest *Angræcums*.

There were also issued, with this, six coloured folio plates, two of them representing *Angræcum sesquipedale*. The same author made known the singular *Ouvirandra*, and the familiar *Stephanotis*. ADANSON had previously described the celebrated *Ravenala*, and SONNERAT figured it in the narrative of his voyages to the East, early in the last quarter of the last century.

The British also had not been idle in relation to Madagascar. RICHARD BOOTHBY, a London merchant, visited the island about 1644, and wrote a glowing account of its productions. In consequence, an attempt was made to establish a factory at St. Augustine's, but after a two-years' struggle against the natives and climate, it was abandoned.

In 1815, the English Governor of Mauritius formed a settlement at Port Luquez, in the extreme north-east; and this also proved disastrous. But shortly after that date the first English missionaries established themselves in Madagascar, and from that time down to the present they have continued their labours under many vicissitudes, with varying success, and not without interruptions. They have not confined themselves to the conversion of the natives to Christianity: they have laboured at their general education, practical and mental; and they have done, among other things, much towards making known the flora of the country, both by sending home living plants and seeds, and dried specimens. Indeed, it is almost entirely through missionaries that we in England have obtained our knowledge of Madagascar, its people and productions. Foremost comes the Rev. W. ELLIS, the author of *Polynesian Researches*, a *History of Madagascar*, and other books. It was he who first brought to England living plants of *Ouvirandra fenestralis* (*Bot. Mag.*, t. 4894), and subsequently introduced *O. Bernieriana* (*Bot. Mag.*, t. 5076). Horticulture is also indebted to him for *Angræcum sesquipedale* (*Gard. Chron.*, p. 253, April 11, 1857, when the original account of the plant found place in our columns), which first flowered in his own garden at Hoddesden, Herts*; *Grammatophyllum Ellisii* (*Bot. Mag.*, t. 5179), and several other remarkable plants. Many other members of the pioneers of Christianity in Madagascar deserve mention for their exertions in the cause of science, but space will not permit. Yet there is one who has consolidated† the results of his predecessors and contemporaries in the same field whom we cannot pass over. His work is specially valuable for the local information it contains, and as a summary of Mr. J. G. BAKER'S numerous papers on the collections made chiefly by English missionaries within the last twelve or fifteen years. He roughly estimates that 50,000 square miles, or about one-eighth of the country, is clad with forest. But he goes on to say, that every year thousands of acres of trees are burned, to provide ashes as manure for a mere handful or two of Beans, and a few cobs, or a little Rice to be grown in the clearing. Moreover, young trees are extensively used to form stockades around the villages. In one village alone he counted 10,000 trees used in this way; and in another place no fewer than 25,000 trees had been sacrificed to make a road to remove a tombstone from the quarry! During the last twelve years the French have been equally active in collecting, and the collections have been worked out principally by the late Dr. H. BAILLON. The publications include a

* See *Gardeners' Chronicle*, 1857, p. 253, with a figure; and *Botanical Magazine*, t. 5113.

† "The Flora of Madagascar," *Journal of the Linnean Society*, xxv. (1859), pp. 246-291, by the Rev. R. Baron.

series of upwards of 300 magnificent quarto plates, representing as many peculiar plants of the island. It is estimated* that about 5000 species of Madagascan flowering plants are represented in the herbaria of Europe, and that they belong to about 1000 genera and 144 natural orders. Contrary to the expectations of some naturalists, the flora is very similar to that of tropical Africa, having many elements in common, and exhibiting no greater peculiarities than distant parts of the Continent. Readers of this journal may be referred to several articles on Madagascar published in these columns in 1874 and 1875, from the pen of Captain OLIVER, an authority on the geography and products of this island. The illustrations now given, figs. 80 and 82, are from his pencil.

THE fourth part of the monumental production known as the *Index Kewensis*.

Kew Index has just been issued, and with it the work is terminated. We may remind our readers that it is a list of all the properly-authenticated names of flowering plants published since the time of LINNÆUS to the year 1885. It has been compiled by Mr. B. DAYDON JACKSON, under the direction of Sir JOSEPH HOOKER, and at the expense of the late CHARLES DARWIN. Daily use has shown us how extremely serviceable the book is to workers, and it has also proved with what care the laborious undertaking has been carried out.

The expert botanist will readily appreciate the nature of the book; but it may be desirable to remind those who only make casual reference to it, that it is no more than it pretends to be—an index of names and references. The precise value and significance of each particular reference must necessarily be left to the student to determine. All that we can expect is consistency and correctness of entry and of reference, and these the unwearied patience of Mr. JACKSON and the supervision of Sir JOSEPH HOOKER have secured. Under the circumstances just mentioned, any elaborate explanation is perhaps not needed. Nevertheless, we had hoped that some explanation of the principles upon which the list has been compiled would have been afforded us. We should have liked to know, for instance, why one name is inserted and another rejected; for these particulars we must now look to some article of Mr. JACKSON'S in the *Journal of Botany* and elsewhere. Many garden names given without adequate descriptions or figures, and liable to change in the hands of commercial speculators, and those which are ephemeral, or speedily rendered nugatory by the death and extinction of the plants—are, of course, not inserted. For garden purposes, however, some of these names would occasionally be useful as historical evidence, and it would be a boon to have them published in some form. Of much greater importance, however, is the necessity for supplementary volumes, bringing the list of authenticated names up to date, and these we shall hope to see in due time. Some means should also be taken to testify the gratitude of workers towards the compilers of this work, and thus fitly commemorate its conclusion.

BRUNSVIGIA JOSEPHINÆ.—This plant is one of the ornate large-growing South African bulbs, and very striking, with its massive pseudo-bulbs covered with numerous silky tunics, and bearing in the season of vegetation broad, lorate, glaucous-green leaves. The only thing to be said against the plant

* W. B. HEMSLEY, in *Science Progress*, iii., pp. 447-475.

as cultivated in gardens is that it has not generally flowered freely. But in the hands of those who study the requirements of the species of Amaryllids, which are natives of hot, sandy plains, a reasonable amount of success is attained, and especially in very warm, dry summers. The plant makes a noble show, with its tall, stout scapes crowned with bright red flowers. The chief points to be observed in the culture of *Brunsvigia* is to withhold water early in the season, and when the leaves begin to

wither, for we have seen the species under notice in flower at Kew and several other places. One of the best examples was that exhibited by Mr. R. B. Lowe, gardener to Earl Brownlow, Ashbridge Park, at the Royal Horticultural Society on August 13 this year, and which was much admired, and from which our illustration (fig. 81) was taken (see *Gardeners' Chronicle*, August 17, p. 191). It is a very old inhabitant of gardens, and it is recorded that the first bulb to flower was purchased by the

satisfactory sale resulted. The principal things in demand seemed to be some splendid plants catalogued as *Cattleya* species, but which were evidently of the *C. Warszewiczii* type, than which no handsomer plant could be desired. Good healthy specimens of the many, fine, named forms of *Lælia purpurata* which emanate from the Brussels firm, and equally good plants of their noted *Lælio-Cattleyas* of the L.-C. \times elegant class were also offered; and the fine *Sobralia Lindenii* which we noted in a recent issue, and the singular and pretty *Zygopetalum Jorissianum* found favour with the purchasers, if we may judge by the good prices at which they were knocked down. If Messrs. LINDEN continue to offer none but really first-class plants as on this occasion, the success of the venture should be assured.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The monthly meeting of this Society was held at 25, Werdgate Road, on Tuesday, October 8, Mr. JOHN BULLOCK taking the chair. Mr. LAWSON, Heatthdale, Gosforth, exhibited a collection of twenty-two varieties of exotic Ferns, in admirable condition; and Mr. W. LARKE, Northdene, Gateshead, showed blooms of *Chrysanthemums*. An excellent paper on the cultivation of fancy *Pelargoniums* was read by the chairman, in which he recommended cuttings struck in the spring for making the strongest and healthiest plants. An interesting discussion followed, in which many took part.

MARKET REPORTS.—It is so exceedingly rare to receive a letter like the subjoined, and so exceedingly common to receive others of exactly opposite tenor, that we have great pleasure in publishing it:—“Will you pardon me saying your Covent Garden prices are a long way from accurate. Last week I note Peaches, 6s. to 8s. a dozen, and I may say—the very same day I realised 15s. at MUNRO'S, Covent Garden. R. GILBERT, Burghley Gardens, October 9.” We must repeat that the prices quoted are not exceptional ones, but averages for the week.

COMPLIMENTARY DINNER AND PRESENTATION.—On the occasion of Mr. CLIFFE leaving Shoreham Place to take charge of Lord EGERTON'S garden, Tatton Park, Cheshire, a few friends entertained him at dinner at the George Inn, Shoreham, on the evening of Friday, October 4. Mr. CLIFFE was afterwards presented with a handsome marble clock with inscription, as a mark of esteem.

THE ARNOLD ARBORETUM.—By an arrangement recently concluded between the President and Fellows of Harvard College and the city of Boston, important additions have been made, says *Garden and Forest*, to the Arnold Arboretum. These include two parcels of land with an area of about 20 acres within the boundaries of the original Arboretum, but reserved by the city for its own uses when it was established; two pieces of land with an area of about 3 acres on the north-west border of the Arboretum, and purchased by the city last year; a piece of land, the property of Harvard College, south-west of the old Arboretum, with an area of 67 $\frac{1}{2}$ acres; this consists of a high, rolling, grassy hill, the second highest land in the city of Boston. From the summit of this hill fine views are obtained; the wooded portions of the Arboretum lie at its base; to the south all the Blue Hill range is in view; the waters of Massachusetts Bay are seen to the south-east, and to the north and west a broken well-wooded country. With these additions the area of the Arboretum is 222 $\frac{1}{2}$ acres; 2 $\frac{1}{2}$ miles of drives have been finished and planted, and under the new arrangement the city of Boston is to construct 1 $\frac{1}{2}$ miles of additional roads. Among the scientific gardens in the United States and Europe, only the Royal Gardens at Kew, with an area of 251 acres, exceed the Arnold Arboretum in size, and it is probably safe to say that no other scientific garden of such an area is so accessible to the people of a great city or possesses such a diversified surface and such advantages in the way of natural woods. The Arboretum lies entirely

FIG. 81.—BRUNSVIGIA JOSEPHINE: FLOWERS DEEP RED. (SEE P. 460.)

wither, to place the bulbs in a sunny situation, either in full sunshine out-of-doors or in a frame or greenhouse, to be thoroughly dried and kept in a dry state till the flower-spikes appear, which will take place in advance of the leaves if the plant is going to flower. But if the leaves appear and get well advanced, and no flower-spike appears, it is reasonable to conclude that the bulb will not flower that season; and the plant should be liberally watered and grown on until the leaves again wither, when, if kept dry, as before-mentioned, it will, in all probability, reward the cultivator with its gorgeous display of bloom. The present season seems to have been a favourable

Empress JOSEPHINE in Holland, and on its flowering in the garden of Malmaison, it was named in honour of her.

LINDEN'S ORCHID SALE AT STEVENS' ROOMS.—On Thursday, October 17, Messrs. LINDEN, L'Horticulture Internationale, Parc Leopold, Brussels, commenced the series of Orchid Sales announced to be held at Mr. J. C. STEVENS' Rooms, 38, King Street, Covent Garden, and certainly the splendid quality of the plants sent was worthy of the occasion. There was a fair attendance in the Rooms, and with the aid of the numerous commissions held by the auctioneer a fairly

within the limits of the city of Boston, and is not more than 4 miles from the centre of population, being easily reached by one line of railroad and by two lines of electric cars, while the parkway which unites the different parks of the City Park System, starting from the Public Garden, in Arlington Street, in the heart of the residential quarter of the city, skirting the town of Brookline and enclosing Jamaica Pond, forms its eastern boundary and connects it with Franklin Park beyond. By this parkway the distance from the Common to the Arboretum is 6 miles.

THE EFFECTS OF THE FROST AND DROUGHT ON BRITISH MEDICINAL PLANTS.—The intense and lengthened frost of last winter, followed by the extreme drought of the early summer, are showing as the months roll round, that the devastation has not been confined to garden crops. One branch of British culture, about which little is perhaps generally known, is the growth of medicinal plants, which are now for the most part cultivated at Hitchin, Bodicote, Mitcham, and in Lincolnshire. A most interesting report on the state of these crops was recently given in our contemporary, the *Chemist and Druggist*, from which we gather the following facts. From Hitchin, Messrs. RANSOM & SON reported that Lavender will be the shortest crop that has been gathered for many years. A temperature of 0° Fahr. which occurred at Hitchin and many other parts of the country, proved fatal to the greater number of the older plants, and whole fields which last year appeared promising have been cleared and planted with other crops. The young plants, though in fairly good condition, are estimated to produce but very little flower this year. Peppermint suffered severely from the dry weather, the plants being short, and the yield of oil per acre being therefore considerably below the average. Rosemary, which is described as the most delicate of the cultivated Labiatae, was almost entirely destroyed by the frost. Belladonna promised well in the early part of the season, and a large crop was anticipated; the drought, however, diminished the growth, and the prospects of a good crop accordingly. The old plants of Euterpe were said to be nearly all killed by the severity of the winter, but young plants were abundant, and the field of fruit, although late, was anticipated to be fairly good. Henbane was reported to vary much in different localities; in damp, low-lying situations about Hitchin there have been heavy crops, but in dry situations the yield has been very deficient. At Bodicote, near Barbary, it is said that the winter killed at least two-thirds of the second biennial Henbane, and as much of the Belladonna; the only bright picture of the medicinal plants in that locality is stated to be Ranunculus, which has done remarkably well. From the Mitcham district the report states that it would be necessary to go back more than ten years to find a season so disastrous to the cultivation of Mint, Lavender, and Rosemary; the runners of the Peppermint plants were frozen, and the succeeding drought completed their destruction. Of Lavender, twenty-five per cent. of the young plantations were killed by the frost, and the remaining three-quarters having also suffered, only half the usual harvest was expected. Camomiles seem to have stood the winter, and on the termination of the cold weather the plants assumed a healthy appearance, and a good crop was almost certain.

GRASSES OF TENNESSEE.—The Agricultural Experiment Station of the University of Tennessee, has published a *Bulletin* containing full descriptions and illustrations of all the grasses of that State. As none of the species is peculiar to the State, this handy manual, prepared by Mr. F. LAMSON-Scribner, will be of great service to botanists and agriculturists throughout the North-eastern States generally. Mr. F. LAMSON-Scribner is "Agrostologist" to the United States Department of Agriculture at Washington. It will be some time before we are sufficiently advanced to have such officers in our Agricultural Department.

FRUIT PRESERVATION IN TRANSIT.—We take the following from the *Yorkshire Daily Post* of October 3, 1895:—The latest experiment in fruit preserving is decidedly novel. Sir SAUL SAMUEL the Agent-General for New South Wales, has just received at his London office a parcel of fruit despatched from Sydney at the end of July, which has been preserved in transit not in an ice chamber, but by an innocuous coating which excludes the air and arrests decay. The exact nature of the preparation is not disclosed, but it would appear to be something of the nature of collodion, and Oranges, Lemons, and Pine-apples, by being simply dipped in it, are coated with the preservative, which easily peels off, and is said to cause no deterioration in the quality of the fruit. Of course, only hard fruit can be thus treated, and at present the method is in the experimental stage, but its development will be watched with interest, in view of the large trade which has sprung up with New South Wales and Australia generally in fruit for winter and spring consumption in England.

IMPORTED PLANTS AT SANTA BARBARA.—We have received from Dr. F. FRANCESCHI his brochure, entitled *Santa Barbara Exotic Flora: a Handbook of Plants from Foreign Countries grown at Santa Barbara, California*. This descriptive catalogue of plants speaks well for the climate of their new country, as natives of such diverse climes there do well and flourish. Due tribute should also be paid to the enterprise of the planters, who, for various utilitarian purposes, have succeeded in acclimatizing so many valuable species; and also to Dr. FRANCESCHI, whose careful Handbook should serve both now and in the future to prove what has been done, and what may yet be accomplished in this direction.

"HORTUS FLUMINENSIS."—SENOR J. BARBOA RODRIGUES has published, under the above title, a brief account of the Botanic Garden of Rio de Janeiro, compiled to serve the requirements of visitors. It is written in the Portuguese language, and contains a brief history of the garden. The existing establishment dates from 1808. A descriptive list of the principal species cultivated, arranged under the natural orders up to Compositae, is given, and some photographic illustrations, serving to show the beauty of this renowned garden. The famous Palm avenue was planted in 1843.

ROSES.—The publication of an eighth edition of Mr. WILLIAM PAUL'S book on *Roses and Rose Culture* is in itself proof of the utility of the work. We can therefore heartily commend it to such of our Rose-loving readers who do not already avail themselves of the instructions contained in it. The publishers are SIMPKIN, MARSHALL, HAMILTON, KENT, & CO.

PRESENTATION.—On Saturday afternoon, Oct. 5, a deputation of the Chippenham Horticultural Society waited on the president, JOHN GLADSTONE, Esq., at Bowden Park, and presented him with a Silver Medal in commemoration of the silver anniversary of the society. The medal, which was richly embossed and inscribed, was presented by Mr. A. WRIGHT, the secretary, and suitably acknowledged by the recipient.

MISSING LINKS.—Commenting at the late meeting of the British Association at Ipswich, on the botanical work of the late Professor WILLIAMSON, of Manchester, Dr. SCOTT showed that the Calamariae were allied to Equisetaceae but possessing a cambium as in existing Dicotyledons and Gymnosperms. The Sphenophyllae have no living representatives; the Lycopodiaceae were represented by Sigillariae and Lepidodendron, which, however, possessed cambium. The Lyginodendreae consist of plants with the foliage of Ferns, but, according to the report in *Nature*, with stems and roots resembling those of Cycads. In this connection the existing Stangeria is of interest.

PANGIUM EDULE.—The poisonous principle of this plant has been shown to be hydrocyanic acid. Dr. TRUB, the Director of the Botanic Gardens at

Buitenzorg, is of opinion that hydrocyanic acid is one of the first substances in the manufacture of proteids, and the first visible result of the absorption of inorganic nitrogen.

CAMBRIDGE UNIVERSITY.—We learn that the library and herbarium of the late Professor BABINGTON have been bequeathed to the University. The fine collection of shells made by the late Miss SAUL has also been left to the University.

GYNERIUM JUBATUM.—Mr. W. E. GUMBLETON obligingly sends us a spike of this species, which in its alky lightness, and the silvery lustre of its florets, exceeds in beauty the ordinary form. Mr. GUMBLETON tells us that it is less hardy than the other species. *Gynerium jubatum* is a native of Ecuador, and was first noticed in the *Revue Horticole*, 1878, p. 449.

"CIDER."—This is the title of a new illustrated monthly journal devoted to the interests of cider and perry, and is the official organ of the National Association of Cider Makers. Director and editor, E. SAMSON; publishing office, 15, Lincoln's Inn Fields. The subject-matter of this magazine is explained by the title, and will prove of interest to growers, vendors, and sellers of Apples, as well as to those immediately connected with the manufacture of cider. The price of the magazine is sixpence, and it is composed of two dozen clearly-printed pages, interspersed here and there with an illustration.

"THE CASE AGAINST BUTCHER'S MEAT."—A pamphlet has been sent us which bears this name, and is written by Mr. CHARLES W. FORWARD (London: The Insurance Publication Dept., 6, Dorset Street; Ideal Publishing Union, Memorial Hall; and Manchester: Vegetarian Society, 9, Peter Street). This small book warmly advocates a non-flesh diet, and in it the author argues out to his own satisfaction many reasons, based on considerations of health, humanity, and morality, why a diet of butcher's meat is wrong for mankind.

MEAD AND HONEY.—*Mead, and How to Make It, and Honey and its Uses*, are the titles of two small pamphlets by the R-V. GERARD N. BANCES, published by PERAY & SON, Dartford and Ludgate Hill. The author recommends mead, when properly made, to the consideration of all connoisseurs, and he quotes the opinion of former generations as confirming his own. Several recipes for preparing mead carefully and satisfactorily are given. The leaflet on honey speaks highly of its dietetic and other virtues, advises the use of it warmly, and also gives receipts for various dishes, which include this dainty. The author writes clearly, and to the point.

FIRE AT AN EDINBURGH NURSERY.—A fire took place last Thursday at the nursery of Messrs. R. B. LAIRD & SONS, Pinkhill, Murrayfield. The fire was confined entirely to the office, and Messrs. LAIRD are afraid some of their autumn orders have been destroyed, and would feel obliged by their friends who may read this paragraph kindly repeating any orders they may have given for autumn or spring delivery.

LEMONS.—A writer in a morning contemporary this week makes mention of a fine consignment of Lemons just arrived from Australia, and grown on the estate of the Australian Irrigation Company, remarking that this afforded an indication of what our Australian friends could do in filling up what would otherwise be a lemonless period. It so happens, however, that there are just now some very good samples of Neapolitan and Palermitan Lemons on the London market at a fairly moderate price. Our Italian friends have been slow to move, but we fancy they are pretty well alive to the advantages accruing to being first on the market, either in Manchester or London.

THE LUTOVKA CHERRY.—Among the new or little-known Cherries received at this station in recent years, the Lutovka is one of the most promising of the late sour varieties. It was imported

from Europe about twelve years ago by Prof. Budd of Ames, Ia., who says that it is much grown in Poland and in Silesia, as a road-side tree. It was first planted at the station in 1883. So far as observed, it is not catalogued by any nurseryman, although it is grown to some extent in western nurseries. It appears to be worthy of extended trial as a late sour Cherry. Description—tree of Morello type, a vigorous grower, young branches rather slender; fruit firm, good quality, sprightly acid, as large as English Morello or larger, more nearly round, very similar to that variety in colour, but the flesh is not so dark as that of English Morello; clings tenaciously to the long stem. So far as tested here the tree has proved to be very productive, ripening its fruit as late as, or later, than the English Morello. *N. Y. Agricultural Experiment Station, Geneva, N. Y.*

RARE TREES OF WEST PRUSSIA—Herr CONWENTZ, in the *Abhandlungen zur Landeskunde der Provinz West Preussen*, heft. ix., 1895, publishes an account with figures of certain rare trees, including *Pirus torminalis* and *P. suecica*, the distribution of which through neighbouring countries is given. Under the head of *Picea excelsa* (Spruce), an account is given of various curious forms of this species, such as the Weeping Spruce, the Columbar Spruce, and of one very curious form in which the upper branches are deflexed and appressed to the stem, whilst the lower ones are spreading.

DIASTASE IN FOLIAGE LEAVES.—Professor J. REYNOLDS GREEN, in a paper read before the British Association, gave an account of a series of experiments he has been conducting on the diurnal variation in the amount of diastase in foliage leaves. From this it appears that there is more diastase present in a plant in the morning than in the evening, and to account for this fact it has been stated that the diastase is utilised for the conversion of starch, but this theory is opposed to the view that enzymes do not diminish in quantity. The author's experiments were carried out on diastase in solution and on actual leaves. In the first instance it was noticed that on exposure to the electric arc light or sunlight, 75 per cent. of the diastase was destroyed. Leaves of one of the Leguminosæ were employed for the latter experiment. They were gathered in the morning, and kept in the dark until used, when half of the blade was shaded, whilst an arc light was brought to bear on them for nine hours. It was then found that 10 per cent. of the diastase was destroyed, which proportion was increased to 20 per cent. if exposed to sunlight. It will therefore be seen that the amount destroyed is greater in the solutions than in the living leaf, and this is accounted for by the fact that the proteids in the cells have a protective action. *Pharmaceutical Journal*.

JAPANESE MATTING.—The demand for Japanese matting, probably made from the culms of *Lepironia mucronata*, appears, from a recent report from Hirgo and Osaka, to be still increasing. The progress made in the manufacture of this article is more and more noticeable each year, the export for 1894 amounting to over 277 000 rolls of 10 yards each, against 227 000 in 1893. The chief demand comes from New York, and the quantity carried to that port by sailing vessels alone amounted to over 170 000 rolls, being an average of over 12 000 rolls per vessel, which shows what an important factor as regards freight this industry has assumed. New designs of matting are constantly being invented by the Japanese, while the workmen are very ready to execute orders based on patterns received from foreign countries, so that the number of styles now available to the exporter are almost unlimited. The crop of Rush from which the matting is made was particularly good and abundant during the year, and the result has been that the trade proves capable of great expansion without any important change in prices, to the considerable advantage of both the Japanese and foreigners engaged in it. To all appearance, the demand for floor matting is likely to increase in the future.

ACTION OF SULPHURETTED HYDROGEN ON PLANTS.—M. H. BARNOUVIN has carried out some experiments which confirm those previously recorded by M. MORREN. Strawberry plants in full leaf were exposed in the one case to the action of sulphuretted hydrogen gas accompanied with free exposure to the atmosphere, whilst in the other the plant was covered with a bell jar during the experiment. As a result, it was noticed in the first instance that after the gas had been allowed to diffuse through the atmosphere for several days the leaves became covered with yellowish spots, and then withered and rotted, but the plant recovered its normal appearance slowly if removed to a pure atmosphere. If, on the other hand, the gas acted on the plants in a confined space, the effect was much more marked, as in twenty-four hours' time all the leaves assumed a brown colour, and shortly afterwards blackened, withered, and died off, and no subsequent removal to fresh air was able to restore the plant. M. BARNOUVIN concludes, therefore, that the action of sulphuretted hydrogen on plants is directly analogous to its action on animals (*Rép. de Pharmacie*, vii., 336) as "*Pharmaceutical Journal*."

BOOK NOTICE.

BIOLOGY NOTES.

Under this title Mr. Houston has got together the monthly series of notes on biological matters, issued for the benefit of the students receiving technical instruction under the auspices of the Essex County Council. Some of these students are destined to become teachers in the future, and we have before noted the very careful and thorough training they receive in botany, zoology, and the sciences, on which agriculture and horticulture depend. Illustrations of the methods of tuition adopted, whether for elementary or more advanced pupils, are given in the present volume, and will serve as excellent examples to others desirous of carrying out a similar scheme. The main feature is to make the pupil verify, as far as possible, for himself everything the teacher tells him, and then to induce him to make further research for himself. The laboratory at Chelmsford is not only a teaching centre, but it is, as we see from the volume before us, becoming the source whence information on plant-diseases, weeds, &c., is disseminated among the cultivators of the county. Those of us, who, from knowledge of what has been done for years in Belgium and Germany in this way, have earnestly advocated the adoption of similar methods here, must feel gratification at the thorough way in which the subject is being taken up by the Essex County Council and other similar bodies. Instruction in technical details and manual performance is of primary importance no doubt, and in many cases is all that can be done, or even aimed at. It is evident, however, that unless an adequate knowledge of general principles be superadded, there is no chance of making any real progress, or of turning out better practitioners than our forefathers were. The proceedings at the Summer School of Horticulture have already been detailed in full in our columns, so that now we need only congratulate the Council on the judgment, zeal, and energy displayed by their staff-lecturer.

HOME CORRESPONDENCE.

BOUGAINVILLEA SANDERIANA.—I have on three or four occasions during the past season seen Mr. James Cypher, of Cheltenham, show a fine specimen of this form, and when well-coloured it constitutes a striking contrast to *B. glabra*. The bracts are of a dark tint of mauve-purple; and in the case of Mr. Cypher's specimen, bracts and foliage alike were smaller, though it was a fine example of high culture. But as an effective exhibition plant it did not appear to me to equal *B. glabra*. When the latter is vigorously grown, and the large lustrous mauve bracts are bright in colour as well as numerous, it is a superb exhibition plant, and the first to catch the eye in a collection. I am afraid some exhibitors

make the mistake of starving the plant in order to get it into flower, with the result that the foliage is small and the lower branches bare of leaves. To see as one sometimes does a specimen of *B. glabra*, bare of leaves at the base and back, though there may be a good deal of colour at the top, is to cause one to regret that the treatment meted out to the plant was not more generous. *B. Sanderiana* is so distinct in character that it can be shown as Mr. Cypher had it at Tatton in August last, in the class for twelve varieties of stove and greenhouse plants in flower, he having also a fine example of *B. glabra*; but if species were required it might raise the question as to whether *B. Sanderiana* is really a distinct species, although it is, I believe, claimed as such. *R. D.*

FRUITING OF DOUBLE PEACH.—We would like to know if it is not unusual for the double-flowering Peach to produce fruit of a good size, and excellent flavour, out-of-doors? This has been our experience, and also that of one of our customers, whose tree is about ten or eleven years old, our trees being young nursery stock. It may have been the exceptional season, but the experience is new to us. *Carter Page & Co.*

CHOU DE BURGHEY.—I have grown this variety of Cabbage, or Cabbage-Broccoli, as it is usually called, for a number of years, but have not, so far, been able to add the surname "Broccoli" to it, failing to discover the slightest trace of a miniature Broccoli enveloped in the leaves, as advertised. Whether the fault rests on my inability to give it the proper treatment, or that I am not supplied with the genuine seed, I am at a loss to know. The outward appearance is very similar to the Sugar-loaf Cabbage, but I find it differs from any other Cabbage in point of flavour when cooked, being, to my estimation, quite equal to the Brussels Sprout, especially to the sprouts that spring from the base of the stem after the head is removed. Anxious to obtain its full value, I have grown it to come in at different seasons, to ascertain if any Broccoli heads would form, and have let it remain uncut until very late in the spring—but all to no use. Perhaps Mr. Gilbert, the raiser, will kindly let me know what time of the year they should be planted, and how long a time they should grow before a head of true Cabbage-Broccoli forms. *W. Jones, Aston Bank, Hawarden.*

VERBASCUM CHAIXI AND RUDBECKIA NEWMANI.—On looking through the fourth and last volume, just issued, of *Index Kewensis*, I note one or two things of general interest to amateur gardeners. First, a plant very often mentioned in gardening journals, *Verbascum Chaixi* (Villars), is declared to have no separate existence, but to be identical with our native *V. nigrum*. Also another very tall perennial, Mullein, about which gardeners write sometimes as *V. Chaixi*, sometimes as *V. vernale* (Wierzbick), sometimes as *V. Wierzbickii* (Heuffe), has lost all these three specific names, and is merged in *V. nigrum*, of which E. Boissier always declared it to be a hybrid. Then we have *Rudbeckia Newmani* (London), distinguished from *R. speciosa* (Wenderoth), though no name like *Newmani* is attached to any species of *Rudbeckia*, even as a synonym, in Asa Gray's *Flora of North America*; and we must hence conclude that *R. Newmani* (London) is unknown to American botanists, and that one of these two species is unknown in English gardens, where the two names have hitherto been considered synonymous. *C. Wolley Dod, Edge Hall, Mapes.*

TRIALS AT CHISWICK.—Your correspondent, "A. D.," says, at p. 336, "a recent wrangle over the nomenclature of a *Ban*, with a purposeless result, led to the statement being made on behalf of Chiswick Gardens, that not everything sent there for trial is tried. That such is the case," explains "A. D.," "is due first, to lack of space; and second, to there being no trial of the particular products taking place that season. There is," he writes, "a general assumption in the country that anyone may, unsolicited, send anything at any time to Chiswick to be grown for trial, quite oblivious of the fact that one thing grown does not constitute a trial, but that real tests of value are found only when the best representatives of any one product are grown along with new comers." Adding, "it was doubtless under these conditions that the *Ban*, the unfortunate object of a sharp discussion recently, was, in 1885, put on one side at the time, and was, with many other things, probably relegated to the dustheap after the seed had become sterile." I should like to know whether the above statement has been made

with the consent and by the authority of the Royal Horticultural Society, because if not, it would be unjust to censure it for statements made by irresponsible persons. However, I may be allowed to say that "A. D." assumes too much in writing of the "general assumption" prevailing in the country, &c. "A. D." in his support of the statement "that everything sent to Chiswick for trial was not tried," for the reasons, he asserts, rightly or wrongly, (1), that there was not space, and (2) to there being no trial of the particular product taking place that season! The Royal Horticultural Society may well exclaim, 'save us from our friend 'A. D.!' How could there possibly be a trial of the particular product taking place that season? seeing that my Climbing Canadian Wonder French Bean was the only "Climbing French Bean" heard of (except by visitors to Longford Castle Gardens), or submitted to Chiswick for trial before the above-mentioned date (April 9 1885), or for six years later, when Messrs. Sutton's Tender-and-True made its appearance. This is the annihilation of reason No. 1, and the same fate awaits reason No. 2. As it is not by any means reasonable to suppose for one moment that space would not or could not be found in our national trial-garden for a short row of a novelty, namely, a French Bean bearing the written reputation of attaining to (at the time) a hitherto unheard of height—7 feet—and heavily laden from bottom to top of bine with Canadian Wonder-like Beans of the finest quality. I repeat, is it at all likely that a novelty of the description indicated would be refused a trial in the trial-gardens of the Royal Horticultural Society on the shallow grounds mentioned by "A. D.," or that the fact of its not having been afforded a trial at Chiswick Gardens could reasonably and satisfactorily be accounted for by the explanation elicited by the Fruit Committee at Chiswick on Sept. 10, to the effect, "we do not always try everything that is sent us for trial at Chiswick." An admission which, under the circumstances, naturally provoked a pardonable expression of opinion from the person responsible for the introduction of the Climbing French Bean—an opinion which was entirely retrospective in its application, and, therefore, did not in any way apply to the present Fruit Committee or management of the Royal Horticultural Society's affairs. However, one thing I venture to think the Fruit Committee might have done on the occasion referred to, without in any way compromising itself or doing anything other than a just act, namely, recorded the fact that that body was quite satisfied, judging by the official receipt of the Royal Horticultural Society, that my Climbing Canadian Wonder French (now Veitch's) Bean had been sent to the Royal Horticultural Society's gardens for trial at Chiswick six years before Tender-and-True was heard of. This much, I respectfully assert, was within its legitimate province to do. In conclusion, I should advise "A. D.," who is ventilating the Climbing French Bean subject in all the horticultural papers, to let the matter rest now. In fact, I fail to see in what way he should consider it incumbent on him to take such a prominent part as he has done during the last twelve months in the fate of the two Beans in question, but always, be it observed, advocating the claims of one to the detriment of the other. *H. W. Ward.*

HELENIUM GRANDICEPHALUM STRIATUM—A yellow Composite, with striped flowers, having started from Ware's nursery a few years ago, is now becoming common in gardens under this very objectionable name. The plant is nothing more or less than *H. nudiflorum* of Nuttall. The striped ray, very globular head, brown-purple disc, and pointed receptacle distinguish it from all forms of *H. autumnale*, to which it has been attributed by some. All these are characters of *H. nudiflorum*. See Asa Gray's *Flora of North America*. C. Wolley Dod, *Edge Hall, Malpas*.

ROTATION OF CROPS—In answer to your correspondent, "D. T. E.," at p. 399 of the issue of the *Gardeners' Chronicle* for October 5, I admit the statement "that the Cabbage tribe will thrive upon land much too poor to grow a good crop of Onions or Carrots," requires some qualification. We have in this neighbourhood a field which, within the last ten years, has been let out in garden allotments. This field had been under ordinary arable culture, but had been sadly neglected, hence fouled with weeds of the very worst kind, and exceedingly exhausted of its natural fertility. For several years it was utterly impossible to grow a crop of either Carrots or Onions upon the land; but as the soil is gradually being enriched and ameliorated by careful

cultivation and manuring, these latter crops are now becoming more frequent. The Cabbage tribe thrives capably from the first commencement of the gardens. The explanation appears to me to be, that the Cabbage tribe, while they undoubtedly prefer an enormously rich soil, yet from their deeply rooting habit and robust character of growth, are able to draw upon the store of plant-food in the subsoil (the surface-food having become exhausted), and below the root-range of the more shallow rooting crops. Also this same power from deep-rooting, gave to the Cabbage a command of the water supplies of the subsoil not available to surface-rooting plants. Of course, the texture of the soil has much to do with the successful growth of any crop. While Onions and Carrots delight in a light free working soil containing a good supply of lime, the Cabbage tribe seems to do best on the stiffer classes of land, which on analysis show a large percentage of potash and phosphoric acid in the subsoil. These different descriptions of soil best afford to the roots of the different plants substances which enter directly into their structure. *J. J. Willis, Harpenden.*

WARE'S BEGONIAS.—Another roadside garden, but unlike the suburban one described at p. 431, is that consisting of 3 acres of land under tuberous-rooted Begonias in full bloom—a very valuable crop, the property of Mr. T. S. Ware, of Hale Farm Nursery, Tottenham. This is a branch nursery, and adjoins the road at Crook Lodge, Bexley Heath, about a mile distant from the town of Woolwich, on the Dartford Road. The plants number about 200,000, and they were a blaze of colour when I saw them, double and single-flowered varieties, of fine form and glowing tints. The novelties are kept in pots in the glass-houses. Mr. Pope, the manager of this nursery, is a specialist in Begonia, and he was moreover the raiser of the first hybrid tuberous-rooted Begonia of gardens, when employed at the Exeter nursery. This cross was obtained from *B. Veitchii* × *B. Pearcei*, and it has the brilliant flowers of *B. Veitchii* with the beautiful marbled leaves of *B. Pearcei*. This cross was named *B. Woodmanii*, in compliment to the late Dr. Wm. Robt. Woodman, who had just succeeded his uncle, the late Mr. R. T. Pince, in the proprietorship of the Exeter Nursery. *W. Napper, Chelsea.*

THE SEASON.—On Saturday last, the 12th inst., I was driven with some friends through the Epping Forest with a view to inspect the autumnal tints, but to my surprise the foliage of the trees was as green as in June or July. Perhaps some of your readers will be good enough to state whether such an abnormal state exists in other counties. It has been attributed to the absence of frost, but I doubt not horticulturists may be able to give other reasons. I spoke to a few people at Loughton close by, who never before remembered the forest remaining so green at such a late period of the year. In Leicestershire in August I saw in the garden of a friend an Apple-tree both in fruit and blossom, and I heard in Essex that persons there had witnessed the same thing. *C.*

PEPPERMINT CULTURE.—Messrs. G. & J. Miller, Mitcham, extensive growers of Peppermint for distillation, find—first, that Mitcham soil is almost the only soil about London that will grow this Mint profitably; and, second, that when a crop has been grown for four years, the ordinary time, that, so much is the soil exhausted of the constituent which produces the essential oil, that it is useless to plant the same ground under twenty years. Could it be shown what that needful constituent is, and whether it could be artificially supplied in any form of dressing? *A. D.* [Only by analysis.—*E1*].

THE CULTIVATION OF THE ENGLISH SHOW TULIPS.—It is both gratifying and encouraging to learn that the efforts which have been made during the last few years, to resuscitate in the south the cultivation of that fascinating florist's flower, the amateur's English Tulip, are meeting with so much influential support, so much so, that an annual Tulip Exhibition in London, in conjunction with the leading flower shows, may in the future be considered a settled question! The Tulip exhibitions held in London last year and this, could only be looked upon as successful, especially as the exhibitors had no choice as to the date of exhibition, and consequently, the Tulip blooms could not be shown in the highest state of perfection; they were, however, sufficiently attractive to call forth the admiration of all persons touched with the love of florist's flowers, and many were not surprised, after minute examination of their exquisite purity, shape, and

refinement in marking, that their fathers and grand-fathers should have been so infatuated in the cultivation of them. Money prizes, although not high in amount, were given, but the handsome Silver Medals awarded by the Royal Horticultural Society, and Messrs. Barr & Son, of Covent Garden, were highly appreciated by those exhibitors who were fortunate enough to win them. I understand that Messrs. Barr are still adding to their leviathan stock, feeling assured that the time is not far distant when the English Talips will be cultivated in the south by amateurs, as extensively as they are at the present time cultivated in the north. I have cultivated for nearly half a century, almost every description of florist's flowers, and I can reiterate sincerely what I have heard the late Doctor Hardy say on many occasions, "that of all the pleasures which can be derived from the cultivation of florist's flowers, none are so great and charming as those experienced by the growers of the English Show Tulip!" The time having now arrived for Tulip planting, amateurs who may feel inclined to give their cultivation a trial, should lose no time in obtaining a small collection, the price of which is a very nominal sum. *Jam's Thurstan, The Green, Cannock.*

VALE OF CLEVELAND POTATO.—When recently in Lincolnshire I inspected a plantation of early varieties of Potatoes grown to test their earliness and cropping qualities for market purposes. It has been stated that in the Boston district considerable breadths of early Potatoes are grown, the soil, position, and method of culture adopted favouring precocious ripening; and considerable sums are made by the growers by getting early produce into the various markets. Among the varieties tested are Vale of Cleveland and Sharpe's Victor, and I could detect no difference between them—in growth, in haulm, and in the shape and colour of the tubers. On making enquiries as to the origin of the Vale of Cleveland Potato, I found it was raised by the late Mr. Geo. C. Short, nurseryman and seedsman, Stokesley, who described it as a seedling raised from a cross between the Early Rose and the old Ash-top Kidney. The stock of this Potato was, it is said, sold to Messrs. Charles Sharpe & Son, in the early part of 1879, and shortly after Sharpe's Victor was put into commerce; and Mr. Short on testing Victor, pronounced it to be identical with his Vale of Cleveland. Assuming these facts to be correct, it will account for the similarity I observed in the trial above referred to. I think it is claimed that Victor was raised by Mr. R. Nisbett, for many years gardener at Aswarby Hall, Lincolnshire, and latterly at Cliveden, Maidenhead; and the question fairly arises—did two men working in the same direction, each raise a Potato perfectly alike? But it should be stated there are two Victors in the field, one a yellow-fleshed tuber, which is said to be the original and true form of the Potato, and a white-fleshed form, which is said not to be so good. It is claimed for Mr. Nisbett that he raised Victor from Alma Kidney, at one time a popular early variety, and the old Early Short-top Round. Did one raise the yellow-fleshed, and the other the white-fleshed form? For it is well known that seedling Potatoes raised from definite crosses vary considerably, not only in the tint of the flesh, but also in shape and colour of the skin. In the particular trial of early varieties to which I have referred, both Vale of Cleveland and Victor were yellow-fleshed. I am quite unable to assign a reason why Mr. Short of Stokesley named his seedling Vale of Cleveland, unless that is a local name for the district in which he resided. I have referred to this matter because I find that Vale of Cleveland and Victor are being cultivated under different names though to all appearance identical. *R. D.*

NURSERY NOTES.

MESSRS. J. CHEAL AND SONS.

If further illustration of the extent of the season's Apple crop were needed, this and much other interesting information was afforded by a recent visit to the nurseries near Crawley. We believe these are generally thought to be in Sussex, probably because Crawley is the post town, and the nearest station is there. As a matter of fact, the whole of the land is in Surrey, and the visitor from London will generally find it most convenient to book to "Three Bridges" station, from whence the nurseries are distant rather more than two miles. The soil in the neighbourhood

is very heavy, and there is no trace of chalk, nor much lime, as the chalk only approaches as close as the nearest "downs." The nursery itself is, in large measure, reclaimed land from Lowfield Heath, and consists of better surface-soil than that which surrounds it, inasmuch as it is lighter and more workable.

Apples usually do well here, but the crops this season are extraordinary. A large tree of *Bess Pool*, near Mr. Cheal's residence, attracted our attention, as it was covered with an abundance of good-sized, well-coloured fruits. "Yes," said our guide, "that is just a fair instance of the

until February. Then is seen a good crop of *Washington*, the fruits well coloured and large; it is a good dessert variety, but too tender as a rule in this district. *Yorkshire Beauty* is strongly recommended to growers who have a cold soil as a culinary variety, being thoroughly hardy; the fruits are yellow-coloured, with bright cheek, and of good size. *Jefferson* is a soft-fruited variety for dessert, very pretty, but not planted in many gardens; some very fine fruits of it were noticed. Passing many varieties, most of them with large crops, we come to *Lansberger Reinette*, an excellent Apple, good for both kitchen and dessert, and a faithful cropper; it is in

quality. *Margil* and *Lady Henniker*, *Cox's Pomona*, and the pretty fruits of *Colonel Vaughan* were numerous and good. *Beauty of Kent*, an exceedingly pretty and useful culinary Apple, though not one of the most suitable for the locality, had some very good fruits; nor have we ever seen better specimens of *Royal Jubilee* than Messrs. Cheal have in their fruit room; they are splendid fruits.

Turning from the fruiting-trees to the nursery-grounds, there are stocks of Apple, Pear, Plum, and Cherry-trees, and a lesser quantity of Peaches in trained and untrained specimens. Apples two and three years old on Crab stocks, and others upon the

FIG. 82.—A ROYAL GARDEN IN MADAGASCAR. (SEE P. 460.)

remarkable character of the season. *Bess Pool* is a variety which by reason of the cold subsoil matures but poorly here, and that tree has never during the last fourteen years, to my personal knowledge, borne such a crop of fine fruit as you now see. *Cox's Orange Pippin*, *Washington*, and such varieties, are also wonderfully superior in quality than we generally have them." In a closely adjacent spot are kept a few trees of a good many varieties for the convenience of visitors who may wish to inspect the trees when in fruit without walking through the whole of the grounds. Here was first remarked a tree bearing an abundant crop of one of the best of dessert Apples—*Loss Nonpareil*. For cold soils none is better, and the quality of the ruddy fruit is good; it is in season about the beginning of November, but will last

use at this season, and will be good until the end of the year. *Hoary Morning* does not usually bear many of its pretty fruits in this district, but there were good crops when these notes were taken. We should not class this variety higher than third-rate in quality, although it bears heavily. *King Pippin* and *Ribston Pippin*, very well known, need no remark, but the crop each was carrying attracted our notice; as did *Hornmead's Pearmain*, which was marvellous—this is a good Apple, but more suitable for cooking than consuming raw, though it is sometimes used for both purposes. A tree with a crop of excellent fruits of *Lord Lennox* was interesting, as we have not seen the variety for some years. It is essentially a midland county Apple, and there we have seen it; the fruit is high-coloured, rather small, and of very good

Paradise, we noticed in considerable quantity; and maidens on either stock had made a good growth. Pears, like the Apples, may be seen of differing size and age on the *Quince* and on the *free or Pear* stock, and the young trees were fast ripening their growths.

The stocks, which have been budded this season, in most cases are good and strong, in others again they are weaker on account of the dry hot spring following on the severe frost. Among trained trees, the most popular style at these nurseries is the cordon, and it is made a specialty. We noticed a lot of excellent cordon Pears three years old, studded thickly with good fruit buds, and very healthy. These trees, if planted against a wall, would bear good crops of fruit at once. The system is certainly one by which a wall may be quickly and

profitably covered, and also one which will produce really fine exhibition fruits, but it must be remembered that some varieties are less suitable for such treatment than others. The nursery grounds, as some of our readers will remember, are divided by a considerable number of thick, high hedgerows of Hornbeam, Thorn, and other plants, which are invaluable as protection from winds. There is a compact piece of land entirely devoted to young fruit trees, known as the "8 acres." Here we thought were the kindest-looking, most promising of all the stock. Amongst the Apples notice was made of the two varieties that Messrs. Cheal sent out a year or two ago. The first is Armored (figured in *Gardeners' Chronicle*, March 4, 1893), a rather small russety-dessert kind of very high quality; it is exceedingly late, and may be had in good condition in May. Acalanta (figured in *Gardeners' Chronicle*, March 11, 1893), is a larger Apple, pale yellow in colour, with sparse red streaking on one side, and is fit for culinary and dessert purposes; it comes into use about November, and is an uncommonly good cropper.

Now we have to speak of another Apple, called Bismarck, because this variety furnished an instance of precocious, heavy bearing that we do not remember to have seen equalled. Eighteen rods and a half were covered with Bismarck trees of two years old upon the Doncin. Many of these had eleven, a few twelve, large fruits upon them, and some had none. Now all the fruits on this piece of land were counted, and the total divided by the number of trees, which gave an average of five to each tree. The trees are planted in rows about 3 feet apart, and the plants about a foot asunder. An acre of land cropped in such a manner would yield about 500 bushels of fruit per acre.

Trees and Shrubs, Dahlias, &c.—Messrs. Cheal cultivate a great many other subjects than fruit trees, and it would be hardly fair to conclude this note without some reference—though it must be only reference—to the stock of ornamental trees and shrubs, Conifers and other plants useful for the furnishing and embellishment of pleasure-grounds. Mr. Jos. Cheal being frequently employed in laying out new grounds, and in the improvement of existing ones, a collection of the best kinds of such plants is very necessary. Considerable quantities of Rhododendrons of choice varieties grafted on a common stock were noticed, and others which had been so treated a season or two back appeared to be very happy; nor were many of the varieties of Conifers in a less healthy condition. The Silver Poplars, and other shrubs and trees with variegated or coloured foliage, might be remarked upon, but we must close after mentioning the Dahlias. The firm has an excellent reputation for these showy autumn-flowering plants, and the Lowfield collections are a very familiar sight at most of the exhibitions. Only a fortnight or so ago we figured a novelty in the Cactus section for which Messrs. Cheal received an Award of Merit from the Royal Hort. Society at the Chiswick meeting; this was Mrs. Wilson Noble, a variety of much excellence.

The date when these notes were taken was a late one to visit the Dahlia-grounds, and the plants were very thirsty-looking in the absence of the rain they have since received, but plants of the variety just mentioned were remarked, and a fine stock of Matchless and Mrs. Montefiore, a true Cactus-like bloom, and a better habited plant than many of the older ones, the flower-stems being much longer than is usual in such varieties as Lady Penzance and nearly all others. The blooms were thoroughly well above the foliage. Pompons to our mind are not less effective than any of the types, and new ones that may be mentioned are Annie Holton, scarlet-crimson, with silver tips, very high centre; and Rosebud, which has a light ground, and is tipped with rose. Until we saw the Tom Thumb type of Dahlias as growing in these nurseries, previous experience with them had not been altogether favourable. Here they looked healthy and were blooming in profusion, and some of the varieties

bear the flowers only 11 inches above the ground-level, others 14 and 20 inches high. The varieties Canary, Fairy Maure, and Dailey, the last-named being 20 inches high, with good dark blooms, were remarked, and Gam, pale yellow; Tomtit, scarlet with yellow rim round disc; Mignonne, mauve, with white rim round disc; and Hoop La, maroon-crimson, with light ring, were pretty. This type of single-flowered Dahlia raised by Mr. Girdlestone is, of course, only suitable for bedding purposes.

MR. HENRY BROWNELL'S SEED STORES, SALE, MANCHESTER.

All about Cheshire, within convenient proximity to Manchester, there are plant and seed farms which evidently pay better than the various subjects of agriculture. The land is low-lying, and the marshes are sufficient even in dry seasons to keep up the nutriment needed for a crop of flowers. Many of the growers here about grow for the market alone, and the bundles of flowers of all sorts that are cut twice a week—in fact, every morning—and which find a ready sale in town at a price, are astonishing. The trade in this way has grown immensely, and the teeming thousands that flock into Manchester almost every day, but particularly at week ends, from the densely populated places of Yorkshire, Lancashire, and Cheshire use up large quantities of them. Mr. Brownell, in addition to his local trade, grows largely in the seed way for the general market, and in this way he has a grand show of flowers all through the season. His stock of annuals, comprising Everlastings, Asters, Stocks, Gaillardias, Centaureas, Chrysanthemums, Poppies, Zinnias, Scabiosas, Mignonettes, and so forth, cover a considerable area, and are selected with the greatest of care. His stock, too, of such things as G. adoli of the *Brenchleyensis* section is notable, although, he says himself, since the drainage operations came into force about his neighbourhood, he cannot grow the same sized bulbs. The plants were beautiful and healthy, but bottom moisture is much relished by them. The scarlet is the popular colour in these Sword Lilies. Whits in Asters, in Stocks, in Gaillardias, in Dahlias, aye, even in Begonias take well.

This is a special mart for tuberous Begonias, which are bedded-out galore both out-of-doors and in the houses covered with glass for them alone. In double Begonias particularly, there is a large and selected lot. Whenever something better turns up in the seedling way than any of the type, it takes the place of the discarded ones. Really, the gain in double Begonias is very marked, more particularly on those sorts that are as double and as formal as a Camellia. Many partake of the Hollyhock form, and are heavy masses of florets, so heavy, in fact, that the flowers bend over and require to be lifted up to be seen to advantage. Among some of the most striking of the Sale novelties are Dr. W. G. Grace, a finely-formed rose; E. W. Powell, grandly imbricated, and having the Picotee edging, which is much sought after by the cross breeder; Modiste is a beautiful marked variety; Beauty of Sale is an immense flower of bright colour; and amongst pinks, Robert Hughes is very telling, and so is Linnie. W. F. Smollet and G. R. Ward are among the best of yellows. Indoors they are really beautiful when you see them by the thousand, and outdoors, in anything like weather, they make grand beds.

Roses, particularly Teas, are largely grown indoors, both as standard plants, allowed to roam as they like, and as climbers in the ordinary way. One of the most useful is Bongère, because of its standing longer when cut, which is of commercial importance. Niphetos still stands its ground among whites, and the climbing Niphetos is much appreciated as a good paying variety. Among others, Madame Hoste is grown more than Marshal Niel, and then Grace Darling, Catherine Mermet, and the Bride are chief among others. The old Géant des Batailles, as an H.P., is grown here, and proves one of the best of market Roses.

There are quantities of created Pteris grown, chief among them for market being *sempervirens*, a good grower, and a captivating plant. One Pteris named

Ouverardi was a dwarf beautiful form, with undulating pinnae, and so dwarf and bushy, as to make it an eligible plant for table decoration.

A large crop was being harvested of a new Pea called Rantpayer. It is a cross between Maclean's Little Gem and Duke of Albany. It is a remarkable gain in its stiff habit, about as stout as a Windsor Bean in the stalk, and remarkably dwarf, bearing about an average of ten peas in a pod of typical size. The pods were borne in clusters about two-thirds up the stem, and the heaviest manured plots did not produce stalks more than 30 inches long. *Viator*.

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 15.—Owing to the vegetable exhibition held at Chiswick in September, and the great show of British-grown fruits at the Crystal Palace on the 26th, 27th, and 28th of the same month, the meeting held in the Drill Hall, James Street, Westminster, on Tuesday last, is the first that has taken place in the building since August 27. On the occasion under notice there were plenty of exhibits before the committee. Orchids were numerous; Chrysanthemums occupied a considerable share of space and attention; and several groups of a miscellaneous description were important. Fruits were again largely exhibited, more especially Apples and Pears; and new Melons, Apples, Pears, and Grapes, a seedling Plum, &c., gave this committee ample scope for their discriminating qualities. Of vegetables there was staged one of the very finest collections ever exhibited in the hall.

Floral Committee.

Present: W. Marshall, Esq., in the chair; with Messrs. J. Fraser, O. Thomas, C. T. Drury, H. B. May, H. Herbst, J. H. Fitt, R. Owen, R. Dean, G. Stevens, C. J. Sater, J. Jennings, H. Cannell, H. J. Jones, H. Briscoe-Ironside, E. Beckett, J. Walker, C. E. Pearson, E. Mawley, C. E. Shea, J. D. Pawle, J. T. Bennett, F. H. Turner, G. Paul, Rev. H. H. D'Ombraun, C. Buick, G. Nicholson, and C. Jeffries.

A large and excellent collection of Crotons, arranged in a group, was exhibited by Mr. H. B. MAY, Devon's Lane Nursery, Upper Edmonton. The broad and medium-leaved varieties Thomsoni, Newmani, Massangeana, Motii, and rose-pictus were noticeable for their colour; also finer-leaved sorts, as Mrs. Durman, nobilis, formosus, majesticus, ruberrimus, Flambeau, and elegantissimus. A few plants of a new yellow Carnation named Primrose Day were also included, and a crimson-scarlet one named Leonidas (Silver-gilt Flora Medal).

A collection of Nepenthes and stove decorative foliage plants was shown by Earl PERCY, Syon House, Brentford (gr., Mr. Wythes). The Nepenthes were very praiseworthy, and carried a fine lot of pitchers. Included were such varieties as Masersiana, Rafflesiana, Hookeriana, Amesiana, Dicksoniana, the new and handsome mixta, formosa, Wrigleyana, Curtisi superba (Gold Medal).

Mrs. WINGFIELD, Amphill House, Amphill (gr., Mr. W. J. Empson), had a group of small Crotons, Aralias, and other foliage plants, backed by a few specimens of *Aracaria excelsa*, *Dracena australis variegata*, &c. (Silver Banksian Medal).

Dahlias have not yet been cut by frost in the Tottenham district, for Mr. THOS. S. WARE, Hale Farm Nurseries, staged a large collection of flowers of the single type, very remarkable in quality and freshness for so late a date. A few Nerines in flower were also shown by Mr. WARE (Silver Flora Medal).

A. LAURIE, Esq., Rockdale, Sevenoaks (gr., Mr. E. Francis), exhibited a dozen plants of a seedling yellow-leaved Pelargonium, but as exhibited the variety is not valuable. A plant in flower of *Hippeastrum striatum maculatum* in a 10-inch pot, bearing about eighteen scapes of flower, was exhibited by H. G. E. GREEN, Esq., King's Ford, Colchester (gr., Mr. T. H. Kettle). Mr. O. THOMAS, Frogmore Gardens, exhibited blooms of a new Violet named Princess of Wales; the flowers are very large, pleasantly fragrant, and of a pretty blue, with a distinct white eye (Award of Merit).

A First-class Certificate was awarded to a plant of *Abies Douglasii glauca pendula*, shown by Messrs. PAUL & SON, The Old Nurseries, Che-hunt. This glaucous variety is quite distinct, and decidedly pendulous, the branches drooping close to the main stem. Messrs. PAUL & SON also staged a few plants in flower of a new Tea Rose, which they have called Paul's Winter Broomer; the bloom is pink in colour, and very pretty as a bud. Also a few plants of the blue-flowered *Caryopteris Mastacanthus* from the open ground, where it stood during the last severe winter.

Mr. E. MAWLEY, Rosebank, Great Berkhamsted, exhibited blooms of an attractive single Dahlia, named Beauty's Eye; and new single-flowered Dahlias were also staged by Mr. W. J. Empson, gr. to Mrs. WINGFIELD, Amphill.

A few blooms of the intense-coloured Nerine *stro-rubens* were sent by Mr. F. W. MOORE, Botanic Gardens, Glasgoven.

Another Apple, called Stubb's Seedling or Winter Quarrenden, was shown in quantity by Mr. W. PALMER, Cobden Villas, Andover. The fruits are very highly coloured, in shape like Quarrenden, but rather larger. Some of the best fruits were taken to Chiswick with a view to ascertain their keeping qualities.

Mr. E. C. BANKS, Waterville, Nova Scotia, sent some fruits of an Apple which he called Banks', or Red Gravenstein, also some fruits of Gravenstein, for comparison.

Messrs. PAUL & SON, Cheshunt, sent fruits of a large kitchen Apple, named Captain Sanders, which the committee desired to see again in the spring.

Still another new Apple, Lindura Pippin, was exhibited by F. WELLS, Esq., Leighton Buzzard; the fruits are of moderate size, quite yellow in colour, and but little like a Pippin in appearance.

An extraordinary coloured fruit of Benheim Orange Pippin Apple were shown by Mr. JNO. MILES, S, Dudley Villas, Portwood Road, Southampton (Vote of Thanks); and Mr. E. Hill, gr. to Lord ROTHSCHILD, Tring Park, exhibited some of the largest fruits of Doyenné du Comice Pear ever seen. They were grown on an outside wall (Cultural Commendation).

Mr. WILL TAYLOR again exhibited bunches of the hardy Grape, Reine Olga de Wurtemberg; and from the Royal Horticultural Society's Garden at Chiswick came ripe bunches of the hardy Grapes Chasselas Rose, Chasselas Noir, and Gamay Noir; the two last-named, but especially Gamay Noir, give the best results in the open-air vineyards belonging to the Marquis of Bate at Cardiff. Another Grape, named Black Monukka, was also sent from Chiswick. The bunch was long and thin, and the berries of acorn shape, and rather small, with little flavour, but juicy and sweet, evidently from indoor culture.

Mr. W. J. EMPSON exhibited a rather indifferent bunch of the Grape Mrs. Wingfield; the berries are black and rather long in shape, a little like those of Madresfield Court. The committee asked to see the fruit again in March.

The white Grape Marchioness of Downshire was exhibited by Mr. T. BRADSHAW, Hillsborough Castle, co. Down.

Mr. McIndoe, gr. to Sir J. PEASE, Hatton Hall, Guisborough, Yorkshire, exhibited four fruits of a new Pear, named Charles Ernest. The fruits are large, not unlike those of Pitmaston Duchess in shape, yellow with isolated flushes and stripes of red.

Mr. H. DEVERILL, Banbury, exhibited very large bulbs of his Ailsa Craig Onion, and the flatter-shaped Anglo-Spanish variety.

Messrs. DOBBIE & CO., Rothsay, had good Leeks and excellent Curled Parsley, known as Dobbie's Selected (Silver Bankian Medal).

Mrs. JONES, Greenford Place, Sudbury, Harrow (gr., Mr. Jones), exhibited excellent Leeks, Auburn Castle Giant, Champion, The Lyon, and Sutton's Prizetaker (Cultural Commendation).

Melon Earl's Favourite was again exhibited by Mr. WARD of Longford Castle Gardens, who had six fine fruits (Vote of Thanks).

Seedling Melons included one called Anthony's Favourite, shown by Mr. W. J. EMPSON. The committee asked to see further fruits of the variety.

R. BURRELL, Esq., Bury St. Edmund's (gr., Mr. Bishop), showed two red-flesh Melons, named respectively, B.H.S. and Wesley Hall.

Mr. Geo. Wythes, gr. to Earl PRYOR, Syon House, Brentford, exhibited two small apricot-coloured fruits of Melon Beauty of Syon.

Apples and Pears were exhibited in large quantities. Messrs. PAUL & SON, The Old Nurseries, Cheshunt, had a collection of dessert Apples in about fifty dishes. Gascoyne's Scarlet, King of the Pippins, Jonathan, Mabbott's Pearmain, Golden Reinette, Blenheim Orange, Cheshunt Pippin, Fearn's Pippin, and Adams' Pearmain were noticeable for their size and colour (Silver Bankian Medal).

Messrs. T. RIVERS & SON, Sawbridgeworth, exhibited a collection of Apples and Pears of remarkable quality, and the varieties were selected from the very best; Washington, Court Pequin Plat, Belle Dubois, Wadhurst Pippin, Bismarck, King of Tomkins County, Peasgood's Nonsuch, and Cox's Orange Pippin (the last-named variety being shown as large as Blenheim Orange is usually seen), were all superb. Among Pears, prominence was given to Conference (Rivers), Pitmaston Duchess, Magrate, General Todleben, and Doyenné du Comice (Silver gilt Knightian Medal).

Messrs. T. RIVERS & SON, Sawbridgeworth, exhibited fruits of a new large purple Plum, Rivers President. It was recommended an Award of Merit on account of the fruits being so late. This much has already been proved.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, brought a collection of Apples in a hundred varieties, all of them different from the hundred kinds staged by the firm at the recent show at the Palace. Among Apples we noticed Lady Snuffield, Braddick's Nonpareil, Rymel, Wyken Pippin, Bess Pool, Northern Greening, Betty Geeson, Golden Pippin, the Old Ringer, and other less known sorts (Silver Knightian Medal).

The only collection of fruit from an Amateur was one of Apples and Pears, from the Dowager Lady FREAK, Fulwell Park, Twickenham (gr., Mr. Richmond), who had about forty dishes of Apples, and thirty of Pears. Many varieties of each were shown in good condition (Silver Bankian Medal).

Vegetables were capitally shown by H. H. GIBBS, Esq., Aldenham House, Elstree (gr., Mr. E. Beckett). This exhibitor had a very large and excellent collection. The background consisted of Savoy, Artichokes, Broccoli (Veitch's Self-Protecting), Cauliflowers (Veitch's Autumn Giant), Kale, &c.; and there were very fine roots, Parsnips,

Sutton's Student, Carrots Long Red Surrey, Veitch's Matchless Scarlet, and Sutton's New Intermediate, were all capital. Leeks, Sutton's Prizetaker and The Lyon were large and very good. Celery, Standard Bearer, Sutton's Solid White, and Catbush's Red. Onions were wonderfully large and heavy; the varieties were Ailsa Craig, Sutton's Al, Cocconut, and Sutton's Exhibition. The varieties of Beet exhibited were Pragnell Exhibition and Dell's Crimson. Turnips, Veitch's Red Globe, Green-top, Stone. Potatoes, Magnum Bonum and Snowdrop. Bean (Banner), Ne Plus Ultra and Jubilee. Then there were Brussels Sprouts, Salsafy, Stachys tubifera (Chinese Artichoke), Capsicum, Tomatos, Cabbage, Colewort, French Beans, Peas, Mushrooms, Maize, Marrows, &c. (Special Cultural Commendation and Silver-Gilt Knightian Medal).

A fine collection of Celery was exhibited by Mr. W. H. Divers, gr. to the Duke of RUTLAND, Belvoir Castle Gardens, Grantham. Sutton's White Gem, Sandringham Dwarf White, Incomparable Dwarf White (Veitch), Wright's Grove White (Veitch), Cole's Crystal White (Veitch), Sutton's Solid White, and Belvoir Castle White, raised by Mr. W. DIVERS. The last-named is described as being similar in quality to the Major Clark from which it was raised. Nearly a score of red and pink varieties were shown, and among them was included a rather large variety named Man of Kent (to be tried at Chiswick), raised by Mr. Divers, and described by him as remarkable for standing longer than other kinds before running to seed (Silver Bankian Medal).

Mr. H. A. ORR, Bedford, exhibited his patent storing-trays for fruit, noticed at the Crystal Palace. High Commendation and a Silver Bankian Medal were extended by the committee to this useful contrivance.

Lecture on Nut Culture.

In the afternoon a lecture on Nut culture in England was given by Mr. J. Omer Cooper. The lecturer explained the botanical affinities of the Hazel, the various uses to which the wood has been put, and then gave some information respecting the culture of Filberts in the district of Maidstone. Mr. Cooper's remarks were devoted solely to Filberts.

NATIONAL CHRYSANTHEMUM.

OCTOBER 8.—A considerable number of new varieties of Japanese Chrysanthemums came before the Floral Committee on the above date, and First-class Certificates of Merit were awarded to the following:—Mons. Auguste de Lacvievier, pale reddish-cerise, with yellow reverse—a large, full, broad-petalled variety, of great promise (H. J. Jones). This variety was also finely shown by Messrs. J. Veitch & Sons, in their group of plants. To Phœbus, a large deep yellow Japanese, likely to make a very useful exhibition variety (H. Shoemith). To Boale d'Or 95 (E. Calvat), a very fine amber-coloured incurved Japanese, in the way of Louise in reference to its build (W. Wells). To Lady Esther Smith, a magnificent broad-petalled white variety, a seedling from Viscountess Hambleton; and Pompon Little Gem, a small and finely-formed bright yellow variety, very free (both from Mr. R. Orr). To Mons. C. Molin (W. J. Godfrey); and to an early-flowering Japanese, Madame Maria Masse, previously described, a most useful decorative variety, being remarkably free.

NEW INVENTIONS.

A SAFETY LAMP.

THE question of the safety of paraffin lamps is one of great interest, affecting rich and poor alike. Far too frequently we read of lamp explosions, and many times the necessity of legislation in the matter has been urged. But with the Kiesow Safety Lamp (one of which we have received for notice) explosion is impossible. And considering that one of the largest insurance companies has taken the risk of issuing an insurance policy against fire with every lamp sold, they at least must believe in the claims of the inventor and manufacturer. The reservoir being made of metal, it is unbreakable in the ordinary sense of the word. The patent consists of a tube made in the shape of the letter S, through which the wick passes, and should the lamp be upset or dropped, one half of the S-like tube fills with air and prevents the oil escaping. An excellent gardener's lamp for use in his lantern when examining the thermometers in the houses and stoking the boiler-fires at night, the light being far more brilliant than that of a candle; and should the lamp be knocked over, nothing worse than a smoky chimney can happen. The reservoir is of about the size of a

Peasgood's Nonsuch Apple; and the total height, including the chimney, about 9 inches. The makers are Messrs. Kiesow & Co., 25, Fore Street Avenue, London, E.C.

Obituary.

J. CRISPIN, F.R.H.S.—We regret to announce the death of Mr. James Crispin, F.R.H.S., the head of the firm of James Crispin & Sons, Horticultural Engineers, of Nelson Street, Bristol, who, after a prolonged illness, at fifty-five years of age, passed away at his residence, Chester Park, Fishponds, on the 14th inst. Mr. Crispin was born at Mells, near Frome. A skilled horticultural engineer, he spread his business operations over a very large area, where his knowledge and experience were readily admitted, and always appreciated. He was one of the most successful growers of Orchids in the kingdom, and only recently, it will be remembered, he had a magnificent show of these much-prized flowers at the showrooms of the firm in Nelson Street. His collection at his residence, Chester Park, was well known, and attracted many amateurs from all parts of the West of England. He many times won 1st prizes for these Orchids at flower shows, and twice he was awarded the Bankian Medal of the Royal Horticultural Society.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named:—a "Day-degree" is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—
0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending October 12, is furnished from the Meteorological Office:—

"The weather during this period was generally changeable and unsettled. Frequent rain was experienced in nearly all districts, heavy falls occurring at most of the English stations on the 6th, and in Scotland on the 11th.

"The temperature just equalled the mean over the greater part of England, but was slightly below it in the western and northern parts of the Kingdom. The highest of the maxima, which occurred on somewhat variable dates, ranged from 64°

in 'England, S. and the Channel Islands,' to 57° in 'England, N.W. and Ireland, N.'

"The rainfall was rather less than the mean over 'Ireland and in England, N.W.' and just equal to it in 'Scotland, E. and W. and England, S.W.'"

"The bright sunshine was much less prevalent than of late, but, taking the Kingdom as a whole, it did not differ much from the normal for the time of year."

MARKETS.

COVENT GARDEN, October 17.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations.

Table with columns for 'AVERAGE WHOLESALE PRICES' and 'ORCHID-BLOOM in variety'. Lists items like 'Orchids', 'Cattleya', 'Odo n to glosum', etc.

Table with columns for 'PLANTS IN POTS.—AVERAGE WHOLESALE PRICES'. Lists items like 'Ficus elastica', 'Foliage plants', 'Fuchsias', etc.

Table with columns for 'FRUIT.—AVERAGE WHOLESALE PRICES'. Lists items like 'Peaches', 'Pears', 'Marie Louise', etc.

Table with columns for 'VEGETABLES.—AVERAGE WHOLESALE PRICES'. Lists items like 'Onions', 'Tomatoes', 'Liflowers', etc.

POTATOS.

Markets during the past week show a tendency to harden, and prices inclined to advance, especially for best samples.

SEEDS.

LONDON: October 16.—Messrs. John Shaw & Sons, Seed merchants, of Great Maze Pond, Borough, London, S.E., report a more hopeful feeling.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending October 12, and for the corresponding week in last year:—1895: Wheat, 24s. 3d.; Barley, 25s. 7d.; Oats, 13s. 4d.

tions are cabled for Canary-seed; the new Turkish seed, just landed, shows satisfactory quality. Hemp-seed is dull. For Peas and Haricots there is a brisk sale at the late advance.

FRUITS AND VEGETABLES.

BOROUGH: Oct. 15.—Quotations:—Cabbages, 1s. 6d. to 2s. 6d. per tally; Marrows, 2s. to 2s. 6d. do.; Onions, 3s. to 4s. per bag;

SPITALFIELDS: Oct. 15.—Quotations:—Sprouts, 2s. 6d. to 3s. per half-sieve; Greens, 2s. to 2s. 6d. per dozen bunches;

STRATFORD, Oct. 15.—Fair supply of all kinds of fruit and vegetables, and rather better trade, except for Potatoes, which was a weak trade. Quotations:—Cabbages, 2s. 6d. to 5s. per tally;

FARRINGTON: Oct. 17.—Quotations:—Cabbages, Collards, 3s. per tally; Sprouts, 2s. 6d. per half-bushel; Spinach, 1s. 6d. per bushel;

POTATOS.

BOROUGH: October 15.—Prices here ranged from 50s. to 80s. per ton.

SPITALFIELDS: October 15.—Quotations:—Magnum's, 45s. to 55s.; Main Crop, Kidneys, 50s. to 60s.;

STRATFORD, Oct. 15.—Quotations:—Bruces, Dark soil, 32s. 6d. to 40s.; light do., 45s. to 65s.;

FARRINGTON: Oct. 17.—Quotations: Jeannie Deans, 75s. to 80s.; Sutton's Abundance, 65s. to 75s.;

LONDON AVERAGES: Oct. 16.—Regents, 60s. to 80s.; Early Rose, 50s. to 60s.;

HAY.

Averages.—The following are the prices at the principal metropolitan markets during the past week:—Clover, best, 80s. to 105s.;

VARIORUM.

ENGLISH WHEAT AND A NATIONAL LOAF.—In reference to the idea recently suggested that, in order to revive the Wheat-growing industry in this country, we should have a "national loaf," that is a loaf made exclusively of English Wheat, and sold at a penny a quarter more than other bread,

ENQUIRY.

"He that questioneth much shall learn much"—BACON.

FRUIT FARMING, ETC., IN SOUTH AFRICA.—A correspondent, "H. E. T.," is desirous of looking up the question of fruit farming and cognate enterprises in South Africa, and would be glad if some of our readers having acquaintance with that colony would kindly furnish him with reliable data.

Owing to the large increase in our circulation, we are under the necessity of going to press some hours earlier. Our contributors will kindly aid us by sending their communications as early in the week as possible.

BELLADONNA LILIES AND VALLOTAS: W. S. When purchasing the bulbs of the Belladonna Lily in August and September, the flower-spikes should be prominent. They will expand perfectly if they are potted in any kind of moist material, although if they are to be kept for the purpose of planting out on a warm border close to a wall where the young brood will bloom beautifully if left for years undisturbed, and merely protected by a covering of leaves, or by having a handlight put over the clump, they should be potted in rich sandy loam, three bulbs in an 8 or 10-inch pot, with the swelling part of the bulbs just beneath the surface of the mould.

BOOKS: A. B. C. The Garden Annual, 37, Southampton Street, Covent Garden, W.C. Chrysanthemums and their Culture, 171, Fleet Street, E.C.; and of the author, Mr. Molyneux, Swanmore Park Gardens, Bishops Waltham.

ERRATA: Top line of col. 3, p. 399, scale on Carrots should be scab.—Mr. Charles Slocombe. We were in error in supposing Mr. Charles Slocombe, whose death we recently announced, to have been the artist who occasionally contributed illustrations

to the *Gardeners' Magazine*. These are the work of Mr. Alfred Slocombe, who is still happily among us.

FLAX CULTURE: *Enquirer*. It is still cultivated in Ireland for manufacturing purposes, but in not such large quantities as formerly, although the maritime climate of that country is well adapted to the needs of the plant. But, as in many other productions which we are well able to raise as the foreigner, we go abroad for the greater part of our supplies, and the farmer wrings his hands and laments his lack of pence.

HOLES IN PEACH WALLS: *F. Moulard*. Portland cement is a good material for stopping the nail-holes; and to give a uniform appearance to the face of the wall it may be coated with a thin coating of cement, which may be put on with a whitewash brush, or, if freed from all grit, with the garden engine.

INSECTS: *A. Laker*. We do not recognise the caterpillar; try and breed the moth. Thorough fumigation two or three times repeated, might be efficacious.—*Armitage Bros.* The grubs were those of Dipterous insects, apparently of two kinds, but it is not possible to state the species with certainty. The earth should be treated with some insecticide. *R. McL.*

LEAK IN PIPE: *Vinder*. Cut out the packing of cement, and make a new joint with molten lead, or iron-filings and sal-ammoniac.

MANUSCRIPT FOR PUBLICATION: *A. B. C.* We cannot publish any communication from unknown correspondents unless it be accompanied with full name and address; not necessarily for appending to the article, but as an earnest of bona fides.

*. PLANTS, FRUITS, ETC., TO BE NAMED.—The applications to name flowers, and especially fruit, are so numerous at this season as severely to tax our resources. They entail an expenditure of time, labour, and money, of which our readers have no idea. We are always willing to oblige our correspondents as far as we can, but the editing of the *Gardeners' Chronicle* is our business, to which everything else must give way. Correspondents are respectfully requested to observe the rule that not more than six specimens can be dealt with at a time. If more are sent, it would be a graceful act on the part of the sender, to send also a small contribution to the *Gardeners' Orphan Fund*. Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered. Leaves only, or Florists' varieties cannot, as a rule, be named.

NAMES OF FRUIT: *R. V. Sherring*. Pear Doyenné du Comice.—*G. S. 1*, Marie Louise; 2, Benrrié Charnenees; 3, Seckle; 4, Col. Vaughan; 5, Court of Wick.—*A. G. T. 1*, Williams' Bon Chrétien; 2, Ne Plus Mearis; 3, Marie Louise. Apple; 1, Beauty of Kent; 2, Golden Reinette; 3, Minchall Crab; 4, Baxter's Pearmain.—*F. F. P. 1*, Golden Noble; 2, Bachelier; 3, 4, Blenheim Orange; 5, not known; 6, Jersey Gratioli; 7, Benrrié Clairgeau.—*T. S. 10, 27, 28*, Damelow's Seedling; 25, Col. Vaughan; 42, Dutch Mignonne; 52, Blenheim Orange.—*D. McD. 1*, Minchall Crab; 2, Stirling Castle; 6, Lane's Prolific; the others too much bruised to determine.—*Carlton. 1*, Queen Caroline; 2, King of the Pippins; 3, Mammoth; 4, Cox's Orange Pippin. Pear, Benrrié d'Amanlis. [Contribution to *Gardeners' Orphan Fund* has been sent to the Secretary.]—*H. Howard, Purfleet. 1*, Alfriston; 2, Frogmore Prolific; 3, too small to determine.—*J. W., Please. 1*, Nonsuch; 2, Alfriston; 3, Beauty of Kent; 4, Hawthornden; 5, B-nrrié de Capiaumont; 6, Winter Nellis; 7, Old Crassane.—*G. A. J. 1*, Baxter's Pearmain; 2, Golden Noble; 3, Gloria Mundi; 4, Hornead Pearmain.—*J. Kent. 1*, Reinette du Canada; 2, Cellini Pippin; 3, not recognised; 4, Northern Greening; 5, Cox's Orange Pippin; 6, Cellini Pippin.—*Biddles & Co. 19*, Jersey Gratioli; 21, Murfitt's Seedling; 20, Cox's Orange Pippin; 23, Tower of Glamis; 30, Golden Noble.—*J. W. M. 1*, Court Pendu Plat; 2, New Hawthornden; 3, Northern Greening; 4, not recognised; 5, Reinette du Canada; 6, Tower of Glamis; 7, Lane's Prince Albert; 8, French Crab; 9, Wareham Russet; 10, Bedfordshire Foundling.—*J. W. Swaffield. 1, 1½*, resemble Keswick Codlin grown in a cold locality, but they are evidently not that variety—they may be Lord Grosvenor. 2, Scarlet Nonpareil; 3, Golden Winter Pearmain; 4, Autumn Bergamot; 5, Comte de Lamy; 6, Bonne d'Ézée. [Never send plants and fruit in the same box, kindly send fresh specimens of the shrub, Lily, and grass.—*C. G. Woodrofe. 1, 2, 3*, Blenheim Orange;

4, 5, 6, 7, 8, 9, 10, 12, Cox's Orange Pippin, excellent specimens; 11, Ribeton Pippin; 13, Kerry Pippin; 14, New Hawthornden; 15, Damelow's Seedling; and 16, probably small fruit of Bramley's Seedling.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to consult the next number.*—*E. B.* A species of Casuarina.—*S. K.* Plumbago Larpentæ.—*Ignorant. 1*, Malope trifida; 2, Hibiscus syriacus, commonly called Althæa frutex; 3, Sedum spectabile; 4, Malope trifida, white var.—*W. M.* Houletia Brocklehurstiana.—*W. J. B.* Phytolacca decandra.—*J. P.* Tropæolum speciosum.—*E. W. 1*, Sedum tortuosum (*Bot. Mag.*, t. 296) var. variegatum; 2, Diplacnis glutinosus; 3, Fuchsia procumbens; 4, Selaginella viticincosa; 5, Enallia japonica variegata; 6, Agathea celestia.—*J. R. 1*, Cattleya Walkeriana; 2, Oncidium spillopterum; 3, Ocidium divaricatum.

PEAR: *Mells Rectory*. A seedling probably of some garden variety of Pear. Can you send some fruits when ripe?

POTATOS SEEDING: *E. H. O.* Many varieties do not bear flowers, or they rarely do so, and those which flower do not always "set" the flowers. Cultivation has a tendency to suppress the flowers, and prevent their fertilisation! and the longer any variety has been in cultivation, the fewer the blossoms, or none at all. In the Ashleaf varieties, the ability to flower seems to be quite lost.

ROCK PLANTS: *W. T. H.* Omphalodes Luciliae, Globularia, and Campanula Zoyisii and C. Waldsteiniana, by division; Edriantia by seeds.

ROSE DIFFICULT TO STRIKE: *Miss Armstrong*. The species is Rosa Brunonis. The striking of cuttings would be successful if half-ripened shoots with a heel were taken in July, and struck in a close frame or hand-light, on bottom-heat of 75° to 80°. The leaflets should have the central one cut off, and the leaf at the base, if any, should remain on the cutting. Put one cutting in the middle of a 2½ or 3 inch pot, in sandy loam, pressed firmly, and then well water the cuttings. No more water is likely to be needed if the frame be well shaded during the sunny hours before rooting has taken place. Take out all pots containing rooted cuttings, and place in a less close frame, gradually inuring them to full exposure. The above method is applicable to all Roses difficult to root as cuttings. Less troublesome methods are, to layer either the tips of the shoots—say the first foot of growth, or lay whole shoots on the soil, pegging them down at intervals of a foot, and putting a little soil over them, at the points where the pegs are inserted. Maréchal Niel Rose can be readily increased by this method. It takes a whole season.

STAPHYLEA PINNATA: *W. D. H.* It is called Job's Tears, Bladder Nut, and St. Anthony's Nut. London, quoting Haller, remarks in *Arboretum et Fruticetum Britannicum*, "that the kernels taste like those of Pistacia, and are eaten in Germany by children, and this appears to have been formerly the case in England, for Gerard says the kernels, though sweet at first, are succeeded by a nauseous taste, and finally they act as an emetic." The flowers contain much honey, and are much visited by bees. The plant is a native of Europe, and is not indigenous in this country, but it is now common.

WALNUTS TO KEEP FRESH FOR FOUR MONTHS: *F. M. C.* Oily seeds such as these cannot be kept in a good condition for eating, unless the air be kept from them, the moisture contained in the nut soon evaporating, and the oily constituent of the kernel becoming rancid. Choose a box or barrel of a size suitable to the quantity of nuts to be stored, and having at hand some not very dry sand or charcoal-dust, proceed to lay them in the receptacle in alternate layers of sand, &c., and store in a cool place.

GARDENERS' CHRONICLE OFFICE, 41, WELLINGTON STREET, STRAND, W.C.

THE BEST THING
TO FEED WITH TO FINISH UP FINE
CHRYSANTHEMUM BLOOMS
IS THE
XL ALL LIQUID MANURE
(No Smell).

One-pint bottle, 1s.; one quart, 1s. 6d.; one-gallon tin, 3s. 9d.; four-gallon drum, 12s.; twelve-gallon cask, 32s.; eighteen-gallon cask, 45s.; forty-gallon barrel, 95s.

Cheap, only 1 part of Manure required to 50 of water. Mr. W. H. LEE'S, The Gardens, Trent Park, New Barnet, the most successful exhibitor of Chrysanthemum Blooms during the season of 1894. This celebrated grower writes:—"I have used your new Liquid Manure on many things this season with highly satisfactory results—especially on Chrysaanthemums. The 1st Prize Blooms which I exhibited at the Aquarium Show, on November 6, were reared to such perfection with this Fertiliser."

To be had (the same as all the other XL ALL'S), through all Nurserymen, Seedsmen, Florists, and Sundriesmen everywhere; or direct from the Sole Manufacturer, G. H. RICHARDS, Old Shot Tower Wharf, Lambeth, London, S.E.

THOMSON'S
VINE AND PLANT MANURE.

The very best for all purposes.
The result of many years' experience. Largely used both at home and abroad.

Agent for London:—J. GEORGE, 14, Redgrave Road, Putney, S.W.

Agent for Channel Islands:—J. H. PARSONS, Market Place, Guernsey.

Sole Makers:—WM. THOMSON AND SONS, LTD., Tweed Vineyard, Clovefords, N.B.

Price Lists and Testimonials on application. Analysis sent with orders of ½-cwt. and upwards.
SOLD BY ALL SEEDSMEN.

HUGHES'
VAPOUR ROLL
FUMIGATOR

For Greenhouses. Cheap, safe, and always effective for Greenfly, Thrip, &c. Used in nearly all the large establishments in England.

Price 1s., enough for 1,300 cubic feet, carriage paid. Refills for 3 tins, 2s. 6d. Everyone should try them. Held under a Gooseberry bush every caterpillar will be on the floor in less than a minute.

Manufacturer—E. G. HUGHES, Victoria Street, Manchester. Sold by all Seedsmen.

GISHURST COMPOUND, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

SAVE HALF THE COST.

ROBERT WARNER & CO.'S
NEW PATENT
WINDMILLS.

Saves Coal, Pumps Water, Grinds Corn, Cuts Chaff, &c.

Support can be made in Teak, Iron, or Steel, for Hot Climates.

Prices from £17, including Pump and Timber Supports. May 27, 1893, The Dell, Englefield Green, Surrey.

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.

Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail geared Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,

H. BALLANTINE, Head Gardener to Baron Schröder. R. WARNER & Co. have made and erected a similar Mill and set of Pumps for Lord Northbourne.

IMPORTANT.

We beg to inform all readers of this Paper that the Fourth Edition (100,000 copies) of our Revised PRICE LIST, consisting of 400 pp. and about 1200 Illustrations, bound in cloth, is Now Ready. We shall have much pleasure in forwarding to every person one post-free on application. This List is the most complete in the Trade, and has cost several thousand pounds to produce.

THERE IS NOW A CERTAIN AND SAFE REMEDY IN THE XL ALL MILDEW WASH.

 Kills Mildew and Insects at the same time.
 Does not Mark or Stain Fruit, Flowers, or Foliage.

PRICE:—
1 gallon, 12s. 6d.; ½ gallon, 6s. 6d.; 1 quart, 4s.; 1 pint, 2s. 6d.

A Report selected from many:—

October 8.
From Mr. W. H. MORTER, High Elms Gardens, Farnboro.
"I have used your XL ALL Mildew-Wash as directed, on Roses, Strawberries, and Chrysanthemums, and I have no hesitation in saying it is a sure and safe remedy, and supplies a long felt want, as it does not discolour the flowers nor rot the wood, as so many of the sulphur remedies do."

To be had (the same as all the other XL ALL'S), through all Nurserymen, Seedsmen, Florists, and Sundriesmen everywhere; or direct from the Sole Proprietor, G. H. RICHARDS, Old Shot Tower Wharf, Lambeth, London, S.E.

FLORISTS.—Young Lady, age 19, seeks re-engagement. Used to Buttonholes and Wreaths; also to Servicing. Good references.—E. W., 13, Hamilton Road, Highbury Park, N.

£10,000 A YEAR.—How one might play the part of Prince Beautiful as such an income! What comfort and relief one could bring to the poor and to the suffering. And yet, even without money, one can do good if one has the will. If I see a fellow-creature suffering from ague, fevers, or disorders of the stomach; or from gout, rheumatics, neuralgia, and the like, I don't need to be a man of wealth in order to show him the way to health. If I point out to him the wonderful efficacy of HOLLOWAY'S PILLS and OINTMENT, I have perchance done more good by that one thoughtful action than I could have achieved with all the wealth of all the Rothschilds.

BY SPECIAL APPOINTMENT TO H.R.H. THE PRINCE OF WALES.

MACMILLAN & CO.'S PUBLICATIONS.

THE BOOK OF THE ROSE.

By the Rev. A. FOSTER-MELLIAR, M.A., Rector of Sproughton, Suffolk. Illustrated. Extra crown 8vo, 8s. 6d. net.

Gardeners' Chronicle.—"As the work of a sound and experienced practitioner, this will be received with acclamation."

Mr. FRANK CANT writes in the Journal of the Royal Horticultural Society:—"The Book of the Rose" is the most scientific, complete, and perfect ever published on that subject, and I strongly advise those who have not read it to lose no time in possessing a copy."

GREENHOUSE and WINDOW PLANTS.—A Primer for Amateurs. By CHARLES COLLINS. Edited by J. WRIGHT, F.R.H.S. With thirty-eight illustrations. Pott 8vo, 1s.

Speaker.—"These pages show, not merely the breadth of his knowledge, but uncommon felicity in the task of exposition. . . . The directions are in every case simple and explicit, and deal with the real difficulties of the beginner."

GARDEN FLOWERS and PLANTS.—A Primer for Amateurs. By J. WRIGHT, F.R.H.S. With fifty illustrations. Pott 8vo, 1s.

Horticultural Review.—"The work undoubtedly gains in value from the completeness of its survey of elementary gardening. . . . Attention is paid to the denizens of the cottage gardens, and the directions as to the culture of these are plain and reliable."

A PRIMER OF PRACTICAL HORTICULTURE.

Ten Lectures delivered for the Surrey County Council. By J. WRIGHT, F.R.H.S. Pott 8vo. 1s.
Schoolmaster.—"The book is crammed with valuable information, and profusely illustrated."

SATURDAY, OCTOBER 26, 1895.

SACRED FLOWERS.

THE following "Rough Notes on some of the Sacred Flowers of the Hindus" are contributed by Yogendracri Ghosa, to a recent number of the *Proceedings of the Agricultural and Horticultural Society of India*:—Flowers have been associated more or less with religious festivities of every nation and in every time. Garlands and wreaths of flowers appear in the Old Testament, as well as in the *Zend Avest* of the Fire-worshipper. With the ancient Greeks and Romans, flowers were a no less favourite adjunct to their ceremonies, religious, political, and social: a Palm and a Laurel were emblems much coveted. In India, however, flowers have attained an importance unprecedented in the annals of other nations. No religious or social ceremony of the Hindus is complete without flowers. In an assembly, the respected is decorated with garlands, and at times there is much heart-burning as to who shall get the first garland. In a party the invited have their share of nosegays as well as of *pan* and *attar*. The marriage ceremony is completed by the exchange of garlands between the bride and the bridegroom. The corpse is bedecked with garlands before it is placed on the funeral pile.

Naturally, therefore, the Castras teem with directions as to the kinds of flowers to be used on particular occasions, as to the time of collecting them, as to how to collect, and who shall collect, and as to the time a particular flower is fit for offering before it becomes stale.

In festivities and ceremonies connected with the *manes* of the ancestors, white flowers, and garlands made of white flowers only, are used. In nuptial ceremonies red, yellow, and white are allowable. In ceremonies connected with the worship and festivities of the goddesses of female energy, red flowers are preferred. But in the following flowers the colour is of no consequence, viz, Karabira (*Nerium odoratum*), Padma (*Nelumbium speciosum*), and Roses. The Padma or the Sacred Lotus is considered the prince of flowers, and the prohibition as to Cudra (*Shudra*) does not apply to this. Padma and some other flowers, such as *Michelia Champaca*, where the work of collecting is arduous, a Cudra (*Shudra*) may be permitted to bring them for the use of a person of the twice-born race.

So far back as Manu, the Brāhmana himself is directed to collect his own Kuça (*Pos cynosuroides*) flowers, Samid, i.e., faggots and water: those collected or brought by persons of the Cudra class, being polluted by their touch, are not fit for use. A Brāhmana should never beg flowers, but he can take them from anywhere without the permission of their owner, for the

act is not a theft. A Bráhmāna must not buy flowers, but he may do so if he pays a heroic price for the same. Flowers should not be collected in the afternoon nor after the midday bath. Flowers growing on trees in a temple, or near a burning-ground, or on a polluted land, are unfit for the purposes of offerings. Stale flowers are unfit for offering. Certain flowers become stale sooner than others. Stale flowers, —flowers not fresh-looking, and flowers dried or withered—should never be used. In collecting flowers one should not denude the plant of every blossom, and the picking of buds which may not open the following morning is forbidden.

The use of flowers, or leaves and twigs, in religious ceremonies, though originating in the Vedas, became general in the later Páras. In the Vedas, the Samid (faggots), or rather twigs, with small leaflets for feeding the fire with, were much valued. The Soma, however, which was squeezed for its juice to mix with fermented barley gruel, superseded all. But what this Soma was it is rather difficult at this distant age to ascertain; more so when the Vedic Yágas and observances have all been forgotten. The Soma was a rare commodity even in the days of the Vedas, and it used to be brought from distant countries on the backs of goats through tracts uninhabited, and infested by wild beasts and robbers. It used to be bartered for cows. The Mojavat Hill is said to be its native land; but where is this Parvat? Scarcity of the true Soma was perceived in the later Vedas, for its substitute, the Pútikā, is mentioned in the later Bráhmanas. This Pútikā again has now become pretty scarce, and there are few experts in the Yajnas who can recognise it and know its habitat. The substitute Soma has been identified by the early Anglo-Indian botanists with the *Sarcostemma brevistigma*. It is an almost leafless twining plant which exudes a milky juice, and it grows in dry and arid soil. With the kind assistance of His Highness Prince Rájā Varmā of Travancore, a few living specimens of the same were obtained, but the plants being impatient of damp, almost all died; the few which survived are now thriving and bearing flowers in the dry climate of Vindhyaçal, in Mirzapur, North-western provinces. A solitary specimen, reared in a hanging pot, is growing with some luxuriance, but it has never been seen to bear flowers here in the moist atmosphere of Calcutta.

The Palāça (*Butea frondosa*), is a Samid or faggot of Vedic antiquity. Its origin is described in a legendary anecdote occurring in one of the Bráhmanas of the Veda, and it is said to have been born of Nectar. With this tree is associated in the Vedas the Khadía (*Acacia Catechu*), but they are both used as Samid or faggots dipped in *ghí* and thrown on the fire just to feed on the same. The Soma and the sacred Grass *Kuça* predominate in the Vedas.

Although the Soma has been forgotten and lost sight of, the *Kuça* Grass still retains its importance. No ceremony can be performed without this grass or any of its substitutes; for, under the rules, a mat made of this grass is specially considered a sanctified carpet, and though it may be dispensed with in certain ceremonies by using woollen carpets, the ring which has to be borne on both the ring fingers made of two blades of *Kuça* Grass, is an indispensable adjunct of every ceremony. A bundle of *Kuça* is equally indispensable, for it has to be held in the left hand while the ceremony continues. Three blades of the *Kuça* Grass tied together with a peculiar knot make up the Pavitri, the purifier, with which every sacrificial object being sprinkled is purified.

The ternate-leaved Palāça in the later periods has, however, been substituted by the Vilva (*Ægle Marmelos*), which has also ternate foliage. Pávanic legends assign a similar origin to the Vilva. The Vilva is said to have been born of Nectar (*Amrita*), hence the Vilva is often styled as the *Amritodbhava*,

i.e., born of Nectar (*Amrita*), which was churned out of the ocean by the joint labours of the gods and the demons, who, in so doing, used the serpent-god *Cesa* as the churning-rope, and the Mount Meru as the churning-staff.

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

MASDEVALLIA FORGETIANA, Krnzl., n. sp.*

A NEW species of *Masdevallia* from Northern Brazil, the home of the old *Masdevallia infracta*, Lindl., one of the veterans of the genus. The leaves are comparatively narrow, glossy, bright green, paler below, blunt or rounded at the apex, and a little shorter than the slender sharply three-angled flower-stalk. About the latter, I am not sure if it be one-flowered or few-flowered; the specimen at hand is one-flowered, but it seems to me that there have been several flowers. The cup or calyx of the sepals is very short, somewhat compressed, with a deep impression below, forming a rectangular chin at the very base of the cup; the free portion of the sepals is very short, the lateral ones especially being united, the top excepted; the tails are about 2.5—3 cm. long, the dorsal one being a little longer than the lateral. The colour of the sepal-cup is very tender tint-apricot outside, &c., and a little more intense on the inside. The petals and the column are very insignificant, and just as in many other *Masdevallias*; the lip, though very small, needs some remarks. It is linear, with a blunt, triangular, thickened, and somewhat warty apex; in the middle there are on each side two small lobes, and two small elevations or calli on the disc. The plant is, perhaps, not a first-rate beauty, like many other *Masdevallias*, but it is nevertheless a nice little plant, and interesting as a *Masdevallia*, coming from Brazil, a country not nearly so rich as the Andes of Peru and Ecuador. It is, of course a genuine tropical Orchid, and requires warmer treatment than the alpine *Masdevallias*. By special request of Messrs. F. Sander & Co., who first flowered the plant, it is named after the collector, Mr. Forget. *F. Kränzlin.*

ANÆCTOCHILUS SANDERIANUS, n. sp. (?)

To establish a new species, flowers are, of course, strictly necessary, especially in Orchids, and nobody is able to describe a new *Odontoglossum* or *Dendrobium* when only leaves or bulbs are at hand. But among the terrestrial Orchids of the Sunda Islands the little group of *Anæctochilus* and allied genera show so peculiar a character in the leaves, that we can assume a species to be new if the leaves that we receive show differences from those of other plants of the same genus. The two leaves I received from Mr. F. Sander belong undoubtedly to a new *Anæctochilus*, and are the most brilliant Orchid-leaves I have seen. Imagine two opposite, broad, oblong leaves, blunt at the top, with a slightly wavy border, dark green and velvety on the upper side, with a network of greenish-golden veins as in *Anæctochilus setaceus*, the underside pale flesh-coloured, with whitish veins. In size the leaf greatly surpasses the dimensions of other known species of *Anæctochilus*, being nearly 11 cm. long (about 4 inches) and 6 cm. broad (2½ inches)—dimensions never reached by other *Anæctochilus*, and rarely by the beautiful *Dossinia marmorata*, which entirely differs in the

* *Masdevallia Forgetiana*, Krnzl., n. sp.—Foliis oblongo-lanceolatis obtusis in petiolum sensim angustatis laete viridibus nitida crasse coriaceis ad 12 cm. longis ad 2 cm. latis; scapo longiore 15 cm. alto, triquetro subtorto monantibus floribus saccadaneis? bractea scariosa longa pedicellum longum (3 cm.) dimidium usque vestiente, ovario-brevi; cyatho floris brevi campanulato infra mentum rectangulum formante parte libera sepalis dorsalis brevi triangula in caudam teretem 3 cm. longam protracta; sepalis lateralibus multo majoribus semi-orbicularibus fere omnino conatis parte libera brevissima in caudas 2.5 cm. longas protracta, toto cyatho pallide persicino intus roseo-adsperso caudis intensioribus; petalis linearibus subfalcatis incurvis apice brevi-triangulis apiculo incrassato; labello aequilongo lineari medio utrinque lobulato, apice reflexo triangulo apiculato carnosio tuberculoso; gynostemio aequilongo, generis.—Northern Brazil, leg. Mr. Forget, Mr. F. Sander's collector. *F. Kränzlin.*

form and position of the leaves, and the two leaves that I received were by no means the biggest. Is it a new species, or only a giant form of *Anæctochilus setaceus*? *Qui vivra verra.* To conclude, by analogy, I incline to regard the plant as being a true species, and I have therefore given it provisionally a name. *F. Kränzlin.*

AN ENGLISH ASTER FIELD:

ASTERS are at once amongst the most beautiful, easy cultivated, and popular of our half-hardy annuals, and, in fact, they deserve more care bestowed upon them than they usually get. The seeds which we purchase are mostly raised in Germany, where the weather in the autumn, as a rule, is more favourable for seed-saving than in this country. While on the Continent large breadths of land are devoted to their culture for seeding purposes, it has not been the custom to grow other than the "Globe" or "Quilled" variety in this country with the same end in view. Messrs. H. Cannell & Sons, of Eynaford, have made experiments in this direction of late years, and Messrs. Dobbie & Co., Rothesay, similar ones elsewhere with results which have justified their firm in making a more extended trial in their new grounds at Orpington, in Kent. The illustration here given (fig. 83, p. 485) is of a corner of Messrs. Dobbie's Aster field, in which were cultivated the Quilled, Victoria, Pæony-flowered, Cornet, Dwarf Chrysanthemum-flowered, and other varieties, to the number of close on 30,000 plants. The seeds were sown in March, the seedlings pricked out in the usual way, and placed in the quarters early in June—somewhat later than usual on account of the drought, from which, indeed, they suffered severely at a later stage. The remarkably fine autumn made up for these and other shortcomings, and we are informed that this year's experiment has been a decided success, and such as to lead Messrs. Dobbie to believe that in the county of Kent, seed of Aster, of the flat-petalled varieties, may be saved to advantage in an autumn of the ordinary character. Other points being equal, we should prefer home-grown seeds to any others.

KEW NOTES.

ARISTOLOCHIA CLYPEATA.—We have at last succeeded in inducing this species to develop its handsome flowers, after having been unfortunate for three years. Hitherto, the logs of October have caused the buds—of which plenty always formed on the old stems in September—to fall before any of them opened. At the present time two plants may be seen in flower, one in the Water-Lily-house, bearing about a dozen blooms; and the other in the T-range. There is a figure, with description of this species, in *Gardeners' Chronicle*, 1892, xi., pp. 433 and 435, which represents the flowers now at Kew, except that the latter are larger and more delicately reticulated, whilst the leaves are smaller. They have no perceptible odour, and are in size 6 inches by 7 inches, coloured inside of a rich velvety dark-brown, beautifully chequered with creamy-white, with a blotch of bronzy-purple above the entrance to the tube. The plant ought to find favour as an autumn-flowering stove-climber. It is quite different from the now popular *A. gigas* Sturtevantii, both in leaf-characters and habit, the leaves being ovate acuminate, slightly peltate, of rather dry and papery texture, with rough venation on the under side, whilst the flowers are always developed from the old corky-stems, and not from young shoots. The Kew plants were received for, and have been grown as *A. gigantea*, a species with somewhat similar leaves and flowers, but the latter are larger. *A. clypeata* was discovered in Colombia (New Grenada), by the collector Wallis, who sent it to Mr. Linden in 1868. There is a good coloured figure of it in *L'illustration Horticole*, 1870, pl. 40.

ALBERTA MAGNA.

This plant was introduced from Natal in 1891, and flowered for the first time at Kew in October last

year. It is now in flower again in the Cape-house, and will probably continue in bloom for some time yet. The habit of the plant is that of an erect, sturdy, freely-branched shrub, with ovate glossy green leaves, and terminal panicles of narrow tubular flowers, an inch long, and coloured of a bright crimson, suggesting, in the effect they produce, those of *Embothrium coccineum*. It is a promising plant for the cool conservatory, and may even prove hardy in the warmer parts of these islands. There is a second attraction in the bright red colour of the leaf-like calyx lobes, which develop

the form of stars, their colour being cream-yellow, dotted with brown, and the whole surface covered with long soft white silk-like hairs, the attraction of the specimen here described will not be doubted, not mentioning the disagreeable odour which excites much curiosity among visitors until its source is discovered. This *Stapelia* thrives only when grown in a hot moist stove—in fact, the Kew plants are grown along with *Dendrobium Phalenopsis*. Possibly many other species of *Stapelia*, which are generally difficult to manage, or, at any rate, to flower in a dry succulent house, would grow better and flower with

are borne on a crowded, branched panicle, which is partly enclosed in a large boat-shaped spathe 18 inches long, springing from the axilla of the oldest leaf. A figure of it has been prepared for the *Botanical Magazine*.

CYCNOCHES HAAGEI.

This distinct species first flowered at Kew exactly three years ago, a year after it had been received from Mr. E. Rand, of Para, Brazil, along with *C. pentadactylon*, which flowered at the same time. *C. Haagei* was first described by Rodriguez, and the

FIG. 83.—MESSRS. DOBBIE AND CO.'S ASTER FIELD AT ORPINGTON, KENT. (SEE P. 484)

after the flowers have faded, and assume a bright red colour. The same character occurs in the allied genera *Mussaenda* and *Howardia*. There are only two species of *Alberta*, the second being a native of Madagascar. *A. magna* is evergreen, and is a handsome Laurel-like shrub when not in flower. It prefers a peaty soil, and enjoys plenty of sunlight.

STAPELIA GIOANTEA.

A well-flowered example of this magnificent *Stapelia* has lately been exhibited in the stove at Kew. It began by developing four large flowers simultaneously, and bore at the same time thirteen buds in various stages of growth. The plant is growing in a 9-inch pan suspended from the roof, and its fleshy, four-angled stems almost completely hide the pan. As the flowers are each nearly a foot in diameter, and in

greater freedom if treated more liberally in respect to moisture and heat.

SCHEELEA SPECIES.

Scheelea is the next genus to *Maximiliana*, of which *M. Martiana* (*regia*) is one of the most magnificent of all Palms, and whose oval-shaped fruits are known in South America as "Kokerites." There is a grand specimen in the Palm-house at Kew which has been grown for this *Maximiliana*, but now that it is in flower, it proves to be a species of *Scheelea*. The principal, indeed one might almost say the only notable difference between these two genera is in the structure of the small flowers. The Kew plant has pinnate leaves 25 feet long, and narrow pinnae from 3 to 5 feet long, each leaf being a gigantic plume as elegant as those of an ostrich. The flowers

name has since been adopted by Mr. Rolfe, who has paid special attention to this and allied genera for some years, with the result that a considerable number of species have been added to our collections. *C. Haagei* has elongated pseudo-bulbs 6 inches long, pale green lanceolate leaves 8 inches by 1½ inches, and a slender arched scape 6 inches long, bearing six flowers, each 2 inches across; the sepals are 1 inch long, lanceolate and keeled; the petals are ovate, flat, and as long as the sepals, their colour being dull olive-green; the lip, which is coloured cream-yellow, with a tinge of rose and a few red dots, is nearly round, flat, 1 inch in diameter, acuminate at the tip, with a pair of teeth-like projections in the centre below the top of the slender arching, green column. The plant is again in flower in the warm Orchid-house.

BULNOPHYLLUM MEDUSÆ.

Two plants of this extraordinary species are now in flower in the Orchid-house at Kew, each bearing two of the drum-stick-like inflorescences. The scapes are about 6 inches long, and the globose heads of flowers, which are 2 inches in diameter, are composed of large lanceolate whitish bracts, and small pale yellow flowers, with sepals tipped with long soft hair-like appendages, which hang down to a length of 3 inches, and are cream-white, with a few small dull-red spots. The plant is a native of Singapore and neighbourhood, and although it has been in cultivation over fifty years, it is rare in collections. Its other name is *Cirrhopetalum*. At Kew it is grown in baskets suspended close to the roof in a hot moist house, along with *Phalaenopsis*. It is worthy of a place in all representative collections, and I believe it is to be bought cheaply. *W. W.*

CARYOPTERIS MASTACANTHUS.

Not only is this a rare and interesting shrub, but it is also one possessing much beauty. It was one of Fortune's introductions from China, but it afterwards nearly or quite disappeared from cultivation. It was, however, collected in Japan both by Oldham and Maries, and by the latter was re-introduced to English gardens about fifteen years ago. It is a member of the Verbenaceae family, and grows to a height of 3 or 4 feet; the opposite leaves are oblong-lanceolate, tomentose, and, as a rule, very coarsely toothed. The small flowers are of a pretty purplish-blue, closely packed in semi-globular cymes, which spring from the leaf-axils at the upper part of the stem. The bottom lobe (or lip) of the corolla is slightly fringed, a character which suggested the now obsolete generic name of *Barbula*. A specimen of this shrub is planted at the foot of the wall of Museum No. 1 at Kew, and is now very finely in flower. Except in the south-western counties of England and similarly-favoured localities, this shrub will probably require at least an equal amount of protection. It was originally treated as a greenhouse plant, but it is as an outdoor shrub that its value is most apparent, for flowering, as it does, in August and September, it is especially welcome. *W. J. B.*

FOREIGN CORRESPONDENCE.

CATTLEYA CANDIDA (*Kth.*) *Lehm.*

(*SYNCH. CYMBIDIUM CANDIDUM*, H.B.K.; *CATTLEYA CHOCHOENSIS*, HORT.)

IN accordance to the laws of priority in naming and describing plants, I consider it high time that this plant should be referred to its original name as given by Kunth. *Cattleya candida* is one of the two first described species of this genus, and although it was placed with *Cymbidium*, Kunth expressed his conviction that it could not belong to that genus on account of its possessing four pollinia. The species is very well described in the *Syn. Plant.* by Kunth, and easily recognised by this description. It may be objected that the plant is not a pure white one, and therefore the name *candida* is not quite appropriate. To this I observe that every author is allowed to name his plants as he thinks best, that there are other plants far less white and yet bear that specification, *vide* *Miltonia candida*, and that the specification "*chochoensis*" is far less appropriate, as this *Cattleya* does not grow in the Choco, but in the Cauca Valley, two quite different provinces.

Cattleya candida is a very variable and very floriferous species in its natural habitat. The masses attain often large proportions, are well shaped, but mostly loose and straggly at its rhizomes. The flowers are produced from three to five—most commonly in threes—on a spike, and borne aloft free of the leaves. In the best strain of the species, the flowers are pure white with the lip pearl-shell-rose at the tube, yellow at the base, and crimson at the dilated apex. There are scarcely two plants in which the cordiform crimson zones of the lip are exactly alike and of the same size and colour. It changes from the

deepest crimson to the most tender rose, but always leaving a white margin. Of conspicuous varieties, there is one with pure white flowers except some yellow at the base of the lip, and another in which the sepals and petals are deep rose and the lip of glowing crimson-purple. This latter variety is the rarest!

Cattleya candida is distributed over the valley of the Cauca from Tulná down to the neighbourhood of Fredonia and Concordia in Antioquia, and restricted to a region that extends from 600 to 1100 metres above the sea-level. It grows on trees high up on their branches in dense woods. The climate of the region is very damp for some six months of the year, and very dry during three months in the time at which the plant flowers. The temperature of the region ranges between 22° and 25° Centigrade. *F. C. Lehmann.*

A TOUR IN LOMBARDY.

The public garden at Milan is one of the prettiest gardens in Lombardy. A small stream flowing through the garden, and traversed in various places by ornamental and rustic bridges, beneath a rich and varied vegetation, forms one of the greatest features of the garden. Amongst many noteworthy trees I remarked several fine specimens of the Maidenhair tree (*Ginkgo biloba*), *Ailanthus glandulosa*, which is very common in Lombardy, several fine groups of *Magnolia grandiflora*, and some very fine trees of *Magnolia conspicua*. The latter was labelled *M. porphorone*, which is probably a mistake. Conifers, especially the *Abies* and *Cedars*, were fine. The flower garden was gay with various flower-beds, carpet bedding being the finest feature. In a subtropical bed I noticed a very showy *Polygonum*, probably *P. filiforme variegatum*, which is very effective, with its large green and white mottled foliage. In an adjacent bed was a very pretty dwarf variety of *Lantana*, free-flowering and pure white in colour.

Extending all round the town is a very fine avenue of Horse-Chestnut trees, which, before the storm of 1873, formed one of the features of the town, but owing to so many branches having then been broken off, they were topped, and present now a rather stunted appearance. The Syrian Mallow (*Hibiscus syriacus*) is used largely for hedges, and at the time of my visit presented quite a feature in itself, so varied are the colours of the flowers. Having made the tour *en bicyclette*, I cannot pass Turin without a remark on its beautiful avenues. Such a variety of trees cannot be found, I should think, in any other European town, for I noted no less than nine species including the Elm, Plane, Hornbeam, Sycamore, Horse-Chestnut, Oak, *Sophora japonica*, *Robinia pseudo-Acacia*, and *Acer*, and each rivalling the other in beauty.

After crossing the Maritime Alps, a vast plain is traversed through fields of Hemp and Maize, and a few fields of Rice near the rivers, but the crops are chiefly the two former. I was most surprised to find that fruit is not grown in this part, as the soil and aspect is certainly favourable for it. Leaving Milan *en route* for Genoa, one soon gets again into the famous Vine country, where a good bottle of *vin d'Asti* is very acceptable to a bicyclist who has done fifty miles before dinner. *Riviera.*

FOOD REQUIREMENTS OF THE CHRYSANTHEMUM.

(Continued from p. 181.)

Having written my article about a year ago, and long since got the question answered to my satisfaction, and the present being a busy time, I shall try to answer Mr. Dyke as briefly as possible. I did not write, "I have got a complete analysis of the soil;" but, on the contrary, "if we have not got a complete analysis," which the editor will find in my manuscript, and it is corroborated by what follows. I have farmed the land from which the loam was taken for the last three or four years only, and know it therefore to be of poor quality, it having been very badly farmed by my predecessor in the tenancy, but not lacking in potash; and this sub-

stance, if used alone, or in conjunction with nitrates and phosphates, does not perceptibly increase the yield of any crop, not even Strawberries or root crops. I do not think a well-managed rubbish-heap, consisting of weeds (always with soil adhering), wood-ashes, and finely-broken charcoal, night-soil, and refuse-plants, well mixed together, by being turned over several times during a year, is so much appreciated in England as it deserves to be—at least, Mr. Dyke seems to have no faith in its value as a manure; and yet it is the cheapest as well as safest one available, forming an excellent soil for pot-plants, by mixing it with fibry loam, even if that be of poor quality. Without boasting, I would mention that I have thirty years' practical experience in England, Belgium, France, and at home, as a gardener, so that I ought to know something about the mechanical and other conditions of soils used in potting.

But to return to the artificial manure question. I suppose I am obliged to quote the different mixtures and analysis again if anybody is in the least to understand the matter:—

Constituents.	Parts of Mixtures recommended by		
	Mr. Willis.	Mr. Dyke.	Used by me.
Kainite	3	4*	3
Basic slag	5*	3
Superphosphate ...	3
Bone-meal	6*	...
Nitrate of soda	1	3	...
Nitrate of potash	5	...
Sulphate of ammonia	1
Phosphate of potash	1
Magnesia (sulphate of?)	...	1½	...
Sulphate of iron	½
The above ingredients in the proportion to soil of	1·250	to be mixed 1·25 1·16 altogether	1·400

Table showing percentage of *Chrysanthemum* Ash and of *abn* Manures.

Constituents.	Chrysanthemum Ash.	Mr. Willis' Mix ure.	Mr. Dyke's Mixture.	Used by me.
Potash	16½	7½	14½	12
Soda	10½	15	8½	12
Lime	26½	18½	28½	19
Magnesia	10½	5½	11	15
Phosphoric acid	19½	19	19	17
Sulphuric acid...	4½	38	11	15
Iron	3½	1¼	3½	(?)
Chlorine...	3	2)	5½	11
Silica	5½	...	2	(?)
Nitrogen	3†	3	6	4

These do not look so entirely different from each other or from the ash; in fact, good results are generally obtained with artificial manure that is in less accordance with the constituents found in the ash of plants, and if this was not the case they could never be used without a complete analysis of the soil being made beforehand. No, the cause of my non-success is quite different, but I will return to that a little later; first a few words about quantities recommended, or actually used. When I am going to use artificial manures for plants in pots, borders, &c., I ask, what is the largest quantity of similar manure used profitably by farmers? When my plants have a restricted root run and they are gross feeders, and the substance to be used is of a harmless nature, I use double that quantity, and of course trying to make its composition in accordance with what is known about the needs of the plants.

Now, the rate of application is one of manure to four hundred of soil, which comes out as something like 2000 to 3000 lb. per acre, reckoning depth of soil at 7 to 8 inches (rather too little), and an average weight of 40 to 50 lb. per cubic foot (this varies very

* These ingredients to be mixed with the soil; the rest in this column to be used as top-dressings by-and-by.

† In fresh plant.

much). Mr. Dyke recommends one of manure to twenty-five of soil, to be mixed at once, with top-dressings following of 1-16, or something like 50,000 to 60,000 lb. per acre. I did not mix the ingredients together before using them, they were simply weighed from the bags, strewn on the heap of soil, and at once thoroughly mixed with it by several turnings. The ammonia may have been liberated in the soil, but the latter will absorb and hold fast a much larger quantity. So I had my four per cent. of nitrogen besides that contained in the soil, and in the one-fifth of good half-rotted stable-mannre; and calculating the amount of nitrogen in this to be 10 to 12, or 15 lb. per ton, every practical cultivator knows that good soil, with an addition of one part stable-mannre to four parts of soil is not lacking in nitrogen when first mixed and for some time afterwards. In fact, many Chrysanthemum growers obtain good results with this alone. And yet I came to the same conclusion as Mr. Dyke in regard to Chrysanthemum potting-soils lacking in nitrogen, as notwithstanding the good supply of nitrogen at hand, the plants were suffering for lack of it, because they are able to absorb it only in the form of nitric acid, and not as ammonia; not even the sulphate of ammonia (not organic) could be transformed into nitric acid. Otherwise this would be quickly done by Chrysanthemum plants afforded sulphate of ammonia, and with about the same result as Mr. Dyke gets from nitrate of ammonia, viz, the appearance of very dark green leaves in a few days.

Here comes the only difference of any consequence in the composition of Mr. Dyke's manure and mine. He afforded nitrates, and I ammonia (or organic nitrogenous substances), and his plants obtained their nitrogen from the nitrates, and not from the soil. But it is quite impossible for Chrysanthemums to be manured solely by artificial substances independently of the soil used. We want a concentrated, effective, but above all, harmless supplementary manure—and kainite, at all events, is not such a one. The price of an article is also of some consequence, and it should be bought in quantity and not in a small way at a high price at the druggists.

I cannot see the force of Mr. Dyke's remarks about the harmfulness of chlorine, sulphuric acid, and lime, when he himself uses the same substances in a much larger proportion to soil than I do, and with good results. His proving that Chrysanthemums may be grown in soil containing 1 part of the above-specified manure to 16 (or 25) parts of soil is very interesting. *M. P. Andersen, Jönköping.*

ORCHIDS IN THEIR HOME.

(Continued from p. 423.)

CATCLEYAS—The Cattleyas are found at from 2000 to nearly 5000 feet above sea-level, almost invariably growing on living trees, on the trunks or in the forks of the branches. They always try, as it were, to establish themselves in places where they receive abundance of light and a glimpse of sun. Sometimes, indeed, they are exposed to the full sun. The latter, as a rule, are the best plants. At the lowest elevation they will persistently follow the course of streams. Higher up they may be found growing in deep hollows or gullies, and at the last stage they are found in all exposures. This is easily explained by the atmosphere being charged with more moisture than at the lower elevation, where a dryer heat prevails. Most of the Colombian Cattleyas and also other Orchids have no well-defined resting periods, as far as I have observed, within almost two-thirds of the entire territory. There are two rainy and two dry seasons in the year, while even during the dry seasons it is not an infrequent occurrence to have a shower of rain now and then.

Plants of *Cattleya Trianaei* are found in flower almost the year round, yet there are two marked flower seasons, December to January and May to June, the latter being the chief. A number of plants would have four and five flowering leads already fully up, with another half-grown break at its base, while very often a third would be starting. Such breaks

always seemed to grow and mature in much less time than the mother bulb, in order to, as it were, in one united effort display their floral treasure.

GEOGRAPHICAL RANGE.

The Republic of Colombia is very rich in Orchids, the different species being spread over its entire territory. The greatest number of species, however, is probably to be found on the eastern foothills of the central Cordillera, which is a continuation of the Peruvian and Equadorian Andes; but upon entering Colombia they branch out into three distinct chains, known as the Central Cordillera, the Eastern Cordillera, and the Western Cordillera, forming between them the immense valley and river systems called the Cauca, the Magdalena, and "Los Llanos de St. Juan," or the "Cazanara." This latter immense territory is drained principally by the Amazon and the Orinoco systems, great stretches of which are as yet unexplored.

The State of Tolima may be considered as the home of *Cattleya Trianaei*. It follows the eastern foothills of the Central Cordillera from about the second degree to about the fifth degree northern latitude, and at its southern limit it is distributed over all the three chains. This latter region is also the home of *Odontoglossum crispum Lehmanni*.

Cattleya gigas takes the place of *Cattleya Trianaei* further northward, where it extends between the sixth and the eighth degree northern latitude on both the central and eastern chains. This territory is exceptionally rich in useful species, such as *Cattleya chrysozona*, *Miltonia vexillaria*, *Odontoglossum lateo-purpureum*, *O. spectrum*, *O. coronarium*, *O. Wallisii*, and *O. Harryanum*; also *Cypripedium Schlimii*, *Maxillaria lateo-alba*, *Epidendrum fimbriatum*, and *Masdevallia* in variety. Sansan, however, may be considered as the principal district for the latter.

I found *Miltonia vexillaria* as low as 2000 feet above sea-level, and as high as 6000 to 7000 feet, but at the first-mentioned altitude the plants were generally very small. It generally grows on smaller trees and branches of *Melastomas* and *Quercus*. *Odontoglossum coronarium* is found at a very high altitude, often growing on the ground or in masses, where it rambles for yards until it finds a tree suited for its requirements. The magnificence of the flower-spikes surpasses imagination.

ODONTOGLOSSUM CRISPUM.

On the Eastern chain *Odontoglossum crispum* is found, principally between the fourth and sixth degree northern latitude at an altitude of 6000 to 9000 feet. The best plants and the best varieties, however, occur at 6,000 and 7,000 feet elevation, where they grow in occasional openings of the forests on the trunks and branches of large trees, and where there is an abundance of light. In company with *O. crispum* grow *O. Lindleyanum* and *O. gloriosum*.

Further northward, or in the state of Santander, *Cattleya Mendeli* occurs, and on the eastern foothills of the eastern Cordillera, *Cattleya Schroderae*. On the Western chain or along the Rio Cauca, *Cattleya Chocoensis* is found. Unlike its allies, it grows to a great extent in forests on level land, stretches of which are swampy and unhealthy. This *Cattleya* is very abundant in certain places, and grows invariably on trees. The flowering season is August and September. In this region may also be found *Odontoglossum Rozellii*, growing in a comparatively high temperature.

THE END IS APPROACHING.

Many of the New Granadan Orchids are rapidly decreasing in quantity. *Cattleya chrysozona* is very near extinction, *Miltonia vexillaria* is going fast, as are also *Cattleya Mendeli* and *Odontoglossum crispum*. *Miltonia vexillaria* and *O. crispum* increase rapidly from seed, where the forests are not already destroyed, or they would have been extinct ere this. The natives are also beginning to deal more considerably with the forests, besides which many of the landowners and even the respective governments are taking precautions against the total destruction of their most beautiful jewels. And can you blame them? From a lecture by John E. Lager, reported in "American Gardening."

FORESTRY.

INSECT ENEMIES TO TREES.

The best authorities assert that high cultivation and the proper rotation of crops is the most effectual remedy or preventive of insect attack, and in many cases it is the only practical one. So far as this country is concerned, it may be reasonably contended that the injury caused by few, if any, insect attacks to which our crops are liable, equals the injury caused by a single night's frost in May or June, or a severe hailstorm later in the season. This is probably the reason why cultivators in general pay so little attention to insect pests outside gardens and forcing-houses, where preventive measures can be adopted with good prospects of success, doubtless thinking it useless to strain at the gnat when they have already swallowed the camel.

If this be generally true of farm crops, it is much more so when we come to forest trees. In this connection it must be remembered, however, that our trees in Britain are free from many of those insects which commit such serious ravages upon the same kind of trees in continental forests. The Scots Pine with us has no very dangerous foe among the Lepidoptera, while on the Continent it has at least three which may be thus classed. Among beetles, the Pine-beetle and Pine-weevil are certainly troublesome, but considering that the very existence of the former is practically ignored in most parts of the country, it has evidently done less permanent injury to Pine trees (outside small plantations and isolated clumps) than its habits would lead one to infer. The Pine-weevil is principally confined to the northern parts of the kingdom, and from its size and habit of attacking small and newly-planted trees, is brought into more prominent notice than would otherwise be the case. The Pine saw-fly again, although occasionally assuming a dangerous aspect, gives little trouble as a rule.

Coming to deciduous trees, where have we a pest which gives us any real cause for alarm? The Oak-leaf roller-moth, *Tortrix viridana*, strips our Oaks to winter bareness in dry and blighty springs, but the midsummer shoots put matters right in the course of a few weeks, and the trees seem but little the worse. Many insects, especially beetles, doubtless get a bad name from their well-known habit of attacking old and half-dead trees, and thus hastening their natural decay; but in this they merely act as Nature's scavengers. As a matter of fact, an attack by any of the bark-beetles upon a tree, or part of a tree which still retains a vestige of life, is extremely rare. The least flow of sap is sufficient to stop the female in her boring operations, and numbers of commenced but abandoned galleries may be noticed in trees which are practically dead, but in which life still lingers in one or two branches.

For our comparative immunity from successive and serious attacks of caterpillar swarms, we probably have to thank their natural parasites and enemies. Where human beings are at all crowded together, these epidemic diseases occur; and the insects would seem to be affected in like manner, for a year in which a serious plague of these creatures appears is often followed by one in which they are comparatively rare. Bacteria and other forms of parasitic fungi probably play a great part in regulating the numbers of these prolific creatures, and were it otherwise, our trees and shrubs would be deprived of every green leaf. A pair of moths or beetles may become the happy progenitors of about 5000 individuals in the course of a summer, so it may easily be imagined what would happen if this went on unchecked for a few years. As it is, attacks of caterpillars sometimes occur in the Pine and Spruce Fir forests on the Continent, which threaten their very existence, and even affect the prosperity of the district they infest.

As an instance of this, it may be mentioned that the attendance at several German watering-places on the Baltic coast has seriously fallen off owing to the swarms of caterpillars in the neighbouring Scots Pine woods. These caterpillars are furnished with long and poisonous hairs, which, at the periodical

casting of their skins become detached, and poison the very atmosphere over a considerable area. But such cases as these in this country are not among the probabilities, and we may safely confine ourselves to easy and inexpensive measures of preventing, or rather alleviating, the more severe attacks which occasionally occur, trusting to climate and natural laws to do the rest. *A. C. Forbes.*

OLD-TIME ADVERTISEMENTS.

A COLLECTION of last-century newspapers lately came into my possession, and it astonished me to find numbers of advertisements having reference to the seed and nursery trade in their pages. I have called the following quaint announcements, which cannot fail to interest many in the present enlightened days, as they serve to illustrate the desire of traders to use the Press as a means of pushing their wares, even in times when newspapers had but a very limited circulation. *Seedsmen.*

From the *London Journal*, July 15, 1721:—

"Just brought over from Holland, a fine collection of Orange and Lemon trees, both plain and variegated, with the finest cream and yellow colours, of the best sorts, full of fruit and flowers, of all sizes, fit for the Orangery, or to adorn ladies' chambers. To be sold very cheap, by James Letley, at Mr. Frasier's, next to Beaufort House, near the waterside at Chelsea; where all gentlemen and ladies may be furnished with the most curious forms of bulbous roots from Holland, and other parts of Europe, at the lowest prices."

From the *Country Journal*, November 15, 1729:—

"To be sold, a parcel of standard Elms, of about eight years' growth, now standing and growing at Mr. James Norris's, nurseryman, the backside of Lambeth Wells. Enquire of the said Mr. Norris, who is empowered to treat with any person for the same."

"German Dogtail Grass—sweeter than other grass, and makes with seedings as beautiful lawns as the closest shaven bank. To be had in papers done up at 5s. each at Gregg's Coffee House, York Street, Covent Garden."

"Also American Cabbage seed which comes to 80 lb. weight and near to £40 an acre value, price 10s. per pound. Hungarian Clover exceeding Lucerne, price 7s. 6d. per pound."

Here is an announcement of quite another character, which clearly portrays what a jovial time the florists of the day must have made of their exhibitions. It is taken from the *Kentish Gazette*, April 13, 1776:—

"To the florists. On Tuesday next, the 23rd inst., there will be a Polianthus feast at Mr. Richard Pain's, at Waldeshare. The best flower produced will be entitled to a prize of 10s. 6d., the second best to 7s. 6d., and the third to 5s. No person will be admitted to shew a flower, unless he has subscribed 1s. one month before the day of shewing, or 2s. 6d. on that day. No person will be entitled to a prize unless it is rose-eyed, has six pipe, and in the house before one o'clock. Much company expected. Dinner on table at one o'clock."

A curious illustration of a plant in pot accompanies this notice.

From the *Evening Post*, March 29, 1787:—

"FLOWERS.—John Allport, seedman and nurseryman, Hackney Road, begs leave to inform those ladies and gentlemen and the public that he has now in full bloom fine Roses, Pinks, and other curious Forced Flowers in Pots and for Nosegays, and will continue a succession all the season. Likewise Greenhouse and Hardy Plants, Trees, Carnations, Flower Roots, &c., also all kinds of Seeds for the Flower and Kitchen Garden warranted of the best quality."

The *Newcastle Advertiser*, October 30, 1790, contains a lengthy advertisement for—

"Fruit and Forest Trees, Flowering and Evergreen Shrubs, of John Richard & Co., Leith Walk Nur-

series, Edinburgh. Standard Apples are figured at 6d. each, Dwarf, 4d."

The *Leeds Mercury*, November 30, 1793.

"Thomas Barnes, Nursery and Seedman, Brigade, Leeds, begs to announce that he has received a fresh supply of Garden and Bird Seeds. His Nursery Stock is young and healthful, notwithstanding what some evil-disposed persons may have said to the contrary."

The *Middlesex Journal* for February 15 to February 17, 1776, contains the following curious advertisement about a species of grass that is now handled by the ton:—

"American Cock's-foot grass yields larger than any other, lasts for ever on the land, and smothered all weeds."

THE HERBACEOUS BORDER.

TROPEOLUM SPECIOSUM.

THERE are few finer hardy climbing plants than the brilliant-flowered *Tropeolum speciosum*, where it does well. To any one desiring to give it a trial, the present season offers a good time to make preparations by securing fresh and plump roots, which are usually to be obtained in pots, and planting them without delay. One of the chief points to be observed is, to plant the roots 8 or 9 inches deep; there is no necessity to disturb much ground, and it need not be dug deeper than 1 foot. Place a little decayed manure in the bottom of the hole, covering this with soil, and make it firm. Then plant the roots at the depth stated, and make the soil quite firm over them. The plant appears to prefer a firm soil and comparative dryness, seeing that it more frequently succeeds in a hedge-row, or at the foot of a dwelling-house wall or some similar place. It dislikes frequent disturbance. Where it can be established, it is an excellent plant for covering dark-leaved shrubs, and in such positions its profusion of brilliant flowers display themselves to great advantage. *J.*

CHELONE BARBATA.

This is a beautiful hardy herbaceous perennial plant, an abundant bloomer, with spikes of light scarlet-coloured flowers, which grow 2 feet high; it is, in fact, a Pentstemon in miniature. A plant of this species has been in flower at Basing Park for four months, and still keeps up a brilliant show by throwing up constantly new flower-spikes. Ordinary garden mould suits its requirements, and it is so hardy, that without any protection it withstood the rigours of last winter unharmed. Propagation is by division, and seeds sown in the month of April. These seedlings flower at the end of the first summer. *Wm. Smythe, The Gardens, Basing Park, Alton.*

PRUNING FRUIT TREES.

AFTER reading this paper a week ago, I thought the description "most interesting paper," should be altered to "most extraordinary," coming, as it does, from a fruit-grower. I shall say nothing more about Mr. Pearson's description of the different schools of pruners than that it is impossible to identify them by it; but when he descends to practice one can deal with him. He says the first object of pruning fruit trees is to obtain fruit, and further on he adds—speaking of standards—"that all branches must be so disposed as to admit the sunlight and air into the middle of the tree—for without this fertility was impossible." Will any fruit-grower who really knows how an Apple or Pear tree develops itself endorse this statement? A tree can, by much needless mutilation, be made to grow in the shape of a basin, which is the plan of those who admit light "to the middle of the tree;" and I once worked in a noted garden where the standards were all of that shape inside the walls, but where the chief supply of fruit came from an orchard outside, where all the trees were unpruned, and of the shape of umbrellas more

or less, in which no light or air in the sense understood reached the middle of the tree at all, and I have noted thousands of similar examples since. Left to itself, a fruit tree produces a round, or, as Dr. Lindley said, a "hemispherical" head, "towards the outside of which fruit-spurs and leaves are most abundant," and this is the kind of tree (the opposite of Mr. Pearson's) that every casual observer is familiar with, but in which, according to Mr. Pearson, fertility is "impossible." This shape also produces the greatest quantity of fruit in a given time, and exposes the fruit to the sun and air better than any other form, no matter whether the tree be dwarf or tall. This fact is so evident everywhere, that one wonders to hear it questioned.

It is amusing to read Mr. Pearson's contradictory directions on the subject of standards and cordons. In their habit of bearing fruit there is not an iota of difference. According to Mr. P., young standard Apples, Pears, and Plums are to be cut back in their shoots to one-third their length. This is to secure "form," &c., though in what way this secures anything but a smaller tree and less fruit, under equal conditions, is a puzzle. Cutting two-thirds of a healthy tree away for the rubbish-heap is an extraordinary idea, but in his cordons the leading shoots are, we are told, "left as long as possible, bearing in mind the fact that the more one pruned away the stronger would the growth be from the remaining buds, let them err rather on the side of cutting away too little than too much." Exactly! and it is the same with the individual shoots of standards, practically cordons, no shortening being needed except to secure balance and prevent a too straggling habit. About ten years ago I gave one of my men some Apple trees for his garden, on the condition that he never touched them with a knife, which condition has been observed, and the trees are now of the "impossible fertility" shape, but marvels of fruitfulness all the same. But individual examples are superfluous, for no one can help seeing such as I describe, anywhere. If the "little band" of mutilators which Mr. Pearson alludes to still exists, the sooner it follows the "ten little nigger boys" the better for fruit growers, I should say. I am at one with the Rev. W. Wilks of the Royal Horticultural Society, in his paper read at last year's conference, and published in the transactions, in which he "is strongly of opinion" that young standards, half standards, and bush trees "need very little pruning at all, and that you will do less harm to your trees by leaving them all quite unpruned, than to allow ignorant experiments to be made upon them," and Mr. Wilks, like Mr. Pearson, is writing for the "ordinary amateur." *J. Simpson.*

A FIRE-TREE.

FROM the Foreign Office Report for July, 1895, on the agricultural products of Tolima, Colombia, we extract the following particulars relative to the Chaparro tree (*Rhopala obovata*), and its wonderful faculty for surviving under circumstances fatal to other forms of vegetation. Its power of resisting the ravages of fire is particularly remarkable. Thus, we read that, in Tolima, "no conservation of the natural fertility of the land has ever been taken into consideration. On the contrary, the natural grasses, intermixed with scrub or brushwood, have been systematically burned from year to year, and the burnings effected during the most scorching periods of drought. The principal object attained by this process of despoliation is the reproduction of new and tender herbage or pasturage, which, with the advent of the rainy season, forthwith covers the parched surface. . . . This persistent burning of the savannahs and hills for crops of renewed pasturage, plays desperate havoc with all other vegetation, trees, and brushwood. Isolated Palm trees, with their intensely hard trunks and endogenous structure, together with groups of brushwood in sheltered or humid spots, sometimes withstand the fury of the flames. There is, however, one phenomenal exception to this subversive power of the fire. A humble tree, with contorted and rugged trunk and branches,

and scabrous leaves, a tree presenting the most subdued and weird aspect conceivable; this pigmy tree not only resists the fury of the flames, but fire is actually congenial and subservient to its existence, for the tree, instigated by the conflagrations, forms itself into great plantations. The name of this tree is Chaparro (*Rhopala obovata*), indigenous to Colombia and other South American countries. It attains a height of 15 to 20 feet, and its distorted trunks measure from 9 to 12 inches in diameter. It is widely distributed in Colombia, for I have found it at the Sierra Nevada of Santa Marta, and

plantations. There is a popular belief in Tolima, where alluvial gold abounds, that this tree flourishes only on those seductive lands, serving as a guide to searchers after the precious metal.

"The bark of the tree is peculiarly constituted. It consists of a congeries of integuments or semi-detached layers. The outer portion, about $\frac{1}{2}$ inch thick, performs no organic function, and this portion of the bark, in conjunction with its peculiar composition, protects the inner vital integuments from injury by fire.

"The form and structure of the tree may have

slopes and ridges of the hills to the flat savannah, on which it is seldom found in any considerable quantity, though widely dispersed. Fire rages with far greater fury on the slopes and ridges of the hills than on the plains. I, however, attribute this preference of the plant for the hill-sides to the pernicious influence of the accumulations of water on the plains during the rainy season.

"The illustrious Humboldt, during his travels in South America, noted the dispersal of this plant on the vast llanos stretching from the Orinoco, &c. These llanos are, for the most part, destitute of vegetation other than Gramineæ. The only trees that were found on many parts of these dreary wastes were specimens of Chaparro, and in more humid spots a Palm. Thus, referring to the llanos which he traversed, he says, 'For many square miles not a tree to be seen, but where a few solitary trees are found they are, in humid districts, the *Mauritia* Palm, and in arid spots the *Rhopala complicata*.'

"Vast deserts and semi-deserts abound throughout the tropical world, many hundreds of thousands of square miles. It may be that the Chaparro is destined to play an important part in the reclamation of these illimitable wastes, for the decomposed leaves gradually form a crust of vegetable mould."

ODONTOGLOSSUM CORONARIUM.

THE specimen of *Odontoglossum coronarium* in the collection of Wm. W. Groves, Esq., The Larches, Alderley Edge, Cheshire, is a notable one. It is growing in a square teak raft about 2 feet square, in a mixture in which growing sphagnum moss predominates; the whole surface is a living mass of sphagnum, and beautiful it looks with the great coriaceous pseudo-bulbs attached to rhizomes springing from its midst. There are eleven such pseudo-bulbs clad with leaves, and others rid of them, forming feeding auxiliaries. The representation (fig. 84), shows the habit of the species, and indicates in a measure the stiff leathery-like leaves crowning the pseudo-bulbs, which are ovate and entire, and thick and leathery. The flower-spike springs from the matured growth; and even the second from the lead, which is thoroughly matured, must wait its turn for floral development. The spike is carried on a strong footstalk, and the flowers are crowded to, rather not unlike a Hyacinth spike. There are twenty-four such flowers on the stalk, each of which is about the size and form of an ordinary *O. crispum*. The dorsal sepal is ovate; and the two inferior ones rectangular-ovate; the colour is rich sienna with golden crimped edges; the petals are ovate, bluntly acuminate, with golden clouds shining through the sienna-ground. The lip is ensiform, the throat bright, a brown crest, and an orange base; the column is short, almost sessile, with the wings yellowish, tinted with Indian-red. The freckled-coloured column imparts a certain style of beauty to an otherwise distinguished member of the tooth-tongued *Oncid*. It is kept in the cool air of the *Odontoglossum*-house, and is afforded a copious supply of moisture. The plant is now so large, that we may expect to see it flowering year by year. No check in the way of drying, or pushing with extra heat is at any time practised. Mr. Groves' beautiful plant is under the charge of Mr. Edwin Robertshaw, who is cultivating not only the *Orchids*, but all the other departments under his charge, with marked ability. J. A.

OUR POULTRY.

BY HARRISON WEIR.

(Copyright.)

(Continued from p. 238.)

As shown, the introduction of the Shang-hai and Cochin fowl has had the effect of seriously depreciating many of our English breeds for table purposes; the large coarse bones, thick skin, and lack of breast meat, coupled with a considerable amount of fat, and a persistency for incubation, has rendered the

FIG. 84.—ODONTOGLOSSUM CORONARIUM.

(In the Gardens of W. W. Groves, Esq., The Larches, Alderley Edge, Cheshire.)

dispersed inland 1000 miles from the sea. In contact with the great forest, it maintains a precarious existence. But, as already explained, it usurps dominion in places where no other tree can grow. In Tolima it abounds on the slopes and ridges of the hills at elevations from 1000 to 3500 feet. In this department alone hundreds of square miles of the lower hills, which have been reduced to sterility by incessant burnings, are occupied by this diminutive tree, and it assumes the aspect of vast systematically formed and well-kept plantations. This is more than a triumph of the 'survival of the fittest.'

"It is very remarkable that these fire-begotten plantations are nowhere crowded to excess; on the contrary, the trees are so regularly placed that their aspect vies with that of the most carefully-formed

originated from the severe ordeal through which it has survived. For instance, according to the theory of natural selection, some animals when they migrate into a colder climate become covered with thicker fur. As we have seen with regard to this plant, the powers of nature have been encroached upon, i.e., the plant having emerged from a state of nature it has made for itself a law of its own, for it has triumphed over the most disastrous element to all organic life.

"The hundreds of square miles of worn-out land covered by this beneficent tree in Tolima alone are undergoing a slow process of amelioration, which, moreover, could be easily accelerated by the interposition of a few simple devices.

"It is noteworthy that the Chaparro prefers the

crossings with the old English fowl both dark fleshed and strong in flavour, and to most persons' thinking unpalatable. And yet this crossing and re-crossing, and Mongolian goes on, and seemingly with the approval of a public apparently ignorant of what a good, really good, high quality fowl should be.

But another mischief has arisen, and that is, that there is an supposition that a buff or coloured egg possesses greater richness of flavour, and is more nutritive than the old Kent, Sussex, and Surrey fowl's white eggs, forgetful, of course, that not only does much depend on the food, runs, the woods or pastures to which the stock is confined or has access, and also what the one and the other has to maintain in full health, and deliver when hatched the same-sized chick; therefore, the difference, if difference there is, must be very slight indeed, if any, possibly that of the higher class table-fowl, may be more delicate. But the absurd preference by some for a coloured egg-shell goes far to prevent the farmer and raiser of poultry from having any but those of the Asiatic cross, because there is in some localities, though happily not in all, a more ready sale for these than the purely white. For my own part, I prefer the fine-shelled white, such as the Hamburgs and old English game, or the larger Kent, Sussex and Surrey old breeds.

Next, I must call attention to an excellent breed of French origin, called "Houdans." These came into favour some forty years since, and gained at once much notice, and that of a favourable character, as being useful for the table, and layers of an unusual quantity of medium-sized white eggs; they are evidently a cross with what is now termed the "Polish" and the old five-toed fowl, that has been known both in France and England for centuries. They are good foragers, and of a medium size, rather short on the leg than otherwise, with round, full, plump breasts, though longer in the body than our old Kents, the flesh is white and delicate, and they generally fatten well. On their first importation, they showed more clearly their origin, having but small top-knots, and the cavernous nostrils of the Polish or Hamburg, and the large frames of our five-toed fowls, which is also a part of their development. Their colour, when first brought into notice here, was white speckled with black, with mainly, if not sometimes entirely, white legs. Now, so fashion wills it, they are black with white speckles and dark legs freckled with white, and the top-knots are considerably enlarged, to their detriment as a farm-yard or farmer's fowl, inasmuch as it is liable to get clogged with mud, and to render seeing somewhat difficult; still they may yet be considered both useful and ornamental. I have not found them to be good sitters, and some strains are said not to incubate at all. The chickens are very fragile, and if the weather be wet and rainy, they are difficult to rear; and are, I think, very liable to croup or severe colds, unless they have perfect freedom, and are allowed in summer time to "roost out," which they will readily do, being excellent flyers. I may here mention that most poultry is benefited by having as much air as possible. Life in the open, in woods, cart lodges, &c., suits them far better than hen-houses. My own, just built, have no fronts to them, or if it is necessary on account of foxes, wire fronts might be put, with wire-netted doors. Many years ago I adopted this plan, and found it most successful, though even then many of the fowls, both young and old, would roost in the trees or on the faggot-stacks, and this even in winter.

Now that I have written thus far on the subject, I would like to call the attention of my readers to the fact, that if they require any information on the subjects already dealt with, I shall be most ready to give it as far as I am able, and also to receive letters of experience of the various breeds by amateurs, gardeners, &c., which will be most welcome; and for this reason, that it is well to know of the different breeds under certain conditions of both confinement in runs, or of perfect freedom in high, low, damp or dry localities, for be it known that under such varied climates and

surroundings, poultry, like all else, is often materially altered either for the better or the worse, and some breeds more than others.

There are other French breeds besides the Houdan; the best, possibly, is the "Crève-cœur." It is a fine, large, handsome fowl, broad and thick made, and is black, with a top-knot, muffed and bearded. The carriage is upright, and somewhat imposing, the tail large and full, and carried high; the legs are black. But as a table-fowl it stands in high esteem, both here and on the Continent, where, when well fattened, it fetches very high prices, the flesh being remarkably white, short in fibre, rich and delicious, besides which it is well-proportioned, with a large, full breast. It is not quite adapted to our climate, oftentimes suffering from weakness of the legs, and is subject to colds and catarrh. It is not what may be termed a good layer; but in this respect some are better than others. The chickens also are not over-hardy, but generally do well after they have got their "head-feathering." They require keeping warm and dry, and when the land is wet it is almost sure to bring disaster, if not total extinction; and yet when all things are favourable, there are few better fowls for the table, if any, when black legs is not a consideration.

(To be continued.)

THE WEEK'S WORK.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

ROCKERIES AND HARDY FERNERIES.—Careful attention should now be afforded strong-growing trailing plants, thinning, and making them trim, so that they do not overgrow smaller and more delicate plants. Remove decayed foliage and flowers from all plants, pricking over and top-dressing the soil about Ferns and alpine plants. For the latter purpose use loam, mill-stone grit, leaf and peaty soil, pushing it into the crevices, and covering the roots that have become exposed. The planting of Crocus, Tulips, Squills, and other bulbs and spring-flowering plants thinly in vacant places about the rockery affords brightness in the spring months. Fallen leaves should be gathered up frequently, as if allowed to lie about, the plants are rendered tender, and liable to injury by frost. If the formation of a rockery is contemplated, there is usually more time at this season than any other to do the work. The question of introducing rockwork into flower gardens should be carefully considered before it is undertaken, as there are much labour and expense attending its formation, and the results are not always satisfactory. It should always be of a size proportionate to the size of the garden. As a rule, rocks or mounds of roots are not nice in fine gardens, but they may be made interesting and effective when arranged with trees and shrubs as an approach to a kitchen garden or other department. If it is intended to cultivate alpine plants upon the rockery, a knowledge of the requirements of the plants to be grown is very necessary, some species requiring shade, others partial sunshine, and others again full sunshine. The best place for alpinists is the rockery, and the worst the rookery. The soil may consist of loam, leaf-mould, and peat, varying in depth from 3 to 18 inches. Roots and stumps of trees may be used with advantage for the formation of mounds for Ferns, herbaceous, perennial, and trailing plants. In all arrangements of this description a good supply of water is necessary for forming basins, falls, and fountains, and it should not be forgotten that perfect drainage is necessary in a rockery. Limestone, sandstone (millstone grit) are the best sorts of stone to use. Good varieties of alpine plants are obtainable at many good nurseries, so that it is not necessary that I give a long list of names in this article. Many of them are extremely beautiful in spring and throughout the summer, and their cultivation, if sometimes associated with difficulties of various kinds, is a source of great pleasure to lovers of plants. The same may be said of the Ferns cultivated on rockeries and rookeries, of which there are numerous species and varieties, and some are indigenous to Britain. Providing there are shade, moisture, and variety of aspect, Ferns never fail to do well.

THE KITCHEN GARDEN.

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

REFUSE HEAPS.—The weather having become wet, the garden workmen will be employed at jobs which do not involve the trampling of the soil, and one of these is the turning over, sifting, and mixing together of the accumulations of various kinds commonly called rubbish heaps. The rougher portions may be thrown into large heaps, long stable litter being mixed with them, mixing it altogether in one large heap. This makes excellent dressing for various crops when well rotted. Common salt or lime may be added as the work proceeds, but not both to the same heap. In two years such a heap of materials will be quite ready for use, if it has been well turned over once or twice. Some refuse can only be dealt with by burning or charring—that is, by an open fire or a covered one. Whichever method is adopted, the remains should be screened, and put by for use. Charred refuse is one of the finest things for a gardener to have a good stock of for other purposes besides those of the kitchen garden.

TOMATOS.—No Tomato fruits should have been kept outside till this date, but all with a faint tinge of colour should be got inside. A good plan where many fruits are yet left on the plants in a quite green state is to cut a good portion of the stem, and put a tie to it, and hang it up in a coolinery or Peach-house, where, if kept dry, they will ripen up, and afford fruits for a long time.

CARDOONS.—All those plants which are unprotected by hay-bands may now be bound round. Soil may be put to the stems when it is in a fit condition for the purpose. This vegetable is not grown so much as it deserves to be, because perhaps it is but little known to cooks or their employers, but once sent into the kitchen it is generally asked for again, making as it does a little variety in the list of vegetables. After blanching, if there is fear of the stems rotting from moisture, take them up, but leave the hay-bands round them, and stand them in some cool dark place, where they will keep for a considerable length of time.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

PEACHES AND NECTARINES ON WALLS.—These trees may be lightly switched over with a new birch-broom in the direction of the branches, not in the reverse way, or the buds will get injured. By thus detaching those leaves that have done their work and are ready to fall, sunshine will be enabled to mature the present year's shoots. If these were laid in too thickly, it will be well to lessen their numbers even at this late date, rather than leave them until the spring pruning. A distance of 10 to 12 inches apart is close enough for bearing-wood to be laid-in, though it is the more common practice to lay-in the summer shoots very much closer than that, and the result is green, half-ripened wood, and hosts of insects beneath the close canopy of leaves. Half the failures in out-door Peach culture are due to too-close training, and the consequent immaturity of the shoots. When most of the foliage is cleared off, the trees may be unnailed, and the branches loosely buddled up with strips of bast, fastening them to the wall here and there, so as to prevent injury from the wind; this will tend to still further harden the young shoots by allowing a free circulation of air about them, and it will also afford an opportunity for stopping up all nail-holes and pointing the brickwork, a job that is best done before severe weather sets in. If lifting and transplanting operations have to be done, these should be undertaken without delay, taking care in digging up the trees to preserve as many of the fibrous roots as possible, but amputating the larger roots with a sharp knife after the trees are out of the ground. A few wheelbarrow-loads of fresh turfy loam should be worked carefully in amongst and placed over the roots as the planting proceeds, and the staple soil, if fairly good, may be used to finish-off with. In the planting of all fruit trees, the bottom of the hole in which the tree will stand should not be more than 10 inches below the surface when firmly trodden regularly all over, and it is ready for the reception of tree; and some of the roots may be laid at this depth, but the greater number at various depths up to within 2 to 3 inches of the surface of the border. There will inevitably be some amount of sinking; and at the finish the newly-disturbed soil ought to stand 2 inches above

the level of the rest of the border, and the trees be loosely secured to the wall. Finally, mulch the ground with half-decayed manure.

HINTS ON WORK IN GENERAL.—In any open weather, run the hoe through the fruit-quarters, to cut off all small weeds that may have sprung up, and to keep the soil in a healthy condition. Newly-formed Strawberry plantations will be benefited by the same kind of labour. Continue to make preparations for the planting of fruit trees, if such is contemplated, bearing in mind that planting in well-prepared soil at this season is a season gained. As soon as the trees arrive from the nursery, unpack them without delay, and lay them in damp soil till the planting can be done. Suitable permanent labels should be got in readiness for each tree, stout stakes, &c., and whatever else is likely to be required.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

VANDA TRICOLOR.—Few Orchids have a more stately appearance, in or out of flower, than Vandas of the tricolor section, but unfortunately, from wrong treatment, they often lose a number of their lower leaves during the growing season, and especially after a hot dry summer. Sometimes this is caused by allowing the plants to carry too many flowers, but it is usually the result of high temperature combined with aridity in the atmosphere, or it may be caused by subjecting the plants to a severe drying-off in winter—a process many growers think essential to their free flowering. Give them fair, generous treatment, and no difficulty need be experienced in growing and blooming the plants. All that is necessary is an even intermediate temperature, a constantly moist atmosphere, accompanied by more light (but not direct hot sunshine), and more air than is generally afforded them. If no proper intermediate-house is at command, I would place the plants together at the cooler end of the Cattleya division, keep a decidedly moist atmosphere about them, and use the ventilators freely whenever the external air should be more than 50°. Our plants are now in a similar position, and the bottom ventilators nearest to them are more or less open, even during very cold weather. If any disturbance at the roots is necessary, this is the best season of the year for the work, as less foliage is likely to be lost than when the operation is done in the spring. When repotting, carefully pick out all the old crocks and decayed material, and if any roots are clinging to the sides of the pot, use all the care possible to detach them. As a rule, a number of living roots will be found well up the stem, and the base of the stem may be cut off so far, that when the plant is transferred to the new pot the lowermost leaves will be on a level with the rim. From 2 to 3 inches of large crocks in the bottom of the pot will be sufficient drainage. Lay over these a little sphagnum-moss, and then place the roots, bringing them well up to the surface, and work in amongst them clean picked sphagnum-moss and crocks, at the rate of one-half of each. Fill up to within half an inch of the top, press it down firmly, and finish off with living sphagnum-moss. After potting, tie each stem in an upright position to a strong neat stake, as any swaying about will cause loss of leaves. Any of the large fleshy aerial roots that are long enough may be carefully pegged down on the surface of the moss; these will in time root in the moss, and help the plants to grow vigorously. Large healthy specimens, which have sufficient room for further development, will only need to be re-surfaced with living sphagnum; but if there be any suspicion of the moss low down in the pot having become decomposed, it should be carefully picked out from between the roots, and replaced with fresh material. Those repotted will require shade, and no water need be afforded for several days, after which give them a thorough saturation. The moss on the surface will soon become dry again, when it should be lightly sprinkled over, and kept growing in this way until each plant has re-established itself, when more root-watering may be afforded. If the plants are not strong or well rooted, it is best to remove their flower-spikes for one or two seasons, and give them a generous growing treatment. One of the essential requirements of this class of Vanda is a cool moist stage for them to stand upon, and that their immediate surroundings should be kept humid by syringing between the pots two or three times a day, which is far more beneficial to the plants than affording large quantities of water to the roots through the compost.

INTERMEDIATE ORCHIDS.—The nights are now much colder, and on two or three occasions we have had several degrees of frost, therefore the following Orchids that have been growing in the cool-house during the past summer should be placed in the coolest part of the intermediate-house, where they will get abundance of light and air. *Miltonia vexillaria*, *M. Phalaenopsis*, *M. Warcewiczii*, *Dendrobium Wattianum*, *D. longicornis*, *D. infundibulum*, and its variety, *Jamesianum*, *Masdevallia tovarensis*, *M. Schlimi*, *M. ehippium*, and all those of the *Chimara* section, *Lælia harponophylla*, *L. monophylla*, *Odontoglossum Kramerii*, *Oncidium bifrons*, and *Cryptophoranthus Dayanus*.

PLANTS UNDER GLASS.

By W. H. SMITH, *Gardener, West Dean Park, Chichester.*

FORCING-HOUSE.—Where large quantities of cut flowers are in request throughout the winter and early spring, a proper kind of forcing-house should always be available. Failing a proper forcing-house, a Melon-house is not an unsuitable structure for this purpose, if strong bottom-heat be available. The bed should be filled with clean, fresh leaves of the Oak, Beech, or Chestnut, preferably, and these should be trodden down evenly and firmly, and when heat has risen, the plants may be plunged, or half-plunged, whichever is safer. Take care that violent heating does not occur. A few *Azalea indica* may be put in at once. The varieties *Deutsche Perle*, *indica alba*, and *amazona*, will come on rapidly; also put in a batch of *Richardias*, *Poinsettia pulcherrima*, paper-white *Narcissus*, *Taberoese*, *Roman Hyacinths*, and a few *Lilacs*, of which *Charles X.* will be found to force excellently. Should the whole of the house not be required for forcing purposes, it will be suitable for bringing on plants of *Gardenias* or *Eucharis amazonica* which have been rested for a time. These should be thoroughly cleaned of insects, especially mealy-bug, and plunged up to the rim of the pots in the leaf-bed, receiving a thorough watering at the same time. Keep the plants in the house syringed daily, and afford plenty of moisture on the floors, &c.

FRANCOAS.—These are useful plants for house or conservatory decoration, and as the old plants are now making fresh growth, no time should be lost in dividing each into about three small ones. A compost consisting of good loam, leaf-soil, and sharp sand is excellent for them. After potting the pieces, water them sparingly until well rooted, when more liberal supplies may be afforded. The offsets which come from the base of the plants, if taken off and inserted in small pots, and placed under hand-lights in a heated frame, quickly make nice plants. When rooted, they should be repotted and grown on, and they will flower well next summer. A temperature of about 50° by night to 55° by day, will be quite warm enough during the winter.

IRIS RETICULATA FOR EARLY FORCING.—This species has a very lovely and sweet-scented flower, which may be had quite easily by Christmas, if potted in 6-inch pots in loam, leaf-soil, cow-manure, and sand; when potted, cover the pots with cocoa-nut fibre till an $\frac{1}{2}$ inch of growth has been made, and the pots are filled with roots. Then place them in a cold frame for a week or two, and take in to the greenhouse, or any house or frame where a temperature of 45° by night to 55° by day is maintained. Good varieties are *Iris reticulata*, *I. reticulata major*, and *I. reticulata Krelagei*.

BULBS FOR EARLY FORCING.—*Roman Hyacinths* will now have commenced to grow, and should be removed from the plunging material and placed in cold frames, gradually exposing them to the light, and in a few days a batch may be brought into heat, according to the quantity required. Paper-white *Narcissus* and *Double Roman Narcissus* will also be ready for removing into cold frames. Snowflake is a great improvement on the old paper-white *Narcissus*. Some of the best varieties of early *Tulips* for hard forcing are scarlet, white, yellow, and rose *Duc Van Thol*, white, scarlet, and yellow *Pottebakker*, *Belle Alliance*, *Prosperpine*, and *Canary Bird*. These should be removed to a cold frame, and be brought into the forcing-pit as required. If early named *Hyacinths* have made half-an-inch of growth, they should be removed and subjected to the same treatment as the above, but these must be brought on more gradually or they will not flower satisfactorily. Good varieties for early work are *Norma*, *La Neige*, *Blanchard*, *Albertin*, *Miss Nightingale*, *General Lauristan*, *Baron Van Tuyll*, *Dieraeli*, and *Delicata*.

FRUITS UNDER GLASS.

By RICHARD PARKER, *Gardener, Goodwood, Chichester.*

THE LATE VINERIES.—The vinery containing *Lady Downe's* and other late-keeping *Grapes*, needs close watching, for although the bunches are ripe and properly coloured, gentle artificial warmth will be very necessary at night and during dull weather to ensure their keeping without loss. The air in the vinery should be buoyant and dry, and to that intent no water should be used or spilled in the vinery. The variety *Gros Colmar* will continue to attain colour for some time yet, if a warm brisk temperature be kept up.

PRUNING.—Peach and Nectarine trees may now have all the weak shoots, and those not required for building up the trees, cut out before the leaves fall, as it can then be better seen which shoots should be removed. If the trees were disbudded in the spring, a small amount of pruning will now be required, i.e., if only a sufficient number of shoots were retained to furnish the fruiting shoots for the next season. The object of the grower should be the production of shoots of medium length and of about the thickness of a goose-quill, which, if allowed room for leaf-development, become well matured. When as many shoots are allowed to grow as are produced, there is much loss of strength, and the crop of fruit suffers in consequence. When pruning any tree which has not been properly disbudded, good fruitful shoots should be saved near to the base of each main branch to form the material with which to cover the trellis as these become unfruitful. All weak growths should be shortened, thus strengthening them. It is useless to severely prune any tree which produces great quantities of gross shoots, as this only aggravates the evil, such growths seldom ripening sufficiently to form flower-buds. It is far better to examine the roots, by opening out a trench in front of the tree in the usual manner, and several feet distant from the stem, cutting off all strong roots going down deep into the soil, and preserving all small fibry roots mostly found near the surface. If the soil contains much manure, the trench should be filled in with ordinary garden-mould and lime-rubbish, ramming it firmly. This will cause a less vigorous growth, and bring the tree in a year into a fruitful condition. To order that plenty of sunlight may reach all parts of a tree, the fruiting shoots should not be left closer together than 4 inches.

FIGS.—If the shoots were stopped at the points at different times during the past summer, growth will now have ceased, and Figs be visible at the tips of the shoots. These must therefore not be shortened, except in case of thin and weak shoots. With planted-out trees it may even be necessary to bring up a sucker from the base occasionally, to take the place of or lay in over old bare branches. [Grafting answers well in such a case. Ed.]

CHERRIES are generally spurred-in during the growing season, but all leading shoots should be allowed to extend to the limits of the wall or trellis. Cherries may be managed successfully for years without the use of the knife. Severe pruning often produces gumming and other evils.

PLUMS AND APRICOTS should be managed in much the same manner as Cherries, and in all cases the trees should be so manipulated during the summer, that but very little useless wood will require to be cut out at the present season, not omitting to keep the base of the trees furnished with young shoots.

A NEW COMPETITOR IN THE BUTTER MARKET.—During the last few years dairymen have suffered severely by the increased manufacture of oleo-margarine and butterine, but according to the *American Creamery*, a still cheaper article, and one more calculated to deceive the unwary purchaser, has been discovered in Cocoa-nut butter, which is produced from the oil of the Cocoa-nut. It is stated that a company already engaged in manufacturing Cocoa-nut butter is sending it out at the rate of 5000 lb. daily, and will in a short time increase its output to 10,000 lb. per day. "Elaborate preparations," says the same paper, "are being made for catering to the foreign and domestic trade, and our dairymen must suffer thereby. Another use for the neutral which they make is in the manufacture of filled cheese. It is far superior to lard neutral, and much cheaper, besides harder to detect, and easier to emulsify with the skim-milk. Taken altogether, it is a dangerous competitor, and one to demand immediate consideration."

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, Oct. 29—Royal Horticultural Society's Committees, at the Drill Hall, James Street, Westminster.

SHOWS.

TUESDAY, Oct. 29—Havant Chrysanthemum (two days).
 WEDNESDAY, Oct. 30—Royal Jersey Chrysanthemum (two days).
 THURSDAY, Oct. 31—Kent County Chrysanthemum, at Blackheath (two days).
 THURSDAY, Oct. 31—Highgate Chrysanthemum (two days).
 FRIDAY, Nov. 1—Chrysanthemum Show, at the Crystal Palace.
 FRIDAY, Nov. 1—Swindon Amateur Chrysanthemum and Horticultural Society (two days).

SALES.

MONDAY, Oct. 28—Dutch Bulbs, at Protheroe & Morris Rooms.
 Plants from Belgium, Roses, Ferns, &c., at Protheroe & Morris' Rooms.
 Unreserved Sale of several acres of well-grown Nursery Stock, at the Horsell Nurseries, Woking, by order of Messrs. H. & C. Cobbett, by Protheroe & Morris (three days).
 TUESDAY, Oct. 29—Dutch Bulbs, at Protheroe & Morris' Rooms.
 Important Annual Sale of an immense quantity of Herbaceous Plants: Begonias, Lilies, Hollyhocks, Clematis, Carnations, and many others, at the Hale Farm Nurseries, Tottenham, N., by order of Mr. T. S. Ware, by Protheroe & Morris (two days).
 WEDNESDAY, Oct. 30—Dutch Bulbs, at Protheroe & Morris' Rooms.
 Dutch Bulbs, at Protheroe & Morris' Rooms.
 Plants from Belgium, at Protheroe & Morris' Rooms.
 THURSDAY, Oct. 31—Sale of well-grown Specimen Shrubs and Fruit Trees, Roses and Herbaceous Plants, at the Floral Nurseries, Castle Hill, Maidenhead, by order of Mr. R. Owen, by Protheroe & Morris.
 FRIDAY, Nov. 1—Dutch Bulbs, at Protheroe & Morris' Rooms.
 Orchids at Protheroe & Morris' Rooms.
 SATURDAY, Nov. 2—Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT OHISWICK.—45°.2.

The Institute of France in its Relation to Botany and Horticulture.

THIS week the Institute of France celebrates its centenary, having been founded—or rather reorganised, for a somewhat similar institution dates from the time of RICHELIEU—on October 25, 1795. With the general constitution of this assembly, with its history and position at the present day, it is not the purpose of this article to deal. Our intention is to give a short sketch of some of the most famous botanists who have had a share in the history of the Institute, and to see how botany has fared during the Institute's long and somewhat stormy life. The Institute to-day is divided into five sections, called Academies, and it is with the Académie des Sciences, and especially with the eighth section of this body, viz., the botanical section, that we are chiefly concerned. In this section there are six members, namely, MM. NAUDIN, TRÉCUL, CHATIN, VAN TIEGHEM, BORNET, and GUGNARD; while among the ten correspondents of the botanical section, are to be found the names of Sir JOSEPH HOOKER, M. N. PRINGSHPIM, Dr. MAXWELL T. MASTERS, and Dr. TREUB of the botanical garden at Buitenzorg in Java. There are four prizes at the disposal of this section: the Prix Barbier, to be awarded yearly to him who makes the most important discovery in the surgical, medical, or pharmaceutical sciences, or in botany applied to the art of healing; the Prix Desmazières, awarded to the writer of the most useful work on cryptogamic botany; the Prix de la Fons-

Mélicocq (awarded every three years) for the best work on the botany of the North of France; and lastly, the Prix Montagne.

The Academy of Sciences originated in the seventeenth century, in a private society of scientific men, who had for some thirty years been accustomed to meet at various houses. The idea of giving an official status to this body was due to LOUIS XIV. and his Minister COLBERT. At the outset the members were divided into two sections, the mathematicians and the physicians, and under this latter heading were grouped together naturalists, botanists, physiologists, and those men of science whose province was the study of natural philosophy.

At the time of the Revolution, we find that the members of the National Convention had not much better ideas as to the classification of the sciences than its earlier patrons. They evidently meant to keep a tight hold on the Academy of Sciences, and to assume direct control over the members. They allotted to the same section two sciences so distinct as botany and general physics, and they showed the practical bent of their minds by giving great prominence to the study of practical agriculture. Whilst the Institute was annually to choose twenty persons to travel at the expense of the State for the purpose of collecting observations upon farming, it was decided that six would be sufficient to glean, in every part of the world, the facts which related to all other branches of knowledge, including geography. "It is well known that at a period when by the help of the *maximum*," says a writer on this period of French history, "the horrors of famine had spread over the whole of France, the Convention adopted a language of hypocritical sensibility, borrowed chiefly from agriculture and gardening, and which would sometimes have led a stranger who entered the chamber of the Committee of Public Safety to believe himself transported to happy Arcadia."

In the chronicles of the time we find it written that ROBESPIERRE might often be seen walking with a large bouquet of flowers in the garden of the Tuileries, which had been planted with Potatoes!

Vegetables were then held in great honour, and were introduced everywhere, even into the almanack. Every day of the year had a separate title given it by the National Convention, and these names were as often as not taken from the farm; one was called *Carrot*, another *Cabbage*, a third *Ass*, a fourth *Hog*. But space will not allow us to linger any longer on this stirring period of French history. Our business is with the botanists and the science to which they devote themselves. It is related that the illustrious botanist, ADANSON, a member of the old Academy of Sciences, who endowed science with many novel and pregnant ideas, was reduced, during the reign of terror, to working by the uncertain glimmer of his scanty fire for want of a lamp. When the Academy was re-founded and incorporated as a section of the Institute of France, he was summoned to take his place as one of the new members of this body. He replied to this invitation that he was unable to attend for want of a pair of shoes! NAPOLEON extended his patronage to the Institute, though he made its members feel the power of his sway.

One of the earliest botanists who was a member of the Académie Royale des Sciences was JOSEPH PITON DE TOURNEFORT, and many of his memoirs are to be found in the proceedings of this body, of which he was elected a member in 1692. Sad to relate, he met his death when on his way to take part in one of the meetings of the academy. Somehow or other his breast

was pressed by the axle of a carriage, and he died in 1708. He is universally acknowledged to have been the greatest botanist of his time, and it was by his skill and care that the King of France's gardens, almost quite neglected and abandoned before, were afterwards holden in honour, and thought worthy the attention of all the *virtuosi* in Europe.

Another of its earlier members was A. L. DE JUSSIEU, and his brother, BERNARD, both famous in botanical science. It was the younger JUSSIEU who first attempted to substitute a natural division of the whole vegetable kingdom into larger and gradually subordinate groups, for mere arbitrary enumerations of smaller coordinated groups.

AUGUSTIN DE CANDOLLE, strange to say, never was elected a member of the Institute, though he was certainly the most distinguished botanist of his age. His son, ALPHONSE, equally distinguished, was, however, an associate member of this body.

In recent times, among the more celebrated botanists have been BRONGNIART and MIRBEL; whilst DECAISNE, DUCHARTRE, and NAUDIN, have special claims upon horticulturists for the extent and importance of their labours in the application of scientific knowledge to horticulture.

The Institute of France does not correspond exactly with any institution in this country, for the Royal Society of London is solely connected with those branches of knowledge usually termed sciences, and takes no account of literature, history, archaeology, or painting. Besides, the Institute is distinctly a State-aided affair, and each member of the French Academy, but not those of the others, receives a small *indemnité* of £60 a year.

In conclusion a word may be said as to the *Comptes Rendus* published by the Academy of Sciences every week. Here are to be found brief memoirs of current investigation by the foremost men of science not only in France, but in other countries. It is to be wished that our Royal Society could see its way to publishing some such weekly record of its meetings, for botanists, no less than other men of science, must often regret that the publication of papers in the Royal Society's proceedings takes place so long after the reading of the papers.

WE learn from a circular issued by the National Chrysanthemum Society, that it is intended to celebrate the fiftieth anniversary of the founding of this Society in the month of November next year. From a modest beginning as the Stoke Newington Chrysanthemum Society in 1846, this energetically-conducted Society has grown so rapidly of late years that it now possesses 650 enrolled members, nearly one hundred Fellows, and has affiliated to it more than one hundred Chrysanthemum Societies in the United Kingdom and the colonies. It has Sir EDWIN SAUNDERS for its President, and numbers amongst its Vice-Presidents, Sir TREVOR LAWRENCE, Bart., Sir H. W. PEEK, Bart., Sir JOHN D. LLEWELYN, Bart., M.P., LEOPOLD DE ROTHSCHILD, Esq., and other influential gentlemen. The Society claims to have materially assisted in promoting the cultivation of the Chrysanthemum all over the country; and by awarding good prizes to well-grown plants and fine cut blooms, and recognising by means of its Certificates, novelties in Chrysanthemums, to have helped to popularise the flower to no small extent. No one acquainted with the general advances made in the cultivation of the plant will question the correctness of this asser-

National Chrysanthemum Society's Jubilee Celebration.

VIEW IN THE BLUE MOUNTAINS, JAMAICA.

tion. These are among some of its more notable endeavours and aims, and they have been so generally successful amongst amateurs of all grades and gardeners in general, that it is now extremely rare to see a badly cultivated Chrysanthemum plant or ill-developed flowers, both of which were common enough in gardens twenty-five years ago. Turning with pardonable pride as connoisseurs to the commercial aspect of the plant, we could scarcely name another plant which, in recent times, has so greatly benefited the cultivator and the dealer as has the Chrysanthemum, and more especially the Japanese varieties. There may not be so much "money in it" as there is alleged to be in Orchids, although that assertion seems to be refuted by the numerous small nurseries and florists' establishments which have sprung up everywhere round large towns in which the Chrysanthemum figures largely amongst the different subjects cultivated in them; and it is a fact that cannot be controverted, that the demand for cut flowers of the Japanese varieties has immensely increased in the last few years, the public paying good prices to the florists for well-finished blooms of certain telling shades of colour, or those which come early into the market; so that is a far greater gain all round than the making of two blades of grass grow in the place of one. Good culture in this case implies also an increased demand for suitable soils, for pots, special manures, such as sulphate of ammonia, nitrate of soda, potash, and others, together with a desire on the part of the cultivator for fuller knowledge in the methods of safely employing these useful artificial aids to the cultivation of the plants, and eventually to their use on other garden plants.

We may be inclined to deplore the increase of special societies, and wish to see them brought under one general head as regards those existing in, or of which London is the head-quarters; but seeing the very great ramifications of the National Chrysanthemum Society, and its very conspicuous virility, it will remain a debatable question with many, if affiliated to the Royal Horticultural Society, its progress, and its power for usefulness, would have been what they are at the present time.

The following is the official programme. The Jubilee celebration will take the form of:—

1. An immense exhibition of Chrysanthemums in London in 1896, in which all types of the flower will be fully represented, and which will extend over four days, with an entire reconstruction of the exhibition on the third day.
2. A grand opening ceremony and private view at noon on the first day.
3. A conference of Chrysanthemum growers and raisers from all parts of the world.
4. A Jubilee Banquet at the Hôtel Métropole, and other festive gatherings.
5. The striking of Jubilee Medals of value for competition, and for rewarding such persons as have rendered conspicuous services in promoting the advancement, cultivation, and improvement of the Chrysanthemum.
6. The preparation and publication of an exhaustive Jubilee catalogue of Chrysanthemums, with the most complete classification.

In order to efficiently carry out the Jubilee Celebration, a Special Jubilee Fund has been formed, and it is calculated that the sum of £1000 will be required in order that the Celebration may be accomplished in a manner worthy of the high position occupied by the Society.

Subscribers of ten guineas will receive two banquet tickets, and four special tickets to admit to the opening ceremonial and private view, and during the three following days,

Subscribers of five guineas will receive one banquet ticket and two special tickets to admit to the opening ceremonial and private view, and during the three following days.

Subscribers of one guinea and upwards will receive two tickets to admit to the opening ceremonial and private view, and during the three following days.

BLUE MOUNTAINS, JAMAICA (see Supplementary Illustration).—The finest and wildest scenery in the West Indies is to be found in the heart of the Blue Mountains of Jamaica. There are large forests containing Juniper, Cedar, Tacca (*Podocarpus*) Soapwood and Santa Maria tree, numerous cataracts and waterfalls, and a climate as cool and pleasant as early summer in England. In the illustration is shown a portion of a mountain-torrent in the dry season, with a path above it leading to land cleared for Coffee and Cinchona, or possibly to the provision grounds of the negroes. In the rainy season this gorge would be full of raging, rushing water, carrying everything before it. On its slopes are found numerous Ferns, some of them the choicest species found in English greenhouses. *D. M.* [The view is taken from a copyright photograph by Messrs. Valentine & Sons, Dundee, whose London agents are Messrs. Edmann & Schanz, 4, Salcott Road, Clapham Junction, S.W.]

THE ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral Meeting of the Royal Horticultural Society will be held on Tuesday, October 29, in the Drill Hall, James Street, Victoria Street, Westminster. The committee will meet as usual at 12 o'clock; and at 3 P.M. a lantern-slide lecture on Potatoes will be delivered by Mr. A. W. SUTTON.

THE PROMOTION OF FORESTRY IN SCOTLAND.—It is stated in the *Edinburgh Evening Dispatch*, October 18, that the President of the Board of Agriculture is to receive a deputation from the Council of the Royal Scottish Arboricultural Society in the Scottish Office, Parliament Square, Edinburgh, on Wednesday, October 23, when the views of the society will be submitted upon the following points: (1) the advantages of a separate office in Edinburgh under the Agricultural Department, to which an official having a particular knowledge of forestry should be attached; (2) the present condition of forestry in Scotland; (3) the great and increasing importance of forestry in Scotland; (4) the afforestation of waste land in Scotland; (5) the acquisition of a forest area for experimental and educational purposes; and (6) the limited facilities for obtaining forestry education in Scotland, as compared with Germany and other countries.

THE HORTICULTURAL CLUB.—The first dinner and *conversazione* for the session 1895-96, took place on Tuesday evening October 15, and was in every respect a most successful commencement. The chair was occupied by Mr. HARRY J. VEITCH, and there were present the Revs. W. Wilks and J. H. Pemberton, Messrs. Crowley, H. J. Pearson, C. E. Pearson, J. H. Veitch, H. Turner, O. Thomas (Frogmore), and C. E. Shea. A very interesting account was given by Mr. C. E. Pearson of a visit recently paid to Lapland, Nova Zembla, and Kolgouey. The object of the expedition was, in the first instance, ornithology, but Mr. Pearson found time to make a goodly collection of botanical specimens, which had been most carefully and tastefully mounted by his niece, and were submitted to the inspection of the members present. He stated that the flora was more alpine than arctic, as may be inferred from the fact that such alpine gems as *Eritrichium nanum*, perhaps the crowning gem of alpine, is found in large quantities, as were also *Gentiana verna*, *Myosotis alpestris*, *Silene acaulis*, and many other plants which are found in alpine districts; but, curiously enough, in the whole of their rambles they never came upon a single Fern. The curious geological

formation of the country was described, the absence of rocks *in situ* was remarked, as was also the fact that enormous boulders of various formations were to be found in large quantities, which had evidently been carried along by glacier action. The discussion which followed was participated in by most of those present, and a hearty vote of thanks was accorded to Mr. Pearson for his most interesting address.

NATIONAL ROSE SOCIETY.—At the last committee meeting, held on the 15th inst., it was announced that Mr. ALEXANDER HILL GRAY, the distinguished rosarian at Beaulieu, Newbridge, Bath, had offered a prize of five guineas for the best essay on the "Hybridisation of Roses." Particulars and terms will be shortly announced.

RAILWAY COMPANIES AND AGRICULTURAL PRODUCE.—Those of our readers who followed the discussion on railway-rates and market garden produce in these columns in the years 1892, 1893, and 1894, will read with some interest the following letter which appeared in the *Times* of October 22:—

"Sir,—The Directors of the Great Eastern Railway have just taken a step which may have such important results for the agricultural interest that, although the proceedings I am about to refer to were of a semi-private character, I conceive that I commit no breach of confidence in making the public acquainted in your columns with their general scope and purpose.

"An invitation was addressed by Lord CLAUD HAMILTON to a few leading agriculturists representing the district served by the Great Eastern Railway, and to myself, to meet the directors and principal officials of the company with a view to ascertaining, in friendly conference, whether it could do anything to help the agricultural interest. At the meeting, which took place to-day, an excellent feeling was shown, as well as an evident desire to arrive at a business-like conclusion, and several practical proposals were put forward on behalf of the agricultural interest, which Lord CLAUD promised, in the name of his colleagues, should receive careful attention.

"But to my mind, the most interesting and significant thing about the meeting was that the moment we came to discuss quarters with the question of increased facilities and through rates for the carriage of home produce in bulk, it became as obvious to the whole meeting, as it has long been to myself, that a railway company, however willing, cannot extend these advantages to individual producers unless, and until, they on their part combine together to form an association, which will undertake the collection, packing, and regular supply of produce at country depôts, and to whose agents it can be consigned on arriving at its destination.

"Some time ago, at the conclusion of the celebrated Southampton case, you were good enough to insert a letter from me on 'The Moral of Preferential Rates,' in which I argued that the solution of that vexed question was to be found in an association of home producers.

"We hope to establish such an association very early in the new year. The fact that I brought to the meeting to-day a written proposal for dealing with this part of the subject practically identical with the views which Lord CLAUD HAMILTON, before he had seen it and without previous consultation with me, expressed in his opening speech from the chair, is, I think, conclusive evidence that we are on the right track, and justifies me in expressing a hope that all your readers who desire to see British produce regain its ascendancy in the home market will support the new association when the time comes.

"Your obedient servant,
WINCHILSEA.
"6, Bedford Square, London, W.C., Oct. 20."

MEMORIAL TO ROBERT BROWN.—On Friday last an interesting ceremony took place at Montrose, when a memorial was unveiled to Dr. ROBERT BROWN, the distinguished Scotch botanist, in a niche in front of the house in which he was born. The memorial takes the form of a bronze bust considerably over life size, and is the gift of Miss PARON, a kinswoman of Robert Brown. Mr. D. W. Stevenson, R.S.A., is the sculptor. Robert Brown was the son of an Episcopalian clergyman, and was born December 21, 1773. In 1787 he entered at Marischal College, Aberdeen, where he obtained the Ramsay bursary in Philosophy. Two years afterwards he removed to Edinburgh University, where he completed his academic studies. His devotion to botany bore its first fruits during these years in papers on the local flora. In 1795 he obtained the commission of ensign and assistant-surgeon in the newly-embodied Fifeshire Regiment of Fencible Infantry, and he was stationed with it in Ireland until 1798, when he visited England and made the acquaintance of Sir Joseph Banks, and worked in his library. He returned to his regimental duties in Ireland in 1799, and relinquished them in December of the fol-

lowing year, when he was appointed naturalist to Flinders's Expedition to survey the coasts of Australia. On this expedition he was absent four years, returning with some 4000 species of plants, a very large proportion new to science, and many of extraordinary interest as new types of plant structure. Much of this material he classified with minute accuracy during the voyage. On his arrival in England, he was appointed librarian to the Linnean Society, subsequently succeeding Dryander as librarian to Sir Joseph Banks, and eventually becoming the first keeper of the Department of Botany in the British Museum on the transference to it of the Banksian collections. His scientific works gained for him a reputation scarcely equalled by any botanist before or since, and he became a member of nearly every scientific society at home and abroad. He died in 1858. Short speeches were delivered during the course of the proceedings by Mr. Carruthers, formerly librarian of the Botanical Department in the British Museum; Professor Balfour of Edinburgh, Professor Bower of Glasgow; Professor Traill of Aberdeen, and Professor Gadde of Edinburgh, representing Scottish Universities; Mr. Murray, Keeper of the Botanical Department of the British Museum; and Dr. Howden, President of the Montrose Natural History and Antiquarian Society; all the speakers testifying to the great work of the greatest of British botanists. *Daily Graphic, Saturday, October 19.*

MEETING OF THE BRUSSELS ORCHIDÉENNE.—The meetings for the season 1895-6 have begun brilliantly. Fifty fine Orchids were shown at the last meeting, and some of them deserve special mention. M. le Comte de Bonziez showed *Cattleya labiata atrovirens*, of a dark purple colour, hitherto unknown. M. Van Imshoot sent *Miltonia Blunii* Lubbersiana, with two floral racemes, and flowers of uncommon size and colouring. M. Madoux staged *Cattleya gigas*, with a bloom of unusual dimensions, the divisions pale in shade, lilac tinged with rose, the lip very large, dark purple, eyes bright yellow and very pure white; the habit remarkable. *C. maxima marginata*, from M. Linden, had a lip with a bright yellow lamel in the centre, the background and veins were violet-purple, and with a broad white margin; *Zygopetalum intermedium moortebekense* was the happy choice as an exhibit of a new firm—that of MM. Lucien Linden et Cie., who are established on the west side of Brussels, at Moortebek; the flower of the *Zygopetalum* is remarkable for the lip, which has a white ground streaked with lilac-purple, with a very effective rose-coloured margin. M. Coppens exhibited *Cattleya Warocqueana*, the flower was of excellent form, the petals especially are remarkable in size. M. Van Imshoot showed *Phaius × amabilis*, a hybrid raised by Messrs. J. Veitch & Sons, which meets with general approval. I would also mention *Cymbidium giganteum*, from M. Van Imshoot; *Vanda cœrulea*, from M. Flor. Pauwels, and having large flowers; *Cattleya aurea*, from M. Linden; *C. gigas*, from M. De Lombaerde; *Lælia elegans*, from M. Linden; and his group of *Cattleya maxima*; and also the hybrid *Cypripedium* from M. Madoux. A Botanical Certificate was awarded for *Cirrhopetalum Medusa*, *Dendrobium species*, *Eria species*, and *Bulbophyllum rufinum* from M. Linden. *Oncidium ornithorhynchum* and *O. incurvum*, from M. Pauwels; also *Cypripedium cœnotherum superbum*, from M. le Comte de Bonziez, won Certificates for being well-flowered. *Ch. de B.*

NATIONAL TESTIMONIAL TO MR. A. F. BARRON, OF CHISWICK.—The retirement of Mr. A. F. BARRON from the important position of superintendent of the Royal Horticultural Society's gardens and exhibitions is regarded as a fitting occasion for presenting him with a testimonial. Mr. BARRON'S work in various directions has been of no ordinary character; and during the period of thirty-five years that he has been at Chiswick, he has carried out many important trials and experiments in plant and fruit culture; he has penned treatises on the Vine and Apple which are standard works on

these fruits; has officiated as Honorary Secretary of the Royal Gardeners' Orphan Fund, and in a variety of ways he has exercised a most beneficent activity in rendering assistance to gardeners and gardening. The committee therefore confidently appeal for subscriptions towards a fund for presenting Mr. BARRON with some tangible mark of gratitude and esteem. In so doing the committee earnestly desire that all gardeners and lovers of their gardens shall have an opportunity, according to their means, of participating in a suitable acknowledgment of the long public service of one of the most worthy and eminent of British gardeners. The names of the committee were published in the advertisement columns in our issue for October 19.

CORNELL UNIVERSITY.—Amongst the new instruction offered in horticulture in Cornell University during the present year is a seminary upon the literature of horticulture and one upon greenhouse construction and management. These seminaries are really discussions or lectures, for which all members have prepared themselves in advance. One person acts as leader (as set down in the schedules), bringing in his books and specimens, whilst the listeners take notes and spontaneously discuss the various points as they arise. These seminaries are wholly informal, and as they are composed entirely of advanced students, lively debates may be anticipated. Amongst the students enrolled are one or two professors of horticulture, one or two professional gardeners, botanists, and special advanced students in horticulture, some of whom will lead certain meetings. In addition to the seminary work on greenhouses, there will be other hours devoted to drafting and the making of specifications. The seminary in the literature of horticulture will have the advantage of Professor BAILEY'S library, which is the largest private collection of horticultural books, and which is probably the richest in American literature of any extant collection.

SEMINARY ON LITERATURE OF HORTICULTURE.
Course 3. F. 11.

- 1 (Sept. 27). The herbals.—Bailey.
- 2 (Oct. 4). Roman literature.—Lodeman.
- 3 (Oct. 11). Literature of landscape gardening.—Bailey.
- 4 (Oct. 18). European Grapes literature.—Lodeman.
- 5 (Oct. 25). American Grapes literature.—Bailey.
- 6 (Nov. 1). French literature.—Lodeman.
- 7 (Nov. 8). Early American literature.—Bailey.
- 8 (Nov. 15). German literature.—Lodeman.
- 9 (Nov. 22). Current American literature.—Bailey.
- 10 (Nov. 29). English literature.—Lodeman.
- 11 (Dec. 6). Periodical and Experiment Station literature.—Bailey.

SEMINARY ON GREENHOUSES.
Course 4. W. 11.

- 1 (Oct. 2). Evolution of the greenhouse.—Bailey.
- 2 (Oct. 9). Side-walls and foundations.—Mason.
- 3 (Oct. 16). Roofs.—Lodeman.
- 4 (Oct. 23). Interior arrangements.—Bailey.
- 5 (Oct. 30). Heating.—Bailey.
- 6 (Nov. 6). Heating.—Bailey.
- 7 (Nov. 13). Ventilation.—Lodeman.
- 8 (Nov. 20). Glass and glazing.—Blair.
- 9 (Nov. 27). Styles of houses for various purposes.—Lodeman.
- 10 (Dec. 4). Watering.—Walker.
- 11 (Dec. 11). Pots and soils.—Powell.

THE MILDNESS OF THE SEASON.—Mr. J. P. SHELDON, writing to the *Times* of October 20, from the Brund, Sheen, Ashbourne, under date October 19, says:—"As evidence of the abnormal fecundity of the period, I send you, herewith enclosed, bloom of Strawberry, Primrose, and Crocus, and also a Rose-bud, all gathered this morning in my garden. Some little distance off, a neighbour of mine has a Laburnum tree with a second crop of bloom upon it; I saw it this week. Probably I could find further evidence if I looked for it; that which I now give came, as it were, quite casually to hand. This place is 700 feet above sea-level."

CHESHUNT, WORMLEY, AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The usual fortnightly meeting of this Society was held on Thursday, October 17, at Turnford. Mr. W. HARRISON presided, and there was a good attendance. Mr. A. J. SIMONS gave an able lecture on "Cyclamena and Cyclamen Growing," dealing with the origin, description, and varieties, propagation, time of germination, and all points connected with the cultivation of the plant. An interesting discussion followed. A hearty vote of thanks was accorded to Mr. SIMONS for his instructive lecture. A further discussion then took place on the question of the most effectual method of eradicating "Mealybug on Vines." This created a good discussion, and after the experience of several members had been given, the meeting terminated. The next meeting will be on Thursday, November 7, when Mr. J. H. DEAN will contribute a lecture on "Pears."

PRUNE CULTURE IN AMERICA.—Although America does not produce sufficient Prunes to meet her own demand, notwithstanding that the quantities grown are very large, opinions are being circulated in that go-ahead country that in a year or two, with an extension of cultivation, and an average crop, "the local product is likely to entirely force the foreign article from the market;" and even further than this, the Americans are beginning to think of a future market for their Prune crops. While the consumption of Prunes in the United States is stated to be now as large as 70,000,000 lb. a year, the total product last year amounted to between 35,000,000 and 37,000,000 lb. Oregon, Washington, Idaho, and Arizona are all producing Prunes to some extent, and in San Francisco large areas of young orchards have yet to come into bearing. When all these contribute their quota to the annual output, California's yield will be doubled. In view of these facts, it is said, "The outlook for Prune growers is not very encouraging, unless something can be done to promote a more general use of the fruit in households in the Eastern States. This last remark applies equally to the British consumption of Prunes, which, with advantage to the consumer, might well be considerably increased."

SHIRLEY AND SURROUNDING DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.—The monthly meeting was held on the 21st inst. at the Parish Rooms, Shirley, Southampton, and as the subject was an attractive one there was a strong muster of the members, the President being in the chair. The lecture was under the auspices of the Hants County Council, and their lecturer, Mr. E. MOLYNEUX, Swanmore Park Gardens, had chosen for his address "An Epitome of Chrysanthemum Culture," and no one could be found who has a greater mastery of the subject. Every point of interest in the culture of this popular flower was brought fully home to the audience by means of living examples, illustrating the particular matter under discussion, and each little detail was so fully dealt with, that there was at the finish no room for questions or discussion. A hearty vote of thanks was unanimously accorded to Mr. MOLYNEUX, on the proposition of Mr. W. F. MAJOR. There was a competition for a certificate for the best six blooms of Chrysanthemums, which was awarded to Mr. G. BUSHELL, gardener to Mrs. KEATS, Rowham Park, and there was also several exhibits of fruit and various plants.

PUBLICATIONS RECEIVED.—From the U. S. Department of Agriculture (Washington Government Printing Office), *Water as a Factor in the Growth of Plants*, by B. T. GALLOWAY and ALBERT F. WOODS.—*The Grain Smuts: their Cause and Prevention*, by WALTER T. SWINGLE.—*Fertilisation of the Soil as affecting the Orange in Health and Disease*, by H. J. WEBER. Also (*Farmers' Bulletin*, No. 30) *Grass Diseases on the Pacific Coast*, by NEWTON B. PIERCE. Also, from the same Department, Division of Entomology, Vol. VII., No. 5, of *Insect Life*, edited by L. O. HOWARD.

PLANT PORTRAITS.

ANTHURUM SALMONEUM X, *Illustration Horticole*, September 30. A cross between A. Lindenii and A. Andreanum; the colour of the spathe is pale yellow, flushed with salmon.

APPLE "NONPAREILLE DE PEASGOOD," Peasgood's Nonsuch, *Revue Horticole*, September 16.

ERIDES HOULETIANUM, *Revue de l'Horticulture Belge*, September.

PENTAS CARNEA, *Revue de l'Horticulture Belge*, October.

SARRACENIA FLAVA, *Garden*, September 14.

TRUNIA MARSHALLIANA, *Revue de l'Horticulture Belge*, October.

absent as a separate organ, the flowers were not to lose its beauty altogether, for in some degree it merged into the petals, one of which we here illustrate (fig. 85). Not only does a patch of the crimson colour of the labellum appear in it, but the wavy edge and more ample substance has given the petal a feather-like form, which lends attraction to the flower, abnormal though it be.

ABOUT CHRYSANTHEMUMS.

CROPS of fruit have been so abundant during the present season, and the exhibitions, lectures, and gossip about fruit culture so general and engrossing, that the advent of the Chrysanthemum reign appears to have overtaken us with uncommon suddenness. In the forthcoming week will be held some of the earliest of the exhibitions, and perhaps until these have taken place it would be rash to prophesy

them in their own parks. In each of those we have visited in previous seasons, there are again collections of generally well-grown plants now in full bloom. The only one of the "free" displays in London that has become extinct, is that which for many years has been held on the Thames Embankment, in the gardens belonging to the Benchers of the Inner Temple. Before any of the parks made annual displays, the one at the Inner Temple was in existence, and the late Mr. Daly and, latterly, Mr. Newton have produced many a good exhibition there. Since, however, the growth of Chrysanthemums has become quite an important part of the duties of the superintendents at most of the large parks under the London County Council, the display at the Inner Temple has suffered a little by comparison with collections at places where much greater advantages existed for growing and housing the plants.

There is no evidence of lessened interest or enthusiasm on the part of those responsible for the exhibitions in the parks. The authorities appear to do what they can to ensure a good show of bloom, and the arrangements made for the control and convenience of visitors, and the staging of the plants show improvement, though in the latter respect there is room for much more. There appears also to be a tendency to copy each other, which results in a sameness that might otherwise be avoided. In most cases the visitor will find that the authorities have considered him a little by erecting notice-boards, which indicate the position in the park where the exhibition is made. To strangers this is more than a convenience—it is a necessity. Previously, the experience of the *Gardeners' Chronicle* reporter, when trying to discover the Chrysanthemum-house, has not always been of the happiest nature. As usual, Chrysanthemums, other than Japanese and incurved varieties, are but indifferently represented at all the places, though we are informed that in one park at least this will be reversed next season.

FINSBURY PARK.

Again the Chrysanthemums are housed in the long span-roofed building that was used before the much wider and higher house was built for the purpose. Apparently the newer house is to be reserved for foliage and other plants. The old house is far from unsuitable though; and the collection this year, which is again staged in the form of a two-faced ridge from end to end, is not one of which Mr. Melville, the superintendent, has any cause for dissatisfaction. Usually there are nearly 4000 plants grown here, but the house will not perfectly accommodate more than 2000 at one time. The arrangement of the plants indicates considerable care and taste, although it is the old style again repeated. Many new varieties have been added to the collection, but at present few are worthy of note. Most of them will flower later. Of older sorts we noticed large but poorly-coloured blooms of Chas. Davis, apparently from the crown-bud; J. R. Pearson, a pink or mauve Japanese; capital blooms of Avalanche, and the bright-coloured Gloire du Rocher. Though incurved varieties were not fully developed, there were good blooms of M. R. Bahaant, Baron Hirsch, Golden Beverley, and Barbara. G. W. Childs was only just opening, but promises to be good. Hairy Wonder, nearly developed, had poor colour; but, on the other hand, Sunflower was represented by first-class blooms, which combined size and colour too. The distinct-coloured but well-known Edouard Audiguier was noticed, and buds of the large yellow Philadelphia were fast opening. The excellent large-flowered Anemone Descartes is a fine addition, and should be seen in all collections. Other varieties that may be mentioned as very commendable are Mr. H. Runchman, a flattish bloom of golden yellow, forets slightly recurved, Eynsford White, William Seward, and Florence Davis. Pompons are fairly well represented. The display is only about five minutes' walk from Finsbury Park Station.

VICTORIA PARK.

Mr. J. W. Moorman, who is a member of the Floral Committee of the National Chrysanthemum

FIG. 85.—THE VARIEGATED LIP OF A CATTLEYA LABIATA.

CATTLEYA FLOWERS
ABNORMAL.

FROM time to time we have given illustrations of abnormal flowers of Orchids, and we are always glad of the opportunity to add to them, and give remarks which may tend to throw light on this interesting subject. One thing about such freaks is now tolerably clear, and that is, that in most cases where these abnormal flowers appear, the plant is likely to produce similar flowers, and in some cases, the plant will produce no others. A singular instance of this kind appeared in an inflorescence of *Cattleya labiata* Mendeli sent us some time ago, with the information that it represented the flowers which the plant regularly produced. Very strange they looked, for one expected to see the showy labellum which forms the chief attraction of the flower, but it was wanting in each example; the flower being made up of the three sepals and two petals which were arranged in tolerably regular manner around the column, which was much straighter than usual. But if the labellum was

respecting the prospects of the great show of the National Society. In the meantime, however, we shall give notes upon the condition and features of interest observed in many collections, as we have done heretofore. From glimpses already taken of some collections, the impression given is, that while the season is not likely to be an extraordinary one, at the same time there will be a good general average quality. Some varieties have opened less kindly than might be desired; and the explanation may possibly be, that during the phenomenally hot weather last month the buds became a little too hard. The colour, likewise, in some varieties is hardly satisfactory; and we shall not be surprised if the quality of the flowers of the incurved section is at least equal to that of the Japanese. It may be added, that if any indication of the display the great show will afford may be taken from the October exhibition, then it will be abundantly successful.

THE PARKS.

The metropolitan public have again the opportunity of seeing excellent displays of the Chrysanthemum

Society, and has grown the plant for at least thirty years past, has a capital house at Victoria Park in which to display his Chrysanthemums. The house is a straight span-roof, and as Mr. Moorman has a dislike to straight lines, the plants are staged on either side of a central path, the surface of the plants being made as wavy as possible. In the house there are staged about 2000 plants; but we were shown an excellent reserve batch, which should continue the season for some time. The arrangement of the plants, with a good band of pompon varieties at front, and foliage plants used also as edging, is very satisfactory. The exhibition was opened on the 12th inst., and will be nearly at its best when these notes are printed. Gloire du Rocher is always of good colour here; several of the incurved varieties are also well done by Mr. Large, who has charge of the plants; Louise has been very fine, but is fast passing; E. Molyneux was represented by excellent blooms; and quite a blaze of yellow is made by that fine yellow decorative variety, Rycroft Glory. Mrs. F. Jameson also deserves mention, and some good exhibition blooms of Mademoiselle Melanie Fabre, Vice President Calvat, and Miss Dorothy Shea are among the new ones we noticed, but better blooms of these will be seen later. Visitors should not book to Victoria Park station, which is some distance from the house, but buses run from the City to the park, and Cambridge Heath Station on the Great Eastern Railway will be found convenient.

SOUTHWARK PARK.

Spa Road Station on the S. E. Ry., and South Bermondsey on the L. B. & S. C. Ry., are equally convenient ones for Southwark Park. Between 3000 and 4000 plants have been grown, and Mr. R. Curle, the superintendent here, has been obliged to stage them thickly, as no means are available to shelter a successional batch. The arrangement of the plants is much the same as last year, and could hardly be improved upon in such a house. At one end varieties of the *hirute*, or "whiskered," section have been placed together. Here we noticed good flowers of Hairy Wonder and Louis Böhmer. *Eofant de deux Monde*, or the white Louis Böhmer, was not quite in flower, but King of the *Hirutes* was making a good show with its long-petalled lemon-yellow blooms. This is worthy of recommendation to growers who wish to include good varieties of this section. *Sonvenir de l'Ami Coyer* is white, and is less *hirute* than many of the others, and good blooms are promised by the large buds. *Lady of the Lake* is pale lilac in colour, and quite a good thing; W. A. Mander and Santel had not opened; and the buds were only partly developed on plants of M. Fernand Bertin, a long-petalled flower, very sparsely *hirute*, white, with stripes of rose colour. Among well-grown Japanese varieties worthy of mention were splendid blooms of Elaine, and good ones of Col. W. B. Smith; Wm. Tricker is also well represented, and Madame E. Rey has capital blooms. New ones noticed included Miss Dorothy Shea, which at present is not opening too kindly; Commandant Blussett, Duke of York, bearing large buds, now developing; and Mrs. T. Denne, a good deep wine-coloured Japanese. Rycroft Glory was conspicuous, and the new Anemone-flowered *Descartes* may be observed. Altogether, the collection is better than last season, and there are many fine blooms.

BATTERSEA PARK.

The collection of Chrysanthemums at Battersea is staged in the usual house, a span-roofed one situate in the frame-yard. It may be useful to visitors if we also state that this frame-yard is near the west entrance, and close to the Albert Bridge; for the meagreness of notice-boards to guide the pilgrim has resulted in the writer walking fruitlessly about for some time, when his knowledge of the park was less accurate than it now is. There are about 2500 plants in the collection, and they are staged in one large bank with a path along the side, an alteration from the arrangement adopted on the two last occasions, when two banks were staged to face a central path. The side of the house

running along with the path has been nicely furnished with foliage plants of a more or less ornamental character. The group of Chrysanthemums itself would have been more effective had some efforts been made to screen the large and thickly-placed pots by the use of some dwarf Chrysanthemums or other plants. The flowers will soon be at their best, and a very large number of varieties may be seen. Mr. Coppin, the superintendent, has added many of the new sorts, but few of them were developed when this notice was written. Older varieties that were giving a good account of themselves were *Mdlle. Marie Hoste*, *Mdlle. Thérèse Rey*, *Florence Davis*, *Mons. Tarin*, *Bonquet de Dames*, *Avalanche*, *William Tricker*, *Mons. W. Holmes*, *Hamlet*, *President Borel*, *Gloire du Rocher*, and others. The Park is easily reached from Clapham Junction, or Battersea Park Station on the London Brighton & South Coast Railway.

WATERLOW PARK.

In this little park, at the top of Highgate Hill, the Chrysanthemums are quite as attractive as ever, but poor accommodation exists here for housing the plants. Mr. Pallett has again filled the conservatory and the three small lean-to vineries with very commendable plants, and they are much earlier than some other collections. For instance, *Utopia* was seen in several cases as small plants bearing three large blooms, which had nearly passed. It is a good deep Japanese flower, pale cream in colour, and petals recurved. Good *Graciosa* had not yet opened, though there were good buds. Wm. Tricker, Wm. Seward, Golden Geo. Glenn, and Edwin Molyneux were all very fine. *Old Cullingfordii* is still flowering in this collection, and *Puritan* and G. W. Childs were very nice; *Alice Bird* is a useful yellow decorative variety, and *Source d'Or*, for the same purpose, may be used with advantage. The small incurved flowering varieties promise to make exceedingly pretty blooms in Mr. Pallett's collection.

(To be continued.)

NOTICES OF BOOKS.

GARDENING A LA MODE—VEGETABLES. By Mrs. De Salis. (Longmans.) GARDENING A LA MODE—FRUITS. By Mrs. De Salis. (Longmans.)

These are two little books intended expressly for the benefit of persons who do their own gardening in a small way. The writer relates the result of her own experiences. The cultural directions are mostly clear and good, and the recipes for cooking very appetising. Indeed, we are disposed to think them the best part of the books. The authoress confounds the Aubergine with the Egg-plant. They are very closely allied, but hardly identical. The historical or mythical details might well have been omitted. In such books we do not look to find the opinions on Beans held by Pythagoras, nor the value attributed to Cabbage by Hippocrates. Those to whom such information would be useful would require exact references, which would necessitate careful verification. The authorities quoted by Mrs. De Salis on purely gardening matters are not all of the first rank, a circumstance that would make us doubt the validity of her classical allusions; but, under the circumstances, this is of little import. The books are likely to be useful to those for whom they are specially designed.

SPECIAL MANURES FOR THE GARDEN.

One of the most valuable contributions upon the subject of manures for the garden with which we are acquainted, has just been issued by Dr. A. B. Griffith, F.R.S. (Collingridge, Aldersgate Street, E.C.) The work consists of 123 pages, overflowing with practical manurial information of the very best kind. The work is based mainly on the results of the chemical analyses of seventy-two different garden plants, and never before in this country has such a large number of garden-plant ash-constituents been recorded.

In the introduction the author aptly says, "Our views as to the use of manures has undergone a complete transformation during the past few years. Scientific research has succeeded in solving a number of important problems, and we have consequently been led to adopt new and clear principles relative to the application of manures to plants. We are now in a position to distinguish between merely 'manuring' and 'manuring rationally.' We know what nutrients the soil must contain in order to secure thriving plants and the best crops, and therefore we ought no longer to be content with merely manuring, that is to say, with simply applying fertilisers to soils; but we should manure rationally, that is, put on the soil those fertilising substances which it requires to render it capable of fulfilling the functions required of it."

It must always be borne in mind that the different plants cultivated require for their growth sufficient quantities of different, but quite definite, plant foods, and that they take these chiefly from the soil. If plants are to thrive luxuriantly, these plant-foods must not only be present in the soil in abundance, but also in an assimilable form.

It must also be borne in mind that manuring is always heavier in gardening (especially for vegetable and fruit-growing) than in farming.

In agriculture we have to deal with a comparatively small number of different kinds of plants. We can easily control this number, and without much trouble we can try with each plant whether the accessory constituents of the manures of commerce act injuriously on it or not. In horticulture, on the other hand, this would present far greater difficulties. In this case, we have to deal with a much larger number of species and genera, and we cannot carry out experiments with each of them; moreover, garden plants, various vegetables, the finer kinds of fruits, berries, flowers, &c., are, as a rule, more delicate and sensitive than field plants. Hence it is of the utmost importance that artificial fertilisers or chemical manures should be given in suitable proportions for different plants, and not given at the mere fancy of the grower. Flowers, fruits, and vegetables require manures, but the art of manuring garden crops has been practised in a crude and slipshod fashion. Farmyard-manure, domestic drainage, composts, and occasionally guano, bone-meal, superphosphate, and potash salts are used with ridiculous want of discrimination.

For the benefit of those who are mere tyros in chemistry, it may be stated that, when the chemist burns a plant a greyish-white ash remains. This ash contains the whole of the mineral constituents of the plant; and it teaches the nature of the substances which the plant absorbs from the soil. Mignonette contains 38 per cent. of potash, Beans contain 37 per cent. of phosphoric acid, and Veronicas 36 per cent. of potash, and 30 per cent. of phosphoric acid in their ashes. In other words, Mignonette requires potash, Beans require phosphates, and Veronicas require both potash and phosphates.

But it should not be forgotten that the minor constituents of the ashes play a most important part in the nutrition and growth of all plants; consequently, if a soil be deficient in the minor constituents, or they are not in such a form that they can be readily absorbed by the roots, the plants are bound to suffer from deficient nutrition. Many diseases of plants are due to the want of proper nutrition. It has often been stated that most soils contain a plentiful supply of the minor constituents; and it is therefore unnecessary to add the minor plant-foods to the soil. This the author considers an erroneous idea. Many of the minor constituents may be present in more than a sufficient quantity for a crop's ultimate total requirements, yet the crop does not produce a full and profitable yield, and is often diseased.

In most soils these constituents are present in the form of insoluble compounds, which are only partially rendered soluble during the lives of plants; and those plants which are termed annuals frequently suffer from this cause. It is a policy which

pays the horticulturist to help Nature by adding not only such manures as phosphates, nitrates, and potash, but the minor constituents as well, and in the form of soluble compounds. There is little doubt that many plants are miserable failures because the soil is incapable of properly nourishing them. Soluble manures are readily absorbed by the roots, and they are the principal means of producing healthy, vigorous plants, capable of yielding perfect flowers, fruits, &c. It is very necessary to remember that the object of manuring is to feed the plants, especially during the period of active growth. Fractional top-dressings, and the frequent use of small quantities of manures, dissolved in water, are the best ways of applying manures.

If the cultivator possesses a knowledge of the properties of manures, he understands which particular ingredient should be used to produce beneficial results. He, therefore, applies the special manure wanted, and no other. Many substances which are manures for certain plants, are not manures at all for others; and, in some instances, they may act injuriously. Consequently, the cultivator, be he amateur or professional, who is ignorant of the proper use of manures, subjects himself to double the labour and expense through utilizing any kind of manure to any sort of crop, irrespective of the fact that different plants vary in their constituents, and consequently require furnishing with those ingredients or plant-foods essential to their proper growth. To use the right manures at the right time, and in sufficient quantity, is the correct way to work, and the successful cultivator is now required to pay special attention to the use of manures.

To become acquainted with the food-requirements of plants, we must know their constituents. These constituents fall under three divisions. First, there is water, which forms by far the greater part of all plants; second (which includes the third division), the dry or solid matter may be divided into carbonaceous, organic, or combustible matter, and into mineral matter or ash, or incombustible matter.

The combustible ingredients include woody-fibre, starch, fat, albuminoids, the colouring, flavouring, and odoriferous principles, such as the green colour (chlorophyll) of leaves, the colours of flowers, and the various essential oils of flowers, leaves, fruits, &c.

To illustrate how plants vary in their constituents, we give the following table, being the results of Dr. Griffith's and Mr. R. H. Wilson's analyses:—

Chemical Composition of Various Plants of the Garden. (In parts, per 100)

Composition.	Pea.	Potato.	Cabbage.	Auricula.	Gladiolus.
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
Albuminoids (nitrogenous matters)	22.4	2.2	3.3	6.2	5.3
Carbohydrates (starchy matters)	52.5	21.4	5.1	10.8	12.9
Woody Fibre	6.4	1.0	1.0	1.9	2.2
Fat	2.0	0.2	0.3	0.3	0.3
Ash (mineral matter)	2.4	1.2	1.3	2.6	2.2
Water	14.3	74.0	89.0	78.2	77.1
Total	100.0	100.0	100.0	100.0	100.0
Constituents of the Ashes. Per cent.					
Potash	20.1	53.8	31.0	18.6	18.9
Soda	17.3	0.7	2.6	8.5	9.0
Lime	6.9	3.0	15.7	14.2	13.2
Magnesia	8.9	8.0	5.0	8.9	12.2
Iron Oxide	1.4	5.2	3.3	2.1	3.2
Silica	2.1	5.0	5.0	4.0	4.8
Phosphoric Acid	40.1	15.8	12.9	33.9	28.2
Sulphuric Acid	2.0	5.2	8.8	9.8	8.0
Chlorine	1.2	3.5	8.0	2.0	2.5
Total	100.0	100.0	100.0	100.0	100.0

It will be seen, by carefully studying the above figures, that the constituents of the plants named vary considerably; it is, therefore, necessary that

the manures applied to the soil, in order to nourish these plants, must also vary.

Concerning these constituents, it may be remarked that water is derived from the soil through the roots, that the carbon of the albuminoids, carbohydrates, woody-fibre, and fat is almost entirely derived from the carbonic acid of the air; that the hydrogen and oxygen of the same constituents are derived from the water absorbed by the roots; and that the nitrogen of the albuminoids is obtained from the manure used—except Peas, in which case it is partly derived from the soil or manure, and partly from the air, through the agency of certain microbes which are present in the soil.

It may be stated, that the large number of ash analyses, and the different manurial formulæ given in the work under consideration, are the results of several years' investigations in the garden, field, and laboratory, and we can confidently recommend it to our readers.

SELECT EXTRA-TROPICAL PLANTS.

Baron Ferd. von Mueller's most useful treatise on the plants suitable for culture or naturalisation in extra-tropical regions, has now reached its ninth edition. Its value is attested by its reproduction in India, Germany, the United States, and France. In fact, within its limitations, it forms the most accessible account of the useful plants of the world that has yet been published, and as such is in constant use as a work of reference. Baron von Mueller has not contented himself with writing books, but he has taken a large share in the distribution and introduction of useful plants. The establishment of Eucalypts in various parts of India, California, Algeria, and Southern Europe is largely due to his zeal and energy. It is to be wished that the Baron may be enabled to issue a similar volume devoted to tropical plants. With the aid of the Kew publications, this might readily be accomplished by so indefatigable a worker as the Baron. It may be thought that such books partaking as they do of the nature of compilations, might be entrusted for execution to some clerk, but the necessity for trained judgment and knowledge is evident in every page of the present publication, and freedom from errors could only be ensured by the superintendence of so learned a botanist as Baron von Maeller.

In addition to the alphabetical list of species, lists are given of plants yielding a return in one year, in a few seasons, or not until the lapse of many years—as in the case of timber trees. Catalogues are also given of plants suitable for very cold or for very dry regions; in fact, the practical requirements of cultivators have been carefully studied throughout. A work like this can never be complete, additions and modifications become necessary with the progress of time, and so we find the author already soliciting assistance in the preparation of yet another edition.

We are conscious that our request is somewhat unreasonable, it may be even incapable of fulfilment, but the frequent mention of the opinions and *obiter dicta* of various botanists seems to necessitate fuller reference to the place of publication to enable the reader to see under what circumstances the opinion cited or the fact recorded was given, and the degree of importance to be attached to it. As to the authorities for the names, the New Index happily enables us easily to find the desired references. To show how much still remains to be done, Baron von Mueller instances Mexico. More than three centuries have elapsed since its conquest, but "only the most scanty information is extant on the timber of that empire, even in reference to its numerous kinds of splendid Oaks. Again, of several thousand species of tropical grasses, not many dozens have been tried as yet with rural or chemical exactitude for pasture purposes, not to speak of a multitude of prominently utilitarian trees, shrubs and herbs restricted to temperate mountain regions within the tropics, but never carried to the lowlands of higher latitudes."

THE ROSARY.

BUTTON-HOLE ROSES.

ALTHOUGH the taste for wearing flowers in button-holes has greatly diminished of late years, there are still a few who keep up the custom, a custom which, I think, is much to be admired, even although it is by some carried to excess. One good effect it had so far as the Rose-garden was concerned: it led persons to continue the culture of a class of flowers which, although utterly unsuited for the prize stand, were yet beautiful adjuncts to the garden, and this led to prizes being offered at various exhibitions throughout the country. But still, though the taste for button-holes has decreased, it is a consolation to know that the same class of Roses has come into general use for what are called shoulder-knots for ladies, so that a few notes on them may not be out of place.

The class of Roses most suited for this purpose is that of the smaller Tea-scented, and what are called hybrid Tea-scented Roses, and they must have two or three characteristics; in the first place, the bud ought to be more or less pointed, for it is only in the bud state they can be used, and hence the Polyantha section which, at first sight, seem so well adapted for it, are really unsuitable, and are very rarely used. Then they must have good colour; a white Rose, for instance, would be hardly suitable, and might probably suggest that the wearer was going to a wedding. There is no Rose which more thoroughly fulfils these necessary conditions than—

Ma Capucine, and although raised by Levet now a quarter of a century ago, in some respects it is still not only unsurpassed, but unrivalled; the colour is the deepest in its way of almost any Rose known, being of a rich coppery-orange, recalling in some measure the Austrian Copper and Fortune's Yellow. The bud is pointed, and the petals are very few, and consequently it only remains good for a short time, but when opened is utterly worthless, turning to a poor white; it is, unfortunately, not a good grower, and consequently it has remained difficult to obtain. I was rather surprised to find that my plants of it on a south wall, although somewhat injured by the last severe winter, recovered and bloomed well this season; but there can be no doubt that it is of delicate constitution, and requires a good deal of care.

William Allan Richardson.—This, as far as constitution is concerned, is the very opposite of the preceding, being of the most vigorous constitution, and having probably an affinity to the *Gloire de Dijon* race; the colour of the buds, in which state alone it is of any use, is a rich orange-yellow edged with white, but it is now so well known and popular, that little need be said in its praise. For table decoration, for shoulder-knots, and button-holes, it is extensively used, and very often in large establishments, a house is devoted entirely to it. It has one failing, namely, that in certain positions and in certain seasons, the white edging seems to overpower the orange-yellow ground colour, and the whole flower becomes white, and in this state it is valueless. It has been said by some, that there are different strains of it, and if so, its white one ought to be avoided; its freedom of growth and profuseness of blooming will probably tend to make it hold its position for many years to come.

L'Idéal is one out of the many productions of M. Nabonnaud, and has obtained a permanent place in our gardens. It is vigorous in growth, has a good constitution, and is hardy; its colour it is almost impossible to describe, affording as it does a combination of orange-yellow, metallic red, peach, and gold, making it a most lovely flower, and a general favourite. When exhibited at the Crystal Palace at the National Rose Society exhibition by Messrs. Paul & Sons, it created a great sensation, and is now recognised as one of the most beautiful of its class.

Beauté Inconstante.—A new Rose of novel colour. It has been described as terra cotta with flame-coloured shading, and probably this is as near as we

can get, though it is sometimes abated with cream or white; it seems, so far as one can see, to be of a good habit, and very suitable for a pillar or wall.

Gustave Regis.—This is said to be one of the hybrid Tea class, but I am at a loss to find where the hybrid is in it. All Roses have been more or less either naturally or artificially crossed, so that the term might be applied to every Rose; but by hybrid Tea it is generally intended to indicate a cross between a Tea Rose and a hybrid perpetual, and this I cannot see in this flower—it seems to me a Tea Rose pure and simple. In colour it is a bright canary-yellow, with a very pointed bud; the foliage is good, and the habit of the plant climbing.

Shirley Hibberd.—A comparatively little known but very pretty Rose: was raised twenty years ago by Levet, from Madame Falcot; it is of a bright nankeen colour, with pointed bud, and very sweet. I very rarely see it, and am indebted to my friend, Mr. Cooling, at Bath, for my knowledge of it.

Princesse de Sagan.—The most highly coloured of the Tea Roses. Its unopened buds are very pretty to those who admire these rich colours in Teas, which I confess I do not; but the rich colouring of this variety, which is far brighter than *Souvenir de Thérèse Levet* or *Marie Antoinette*, gives it favour in the eyes of a good many growers.

Madame Chedane Guinoisseau.—A very pleasing and free-flowering Rose, fuller than some of those already mentioned. In colour it is of a bright yellow, and even when more expanded, a not displeasing flower; it is, however, as a button-hole Rose that its chief usefulness consists.

Adeline Viviani Morel.—A comparatively new Rose, raised by Bernaix; in colour somewhat in the way of *W. A. Richardson*, but of prettily combined tints of apricot, orange, and white—likely to become a general favourite.

Alister Stella Gray.—A new flower, raised by Mr. Alexander Hill Gray, somewhat in the style of *W. A. Richardson*; a very free and constant bloomer, so that one rarely goes to the plant without being able to obtain some flowers from it.

Madame Pierre Cochet.—Another of the *W. A. Richardson* style of Rose, raised by Cochet, in 1892; the raiser calls it an improved (for so, I suppose, we must interpret "*perfection de*") *W. A. Richardson*. It is a very pleasing variety, of a very vigorous growth and bright foliage, the colour of the flower is very much like that of its parent, not having so much orange colour, but more primrose-yellow.

Marquise de Vivens.—A very pretty rose-coloured flower, with a yellow centre; it is very sweet-scented, and altogether in its bud state a very pretty Rose. There are probably others that some might wish to include in this list of button-hole Roses, but I do not think that the dozen which I have thus described can be very well exceeded in beauty. They are varied in their colouring, and nearly all very vigorous in habit; many of them partake more of the Noisette than of the Tea character, and indeed occupy the border land between those two sections. Many of them are now, in September, flowering profusely; indeed, in the late glorious autumn weather there was a wonderful abundance of Tea and Noisette Roses of all kinds. Hybrid Perpetuals were not wanting, although the hot sun very soon deprived them of their bright colouring, which only tends more and more to develop the beauties of the Tea Rose; and those who have not already grown the sort that I have described will, I think, do well to add them to their collection even where the space is limited.

Wild Rose.

CHRYSANTHEMUM BOULE D'OR '95.

This is a new incurved Japanese Chrysanthemum raised by Mons. E. Calvat. Those who appreciate the fine early-flowering *Louise*, will find this variety a good companion for same. *Boule d'Or '95*, so named to distinguish it from an earlier variety of that designation, bears resemblance to *Louise* in form and build, beside—if we may judge from its habit this

season—which, its flowers open about the same period. The flower is undoubtedly a very fine one, and generally rather deeper and more compact than shown by fig. 86, p. 499. In colour it is a lovely light-brown or amber on the surface, with a pale yellow reverse. The variety was awarded a First-class Certificate by the National Chrysanthemum Society on October 8, and an Award of Merit by the Royal Horticultural Society on October 15, the blooms in both cases being exhibited by Mr. W. Wells, Earlewood, Redhill, Surrey.

HOME CORRESPONDENCE.

MARKET SALE OF FRUIT.—It does seem as if there was a potent truth in what was recently said during a discussion on fruit culture for market, that it was much less difficult to grow fruit than to sell it profitably. If those now growing fruit for marketing, or proposing to embark in that industry, do not know the best sorts, the best methods of culture, and the best manner to prepare fruit for market, then have they greatly wasted their opportunities. The country has been saturated with advice on these matters, and so much has the subject been ventilated, that even the ablest advocates of reform have nothing fresh to say, but can only repeat what has previously been stated. Our fruit exhibitions certainly show that a knowledge of high-class culture has spread very generally in the country, and such being the case, further knowledge is needed to make fruit culture profitable; for unless it can be rendered profitable as a commercial industry, there is little prospect that such culture will increase. The first thing to clear up is the results of high-class culture with best varieties as compared with ordinary culture, which is often non-culture, with ordinary or inferior varieties. If the cry of starved market returns comes from the high-class growers, then is the outlook dark indeed. If, on the other hand, they have, considering the immense crops of this year, been fairly well content, and do not complain, then is it evident that high-class fruit pays, and that it is the inferior fruit which fails to do so. It is, however, a matter which the high-class fruit grower only can fairly determine. But may not contiguity to a good market, such as a popular centre affords, have much to do with profitable results, assuming that there are sometimes found. Thus the grower who has his ground within some twenty miles of the market, and can send in his own vans and go himself to sell, saving something of the ordinary cost of railway transit and salesmen's commission, enjoys a great advantage over the grower whose land is beyond the distance that a wagon can profitably cover, and who has to pay rail charges, cartage at both ends, and salesmen's commission. Then the grower who is thus in close touch with the market, learns to understand its requirements and movements, and regulates his sendings accordingly. The more distant grower knows less of these matters, and does not see much of other methods in the matter of home and foreign products. Indeed, it is a fact, that marketing is of itself a vocation for which a certain amount of training is required. Then there generally can be found between the fruit grower, whose land is adjacent to the town and the town shopkeeper, an intimate business connection, and where that exists, prices are always rather better than in the open market, and there are no incidental charges to meet. If, too, the grower has adopted the more advanced methods of packing fruit in shallow boxes, baskets, &c., so as to induce the grocer to become a customer, he opens up a way of trade which so far has been chiefly restricted to the foreign importer, whose methods of packing have beaten our old-fashioned ones hollow. I have heard of growers of fruit near to London, whose prices have been low—so low, indeed, as from 1s. to 3s. per bushel for good-sized Apples, according to quality—who have done very well, simply because the crop was so heavy. But if distant growers of even fairly good samples cannot sell locally at a remunerative price, how can they hope to do so in distant markets after paying rail charges, market fees, and salesmen's commission? If there be no demand relative to the enormous supply, it is not possible to create it artificially; and although we may deplore the undoubted fact that not more than a third of the fruit is consumed as food that should be according to the population, and yet it is not possible in any way to force that consumption, then the most

we can do is to tempt to greater consumption by offering the best of fruit in the most attractive guise. We have had various aspects of the market question presented to us from time to time, but they have largely come from the more interested or successful side. When we have heard the other aspect, it has usually been in the form of a lament without any practical suggestions accompanying it. Naturally, the misfortunes of the cultivator of inferior varieties do not command much attention from practical men, because they perceive largely why these misfortunes and failures come. The difficulty presented is to make these growers who are the bane of fruit cultivation and marketing, realise the weakness of their practice. If we could eliminate from market competition all inferior fruit, we should immensely enhance the prospects of higher culture. That we are still passing through the transition stage in relation both to culture and to marketing methods, there can be no doubt. The process is a slow one, but the ultimate result can hardly be doubtful. Surely, the fine fruit presented in the best way, must eventually win in the end, and thus render in Great Britain, high-class fruit culture assuredly profitable. A. D.

A FINE SPECIMEN OF WISTARIA SINENSIS IN BURY ST. EDMUND'S.—In writing to the *Gardeners' Chronicle* two or three weeks' since, of especially fine specimens of this matchless climber, I had two fine specimens in Bury specially in view, the one at the corner of Sparhawk Street, and the other in Northgate Street, near the railway station. The latter is considerably the larger of the two, and is one of the finest I have seen, with the exception of some noble specimens clothing the flower-garden wall at Easton Park, the seat of His Grace the Duke of Grafton. H. R. Barker, Esq., of Northgate Street, kindly sends me the dimensions of his plant, which covers three sides of his large house. The plant is 101 feet 4 inches in length, 23 feet 6 inches high; thus, in round numbers, covering 2,323 square feet. The stem, at the ground, measures 3 feet 10½ inches, and at 2 feet from the ground it is 2 feet and ½-inch round. It was this plant that specially distinguished itself by the profusion and delicacy of its autumn blossoms this season. The zero frosts of last February did it no harm. D. T. F.

VEGETABLE FOODS AND DRINKS.—The past season will long be remembered for great heat and drought, and the abundance of Apples and Plums. In accordance with the ancient notions, sickness, cholera, and other ills would be sure to follow, but this does not appear to have been the case. During this abundant fruit season, with so high a temperature and so small an amount of rain, is it not rather remarkable that we have been unusually healthy as a nation? I think so. The question arises, is there a cause or reason to account for this highly satisfactory state of things? I think there is. Plums at ½d. per lb., and Apples at 3 lb. for 1d. [?] in nearly all large towns and cities, at once make it plain that an enormous quantity must have been partaken of everywhere with excellent physical results. The question is, have we not gained greatly by all this fruit-eating, and if so, what and how much? If any of your correspondents could throw any light on the very important advantages of eating fruit to make us safer from epidemics it would be solving a great question indeed for our future guidance. I have certainly eaten considerably more than usual, and required as a result less to drink; nor have I in the least felt a desire for the usual kinds of drink, and during the hottest weather I never felt better. In my opinion, this general partaking of fruit has caused people to feel more satisfied—the young in particular, they have suffered less acutely from thirst and the craving for drink; and is it not a fact that the free use of popular drinks disagrees with many persons. These drinks apparently contain ingredients which rather increase the parched feeling than allay it, and many persons over-indulge innocently. So it goes on until the stomach can bear the injurious matter no longer, and at last throws it off; but when thirst is satisfied with fruit there are no chemical substances to disagree—on the contrary, an agreeable and pleasing refreshment is taken. Again, by eating good ripe fruit the body is stimulated and invigorated in a more natural manner, and the mind is more cheerful. I have noticed stewed fruit of some kind or other is served on nearly every table, and its use is becoming more general every year. Many persons are great consumers of meat, and these

would find it difficult to alter their diet; yet the question is, if we are wise and wish to keep in good health and fit at all times, whether it would not be advisable to consume more fruit and less meat, and live more in accordance with natural requirements, particularly during seasons of high temperature like the past season. I rejoice to see fruit and vegetables becoming more and more used as food. *Henry Cannell, Swanley.*

PACKING COMPETITION AT THE CRYSTAL PALACE SHOW—The arrangements for the judging in this very important competition need a little

innately obliged to market a great deal, had to send every box separate, what a great addition to their labour of packing would be caused, besides greater cost in transit. *Frank Harris, Eastnor Castle Gardens, Ledbury.*

PRICES OF APPLES.—In the able prize essay on fruit reported in the *Gardeners' Chronicle*, p. 432, the following quotations are given, Ecklinville, which headed the list, fetching from £12 to £22 per ton; Lane's Prince Albert, ditto; Golden Scire, £15; Worcester Pearmain, from £14 to £26 per ton; Warner's King, £16 per ton; Cox's Pomona, Cox's Orange Pippin, King of the Pippins, Lord Suffield,

main £26, that Cox's Orange Pippins, the next best to the Ribston, only made £16 per ton. Can it also be still true that, notwithstanding the numbers of Ribston Pippins grown and shown, and the robust health of the trees generally on Paradise stocks, English-grown Ribstons are still so scarce as not to have their value in bulk assessed in our latest prize-essays? This is the more surprising, as we are all agreed that the Ribston remains still the Queen of all our English or any other dessert Apples. Neither are proofs wanting that it will thrive under good treatment on the Crab or free stocks on good soils, with judicious root-pruning. I have recently seen some Ribston trees in Sussex, over a hundred years

FIG. 86.—CHRYSANTHEMUM BOULE D'OR '95. (SEE P. 498.)

revision. In the first place, I think a leading salesman or two would make very competent judges, instead of the gardeners who judge in this competition. Then, I think, the distance which fruit has to travel should be taken into consideration; otherwise, an exhibitor who has to send a long distance, and very likely over more than one company's lines, is placed at a great disadvantage as compared with a less distant competitor; and to make sure of the fact, the different samples should travel as ordinary parcels, and bear the company's label to that effect. I myself, with others who sent samples for competition, found our cards marked, "two boxes tied together." Is that a fault? and if so, why? If all gardeners who, like myself, are unfor-

Pott's Seedling, Yorkshire Beauty, Stirling Castle, Tower of Glamis, and Dumelow's Seedling. The statement as it stands would be more valuable with a little further explanation. It can hardly mean that the last nine sorts named were sold at the same price as Warner's King, viz., £16 per ton. Neither can it mean that such valuable dessert Apples as Cox's Orange Pippin and King of the Pippins are not worth more than such kitchen varieties as Ecklinville and Lord Suffield. The colour, doubtless, sells Winter Pearmain, though £26 per ton is a high price for such a decidedly inferior Apple. And it seems impossible for the able essayist to have wished to convey the impression that while Ecklinville made £22, Worcester Pear-

old, in fair health and full bearing, that had never had any other food or manure within the memory of the oldest inhabitant but the drainage of a small yard, in which about half-a-dozen bullocks were "moot" fatted every winter; and we have plenty of samples everywhere of the wonderful tenacity with which the Ribston Pippins cling to life, when not crippled with canker, and smothered with American blight. Query: Are these weaknesses the natural results of our modes of culture, or of our climate or the constitution of the variety? *D. T. F.*

THE CRAB FOR THE GARDEN AND ON THE TABLE.—I am very glad to see Mr. Harrison Weir's rousing article about Crabs. It would be almost

impossible to read it without setting to work at once to plant Crabs in greater variety. There is no fear of overdoing Crabs in our gardens or landscapes for many years. There are many of them very much overdone with evergreens; and now is the time, or it will soon be here, to take out and nroot some of the latter for Christmas decorations, and plant Crabs in their stead, if no other places can be found for them. For grace, beauty, brilliancy of flower, fruit, foliage, we have nothing to rival, and few to equal, Crabs. Then as a sweet on the table, they are ever welcome, as jelly, jam, or whole in syrup, with at least a third of the stalk left intact to hold them by. Artists in conserving Crabs vary much in their views of the most orthodox length of the stalk for procuring artistic effect and convenience. Well, it is not of vital moment, and here the charm of variety may be indulged to the full without injury to the artistic effect or eating qualities of sweet Crabs. *D. T. F.*

CRAB APPLES FOR GARDEN DECORATION.—Why should not some of the handsome free-fruited forms of *Pyrus malus*, which are denominated Crab Apples, find a place among the ornamental trees in the shrubby border, where they are but rarely seen? They have two periods of service—when they flower, and when they bear fruit. *P. malus floribunda* is sometimes planted, and is most attractive in spring, being very free-flowering; the young shoots of the previous year assume a naturally pendent growth, and become wreaths of blossom, to be followed by numerous small fruits. The red and yellow Siberian Crabs, forms of *P. prunifolia*, are both highly attractive, both in flower and fruit, the fruit of the former taking on a lively bright reddish tint, the latter pale yellow; both are very free in fruiting, and highly ornamental. Messrs. J. Cheal & Son, of the Lowfield Nurseries, Crawley, who have a very interesting collection of Crabs, have a distinct form of the Siberian, which, it is probable, originated as a seedling, and they have named it the Scarlet Siberian, on account of its brilliant colour. In several particulars, it differs from the Red Siberian, not only notably in the colour of its fruit, in the absence of the cavity in the eye which is peculiar to the common form, and in the presence of calyx-segments, or snuff, which are retained, and do not disappear, as in the case of the two types of the Siberian. John Downie, which takes on a very fine red colour, and is quite distinct in appearance, may be described as a long form of the Siberian, its brilliant orange-red colour is very attractive, and it fruits very freely. This is a striking type to plant among shrubs in the form of standard trees. An extremely handsome form is also found in Transcendent, from America, which produces its fruit in large bunches, which when ripened in the sun are highly attractive. It is very distinct in character, and the fruit takes on a remarkable bloom. Then there is the black-fruited Crab, which is very dark in the colour of its fruit, and in striking contrast to some of the others. What is grown at the Lowfield Nurseries under the name of *edulis* is a small-fruited sort, and valuable as a shrubby plant. Then there is the Dartmouth Crab, the fruit large in size, and distinctly plum-coloured, taking on a beautiful bloom; it is also a free bearer. To suit the requirements of planters, Crabs are "worked"—to use a nursery phrase—both as bushes and standards, the former being best adapted for isolation, unless the position is better suited for a standard tree. In either form they make handsome objects; and while a sunny position is probably necessary to cause a fine colour to appear on the fruit, it was yet noticeable at the Lowfield Nurseries that bush plants partly hidden from view by the growth of others about them, and partly by overhanging foliage, yet bore crops of richly-tinted fruit. *R. D.*

JUDGING AT METROPOLITAN AND LARGE PROVINCIAL HORTICULTURAL EXHIBITIONS.—The suggestion made by "P. M." at p. 336, surely cannot have been made in earnest. The idea is too ridiculous to be entertained for a moment, and thoroughly unpractical to a degree. "P. M." suggests that an expert—say from the Royal Horticultural Society—should be in attendance at all important horticultural exhibitions as a scrutineer. Scrutineer, indeed!—to see that no points of merit in the exhibits are overlooked, and if any error occur, that it may be pointed out before the adjudicators leave their work. Adding, "generally men of notable positions are selected as judges, and rightly so, but after all, they are liable to mistakes, and a scrutineer would materially assist in securing justice in each award." Mark the words, the judges "selected from notable positions, and

rightly so, are liable to mistakes," but the suggested expert is infallible, and readers of the *Gardeners' Chronicle*, especially the committees and secretaries of large provincial horticultural societies, are asked to accept this highly illogical suggestion of "P. M.," which carries its own condemnation with it, and goes to show the exceedingly high, though delusive, opinion which "P. M." has of his ideal expert, and the poor opinion which he entertains of the capacity of men selected to make the awards. Supposing that any committee of horticultural societies were to act upon "P. M.'s" suggestion, the judges selected from "notable positions" to make the awards under the conditions indicated above would assuredly not be forthcoming, and the infallible expert would alone have to award the prizes. The united judgment of two or more practical men "P. M." thinks might be wrong, and that of one man—the expert—must necessarily be right! Why does not "P. M." holdly say to which high-class provincial show recently held, his remarks apply, and also mention the one subsequently held at which the "nonplussed competitor found a peg to hang his 'quibbles' upon," and thereby do that which is right to those judges, exhibitors, and committeemen who have not, in his opinion, transgressed his ideal way of judging, exhibiting, and managing horticultural shows? *Fiat justitia, ruat cælum.*

EARLY FIGS IN POTS.

The cultivation of pot-grown Figs, I am glad to remark, on the increase in this country, and those who have seen the excellent examples at the Royal Horticultural Society's Gardens at Chiswick would be able to note the value of the Fig when so grown. My present concern is, however, with forced Figs for gathering in March and onwards, which is earlier in the year than the Chiswick Figs bear fruit, and, being early, they cannot be compared with those as regards fine flavour. Many of the varieties grown at Chiswick are not suitable for hard forcing, though excellent at a later season. There is the great advantage in pot Figs that their fruits can be obtained at a time when other choice fruits are not too plentiful; moreover, the forcing is easily managed, and the permanent Fig trees, if any, are kept for later fruiting. When pot-grown Fig trees are forced year by year, they force freely, and bear good crops. It is objected to pot trees that the fruits often drop before maturing, but the same objection holds good of the large permanent trees which are hard forced; and my experience is, that there is less dropping with pot-grown Fig trees if the treatment afforded is the proper one. Again, as regards dropping, much depends upon the variety, some being more liable to it than others, and these should be avoided, as when the first crop is lost another early crop is out of the question.

Mr. Barron, in his excellent report on the Figs at Chiswick a few years ago, gave a list of some sixty-six distinct varieties, many of which are not sufficiently known as yet in gardens for me to advise their employment as early forcere. The list of varieties which I now give is a short one. An early forcing Fig should be capable of making sturdy, short-jointed shoots, so as to fruit freely in a small space, and that involves compactness of growth, so that the forcing can be carried out in low pits or houses. Such plants are less subject to fruit dropping than strong growers. It is surprising what a nice lot of fruit a well-managed plant growing in a 10 or 12-inch pot will produce if the preparation of the wood has been good, and due supplies of nutriment and water have been afforded at the right time, any excess of either causing badly-flavoured fruit and fruit-dropping. The regularly-forced pot trees fruit so readily, that I look upon them as being the most reliable of early supplies. During the last few years there have been some valuable additions to early varieties, viz., St. John's, Pingo de Mel, and Violette Sepor. Many other varieties bear forcing well, but they do not fruit in a short space of time; as, take for instance, the first and second named, there is no difficulty in having ripe fruits in March if the plants are started in the middle of November, which allows of slow forcing from the

start. Both varieties are noted for good habit, and not shedding the earliest fruits in the dull season.

With regard to these varieties, I have not much experience with them as permanent trees planted out for summer fruiting, but for pot-work they will supersede some of the older varieties for early forcing, and when of small size. That well-known Fig, Negro Largo, one of the best grown, is not a good early forcere, but there is none like it for late autumn cropping, and where specially grown for fruiting at this season and later it proves a most valuable Fig; and no variety is more amenable to pot-culture. Planted out it runs wild, and refuses to fruit unless one is always pruning its roots, or these are confined to a small space. I am of the opinion that the best use is made of Negro Largo in growing it specially for late fruiting, although it is a valuable Fig for very early forcing, if given plenty of space in which to grow at top. At Syon it is not free enough as an early variety, though later on it is all that one could wish. The best all-round Fig is the favourite Brown Turkey, a grand pot Fig, whose second crop is often better than the first. For growing in a restricted space and for fruiting from May to September, it is a valuable variety; but it will not stand hard forcing like St. John and Pingo de Mel. The small white and black Lechias force well, but the white variety is the more delicious. The White Mareilles is a well-known variety, good for permanent trees, or for growing in restricted borders; and there are some others equally good, but with me none is so reliable as those I have named. The system pursued at Syon is to place the pot-plants indoors in November on a mild hot-bed of fresh leaves, in low pits, close to the glass, and to force slowly. We obtain from these trees fruits in the month of March. I do not advise the hard forcing of Figs, and if fruit be not wanted till April, the month of December will be early enough to begin, as the crop of fruit will then be better and the fruit larger, and of finer quality. A great point with early-forced Figs is the thorough ripening of the wood, and not allowing them to carry late crops, as they will do if the trees be not lightened of the fruits that set. The forced trees here are placed in a cool house after the forcing is over till September, when they are turned out of their pots and denuded of a portion of the old roots, repotted, and sheltered from heavy rains, but stood in the open till placed in the forcing-pit. The potting compost consists of sound loam, old mortar or plaster, and bone-meal. A few Fig cuttings are struck yearly, and the plants grown on to take the place of those which have to be discarded, because too large for the purpose. During their early forcing stages but little moisture at the roots is required; and pinching at the fourth joint is important as growth proceeds, to assist the fruit in settling. *G. Wythes.*

NURSERY NOTES.

CANNAS AT PAUL & SON'S, CHESHUNT.

Canna indica the botanists is now a very popular plant in our gardens, and we need not value it the less because it is an old plant. John Gerard says, 1596, "that he had planted it in his garden divers times, but it never came to flowering; and that it must be set or sown in a pot with fine earth, or in a bed made of horse-dung, in such manner as Cucumbers and Musk-Melons are." Parkinson was more successful later, and flowered it "in some kindly years," but it never bore seed, nor would it "abide the extremities of our winters, unless it meet with a stove or hothouse such as are used in Germany, for neither house nor cellar will preserve it." In Miller's time it bore seeds freely, and he recommended that the old plants be thrown away after they had borne good seeds, as the young plants always flowered better than the old roots; but neither Miller nor the older botanists were very successful in improving the plant, for Mr. W. T. Aiton, in the *Hortus Kewensis*, 1810, enumerates but six varieties—*C. indica rubra*, *C. i. coccolnea*, *C. i. patens*, *C. i. lutea*, *C. glauca*, and *C. flaccida*. Cannas are

among the easiest exotic plants to cultivate. They are excellent in pots for late autumn and winter culture, and they are valuable as semi-tropical plants in the flower garden. *Crozy*, of Lyons, has been very successful in raising richly-coloured varieties from seed; and in England, Messrs. Paul & Son, of the Old Nurseries, Cheshunt, have made considerable progress in producing a new feathered strain of undoubted merit, which combine a fine dwarf habit in the plants. Mr. Geo. Paul, senior, the genial rosarian, is quite an enthusiast amongst Cannas. One of the best varieties is Dr. Masters, the petals of which are bright yellow, very distinctly feathered with bright red, lip deeply spotted and marked with crimson. Mrs. Fandel Phillips has yellow petals feathered red, lip yellow, densely spotted red, and is fine. George Nicholson is a plant of dwarf habit; the flowers are clear yellow, richly flaked with crimson, lip deeply spotted with the same colour. Miss Elsie Perkins is a lovely clear yellow self; *Phœbus* is a very pretty orange-red variety, with large flowers. *Bacchus* is a showy variety, with flowers of large size, deep reddish-crimson in colour. Mrs. Tasker is an excellent dwarf plant for pot culture in the spring; the petals are yellow, with buff centre. *Amphion*, cinnabar red flowers of good form, and a compact spike; *Cheshunt Yellow* has flowers of a distinct clear yellow, the lip reddish-brown. T. B. Haywood is one of the best for autumn flowering; the colour is a distinct deep rosy-crimson. *Crozy's* varieties, though distinct from the Cheshunt strain, are also of great merit. *Papa Crozy* is perhaps the best; the flowers are of a reddish-velvet, and are well-formed. *Gloire Lyonnaise* is yellow, heavily blotched orange-red; *Souvenir de Antoine Crozy*, scarlet, with yellow margin, is very distinct; *Comte de Bonchard* is yellow, evenly spotted with red, very good and large; *Van der Berg* is reddish-orange, with clear yellow margin, and very dwarf in habit. *Emil Rodeck* is a dwarf plant; the flower a clear golden-yellow self, with maroon-red lip. The above are the best of the Cheshunt collection, and they are grown both planted out in the open garden and in pots.

Most gardeners have grown the *Canna* in pots, and few plants are better adapted to furnish the greenhouse or conservatory during the autumn, whilst with a little heat they can be had in flower all through the winter. The plants may be grown to immense size if they are given good loam and decayed manure to grow in, and plenty of pot-room. I have had splendid specimens in 12 and 13 inch pots. The plants also like a light and airy position when making their growth. At Cheshunt smaller pots are used, and quite as good results are obtained in respect to the quality of the flowers. They were also flowering very nicely in the open borders in good deep soil; in masses of one colour, they would have a fine effect in any garden. I have used them in the form of large specimens with good effect in the centres of large beds which are planted with *Pelargoniums* and other things. Not only are the flowers of these *Cannas* richly and brilliantly coloured, but the effect of the foliage at a distance is very striking, and it is easy to obtain colour by using *Phloxes*, *Pentstemons*, *Antirrhinums*, or *Pelargoniums* of the zonal type, *J. Douglas*.

PLANT NOTES.

APIOS TUBEROSA.

This is a pretty Pea-like, deciduous climber, which succeeds in ordinary garden soil, covering a trellis in a short space of time. When well planted, it will take care of itself.

EUCOMIS PUNCTATA.

This useful plant should be found in every collection. The bulbs should be grown in a mixture of porous soil in the open, about 1 foot deep, mulching them during the early winter months. I prefer to grow the plant in clumps of eight bulbs. Our plants were grand objects when in bloom,

CLEMATIS DAVIDIANA AND C. GRAVEOLENS.

The first is a plant of recent introduction, which I can recommend as being hardy, of a distinct character, erect in habit, and bearing a profusion of lavender-coloured flowers, quite different from those of the ordinary type of *Clematis*. It attained a height of 3½ feet this season, and it will doubtless grow taller. It is a suitable plant for a border or rockery, and its hardiness is such that it has stood the test of last winter unprotected; still, I mean to take extra care of it for the future, as it is well worth it. The blooms begin to appear in the month of August, continuing to expand till the end of the following month. *Clematis graveolens* is a pretty pale yellow-coloured species, suitable for covering a fence or trellis, and it forms a fine effective contrast to *C. Jackmani*. *H. May, Markree Castle, Sligo.*

NEW INVENTION.

A NEW TURF-CUTTER.

In fig. 87 is presented a new implement for paring or cutting turf for the purpose of laying down lawns, which is likely to effect an immense economy over hand-labour. The machine has a paring-blade supported by one vertical cutting-blade, and ensures a clean and level cut bottom, and a turve or sod of equal thickness. A heavy roller runs in front of the blade to level the surface and regulate the thickness

FIG. 87.—A TURF-CUTTING IMPLEMENT.

of the cut. The cutter is furnished with guide-wheels to keep it level, and to ensure the turves being cut to a uniform width of 12 inches. Lifting-wheels to raise the implement are provided at each end.

To cross-cut the turves to a uniform length of 3 feet, there is an extra vertical cutting-blade which runs in front of the roller at A, and a marker attached to the implement marks a line on the grass parallel to the cut, showing where the cutting-blade is to run the next bout. The machine has been brought out by Messrs. Ransomes, Sims, & Jefferies, Ltd., Orwell Works, Ipswich.

SOCIETY.

THE UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

OCTOBER 17.—The ninth anniversary dinner of this Society was held at the Cannon Street Hotel on the above date, when James Herbert Veitch, Esq., presided, he being supported by Messrs. Nutting, H. J. Veitch, A. Moss, W. Y. Baker, H. B. May, H. Cutbush, W. Icton, H. Cannell, and other gentlemen. A larger number than usual were present (110), and the greatest enthusiasm pervaded the meeting.

The CHAIRMAN, in his after-dinner speech, when proposing the toast of the evening, placed before his audience a most concise and forcible statement respecting the benefits offered to its members by the Society. More convincing facts could not possibly be given than the quotations from its rules with regard to the many advantages offered. The chairman announced that the Society had now invested funds in Trustee's stocks to the amount of £10,503, the investments for the past three years having been at the rate of £1000 per annum, whilst this year they will, in all probability, exceed that sum. When the Society came of age it had only, after twenty-one years of hard work by its secretaries and officers,

177 members. A new era then commenced with these anniversary dinners, the ultimate object of which was to bring the Society into more prominent notice. This has been fully justified by the results, and there are now 541 members scattered over all parts of the United Kingdom, and a few outside of its boundaries. Then the invested funds stood at £355, as against the present sum given above. Then there were twelve honorary members, now there are fifty; the increase, therefore, has been an all-round one. The Chairman alluded to the alterations in the rules, whereby the amount payable in sickness has been increased from July 1 last. This is especially noteworthy, the alteration having, without the slightest demur, received the sanction of the Registrar of Friendly Societies. The increase thus given is from 10s. 6d. to 12s. per week for those who contribute 6d. per week, and from 16s. to 18s. for those who pay 8d. Speaking of the Convalescent Fund, the Chairman said:—"Peculiar to this Society, and undoubtedly of great value is the Convalescent Fund, a fund which owes its existence to the foresight and generosity of Mr. Sherwood. This fund is purely a voluntary one, and it is at the disposal of the committee, that they may send away for a time any member who may have been so prostrated by illness as to render a change essential, but who may not have the necessary means. To generous friends and to those who are enjoying a larger share of the good things of this world than falls to many of us, I would venture to ask something more than a kindly thought for this fund when the United Horticultural Benefit and Provident Society next comes uppermost in their minds." Remarks worthy of thought by all gardeners were those made also by the Chairman on thrift:—"On the necessity of thrift in general, and the strong advisability of joining such a benefit and provident society as this when young, it would be easy to dwell, and much might be said in particular on the necessity of thrift for the young men and foremen in the botches of the large gardens of this country, more especially as the occupation they have chosen has suffered so much, and is still suffering, through recent years of depression, and through the very large number who are continually entering its ranks. Travelling lately in various parts of this country, I could not help being struck by the number of foremen capable in every way of taking head places, and who, even with strong influence to assist them, fail to obtain the much coveted post. Some have been waiting for years, and are apparently as far off to-day as ever from attaining their wish. To such would I especially recommend the Benefit and Provident Society. The younger a man joins, the sooner a large deposit is acquired, and the sooner one will find oneself in the position of certain members at present, whose interest on their deposit is greater than the amount annually paid in subscriptions." No more weighty arguments than these should be necessary to convince young gardeners of the desirability of joining the society. During the evening it was announced that Mrs. Sherwood would contribute £5 ss. to the Convalescent Fund, a fund largely augmented by the generosity of Mr. and Mrs. Harry J. Veitch, on the occasion of their silver wedding, £100 being then given. Other sums were promised to various purposes, including Mr. A. Moss, £2 2s.; Mr. Icton, who becomes a life member, £10 10s.; Mr. Mott, the sum of £10 10s. Mr. Arthur W. Sutton, Reading; Mr. Jones, Lewisham; and Mr. Wythes, Syon, hon. members of 21s. each annually, with donations of the same amount from Mr. Geo. Munro and Mr. A. F. Harroo. The tables and the room were profusely decorated with flowers and plants, supplied chiefly by Messrs. J. S. Veitch & Sons, Messrs. B. S. Williams & Son, Messrs. Laing & Son, Messrs. Cannell & Son, and others. A plentiful and excellent dessert added to the pleasure of the evening, as did the musical arrangements.

The Chairman, when responding to the toast of his health, stated that W. J. Nutting, Esq., had kindly consented to preside at the next annual meeting in 1895. The Secretary is Mr. Collicie, and his address 9, Martindale Road, Braham, S.W.

LAW NOTES.

WRONGFUL DISMISSAL OF A GARDENER AT ILKLEY.

HEATON F. COURTENAY.—Mr. W. Robinson appeared for the plaintiff, 11y. Edward Heaton, gardener, of Ilkley; and Mr. Child represented the defendant, Jas. W. Courtenay, who resides at Netherwood, Ilkley. The claim was for £4 10s. for wrongful dismissal, or in the alternative, four weeks' wages.

This was a recent case, in which a gardener of experience, who had been employed by Sir Isaac Holden, Mr. Clement Holdsworth, and other gentlemen, was dismissed by his employer with what was practically a fortnight's notice, after having worked for him about eleven weeks. The gardener had received a wage of 22s. per week, with house and coal. He found the garden, and especially the vines, greatly neglected, and in a very bad state; and on many days he had worked from 4 or 5 o'clock in the morning till 9 and 10 o'clock at night. He had one man under him, and he had also extra assistance for a few weeks. On August 19 Mr. Courtenay introduced a jobbing gardener for the purpose of

Answers to Correspondents

•• Owing to the large increase in our circulation, we are under the necessity of going to press some hours earlier. Our contributors will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

A PLAN FOR ICE-HOUSE: Z. The plan for a good ice-house must depend upon the locality for which the particular one is required. If the soil is very porous the well would perhaps be best above ground with double walls. The figure given is of one

CORRECTION.—We regret that in the list of subscribers to the Testimonial to Mr. A. F. Barron given in our last issue, the name of the Rev. W. Wilks was spelled Weeks.

DENDROBIUMS: C. S. It is most likely that the *Dendrobium nobile* are making growths on the pseudo-bulbs, in place of flowers, through the plants not having had a sufficiently long rest in a cool house. Or water may have been afforded too soon. Sometimes, when all other necessary conditions are observed, the plants will grow as indicated, if the house in which they are kept is not sufficiently ventilated.

IN A FRENCH BEAN HOUSE: *Enquirer.* Tomatoes would succeed with the Beans, but both must be kept free from weeds.

LILIUM CHALCEDONICUM: W. J. N. The old bulb produced two flower shoots, which is in excess of what is usual, and when this is the case two bulbs form, and the mother bulb as a consequence becomes so much weakened that it is not likely to be of any more use.

LARGE PEARS: R. H. B. Twenty-eight ounces is a good weight for Pitmaison Duchesse, but much heavier examples have been seen of Uvedale's St. Germain, Grosse Dillon, Chaumontelle, Beurré Diel, and Catillac.

MISS JOLIFFE CARNATIONS DYING: *Thos. Simmonds.* The plants are probably infested with eelworms at the roots. If you will send a specimen or two we shall be glad to inform you of the cause of their loss.

•• PLANTS, FRUITS, ETC., TO BE NAMED.—The applications to name flowers, and especially fruit, are so numerous at this season as severely to tax our resources. They entail an expenditure of time, labour, and money, of which our readers have no idea. We are always willing to oblige our correspondents as far as we can, but the editing of the *Gardeners' Chronicle* is our business, to which everything else must give way. Correspondents are respectfully requested to observe the rule that not more than six specimens can be dealt with at a time. If more are sent, it would be a graceful act on the part of the sender, to send also a small contribution to the *Gardeners' Orphan Fund.* Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered. Leaves only, or florists' varieties cannot, as a rule, be named.

NAMES OF FRUITS: J. P. 1, Ecklinville Seedling; 2, Scarlet Golden Pippin; 3, Cox's Orange Pippin; 4, Fearn's Pippin; 5, New Hawthornden; 6, Emperor Alexander.—R. Botting. Apple, good specimen, Gloria Mundi.—J. Twitcheam. 1, Napoléon Pear; 2, Rymer; 3, Emperor Alexander; 4, Alfriston; 5, Lady Henniker; 6, not certain.—Bob. 1, Duchesse d'Angoulême; 2, Uvedale's St. Germain; 3, not known; 4, Beurré Diel; 5, not known; 6, Bramley's Pippin.—*Answers.* Apples, 1, Braddick's Nonpareil; 2, Grange's Pearmain; 3, not known; 4, Claygate Pearmain; 5, Kerry Pippin; 6, Blenheim Orange; Pears, 1, Vernalam; 3, Ballisème d'Hiver; 6, Bergamot d'Esperen; others not known.—T. J. 1, Manks' Codlin; 2, Kirke's Lord Nelson; 3, Schoolmaster; 4, Hambleton D'aux-ans; 5, Pear, Jersey Gratoli; 7, Cox's Orange Pippin; 6, Beurré Hardy.—G. D. 1, Beurré de Capiaumont; 2, not determined.—Geo. Abbey. Pear, Gansell's Bergamot.—A. C. G. 1, Besspool; 2, Forge. The varieties you mention are better exhibition fruits.—E. J. 1, Pear, Noveau; 2, Beurré d'Asain; 3, Beurré d'Aremberg; 4, Scarlet Russet; 5, White Nonpareil; 6, Old Nonpareil.—G. B. 1, Cox's Orange Pippin; 2, Scourer Pippin; 3, Clarke's Seedling; 4, Stirling Castle; 5, Tower of Glamis; 6, not recognised.—C. B. Apple not known to us, probably not yet introduced; a handsome fruit.—F. K. & Co. We do not recognise your Apple; it seems to belong to the Sturmer section.—W. Jones. 1, Pear, General Todtleben; 2, Beurré Superfin; 4, Maréchal de la Cour; 5, Apple, Heary Morning; 6, Fearn's Pippin.—W. E. H. 1, Fearn's Pippin; 2, Cox's Orange Pippin; 3, not known; 4, Cellini; 5, not known.—F. K. & Co. 1, King of the Pippins; 2, not known; 3, Rymer; Pear, Josephine de Malines.—*Claud Lonsdale.* 1, Pear, Bergamot d'Esperen; 2, Beurré Diel, large specimen; Apple, 1, Scarlet Nonpareil; 2, Grange's Pearmain; 4, Kerry Pippin.—H. D. H. Apple, Scarlet Nonpareil.—W. W. 1, Duchesse d'Angoulême; 2, Beurré Diel; 3, Northern Greening; 4, not recognised; 5, Grosvenstein; 6, Court Pendu Plat.—F. H. Pear, Duchesse d'Angoulême.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number.—A. R. Phaeolus Caracalla.—A. S. 1, Matricaria

inodora flore-pleno; 2, *Pyrethrum Parthenium flore-pleno*.—E. M. C., *Kingstown.* *Globba escaiff-lora*, *Bot. Mag.*, t. 1428.—R. M. 1, *Maranta Makoyana*; 2, *Zingiber officinalis* (Ginger-plant). You may grow it as an evergreen, or rest it for a time when all the growths are matured, and no more leaves coming.—A. B. The flower of *Cypripedium* was crushed. Tain card-board boxes are of no use for sending flowers through the post. If the leaves are somewhat like those of *C. barbatum* it is *C. siamense*.

NERINES: J. D. The Nerines, owing to their having been loosely packed, were quite destroyed. Send more flowers properly packed.

ODONTOGLOSSUM CRISPUM: *Devoniensis.* It is a very unusual occurrence for a plant of this species to produce a flower-spike from the apex of the bulb, and in your case it is still more extraordinary, seeing that another spike is being produced from the base concurrently.

OMISSION FROM THE GARDEN DIRECTORIES: *J. Coomber.* The garden not finding a place in these publications, the publishers will be only too glad to insert it if you will communicate with them.

ONCIDIUM TIGRINUM: *Devoniensis.* It is not an uncommon thing for this plant to have two spikes to the bulb, but with it, and also the *Odontoglossum*, there is strong evidence that you get a good show of flowers from your plants, and that in the culture of them you will be successful.

PEBBLESTONE PIPPIN: *Hibernia.* We know of no variety of this name. The other question next week.

PLEIONE: R. M. The Orchid is *Pleione lageneria*. After flowering it should be freely watered until the leaves turn yellow and fall off next year, when it should be kept dry until the flower-buds appear.

RASPBERRIES: T. P. Very fine fruits for this or any season.

STRAWBERRIES IN POTS NOW IN BLOOM: W. H. A. We should fear the plants are ruined for forcing purposes, unless you can put a stop to the flowering. Do not expose them to the rain, but place them in frames or in stacks in layers, with half-rotten leaves between the pots. These may stand against a wall facing north, or they may stand free, the plants then, therefore, facing two ways.

VIOLET CZAR: E. A. C. It is late for transplanting Violets into pits or houses; moreover, the old plants would not bloom so satisfactorily, at least, at any early part of the winter, as young plants which have been suitably prepared for this kind of culture. A greenhouse is not a suitable place either, the plants being too far from the glass if planted out, and artificial heat is inimical to their well-being. You may cultivate Violets in pots on a greenhouse shelf. Large ones should be employed for them, so as to put up the mother and half-a-dozen of the strongest runners, but this must be done in September.

COMMUNICATIONS RECEIVED.—C. P. N.—G. W.—H. W. W.—N. E. B.—T. C.—H. M.—Harrison Weir.—W. H. S.—R. L. H.—A. D.—R. D.—R. Y.—A. H.—R. Vitch & Son.—B. Wadds.—J. H.—R. S. & Co.—D. M.—H. G. H.—Houston.—B. R. S.—H. T.—M. P. R.—K. & B.—W. B.—Camdens.—W. H.—J. H.—A. M.—H. J. C.—M. T. M.—W. K.—R. V. & Sons (with thanks).—C. J. W.—B. C.—A. B. & C.—O. C.—G. S.—M. T.—W. W.—E. C.—Dicksons—East Anglia.—Mells Park—S., next week (thanks for donation of 3s. to *Gardeners' Orphan Fund*).

DIED.—CHRISTIAN FREDERICK BAUSE, of Morland Nursery, South Norwood, London, S.E., aged fifty-six years, passed away October 23, 1895.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "*Gardeners' Chronicle*" has, since the reduction in the price of the paper increased to the extent of more than 80 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "*Chronicle*" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is prepared for reference in all the principal Libraries.

FIG 88 - PLAN OF ICE-HOUSE.

partially underground, and explains itself. The dimensions of a good house should not in any case be less than those in this case.

Books: J. D. *Fruit Farming for Profit*, by G. Bunyard, published by F. Bunyard, 29, Week Street, Maidstone. *Fruit Culture for Small Holdings*, by J. Cranston, published by Jakeman & Carver, printers, Hereford. *Market Garden Husbandry*, by W. Ablett, published by Chapman & Hall, London.—A. Lafort, *Graville St. Honore*. *The Rosarian's Year Book*, published by B. Mrose & Sons, 23, Old Bailey, London, E.C.

CARNATION: H. J. Ross. A monstrosity, known as the Wheat-ear Carnation. It is not very uncommon.

Cauliflowers and Broccoli: V. A. G. The season for the first has been a most favourable one, and the produce is finer and better than usual. Broccoli, on the contrary, are still growing, and should hard weather be experienced, many of the plants will suffer. We should advise the lifting of all exuberant plants and replanting them, their heads inclining to the north. This is readily done by two men, one of whom should use the spade, and the other handle the plant, and in such a tender manner that the leaves be not injured in any way.

HOTHOUSE BUILDERS and HOT-WATER ENGINEERS, ROYAL HORTICULTURAL WORKS, MIDDLETON, MANCHESTER.

Vinerias, Stoves, Greenhouses, Peach Houses, Forcing Houses, &c., constructed on our improved plan, are the perfection of growing houses, and for practical utility, economy, and durability cannot be equalled. We only do one class of work, and that THE VERY BEST.
Conservatories and Winter Gardens designed architecturally correct without the assistance of anyone out of our firm, from the smallest to the largest. Hot-water Heating Apparatus, with really reliable Boilers, erected, and success guaranteed in all cases. Melon Frames, Sashes, Hot Bed Boxes, &c., always in Stock.
Plans, Estimates, and Catalogues Free. Customers waited on in any part of the Kingdom.

Moderate Charges. First-Class Work. The Best Materials.

THE SEASON HAS COMMENCED FOR USING THE XL ALL LAWN SAND.

Largely used last season at Gunnersbury Park and Waddesdon Manor with most satisfactory results.

Those who have poor Weedy Lawns should not fail to give it a trial, if only on a small scale at first. It destroys Daisies, Plantains, &c., and Fertilises the Grass to such an extent that it will spread and cover over in one season the bare places formerly occupied by the weeds. When applied lightly, only as a dressing for the Grass, the results have been very satisfactory.

Supplied in air-tight Tins, 1-, 2 1/2, and 5- each. 28 lb., 9/-; 56 lb., 16/-; and 112 lb., 30/-.

Can be had through the trade, or direct from the Manufacturer.

THE BEST & CHEAPEST FUEL for GREENHOUSE BOILERS, STOVES, & HEATING APPARATUS.

ANTHRACITE SMOKELESS COAL.

G. R. CARTER & SON supply their LARGE, NUT, or COBBLE COALS (the Nuts being about the size of a Walnut, and the Cobbles about the size of a man's fist), delivered by van, at any address within the 4-mile radius of Charing Cross; or in truckloads, at any Railway Station. This Coal is absolutely smokeless, and it requires much less attention than any other description of fuel, burning for twelve hours at least without any supervision, and giving from five to ten degrees more heat than Coke. Quotations on application to—

Seed Trade. SHOPMAN or ASSISTANT.—Twelve years' experience in all departments of the trade. First-class references.—BEGONIA, 41, Wellington Street, Strand, London.

MAN'S INGRATITUDE.—We have it on Shakespeare's authority, that the winter wind is not more unkind than man's ingratitude. In many cases this is unfortunately only too true. There are times, however, when the benefit received is so great that ingratitude becomes impossible. When life is rendered a burden to us by sickness, and someone comes and restores us to health, we should be base indeed to feel ungrateful. Thus millions are to-day grateful to HOLLOWAY'S PILLS and GINTEMENT, which have cured them of all stomach and liver troubles, banished headache, flatulency, indigestion, and low spirits, and cleared their systems of gout, rheumatism, sciatica, and all similar ailments.

WANTED, to Rent on Lease, a NURSERY, with 200 feet or more of Glass, and not less than 5 Acres of Land, with House and Outbuildings preferred.—Apply by letter, B. L., Alpha Place, Yiewsley.

To Nurserymen and Florists commencing business.

HAMPTON-ON-THAMES, on THE MARLING PARK ESTATE, free from London fogs, a deep rich loam, the favourite neighbourhood for Growers, FREEHOLD LAND for SALE, on easy system of payment. Excellent sites for residences.—For full particulars apply to Mr. FREDK. G. HUGHES (Surveyor), the Estate Office, Hampton-on-Thames.

FOR SALE, a small valuable long leasehold NURSERY, 6 miles from Covent Garden. Seven large Greenhouses, well stocked; two Vineries, Cucumber-house, Plant-houses, five-roomed Cottage, Low Ground Kent. Lease eighty-six years to expire. Eighty-five feet Glass. Facing main road. All particulars of FLORIST, 11, Dafforne Road, Tooting, Surrey.

To Market Gardeners, Florists, and Others.

THE GREAT LODGE GARDEN S.

(Within a mile of a Railway Station and Tautbridge Wells.) **TO BE SOLD, as a Going Concern, the BENEFICIAL INTEREST in LEASE** in large WALLED and KITCHEN GARDENS of about 2 acres; good house, very low rent; together with hothouses, hot-beds, van, and other valuable plant, and sea-oastie growing crops, with right of usage to any amount of sewage. Ill health sole reason for disposal, as this is a most genuine concern. It is open to the strictest investigation to bona fide applicants with a capital of £300.—Full particulars given by JAMES M. RICHARDSON, Sole Agent, 33, Dudley Road, Tautbridge Wells.

TO BE SOLD or LET, a small, old-established FREEHOLD NURSERY, with a good connection, within easy distance of four Market Towns. If sold, part of the purchase-money might be left as mortgage at 4 per cent. The reason of retiring is through ill-health. The business is an all-round one, including Cut Flowers, Jubbing, &c., also a good In and Outdoor Trade. This is a good opening for a man of energy, and a good living can be made. Address—HORFUS, 41, Wellington Street, Strand, W.C.

TO WATERCRESS GROWERS.—Plough Lane, Wimbledou, About 5 acres of Land adjoining the river Wandle, suitable for Watercress beds, TO BE LET.—Apply to BOTTON & CO., 3, Temple Gardens, E.C.

GENUINE FLORIST'S for DISPOSAL, an exceptional chance to secure a good paying concern in fashionable town. Premises and position second to none. Scope for doing any amount of trade; doing £120 monthly. Price, £300; Stock at Valuation. No agents.—VENNOR, Gardeners' Chronicle Office, 41, Wellington Street, Strand, London, W.C.

FOR SALE.—Small NURSERYMAN and FLORIST'S BUSINESS. No Goodwill, Glass, Sheds, Palms, and Nursery Stock. Would suit intelligent, pushing young man, with good all-round trade experience. Well situated, London, S.W. No agents.—Write W. H., 41, Wellington Street, Strand, W.C.

Fifty Nurseries, Market Gardens, Florist and Seed BUSINESSES to be DISPOSED OF.

MESSRS. PROTHEROE AND MORRIS' HORTICULTURAL REGISTER contains full particulars of the above, and can be obtained, gratis, at 67 and 68, Cheapside, London, E.C.

MACMILLAN & CO.'S PUBLICATIONS.**THE BOOK OF THE ROSE.**

By the Rev. A. FOSTER-MELLIAR, M.A., Rector of Sproughton, Suffolk. Illustrated. Extra crown 8vo, 8s. 6d. net.

Gardeners' Chronicle.—"As the work of a sound and experienced practitioner, this will be received with acclamation."

Mr. FRANK CANT writes in the Journal of the Royal Horticultural Society:—"The Book of the Rose' is the most scientific, complete, and perfect ever published on that subject, and I strongly advise those who have not read it to lose no time in possessing a copy."

GREENHOUSE and WINDOW PLANTS.—A Primer

for Amateurs. By CHARLES COLLINS. Edited by J. WRIGHT, F.R.H.S. With thirty-eight Illustrations. Pott 8vo, 1s.

Speaker.—"These pages show, not merely the breadth of his knowledge, but uncommon felicity in the task of exposition. . . . The directions are in every case simple and explicit, and deal with the real difficulties of the beginner."

GARDEN FLOWERS and PLANTS.—A Primer for

Amateurs. By J. WRIGHT, F.R.H.S. With fifty Illustrations. Pott 8vo, 1s.

Horticultural Review.—"The work undoubtedly gains in value from the completeness of its survey of elementary gardening. . . . Attention is paid to the denizens of the cottage gardens, and the directions as to the culture of these are plain and reliable."

A PRIMER OF PRACTICAL HORTICULTURE.

Ten Lectures delivered for the Surrey County Council. By J. WRIGHT, F.R.H.S. Pott 8vo. 1s.

Schoolmaster.—"The book is crammed with valuable information, and profusely illustrated."

Invaluable for Capturing the Winter Moths where trees have been troubled with the caterpillar pest. October best month in the year for the purpose. Write at once for particulars and price.

Box Hill, near Maidstone, Oct. 5, 1895.
Dear Sir,—Please send me to Watlingbury Station 1½ cwt. of Fruit-tree Dressing, and also some Grease-proof Paper. I found those trees I did last year were quite free from caterpillars, and one could see to a tree where it was done.
Yours truly,
A. S. WHITE.

Special Offer of Fruit Trees, to clear ground.

MAIDEN APPLES for cordons or growing-on; purchaser's selection, 8s. per doz., 30s. per 100. MAIDAN PLUMS and Pittaston Duchess PEAR, same price. Grand new PLUM, Monarch, maidens, 10s. per doz.; 75s. per 100. New Strawberry, Royal Sovereign, 1s. 6d. per doz.; 7s. per 100.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 2, 1895.

TURVEY.

PROBABLY only a very few readers of the *Gardeners' Chronicle* have heard of the delightful village of Turvey. It is one mile from a station on the Midland line between the towns of Bedford and Northampton. My intention is to say something of the gardens of Turvey House, but I venture to preface my remarks by a brief sketch of the village, one of the most picturesque in England; and yet the greater part of it is not half a century old. The road to the village, about 1 mile and a quarter, is chequered with the shadows of noble trees. On the left, separated from the road by a low stone wall, stretches a beautifully undulating park, studded with Elms, Chestnuts, Walnuts, Oaks, and clumps of Hawthorns. Footpaths cross the park in several directions, and the further side is bounded by belts of woodland. The visitor cannot fail to notice that almost every tree is surrounded by coils of Ivy, some of enormous thickness, and singularly varied aspects, which doubtless are doing great injury to the trees. But the grand old man who lived all his life, with the exception of a few days, at the fine old house known as Turvey Abbey, the residence of Major Higgins, delighted to see the rugged boles of his trees wreathed about in such fantastic fashion with Ivy; and, perhaps, the protection thus afforded to birds, both in shelter and food, accounts for the number and variety to be seen and heard in the neighbourhood.

Little of the garden proper can be seen from the high road or the park, but from either, one may get charming views of the old house and its surroundings. There is not much on the north front, except the fine porch and mullioned windows, the smooth and perfectly-kept lawn and carriage drive; and, level with the top of the balustraded stone wall, a level green plateau of trimmed Box. Box seems to have been a favourite of the old squire's. To break the monotony of a range of stabling, a dozen green, closely-trimmed cones stand sentinel. Perhaps, of all shrubs, the Box lends itself most readily to the topiary art, presenting all the year round a more cheerful greenery than Laurel or Yew. On the opposite side is a terrace of cottages, standing well back from the road, each with its cheerful garden-plot. Here, too, on each side of a path leading to the cottages, the great cones of green Box stand in martial array.

Now, taking a turning to the left, down a narrow lane, we find ourselves in the park itself. A notice-board confronts us, saying that there is no road, but that the stranger, nevertheless, may pass; and above this a typical yeoman, who is tenant of the park, bids us "Beware of the bull." It is quite excusable, seeing that it is an imaginary bull, and that his sometimes scanty grass crops have suffered from the wilful mischief of visitors of the "Arny"

tribe—"visitors" only, for, so far as I am aware, Turvey having no "Arries."

The views from the park afford a charming bit of English scenery. The fine old gabled house, with its great windows, porches, and balustraded walls, with here and there a flower-laden urn, stands back some 200 to 300 yards, and is seen through three vistas of tall trees, engirdled with clipped Yew hedges. The extensive lawn, smooth as velvet, is traversed by broad gravel paths; while to right and left these lead beneath the trees in delightfully cool, shady walks. Here is a capital lesson for the landscape gardener, showing how much may be done by the judicious planting of flowering shrubs and trees on grass. There is scarcely a glimpse of colour except some vases of Pelargoniums near the windows, and Roses and other climbers on the walls. Among the latter we noticed the charming white Clematis montana, one of the most effective of climbers.

The outlook from the south front has a view of the park with its noble trees, its grove of Chestnuts, Elms, and Walnuts. An architect of excellent taste was the old squire. The sea of greenery in which his old house stands, however, might be greatly beautified and cheered by the addition of the bright colours and fragrance of flowers. There is much to admire as we pass along the village street. Here there is a house covered entirely with Ampelopsis, Roses, and Vines, while every window-sill is gay with bright colours, and the lawn in front with bedding-plants. The visitor will perhaps notice the number of Walnut trees, and may imagine the scramble of the youngsters, just let loose from school, when the ripe fruit patters on the ground, as the equinoctial gales shake the branches. One then passes the handsome school buildings and library. What a relief it would be to see them encircled with flower-beds, and embellished with climbing Roses, Jasmines, Clematis, or even the humble Ivy. In the courtyard of Turvey House there is a grand old Exmouth Magnolia—why not have one where the villagers could see it? I knew a school-house, years ago, at Harrow, thus encircled and embellished; the boys, under charge of their teacher, mowed the grass, trimmed the edges, weeded the beds and watered the plants. Many a Londoner raised perforce at that garden-gate, to gladden the heart and feast the eye on the flowers.

But at last we arrive at the grand old church, with its Yews and rugged Elms. One must not stay, however, to describe its ancient tombs, with their recumbent barons, knights and ladies. Village communities, however, might follow the example set here, of planting Roses, and putting a border of flowering shrubs round the quiet God's acre.

A wicket-gate leads us at once into the grounds of Turvey House, a stately structure of the Grecian order, with terrace garden, rich with colour. In front is a well-wooded park stretching down to the winding Ouse—Cooper's lyrical Ouse. The poet, it may be remembered, lived at Olney, about four miles distant; the house is standing in which he spent some of his happiest years. Turvey House has two separate walled gardens, one near the stables, devoted to early vegetables and fruit; the larger one adjoining the house, has a range of glasshouses, consisting of conservatory, vinery, and greenhouse. A separate enclosure contains the forcing-houses, pits, and frames. The principal walk is approached from the house by handsome iron gates. On either side of it is a clipped Yew hedge. Between this and the wide smooth gravel paths there existed, until last season, a border of flowers, but the roots of the Yews so impoverished the soil that nothing would thrive, and it was laid down in turf. The good old-fashioned custom prevails here of surrounding the beds of vegetables with borders of Roses and herbaceous flowers; and among the latter are large beds of the white Pink, Mrs. Sinkins. After the Roses, however, of which there is a capital collection, are the seedling Briars. A most useful and graceful plant for cutting is the Aquilegia; Mr. Pullen, the able and experienced head-gardener, has some capital hybrids from glandulosa, chrysantha, canadensis, cœrulea, and others. With a few fronds of Adiantum or some

grasses, Aquilegia makes a light and graceful embellishment to the table. The single-flowered Pyrethrum roseum is another favourite; it is of delightful shades of colour. It is succeeded by Cactus and other Dahlias, and then by Asters and Chrysanthemums. In a mixed border in front of the glass structures the brightest bits of colour at present come from the Shirley and Iceland Poppies. There is one kind of the latter, as is well known, of a brilliant orange-red, peculiar, so far as I remember, to this flower only.

Most herbaceous plants, owing to the long drought, are stunted and backward in their growth, Delphiniums and Phloxes especially so. The flower garden, and more especially the herbaceous section, suffers from lack of blue colour; there is nothing, it seems, of permanence to take the place of the Delphinium and Salvia patens. It is in summer, moreover, that blues are wanting. Just at the time when the cooler tints of the blues are most acceptable, we are sweltered with scarlets

round its stem some charming alpines grow, and among them Anemone apennina. Spread as a delicate flagree of silver and pale green, the feathery variegated Acer Negundo added an indescribable charm. Now it is Guelder Roses and Syringas, with here and there a Clematis or Honeysuckle. Through this wilderness of sweets one may refresh the eye with glimpses of green turf and stately trees, and the silvery ribbon of the Ouse. T. W., H.

NEW OR NOTEWORTHY PLANTS.

A HYBRID MUSA.

A HYBRID Musa has flowered this year at Kew, which has been raised by Mr. Watson by crossing *M. Mannii* and *M. rosacea*. As it presents a decidedly distinct type, he proposes to call it *Musa kewensis*. This is, so far as I know, the first instance in which the hybrid origin of any species of the genus has been properly certified, so that it is important that

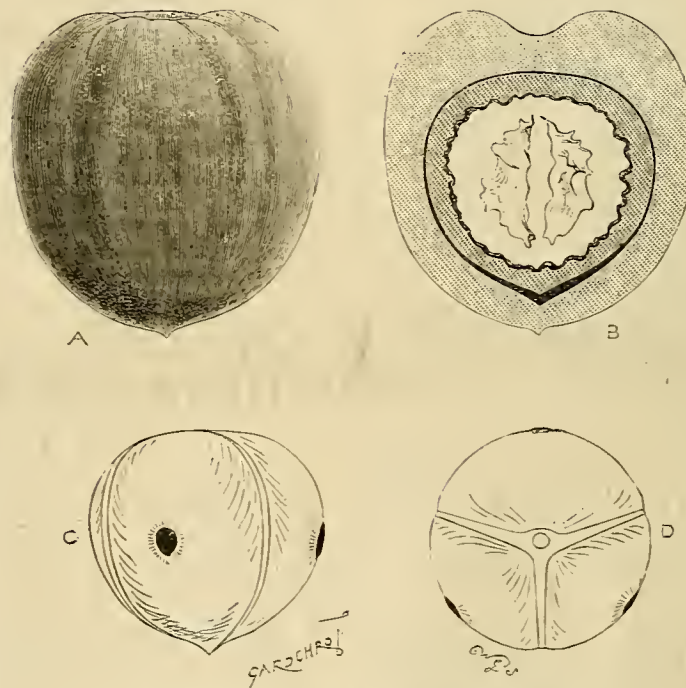

FIG. 89.—FRUIT AND STONE OF *JUREA SPECTABILIS*.

A, the fruit; B, section of the same; C, the stone; D, section of the same. (See p. 518.)

and yellows! Why not utilise the Clematis of the Jackmani type? What a relief it is to rest the eye on grand masses of Jackmani when the garden is aglow with the fiery tones of colour! By the way, Mr. Pullen has a Lobelia, of a richer colour, and more telling than the last-mentioned Clematis. It is of a deep blue, deep as *Salvia patens*, and with a clear large white eye. It is a bright and effective edging-plant, and a profuse bloomer. Dame Nature is sparing of her ultramarine. She puts one vivid spot in the throat of the Gentian. But ay! I had forgotten that bell of the Gloxinia! which in some inexplicable way has acquired many delightful hues. Then, again, one can think her nowise niggardly while gazing on those stretches of Hyacinth in the spring woodlands, or the long fringes of *Myosotis* by the river, or banks of Speedwell on wayside banks.

At a furlong's distance from the wicket by the churchyard, as was said, one enters this beautiful demesne, and then through a shrubbery by a winding walk, finds one's way to the garden. But in this shrubbery—it may not be more than a dozen yards in width in some parts—here and there are little green bays in which is a Robinia or a Fir, and

it should be placed on record. Its two parents are nearly allied, both belonging to my section Rhodochlamys, in which the flowers are few in number, the bracts bright coloured, usually red, and the fruits not edible. The following description is drawn up from two plants that flowered at Kew, one in June, and the other in October, 1895. Stem cylindrical, 3 feet long, above 1 inch in diameter. Leaves fine, crenated towards the apex of the stem; petiole deeply channelled, 6 to 15 inches long; blade oblong obtuse, 2 to 2½ feet long, 6 to 10 inches broad, thin in texture, bright green above, paler green beneath, cuneate or rather rounded at the unequal base. Spike short, erect, shortly peduncled; bracts oblong, 4 to 6 inches long, crimson, with a tinge of mauve. Female flowers in four clusters of three flowers each; ovary finally 1 inch long. Male flowers also in threes. Calyx yellowish, 1½ inch long, truncate, and obscurely toothed at the tip. Petal oblong, obtuse, white, nearly as long as the calyx. Stamens five, protruding beyond the reflexed tip of the calyx; anthers linear, ½ an inch long. A drawing of it has been made by Miss Smith for the Kew collection. J. G. Baker, Herbarium, Kew.

FIG. 90.—*JUBAEA SPECTABILIS*, IN THE KING OF PORTUGAL'S GARDEN, LISBON. (SEE P. 518.)

JUBÆA SPECTABILIS.

THE Coquito Nut or Wine Palm of Chili is one of the most interesting of sub-tropical Palms. It has a very stout stem which attains a height of from 40 to 60 ft., and bears a large spreading head of pinnate leaves. The fruit is borne in pendent racemes which look like gigantic bunches of very large Grapes. Each fruit (fig. 89, p. 516) contains a single seed which is nearly round, has a hard brown bony shell, and the albumen is white, harder than in the Coconut and sweet to the taste. The stems contain a large quantity of saccharine juice, which, when boiled, becomes a sort of treacle, and is much esteemed as an article of food, known as Miel de Palma—Palm-honey. A full-sized trunk yields about ninety gallons of this sap, to obtain which the trunks are felled, the leaves lopped off, and the juice is caught as it runs from the upper end.

There is some danger that this Palm will soon be extirpated from Chili, through the wholesale felling of the trunks for the Palm-honey. When Darwin visited Chili in 1832, as recorded in his *Voyage of the Beagle*, it was very abundant in the country round Valparaiso, he having counted several hundred thousand trees on one estate alone. The late Mr. John Ball was there in 1882, and although he devotes a considerable portion of his book (*Notes of a Naturalist in South America*) to the flora of Chili, he does not even mention the Jubæa. Miss North visited Chili in 1884, and painted a picture of the Jubæa, which is in the Kew collection. "In a place called Salto, one of the most attractive coast suburbs of Valparaiso, there is a valley full of the native Palm, Jubæa spectabilis, which used to cover the country forty years ago, but now scarcely a hundred trees remain. They are mis-shapen things, but seem quite in character with the rocky valley they grow in" (*Recollections of a Happy Life*).

According to Siemann, the Jubæa is cultivated in Colombia and other parts of South America. The seeds are sometimes imported into this country, and are known commercially as Monkey's Coconuts. They are eaten by boys, but I know of no other use to which they are put in this country.

There is a large healthy specimen of this Palm in the temperate-house at Kew. It has a trunk $8\frac{1}{2}$ feet in circumference at the base, and 7 feet at a distance of 5 feet from the ground. It bears a grand head of feather-like leaves, each 17 feet long and $4\frac{1}{2}$ feet wide, and certainly is not a mis-shapen thing, as described by Miss North. The accompanying figure represents a specimen of the Jubæa in the King of Portugal's garden at Lisbon, which was published in the *Gardeners' Chronicle* in 1882 [and which we now reproduce (fig. 90, p. 517). Ed.]. At that time the trunk was $13\frac{1}{2}$ feet in circumference. In 1886, this identical specimen flowered and ripened fruits. It was then thirty-five years old, and had a trunk over 16 feet high, and 14 feet in circumference at the base. The flowers were produced in January, and the fruits ripened the following August. I believe this is the only recorded instance of this Palm flowering and fruiting in Europe.

I have seen it thriving in the open air in gardens on the Riviera, a specimen in Mon. Naudin's garden at Antibes having a trunk nearly as large as that at Kew, but the leaves were much shorter and less handsome. [This tree, as M. Naudin kindly informed us, when he sent the fruit figured, is 16 feet high, the girth of the trunk at a yard high is more than 12 feet, and the age of the tree is thirty-six years. Ed.] I believe there is a plant out of doors in the garden of Mr. Smith-Barry at Fota, near Cork, which requires only slight protection in winter. A plant was tried in the Bamboo Garden at Kew two years ago, but it succumbed to the first severe frost. W. W., Kew.

NOTES FROM CAMBRIDGE BOTANIC GARDENS.

SAGITTARIA MONTEVIDENSIS.—There was a fine group of this plant at one end of the Nymphaea-house, in which several of the latter were blooming freely in October. These Arrow-heads deserve more general cultivation, and this Montevidean species especially

would furnish some valuable material for cutting at this season of the year, for though most of the Arrow-heads flower in the summer, this fine species was in flower in October. Again, though they love the water and are most at home in a marsh, they will thrive well in loamy soil in pots if freely supplied with water. The Arrow-heads are almost equally accommodating in regard to temperature. We have several North American species, and at least one native species, *S. sagittifolia*; and this fine species, *S. montevidensis*, all of which thrive almost as well in the greenhouse as the stove. Though I have it covered with its striking white panicles of bloom throughout the winter, the plants will require, as they have at Cambridge, the stimulus of the stove. When water-plants and semi-aquatics get more in demand in our gardens, as well as in vases and glasses in our homes, more Arrow-heads will be grown, alike for their foliage and flowers. Mr. Lynch deserves hearty thanks for his strong and persistent lead in this direction.

ARISTOLOCHIA GIGAS STURTEVANTI.

I do not remember to have seen this particular variety of the giant Dutchman's Pipe before. The magnificent flower in full bloom at the time of my visit must have been 15 inches long and 9 inches broad, with a drooping tail about 2 feet long in addition. Such flowers must be seen to be appreciated, for they are so extraordinary as to pass the bounds of a popular description. They suggest, on first sight, an enormous *Stapelia* or a star-fish suspended by a stem, and embellished by a tail alike so small as to be out of all proportion to the apparently massive solidity, unique colouring and spotting, and extraordinary forms of the flowers. This fine plant seems just at home on a rafter in one of the fine new plant-stoves recently erected here—one of the handsome groups of glass so admirably linked together by the magnificent corridor into which the whole of the houses open. The plant is blooming with great profusion, and is in the most robust health, though, Mr. Lynch says, many of the blooms drop off during different stages of their development, a result surely not to be wondered at as we reflect how much raw material and vital force must be expended in the formation and finishing of one of these curious blossoms. I have seen some fine samples of *A. gigas* and other species in several botanic gardens, but never one of such gigantic dimensions before; and lovers of the curious in horticulture could hardly do better than secure and grow this splendid variety. It is grown and bloomed at Cambridge in the highest perfection on the lower side of a by-no-means long rafter; and though it is looked upon as a summer bloomer, the plant was thickly studded with buds and blooms in all stages of development in the middle of last month. D. T. F.

HARDY FRUITS AT SUNDORNE CASTLE GARDENS.

HAVING an opportunity early in last month of calling upon the head-gardener, Mr. Phillips, I noticed in walking round the garden some splendid fruits of Apple. The following varieties were exceptionally good:—Ribstone Pippin, the trees are bearing good crops of fine clean fruits, good size, and the trees comparatively free from canker; a disease that has prevented this variety from being much planted of late years. The fruits of Cox's Orange Pippin are of medium size, but clean. To get size in this variety the roots of the tree must be fed with manure at the final swelling period, about the first week in August, with water applied weekly for a time, and only one fruit allowed to swell on each bunch of blossom or fruit spur; the variety would pay well to be highly cultivated, as it is one of the best-flavoured dessert Apples. Blenheim Orange Pippin, grown upon a wall tree, was very fine and of good colour. King of the Pippins, Sturmer Pippin, Lord Suffield, Cellini Pippin, and Stirling Castle, were good. Golden Noble and Lord Derby also good; as was Warner's King, or as there named D. T. Fish. These trees, as well as a few others, were bearing

excellent crops of fruit. The trees are bush-trained, a form so useful for gardens, as they do not shade other crops much when kept pruned annually as there. These trees are top-dressed annually with farmyard manure, and otherwise well managed. The bush Pear trees were not satisfactory, and I advised heading them over for grafting next spring, and grafting the following varieties upon them, namely, Doyenné du Comice (the best-flavoured Pear grown), Marie Benoist, Souvenir du Congrès, Beurré Hardy, Magnate, Olivier des Serres, Darondeau, Triumphe de Vienne, Clapp's Favourite, Fondante d'Automne, Doyenné d'Alençon. These varieties would, undoubtedly, strengthen any collection of Pears, ripening between the months of September and March, and they are found to succeed as bushes in the open. The following varieties were found to be very satisfactory, growing against south and west walls, and horizontally trained:—Jargonnelle (the crop had been gathered), Williams' Bon Chrétien, Louise Bonne of Jersey, Marie Louise (both of these had splendid fruits upon them, clean and handsome), Pitmaston Duchess (the largest Pears in the garden, but only a few fruits), Beurré Superfin, Beurré Diel, Winter Nelis (splendid fruit and crop), Beurré Rance and Glou Morcean were good in size and crop. The soil in these gardens seems to be well suited for hardy fruit culture. The Apricots, Peaches, and Nectarines upon the south walls were in excellent health, and good fruit was and had been grown upon them with one exception—Apricots, the crop of which had been poor. Many useful young trees had been planted of late years between the old ones; the latter taken away, as the space was required by the young ones. These promised well for the future. The following varieties will be found suitable for open walls, south and south-west aspects, in the order of ripening in this district:—Peaches: Alexandra, Hale's Early, Grosse Mignonne, Nobleess, and Walbrton Admirable. Nectarines: Early Rivers, Lord Napier, Pitmaston Orange, Pine-apple, and Elruge. Apricots: Breda, Hemekirk, and Moor Park.

The ordinary varieties of Plums I found doing well, as also Damsons. I learnt that no protection was given to the wall trees last spring against frosts, thereby testifying that wall fruit, however choice, may be grown on open walls when good cultivation is adopted, as here. I have proved for many years past that frost protection to wall-fruit trees when in blossom is often a hindrance rather than a help to fruitfulness. The best help I found was in using a board at the top of the wall, 11 inches wide, in the spring months, removing it early in June. In this way I was enabled to get crops of choice fruit annually for fifteen years in succession. Many people in Shropshire think that the county is not suited to the growth of choice fruit against open walls; such is, in my opinion, a fallacy. To be successful, however, there is need for care in the selection of varieties, planting the trees properly, in the autumn, care in pruning in the spring, and of keeping the summer shoots free from insects—the most important point of all in the cultivation, early thinning of the fruits when young and before the stoning period, regulating the number of fruits to each tree according to age and size. Given attention to these matters, choice fruit can be grown as well in Shropshire as elsewhere, as proved this year in a few districts. Robert Smith, *F.R.H.S.*, in "*Shrewsbury Chronicle*."

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT ROSSLYN, STAMFORD HILL.

THAT few plants cultivated in the neighbourhood of London thrive so satisfactorily as Orchids when properly tended is a well-known fact, and an excellent example in support of it is always to be seen in the collection of H. T. Pitt, Esq., at Stamford Hill. Begun a few years ago with a few Orchids in one of the houses, it has gradually extended until at the present time, several important ranges

of houses are entirely devoted to these plants, and admirably do they thrive under the care of Mr. Aldous, and the no less careful supervision of Mr. Pitt himself. At the present time, the two most showy plants contributing the largest number of handsome flowers here as in most other collections, are the varieties of *Dendrobium Phalaenopsis Schroderianum* and of *Cattleya labiata*, which may be regarded as two of the most useful plants ever introduced to gardens. Both are free-growing and profuse-flowering, and seem to adapt themselves to almost any quarters. The *D. Phalaenopsis* have been flowering here for months, but still they are embellished with graceful sprays of bloom; and with them in flower are *D. P. Statterianum*, *D. Hildebrandii*, and other species.

In the adjoining house, suspended over a bed of fruiting Pines, and taking full sunshine at all seasons, is a fine batch of varieties of *Laelia anceps*, so thickly set with flower-spikes that more could scarcely be got from plants of their size. Taking one 12-inch basket as an example, we counted on it twenty-seven flower-spikes, which on maturing their flowers will give a specimen of extraordinary

CATTELEYA LABIATA.

Amongst the numerous kinds of Orchids which have been so plentifully imported during the past few years, I am of opinion that, taking all points into consideration, the above-named *Cattleya* is decidedly the most useful. Its natural period of flowering during the months of October and November, when choice flowering-plants are not at all plentiful, is a very strong point in its favour. It is also what may be termed a general gardener's plant, seeing that anyone with a stove may, with ordinary culture, have it in perfection. In this respect it may be compared to *Dendrobium nobile*. I know of plants which have been in the possession of their owners nearly forty years, grown under the conditions named above. One more interesting point in its favour is the wonderful variety of forms there are in, say, a dozen plants. I saw ten distinct varieties in that number of plants the other day; and they had been just purchased in bud as unflowered plants from the nursery. The price, too, at which good plants can be purchased is quite moderate. For the decoration of the dinner-table or other indoor purpose they are invaluable as cut-blooms at

places. This year the crop is a plentiful one, but prices are not so high as one might wish; still, good fruit always finds a ready sale, and fetches fair prices. In almost every direction mere encumbrances of the ground are to be met with, the produce of which is in many instances of a rubbishy description, and yet these trees are allowed to remain from year to year. All this might be altered by planting healthy, sound young trees in new situations, which, if carefully planted and consist of suitable varieties, soon begin to come into bearing, and the fruit is of good size, colour, and general quality leaving nothing to be desired. If we are to keep pace with the times, which means supplying our own country people with good sound fruit, and thereby rendering the import of fruit much less profitable to the foreigner and colonial, more trees must be planted, and trees in good bearing kept in first-rate fruiting condition by annual top-dressings and careful pruning. Any kind of soil that is capable of producing other good crops, such as corn and vegetables, is suitable for Apple culture. The essential thing to be aimed at is good drainage and a fair depth of soil, also a suitable site.

Trenching land for newly-planted orchards entails a great deal of laborious work, and is not very necessary—at least, not in all parts; but there should be no lack of care in the due preparation of each tree station. On large plots of pasture land, if the trees are to stand at not less than 40 feet apart, holes should be dug out and prepared fully 7 or 8 feet in diameter, and well broken up to a depth of 2½ feet, and for several years after planting the grass should not be allowed to grow on the soil over the roots, and a mulching of well-rotted manure applied, which will be found of great benefit to the trees in promoting a free growth.

It is very seldom, after trees have been well planted on a somewhat firm soil, and where space to grow is practically unlimited, that root-pruning is required, as with a fair proportion of branch extension, and a moderate use of the knife, the trees quickly come into good bearing. It is of far the better method to let the crown become well developed before allowing the trees to bear fruit in any quantity; for if once they are rendered stunted in growth through heavy early cropping, it is many years before the trees recover their former healthiness and vigour.

When in first-rate condition, young Apple trees, planted in lines at a good distance apart, and allowed to make a fair proportion of wood, produce crops which far outweigh both in size, quality, and bulk, that produced by trees crowded together. Probably the best course to adopt, if fresh ground cannot be obtained, and the best must be made of the old Apple-sick soil, is to mark out the places for each tree to be planted, avoiding, if possible, spots on which trees have stood, digging out the old soil to a depth of from 2 to 3 feet, and breaking up the subsoil. The holes should not be less than 8 feet in diameter, and it is good practice to leave them open for several weeks. This will allow the frost to pulverise the stiffer subsoil usually found in old orchards. Advantage should be taken of frosty weather to get as much fresh soil and road-parings carted to the spots as may be required, planting the trees at any mild time during February and March. Good varieties are numerous enough, and the goodness of Apples seems now to be more looked to by consumers than was the case formerly; but, unfortunately, the yield of some favourite varieties is not very abundant. A good early kitchen Apple is found in Lord Derby; the tree grows strong, and it is one of the best for general early cropping, the fruit of capital size. In my locality it is considerably better than Lord Saffield. Yorkshire Beauty is another variety that rarely fails to bear; in fact, we have no kind so trustworthy in that respect. Waltham Abbey Seedling is a large clear yellow Apple, and very useful as a kitchen cooking fruit, and the tree is hardy, and not liable to canker. Stone's, New Hawthornden, Bramley's Seedling, Annie Elizabeth, all fruit well. Tower of Glamis, Ecklinville Seedling, Golden Spire, Golden Noble,

FIG. 91.—FLOWER, AND SECTION OF FLOWER, OF YUCCA GUATEMALENSIS. (SEE P. 524)

beauty; and there will be many others equally worthy. On a shelf on the back wall of the same house and also in full sunshine, plants of *Laelia cinnabarina* and others of that class are well furnished with flower-sheaths, and *Laelia monophylla* is in flower. In the *Cypripedium*-house, which contains many choice varieties and hybrids, there is a good show of *Cypripedium Spicerianum*, *C. Charlesworthii*, as well as varieties of *C. insigne*.

In the *Cattleya*-house, facing the door is a fine group of *Cattleya labiata*, together with a few other Orchids in flower, and in the warm-house range in several divisions, some surprisingly good results in the culture of plants not generally found to be easily managed are to be found. Foremost of these may be noted a collection of the different species of *Bollea* and *Pescatorea*, which few succeed in growing even passably well, but which here are most luxuriant, and flower continuously for a great part of the year. The large specimens of *Miltonia Roezlii* are also remarkable examples of good culture, and the *Phalaenopsis* and many other difficult subjects are in good condition.

The *Odontoglossum*-houses contain a large number of remarkably well-grown plants, and among them some splendid varieties. Some few *Odontoglossums* are in flower, as well as some *Sophranitis*, *Brassia longissima*, *Zygopetalum intermedium*, *Oncidium tigrinum*, &c.

this dull season of the year. I was reminded of the above qualities of this excellent *Cattleya* when recently looking through the extensive Orchid-houses of Messrs. Charlesworth & Co., Heaton Nursery, Bradford, Yorkshire. One side of a large span-roofed house was a complete mass of flowers of *C. labiata*, almost reminding one of the *Pelargonium* tent at York Gala in the month of June. Doubtless other large growers of Orchids will also have a more or less similar display. To my mind, all lovers of choice flowers are indebted to those who have so plentifully introduced *Cattleya labiata*—autumn-flowering variety. *Yorkshire Gardener*.

APPLE CULTURE.

By this date most of the fruit will have been cleared off the trees, and the produce either marketed or put into store for future use. That being so, the present season is the best for deciding whether any trees of worthless varieties, and old worn-out trees should be replaced, and for the preparation of the land for planting, whether in orchard or garden. Within the past few years immense numbers of Apple trees have been planted, and old plantations cleared away, and being replaced by new and more extensive ones. Moreover, a better class of fruit has been planted, with the result that much finer fruit is sent to market and grown in private

Deux Ans, and Lady Henniker are all good market fruits; also Wellington, Gooseberry-Apple (not Pippin, the two being quite distinct), and Northern Greening are excellent for late use. There are many other good culinary varieties, but I find those mentioned are very suitable hereabouts. Dessert varieties consist of Cox's Orange, Kerry, Ribston Pippins, and King of the Pippins; this year the latter has grown out very fine and clear—all points considered, this Apple is still one of the best. Blenheim, either for dessert or cooking, is probably the best all-round Apple grown, and full-sized trees fruit abundantly; this last always sells readily at good prices. Worcester Pearmain, although not of first-rate quality, puts on a high colour, and comes into use at a time when Apples of the best quality are unfit. The tree bears well, and it is a variety well worth growing.

Claygate's Pearmain is of fine quality; Cornish Gilliflower, although not a pretty-shaped fruit and fruiter, is certainly, in my opinion, one of the first quality; Starmer Pippin is one of the best late dessert varieties if the fruits are allowed to hang on the trees till very late in the year; Yellow Ingestre is small and useful, and it is doubtful if there is a more profitable Apple grown from a market point of view. Mabbott's Pearmain, Brownlee's Rasset, and Calville Rouge Précoce are all good.

PRUNING STANDARD TREES.

This is usually done after the leaves are down, but it may safely be performed at any time after the fruits are gathered, as by removing some of the old limbs early, and before the leaves fall, decaying branches are better seen; keeping the tops moderately thin is the most important item, but if the heads are kept too open and the branches far apart, they are more apt to sway during high winds when heavily cropped, and the fruits get damaged—so that some judgment is required, and the habit of the variety studied in branch thinning. The finest lot of Blenheim Orange Pippins I ever saw were growing in a large fruit garden this year, where it was evident that the pruning-saw is not spared, the long limbs being completely loaded with fruits from top to bottom, and fortunately no rough high winds were experienced this season to bring down the crop and bruise those that remained on the trees. *H. Markham, Mereworth Castle, Maidstone.*

THE BULB GARDEN.

IRIS KEMPFERI.

THE rarity of these beautiful Japanese Iris in private gardens is scarcely to be accounted for, unless it be thought that a pond or stream or lake are absolutely needed for their successful cultivation. It is almost impossible to realise the beauty of a fine group of these hardy flowers, and were they grown in proportion to their merit, they would certainly be seen in abundance in all private gardens. Even in such gardens in which the plants may be found, it is rarely that a full measure of success is obtained. That they are moisture-loving plants is not questioned, but this does not mean that they will succeed in or near to stagnant water. I have, indeed, grown them better in richly-manured ground in the neighbourhood of Hampton than others have at the water's edge. Moisture is necessary, and so is an open vegetable soil, or a soil largely consisting of leaf-soil and peat, with a good quantity of decayed manure. Any amateur who feels so inclined may grow these delightful subjects in the most satisfactory manner by adopting the following simple means:—In gardens with a heavy retentive soil, a special bed should be made by digging out the soil to the depth of 2 feet, and in the form of an oval, oblong, or other desirable figure, and replacing it with rough peat, half-decayed leaf-mould, and very short manure, the first two in equal ratio, and the manure about one-fourth, to which may be added about one-fourth of the staple, making at the least a bed $1\frac{1}{2}$ or 2 feet deep. It should be well mixed together, and left in

a comparatively loose state. In finishing off the bed, allow the surface to be 3 or 4 inches lower than the surrounding level of the soil, so that it can be deluged with water in dry weather in the growing season. In gardens where the soil is strong, and the subsoil is gravelly or sandy, a similar excavation will be needed; but in this case I would advise lining the bottom with clayey soil, so as to retain the moisture. What these delight in is an unlimited supply of vegetable mould below, and plenty of moisture afforded from April to September. What they dislike is stagnant moisture throughout the winter, which must be avoided if success is to be insured; and they are safer, and stand better chances of flowering in any ordinary damp, shady border; but where abundance of vegetable soil can be afforded the roots, a marked difference will soon be observed. If only a dozen plants be obtained, they will repay proper care. This Iris is by no means fastidious as to the season to plant; but preference should be given to the autumn, as this enables them to make fresh roots by the time growth commences in the spring. *J.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

PREPARING FOR FORCING.—The houses or pits in which the earliest forcing will be done should now be got in readiness by cleaning the wood-work and glass, and lime-washing the walls. If a small quantity of petroleum be used in the lime-wash, it will prove a good kind of insecticide. When the work of house-cleaning is thoroughly done at this season, much labour in cleaning the plants later is avoided. A large heap of stable-litter and Oak or Beech leaves should be prepared in some sheltered corner where the wind will not reach it, and be well mixed and turned over several times, so as to fit it for bringing into the vinerie, &c., as may be required. It forms an admirable mild hotbed for hastening the flowering of plants, and adding warmth to the house. A compost consisting of fresh turfy loam, crushed bones, wood-ashes, and old mortar-rubble or plaster, should also be prepared, and placed under cover, in readiness for top-dressing purposes.

STRAWBERRIES IN POTS, ETC.—Sharp frosts having set in, the plants in pots should forthwith be placed in winter quarters as previously advised. A bad drainage is more injurious to the Strawberry than frost, no water should be allowed to collect about the pots. I do not advocate placing the plants on their sides under walls, &c., as the soil is apt to become too dry, causing the roots and crown to lose their plumpness. Frames and pits form a better shelter if the pots can be plunged closely together up to their rims in beds of fine coal-ashes or tree leaves. The frames should have a southerly aspect by preference. Foliage which has become brown should be retained, as it forms a protection for the crowns. As was before stated, those plants which are to be forced early should be plunged in leaves, &c., in pits, and the lights should be only placed on them during frosty weather. All kinds of fruit trees in pots should by this time be plunged in beds of coal-ashes, or have their roots protected in some other manner from frost.

THE OTHER FRUIT-HOUSES.—Continue to freely ventilate all the Peach-houses and vinerie, excepting those containing Grapes, care being, of course, taken to prevent the water in the heating-apparatus from being frozen.

PINE-APPLES.—Queen Pines, to ripen in May and onwards, should now have the amount of water afforded at the roots somewhat reduced, a slightly lower temperature maintained, as well as a drier atmosphere, and thus afford the plants a two months' rest, which is especially desirable if the plants are to show fruit at a given time. The pinery may be carefully ventilated for a few hours daily during mild weather, when the inside temperature has risen to more than 68°. The night temperature should not exceed 65°, and the bottom-heat should be steady from 70°. It is very desirable to cover Pine-stoves at night, especially in frosty weather, the retention of the desired degree of heat by this means being preferable to the excessive use of the hot-water pipes. Thick blinds answer the purpose very

satisfactorily, although Frigi Domo and mats are also of use. In the fruiting-house, a brisk moist heat should be kept up, to encourage the swelling of the fruits, and no overhead syringing be performed during the winter months, but the surface of the plunging material moistened instead, by syringing it slightly between the plants about 9 A.M. and 2 P.M. Very little ventilation should be afforded, unless the sun be very warm, as draughts of cold air are injurious. A day temperature of 70° to 75° in this division, and one at night of about 68°, should be maintained. The rooted Pine suckers should be afforded much the same kind of treatment as that recommended for the Queen Pine plants until the turn of the year, and by keeping the plunging material well up to the rim of the pots, and keeping this in a fairly moist condition, less water will be required at the roots. In each department see that there are no drips from the roof, as water falling constantly into the pots sours the soil, and causes the roots to decay. Ripe fruit should not be allowed to remain in the stove, as it keeps much better in a dry room.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

TUBEROUS-ROOTED BEGONIAS.—These plants will, in most gardens, be past their heat, and should be gradually dried off, for which purpose the pots containing them may be placed beneath the greenhouse stage. When they are completely dried down, shake all of the old soil from them, and keep them in the winter in shallow boxes filled with cocoa-nut fibre refuse, placed in a dry place, from which frost is excluded. All double-flowered and unusually fine single-flowered varieties should be in some way designated, in case it should be desirable to propagate from them next spring. If cuttings of double-flowered varieties were struck at the time advised in a previous calendar, the plants should be kept actively growing for some time longer, in order to obtain as large a tuber as possible. For this purpose a mild hotbed-frame, and the plants placed close to the glass, will suit them admirably. All flowers should be picked off these young plants as fast as they appear on them.

ACHIMENES.—The latest batch of these tuberous-rooted stove-plants may be gradually dried off, and then placed beneath the greenhouse stage or in the potting-shed if it is frost-proof. Those grown in baskets may be shaken out and placed in boxes of dry peaty soil or silver sand, and similarly stored. Achimenes should not be kept in too dry a place, as the tubers are then liable to shrivel.

DEUTZIA GRACILIS.—Plants which have grown in pots all the summer may now be examined as to the drainage of the pots, and removed to cold frames, in readiness for being forced, and placed close together if frame accommodation be limited. The plants will require little or no water until they are taken into the forcing-house. Those planted out should be lifted and potted up, these latter being taken last into the forcing-house, as the pot-grown plants stand hard forcing better than they.

HINTS ON SEASONABLE OPERATIONS.—No time should now be lost in getting all plants which have been standing outside into the greenhouses, conservatory, cold frames, or brick-pits, although such species as Montan (Tree) Pæonia, Hydrangeas, Campanulas, Fuchsias, Richardias, Carnations, Agapanthus, &c., are able to stand a little frost. The Hybrid Perpetual Roses for forcing purposes, if no room be available in pits and frames, or the Rose-house, should be plunged in beds of cocoanut-fibre or fine coal-ashes, to a depth of an inch below the rim.

VIOLETS IN FRAMES should have regular attention in airing, keeping free from weeds and runners, and in watering and protecting from frost. At this place, on October 26, the thermometer registered 10° of frost, and the protection of the frames with mats was very necessary. Air should be admitted to the frames as soon as the rime is off the glass.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorset.

HABENARIAS.—The species, *Habenaria militaris*, *H. rhodochila*, *H. Susanæ*, *H. carnea*, and its pure white variety *nivosa*, are well worthy of attention, their flower-spikes presenting a gay appearance at a time when there is a comparative absence of flowers in the Orchid-houses. Where convenience for their culture exists, they are plants which deserve to

be well represented. Now that their requirements are better understood than formerly, but little difficulty is experienced in the management of them. At the present time a large number are in bloom at Barford, and already the leaves of the earliest-flowering species are beginning to show discoloration; water must be therefore gradually withheld from them so as to induce the dying down of the stems and foliage. The stem should not be cut off when decaying, but left to fall naturally away. It is not advisable to withhold water altogether when growth ceases, as over-dryness at the root causes the tubers to shrivel, and it is doubtful if they ever regain their plump condition; and they invariably start weakly the following spring. The plants should be kept intact in their pots, and be carefully examined once a week. Those which are found to be dust-dry should be stood by themselves and afforded a good sprinkling of water from a fine rose watering-can. *Habenaria militaris*, *H. carnea*, and *H. c. nivea*, should be rested on a shelf near the glass in the warm-house alongside the deciduous *Calanthes*; while *H. Sasanæ* and *H. rhodochila* should occupy a similar position in the Cattleya-house.

DENDROBIUM PHALÆNOPSIS.—Many collections are now gay with flowers of this beautiful Dendrobe, showing as it does, a great range of colour in the different plants. The dark richly-coloured varieties appear to be the more common, although there are many lighter forms which are always much admired. The white variety is very rare. If the atmosphere about the plants be kept a trifle drier than usual, the blooms will remain fresh for a long time—a matter of importance where cut flowers are much in request. As soon as the bloom is over, the plants should be placed in the cooler part of the East India-house, and kept rather dry at the root, water being afforded just as often as will prevent undue shrivelling. Other species of *Dendrobiums*, viz., *D. bigibbum*, *D. superbiens*, *D. Goldei*, and *D. Statterianum* plants of which are now in bloom, will require a similar kind of treatment when they are resting.

CATTELYAS.—The best varieties of Cattleya eldorado are very desirable plants, and their fragrant flowers remain in beauty for a period of four or five weeks. At the present time these plants are freely making roots, and when the temperature of the Cattleya-house falls below 60°, it will be advisable to remove them to the warmer East India division, and keep them there whilst the roots are active. They should not be watered unless actually dry, and then it should be thorough. To keep the potting materials constantly moist certainly causes the pseudo-bulbs to decay.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

THINNING AND DRESSING STANDARD TREES.—The present is a very suitable season for the thinning of the crowns of orchard and other standard fruit trees. Pruning, as it is generally understood, is rarely necessary in this department, but thinning is beneficial to the trees, and should be taken in hand, always before the leaves fall if time can be spared. It is so much easier to determine whether a branch may be taken away with advantage, when the foliage is on the trees, regardless of the known benefits of early pruning. In the case of old or neglected trees, large branches should not be cut away at once with the view of thinning once and for all, as the effects would be worse than those which accompany neglect; but commence by taking out a few of the smaller branches, and overgrown spurs here and there—an operation which may be repeated year by year, and which together with manual aids to the roots in the shape of wood-ashes, soot, or farmyard drainage applied during the winter will lead to a great improvement in the health of the trees and the quality of the fruit. As soon as all the leaves have fallen, the rough bark of the trunk and larger branches should be scraped with some blunt instrument to free it from moss and lichens, which form a hiding place for various injurious insects and their eggs. These scrapings should be allowed to fall on to a sheet, so that they may be easily collected and burned, as well as the leaves and small prunings. It would be well, if the trees have been infested with insects, to shovel up surface-soil under them, and char it, fresh soil from land not under fruit taking its place. When insects give much trouble in orchards under grass, it is sometimes advisable to pare off and char the turf, afterwards lightly pricking over and pulverising the ground, which is best done with a digging-fork or

Kentish hoe, and applying a light top-dressing of gas-lime or gas-water, the latter being used on the branches as well. Gas-water should be diluted with three times its bulk of clear water. For the destruction of moss on the trunks and branches, freshly-slaked lime is an effective, and easily-applied means. It should be scattered over the trees, when they are wet with rain or dew.

PRUNING AND DRESSING APRICOTS.—The unripened shoots may now be shortened to a firm wood bud usually found at the base of the shoots, and if the summer pinching was properly attended to, not much pruning will now be required. As soon as the leaves have fallen, unfasten the trees, and wash the branches with warm soap-suds, made by dissolving 4 oz. of soft-soap in one gallon of water; a soft brush should be used generally, but when the brown-scale is present, it may have to be dislodged by other means before washing the trees. If the walls have many nail-holes, and the pointing has fallen out, some good mortar or cement should be used to stop the holes and make good the pointing. When nailing the trees, be careful not to bruise the shoots with the hammer, or have ties that will cut into the rind, as injuries of this kind cause canker and gumming. Having finished the training of the trees, afford a dressing of short dung, after lightly pricking up the surface of the border and pulverising the clods.

THE KITCHEN GARDEN.

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

LATE CAULIFLOWERS AND AUTUMN BROCCOLI.—In my earlier note on these crops I mentioned that all those intended for lifting should have the roots cut round with the spade so as to check growth and prepare them for lifting. From now onwards, these crops are very important ones in most country establishments. Owing to the mild weather hitherto enjoyed, we ought not now to be caught unprepared. If no light brick or turf pits are at command, some short, pointed, stout stakes should be driven into the ground in a warm sheltered spot, and to these slating-laths should be nailed across at the top; in this simple manner protection may be found for a great number of plants. Leave standing all those with the more forward heads, which may be covered up where they are, or lifted when sharp frosts threaten; but lift the bulk of the crop, and transplant them under the temporary protection made, giving them as much room as the space at command renders possible, keeping the plants erect, which is easily done by sinking them a little deeper than they were before. They should be just clear of each other. All decaying leaves should be removed, and care taken to keep them free of these afterwards, or the heads will become ill-flavoured. Do not cover the plants with mats, &c., unless it be quite necessary; and when the frosts get more severe, dry fern or straw may be used as an extra protection. In this manner, Broccoli may be cut to the end of the year, and sometimes later. Cauliflowers and Broccoli intended for exhibiting in November, should be left in the ground, and some means taken to protect them from frost, but dig them up before there is any sign of the curd opening. Endeavour to keep them white and fresh; the leaves also must be green, nothing looking worse than Cauliflower heads stripped of all their leaves.

CHICORY AND SALSIFY.—The first-named tender roots should be the first removed from the ground, and stored in fine coal-ashes or damp sand, the leaves to be used later in the blanched state in salads. Salsify I prefer to leave in the ground as one does Parsnips, covering the ground slightly with litter as protection against frost.

ASPARAGUS BEDS.—The tops of the plants being quite ripe, they may be removed with a sharp knife or scythe, and all weeds pulled out or hoed and raked off. If some of the tops with seeds were saved, these should now be gathered, choosing the finest berries only. Spread the berries out to dry in a cool vinery, rubbing out the seeds when time permits.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

WINTERING BEDDING PLANTS.—The severe frosts of the past week having cut down Dahlias, the tubers should be lifted and stowed away in a shed from which the frost can be excluded. Cut the stems to within 6 inches of the tubers, which should be placed on shelves or on the floor for a week in order to dry the soil that is about them. After that

time they may be put closely together in boxes on the floor, or on broad shelves in dry places. Cover the roots about 1 inch deep with dry sandy soil, and then, if the shed is dry and cool, and frost is excluded, they will keep well until February or March. Hollyhocks, if of scarce varieties, should be lifted from open borders and potted into good sandy loam and leaf-soil, and the pots plunged in old Mushroom-bed or other dry material that will not heat. A cold frame, or preferably pits from which the frost can be excluded, will answer for them. Cuttings that were struck in August may be plunged in the same place. Admit abundance of air during mild weather, keeping them plump and fresh; but not over-watering them. If mildew or other fungoid growth occur, dust the plants over with sulphur. Gladioli bulbs should be lifted and dried in a cool airy shed, keeping them from frost. The Breckleyensis varieties are hardy in dry well-drained borders, but the surface should be well mulched to keep the frost from them. I prefer to lift them every year, and plant afresh in the spring. Tuberosus Begonias and Cannas should be lifted and dried a little, and the tubers afterwards stored away in dry sandy soil in shallow boxes or on shelves in a dry shed. If the temperature of the place is not allowed to fall below 40°, they will keep very well.

CALCEOLARIAS.—Good early cuttings of these were very scarce this season, owing to the drought. They should be kept well shaded and watered, that they may keep plump and fresh until they have made roots, then affording them abundance of air, except during sharp frosts, when they should be well protected with mats and litter.

PELARGONIUMS.—This has been a good season for striking Pelargonium cuttings. Those in boxes will require very little water after this time. Keep them as cool as possible; it is better for them not to make much growth until they are potted off in February. The floor of a late vinery is a good place for them. Old plants that have been lifted from the flower-beds should have all of the leaves removed, and be laid thickly together in leaf soil in pits or cool-houses, giving them a water to keep them from withering, and abundance of air. Do not cut them in any way at present, unless to take out decaying shoots. When pits or beds for laying-in old plants are not to hand, they should be potted six or eight together into 8 or 10-inch pots, and placed out of the reach of frost.

MISCELLANEOUS.—Iresine, Colens, and Alternantheras require to be kept in a warm or intermediate house during the winter months, and care should be taken to keep them clean from aphides by fumigation. *Lobelia speciosa*, *Verbenæ*, *Azarias*, *Ageratum*, *Heliotropes*, *Nierembergia*, and the cool varieties of bedding plants that are struck in pots and stored during the winter for propagating in the spring, may be kept in a cool airy house, and be carefully watered, not allowing them to get dry at the roots. Flowering shoots should be pinched out as soon as seen. A temperature of 40° to 45° at night, and 50° by day, will suit them very well. *Centaurea candidissima* may be lifted from the beds and potted into 5 or 6-inch pots. Well water them and place them in a cool house where they may have plenty of air, and be kept free from frost. Do not water them over the foliage in the winter time. These plants will give abundance of cuttings in the spring, but unless old specimen plants are require for planting out, the stock is quickly increased by sowing seeds in February. Carnations and Picotees that have been potted for keeping in pits and frames through the winter must be kept rather dry at the root, affording them abundance of air, and removing the lights whenever possible. The pots should be plunged into cocoa-fibre or other good dry material, to keep the frost from the roots, and covering need only to be used during severe frosts, the plants not being coddled in any way.

A WELSH FOSSIL-TREE.—A fine trunk of a Fossil-tree stands upright in the offices of the Maerdy Coal Company, in the Rhondda Fach. It was taken out of the colliery some time ago, and is 5 feet to 6 feet in length, and judging roughly from its appearance, is over 2 feet in circumference. There is another tree in the colliery, and not yet removed. It stands on the side of a road, and only a portion of it can be seen, but it will, no doubt, be removed some day, so that people may have an opportunity of examining a natural monument of the glories of a "Cymru Fu" forest. *Western Mail*, Oct. 21, 1895.

APPOINTMENTS FOR NOVEMBER.

MEETINGS.

TUESDAY,	Nov. 5	National Chrysanthemum Society at Royal Aquarium.
SATURDAY,	Nov. 9	Royal Botanic Society.
TUESDAY,	Nov. 12	Royal Horticultural Society's Committees, at the Drill Hall, Westminster.
SATURDAY,	Nov. 23	Royal Botanic Society.
TUESDAY,	Nov. 26	Royal Horticultural Society's Committees.

SHOWS.

SATURDAY,	Nov. 2	Crystal Palace Chrysanthemum, Loughborough Chrysanthemum and Fruit.
MONDAY,	Nov. 4	St. Neot's Chrysanthemum, Battersea Chrysanthemum.
TUESDAY,	Nov. 5	Chrysanthemum Shows at Hereford (two days), Southampton, Hanley (two days), Brighton (two days), and Watford (two days). National Chrysanthemum at the Royal Aquarium (three days).
WEDNESDAY,	Nov. 6	Chrysanthemum Shows at Bromley, Ware, Coveutry, Wolverhampton, Tamworth (all two days), Ascot, and Chesterfield.
THURSDAY,	Nov. 7	Chrysanthemum Shows at Exeter, Hitchin, Birkenhead, and Harrogate (two days).
FRIDAY,	Nov. 8	Chrysanthemum Shows at Beigate, Waterford, Windsor, and Derby.
MONDAY,	Nov. 11	Gloucester Root, Fruit, and Grain.
TUESDAY,	Nov. 12	Chrysanthemum Shows at Croydon (two days), Louth (two days), Plymouth (two days), Kingstou-on-Thames (two days), and Farnham.
WEDNESDAY,	Nov. 13	Chrysanthemum Shows at Birmingham, Bournemouth, Bristol, Hertford, Hull, Isle of Thanet, Reading, Lewes, Faversham, Rugby, Barnsley (all two days), and Chelmsford, Ayr, and Yeovil.
THURSDAY,	Nov. 14	Chrysanthemum Shows at Edinburgh (three days), Winchester (two days), Lincoln, Wimbleton, Barnet, Guildford, Fitchley (all two days), and Caterham and Cambridge.
FRIDAY,	Nov. 15	Chrysanthemum Shows at Bolton, Sheffield, Bradford, Stockport, Hincley, and Chorley (all two days).
SATURDAY,	Nov. 16	Chrysanthemum Shows at Batley, Crews, and Eacup.
TUESDAY,	Nov. 19	Leeds Paxton Chrysanthemum (two days). Chester Chrysanthemum (two days).
WEDNESDAY,	Nov. 20	Chrysanthemum Shows at York (three days), South Shields (two days), Dundee (two days), Tonbridge (two days), and Helensburgh.
THURSDAY,	Nov. 21	Chrysanthemum Shows at Norwich, Aylesbury, Glasgow, and Warwick.
FRIDAY,	Nov. 22	Manchester Chrysanthemum.
TUESDAY,	Nov. 26	Tredegar Chrysanthemum (two days).
FRIDAY,	Nov. 29	Alderley Edge Chrysanthemum at Wilmslow (two days).
SATURDAY,	Nov. 30	Dunfermline Chrysanthemum.

SALES FOR THE ENSUING WEEK.

MONDAY,	Nov. 4	Dutch Bulbs, at Protheroe & Morris' Rooms. Plants from Belgium, Roses, &c., at Protheroe & Morris' Rooms. Important Sale of Fruit and Ornamental Trees, at the Burnt Ash Hill Nurseries, Lee, by Protheroe & Morris, by order of Messrs. B. Maller & Sons.
TUESDAY,	Nov. 5	Dutch Bulbs, at Protheroe & Morris' Rooms. Freehold Land at Wickford, Essex, by Protheroe & Morris, at the Mart, London. Freehold Market Nursery at Brentford, by Protheroe & Morris, at the Mart, London.
WEDNESDAY,	Nov. 6	Dutch Bulbs, at Protheroe & Morris' Rooms. Sale of thriving Nursery Stock, at the Cart House Lana Nurseries, Woking, by order of Mr. R. Collyer, by Protheroe & Morris (three days). Great Sale of Fruit Trees, at the Nurseries, Tooting, Wandsworth, Gloucestershire, by Protheroe & Morris.
THURSDAY,	Nov. 7	Dutch Bulbs, at Protheroe & Morris' Rooms. Plants from Belgium, Roses, &c., at Protheroe & Morris' Rooms.
FRIDAY,	Nov. 8	Dutch Bulbs, at Protheroe & Morris' Rooms.
SATURDAY,	Nov. 9	Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCTED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—44°.5.

IN connection with changes, present and prospective, the fate of Chiswick is regarded by gardeners with some apprehension. The Council of the Royal Horticultural Society has informed the public that changes are contemplated, but up to the present it has vouchsafed not a particle of information as to what its policy is likely to be. We need not do more than make passing allusion to the glorious history that attaches to Chiswick, the plants that were introduced from there, the collections of fruits that were got together, the observations that were made in these old gardens. But this is all ancient history: and the present generation, and still more the coming race of gardeners, is, or will be, if not wholly ignorant, at least indifferent to what has been done. There was a time when even the Council, extraordinary as it may seem, were compelled to neglect Chiswick. Owing to financial troubles, the garden was first reduced by more than half its area, and then the remainder was left pretty much to take care of itself. When brighter days came, the Council very properly set to work to restore the dilapidations and ruin caused by years of neglect. Of late years the expenditure has been large, but the result is seen in the general good condition of the buildings. Only two of the old ruinous houses remain, and these have long since been condemned by the Chiswick Board.

The Conferences on Apples, Pears, Ferns, Conifers, Roses, Pinks, Chrysanthemums, Dahlias, and other subjects, which have been held of late years in the gardens in connection with exhibitions, have been singularly valuable and instructive. Some of these, no doubt, could have been as well held elsewhere as at Chiswick: nevertheless, the fact remains that the Conferences held at Chiswick have been quite the most successful of any—we mean, of course, so far as the fulfilment of the object of the particular conference was concerned.

The work done at Chiswick at the present time is varied. As every gardener knows, there are each year numerous trials—now of this flower, now of that; now of this vegetable, now of that, whilst standard collections of fruit are maintained. The trials, so far as they go, are well carried out, and the results are carefully recorded. Especially are they conducted with scrupulous fairness and absence of bias. Complaint is made, and with reason, that the publication of these records is sometimes delayed so long, that their value for commercial purposes is seriously impaired. That is a defect which can easily be remedied; and, moreover, commercial considerations are better left to the great traders, who have their own trial-grounds. It is obvious that the results of these trials, organised and supervised by the superintendent and his assistants, and periodically examined by the several committees during the season, must be of far higher value than those obtained by the cursory examination made of specimens exhibited at the Drill Hall, and of much more importance than the opinion of individual gardeners paraded in trade catalogues.

In some cases the trials are superfluous. There is little utility, now-a-days, in the Society growing a collection of Chrysanthemums, Pelargoniums, Fuchsias, or tuberous Begonias. These have long since passed out of the experimental stage, and the trade may be trusted to make their trials on a larger and more complete scale than can be done at Chiswick. Cannas, on the other hand, are at present relatively new in gardens. The public do not yet know much about them, and it is desirable that the Society should grow illus-

trations of the various types, under various methods of cultivation, until they become generally known, and the most appropriate method of culture decided on.

A very large portion of the resources of the Society is now spent on the growth of plants for distribution to the Fellows. This is a matter in which reform is needed. The plants grown are, for the most part, of no special horticultural interest in themselves, nor does their cultivation present any problems to be solved, as they are, for the most part, of the easiest culture. They are plants which, speaking generally, can be bought from the nearest greengrocer for a shilling or two. In the matter of cultivation they cannot reach the standard attained by the market growers, who grow superb specimens of special things because they can devote an undivided attention to them which is not practicable at Chiswick.

The sale of Grapes, Tomatos, and other produce, is necessitated under present circumstances. This is a great misfortune—a lamentable departure from the legitimate work of such a garden, and an unjustifiable trespass on the functions of business establishments.

With a gigantic conservatory and other houses to maintain, we do not wonder that successive Councils endeavour to recoup some of the expenses of maintenance: but everyone will admit that to attempt to combine an experimental garden with a commercial establishment is to neglect the one department, and to conduct the other unsatisfactorily. All over the world this is so, as those may see who read the accounts of colonial gardens where commercial interests are allowed to be mingled with those of horticulture proper.

The resources of Chiswick and the labours of the staff should not be devoted to objects which can be as well, or better, carried out elsewhere; rather should attention be paid to matters which the average horticulturist, amateur or commercial, has not the means to undertake for himself, or which it may be, for the time being, inexpedient for him to attempt.

Chiswick should be a great reference-garden, where authentically-named specimens of the best fruit trees, and the best vegetables, should be grown for reference and comparison. Many questions of disputed nomenclature, which now-a-days are difficult or impossible to solve, might readily be settled in this way.

In like manner, diverse methods of pruning, and variations in cultural methods generally, should be tried. So far as possible all new methods and all new inventions should be subjected to trial at Chiswick. New plants of all kinds should be grown, and their value for horticultural purposes be tested. With such a large constituency and so many foreign members, seeds of tropical and other plants might be grown for trial. What if the bulk proved to be of no value, even that information would be useful, and in a few cases something interesting would be sure to turn up. As it is, we do not remember a single new plant to have been made known, still less distributed through the agency of Chiswick for many years. What a contrast to what was the case thirty or forty years ago!

Scientific experiments and "research" are, we fear, hopeless without a competent director to initiate, watch and conduct them to a successful result. The salary of a competent director of the kind we have in view would form so considerable an item in the yearly budget, that we fear in the absence of other support it would not be sanctioned. We do not forget that some years ago more than one series of experiments

were carried out at Chiswick under the auspices of the Scientific Committee. But the labour, and it was not inconsiderable, fell to the share of two or three busy men already overweighted with their own affairs. The encouragement

important—if not the most important—features of a national experimental garden.

Much more might be said in detail as to the proper functions of Chiswick, more especially in connection with a properly-equipped school of

LINNEAN SOCIETY.—The next meeting of the Society will be held on Thursday, November 7, at 8 P.M., when the following papers will be read:— Col. SWINHOE, "On Mimicry in Butterflies of the genus *Hypolimnas*, Hüb." Mr. G. F. SCOTT ELLIOT,

FIG. 92.—FLOWER OF *YUCCA GUATEMALENSIS*: FLOWERS IVORY-WHITE. (SEE P. 524.)
(Grown in the Botanic Garden, Cambridge.)

received by the willing horses from the Council was practically nil, whilst by the Fellows at large the whole thing was ignored. The prospects of experiments of this kind are therefore far from promising, and yet these experiments should undoubtedly constitute one of the most

horticulture supported by the public funds and managed by the Society. The Council has raised our expectations to a high pitch. We earnestly hope we may not be disappointed, but that Chiswick may take its place as the first horticultural experiment and reference station of the world.

"A Revision of the genus *Pentas*, Benth." Dr. A. G. BUTLER, "An Account of the Butterflies of the genus *Charaxes*, Ochs."

ROYAL HORTICULTURAL SOCIETY OF IRELAND.—On Wednesday and Thursday, November 6 and 7, the Royal Horticultural Society of Ireland will hold

their annual Fruit and Chrysanthemum Show. The show will be held in the premises of the Royal Dublin Society, at Ball's Bridge. Several special prizes are offered for competition, including three challenge cups presented by Lord ARDILAWN, Messrs. WATERHOUSE & Co., and by the gardeners of Ireland. Silver and bronze medals, and many presentation and money prizes will also be competed for. The date of the show is earlier this year than usual, as the council were anxious to convenience exhibitors who might wish to attend the show to be held in Belfast the following week, and also to allow of growers from the north competing here.

THE GARDENERS' COMPANY.—At a meeting the court held on Tuesday, October 22, the Master (Lient.-Colonel GEORGE LAMBERT, F.D., F.S.A.) presiding, the clerk, Mr. R. GOFTON SALMOND, read a letter from the Commissioners of Sewers, regretting that they could not accept the offer of the company to place seats in various parts of the City for the convenience of the public. The company had been enabled to make this offer to the Commissioners through the kindness of a member as a memento of his election to the court. The seats will now be placed outside the City through the Metropolitan Public Gardens Association. The hon. librarian, Mr. CHARLES WELCH, F.S.A., read a report upon the gardening library presented by the company in 1891 to the Guildhall Library, and supported by a yearly grant from their funds. The number of volumes has now reached eighty-seven, a large number of which were fortunately acquired at the sale of the library of the late Mr. SHIBLEY HIBBERD. Besides several important treatises on gardening in general, there are monographs on the Begonia, Carnation, Chrysanthemum, Clematis, Pelargonium, Narcissus, Rose, Vine, and other plants. The recent purchases include Nicholson's *Dictionary of Gardening*, and a specially fine copy of Lindley's *British Fruits*. The books are already largely used by the readers at the Guildhall Library, and as the collection is rapidly growing in extent and importance, it will doubtless soon become very widely known and appreciated. The example of the Gardeners' Company may with great advantage be followed by many of the more wealthy City guilds. *City Press, Oct. 26.*

THE ROYAL GARDENERS' ORPHAN FUND.—The usual monthly meeting of the committee took place at the Horticultural Club on the 25th ult., Mr. WILLIAM MARSHALL presiding. The following special receipts were announced as having been received during the past three months:—Legacy from Mr. J. Taplin, Havant, £5 5s; the Rev. A. Lowe, proceeds of collection at Harvest Thanksgiving, per Mr. J. Bennett, Burton-on-Trent, £6 6s.; Messrs. J. Crispin & Sons, Show Rooms, Bristol, per Mr. J. H. Vallance, £5 5s.; Mr. Arthur Miles, Dudley Villas, Southampton, £2 3s.; collected at Woodford Flower Show, per Mr. W. D. Wiloughby, £2; Bradford Paxton Society, per Mr. R. Scott, £1 10s.; Mr. J. Barn, Abbey Park, Leicester, £1 5s.; the Misses Evans, Wimbledon, 17s.; Mr. H. Barbridge, Westgate, 10s. 6d.; and collected by Mr. W. G. Head, Crystal Palace, Sydenham, £3 15s. 8d. By means of boxes, the following sums were obtained:—Mr. J. Selway, Betteshanger, Dover, £4 5s.; Mr. J. McIndoe, Hatton Hall, Gaisborough, £5; Mr. C. Sutton, Chavening, Sevenoaks, £1 12s.; Mrs. H. B. Smith, Ealing, 7s. 5d.; and Miss McRonal, Chichester, 7s. In small sums, per the Editor of the *Gardeners' Chronicle*, from October, 1894, to October, 1895, £2 4s. The remainder of the business was of a purely formal character, and the proceedings closed with a vote of thanks to the chairman.

PEBBLESHIRE HORTICULTURAL ASSOCIATION.—The second meeting of the session of this flourishing Association was held in the lesser Good Templars' Hall on Tuesday evening last. Mr. A. SLATER, Vice-President, occupied the chair. After the minutes of the previous meeting had been read by the Secretary, Mr. MCINTOSH, The Gardens, Kingsmeadows, read a paper on "The Cyclamen."

THE SOUTH SHIELDS AND NORTHERN COUNTIES CHRYSANTHEMUM SOCIETY'S exhibition will take place on November 20 and 21, in the Royal Assembly Rooms, at South Shields. The schedule now before us includes fifty-two classes, and there are in addition to local classes, others which are open to all comers. Mr. BERNARD COWAN is the Hon. Sec.

MARRIAGE OF MR. JACKMAN.—On the 17th ult., the nuptials of Mr. A. G. JACKMAN, nurseryman, Woking, with Miss FLORENCE SANNAGE, of Leicester, were celebrated, and in connection therewith, the employés of Messrs. JACKMAN & SONS were entertained to dinner.

MR. VERNON HEATH.—We learn with regret that this well-known photographer died in London on Friday, October 25, at the age of seventy-five. Mr. HEATH's landscape-photography and his views of country-houses attained to a high degree of excellence. A number of them are in the Guildhall Library. Among some of the best he ever took were those of Barnham Betches, a series of striking, beautiful views. Mr. HEATH, a few years ago, compiled a volume, entitled *Fifty Years' Recollections*, which was pleasant reading, and contained many good stories.

AGRICULTURAL RETURNS.—Farmers and others interested in the cultivation of the soil, cannot but agree that they are well attended to by the Board of Agriculture in the matter of statistics and other contributions to the literature of the day selected for their special use and delectation. And this is certainly to be commended, especially as the Board of Trade returns published every month supply the same gentlemen with "matter sufficient to give them pause." Last week there was issued by the Agricultural Department what is termed "Statistical Tables," showing acreage under crops and grass, and number of horses, cattle, sheep, and pigs in the United Kingdom, with particulars for each county of Great Britain—all preliminary to the annual and completed report for the year, to be issued at the usual time. The pamphlet is made up of an enormous mass of figures, none of which do we propose inflicting upon our readers. Sufficient to note here, the growth in the number of acres devoted to market-gardening, and to orchard cultivation. As to the latter, they (in England, Wales, and Scotland), cover an area of 218,000 acres, in 1894 it was a trifle under 214,000 acres. As to market gardens they cover 92,837 acres, as against 88,210 last year. But it must not be supposed that all of this land was withdrawn from other culture, for those who read of land sales, know very well that large estates are being broken up into small farms, which produce better returns for the vendor and form grand speculations for the buyers. As for fruit, there is not now a breakfast-table in the land lacking its jam-pot—jams of all sorts, single and compound, are in great and growing request; and in addition, sugar continues cheap. Decentralisation in the matter of markets is being duly recognised as beneficial; and doubtless, our friends of the Agricultural Department will more and more see their way to extending their field of vision—especially in the matter of markets for sale, and the results in the matter of land and crops.

THE WONDERS OF FERNLAND.—At the Memorial Hall, Farringdon Street, on November 5, under the auspices of the National Amateur Gardening Society, Mr. CHAS. T. DAVERY, F.L.S., will give a lecture on this subject, illustrated with numerous lantern slides, showing photographically and actually the wonderful features of Fern life generally, and more especially of British Ferns, and their most beautiful varieties.

COLOURED GLASS AND STRAWBERRIES.—We read in *Inventions* of Oct. 22, that in cultivating Strawberries under glass of various colours, Prof. ZACHAREWICZ, of Vancluse, France, has obtained the following results:—Ordinary clear glass gave the best and earliest fruit; orange glass increased the

vegetation, but injured the quality, size, and earliness of the fruit; violet glass increased the yield, at the expense of the quality; red, blue, and green glass were harmful to all kinds of vegetation.

THE WORCESTERSHIRE BRANCH OF THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The inauguration of this branch will take place at the Guildhall, Worcester, on Monday, Nov. 18, and the chair will be taken by the president, Earl BEAUCHAMP, Mayor elect of Worcester, at 3 P.M. Several influential gentlemen have promised to support the chair and address the meeting, whilst every effort is being made by the committee to secure a thoroughly representative and successful gathering. All friends of the cause, and patrons of horticulture, are cordially invited to be present.

THE LATE PROFESSOR HUXLEY.—A biography of Prof. HUXLEY is being prepared by his son, Mr. LEONARD HUXLEY, who will be greatly obliged if those who possess letters or other documents of interest will forward them to him at Charterhouse, Godalming. They will be carefully returned after being copied.

YUCCA GUATEMALENSIS, Baker.

This species, the subject of our illustration, fig. 92, is perhaps the most imposing of the very ornamental genus to which it belongs. The drawings were made from a fine specimen, which flowers about every three years in the Botanic Garden at Cambridge, and where, no doubt, it has grown for many years. Owing chiefly to its size, it is cultivated in the Palm-house, where it is planted out, and, in order that too much space may not be occupied, it is cut back after flowering, and only one or two shoots are allowed to grow. It has a principal stem or trunk, from which the flowering-branches proceed, and the treatment just alluded to accounts for the habit shown by the illustration on p. 525. With free growth there would be several stems, bearing an enormous mass of foliage. The main stem or trunk above referred to, is about 6 feet in height, and about 7 feet in circumference at the base, whence it decreases in size to about the middle, again increasing somewhat towards the point of branching. The flowering-shoot measured about 18 feet, including the panicle, the height of which was about 3 feet 6 inches, and foliage began at about 3 feet from the base of the shoot. The total height of the specimen, it will be seen, was about 24 feet. The panicle of flowers is rhomboid in shape, and striking on account of its density, the flowers seeming to form a solid mass. They are (see fig. 91, p. 519) from 2½ to 3 inches long, the segments oblong-lanceolate, sharp at the point, and about 1 inch in width, those on the outside broader than the inner. The colour may be described as ivory-white, and, speaking of the panicle, as a whole, it could not easily be surpassed in magnificence.

Yucca guatemalensis belongs to a set of about half-a-dozen species, which is characterised by having serrulated leaves. All have a very short peduncle, with the exception of *Y. rupicola*, in which it reaches a length of 3 feet. *Y. aloifolia* is a species too well-known to need description. *Y. yucatanensis* is similar, with leaves 14 to 16 inches long. The remaining species, described by Mr. Baker in the *Journal of the Linnean Society*, vol. xviii., are *Y. brevifolia* and *Y. Desmetiana*, the former having rigid leaves from 6 inches to 1 foot long, and one third of an inch broad, the latter with recurved leaves of twice that width, and either of a purple colour when young, or when older having a narrow pale margin. The present species is the largest of all, its leaves are ensiform, 3 feet long, about 3 inches wide near the middle, very dark green, shining and smooth. It was described and figured by Mr. Baker, in Saunders's *Refugium*, in the year 1870, and, according to him, was introduced about twenty years earlier. In gardens it has been known under a variety of names, *Y. Roezli*, *Dracæna yuccoides*, and *D. ensifolia* being perhaps the more familiar. The name adopted at Cambridge was received from Kew, and may, therefore, be accepted without question. Though referred to Guatemala by its name, this species is also a native of Mexico. *R. J. L.*

HOME CORRESPONDENCE.

FRUIT FARMING IN SOUTH AFRICA.—In answer to the enquiry of your correspondent, "H. F. T.," as to fruit farming in South Africa, as agent for the Cape Orchard Co., I shall be glad to give him any information I can on the subject, if he will call and see me, or write what subjects he wishes to be informed on. My son, who has just returned from the fruit districts of South Africa, will also be able to enlighten him on most of the points connected therewith. *G. E. Hudson, The Cape Orchard Co., Limited, Suffolk House, Laurence Pountney Hill, Cannon Street.*

FLOWERING OF THE JERUSALEM ARTICHOKE.—As a consequence of the prolonged warmth, this plant has been blooming in abundance in the market gardens in and around Bath, and has thrown up stems to the height of 10 to 12 feet, bearing clusters of bright yellow flowers, which when cut are useful for decoration. *F. Nash, Bath.* [It is not uncommon in warm years. Ed.]

THE GUIDE TO KEW GARDENS.—When greatly enjoying a recent visit to these fine gardens, I was much disappointed to find that the popular guide had been out of print for some time, and not one to be had for love or money. Perhaps the authorities would advertise these guides in the *Gardeners' Chronicle*, and the other gardening papers. The want of this guide and the shortness of the time available prevented me from making notes of the herbaceous plants and others in bloom at the time of my visit. *D. T. Fish.*

PRUNING FRUIT TREES.—After reading Mr. J. Simpson's articles under this heading in your last issue, I came to the conclusion that to write anything which shall be clear to the mind of the ordinary reader is a difficult matter. Mr. Simpson professes to criticise what I have written, and I feel sure that he wishes to do so, but what he criticises is very far from what I intended to say. I have not a copy of my paper before me, but I would ask, whence comes the statement that a standard tree, or, indeed, any other, should be pruned as a basin? I am perfectly sure that it is not to be found within the limits of my short paper. I am, of course, aware that the greater part of the more recently-planted orchards in California are pruned in this way, and the pruners find the results excellent, despite Mr. Simpson's experience, but I certainly never advocated it. What I said was, "that all branches must be so disposed as to admit the sunlight and air into the middle of the tree," but I fail to see the necessity of cutting out the centre of a tree, so that the sun may reach it, and certainly after it was removed, it could not be fertile. No, I do not advocate a basin-shape for standard trees in this country, for I think that a tree with a central axis from which the branches radiate, is much better calculated to resist storms, and much more easily managed. What I wished to insist upon was, that the branches radiating from this central axis, should be placed wide enough apart to admit sunlight into the interior of the tree; this, after the first pruning or two, is a very simple matter, and if any crossing branches be removed, and the thin growths which often shoot up from the lower portions of branches and make the interior of an Apple tree like a crow's nest, be cut out, the less pruning a standard tree gets the better. I fancy all this difficulty has arisen from the writer having amused himself with mixing up standards and cordons "in the fruit-bearing habit, of which," he says, "there is not an iota of difference." Let us grant this proposition, it is perfectly true of a really scientifically pruned pyramid, such as I have helped to prune in years gone by in Mr. Van Houtte's garden, near Ghent, but I fear it would be quite out of the question to prune a standard tree in such a way, and, at any rate, the umbrella-shaped head into which no light or air could penetrate, which seems dear to Mr. Simpson's heart, is as far removed from cordon training as the equator from the poles. Mr. Simpson says that my directions on the subject of pruning standards and cordons are contradictory; they were intended to be so, and I rejoice to find that at least on one point I have been understood. My remarks were upon pruning young trees, and my reason for cutting away two-thirds of a healthy standard was, that it should make strong vigorous growth to form the tree of the future, and to prevent its bearing fruit. This is the rock upon which we split—the non-pruning of freshly-planted standard trees. I want my young trees to make growth and not fruit, and therefore I am dubbed a "mutilator."

FIG 93.—YUCCA GUATEMALENSIS. (SEE P. 524.)

I am content, the "little band" is growing fast, and I hope one day to find my critic creeping into the fold; but because we prune our young trees to produce growth, and our formed cordon, espalier, and pyramid trees to produce fruit, we are held up to ridicule—this I do not consider reasonable. Mr. S. admits that my advice upon pruning cordons is sound, this makes me happy, and as, in spite of his mixing the two together, I intended the advice upon pruning young standards to be diametrically opposite, after all, I think, I must have made myself understandable if not understood. The quoted remarks of Mr. Wilks, to which might be added those of the late Shirley Hibberd and hosts of others, as to non-pruning, do not enter here at all. I wrote a paper on pruning, not on neglecting to prune. I do not for a moment say that the majority of standard trees are not better if in after life they are left, practically speaking, unpruned, i.e., if they simply have crossing branches and brush wood removed, but before one can leave them to thus stand alone, they must be trained in good ways; this is obvious, or one might reduce the question to utter absurdity, by saying that a tree should not be pruned from the time the graft is put upon the stock in the nursery. On the other hand, all forms of garden trees, espaliers, cordons, and pyramids, must be pruned to obtain the best results, and surely because a certain section of the public, professional as well as amateur, are so incompetent as to ruin their trees when they attempt to prune them, this is no reason why we should abstain from trying to throw some light upon the subject. No, Mr. Simpson, you no doubt thoroughly understand pruning, and you should have taught your man how to use his knife, and not have bargained that it should be kept in his pocket. *A. H. Pearson.*

WINTRY WEATHER IN YORKSHIRE.—During the past week there have been experienced in this locality a sharper snap of winter for the time of year than has been known for twenty-three years. The lowest readings of our thermometers have been 20°, that is 12° of frost; but I hear of a neighbouring gardener who has registered 14°. On Saturday morning last there was a complete covering of snow, which in places the sun does not reach, still lays on the ground. The ground this morning (Saturday last), was hard enough for us to wheel manure upon the vacant quarters in the kitchen garden, a rare occurrence in October hereabouts. *H. J. C., Grimston, Tadcaster, October 28, 1895.*

IN SUSSEX.—On the morning of the 27th the mill-pond in front and behind Uckfield Mill was frozen over. Such has not occurred in October before for the past forty-six years. All outside flowers have disappeared as if by magic. *A. P.*

IN KENT.—During the last few days I have been travelling in that garden of England, Kent, and have heard of a robin's nest with eggs, and rooks engaged in nest-building; and have seen *Rhododendron ponticum* in flower, also *Laburnum* and *Pyrus japonica*; and I have gathered Apple blossom from trees bearing grand crops of fruit. On Friday, October 25, I gathered ripe Strawberries and grand Raspberries from plants in the open, and there are good crops of these fruits in places. That grand old Rose, *Gloire de Dijon*, and others are flowering profusely on cottage walls, and fine blooms too, proving what a remarkable season it has been; and now in some districts severe frost has set in, 10° to 12° being noted, killing all kinds of tender things, especially bedding plants, Dahlias, &c., and making terrible havoc. *A. O.*

THE TRUTH ABOUT PRICES.—What jolly times we poor growers might have if the prices for Apples and Plums given in that cheerful prize essay were only correct! £26 per ton means about 11s. per sieve. Apples differ in weight, but 48 lb. per sieve is not far out. Wellingtons, when well-grown and well kept, fetch as much as any sort, and we must look back to 1889, when that severe frost spoiled so many Apples both native and imported, to find a bushel selling for 12s. after the winter was over, and when I marketed 869 bushels of winter kinds. But that is the sort of good luck which comes to one once in a lifetime. In March, 1895, Wellingtons were 8s.; to-day they are 4s., and very fine fruit indeed, but the fruit will not keep, it having been grown on cultivated land; those from orchards are stored for next spring. King of the Pippins is making 4s. 6d. per bushel now; in October last they were 5s. 6d.; and in November, 1893, 5s. Of course, there are carriage and commission to take off these prices, which cost

me ls. per bushel. Czar Plums last August were 8s. per bushel, Rivers', 9s. In fact, a glance at any market report will show the fallacy of the essayist's statements. *Mid Kent.*

Your correspondent, "D. T. F.," does well to call attention to need of further explanation as to these, as put forward in the Royal Horticultural Society's prize essay. Are the prices quoted averages? If so, how many years, and from what source received, open market, or from private shop or otherwise? I know that the top price for good Blenheim Orange Pippins, or King of the Pippins, offered by large buyers in this country, does not at present exceed £8 per ton; while quotations from markets away are from £7 to £10, the railway and market charges taking away from these £2 to £3 per ton, the net returns being at the rate of £5 to £8. Your average market quotations are also very much on the same scale. *Robt. Grindrod, The Gardens, Whitfeld, Herefordshire.*

MUSCAT OF ALEXANDRIA VINES AT PRESTON HALL, MAIDSTONE.—Amongst the many examples of good cultivation to be seen in the gardens at Preston Hall, is a vine of Muscat of Alexandria. This vine was planted in April, 1894, and the Vines were cut back in February of the present year. The canes are fully 26 feet long, short-jointed, and over 3 inches in circumference at 5 feet from the ground. The border is outside. These Vines afford promise of rendering a good account of themselves next season. Mr. Jarman, the able gardener at Preston Hall, intends replanting all of the vine-ries there by degrees; and should they all do as well as have the Muscats, the results should be quite extraordinary. *A. O.*

BARRON TESTIMONIAL FUND.—Residing, as will be seen at foot of this note, a considerable distance from London, and seldom going that way, I have not had the opportunity of seeing the work done at Chiswick, and am not in a position to give an opinion as to its merits. Judging, however, by the abundant testimony of those who have seen that work, both as expressed in your columns and in private correspondence, I am fully satisfied that, on the whole, it has been real solid work, and as such, deserves the praise of all horticulturists. Personally, I am of opinion that, as a rule, the best testimonial a man can have for any good work he has done, is the still small voice of conscience. No doubt there may be exceptions to this rule, as in the very excellent services Mr. Barron has rendered as Honorary Secretary to the Gardeners' Orphan Fund. Having had some little to do with suggesting the idea of such a fund in the early part of the Jubilee year of 1887, I shall gladly give my small mite to the Testimonial Fund now being got together on his behalf. At p. 51, vol. ii., of the *Gardeners' Chronicle* for 1887, you published a few notes from me bearing upon the fair start already made in establishing a Gardeners' Orphan Fund; as the following extract has some bearing on my point now, perhaps you will let me repeat it. "Amongst the many others who have given their time and experience to maturing plans for the future working of the fund and other organising work in connection therewith, I think that much is due to Mr. Barron of Chiswick for using so freely his great horticultural influence on its behalf. I can say this the more freely as I have not the honour of being personally acquainted with him, or but very slightly." As to the latter portion of this extract matters remain as they then were, we have not met since. Without in the least wishing to detract from the very excellent work done by the chairman, committee, and others, in connection therewith, I still think much is due to Mr. Barron for his services as hon. secretary. It is on this ground I venture to suggest to all interested in the good work of helping those who cannot help themselves, i.e., orphan children, to add their mite to Mr. Barron's testimonial fund. I say mite advisedly, as I take it the smallest sum will be acceptable as well as the larger ones—just according to the power of the contributor. *H. J. Clayton, Grimston Gardens, Tadcaster.*

BOUGAINVILLEA SANDERIANA.—I was interested on reading your correspondent, "R. D.'s," note on this plant in the issue of the *Gardeners' Chronicle* for October 19. That it is distinct from *B. glabra* I am willing to admit, but I was under the impression that it was much freer-flowering, but, unfortunately, with us it has not proved itself to be such. I shall be glad to know how this variety has behaved in this respect in other gardens. *E. Beckett, Elstree.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

OCTOBER 15.—Present: Dr. M. T. Masters (in the chair); Rev. W. Wilks, Mr. J. Weathers, and Rev. G. Henslow, Hon. Sec.

Injury to Foliage by Wind.—Mr. Ch. Plowright, of Lynn, sent photographs showing how trees, &c., were damaged on the north sides by a cold wind on May 16, with the following communication:—"After a spell of fine weather, lasting until May 14, we began to think our fruit crop was safe for the year; but on the 15th the temperature fell, and on the 16th we had a gale from the north, accompanied by one or two hail showers. The effect was seen in a Hawthorn hedge facing north and south, for the foliage was shrivelled up on the north side where it is dead, but remained bright green on the south side. Similarly, three or four Pear trees showed a remarkable appearance: the north side was quite black, not a leaf escape, while the opposite side did not seem to have suffered at all. A row of Elms showed graphically which way the wind had blown, and some fine old Beeches assumed on their north side quite an autumnal hue. The Horse-Chestnuts, from the size of their leaves, afforded very distinctive evidence of the injury they sustained, the foliage having turned a bright red. The above effects were general in this part of Norfolk; indeed, no tree which was exposed in the least seemed to have escaped. One of the most striking incidents is the Spruce Fir; at East Walton there is a row of these trees, whose young shoots have been killed by the cold wind on the north side, and hang like brown plumes at the end of the branches." Mr. Plowright does not allude to the probable effect of salt, but as a north wind at Lynn is entirely a sea wind, the disastrous effect to the foliage was probably chiefly due to the presence of salt spray.

Young Apple Fruit.—Mr. T. Eyre, of Thorpe Lea, Egham, forwarded a sample of a second crop of Apples, due to the prolonged high temperature. Raspberries and other fruits, as well as Laburnum, &c., in blossom, as the Secretary observed, have been recorded in Ealing and elsewhere this season.

Cattleya Mossie, with Double Growth.—Mr. W. C. Walker forwarded a photograph of an abnormal specimen with the following remarks:—"I enclose a photograph of *Cattleya Mossie* that has developed an unusual double growth. When it started after flowering it appeared little different from ordinary growth, but as it grew it formed the two distinct growths included in one green sheath at the base."

Aphides on Lettuces.—With regard to the aphides in the soil about the roots of Lettuces sent to the last meeting, Mr. G. B. Buckton of Weycombe, Haslemere, reports as follows:—"As the earth was loose the shaking during transit and the comparative drought killed the insects; but I secured fifty or more specimens. They were all pupæ of aphides, and I am satisfied that they are *Pemphigus lactoæ* (Passerini). This species is subterranean in its larval condition, and it attacks also *Soenhus* and *Melilotus*. On opening the box two winged flies escaped, one of which I secured, and it turned out to be a true *Pemphigus*. The pupæ are without nectaries, and almost if not quite blind. The winged female has moderate eyes, and black. A diagnosis of the insect will be found in *Aphidide Italica Passerini*, p. 77, 1865."

Monstrous Anemone japonica.—Rev. C. Wolley Dod sent specimens of the foliage with the following remark:—"Six years ago I noticed a shoot with crimped leaves, and separated it; next year, with ordinary soil and cultivation, it assumed this monstrous form. It has entirely lost the usual running habit, and does not increase." The leaves were enormous in size, evidently at the expense of the increase of the plant.

Supposed Spontaneous Hybrid Asters.—Mr. Dod also sent a flowering plant of a supposed hybrid between A. Thomsoni, Clarke, and A. omellus, Linn., remarking, "This came from seed collected in my own garden. It has now flowered for five years. It begins to flower early in July, and continues in flower till hard frost. It has never produced fertile seed. The other hybrid was between A. Thomsoni and A. pyrenaicus, D.C. A. Thomsoni produces good seed very sparingly, but one plant growing between two plants of A. pyrenaicus produces good seed plentifully. Some of these seeds produce typical A. Thomsoni, and often the nondescript plant sent. This is entirely sterile. I have raised many for two or three years in succession. They always have a white pappus to the achene, which A. Thomsoni never has."

Some Historic Cedars.—Rev. G. Henslow described two large Cedars (*Cedrus Libani*) in the garden of the Rectory at Bishop's Waltham, which, since their age is known, are perhaps worth recording. They were planted to commemorate the Battle of Waterloo. Both have lost some large boughs. One, indeed, has so greatly suffered in a storm, that nearly half the tree has gone. This one must also have lost its leader at a comparatively early date, as the main trunk now suddenly branches into five large erect minor trunks. It is 42 feet in height. The other has retained its leader, and is about 50 feet high; three of its larger boughs are gone. The girth of the trunk of the first at the parting of the roots is 17 feet. The girth at a height of 5 feet from the ground and just below the lowest bough is 15 feet. The girth of the lowest bough is 6 feet. This bough arises at a height of 5 feet from the ground. The girth of the trunk of the other at the parting of the roots is 17 feet. The girth of the trunk at a height of 5 feet from the ground is 14 feet. The girth of the base of the lowest bough is 5 feet 2 inches. This bough arises at a height of 1 foot 3 inches from the ground. A bough at a height of 4 feet

4 inches from the ground has been sawn off, revealing fifty-seven rings of growth. In all the boughs removed the eccentricity is remarkable; in one instance the centre is 4 inches from the upper surface, and 15 inches from the lower. The situation is high and the soil clay. Both trees are bearing cones.

Pear Diseased.—Mr. Veitch, of Exeter, forwarded a Pear attacked by a fungus. The latter had assumed a remarkable spiral growth round the fruit. It was sent to Kew for investigation.

Parsnip Diseased.—Mr. Reid, of Ealing, forwarded a portion of a Turnip-rooted Parsnip, with purple interior, apparently due to some fungus. It was also forwarded to Kew.

OCTOBER 29.—The meeting on Tuesday last in the Drill Hall, Westminster, was remarkable for a large display of Potatoes. These were chiefly in illustration of a very interesting lecture on the same subject, which Mr. A. W. Sutton delivered in the afternoon. Near upon fifty lantern slides, which had been prepared by Mr. Sutton in connection with the lecture, were greatly appreciated. Orchids were, as usual, exhibited before the committee, but were few in number. *Chrysanthemum* novelties were numerous, and a number of awards were made. The cold weather did not prevent the exhibition of a group of *Crotona*, and a few other house plants.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. J. Laing, H. B. May, H. Herbat, R. Dean, R. Owen, G. Stevens, J. Jenning, C. J. Farries, H. Briccoe Ironside, J. D. Pawle, C. E. Pearson, C. Blick, H. H. D'Ombrin, H. Cannell, and J. Barr.

In contrast with the usually pleasant duties of the committee, was the vote of condolence unanimously passed on this occasion to the widow and family of Mr. C. F. Bause, whose decease was reported in our issue of last week. Mr. Bause was a very much respected member of this committee.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, showed some clearly hybrid Begonias in bloom, obtained by crossing *B. socotrana* with a variety of the tuberous-rooted section. An Award of Merit was recommended to Success, a rosy-crimson-flowered variety, semi-double, greenish-yellow in the centre; the habit of growth much resembles *B. socotrana*. Eclipse, Sidonia, and Splendent are varieties differing from Success chiefly in the shade of colour in the flowers.

Messrs. R. WALLACE & CO., Colchester, exhibited half-a-dozen plants in flower of *Lycoris aurea*. Spikes about 14 inches long, bearing six or seven golden-yellow flowers about 1½ inches across. The leaves are developed after the plant has flowered. A very pretty species from China, introduced to this country more than a century since, but lost again to cultivation until a year or two ago (First-class Certificate).

Nerine Alleni, a seedling from *N. coruæa* major, crossed with *N. sarniensis*, was exhibited by Mr. R. H. ALLEN, Guernsey. The flowers are very closely placed on the scape, and are a good rosy-crimson in colour.

A collection of small *Crotona*, well-coloured, was exhibited by S. T. FISHER, Esq. (gr., Mr. G. Bond), amongst which were some useful and pretty plants for winter furnishing (Silver Banksian Medal).

Messrs. B. S. WILLIAMS & SONS, Upper Holloway, London, exhibited a plant of *Bouvardia* Silver King. The leaves are variegated with white margins, and the flowers are coral-red.

From Mr. ANTHONY WATERER, Knap Hill Nursery, Woking, came a plant from 20 to 30 feet high, of *Quercus americana* *coccinea splendens*, a very effective variety of the Scarlet Oak.

CHRYSANTHEMUMS.

Novelties in *Chrysanthemum* were numerous. Awards of Merit were made to Dorothy Gibson, a glorious true reflexed flower, of a deep shade of yellow, from Mr. R. OWEN, Maidenhead; and Rose Owen, an incurved flower of the Violet Tomlin type, but paler in colour, the prevailing tint being pale pinkish-rose, the petals, and especially those in the centre, tipped with white (R. OWEN). To Florence Luna, another finely-formed reflexed flower, of a clear bright mulberry shade, full, and shaped well; and Mrs. Briccoe-Ironside, a lovely flower, of a delicate creamy or silvery-blush tint, with lemon centre—a large, full, incurved Japanese, in the way of Edith Præss, quite a new colour, and extra fine, both from Mr. H. BRICCOE-IRONSIDE, Burgess Hill. To Edith Tabor, a large, very broad-petalled soft yellow Japanese, with drooping basal florets, and highly effective in a stand, from Mr. R. C. NOTCUTT, Ipswich. To Mrs. Charles Blick, another large white, broad-petalled, incurved Japanese, having a citron centre—vigorous grower, represented by a dozen plants on single stems, of quite dwarf growth, and each carrying a huge flower, exhibited by Mr. C. BLICK, The Gardens, The Warren, Hayes; to Beauty of Teigamouth, probably the most magnificent variety of a Japanese *Chrysanthemum* seen this season, the surface of the broad incurving florets bright crimson-samaranth, with silvery reverse; the florets not too much incurved to hide the brilliant surface colouring, very large and full. Last year, this was thought to be like Duke of York, but this season it has proved that it is quite distinct in character; from Mr. J. AGATE, nurseryman, Havant. To yellow Source d'Or, a pure pale yellow sport from this old and favourite decorative variety, the sport promising to be as popular for decorative and market purposes as the type, from Messrs. H. CANNELL & SONS. To incurved, Charles H. Curtis, a beautiful pale yellow, compact in form, full and

bright; to single-flowered Annie Holden, a pleasing sulphur sport from the well-known Mary Anderson; to Queen of the Buffs, bright buff, with a slight pale crimson surface to the petals, and very thin side edgings of the same, novel and distinct; and to Mrs. E. G. Whittle, very delicate sulphur-white, having large, broad, incurving florets, somewhat loose at the base, a variety which gained an award for its colour more than for its other merits, all from Mr. H. J. JONES, Lewisham; and to Mons. Chino de Lesche, a very large and massive flower, having broad florets, the surface tinted and striped with cerise, deepening to pale purple on the basal florets, the reverse deep gold, a very fine and distinct Japanese, from Mr. W. WELLS, Earlswood, Redhill.

Other notable new flowers were Maggie Shea, yellow, with a slight white tip to the florets; and Miss Elsie Teichmann, white, with sulphur centre, both very promising, from Mr. C. E. SHEA, Foots Cray. Charles Young, deep rose, with slight shading of violet; and Ada Fulford, an incurved variety, buff, the reverse gold, with slight lines of purple on some of the outer florets, both from Mr. R. OWEN. Mr. J. F. McLEOD, Dover House, Roehampton, had Japanese Belle Jeune, a clear yellow variety of medium size, like La Chirine. From Mr. W. E. TIDY, Havant, came Duke of Connaught, a large yellow incurved Japanese, the basal petals somewhat drooping, in the way of W. H. Lincoln; Mr. T. G. Foster, deep yellow, of a fine depth of colour; and Zelandia, a large, broad-petalled, fully incurved Japanese, of the Queen type. Mr. RICKWOOD, Fulwell Park, Twickenham, had Japanese Fulwell Park, the florets white and yellow, with slight stripes of pale purple. From Mr. GEO. STEVENS, Putney, came incurved Madame F. Minstral, pale rosy-purple, and golden centre. Mr. H. J. JONES had incurved James Murray, very like Princess of Wales; and D. B. Crane, incurved, not in such good character as when shown at the Royal Aquarium. Mr. H. CANNELL had plants of Kentish White, a very promising incurving white Japanese, with pale yellow centre, dwarf in growth, and highly promising.

Messrs. VEITCH & SONS, Exotic Nurseries, Chelsea, had a fine and attractive group of plants, some of them bearing remarkably good flowers, the most noticeable being Louise D. Black, Warrior, Palanza, Louise, Madame Calvat, Mutual Friend, M. George Biron, G. W. Childs, and other leading varieties (Silver Flora Medal).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Secretary), T. B. Haywood, Sydney Courtauld, W. Cobb, T. Statler, T. W. Bond, E. Hill, H. J. Chapman, J. Gabriel, H. Billantine, and H. M. Pollett.

Despite the cold weather, there was a nice show of Orchids, though fewer groups than usual were staged. Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, sent some pretty and interesting hybrid Orchids. Of them *Laelio-Cattleya* × *Euphrosyne* (C. Warszewiczii × L. *pumila* *Dryana* ♀), was a plant of dwarf habit, with a very large and well-formed flower, with sepals and petals of a light rose colour and narrow yellowish margins, and bright purple lip, with a lilac tip and primrose-yellow disc (Award of Merit); *Cattleya* × *Enrydice* (Aucklandiae × *labiata* ♀), a very charming novelty, with the colours of *Cattleya amethystoglossa*, and the size and somewhat the form of C. Walkeriana nobilior. The very dwarf plant bore a wax-like flower, with ovate sepals and petals of a pinkish-lavender hue, bearing a few purple spots; the lip being rich crimson on the broad, flat, front lobe, and tips of the side lobes; the base bluish-white, and the disc yellow. Their beautiful *Cattleya* × *Mantini*, two varieties of which were now exhibited, as on the former occasion (October 15), now secured a First-class Certificate. Messrs. VEITCH also showed *Laelio-Cattleya* × *Statteriana*, a beautiful hybrid of L. Perrinii and C. *labiata*; and two hybrid *Cypripediums*.

Mons. GEORGES MANTIN, Château de Bel Air, Olivet, Loiret, France, after whom the *Cattleya Mantini* (C. *Dowiana* × *Bowringiana*) was named, sent a grand plant of it, with a noble inflorescence of rich rosy-purple flowers, with orange centre and maroon-crimson front to the lip. It was said to differ from the original, and in consequence was named C. × *Mantini colorata*, but seeing that the three which Messrs. VEITCH exhibited also differed from it and from each other—one of Messrs. VEITCH's being brighter in colour than Mr. MANTIN's—it was decided to award the Certificate as to the type, and as such it received a First-Class Certificate.

Sir TREVOR LAWRENCE, Bart., Burford, Dorset (gr., Mr. W. H. White), showed *Houlletia tigrina*, an old but extremely rare species with decumbent inflorescence of large flowers, which were French-white freckled with rose; the lip ivory-white with crimson spots. A most singular and handsome species (Botanical Certificate).

THOS. STATLER, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed a very interesting group of rare Orchid blooms, for which a Silver Flora Medal was awarded. The most remarkable was *Cattleya aurea* Johnsoniana, with light buff sepals and petals, marbled with rosy-lilac, and a very beautiful and ample dark velvety crimson lip with gold veining. It comes nearest to the fine C. *aurea marmorata* which received a First-class Certificate from the Right Hon. Lord Rothschild's collection; and Mr. STATLER received a similar award. In the group also were six other grand forms of *Cattleya aurea*, some very handsome C. *labiata*, including C. L. excelsior, with flowers prettily flaked with purple, *Cypripedium* × *Edwardii*, and the pallid, green-tinted C. *Spicerianum* *viridescens*.

Messrs. HUGH LOW & Co., Clapton, were also awarded a Silver Flora Medal for a very bright and effective group of

Orchids, in which fine varieties of *Cattleya labiata* figured conspicuously. The remarkably handsome *Cypripedium insigne*, var. *Laura* Kimball, with clear yellow unspotted flowers bearing a broad band of pure white on the dorsal sepal, was also shown, and received an Award of Merit. It is of the C. i. *Sanderæ* class, and differs in having the yellow of a darker tint and in some other respects. Also in Messrs. LOW's group were *Cypripedium* Charlesworthii unicolor, a small but uniformly rose-tinted form; a very distinct form of *Oncidium hæmatochilum*, O. *ornithorhynchum album*, O. *varicosum*, and various other showy species.

Messrs. F. SANDER & Co., St. Albans, staged a group of Orchids, in which were the finest and richest-coloured forms of *Cattleya labiata* yet exhibited, the handsome rose-pink and cream-white *Calanthe* × *Florence*, and the pretty C. × *Clive*, *Catatum Christyanum*, *Lælia pumila marginata*, a fine pan of the stately white *Habenaria Suzanne*, some pretty specimens of *Sophranitis grandiflora*, *Zygopetalum crinitum*, *Cattleyss*, *Cypripediums*, &c.

R. I. MEASURES, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), exhibited *Cypripedium Allenanum superbum* (Curtisii × *Spicerianum*), a very large white flower tinged with brownish-rose, and certainly a very striking variety (Award of Merit). *Cattleya labiata*, R. I. Measures' variety, a most charming pure white flower with delicate pink veining on the lip, and which had been previously Certificated; *Cypripedium* × *Zeno* (callosum × *ciliolare*), C. × *Arthurianum*, C. × *Chas. Richman*, C. *insigne* Cambridge Lodge var., C. × *Leeanum superbum*, *Cattleya* × *Hardyana*, &c. A Silver Banksian Medal was awarded.

FRED HARDY, Esq., Tynesfield, Ashton-on-Mersey (gr., Mr. T. Stafford), showed *Cattleya Bowringiana gigantea*, a very finely-coloured and extraordinarily-large form (Award of Merit); the handsome white *Cattleya labiata* Cooksoniae, *Cattleya* × *Harrisii* (Leopoldii × *Mendeli*), a very beautiful soft rose, wax-like flower; and a very fine lot of cut spikes of some splendid varieties of *Cattleya labiata*, &c. (Silver Banksian Medal).

GEO. C. RAPHAEL, Esq., Castle Hill, Englefield Green (gr., Mr. Adams), showed *Cattleya labiata*, Raphael's var., with brilliantly-coloured flowers of fine form; *Vanda cœrules*, Raphael's var.; a fine spike of almost circular, pale blue flowers, netted with violet, and with violet lip; and the rare and pretty *Zygopetalum Burkei*.

Messrs. W. L. LEWIS & Co., Southgate, showed a small collection of Orchid blooms, in which were *Cattleya labiata* in several good examples, *Oncidium varicosum*, O. *pratense*, *Cypripedium insigne* Maulei, &c. Mons. TRUFFAUT, Rue des Chantiers, Versailles, sent *Laelio-Cattleya* × *Andrea* (bicolor × *elegans*), of slender growth, and resembling a small L.-C. *elegans*, but with ovate, slightly recurved purple front lobe to the lip. REGINALD YOUNG, Esq., Sefton Park, Liverpool (gr., Mr. Poyntz), sent *Cattleya labiata* Youngianum, *Cypripedium* × *Clotho* (politum × *Boxallii atratum*), and *Lælia pumila*.

WALTER C. CLARK, Esq., Sefton Park, Liverpool, sent varieties of *Cypripedium insigne* and *Cypripedium* × (villosum × *Leeanum superbum*). WILBERFORCE BRYANT, Esq., Stoke Park, Slough (gr., Mr. D. Kemp), sent a grand inflorescence of *Cattleya labiata*, Stoke Park variety, very fine in colour.

Frutic Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. S. T. Wright, J. Cheal, J. H. Veitch, H. Pearson, W. Pope, A. H. Pearson, G. Bunyard, J. Wright, A. Dean, C. Herrin, W. Bates, G. T. Miles, F. Q. Lane, H. Balderson, G. Reynolds, R. Fife, and J. Hudson.

An interesting exhibit of Vine leaves, naturally tinted with autumn colours, and displayed on stretched white canvas, was made by Messrs. D. & W. BUCHANAN, Forth Vineyards, Kippen, who grow them for commercial purposes; very fine Grapes, Gros Colmar and Alnwick Seedling; also clusters of fruits of Tomato, Forth Vineyard Selected, were exhibited. The produce had been grown by the use of Thomson's Vine and Plant Manure (Silver Banksian Medal).

An interesting and very commendable collection of vegetables was made by Mrs. WINGFIELD, Amptill (gr., Mr. Empson). The twenty varieties included a large number of Gourds, Marrows, and two Pumpkins, Leeks, Carrots, Tomatoes, Celery, Cauliflowers, Cabbages, Onions, &c., were very well represented. Some fine heads of Sutton's Cardoon were included, and some purple Kohl Rabi, &c. (Silver-Gilt Knightian Medal).

Mr. Geo. Wythes, gr. to Earl PEFOY, Syon House, Brentford, exhibited a collection of salads in twenty-four varieties. We noticed the Turnip-rooted Celery was included, besides a bunch of the same shown separately (Silver Banksian Medal).

Mr. ROBT. FENN, Sulhamstead, showed a dish of Cox's Orange Pippin Apple, and some fruit of his green culinary Apple, called Pay-the-Rent; the latter is a medium-sized fruit, of good appearance, and keeps well. This was recommended an Award of Merit.

Some fruits of a good-looking kitchen Apple (Continental) named Sanspareil were exhibited by Mr. ANTHONY WATERER, Knap Hill Nurseries, Woking.

Seedling Melons were again shown by Mrs. WINGFIELD, Amptill (gr., Mr. Empson). One of these, Anthony's Favourite, a scarlet-fleshed variety, of very good flavour, received an Award of Merit. Mr. OWEN THOMAS, Royal Gardens, Windsor, sent a fruit of a pretty Melon named Frogmore, which the Committee desired to see again; and fruits of his white fleshed Melon, The Duchess.

The only collection of fruits on this occasion was one exhibited by Mr. WYTHES, embracing seventy-six varieties of Apples and Pears, very commendable in quality, as grown so near the Metropolis (Silver Banksian Medal).

Three large dishes of large excellently-coloured fruits of Gascoigne's Scarlet Seeding Apple from Mr. CHAS. E. SHEA, Foots Cray, Kent, appropriately received the Cultural Commendation of the Committee.

Messrs. SUTTON & SONS, of Reading, and Messrs. H. CANNELL & SONS, Swanley, staged large and most interesting collections of Potatos. The former had representatives of their own raising, including some very handsome seedlings, and further representative tubers of a few species, as also of the quaint Fir-apple section. Messrs. CANNELL & SONS sent anybody's varieties they may grow for trade purposes, under ordinary field culture, the whites being separated from the coloured varieties. Of the beautiful Reading collection, comprising sixty dishes, there were Kingleader, field-grown Ashleaf, Early Border, Magnum Bonum, Triumph, Windsor Castle, Matchless, Sutton's A.1, and others that are now so universally identified with the name of Sutton. All these samples were very clean and handsome. The Fir-apple section, so named because of the similarity of portions of the tubers to Fir-cones, having myriads of deep eyes, and yet so nice for slicing and frying, were represented by the red, white, and purple-flushed varieties. The Almond Potato has small white and kidney-shaped tubers. The species were represented by tubers of *Solanum Maglia*, small-coloured; also of *S. tuberosum*, red round, but yet larger than were the white round tubers of *S. tuberosum*. This is probably but a white form of *tuberosum*, as it seems to differ chiefly in colour. This collection was awarded a Silver Knightian Medal.

Messrs. CANNELL & SONS' collection, if showing less handsome tubers, at least allowed the varieties to show average character under field production thoroughly. The white flat round Come-to-Stay, was in fine form, and handsome. This seems to be a first-rate variety. Others of kidney form were Cannell's Victory, Future Fame, The Canon, Chancellor, Col. Long, Lily White, Snowdrop, Maincrop, Welford Park, and National; and of rounds, Satisfaction, Progress, Schoolmaster, Paul's White Round, Prodigious. Best of All, M.P., Abundance, &c. Of coloured rounds, The Dean, Vicar of Lisleham, Purple Perfection, Pink Perfection, Lord Tennyson, Reading Russet, &c.; and of coloured kidneys, Early Vermont, Mr. Breese, Edgata Purple, Field Marshal (very red), Blue Giant, Prize-taker, &c. The collection comprised 100 varieties, and was of exceeding interest, well meriting the Silver Medal awarded.

Mr. ROBERT FENN, Sulhamstead, showed a box in partitions, in which were small tubers of *Solanum Fendleri*, of American origin; also tubers, the product of a cross between the species and a white seedling, Antagomot. Then other and larger tubers, the result of a second cross between the product of this later cross, and pollen of the Rector of Woodstock. These tubers grown a second year will doubtless give a fine and apparently a handsome sample. A cordial Vote of Thanks was awarded by the committee.

Lecture on Potatos.

In the afternoon was read a lecture on Potatos, by Mr. A. W. Sutton of Reading, whose remarks were rendered doubly interesting by a large number of lantern views, which Messrs. Newton had prepared from photographs taken specially for this lecture. The first portion of Mr. Sutton's lecture was devoted to a review of the historical data connected with the tuber, which included the reading of extracts from Gerarde, and from Loudon's *Encyclopædia*, and other authorities. Mr. Sutton declared that every section of the subject of the Potato had been dealt with on previous occasions, and his task was a very difficult one, for but little that was new could be said, either in regard to the botanical characteristics of *Solanums*, or the culture of the Potato itself.

Then there was the increasingly-important question of disease prevention, which can be treated from at least two chief starting points, either with the object of simplifying and extending the French system of spraying the crops when growing with the Bordeaux Mixture known as "Bouillie Bordelaise," or of dusting the plant with the same compound in the form of powder, and thereby saving from disease the sorts of Potatos already largely grown; or, on the other hand, of introducing to the public novel varieties obtained by cross-fertilisation which may have proved themselves able to withstand the ravages of the dreaded fungus.

"On all topics, except the last," said Mr. Sutton, "so much has been said already, that I felt I could not hope to interest you with any additional remarks of my own; but as I have long been identified with the raising and introduction of seedling Potatos. I thought it possible that I might succeed in popularising this branch of study, especially if aided by the lantern views which Messrs. Newton have made for me from photographs taken specially for this lecture."

The first picture on the screen was a portrait of Gerarde, which appeared in the frontispiece of his well-known *Herbal*, where Gerarde holds a spray of the Potato plant with flowers and berries, he evidently thinking the Potato one of the most important and valuable plants of those so ably described in the *Herbal*. Photographs taken from Gerarde's engraving of the Potato plant on p. 927 of his work were next given, which, no doubt, represent the Potato as grown in his garden. These were followed by the reading of Gerarde's quaint description of the plant and its uses.

Mr. Sutton went on to say, "This picture suggests many thoughts and comparisons. How little have the fine, handsome, and even tubers we see at the time for sale at all the greengrocers in London and elsewhere!

"Then also the use of the Potato in Gerarde's time by the wealthy few as a luxury of questionable value or utility, how different to the present enormous consumption in all civilised parts of the world!

"While Gerarde's Potato is before us, it may be interesting to note that the acreage planted in the United Kingdom in 1894

amounted to 1,252,655 acres [this year it is 1,262,765 acres, vide agricultural returns in *Times* of October 29], averaging 3 tons 15 cwt. 2 qrs. 20 lb. per acre, or a total of 4,652,147 tons grown in the United Kingdom, besides a large quantity imported (for 1893 the figures were 14,140 tons). Reckoning the entire population as 37,880,754, this would allow about 2 cwt. 1 qr. 24 lb. for every man, woman, and child per annum, but these figures make no allowance for the quantity annually consumed in feeding cattle, which is always considerable, and varies chiefly in proportion to the market value of Potatoes.

"My friend Monsieur H. de Vilmorin, has very kindly sent me the figures for France, and he tells me that the acreage under cultivation is annually about 3,842,500, and the total yield for the whole of France is 10,100,000 tons, or making allowance for the quantity exported and imported, the figures stand at 10,000,000 tons. Whilst in England, Potatoes are grown almost entirely for use as a vegetable. Monsieur Vilmorin estimates that about two-fifths or 4,000,000 tons are annually used in France in the manufacture of starch and alcohol.

"I have also learned from my friend Herr Fritz Benary, of Erfurt, who forwards me very valuable statistics, that the total acreage devoted to Potatoes in the German Empire in 1893 was 7,892,165 acres, and the total quantity of Potatoes harvested amounted to 32,277,851 tons, or allowing for the quantities imported and exported, 32,575,497 tons, which was the total quantity available.

IMPROVEMENT AND DETERIORATION.

"I think that it would be interesting now to trace the steps by which the great improvement in the cultivated forms of the Potato has been brought about. And here it is necessary to refer to a misunderstanding arising from the fact that 'Seed Potatoes' and 'Potato Seed' are often supposed to be one and the same thing. Seed Potatoes may be either a crop of Potatoes grown with the special object of producing tubers to plant again the following year, or else, as is frequently the case, they are merely the smaller tubers, which, being too small for market, are therefore kept back for planting. Now, it is well-known that Potatoes are merely the enlargement of underground stems, shortened and thickened, in which starch is stored up in greater or less proportion according to the several varieties. Like other stems, the tubers produce buds or eyes, and are capable of re-development by fresh shoots at the axil of the leaves, which in the case of underground stems are replaced by simple scales scarcely visible.

"Although they may be kept through the winter, and planted again the next spring, they are in no respect anything more or less than portions of the old plant which had died down and apparently ceased to exist the previous autumn; consequently, while through the almost unlimited prolongation of the life of a single Potato-plant weakness and deterioration often set in, there is practically no room for improving the original type by any selection of tubers. This anyone can prove by planting a tuber which may from some cause or other be mis-shapen, and the produce will be found to revert to the same handsome and uniform type as the other Potatoes which were growing on the same plant. The only modification of this rule I am acquainted with, is in the cases where all the tubers of one plant show a uniform divergence in character, either for better or worse. When this is so, it is possible that, by the selection of all or any of these tubers, a slightly different Potato might result, as in the case of some types of the Ashleaf section which are dwarfier and more compact, or else taller and coarser-growing than others. Outside the Ashleaf class, however, I know of no such instances.

"In reference to this point, Monsieur Vilmorin mentions he does not consider a really first-class seedling Potato is liable to degenerate so quickly as is generally supposed. If degeneration sets in soon after its introduction, it merely proves that the variety is one which never ought to have been brought to public notice.

"Potato seed, on the other hand, is totally distinct in every way, being the seeds formed in the Potato berries which some, though not all, varieties of Potatoes bear so freely."

Views were then shown of some of the berries in their natural condition, and also cut to show the arrangement of the seeds within the berries. "A berry," said Mr. Sutton, "may contain from 100 to 300 seeds—the average of five berries examined being 232!—and as the parent plant appears able to control but slightly the distinctive character of its progeny, and as all the different seedlings from one Potato berry may produce plants differing from one another, not only in form but many of them in colour also, it is here we find the great possibilities for improving the race by selection of the better seedlings. Even if no cross-fertilisation of flowers was attempted, great improvement might be made by the selection of the most promising seedlings during the first few years of their existence; but where judicious crossing of the best known varieties is undertaken, we can in a great measure combine in some of the resulting seedlings the merits of both male and female parent, although, even then, no two seedlings from the same berry may be exactly alike.

SEED AND SEEDLINGS.

"Anyone attempting to raise seedling Potatoes must have abundance of patience. Like many other species which are not habitually multiplied by the seed, the Potato has a remarkable tendency to revert to the wild form. It may be necessary to cultivate 100 or even 1000 seedlings before finding one which is really worthy of a place amongst the better varieties already existing. Mons. Vilmorin says that in France the raising of seed Potatoes has been proceeded with in a somewhat haphazard manner; whereas in England, on the other hand, a more systematic method has been followed, mentioning that richness in starch, excellence of flavour, power of resist-

ing disease, with little tendency to develop haulm, are the characters we generally seek. Unfortunately, he says, they are not always able to profit in France by progress realised in England, because the French have a marked preference for Potatoes with yellow flesh; whereas in England, for many years past, there has been a preference for white-fleshed Potatoes. On this account even the celebrated Magnum Bonum, which my house had the honour of introducing in 1878, after having enjoyed a brief popularity in the Paris markets, has been almost abandoned as a table variety on account of the flesh being too pale in colour. Mons. Vilmorin remarks that in Germany considerable attention has been given to raising seed Potatoes, but more particularly with the object of raising varieties which are specially adapted for the production of alcohol and starch."

The next three views represented the pistil, after the anthers had been removed, to prevent self-fertilisation, then the arrangement of anthers around the stigmas, both closed and expanded, and then the inner surface of three anthers and their pollen.

SPECIES AND VARIETIES.

A Potato Seedling at the end of the second year, and another at the end of the fourth year, were next illustrated, after which Mr. Sutton had a picture of *Solanum tuberosum*, but remarked that "he had not noticed anything in this Potato either denoting that it was deserving of cultivation on its own account, or for crossing with the ordinary *Solanum tuberosum*, which it seems so nearly to resemble."

The "Papa Amarilla" was then shown. This is much grown in Peru, but Mr. Sutton after carefully growing the variety for eight years, is of opinion that it is of no use in this country.

Representations were then given of a variety found growing in South Africa, which after being grown at Reading for seven years, Mr. Sutton describes as distinct from all Potatoes, and as being free from disease until 1894, when it suffered badly. Another one found growing in the Rocky Mountains, almost the counterpart of the large white Fir-apple Potato, very much diseased in 1894, and the red and white Fir-apple varieties.

Other interesting representations followed, including the Black Congo Potato, the dense purple of which renders it useful for ornamental cookery.

Another variety, grown much in Norway. It has been considered valuable for the supply of so-called new Potatoes throughout the year. The tubers are seldom larger than an Almond, and by lifting the crop before it is quite ripe, the close texture peculiar to new Potatoes is retained indefinitely.

Slides 22, 23, and 24 represented plants taken from Messrs. Sutton's trial-grounds. Owing to an injury to the stem, the plants were unable to produce tubers below the surface of the ground, and did their utmost to make up for this failure by a vigorous attempt at tuberation from the axils of the leaves.

Other pictures represented a spray of *Solanum nigrum* and berries of the Bitter-sweet (*Solanum dulcissimum*), and the deadly Nightshade (*Atropa Belladonna*). "There were 700 *Solanums*," said Mr. Sutton, "of which only six kinds were tuberous-bearing."

Slide 25 represented flowers and foliage of *Solanum Maglia*, of which Mr. Sutton proceeded to say:—"Chiefly on account of the fact that the dreaded Potato fungus produces most havoc in damp, wet seasons, it has been very much hoped by Lord Cathcart that if hybrid seedlings could be obtained between the *Solanum Maglia* (whose habit was that of low-lying marshy places near the coast of the Islands of the Chonos Archipelago) and the *Solanum tuberosum*, which most writers consider a native of the higher slopes of the Andes, a new race of Potatoes might be secured which would resist disease; but here I may say, in parenthesis, it is not at all impossible that *Solanum tuberosum* may have had its origin as a littoral plant rather than a species of elevated or mountainous regions, which thought is strengthened by the fact that Potatoes flourish so amazingly on the warp-lands of our eastern seaboard. Although many hundred flowers of *Solanum Maglia* were artificially fertilised with pollen from cultivated varieties only five were successful, resulting in five seed-berries, and out of these seed-berries only two seedlings were secured, and only one of these showed any promise whatever, the second requiring to be grown under glass to prevent its dying away."

"Slide 29 shows the tubers of *Solanum Maglia*, and I regret to say that last year, in 1894, the crop was almost entirely destroyed by disease out-of-doors, some indoors being free.

"Slide 30 shows the hybrid seedling just referred to, which, although a vast improvement on the *Solanum Maglia*, is very far behind the ordinary cultivated Potato both in appearance, crop, and qualities. This seedling has now been grown for eight years, and in 1894 the crop was slightly diseased; previously it had almost escaped."

"The next few slides illustrate some of the highest types of seedling Potatoes which my house has had the honour of introducing to the public, the crosses having been made in the majority of cases by the late Mr. Clarke, so well-known as the raiser of Sutton's Magnum Bonum Potato, and two by Mr. Robert Fenn, one of the oldest and best authorities living on the artificial crossing of Potatoes. They are A 1 Potato, Harbinger, Ringleader, Windsor Castle, Supreme, Early Regent, Triumph, Satisfaction, Satisfaction Potato as lifted, Magnum Bonum, Flourball. I must not conclude without referring to the use of the Bouillie Bordelaise as an application for preventing Potato disease."

DISEASE AND SPRAYING.

"Slide No. 42 shows two plots of Sutton's Magnum Bonum Potato growing side by side during the past season, that on the left hand side having been sprayed three times and that on the

right hand not having been sprayed at all. It will be seen that the result was very marked, enabling the plants where sprayed to continue in growth some time after the unsprayed portion had died down, and the weights of the two plots when lifted were as follows:—The sprayed, 3 cwt. 1 qr. 25 lb., and the unsprayed 3 cwt. 1 qr. 4 lb. Strange to say, the quantity of diseased tubers was precisely the same in both plots, viz., 4 lb. The question really remains whether the additional weight per acre would compensate the grower for the somewhat laborious task of spraying his crop three times during the growing period.

"In a most elaborate series of experiments I have conducted this year in conjunction with Prof. Gilchrist of the University Extension College, Reading, we have found that in the first and second early varieties there is no advantage from spraying, as these had finished their growth before any disease could attack the plants, and the dressing did not lengthen appreciably the period of growth. Undoubtedly in some sorts which are peculiarly liable to disease, especially when grown in gardens, a judicious application of the Bouillie Bordelaise would secure even in bad disease years a crop of sound Potatoes."

[GRAFTING THE TOMATO AND POTATO.]

Mr. Sutton then referred to some interesting experiments in grafting the Tomato, and the next few slides represented (1), a bunch of Tomato flowers; (2), bunch of Tomato flowers and berries greatly resembling Potato flowers and berries; (3), a photo of the Tomato plant by Gerarde in 1597. This was followed by a quotation from Gerarde.

Mr. Sutton then proceeded:—"Slide 45 represents our Tomato and Potato graft. One tuber was planted in each pot on March 22, and when about 4 to 5 inches high the plant was cut off half an inch from the level of the soil, and a graft of a Tomato plant introduced on May 8. The result of this has been that the Potato, nourished by the Tomato plant above-ground, has produced a crop of Potatoes in the pot, as will be seen in the picture; and also the Tomato plant above-ground has produced a fairly good crop of Tomatoes, nourished by the Potato roots in the pot."

"Slide 47 is the same process reversed. The Tomato plant was cut off half an inch above the surface, and the Potato graft introduced. The Tomato roots have not, of course, produced Potatoes, but the Potato plant above ground produced one truss of flowers and seven berries; and in order to extend this somewhat interesting experiment, the Tomato flowers have been fertilised with Potato pollen, and the Potato flowers with Tomato pollen for further experiment next year. These photographs were taken on August 14; but on looking at the plants recently, it was found that two of the Potatoes growing on Tomato stalks appeared suddenly to be aware of the fact that, although producing flowers and berries, they had not yet produced tubers, and it being 'never too late to mend,' they have, as you will see in slides 43 and 49, produced tubers from the axils of the leaves and stems."

Some discussion afterwards took place;

NATIONAL CHRYSANTHEMUM.

OCTOBER 23.—The Floral Committee of the above Society met at the Royal Aquarium on the above date, under the presidency of Mr. Thomas Bevan, a considerable number of novelties being staged. So plentiful, indeed, have new productions become, and so much alike are many in general character to varieties already in cultivation, that the Society does well to be sparing with certificates, which are given only to varieties of decided promise after their claims are well considered.

On this occasion First-class Certificates were awarded to Edith Tabor, a highly-promising clear pale yellow Japanese, reflexed like Sunflower, having long basal florets, from Mr. R. C. NOTCUTT, Ipswich; to Mrs. Charles Blick, a large pure white, the florets narrow, and slightly grooved, from Mr. C. BLICK, The Gardens, The Warren, Hayes; to Dorothy Seward, the surface of the petals bright reddish-chestnut, with an amber reverse, very attractive and bright in colour; to Mrs. J. Shrimpton, of a very pleasing orange-amber shade, here and there streaked with reddish-crimson—novel and distinct; and to John Seward, clear medium yellow, large and full, the florets long and drooping, and somewhat broad; the three foregoing were from Mr. WILLIAM SEWARD, The Firs, Hanwell, the raiser of several fine varieties. To Lady Byron, a large white Japanese of considerable substance, said to have come from a cross between Puritan and Mrs. Alpheus Hardy, from Mr. H. WHEAT, Thrumpton Hall, Derby; to Pompon Piccinino, one of a batch of charming varieties raised by Mr. H. BRISQOZ ISONADE, Burgess Hill—bright rosy lilac in colour, fine in shape, small, compact, and very pleasing; to single, Miss Annie Holden, a sulphur-coloured sport from Mary Anderson, which is white, and which appears to have all the good qualities of the latter, from Messrs. H. CANNELL & SONS, Swanley; to Japanese, Ethel Addison, a broad-petalled flower, bright rosy violet in colour, with a silvery reverse, very promising; Emily Spilsbury, a large and full white reflexed Japanese, of excellent form and pure in colour, and incurved; D. B. Crane, colour deep gold, a flower of full substance, and very handsomely incurved, all from Mr. H. J. JONES, Bycroft Nursery, Lewisham; to Japanese, Mutual Friend, a bold and massive broad-petalled white variety, with long curling florets deeply grooved, extra fine, from Mr. E. BECKETT, The Gardens, Aldenham House, Elstree, and to Dorothy Gibson, a beautiful bright deep yellow reflexed flower of exquisite symmetry, and a valuable addition to its class, from Mr. R. OWEN, nurseryman, Maidenhead.

In Mr. R. IRONSIDE'S collection of novelties were Japanese Milano, orange and reddish-cerise, with a golden reverse, having a rare metallic lustre, very promising; and incurved Castagnola, bronzy chestnut, also very promising. Japanese Mons. George Biron, pale chestnut, with a silvery reverse; and Beauty of Teignmouth, an American variety, vivid vermilion-crimson, with silvery reverse and massive petals, both from Mr. W. J. GODFREY, Exmouth, are also very promising.

Japanese Pride of Madford, from Messrs. H. CANNELL & SONS, the committee wished to see again; and they also had in very fine character Globe d'Or, a new incurved flower, certificated last year. Japanese Moos, B. Girond and Moos, G. Montigny did not succeed in obtaining awards, though much flattered by some. Japanese Mdle. A. de Galbert, a large white, from Mr. H. SHOESMITH, Woking; and Japanese C. B. Haywood, from T. B. HAYWOOD, Esq., Woodhatch, the committee wished to see again.

OCTOBER 28.—A meeting of the General Committee was held at Anderson's Hotel on the above date, Mr. B. Wynne presiding. The Secretary reported the amount of prize-money awarded at the October show, all of which had been paid; and the awards of medals by the Arbitration Committee to miscellaneous collections was also approved.

Complaints having been made as to the imperfect lighting of the Royal Aquarium on show days, the Secretary was instructed to address a strong and urgent remonstrance to the Directors in favour of an earlier lighting-up, and a greater volume of light, members having complained of their inability to satisfactorily examine the flowers during the afternoon. An interim cash statement of a very satisfactory character was made by the Secretary, who also gave an interim Jubilee report of an encouraging character, the Secretary being instructed to issue the preliminary schedule of prizes. It was resolved that, following the practice observed in the case of the Centenary Celebration in 1890, a Bronze Jubilee Medal should be given to every Society in affiliation with the National Chrysanthemum Society during 1895. The Secretary reported that the annual dinner would take place at Anderson's Hotel on Wednesday, November 27, the President, Sir Edwin Saunders, in the chair. Twenty-five members were elected, including two Fellows, the number who have joined since the beginning of the year being nearly one hundred.

SHIRLEY AND SURROUNDING DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.

OCTOBER 25 AND 28.—Two meetings, held under the auspices of the Hants County Council, were held on the above dates, Mr. E. Molyneux, of Swannore Park Gardens, addressing each meeting.

The first was held at Highfield, Southampton, and the subject was "Hardy Fruit Culture for Cottage Gardens and Allotments." There was a very creditable display of fruit, and the lecture was of a most instructive nature, all the principal points, such as planting, training, grafting, and pruning being fully explained.

The meeting on the 28th was at Nurling, Southampton, and the "Cultivation of Fruits and Vegetables for exhibition, with Hints on Packing for Transit," was the subject of a very able address.

The varieties of vegetables and fruits most desirable for exhibition, and the character of the specimens most likely to win prizes, were given. The largest specimens in many cases do not obtain prizes at shows, and the lecturer endeavoured to impress on the minds of his audience that something more than mere size should be aimed at to ensure success. There was quite a show at this meeting of high-class fruit and vegetables, made entirely by the gardeners in the locality, and there was also a good attendance. Hearty votes of thanks were accorded Mr. Molyneux at the close of each meeting.

FRUIT EXHIBITION IN DARLINGTON.

OCTOBER 24 AND 25.—This exhibition, in connection with the Gardeners' Institute, was held in the Mechanics' Institute, on the above dates. It is seldom that fruit attains such perfection in Durham and North Yorkshire as it has done this season, and the specimens exhibited by local growers, both for size and colour, were such that might have made the growers in the southern counties envious.

Specimens of such varieties of Apples as Warner's King, Bismarck, and Peasgood's Nonsuch were exhibited up to 13 oz. in weight; while the bright colours of Mère de Ménage, Baumann's Red Reimette, Reimette du Canada, Scarlet Pearmain, &c., drew forth exclamations of admiration and wonder from all who saw them, many expressing themselves surprised that such splendid specimens could be grown so far north.

In the Pear section, Pittaston Duchess figured most prominently, but there were also some very good specimens of Bergamot d'Espèren, Beurré Diel, Louise Bonne of Jersey, Durondeau, Catillac, Doyenné du Comice, Beurré Clairgeau, Beurré Bachelier, Vicar of Wakefield, Chaumontel, &c.

The nursery trade was well represented by Messrs. KENT & BRYDON, Darlington, BACKHOUSE & SON, York, and T. RIVERS & SON Sawbridgeworth, all of whom staged large collections, and their exhibits were of a most meritorious character.

The varieties most noticeable in KENT & BRYDON'S collection were, Stirling Castle, Cellini, Lord Lennox (of exceptionally high colour), Cox's Pomona, Bismarck, Pott's Seedling, Hawthornden, Brownlee's Russet, and Cox's Orange Pippin. In BACKHOUSE & SON'S, Peasgood's Nonsuch Greenup's Pippin, Rose Hill, Annie Elizabeth, Lady Henniker, and Winter Queening. In RIVERS & SON'S, Wadhurst Pippin, Pitmaston Pine, Mère de Ménage, and Nelson Codlin Apples.

The other exhibitors were Mr. WM. SMITH, North Rise, Darlington; Mr. J. MCINDOE, Hatton Hall Gardens; Mr. Temple, gr. to Sir DAVID DALE, West Lodge, Darlington; Mr. H. Y. JOHNSON, Elm Ridge (gr. Mr W C Barrod), Darlington; Mr. MACKAY, Darlington; Mr. DOUGLAS, gr., Bolderby Park; Mr. J. HORNBY, Heslington Hall Gardens; Mr. HANAGAN, Roughton Grange Gardens; Mr. J. MCINTYRE, Woodside Gardens; Mr. GLAISTER, Orchard Croft; Mr. WM. MALLABAR, Hummersknott; Mr. H. Y. WAND, Briukburn Gardens; Mr. R. SIMPSON, Pitmore Hall Gardens; Mr. J. LEE, Clifton Castle Gardens; Mr. PEEL, Rlydon-on-Tyne; and Mr. SUFFIELD, Stanke Prior. There were also some specialities in vegetables exhibited, most noticeable being a tray of Onions averaging 1½ lb in weight, grown by Mr F. Kneller, gr. to the Marquis of RYON, Studley Royal, Ripon.

The exhibition was visited by a great number of people, and the Secretary (Mr. J. G. WILKINSON) and Committee are to be complimented on the success which attended their efforts in getting together such a large and interesting display.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 6, England, including London, S.
- Principal Grazing, &c., Districts—5, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending October 28, is furnished by the Meteorological Office:—

"The weather was fine and dry generally at the commencement of the week, but an unsettled condition soon set in, with frequent showers of rain, hail, sleet, or snow in the north-west, and this extended later on to almost all parts of the Kingdom. The showers were, however, heavier and more frequent in the northern and western districts than elsewhere. During the latter part of the week thunder and lightning were experienced in various parts of the country.

"The temperature was unusually low for the time of year, the deficit ranging from 4° in the 'Channel Islands,' and 6° in 'England, E. and Ireland, N.' to 3° in 'England, N.W. and Ireland, S.' The highest of the maxima occurred on the 20th, and ranged from 60° in 'Ireland, S.' to 53° in 'Scotland, N. and England, N.E.' The absolute minima were recorded towards the end of the period, and were extremely low for the

time of year. They ranged from 18° in 'England, S.W.' (at Llandover), 21° in 'England, S.,' and 22° in the 'Midland Counties, Scotland, W., and Ireland, S.' to 27° in 'Scotland, N. and E.,' and to 37° in the 'Channel Islands.' The lowest readings reported from stations with a thermometer exposed on the grass were 13° at Worksop (both on Thursday and Saturday), 16° at Loughborough, 18° at Gilcrux, and 20° at Oxford and Cullompton.

"The rainfall varied very greatly in different parts of the Kingdom, but was, on the whole, in excess of the mean over 'England and Scotland, E.,' and just about the normal elsewhere. The fall consisted mainly of hail, sleet, and snow in the western and northern districts.

"The bright sunshine was more prevalent in the west and south-west, and in 'England, N.E.' than elsewhere. The percentage of the possible duration ranged from 53 in 'Ireland, S.,' 44 in the 'Channel Islands,' 43 in 'Ireland, N.,' and 41 in 'England, E.,' to 25 in the 'Midland Counties,' and 23 in 'England, N.W.'"

PRIZE ESSAYS.—The prizes offered by the Royal Horticultural Society for the best essay on "The Commercial Aspect of Hardy Fruit Growing in Great Britain," were presented at the meeting on Tuesday last, by Sir A. ARBUTHNOT, in the unavoidable absence of Sir Trevor Lawrence. As the judges were unable to decide between two of the papers sent in, the Council have given £15, instead of £10, and this has been divided equally between Mr. LEWIS CASTLE and Mr. S. T. WRIGHT, gardener at Glewston Court, Herefordshire. Dr. HOGG has also presented a large Silver Medal to both essayists.

MARKETS.

COVENT GARDEN, October 31.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the price on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

Markets remain about same as last reported. *J. B. Thomas.*

SEEDS.

LONDON: October 30.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended, with but little business doing. Rather more attention latterly been given to Clover seeds, and the impression widely prevails that the lowest prices possible have been reached. Winter Tares are slow this week. There is no change in Rye. New Haricot Beans on the spot, being in strong demand, and almost unobtainable, have again advanced several shillings per qr. Bine Peas also sell freely at rising quotations. The new Hemp seed just landed, being cheap and good, meets with favour. Canary seed is steady. There is no alteration in either Mustard or Rape seed.

FRUITS AND VEGETABLES.

BOROUGH: Oct. 29.—Quotations:—Cabbages, 2s. 3d. to 2s. 9d. per tally; Carrots and Turnips, 2s. to 2s. 6d. per dozen bundles; Apples, 3s. to 6s. per bushel; Pears, 3s. to 7s. do.; Chestnuts, 6s. to 8s. per basket; Walnuts, 4s. 6d. to 8s. per bag.

SPITALFIELDS: Oct. 29.—Quotations:—Savoys, 5s. to 7s. per tally; Collards, 3s. to 4s. do.; Greens, bunch, 2s. to 2s. 6d. per dozen bunches; Cauliflowers, 6s. to 8s. per tally; Sprouts, 2s. to 2s. 6d. per half-bushel; Turnips, 1s. 9d. to 2s. per bag; Carrots, 1s. 6d. to 1s. 9d. do.; Beets, 1s. 3d. to 1s. 6d. per bushel; Parsnips, 7d. to 9d. per score; Onions, 3s. to 4s. per cwt.; Apples, Cox's Orange Pippin, 2s. 6d. to 3s. per bushel; Northern Greenings, 2s. 6d. to 3s. do.

STRATFORD, Oct. 29.—There has been an improvement generally during the week, consequent upon the change in the weather. Cabbages, 2s. to 5s. per tally; Savoys, 2s. to 6s. do.; Greens, 1s. 3d. to 2s. per bag; do., 1s. 6d. to 3s. per dozen bunches; Cauliflowers, 1s. to 2s. 3d. per dozen; do., 5s. to 10s. per tally; Scotch Kale, 6d. to 9d. per bushel; Vegetable Marrows, 1s. 6d. to 2s. 6d. per tally; Beans, Scarlet, 1s. to 1s. 6d. per dozen; do., 2s. to 2s. 9d. per bag; Beet-root, 2s. 6d. to 3s. per dozen bundles; Celery, 6d. to 1s. per roll; Horse-radish, 1s. 1d. to 1s. 3d. per bundle; Parsley, 1s. to 1s. 6d. per dozen bunches; Turnips, 1s. to 2s. per dozen bunches; do., 3s. to 40s. per ton; Carrots, household, 25s. to 32s. per ton; do., cattle-feeding, 20s. to 25s. per ton; Parsnips, 8d. to 1s. per score; Mangels, 12s. to 15s. per ton; Swedes, 17s. to 20s. per ton; Onions, Ghent, 2s. 9d. to 3s. per bag; Dutch do., 3s. to 3s. 3d. per bag; Bordeaux Port., 4s. 6d. to 5s. 6d. per case; Apples, English, cookers, 2s. 6d. to 3s. 6d. per bushel; do., dessert, 3s. to 5s. per bushel; Pears, English, 2s. to 5s. per bushel; Tomatos, English, 3s. to 3s. 6d. per doz. lb.; Cucumbers, framed, 1s. to 2s. per dozen.

FARRINGTON: Oct. 31.—Quotations:—Apples, Wellingtons, 3s. 3d. per bushel; Blenheim, 4s. do.; King Pippin, 4s. do.; Suffolk, 4s. 6d. do.; Gravensteins, 11s. 6d. per tub; Cox's Orange Pippin, 4s. 6d. per bushel; Pears, California, 10s. 6d. to 14s. per case; Walnuts, 4s. per bag; Chestnuts, 13s. per bag; English Grapes, 1s. per lb.; Tomatos, 6s. per 12 lb.; Prunes and Plums, 2s. 6d. per half bushel; Sloes, 2s. 6d. per peck; Collards, 3s. 6d. per tally; Leeks, 2s. per doz.; Carrots, 3s. per dozen bunches; Turnips, 3s. do.; Cauliflowers, 2s. per dozen; Spinach, 2s. per bushel; Beetroot, 2s. per bushel; Parsnips, 1s. 3d. per score; Artichokes, 2s. 6d. per half-bushel; Celery, 1s. per roll; Onions, English, 4s. per bag.

POTATOS.

BOROUGH: October 29.—Prices ranged from 55s. to 80s. per ton.

SPITALFIELDS: October 29.—Quotations:—Sutton's Abundance, 55s. to 70s.; Reading Giants, 45s. to 65s.; Main Crops, 50s. to 70s.; Imperators, 50s. to 70s.; Fidler's Colossal, 50s. to 65s.; Bruce, 45s. to 60s.; Snowdrops, 60s. to 80s. per ton.

STRATFORD, Oct. 29.—Quotations:—Bruces, dark soil, 40s. to 45s.; do., light soil, 40s. to 60s.; Reading Giants, 45s. to 65s.; Snowdrops, 50s. to 70s.; Hebrons, 55s. to 70s.; Sutton's Abundance, 50s. to 70s. per ton.

FARRINGTON: Oct. 31.—Quotations:—Snowdrops, 30s. to 100s.; Hebrons, 70s. to 90s.; Regents, 80s. to 70s.; Paritans, 55s. to 60s.; Imperators, 50s. to 80s.; Early Rose, 60s. to 70s.; Magnams, 45s. to 55s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 50s. to 100s.; do., inferior, 50s. to 70s.; hay, best, 60s. to 90s.; do., inferior, 30s. to 80s.; mixture, 70s. to 87s. 6d.; and Straw, 20s. to 40s. per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending October 23, and for the corresponding week in last year—1895: Wheat, 25s. 5d.; Barley, 25s. 4d.; Oats, 13s. 7d. 1894: Wheat, 17s. 7d.; Barley, 23s. 8d.; Oats, 13s. 3d.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

Will some of our Danish correspondents kindly inform "Hibernia" of the meaning of the word Traasteen, as given to an Apple; a new variety, said to be the finest in existence, with this name, having been introduced to the gardens of the Prince of Wales at Sandringham in 1893.

* * * Owing to the large increase in our circulation, we are under the necessity of going to press some hours earlier. Our contributors will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

CATTLEYA LABIATA BLOOMS: *W. Bull.* One of the richest coloured varieties ever seen, and the flower of more than fair size. The other exhibits an attempt on the part of the flower to produce two extra lips out of what are really the sepals.

ERRATUM: The large Pear from "F. H.," inadvertently named Duches d'Angouême in this column last week, should read Pitmaston Duchess.

FRUIT CULTURE IN SOUTH AFRICA: *H. F. T.* You should write to Mr. Cooke, Ravenscourt, Bexley, Kent, who has information to impart.

INSECTS: *F. A.* The grubs appear to be those of the small cockchafer or Fernchafer (*Rhizotrogus solstitialis*). In the case of the lawns, you might try copious applications of diluted gas-water. As to the Begonia beds, dig up and carefully hand-pick and destroy all grubs and affected tubers; gas-water might then be applied, or the earth be removed, and replaced by fresh. *R. McL.—W. R.* The insects are the grubs of one of the boring beetles, which are often imported with Orchids. If the parts affected by them are cut off and burnt, they are easily got rid of.

MUSHROOMS TURNING BROWN WHEN QUITE SMALL: *F. B.* This may happen when the soil and bed are deficient in moisture, as will often occur when excessive heating has taken place. The "spawa" will sometimes be injured by the great heat, and vegetates but weakly. Loss of heat in the bed will arrest development in the Mushrooms. Without seeing the bed, and knowing more of the treatment afforded, we are unable to say what is the exact cause.

* * * PLANTS, FRUITS, ETC., TO BE NAMED.—The applications to name flowers, and especially fruit, are so numerous at this season as severely to tax our resources. They entail an expenditure of time, labour, and money, of which our readers have no idea. We are always willing to oblige our correspondents as far as we can, but the editing of the *Gardeners' Chronicle* is our business, to which everything else must give way. Correspondents are respectfully requested to observe the rule that not more than six specimens can be dealt with at a time. If more are sent, it would be a graceful act on the part of the sender, to send also a small contribution to the *Gardeners' Orphan Fund*. Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered. Leaves only, or florists' varieties cannot, as a rule, be named.

NAMES OF FRUITS: *Houston.* 1, Easter Berré; 2, Vicar of Winkfield; 3, Passe Colmar; 4, Berré d'Aremberg.—*M. P. R.* 1, Cox's Orange Pippin; 2, Small's Admirable; 3, Berré de Capianmont; 4, other Pears over-ripe.—*Camens.* 1, Gloa Morcogan; 2, not known—worthless.—*Charles J. W.* Your Apple is known as the Black Crab.—*H. F.* 1, Berré Rance; 2, Vicar of Winkfield; 3, Passe Colmar.—*B. R. S.* 1, not known—a wild variety; 2, Criméon; 3, Pott's Seedling;—*W. Hunt Charleville.* 1, Cox's Orange Pippin; 2, Cox's Pomona; 3, not known; 4, Warner's King; 5, Ribston Pippin; 6, Yorkshire Greening.—*Kent & Brydon.* Your Apple is inferior to hundreds of others in cultivation.—*Rev. C. C.* Pears, 1, Uvedale's St. Germain; 2, Verniam, both excellent stewing Pears.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number.—

Mells Park. 1, *Crataegus crus galli* var. *splendens*; 2, *Crataegus punctata*; 3, *Pyrus prunifolia*; 4, *Crataegus coccinea* var. *macracantha*; 5, *Crataegus coccinea*.—*Gurteen.* *Prunus Padus* (Bird Cherry).—*S. 1.* *Galactites tomentosa*; 2, *Lathyrus Cymenium*; 3, *Sclerolepis verticillata*; 4, *Hamamelis virginica*, very untimely in flower.—*E. J.* *Panicum capillare*.—*J. D.* 1, *Nerice coracæ major*; 2, *N. sarniensis*; 3, the large form of *N. hamilis*, or a hybrid of it; 4, *N. rosea*.—*W. C. R.* 1, *Fankia obcordata*; 2, *Calycanthus præcox*.—*W. F. M.* 1, *Dendrobium album* (aqueum); 2, *Trichosma suavis*; 3, *Eulophia megistophylla*; 4, *Adiantum cuspidatum*; 5, *Adiantum macrophyllum*.—*J. D.* Next week.—*R. B. L. & S.* 1, *Kadsara japonica* variegata; 2, *Siphocampylus bicolor*; 3, *Mentha arvensis*, send when in bloom; 4, *Saintpaulia ionantha*.

NEAPOLITAN VIOLETS IN FLOWER BY CHRISTMAS: *H. May.* It cannot be done, except under exceptionally favourable circumstances, and by a special treatment of the young plants. Naturally, this variety is later in flowering than Marie Louise, The Czar, and Victoria. Very little warmth is required by Violets, a day temperature of 45° to 55° or 60° by sunheat, and 45° as the minimum by night suffice all through the winter. The plants are impatient of a close atmosphere, and require air whenever it can be safely afforded.

PELARGONIUMS AND FUCHSIAS: *Flora.* The first-named may be kept in a sunny window, and afforded water only when the soil gets almost dust-dry. Do not prune till February, nor use saucers under the pots. The Facheias may be kept in the cellar if it be dryish, or similar place, and be cut back or cut right down in March. Cuttings of Pelargonium would root now, and you may succeed with Fuchsias if the cuttings are placed in sandy soil covered with a glass.

RASPBERRIES IN FRUIT: *W. Jones.* By no means unusual before the frost came.

RHUS SUCCEDANEA: *Munches.* A small Japanese tree with smooth branches and leaves, the latter being pinnate, and consisting of fifteen shining green leaflets. So far as we know of, it has no other name outside of Japan.

ROSE LEAF CATERPILLAR: *W. P.* For clearing bushes in the Rose-house, Richard's XL might be tried instead of the time wasted in hand picking. Out of doors you could use quassia water, soap-suds, and tobacco water—the latter not made at home from good tobacco, but purchased at the tobacco manufacturers, which is much stronger and consequently economical. The proportion may be one of the juice to twelve of soapy water. These washes do not kill, but they make the leaves of the Rose unpalatable to the caterpillar.

TOMATO: *Market Gardener.* Not burning from bad glass, but a fungus disease—*Cladosporium lycopersici*. Cut off and burn all affected fruits, and apply the Bordeaux Mixture. See *Gardeners' Chronicle* for receipts for making the same in "Answers to Correspondents" on July 27, 1895.

WORKSHOP AND FACTORY ACTS: *A. T. B.* Send to Messrs. Eyre & Spottiswoode, Queen's Printers, East Harding Street, London, E.C., for a copy of the Act. It will cost but a trifling sum.

COMMUNICATIONS RECEIVED.—*D. L. M.*—Geo. Hunt (next week).—*W. W.*—*G. N.*—*H. M.*—*R. W.*—*B. V.* & Sons.—*R. C.*—*E. H. J.*—*K. W. J.*—*G. J.*—*J. Wheeler.*—*G. P.*—*G. W.*—*D. C. P.*—*R. J. CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

increased to the extent of more than 80 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

TOP-SOIL AND GARDEN MOULD FOR SALE.

THE METROPOLITAN ASYLUMS BOARD are prepared to receive Offers for the Purchase of about 1,000 yards of MEADOW TOP-SOIL AND GARDEN MOULD on the Park Hospital Estate, Hither Green, Lewisham, S.E., which may be seen on application to the Clerk of the Works.

Purchasers will be required to pay for the soil and mould on or before delivery, to place the same in carts, and to cart it away. OFFERS (which may be for ANY QUANTITY not exceeding 1,000 yards) should be enclosed in sealed envelopes, endorsed "Top-Soil and Garden Mould, Hither Green," and should be delivered at the offices of the Board, as below, by 11 A.M. on Monday, the 4th of November. The managers do not bind themselves to accept the lowest or any tender.

(By order) T. DUNCOMBE MANN, Clerk to the Board. Chief Offices, Norfolk House, Norfolk Street, Strand, W.C. 26th October, 1895

LAWN SAND.

NOW IS THE TIME FOR THE
 DRESSING OF LAWNS.

ONE OF MANY UNSOLICITED TESTIMONIALS:—

Red House, Leatherhead.
 GENTLEMEN,—Our Lawns were in a very bad condition, over-run with Dandelions, Plantains, &c. My employer decided to try your Lawn Sand, and now the effect is all that can be desired, indeed, Our Lawns are just like velvet. I consider it is most useful, and can recommend it without hesitation. (signed) J. A. MAY.

ROBERT WARNER & CO.'S NEW PATENT WINDMILLS.

Saves Coal, Pumps Water, Grinds Corn, Cuts Chaff, &c.

Support can be made in Teak, Iron, or Steel, for Hot Climates.

Prices from £17, including Pump and Timber Supports. May 27, 1893, The Dell, Englefield Green, Surrey. ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C. Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail geared Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 60 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully, H. BALLANTINE, Head Gardener to Baron Schröder. R. WARNER & Co. have made and erected a similar Mill and set of Pumps for Lord Northbourne. NUMEROUS OTHER TESTIMONIALS ON APPLICATION TO 27, JEWIN CRESCENT, CRIPPLEGATE, LONDON, E.C. Engineering Works, WALTON-ON-THE-NAZE, ESSEX.

IRON BAR FENCING, IRON ENTRANCE PARK & FIELD GATES. STRAINED WIRE FENCING. GALVANISED WIRE NETTING. BLACK VARNISH.

TREE GUARDS. The Famous PORCUPINE TREE GUARD. Price Lists Free on Application.

THE SEASON HAS COMMENCED FOR USING THE XL ALL LAWN SAND.

Largely used last season at Gunnersbury Park and Waddesdon Manor with most satisfactory results.

Those who have poor Weedy Lawns should not fail to give it a trial, if only on a small scale at first. It Destroys Daisies, Plantains, &c., and Fertilises the Grass to such an extent that it will spread and cover over in one season the bare places formerly occupied by the weeds. When applied lightly, only as a dressing for the Grass, the results have been very satisfactory.

Supplied in air-tight Tins, 1-, 2, 6, and 5- each. 28 lb., 9-; 56 lb., 16-; and 112 lb., 30-.

Can be had through the trade, or direct from the Manufacturer,

G. H. RICHARDS, OLD SHOT TOWER WHARF, LAMBETH, LONDON, S. E. Further particulars on application.

Friday Next, November 15, 1895.

GREAT SALE OF ORCHIDS.

MESSRS. PROTHEROE AND MORRIS have received instructions from MESSRS. F. SANDER & CO. St. Albans, to SELL by AUCTION, at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, November 15, at half-past 12 o'clock:—

OVER 1000 GRAND PLANTS OF SANDER'S MONTANA CATTLEYAS from beyond Santayuni.

Collected in the entirely new district of Monte Angelos, now being searched for the first time.

See DRIED FLOWERS on day of Sale. Types of Sanderiana, Sanderæ gigas, imperialia, chrysoxoa, Harayana, white gigas, Oweniana, &c.

A snow-white gigas variety is included (see Int 201a). This Sanderian type of Cattleya is the most gorgeous of all the genus, unapproached and unapproachable.

Offered without any reserve. In addition to the foregoing Grand Cattleyas, we shall include a

NEW WHITE ANGULOIA, provisionally named. Anguloia alba magna, probably the white A. Cluweisii. The plants are in fine condition, the Bulbs are remarkably large, and carry abundance of old flower spikes. A

NEW BLUE BOLLEA Flower, of a gentian blue, of the size of small saucers—most striking. The

NEW ONCIDIUM DICHROMUM, Rolfe. A grand new yellow and porphyry-coloured species, blossoms borne on large branching spikes. The

NEW CEOGYNE HALFOURIANA, producing long elegant spikes of cinnamon, orange-and-white flowers. The

NEW ACINETA COLOSSA, bearing large pendent spikes, often 2 feet long, of huge purple blossoms. The

NEW ANETHOCHILUS SANDERIANUS, Krantzlin. Prof. Kranzlin says, "they are the most brilliant Orchid-leaves I have ever seen." A

PHALENOPSIS VARIETY, type of P. Grandiflora, and found growing with P. Sanderiana.

CATTLEYA HARRISONÆ VAR.—The very finest type. DENDROBIUM DENSIFLORUM TYPE, having the characteristic bulb of the magnificent D. Schroderæ.

DENDROBIUM NOBILE.—A type from Assam, offered for the first time.

SACCOLARIUM HARRISONIANUM.—The snow-white Saccolabium. Every part of the flower snow-white, except the centre, which is pea-green.

For full particulars and descriptions of plants see Catalogue. There will also be included in the Sale volumes Nos. 1 and 2 of WARNER'S SELECTED ORCHIDACEOUS PLANTS (very rare).

On view morning of Sale, and Catalogues had.

ORCHIDS—ORCHIDS.

JOHN COWAN & CO., Ltd.,

Are at present Selling, by Private Treaty two large fine Private Collections, which they have purchased, and they have also a very large and fine General Stock of ORCHIDS.

Inspection is very earnestly invited. Descriptive and Priced CATALOGUES post-free on application to the Company.

CHRYSANTHEMUMS. — CHRYSANTHEMUMS.

NORMAN DAVIS

BEGS TO SAY HIS PRELIMINARY LIST OF CHRYSANTHEMUMS IS NOW READY.

This is a carefully-prepared Alphabetical List of the cream of recent introductions, so far as in commerce, free from sensational and unnecessary long descriptions. It will be found a useful List for reference; sent post-free.

SPECIAL NOTICE.—GRAND NATIONAL JUBILEE SET OF NOVELTIES.

Soon as the shows are over I shall prepare a LIST of NOVELTIES for 1896. This List will be a short one, as I am anxious that the set shall be composed of nothing but back row flowers of the choicest description. Several of my purchases have already been shown in public, and received unanimous approval. In addition to the beautiful varieties raised by Mr. H. WEEKS, of Derby, and two exceptional sterling Novelties from America, it is with great pleasure that I am able to announce that I have made arrangements with WILLIAM SEWARD, Esq. of Hanwell, to distribute his set of six magnificent seedlings, which have justly been the admiration of all who have been privileged to see them. The whole of these will form a grand Jubilee Set, worthy of the occasion, and undoubtedly the finest collection of Novelties ever introduced.

NORMAN DAVIS, CHRYSANTEMUM NURSERIES, LILFORD ROAD, CAMBERWELL, LONDON, S.E.

FAY'S NEW PROLIFIC.

The largest fruited and most prolific of all Red Currants. Excellent for table use and for wine making.

MOUNTAIN GOOSEBERRY.—The best of all Gooseberries for wine making. Excessively prolific, and of vigorous growth in almost every soil.

LILACS.—Double and Single-flowering. Splendid varieties.

RICHARDIA (CALLA) LITTLE GEM. The true variety.

IRIS KEMPFERI.—Most splendid; flowers 7 to 8 inches long.

For particulars and price apply to—

ZOCHER & CO., HAARLEM, HOLLAND

 2s. 6d. nett, per post, 2s. 10d.

THE SEASON HAS COMMENCED FOR USING THE XL ALL LAWN SAND.

Largely used last season at Gunnersbury Park and Waddesdon Manor with most satisfactory results.

Those who have poor Weedy Lawns should not fail to give it a trial, if only on a small scale at first. It Destroys Weeds, Plantains, &c., and Fertilises the Grass to such an extent that it will spread and cover over in one season the bare places formerly occupied by the weeds. When applied lightly, only as a dressing for the Grass, the results have been very satisfactory.

Supplied in air-tight Tins, 1/-, 2/6, and 5/- each.
 28 lb., 9/-; 56 lb., 16/-; and 112 lb., 30/-.

Can be had through the trade, or direct from the Manufacturer,
G. H. RICHARDS,
 OLD SHOT TOWER WHARF,

SNOW-WHITE GIGAS VAR.

Lot 201A.

The dried flowers we shall show on the day of sale, with white sepals and petals and red labelluma, are wonderful, and quite new and splendid. Also chrysotoxas, with red and yellow labellums and white sepals and petals. This

SANDERIAN TYPE

OF

CATTLEYA

Is the most gorgeous of all the genus, unapproached and unapproachable.

WITHOUT ANY RESERVE.

NEW WHITE ANGULOA.

ANGULOA ALBA MAGNA (Sander),
Provisionally named.
Probably the white A. Clowesii.
Magnificent masses.

NEW BLUE BOLLEA.

Found with the new type of Cattleyas.
Flowers a gentian blue, and having the appearance of small saucers.

NEW ONCIDIUM.

ONCIDIUM DICHROMUM (Rolfe).
Grand new yellow and porphy-flowered species.

NEW CŒLOGYNE BALFOURIANA

Producing long elegant spikes of cinnamon, orange, and white flowers.

NEW ACINETA COLOSSA

(Sander).

Huge pendent spikes of purple blossoms, 2 ft. long. The large, unopened bud are similar to small apples.

NEW ANŒCTOCHILUS SANDERIANUS.

Magnificent new species.

CATTLEYA HARRISONIÆ VAR.

The very finest type.

DENDROBIUM DENSIFLORUM TYPE,
having the characteristic bulbs of D. Schroderæ.

DENDROBIUM NOBILE,
A type from Annam. Offer for the first time.

PHALÆNOPSIS VARIETY,

Type of P. grandiflora.
Found growing with P. Sanderianus.
&c., &c.

For full descriptions, see CATALOGUE.

THE Gardeners' Chronicle.

SATURDAY, NOVEMBER 9, 1895.

MELVILLE CASTLE.

ONE of the most delightful excursions from Edinburgh is that which embraces the classic and charming vale of the Esk—Roslin, Hawthornden, Melville, Dalkeith, Newbattle, Dalhousie, are so many shrines in what one might call a horticultural pilgrimage. Influenced by the fascination of lovely grounds and gardens, and held fast by the hospitality of Lord Melville's factor and general manager, Mr. McKinnon, we devoted the major part of our afternoon's trip to the enjoyment of the beauties of Melville. As soon as you pass within the gates of the noble park, you are struck with the marks of the interest, care, and taste devoted to arboriculture on the part of the owner. His lordship is a keen arboriculturist, as the frequent strips of young plantations, contrasting with the grand stretches of Oak and Beech, testify. For 1½ mile the Esk meanders through as charming a piece of scenery as the eye need desire—meadows interspersed with magnificent ornamental Limes, Scottish Elms, Beeches, and Oaks, and flanked by heavily-wooded heights on either side. These Beeches and Oaks are classico, if one may judge from the frequent quotations from Sir Walter Scott, with which our guide enlivens the stroll. Unfortunately, the effects of storms and old age have made themselves apparent in frequent gaps; but these ravages have given scope for the enterprise of both owner and manager, with good effect in the present, and the hope of great things in the future. A glance over the fields stretching away to the right, and forming the home farm, tells us that Lord Melville is likewise an enthusiastic agriculturist. The crops are heavy, and give expression to the fertility of the Melville estate. A considerable stock of Highland cattle, Ayrshire cows, and sheep, add to the anxieties of the manager, and, like everything else, they are in prime condition.

Half-an-hour's stroll brings us to the castle, an imposing turretted mansion, commanding a fine bit of the Esk, and surrounded by lawns and shrubberies, rich in ornamental trees. The extensive breaks of Rhododendrons, many of them added of recent years, must have a striking effect in the early summer. The size of some of the Beeches and Oaks in the environs of the castle remind of the remote historic prominence of Melville. It has its Queen Mary's Oak, and its pre-Reformation shrine; and, still more interesting, it is associated with the great Henry Dundas, the friend and colleague of Pitt, and one of the most distinguished and popular of those potent individuals of a past generation, who went by the sobriquet of "Kings of Scotland." His monument in St. Andrew Square, Edinburgh, is the tribute of Scotland to his varied services and

ON FRIDAY, NOVEMBER 15,

Will Offer the above grand New and Choice Orchids,

AT THEIR

CENTRAL AUCTION ROOMS, 67 & 68, CHEAPSIDE LONDON, E.C.

gifts. Besides being associated with the memory of Queen Mary, the annals of Melville proudly record two visits of royalty within the century. George IV. was here in 1822, Queen Victoria in 1842.

The next object of interest is the garden. Melville's fame has long been eminent, and deservedly so. The Grapes grown here for the last twenty years have been the admiration and the envy of many a far-travelled visitor. A long record of prize-taking, which has of late, owing to the multifarious engagements of Mr. McKinnon, been discontinued, attests to the great things they have achieved in competition at all the more important exhibitions.

A look at this year's crop is sufficient to prove that the traditions of Melville in this respect are well maintained, and to induce regret that Mr. McKinnon resists all our arguments to appear once more in the lists. The first house we entered was a lateinery, containing Alicante, Lady Downs, and Gros Colmar. The large size of both berry and bunch, and the presence of excellent colour and finish, indicated both care and intelligence in rearing. The same features were observable in the next two houses, devoted to the culture of Black and Golden Hamburg, Gros Maroc, Muscat of Alexandria, Mrs. Pince, and Madresfield Court. The Golden Hamburg were specially magnificent, and the skill of Mr. McKinnon and his able chief assistant, Mr. Black, have been particularly successful in bringing near to perfection the crop of Madresfield Court, which have a tendency to crack, and are very difficult to finish.

Two other houses are devoted to the rearing of early crops, and from the finished appearance of the bunches left, give every indication of health and vigour. Several other houses are devoted to Peaches, Tomatoes, Figs, Plums, &c., and are similarly indicative of the results obtained by able management. Whether regard be had to the size or to the flavour of these fruits, it is sufficient to say that they are grown at Melville. Another remarkable feature of fruit-rearing here, and one which owes its initiation and perfection to the present manager, is the splendid collection of fruit trees in pots, which crowd other two large houses. A large crop of Apples, Pears, Pines, Cherries, &c., is annually produced, which may challenge comparison with that grown under the most favourable conditions of climate, soil, and sets us marvelling at the resources of the gardening art here brought into play.

Turning from fruit grown under glass to the fruit and vegetable gardens, the results this year have been somewhat disappointing in the case of Apples and Pears at least. The fact that June was excessively dry in this part of the country, combined with the sandy nature of the subsoil, blighted the early promise of a large number of trees. Otherwise, the aspect of these gardens reveal a good average crop of fruit and vegetables. There is a specially fine lot of Morello Cherries.

The exhibition of flowering plants in the conservatories and flower garden maintains the tradition of former years. One of the former, whose roof is hidden by a mass of Tacsonias, Fuchsias, and Clematis, contains a mixture of greenhouse plants, all in prime condition. The broad borders of the walk in front have long been remarkable for the collection of herbaceous flowers, embracing many rare specimens. A number of beds in front of the Palm-house, ablaze with Begonias, give a very striking effect of brilliant colour to this part of the gardens. They have been found to stand the rainy weather of this damp climate better than Pelargoniums, and the heavy rains of the month of July have enabled them to recover from the drought of June.

The flower garden comes last, but it is not the least characteristic of the beauties of Melville. It reveals a fine combination of taste and intelligence. The long rich border of Phloxes, Pentstemons, Antirrhinums, &c., backed by a high wall ablaze with a variety of creeping plants, combines symmetry with profusion. Mixed beds are here the

order of the day, and in addition to many gems of their kind, we were specially struck with the graceful effect produced by a frequently recurring one composed of Begonias, Gladiolus, Lobelia cardinalis, and Dactylis glomerata. The plan of devoting the centre beds to plants of tall growth, serves admirably to break the monotony and artificialness of the conventional flower garden, and contributes to create the impression of the presence of Nature rather than the hand of man. The whole is finely set off by a border of Rhododendrons, mixed with golden Elder, Retinosporas, &c., and runs along the left-hand side. *Tourist.*

BEGONIA DISEASE.

CULTIVATORS of tropical herbaceous plants, such as Gloxinias, Achimenes, Pentas, Impatiens, Vincas, and especially Begonias, are more or less familiar with a "disease" which attacks these plants, sometimes crippling and practically destroying whole batches of them in a few weeks. It attacks chiefly the young leaves and flower-buds, causing the latter to wither and fall off, and the leaves to curl and become aborted. When the disease is bad, the youngest leaves are arrested in growth when very small, and the whole plant soon presents a hopelessly crippled appearance. The leaves are discoloured with patches of a black or brown colour, as if suffering from a rust-fungus of some kind.

The general impression with regard to the nature of this disease is that it is fungoid. Attention was called to it recently in these pages in a paper on "Taberona Begonias," by Mr. W. W. Sheath (see pp. 267, 268), who stated that "Pot-plants (of Begonias) are sometimes infested with a kind of rust on the stems and leaves, which some growers say is a fungus, but I have found it more prevalent when in too much heat in spring; also by sudden changes of temperature or draughts; by imperfect drainage—in fact, by anything that would cause a check in the growth." On p. 305 there is a note signed "W.K.," wherein this disease is attributed to "large numbers of white insects, barely visible to the naked eye." Another correspondent, however, "H. W. C.," who says (p. 337) that he is an extensive grower of Begonias, does not believe that the small white insects are the cause of this rust-like disease, but inclines to believe that it is caused by a fungus.

A similar discussion has been going on concurrently in the pages of *The Garden*. I have been acquainted with this disease for some years, which at first I thought was some kind of rust-fungus, but which I now know is caused by a very small insect or mite, as small as it be invisible to the naked eye. It runs very quickly, and therefore often soon leaves a leaf or shoot if disturbed. This no doubt accounts for the failure of experts to find the insect when specimens of the disease have been submitted to them.

By lightly fumigating once a week with tobacco the plants subject to the attacks of this pest, we have now no difficulty in keeping our Begonias clean; indeed, I may say that tobacco fumigation is a perfect preventive, and almost a certain cure, if the plants have not been hopelessly crippled before it is applied. This year a batch of Acanthaceous plants, such as Justicias, Aphelandras, &c., had been suffering from this particular disease for some weeks before it was noticed. The gardener in charge of the plants thought a fungus was the cause of the curling and discoloration of the foliage. By frequently dipping the affected plants in a weak solution of tobacco, the plants were, in most cases, saved, and have since quite recovered.

Every cultivator knows how easily irregularity of temperature or atmospheric moisture will bring on an attack of red-spider or thrips among plants grown under glass, and this mite, which is smaller than either of the two pests named, and at least as quick-spreading and injurious in its effects on the health of the plant, can get a start from the same cause, viz., bad ventilation or some other fault in the atmosphere in the house containing the plants.

I am quite certain that the disease, as above

described, and which attacks various tropical herbaceous plants, is the work of an insect or mite which may be kept under by the frequent use of tobacco, either in solution or as fumes.

If further proof is wanted, the following should suffice. A few days ago I asked Mr. Massee, the eminent fungologist, to examine some examples of plants affected with this disease, and which had escaped notice till recently. He reported as follows:—"The disease is caused primarily by very minute, white insects—Saprophytic fungi, such as Botrytis, Heterosporium, &c., soon follow. Keep down the insects and the disease will disappear."

Certain forms of black blotching and leaf-curling which often disfigure Masdevallias of the Chimara section and some others beside, are the work of an almost invisible insect, probably a relation of the mischievous little red-spider. It must be sought for very carefully, and when discovered it requires some care and perseverance to get rid of it. But this, of course, is another story. *W. W., Kew.*

KEW NOTES.

MUSA FEHI.—A plant bearing this name is now in flower in the Palm-house at Kew. There appears to be some doubt as to the true characters of M. Fehi, but whether the plant under notice be that species or not, it is certainly new to cultivation, and is strikingly handsome. It has stems 10 feet high and 6 inches in diameter at the base; the leaves are 6 feet long and 18 inches wide, with a cylindrical petiole 18 inches long, clothed with a white mealy down. The inflorescence is horizontal, the stalk 1 foot long below the first whorl of flowers; the bracts are ovate, concave, the largest 8 inches long by 5 inches in width, and coloured crimson-claret, the colour being very rich when the bracts first unfold. They are much more persistent than in *M. sapientum*. There are from seven to nine flowers in each row, at the base of the bracts, and the fruits are angular. *M. Fehi* is a native of Tahiti and New Caledonia, and bears edible fruits which sometimes ripen their seeds, and sometimes are seedless. The plant at Kew was obtained from the Jardin des Plantes, Paris, three years ago, and it is now flowering for the first time. A drawing of it has been made for the *Botanical Magazine*.

AGAVE ATROVIRENS.

One of the largest Agaves ever grown at Kew is now pushing up a flower-spike in the Palm-house, whither it has recently been transferred from the Succulent-house, where it was a conspicuous object during several years. It has fifty leaves, the average size of which is 4½ feet, and width 14 inches, the margins are clothed with stout hooked teeth, and the apex with a stout straight spine 3 inches long. The spike when fully developed is about 30 feet high, the flowers, which are tubular, yellow, and 4 inches long, being crowded on a thyrsoid panicle 8 feet long. The leaves on wild plants are said to be 12 feet long. A plant of this species flowered at Kew in 1888. It is one of the commonest of the Agaves grown in the gardens on the Riviera, where it generally goes under the name of *A. Salmiana*. The big Agaves at Kew have been reduced in number by the flowering of a considerable number within the last three years. This is the third giant that has flowered within twelve months. Of course, they perish with flowering.

WALLICHIA CARYOTOIDES.

This is the handsomest of the three known species of *Wallichia*, which are all represented in the Palm-house at Kew, where two of them, viz., *W. densiflora* and *W. caryotoides* flower now and then; whilst the third, *W. disticha*, is always attractive in the arrangement of its leaves, which is as distichous as in the Traveller's tree, *Ravenala*. The habit of *W. caryotoides* is sabbelliferous (tufted), the leaves forming a crowded cluster 4 feet through at the base, with a spread of about 12 feet; each leaf is 10 feet long, the leaflets are 2 feet long, cuneate at the base, wider and jagged at the apex, dark green on the upper surface, silvery below. The male inflorescence

is developed about a foot above the ground, and has a stout curved stalk clothed with large, boat-shaped, overlapping, purplish-brown bracts, below which is a dense cluster of drooping unbranched tails, about a foot long, clothed with pale pink flowers. This is

& Co., of Colchester, at the meeting of the R.H.S. on Tuesday, October 29. *Lycoris* is allied to *Amaryllis*, but is distinguished from that genus by the small number of ovules in each cell of the ovary. The length of the segments in *L. aurea* is 3 inches, and

PLANT NOTES.

PRIMULA CASHMERICANA (CAPITATA).

This North-western Indian Primrose is one of the most charming alpine for flowering at this

the first male inflorescence the plant has borne, the previous ones hitherto being female, less crowded, with branched tails and inconspicuous bracts. *W. W., Kew.*

LYCORIS AUREA.

SEVERAL plants of this excellent autumn-flowering species (fig. 94) were shown by Messrs. Wallace

the colour a rich orange; the anthers are yellow-coloured. The flowers appear usually in August and September, and before the leaves; the plant is amenable to greenhouse culture. The bulb is sub-globose, 2 inches in diameter. It is figured in the *Botanical Magazine*, t. 409, as *Amaryllis aurea*, and it was introduced from China in 1777 by Dr. Fothergill.

season, decorating the otherwise bare rockery. It has strap-shaped, bright green leaves, which form a rosette. The flowers are of a violet colour, and well elevated on a stout stalk, which is covered with a mealiness even to the calyces, resembling *P. farinosa* in this respect, as in others. I saw a bed of it the other day, and every plant was in bloom. The situation, sheltered by a high bank, and shaded by a

tree, seemed to exactly snit it. The heads were full of flower, and the bed made a fine show. *A. H.*

PETRÆA VOLUBILIS ALBA.

This is a lovely thing when in flower. A small plant at the Botanic Garden, Grenada, is occasionally laden with pendulous tail-like racemes of white flowers. A pretty contrast it is, therefore, to the purple-flowered *Petræa*; and when both flower together on a slope or on level ground, they form a conspicuous and pleasing picture, scarcely to be passed by unnoticed.

VILLAMILLA OCTANDÆA.

This is a plant commonly to be seen and passed by in a walk about the country. It is a pendulous scandent, vine-like shrub, which, at the time of flowering, is oftentimes destitute of foliage, whilst at other times the foliage and flowers come together. The flowers are borne along the branches, and when no leaves are present, the shrub looks like a mass of bare twigs covered with a coating of snow. The flowers are white, with a faint green tinge. The plant might be worth cultivation in Europe, if it has not already been grown there. At its fruiting stage, the plant is even more conspicuous than when in flower; it then bears a great number of purple-coloured fruits. Baskets of different sizes are made from the large stems by an old Frenchman named Sartz, an inmate of our poor-house. These he sells at 2d. and upwards. *W. E. Broadway, Botanic Garden, Grenada, British West Indies.*

ABOUT CHRYSANTHEMUMS.

(The notes below were written before the first of the exhibitions was held.—ED.)

TRENT PARK, BARNET.

THOUGH so young a man, Mr. W. H. Lees, gardener to F. A. Bevan, Esq., has taken so high a position as a grower and an exhibitor, that the condition of his flowers naturally excites amongst growers the liveliest interest. I saw his plants on the 26th, and so far as the Crystal Palace show and the National are concerned, Mr. Lees should be in splendid form. If he has any weakness at all, I should look for it in the direction of undue precocity; just as his formidable competitor at Leatherhead seemed a little late. However, time will show. There are some 600 plants growing at Trent Park in numerous houses, and no effective concentration is made; but that may be no harm to the grower. Japanese are, of course, the prominent section, and many of these are indeed superb. Incurved also are very fine; indeed, Mr. Lees' own estimate—and he is a capable if a partial judge—is that he has never been stronger than this season. Of Japanese, that truly beautiful white *Souvenir d'une petite amie* is splendid. So, too, is a newer one—*Mutual Friend*, that seems like one come to stay; the petals are broad, and the flowers are massive, and of the purest white. What a grand flower is *Thos. Wilkins!* colour cream-yellow, the petals long and drooping; and yet another superb yellow is *Pallanza*, after *Sunflower*, but rather richer, and having broader petals. The rich-coloured *Mr. Seward* is very fine. A striking flower is *Robert Ballantine*, large and distinctive, colour rosy-magenta. *Madame Ad. Moulin* is yet another fine new white; and *George Biron*, a rich reddish-chestnut, is a striking flower. In spite of its curious name—*Denil de Jules Ferry*—violet-amaranth, with pale reverse, is a telling flower; while still another white is found in *Mdlle. M. A. Calvert*, which has a long ribbon-like petal, and is distinctive. Then in *Amiral Avellan* we have another yellow of a rich orange hue; *Madame Champon* is a refined *Etoile de Lyon*, and may, if found generally satisfactory, replace the older variety; *Mephisto* has the colour of the old *La Japonaise*, and the style of *Comte de Germiny*, and is full of promise. A very pretty and true Japanese is *Crystal Belle*, having the form of the old *Golden Dragon*, and of a delicate soft pink hue. That fine older yellow, *H. L. Sunderbruch*, is remarkably good; very delicately tinted and fine in form is *Louise*, now so

popular; and another white, *Guirlande*, is both solid and pleasing. Colonel Chase, though not large, is very beautiful, having a golden centre with outer petals of a soft flesh hue. Older varieties like *E. Molyneux* and *J. Shrimpton* are first rate. *Madame Carnot*, another white, bids fair to stand in the front rank of that section. A good brown chestnut flower is *Madame A. D. Girond*; *H. Jacotot* file, *Mons. Panckoncke*, and *Abbey Maidenhall*, are excellent also. These are, however, but a few of the many fine varieties at Trent Park. Of incurved, there seem to be, if fewer novelties, at least all the very best of the old ones, and all in very fine form. *Queens*, *Princesses*, *Tecke*, &c., are all excellent, and promise capital blooms. Of later novelties, *J. Agate*, white; *Globe d'Or*, buff yellow; *Lucy Kendall*, *W. Tunnington*, and *Robert Petfield* are the most noticeable. In a cool shed, where wonderful early blooms are being retarded, *Mrs. W. H. Lees*, a new Japanese, was grand indeed; so also were *Eva Knowles*, *Colonel Smith*, and other older ones. Throughout the whole collection, there are ample evidences of the highest culture; wood is strong, leafage fine, and fully retained, and flowers of the largest. It will be no matter for surprise if in some notable competitions they should be found hard to beat. *D.*

DOWNSIDE, LEATHERHEAD.

The very high reputation which Mr. W. Mease, Mr. Tate's able gardener, has obtained as a *Chrysanthemum* grower and exhibitor, naturally attracts special attention to his plants every year, and this season as strongly as ever. He is at present one of the champions of the autumn queen, and usually takes a very high place in the competitions. His plants just now are full of promise, and he has a very fine and varied collection of Japanese, incurved and reflexed, though strongest in the two former sections. With characteristic courage, Mr. Mease adds numerous novelties to his collection, picking, so far as possible, the best. Of older ones, he has plenty in the finest condition, and such well-known varieties as *E. Molyneux*, just now splendid, literally for its colours nobelated by any of the new ones; *Souvenir d'une petite amie*, beautiful white; *Eda Prass*, *Mdlle. Thérèse Rey*, *R. Owen*, *International*, *Sunflower*, *Piété Roberts*, *Commander Blussett*, *Hairy Wonder*, and many others fairly well known. Then of new Japanese, *A. H. Fewkes*, something of smaller style, but of a deeper yellow, and broader petal, very fine; *W. G. Newett*, a superb white; *Mrs. C. E. Shea*, creamy-white, fine bloom, and a sturdy grower. This variety enjoys the reputation of being the dearest yet put into commerce, as plants cost one guinea each. It ought indeed to be good for that sum. *Golden Wedding*, though represented by one plant only, is here very robust and healthy, promising glorious golden flowers. *Duchess of York*, soft light yellow, is very full of promise. Another beautiful rich yellow is *Sir E. T. Smith*, that will probably be seen prominently later. *Golden Gate*, bronzy-yellow, promises very fine blooms. A grand new white is *Mdlle. M. A. de Calvat*, petals drooping, the blooms dense. An attractive incurved form is *Globe d'Or*, showing both clear yellow and reddish-brown bloom; this bids fair to make a fine addition to the solid Japanese—or is it a real incurved? *D. B. Crane* is apparently an incurved Japanese, though termed of the ordinary incurved section; colour golden-bronze. Another fine yellow is *Phœbus*, something of the form of *Harman Payne*, but more refined petal. Yet another yellow, *M. Charles Molin*, tinted with bronze; a rich flower. Very diverse is *Denil de Jules Ferry*, large spreading bloom, dark violet-rose face, with silvery reverse. Another massive incurved bloom is *Major Bonnafond*, a massive, pale yellow. Good *Gracious* grows very tall, but it gives some charming soft pink flowers of great beauty. The much-talked-of *Philadelphia* is here too, but far from being incurved; it is promising to assume a drooping character. A massive pure white is *Madame Carnot*. *Mrs. W. H. Lees* has flowers both white and much tinged with pink, but very fine. *Duke of York* is another flower of the *Harman Payne* type,

but deeper coloured, and better. *M. Gruyer* has large blooms and broad petals, colour pale rose, white reverse. *Mr. Joanny Moten* is a striking flower, colour of *Cullingfordi*, very taking and effective. *James Myers*, somewhat after *Vivian Morel* in form, colour soft rosy-rose, is very pleasing. Of newer incurved forms, and these relatively are few, *Mrs. Archie Kingdon*, white, flushed pink, of the *Princess* type, very solid. *Globe d'Or*, already noticed, is amongst the incurved, in deeper tone than previously seen. *Robert Petfield* is very fine; *James Agate* seems here as much Japanese as incurved; *Lord Rosebery* promises very fine flowers; so, too, do all the *Teck* types; indeed, they are very good. *A. D.*

AT LILFORD ROAD NURSERIES, CAMBERWELL.

Mr. Norman Davis showed us about a fortnight ago, a batch of plants in flower of his new yellow Japanese variety *Pallanza*. We had seen the variety elsewhere, but its most valuable characteristic could not be detected so clearly as *Mr. Davis'* group displayed them. The plants generally were dwarf, very weak, and had been grown from cuttings struck in May, and some in June. Yet each plant had six or eight good blooms upon it. The colour is rich, the petals smooth, and the bloom capital for decorative purposes. As there will assuredly be considerable discussion regarding the value of this variety for exhibition purposes, and its similarity to the very pretty but frequently unsatisfactory *Sunflower*, it should be remembered that *Pallanza's* greatest value will be found to be its usefulness for market work, and for the general grower. It will furnish abundance of flowers very similar—yet quite dissimilar—to *Sunflower*, without any special culture whatever. On the other hand, most growers have trouble with *Sunflower*, and some have actually discarded it. *Mr. Davis* admits that it may not be practicable to exhibit the two varieties on one stand or in the same collection. On the crown bud, the flower bears striking resemblance to *Sunflower*, but in the terminal the likeness is much diminished. While it is claimed that as an exhibition flower *Pallanza* will out *Sunflower*, there can be no doubt whatever that in every other respect it is superior to that variety. It has already found unusual favour with market growers, and blooms of it this time next season should be as plentiful as *Blackberries*. We may add, that the variety was raised by *Mr. Briacoe Ironside*, while residing in Italy. *Mr. Davis* regards a seedling which shows a tendency to become a good market and a generally useful kind with as much favour as one likely to give fine exhibition blooms. A variety with the remarkable name of *Son Altesse Side Taieb Bey*, and hailing from *DeLaux*, the French raiser, is expected to become a useful kind. The flowers are very distinct and pretty, rosy-pink, almost the same colour seen in the old variety *Rœsa superba*, but in this case much lighter. A good batch of plants of *Madame Carnot* was observed, and a similar one of *Mdlle. Thérèse Rey*. *Mr. Davis* is inclined to consider the last-named the best white *Chrysanthemum* still, but *Madame Carnot* promises well, although when this notice was written it was too early to determine its exact worth. *Lady Biron* is a capital white Japanese bloom, with incurved petals, large, and not tightly cupped. It will no doubt prove to be a good thing. An unnamed seedling white Japanese in this collection seems to possess great possibilities. *Pride of Madford*, for which *Messrs. H. Cannell & Sons* obtained an award of merit recently, had six good buds on a plant, and promised well. Many other varieties were blooming or about to bloom, including *Philadelphia* and other new ones. *Comte F. Lourane* has nearly dropped out of collections, but it is a very pretty flower, with a white ground, and nearly covered with stripes of rose.

AT THE ROYAL EXOTIC NURSERIES, CHELSEA.

Messrs. Jas. Veitch & Sons, staged a good group of plants at the October show at the Royal Aquarium, but the general collection was not by any means so early as these, and there were many varieties blooming

a week or so since in an excellent manner. International appears to be coming very pale yellow or nearly white, and the light rose seen in the flower last season is wanting. Miss Louise D. Black, an American novelty, from Hill & Co., is not at present a deep flower, but the incurved florets are of reddish-orange colour, and very good. Warrior is a Japanese incurved, the flower large and globular, rather closely cupped, but the colour pale drab, detracts from its value. Graphic (Owen), a Japanese, is snow-white, with irregular petals, and promises to be very attractive. Pallanza was very deep in colour in this collection, and will rival Sunflower. The well-known variety G. C. Schwabe generally does very well at Chelsea, and this season offers no exception; whilst the same remark may be applied to Eda Prass, which is generally good this year. Louise has been capital, and Mrs. F. Jameson is very good. The new William Bolia, rosy purple-coloured, with silver reverse, will make large blooms; and Mons. Panckoncke promises well. Mons. Chas. Molin (Calvat) will prove to be a very good yellow; and Charles H. Curtis (Jones) will no doubt make a good addition to the incurved section—the flowers are a good yellow colour, and when finished the blooms will be of large size. Madame Carnot is expected to become a very good white Japanese flower, and the buds as opening would quite support this view. A variety in the way of E. Molyneux is M. Geo. Biron; it has the advantage of being a good doer, but as regards attractiveness, we still prefer the older variety. A very spreading yellow Japanese flower is Duchess of Wellington (H. J. Jones). The colour is good, and the petals, though narrow, are very long, but the blooms should be deeper. Mrs. W. Dreer has a flower in the way of Mrs. F. Jameson. Buds of Mrs. C. E. Shea were rather late, and had not yet opened; but there were good flowers of Colonel Bourne (Owen), a nice short grower, bearing flowers of a capital crimson, not unlike James Lynch. Nyanza, from Hill, America, is also a capital colour, but apparently the petals by recurving greatly will not show the colour much. Many of the older kinds are grown well at Chelsea, and at the same time the collection is full of novelties. P.

WOODHATCH, REIOATE.

When Mr. T. B. Haywood received the customary large party of friends who annually visit his delightful residence and gardens, as was the case on the 30th ult., he had to show them one of the most varied and attractive of private collections to be found, perhaps, in the kingdom. His gardener, Mr. Salter, does not confine his favours as a first-class cultivator to one section only, for he presents Japanese, incurved, Anemone, reflexed, and Pompons in rich profusion, and in the most varied forms. It is difficult, indeed, to say which exhibits the highest culture, for if the great Japanese seem most attractive, the other sections are of the highest relative excellence, and are of their kinds exceedingly beautiful. The bulk of the some 800 plants grown are ranged on sloping banks in two long lean-to houses, where they make a singularly attractive show. Of newer Japanese, the dominant section now, special interest attaches to an exceedingly fine white from Australia, named T. B. Haywood, that should make a good reputation. International is here very fine, yet not coarse; and Jas. Myers is excellent. Violetta is early, colour white, flushed pink; and Wilfrid Marshall is a fine yellow. Another fine Australian white is Mrs. H. B. Higgins. Such well-known forms as Mrs. E. G. Hill, W. Seward, Eda Prass, Vivand Morel, and Mons. Panckoucke are first-rate. A very beautiful variety, also white, is Florence Emma; a very striking flower is Madame Maurice Ricaud, colour rosy-red. Good, too, is the high-coloured Commandant Blissett; and Colonel C. B. Smith seems to be here, as everywhere, very fine indeed this season. Mr. C. Shrimpton, too, is in grand form and colour; a rich clear yellow is Thos. Wilkine. President Calvat, of chestnut colour, is large, but rather rough; Lady E. Saunders is of a lovely straw-primrose hue; Chas. Davis is very fine; and a very pleasing flower is Mr. R. Dean; one

of the most pleasing soft whites is Rose Wynne. Deuil de Jules Ferry, rich amaranth, is very fine; so, too, is M. Gruyer, large, and of a pleasing pink hue. A superb white here, as elsewhere, is Souvenir d'une petite amie. A truly grand flower, of a delicate straw-yellow colour, is Madame H. Demolfs, the petals very broad and massive. The white Beauty of Exmouth is fine; and J. Agate here is a Japanese incurved, though in other directions a true incurved. Of this latter section, Madame Darrier, M. A. Bahuut, Baron Hirsch, R. Petfield, the Queen family—indeed, all the best—are well represented, and in capital form. Amongst the Anemone section, very fine are Delaware, Mrs. Judge Benedict, W. W. Astor, Minnie Chate, Thorpe Junior (rich yellow), Sir W. Raleigh (mauve), Owen's Perfection, Nouvelle Alveole, and Mons. C. Leboscqz. Of new reflexed, a very beautiful flower is Clara Jeal, ivory-white, with gold centre. Amongst Pompons, Elsie Walker, golden-buff; Prince of Orange, reddish-gold; Pygmalion, reddish-chestnut; Maid of Kent, Toussaint Maurisot, Black Douglas, Golden Mdle. Marthe, St. Michael, and Eynesford Gem, are some of the best. It is possible, however, to refer to only a few out of the great collection. A very beautiful show may be seen in one of the Orchid-houses of eleven pans of the charming Pleione lagenaria, each about 13 inches across, forming dense masses of flowers. Also in another house a grand mass of varied colours, obtained from superbly-grown and bloomed zonal Pelargoniums, such as could not anywhere for quality be excelled. A look into the fine and airy fruit-room is also an interesting feature, for Apples and Pears are not only plentiful, but include noble samples. A. D.

MR. W. WELLS, EARLSWOOD.

On so glorious a day as was the 28th, it was a delightful walk from Woodhatch, across the common which intervenes to Mr. Wells' nursery at Earlswood. Here the plants may be counted by thousands, and it is to the grower's credit that every one is good, and the display a first-rate one. Special interest naturally attaches to the huge trade collections, because novelties are looked for, and we are not disappointed. The bulk of the plants are arranged in a double-sided centre bed in a very large long span-house, and the sides and ends are also fully furnished. Varieties, too, are largely placed in blocks, so that it is more easy to ascertain the average character of any. Japanese, of course, claim first attention, and foremost amongst these is the new M. Chenon de Lechs, broad even reflexed form, outer petals rosy-lilac, centre golden-bronze; this is a gem. Of hairy sorts White Plume, Hairy Wonder, and Louis Boehmer are very good. A good variety is M. Ad. Giraud, style of Gloire de Bæker, but finer, richer colour, and dwarfier. J. Shrimpton is in superb colour, really yet of its line unexcelled. A grand white again here is Madame Carnot; and Colonel Chase, though not large, is lovely. Mons. Ch. Molin is of a rich rosy-bronze. Rose Wynne, one of the finest whites; though Souvenir d'une petite amie is one of the very best now. Mrs. Airdrie, incurved form, white, striped rose, is good; and specially fine is Mons. George Biron, reddish terra-cotta, with pale gold reverse. A fine variety is M. H. J. Jones, colour rosy-amaranth, with silvery reverse; and Madame Mauriel Ricord is here, a great beauty, style of Excelsior, but richer coloured. Deuil de Jules Ferry is superb; this is a constant variety evidently, as it is so good everywhere. Mdle. M. A. Calvat is one of the finest whites without doubt. Louise, now getting well known, is a massive flower of delicate hue. A new and fine yellow is Thos. Wilkine; Maud Pearson, colour not unlike that of Belle Paule, but with larger flowers, is very pleasing. A promising flower of rich golden bronze hue is Mouchette, that bids fair to displace Colonel C. B. Smith, it is so fine and massive. Beauty of Teignmouth, crimson-maroon, shaded violet, and silvery-pink reverse, is a beautiful flower to be borne in mind. Of incurved varieties, J. Agate is here true, and of

fine form; a great beauty in this section also is Mrs. R. C. Kingeton, soft lilac on white ground, fine form and deep. There are hundreds of other well-known varieties, also of Anemones, reflexed, Pompons, &c. Single varieties are very charming, and Mr. Wells grows and raises largely; a good half-dozen of these so delightful for cutting purposes are Virgin Queen, large pure white, rose-pink; Mary Anderson, flesh, charming yellow; Bertha, pink-magenta; and Lizzie Mainwaring, bluish white. A large number of plants of Souvenir d'une petite amie from March-struck cuttings, and carrying fine blooms at from 15 to 20 inches in height, show what a fine variety it is for grouping. The new Japanese incurved Globe d'Or is very fine, and makes it a capital addition to that section, if it may be so termed. A. D.

MR. W. J. GODFREY'S, EXMOUTH.

A large span-roofed house, 156 feet long, and 27 feet wide, full of exhibition blooms of all the newest and best varieties of Chrysanthemums, was the grand sight presented to my view on October 24, when visiting this popular and increasing sea-side town. The entire collection showed signs of superior skill in cultivation, and could not have been more healthy, sturdy, and clean; the house in which they were staged was erected specially for this object, having an arrangement of thin tiffany for shading in case of bright sunshine, but which could easily be removed when not required. I was also fortunate in being conducted by Mr. Godfrey himself, who is now regarded as one of our most experienced specialists in Chrysanthemums. The admired and greatly-discussed Beauty of Exmouth, with which Mr. Godfrey made his *début*, originated an enthusiasm for Chrysanthemum culture, which has resulted in the superb display mentioned in the first few lines of this article. The collection referred to includes all varieties worth growing, varieties of home and Continental raising. Amongst these, I may mention a few which, perhaps, have already been noticed, but are here presented as grand and reliable varieties. White Madame Carnot, an immense bloom, very deep, a grand flower. Mdle. de la Galbert, a lovely white, beautiful form, likely to become a very popular variety. Mutual Friend, also a large white, outer petals very slightly shaded with mauve; Mrs. W. J. Godfrey, a large batch of this variety of sturdy growth, many plants carrying five blooms each of the most beautiful white in existence, the petals slightly hearted, and broad petals, massive, being a greatly improved A. Hardy. Duchess of York was giving some very promising blooms. Miss Rita Schroeter, a monster bloom, creamy-white, each floret shaded and edged with lilac-rose; Mrs. G. West, of American origin, also an immense bloom, after the style of Mrs. E. W. Clarke, but altogether superior in size, form, and colour, the richest yellow in the house; Miss Louise D. Black, in form similar to Lincoln, but larger florets, and much richer colour; Miss Elsie Teichmann, milk-white, one of Mr. Shea's seedlings, capital form and substance; A. H. Fewkes is of a capital dwarf, sturdy habit, a rich globular bloom, and of good size; Beauty of Teignmouth was represented by blooms much superior to Duke of York, having a better habit, much richer in colour, and very distinct in foliage; Gold Dast, whose petals are of a most beautiful plume shape, is an extremely striking flower of a clear canary-yellow; Nyanza seems to be an improved Beauty of Castlewood, of a brighter colour, equal in size, but a much better grower; Phœbus, a splendid yellow, will be much sought after, and is here represented by some very handsome blooms; Philadelphia, a large batch is growing, colour a pale yellow, changing to white.

About 400 seedlings are being cultivated on trial this season, many of them have developed blooms of exceptional merit, while a great many were yet to develop, but looked very promising. The selected varieties are named, and will be sent out next spring, those that are already considered acquisitions, include Pride of Devon, which boasts of being the largest bloom in the house, white, slightly shaded

pink, long drooping outer petals, forming a very deep flower. Wilfrid H. Godfrey, a very distinct variety, canary-yellow, reverse straw colour, the florets curling at the tips, which lends a charming effect. Mrs. J. P. Bryce, a very handsome variety, soft rose-pink, broad florets, bloom of good substance and form.

A large variety is grown for decoration in other houses, besides seedlings in various stages, both of his own and other noted raisers. Mr. Godfrey has special arrangements in his houses made for the perfecting and maturing the seed of the flowers selected for this purpose, his experiments having been attended with a fair amount of success. Several houses were full of Carnations of his famed varieties, showing immense quantities of flower-buds. *D. C. Powell.*

AT THE RYECROFT NURSERY.

At this nursery, in Hither Green, just outside Lewisham, the collection of Chrysanthemums is as interesting as ever; indeed, Mr. H. J. Jones has pursued the cultivation and raising of Chrysanthemums with such thoroughness since he commenced a few years ago, that his collections may be expected to become increasingly important year by year. Nevertheless, the visitor who goes to admire a pictorial display rather than to examine the characteristics of the blooms of the newer varieties, may be less startled with the effect produced than last year. This will be due to a different arrangement which has been adopted. Then, everything was done to create effect, but this year the arrangement enables the visitor to come near to any bloom he may wish to examine, and the tendency is not to increase the effect. Fewer older varieties are cultivated in special manner than formerly, in order to give more attention to novelties, and particularly to the increasing number of Mr. Jones' own seedlings. Most, but not all, of those we can now notice belong to the last-named class.

Additions to the incurved section are always more important, because rarer, than those of the other classes, and a good number of plants of the two varieties that are most interesting at the present time seemed to afford a good opportunity to estimate their worth. Taking Chas. H. Curtis first, we have a very large bloom with plenty of florets, and excellent in colour, being bright golden-yellow; but from present indications, the flowers will require considerable dressing before they are staged as exhibition blooms. D. B. Crane is a smaller but deeper bloom, nearly old gold in colour, and is one that will require very little dressing at all. When staged, however, the blooms of Chas. H. Curtis are much more effective than the other, for they make as pretty blooms as any incurved flower at all.

Turning to the Japanese varieties, there are Mr. P. Parnell and G. H. Hollingworth, both seedlings, the former a large bloom of good colour (crimson), with loose florets; and the latter a light yellow bloom with very wide florets, apparently to be very large, but bloom not yet developed. Mrs. G. H. Smart is a yellow and bronzy-coloured flower, an incurved Japanese, possibly distinct, but not quite to our mind. A bold incurved Japanese seedling has been named Mrs. C. J. Mills; when first opening, slightly blush, but afterwards coming pure white—likely to be a good one. Miss Clara Walker is another good white one, similar in build to the Meg Merrilies type. Duchess of Fife is another white incurved Japanese, similar in some respects to R. Owen, and very bold and deep. J. H. Richardson has extra broad florets, white, striped with rose; and Lady Randolph is a rosy-purple flower, with silver reverse—a very pretty contrast. Miss Ethel Addison will, no doubt, become popular; it has already been certificated, and has large flowers, broad florets, coloured rose, with silver reverse. Miss Elsie Teichmann is an incurved Japanese, has wide florets, and will apparently make a large flower, there being a lot of "stuff" yet to develop; the flower is white, with a straw-coloured centre. Miss Alice M. Love is one of the first varieties certificated this season; it is white with pale yellow centre, florets incurved.

When speaking of incurved varieties, we should have mentioned Mr. Jas. Murray, which will, no doubt, make a desirable pink bloom; the flowers had not "built" when these notes were taken. Mrs. G. Gover is one of the fantastical varieties, has very irregular florets, red with buff reverse, and will make a large flower. T. H. Wooderson in size reminds one of Etoile de Lyon, but, we think, lacks refinement. A capital variety, we believe, Mrs. Richard Jones will be: the flowers are white, large, florets rather narrow, but long, and recurving slightly at the tips; it is graceful, and from the large number of plants in bloom it is a very easy "doer." Mention may be made of Mr. P. Mariton, a hairy French variety: colour, chestnut; likely to be a good thing.

There are so many new and interesting plants in this collection, that we are able to notice but a portion, nor can remark upon many of last year's novelties, and new ones from other raisers. First-rate blooms of such sterling varieties as Amiral Avellan (Calvat), Jno. Machar (Cannell), A. H. Fewkes (American), Mrs. E. S. Hills, Mutual Friend (a capital white one), Mdlle. Paul de Croy, and International, were, however, to be seen; and some of the finest flowers of that excellent Anemone-flowered variety, Descartes, we have yet seen. We must conclude, however, after mentioning an incurved Japanese named Lady Playfair, from the same American raiser as A. H. Fewkes; the bloom is peculiarly pretty from its delicate tint. *P.*

NURSERY NOTES.

THE ALLINGTON NURSERIES, MAIDSTONE.

IF clean land, thoroughly-well tilled, with half-a-foot of absolutely loose soil on the surface through constant working, and stocked from centre to circumference with healthy young trees, are indications of skilful management, then Messrs. Geo. Bunyard & Co. are entitled to congratulation. The fight of trees versus weeds, has not been left without the evident interference of the cultivator in favour of the crop that will pay him, or which at any rate, is more likely than the other to do so. It is undoubtedly disappointing, that notwithstanding all that has been said and written about fruit culture for profit, and for home consumption, there still exist hundreds of acres of good land, on which the old fruit trees of a generation ago still stand, trees that would be unremunerative if only on account of their great age, though in many cases they are doubly worthless, because the varieties they represent have been superseded by better and more useful sorts. On the other hand, there are thousands and thousands of young trees of the best varieties in the nurseries, which would yield a profit to the cultivator if they were planted in the place of these moss-grown antiquities, that furnish arguments of a kind every year to persons seeking to throw cold water on the fruit-growing movement. Fortunately, this is not the case in regard to gardens. Gardeners have learned the lesson well, that good crops of fruit of first-class quality may be looked for only on trees of moderate age, and that if these fruits are to be worth anything, the best varieties possible must be planted; hence there has arisen from gardeners a satisfactory demand for these.

Such remarks as the above are quite *à propos* of our visit to Maidstone in early October, inasmuch as the large quantity of fruit trees there forcibly reminded us of such orchards as we have just described. How satisfactory it would be to the owners of such fruit grounds and to all concerned, if they could be convinced of their opportunities!

Perhaps few localities have had a less quantity of rain during the season now rapidly closing than the Maidstone district, for Mr. Bunyard informed us, that even when the long-endured drought came to an end, the rainfall there was particularly light. "Have you done any watering?" we ventured to ask. "No," was the reply, "not any, it would be impracticable on a large scale, and I think the system

results in more harm than good." How to explain the healthfulness and vigour of the whole of the trees after such a statement, would be a puzzle to strangers, but one having a knowledge of the system of culture here, would unhesitatingly conclude that the surface tilling, the constant hoeing of the surface soil, are the chief causes of the abundant success. The soil must nevertheless be very exceptional, because, while it is comparatively light and conducive to root-formation, it was of sufficient depth and retentiveness to pass through a season like that of 1895 with but few ill-effects. We first went among some trees of the well-known Apple Bramley's Seedling, "just to see the crops of fruit they are carrying." Yes, here were fruits of surprising quality and quantity. Nor did Lane's Prince Albert, which was fruiting in the same spot, make a less worthy show, but, of course, neither sorts had such an effect as the fruits of Gascoigne's Scarlet Seedling, always a well-coloured Apple, but in the Maidstone district especially so, where indeed it is fiery red. Some fine trees were close to these bearing capital fruits of Banmann's Winter Reinette, a variety of which many growers we have met have a very high opinion. Bismarck, too—a grand apple—was bearing heavily, but it is seldom it does not, and we have an idea that planters are not using this variety so freely as they might with advantage. One of its most pronounced qualities is this predisposition to heavy cropping, which we have noticed again and again, then the fruit is of good size, and according to information we have had from some who have tasted the fruit when cooked, it is also of first-rate quality. In appearance the Apple is certainly good, and in addition to other advantages it possesses, the fruit hangs well upon the trees, and may be harvested later than many varieties. We next pass a grand lot of standard Cherry-trees, pretty specimens, and in robust health, capital trees for the Kentish, or, indeed, any other Cherry orchards. But near by is a very large batch of standard Apples and Pears, also for orchard culture. What excellent trees they are! Seems so smooth and straight, as if moulded, and thick withal. These 60,000 standards were only four years old, and the majority of them have large heads that suggest rather half-a-dozen years. How the different varieties vary in their growth! Of course, all the trees are budded or grafted low down, and the stem is formed by the scion, not the stock, hence the difference in time required to get varieties up is considerable. In another part of the nursery a further batch of standards is seen, and Mr. Bunyard estimates that in all he has about 120,000 such trees. Now, the entire stock of fruit-trees is decidedly first-class, but none in the collection are finer of their kind than these orchard standards. As a matter of course, the varieties represented in these trees are those of sterling merit, and useful for market. We noticed a few of them, namely, Ecklinville Seedling, Golden Spire, New Hawthornden, the Queen, one of the best flavoured of culinary varieties; Beauty of Bath, Beauty of Kent, Paesgood's Nonsuch, Colonel Vaughan, a great favourite in Kent; and last, but not least in importance, Newton Wonder, a first-class Apple, sent out by Messrs. Pearson & Sons, Chilwell. This Apple, we believe, was the result of a cross between Dumelow's Seedling and Blenheim Orange, and the young trees and fruits upon the same at Maidstone, were sufficient evidence of its cropping qualities, and of the excellent character of the fruits. Passing on to one of the slopes—which are common in Mr. Bunyard's ground—we were compelled to pause to inquire the name of the Apple making such an effect in one of the hollows. "That is Gascoigne's Scarlet Seedling again," said Mr. Bunyard. It was another batch of this excellent Apple, and, without doubt, it furnished the greatest pictorial effect to be seen in the nursery. But there is little time to linger in such a nursery, and we were soon remarking upon another excellent Apple named Allen's Everlasting. It is usually good in March, the quality is splendid, and it crops very freely. The fruit is only of medium size, russety in appearance, with a few red blotches. A remark is certainly

deserved by a quantity of first-class two-year-old trees of Stirling Castle, an Apple that needs no praise now. Then there is Hollandbury, a good useful Apple; and many others, which we must perforce pass over. In doing so, however, the health and kindly growth of the trees, whether on the free stock or the Paradise, is very apparent. Double grafted trees also are seen, varieties that are not satisfactory except treated so, and by such means even Blenheim Orange Pippin will bear crops of fruit as pyramids at a comparatively early age. A considerable number of amateur standards were looking well. This form of training is still very popular with amateurs, as the stem can be cropped its whole length, until a good-sized head is made, when, if desired, the stem may be cleared closely of all growth.

two reasons. The first is, that the trees here which were grafted upon the Paradise many years ago, furnish effectual proof that there was nothing in the objection that used to be raised that trees so treated would be short-lived. The other reason for walking amongst them was the opportunity they afford of seeing rare and interesting varieties that are, to some extent, little known; and reference might be made to the Apple White Transparent, an excellent early Apple, for which Mr. Bunyard obtained an Award of Merit from the Royal Horticultural Society a short time ago. It is considered much better than Early Julian, is a sure cropper and capital grower. Foster's Seedling, with flesh similar to Cellino Pippin, and flavour like Blenheim Orange; and Mrs. Barron, a good kitchen fruit, might both be better known. Mr. Bunyard thinks

crops of fruit from Apricot indoors. These must be passed, however, with the remark, that of the former, gardeners would do well to plant less sparingly; and in regard to the Apricots, the borders during winter should be kept as dry as it is possible to get them. Strawberry-plants are grown in large quantities.

By no means do Messrs. Bunyard & Co.'s treasures consist exclusively of fruit trees, though these are their speciality. Roses we saw in abundance, standard varieties especially. The choicer sorts of trees and shrubs of vivid-coloured foliage, or conspicuous flowers, and herbaceous plants, less common than most of the species, are also to be seen at Allington; and had we more time and space at our command interesting notes concerning such might be written.

FIG 95.—HOULETIA TIGRINA.

Large-sized trained trees of Apples and Pears, as gridiron, horizontal-trained, or fans, are kept for supply to purchasers who wish to cover walls or espaliers with trees that will fruit at once.

Passing some trees that had been transplanted, a discussion arose as to whether fruit trees should be pruned when first planted. Mr. H. A. Pearson, in his lecture at the Palace recently, after fairly stating the grounds for pruning and for non-pruning the first season, concluded by recommending that the trees should be pruned. Mr. Bunyard, with his large experience, is quite of an opposite opinion. Theoretically, the reasoning of either school is very plausible. Each agree that their efforts should be to induce most root action; but to this end different and quite opposite means are adopted. It is a question that practical planters may soon, by experience, settle for themselves.

The trial ground should not escape notice, for

that James Grieve will be better than Cox's Orange Pippin; and our attention was directed to the dark green culinary Apple, Duke of York, from Tasmania, as being an immense cropper.

Pears occupy an important position in this nursery. Large breadths were observed of bush, pyramidal, and trained trees; but our time was spent on this occasion more particularly amongst the Apples, which this season have carried so many more fruits than the Pear trees.

It may be interesting to state that although a good number of orchard-trees of Apples, Pears, and other fruits, are well grown at Maidstone, the best specimen Apples were to be found this season on the trees in the open nursery.

Many other items of interest call for remark, such as the splendid and large stock of Fig trees of the newer varieties in pots, as well as others, and the successful method by which Mr. Bunyard obtains good

HOULETIA TIGRINA.

ON the occasion of the meeting of the Royal Horticultural Society on Tuesday, October 23, Sir Trevor Lawrence, Bart, exhibited an inflorescence of this distinct and very pretty species. They have free, spreading, sub-equal sepals, and a narrow fleshy lip continuous with the column, the base concave, and the lateral coming from behind the retrorsely-curved horn-like processes; the middle lobe articulated and undivided, usually truncate at the base.

The pseudo-bulbs are one-leaved, and the flower-spike rises from their base. The pseudo-bulb in this species is 2 inches long, ovate, and the leaves plicate, and of a dark-green colour. The sepals are concave, of a pinkish-buff mottled with greenish-yellow; petals bright yellow, with mottling of crimson; lip pale yellow, at the tip white, with minute purplish-crimson spots elsewhere.

This New Grenadan species (fig. 95), like the others, succeeds in the intermediate-house, and during its period of flowering it should be suspended, as the inflorescence arches forward and droops over,

PREPARING LAND FOR, AND PLANTING, FRUIT TREES.

I RECOLLECT attending a Fruit Conference at Chiswick when Mr. Pearson of Chiswell, in a lecture, laid stress upon the way nurserymen were sometimes accused of supplying unsatisfactory fruit trees, while the cause of failure rested with the planter. That non-success in fruit culture may not unfrequently be rightly attributed to either bad planting or inadequate preparations for planting, I think few will deny; possibly mistakes are most often made in not taking sufficient pains with the preparations. In commencing hardy fruit culture, it pays to do everything connected with it thoroughly well; and the most important points that must not be overlooked, are firstly, to select a suitable site, and properly prepare it; secondly, to purchase good trees of the best varieties; and thirdly, to plant them well, and protect them.

In dwelling upon this important subject, I cannot do better than describe the manner in which the fruit-garden here was formed and planted, particularly as the trees and bushes are making very satisfactory progress. The site selected was an old pasture situated above the fog-line, upon a rather sharp S.E. slope, well sheltered from the north and east by higher land and trees, and fairly so from other quarters by trees. The soil is a good loam, inclined to be heavy, resting in some places upon a stony subsoil, and in others marl. The garden, which is oblong in shape, was made and planted in 1893; the work commencing in April, by draining the land with 3 inch tile drains, placed 3 feet deep, and 15 feet apart. This is a necessary preparation that does not always receive the attention it deserves. An instance of this came under my notice some years ago, when I was asked advice about some young Apple trees which were what was termed "going back." After ascertaining the nature of the soil, the cause of the unhealthy condition of the trees was attributed to deficient drainage. "Oh! that cannot be, just look at the fall in the ground," was the reply. A descent in land that possesses a tenacious sub-soil will not, however, ensure good drainage. Once the draining was completed, the land was trenched to the depth of 2 feet 3 inches in the manner known as bastard trenching—the top spit being kept upon the surface. This proved a hard undertaking, for, as will be remembered, the summer of 1893 was very dry, and consequently, the soil was unusually hard. This dry state of the weather, however, had a beneficial influence upon the work, both by sweetening the soil and killing herbage; at the same time, it kept the newly-cultivated land in a dangerously aerated state for planting, and in order to counteract this evil, and also break the clods, a Cambridge-roller drawn by three horses was several times run over it. This done, another digging, this time one spit deep, was afforded, and as it proceeded, the turf was well broken, and mixed through the soil—thus a satisfactory site for planting fruit trees upon was prepared.

Intersecting grass walks, the principal ones being 10 feet wide, and the others 5 feet, divide the garden into six divisions, the two largest occupying upwards of half the garden, and placed on the highest ground, being devoted to Apples. The next two, which take up more than a fourth of the space, are planted respectively with Pears and Cherries, and Plums and Cherries; while the remaining two, which are situated on the lowest ground, are occupied by Currants, Gooseberries, and Raspberries. The Apples, Cherries, Pears, and Plums which are pyramidal and bush in form, are planted in squares, and are 12 feet apart. The Currants and Gooseberries are in rows 6 feet apart, and the Raspberries are also in rows 6 feet apart, the plants being 2 feet asunder in the rows. It has been remarked that the rows of Raspberries are needlessly far apart, but this is not so, for it was found to-day by measurement that many of the canes of *R. Superlativa* are upwards of 9 feet in length; at the same time they are clothed with

robust foliage, and bright red-coloured rind from base to top (good indications of the probable production of abundance of fruit next year), which could scarcely be the case if the rows were appreciably closer together.

Planting commenced with the bush fruits during the last week in October, and was completed with Apples the second week in November. The trees, when received after a journey of about 140 miles, were unpacked, had their roots dipped in water, and carefully laid in damp soil. The weather being favourable, and the ground in excellent condition, however, no time was lost in at once planting them in their permanent quarters. In order to facilitate this, the position of the rows had been previously marked out, with pegs at each end, and a line had also been prepared by being knotted to indicate accurately when stretched each tree's station. In proceeding with the planting, the roots of each tree were closely examined, when any broken or injured portions were removed by a clean cut made on the under side. Pains were taken to spread the roots regularly, and keep them up near the surface of the soil, which was pressed firmly about them. Any trees that required it were then staked, their bark being protected from injury from the ties by pieces of old indiarubber hose, and finally each tree was accurately named, and mulched with farmyard manure. The only quarters that received manure, other than that employed as a mulching, were those occupied by Currants, Gooseberries, and Raspberries, and these had a dressing of decayed farmyard manure worked through the surface-soil. It may be mentioned that the only losses that occurred in the plantation, which covers nearly three acres of land, were a few Raspberry-canes. *Thos. Coomber, The Hendre Gardens.*

BOOK NOTICE.

THE GENUS *MASDEVALLIA*. By the Marquess of Lothian and Miss F. H. Woolward. (Porter: London.) Part VII. Price £1 10s.

THE authors of this elegant monograph are getting near the end of their work. A notice to subscribers issued with the present part states that the next number (Part VIII.) will, it is hoped, be the last. It will be well, therefore, to postpone any further remarks until the completion of the book, when we shall hope to review it as a whole. Suffice it to say that, with Part VII., the number of species and varieties depicted and described is brought up to seventy, the recent decade comprising *Masdevallia caloptera*, *M. gemmata*, *M. O'Brieniana*, *M. pachyura*, *M. porcelliceps*, *M. radiosa*, *M. triaristella*, *M. trinema*, *M. troglodytes*, and *M. velifera*. With two exceptions, these are all species of the late Professor Reichenbach; and also, with two exceptions, were first described in the pages of the *Gardeners' Chronicle*. Several are very rare; and in at least three cases, Miss Woolward has been unable to obtain any record of the native habitat, which remains a trade secret—to the advantage of the importer, but seriously to the disadvantage of science. *A. B. R.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By JOHN LAMBERT, *Gardener, Plover Castle, Welshpool.*

ASPARAGUS BEDS.—Where Asparagus is grown in beds, and the heads are preferred in a green natural state, the soil above the roots will not be more than 3 inches in thickness. This may be forked over very lightly and carefully so that no roots are broken, to break up the hard surface of the soil. The manure to be applied should vary according to the nature of the soil. If inclined to be very retentive of water, use stable-dung and a small quantity of light sandy soil mixed with it. This dressing may be made 2 inches deep. If the soil is already sufficiently light, afford the beds a good dressing of cow-manure, which will enrich the soil, and also afford protection

to the roots from very severe frost. Where a thick surface of soil is kept above the roots for blanching purposes, some of this may be removed by drawing it with rakes into the alleys, and the surface broken up lightly. Then apply a dressing of manure, and leave the spare soil in the alleys for use in the spring. If the beds are getting very poor, some finely-crushed bones may be given at this season of the year, but artificial manures are best applied to a crop when in active growth. If Asparagus is grown on the single-row method, the raised mounds are apt to become bare towards autumn, owing to the heavy rains, and very little forking will be required; the soil between them, however, should be deeply broken up, and every other space between the rows that is used for a path when cutting the produce. Dress the mounds with nice rich, fresh soil if they are too bare, and cover them and the spaces between with a good dressing of manure. No further attention need be given them till spring.

FORCING.—Preparations should be made for forcing Asparagus in proportion to requirements. Good roots for forcing may be produced in about three or four years, if seed be sown in rich, deep soil, and good dressings are afforded frequently. Roots thus grown will now be ready for lifting. Not many gardens are provided with permanent beds for forcing every alternate or every third year, and heated by hot-water pipes or manure. Such a method is, no doubt, the best, because the roots are not disturbed in the least, and being forced gently, they usually prove satisfactory. But, on the other hand, very good Asparagus can be obtained from lifted plants provided they are strong. The first step in the preparations should be the mixing, turning, and wetting of fresh stable manure and leaves. The material should then be turned several times at intervals of about four days or so. A pit of suitable size may be filled with this, or failing pits, such places as Cucumber or Tomato-houses may be used for the purpose. Tread the material down well, and when the heat begins to decline, cover with from 3 to 4 inches of soil. Then place the Asparagus roots so that they just touch each other, and cover them with soil to whatever depth may seem desirable, and if blanched heads are preferred, the light may be excluded. The surface of the soil should not be more than about 9 inches or so from the roof-glass before it is settled by sinking. Keep a test-stick or thermometer plunged in the bed, and do not allow the heat of the manure to rise too high, 75° is warm enough, but 10° hotter will not harm them. A single row of pipes will afford what atmospheric heat may be required. When water is used, it should be tepid. After the "grass" appears, keep a moist-growing atmosphere of about 55°. Another pit should be filled in the same way to come into cutting when the first is exhausted. A bed will not last good for a longer period than six weeks, and it will commence to bear in about two weeks after putting the roots into it. Bottom-heat may be obtained from hot-water pipes, and very good results are obtained by this means when care is used, but such heat is more apt to fluctuate than that furnished by a bed of manure, and the latter affords a moist heat, whilst the former is dry, unless evaporation pans are used underneath the bed, or the pipes are immersed in water-tanks underneath. Keep a stock of manure mixed ready for refilling the pits.

PLANTS UNDER GLASS.

By W. H. SMITH, *Gardener, West Dean Park, Chichester.*

LATE-FLOWERING CHRYSANTHEMUMS.—Where many flowers are required for cutting in the months of December and January, the varieties which flower late, or which can be retarded, are very useful, and especially if large vases have to be kept furnished with flowers, for as most of the flowers which are forced have short stalks, the long stemmed Chrysanthemum blooms form capital material for use. These late varieties should not be much disbudded, being then much more graceful, and therefore of more use for decoration than the larger heavier blooms. If a house having a northern aspect is available, these varieties may be retarded in their flowering very easily. Air must be admitted to the plants freely whenever there is no frost or it is not damp-laden. When there is much dampness in the air, gentle fire-heat should be afforded, and air in small amount given by the top and bottom ventilators or sashes. Varieties for very late flowering are Lady Canning, Lady Lawrence, Ethel, Middle, Lacroix, W. H. Lincoln; and the semi-double yellow coloured Admiral

Symonds, which is one of the best for cutting purposes.

TREE CARNATIONS.—These plants now coming into flower should be afforded weak manure-water in liberal quantities. It need not always be applied in that way, as a small quantity of fertiliser (Clay's or other) may be sprinkled on the surface of the soil, a job which may be readily done when tying and rearranging them. Carnations now require very careful watering, and to be kept free from aphids by occasionally fumigating the houses with tobacco or the XL All compound. A genial growing atmosphere, and a temperature of about 50° by night to 55° by day should be maintained, with air left on at the upper and lower ventilators. In bright weather a light syringing between the pots will help to keep red-spider in check.

CAMELIAS.—Those plants which have begun to open their flowers should be rather liberally supplied with water at the roots, provided the drainage is good, and they are not over-potted; weak manure-water may also be occasionally afforded them, that is, if they seem to need it. Potted plants which may be losing their flower-buds, should be placed for an hour in a tub of water, so as to enable the water to reach every part of the ball, the centre part having probably become dry.

AURICULAS.—These plants will now require very little water, but plenty of air, whenever there is no frost. In wet or very damp weather, it is a good practice to tilt the frame lights at the top and bottom. The frame should face the south, and be covered with mats in case of severe frost.

LILIUM LONGIFLORUM VAR. HARRISI.—The bulbs for early forcing should be purchased forthwith and potted up, placing each bulb in an 8 inch pot, in turfy loam, leaf-mould, cow-manure in a dry state, and coarse sand. If the soil be moderately moist, no water will be needed before the roots permeate every part of it. Plunge the potted bulbs in a cold frame, in cocoa-nut-fibre refuse, covering them to the depth of 5 inches. Here they must remain until the shoot is about 1 inch long, when it will be found that the pots are filled with roots. The plants should then be gradually inured to the light, and eventually put into a warmer temperature.

DAPHNE INDICA ALBA.—A few of the plants may be placed in a temperature a little warmer than that they have been used to, and not forced too hard, or the plants will be apt to lose their flower-buds. A temperature of 50° by night and 55° by day will be sufficiently warm.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

SELECTION OF FRUITS FOR SMALL GARDENS.—The select list of fruits given below is intended for the use of those who may have small gardens, and are desirous of planting a few well-tried varieties of each kind, to afford a useful supply for dessert and culinary purposes.

Dessert Apples.—Irish Peach, King of Pippins, Cox's Orange and Starmer Pippins, Claygate and Adam's Pearmain; of culinary varieties, Keswick Codlin, Stirling Castle, Carlisle Codlin, Annie Elizabeth, New Northern Greening, and Damsel's Seedling.

Plums.—River's Early Prolific, Greengage, Kirke's, Victoria, Monarch, and Cox's Golden Drop.

Pears.—Williams' Bon Chrétien, Fondante d'Automne, Marie Louise, Doyenné du Comice, Maréchal de la Cour, Glou Morceau, and Josephine de Malines.

Cherries.—May Daks, Bigarreau Napoleon, Elton, Belle Magnifique, and Morello.

Apricots.—The Moor Park.

Figs.—As a trustworthy Fig in the south, Brown Turkey is the best.

Gooseberries.—These may consist of Early Sulphur, Whinham's Industry, Red Champagne, and Red Warrington.

Strawberries.—Vicomtesse H. de Thury, President, Royal Sovereign, and Waterloo.

Currants.—White Dutch, Red Dutch, Ruby Castle, Lee's Prolific Black.

Raspberries.—Superlative, and Yellow Antwerp.

Nuts.—Kentish Cob or Lambert's Filbert.

Peaches.—Alexander, Grosse Mignonne, Noblesse, Bellegarde, Albatross.

Nectarines.—Pitnaston Orange, Balgowan, Stanwick Elrage.

Of these the Peaches, Nectarines Apricots,

and Figs, of course, require the shelter of a wall, one either west, south-west, or south, being suitable; all the rest may be grown in the open, either as pyramids, bushes, espaliers, or standards, as the case may be.

FRUIT FOR MARKET PURPOSES.—In planting for market purposes, a multiplicity of sorts should be avoided, and only those selected which are known to be prolific, coming quickly into bearing, and of taking appearance, either in regard to colour or size—colour rather than good quality being sought after in the majority of cases. A few that generally give a fair return are, of Apples, Mrs. Gladstone, Devonshire Quarrenden, Worcester Pearmain, Lady Sadeley, Red Astrachan, King of Pippins, Cox's Orange, Gascoign's Scarlet, Warner's King, Ecklinville, Annie Elizabeth, Lane's Prince Albert, Wellington, and Northern Greening.

Pears.—Williams' Bon Chrétien, Louis Bonne of Jersey, Beurré Clairgean, Jargonelle, Fertility, Doyenné du Comice, Bishop's Thumb.

Plums.—River's Early Prolific, Mitchelson's, Danyer's Victoria, The Czar, Belgian Purple, Pond's Seedling, The Sultan, Monarch, Belle de Septembre, Cox's Golden Drop, Prince Englebert; and Damson the Crittenden.

Cherries.—Frogmore Early, Bigarreau Napoleon, Werder's Early Black, Belle Magnifique, and Morello.

Gooseberries.—Whinham's Industry, Keepsake, Crown Bob, Red Warrington, and Early Sulphur.

Currants.—Lee's Prolific Black, Black Champion, Red Dutch, Ruby Castle, and, if a white variety be required, White Dutch is the best.

THE FLOWER GARDEN.

By BAILEY WADDA, Gardener, Birdsall Gardens, York.

HERBACEOUS BORDERS.—The making of new herbaceous perennial borders, and the rearrangement of old ones, may now be proceeded with when the weather permits. New borders should be arranged whenever possible, so as to have a broad walk on each side, being more attractive in this way than when there is only a walk on one side. Besides, it gives more space to display the plants, and the border need not be of an inordinate length. New ground, if of a strong loamy or clayey nature will be improved by charring the top spit; and it should be well drained and afterwards trenched 2 feet deep, mixing with the staple a good quantity of road grit, leaf-mould, and short manure; but on the other hand, if the soil be light or sandy, or rests on sand, gravel, rock, &c., artificial drainage may not be required, but a mixture of strong loam, cow dung and short manure will improve its holding qualities—these should be incorporated with the staple on trenching it. When a new border is made on opposite sides of a walk, the width of the walk should determine that of the border on each side, as it does not look well to have borders of less width than the walk. As a rule, a border 9 feet wide is sufficiently wide, for showing the plants from the walk, as a greater width does not allow of the plants at the back of it being seen to advantage. As a margin to a border running through a kitchen garden, a Rose fence about 5 feet high at the back makes a suitable dividing line. For the purpose of the fence, strong Larch poles, or a diagonal rustic lattice constructed from the same, answer well. This may be planted with a few climbing plants, Honey-suckles, Clematis, and Tea and other varieties of Roses. I am of the opinion that no kind of permanent edging should be used in the front of the borders, these being in the way of the flowering plants, and the stiff outlines spoil the effects of a border of mixed flowering plants. Nothing impoverishes the soil more than Ivy, Yews, &c., and such edgings form the best harbour possible for the all-devouring slugs. Grass-edging, when the turf is in perfect keeping, form the most appropriate margins for a border situated in a flower garden or pleasure ground. A border gives the most satisfaction when its position is well sheltered, but exposed to the sun, and it is backed by shrubs. The planting in regard to the height of the plants, and the colour of their flowers, and the season when they appear, is a matter for careful study; and to enable one to manage it readily, a plan should be made to scale, and the position of each plant and group of plants indicated on it. No two men will plant a border just alike, and scarcely any rules are of service, excepting very general ones. For instance, it may be proper to plant bold clumps of showy plants at irregular dis-

tances apart throughout the borders, starting at the back with Hollyhocks, Delphiniums, Phloxes, Helianthus, Eryngium, Giant Fennel, Golden Rod, &c. Rheum palmatum, Kniphofia Uvaria and glaucocens, and similar tall-growers; following these with Pæonia herbacea in variety, Spiræas, Perennial Asters, Inula glandulosa, Rudbeckias, Potentillas, Pentstemons, the taller species of Campanula; Iris, Caltha palustris, Trollius europæus, Anemones, Hemerocallis in variety, and gradually finish off with quite dwarf plants at the front.

At the present time divide and plant clumps of old, strong-growing Pæonies, Phloxes, Helianthus, Iris, &c., which if planted at this season soon establish themselves in the spring, and flower satisfactorily in their season. Plants in existing borders should have all dead and decaying foliage cleared off them, and the soil carefully pricked over with a digging-fork, following this operation with a dressing 2 inches thick of well-rotted stable-manure and loam. The task of selecting the plants for filling a new border of any considerable size is one of great interest, and those who may not have had much experience, will have to devote a good deal of care and discretion to the matter.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

THE CUCUMBER-HOUSE.—In keeping Cucumber-plants in health and fruitfulness, two facts should be borne in mind, viz, light cropping and a regular temperature. Moreover, there is always, during spells of frost, danger from affording too great an amount of artificial heat so that the night temperature often exceeds that of the day. To allow this disparity of heat to occur causes a weak growth in the plants, and leads to that pest of the Cucumber-house, red-spider, making its appearance. Less syringing of the foliage should be done as the winter advances, and the atmosphere kept moist by the use of evaporating pans, and by damping the walls and paths occasionally in the daytime. Almost daily attention to stopping the points of the shoots at the second or third leaf is necessary; and the shoots should be thinly trained over the trellis, and no crowding allowed, or the foliage will soon become of a pale green unhealthy colour, and the flowers fail to set, or the fruits become deformed. Slight surface dressing of some fairly rich, friable compost should be afforded at intervals of ten days, the soil used being rendered warm by keeping it in baskets over the boilers. Weak liquid-manure afforded once a week is of much value; but if root-water be used, it should be very weak, or the roots may be injured by it, and the fruit made bitter. The day temperature of the Cucumber-house or pit may range from 65° to 72°, and that of the night from 63° to 65°, roof coverings being afforded during severe frosts, as advised by me in last week's calendar. Fresh air in small quantity is always beneficial, and may be admitted for a short time daily, if it can be done without causing a check to growth.

TOMATOS.—These plants have made good progress, and at the present time they have plenty of fruits in different stages of development. Since they were placed in the house, a gentle warmth has been maintained in the hot-water pipes, and abundance of air afforded by day, with the result that growth is starchy, and the plants have continued to produce flowers, and set them. Applying water to the plants requires care, or the soil will become too moist to suit their well-being. As soon as a fruit begins to colour generally all over, it should be removed, thus not taxing the strength of the plants too much. Continue to ventilate the house freely in favourable weather, but do not let the night temperature fall below 50°.

VARIORUM.

PHENOMENA OF NATURE.—We hear of new Potatoes and Strawberries at Salcombe; and I know of one other place in the neighbourhood where new Potatoes and Green Peas were enjoyed on Friday last. Is it not equally unusual to see a brood of newly-hatched wild ducks on a pond, partially covered with ice on October 29, while swallows—two only—were flitting over the surface in the sun as if it were September? It struck me as very phenomenal—or, rather, Nature slightly out of joint. Is it so? H. C., Oct. 31, in *The Western Morning News*.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.	
SATURDAY,	Nov. 9—Royal Botanic Society.
TUESDAY,	Nov. 12 } Royal Horticultural Society, at the Drill Hall, Westminster.
SHOWS.	
MONDAY,	Nov. 11—Gloucester Root, Fruit, and Grain.
TUESDAY,	Nov. 12 } Chrysanthemum Shows at Croydon, Louth, Plymouth, Kingston-on-Thames (all two days), and Farnham.
WEDNESDAY,	Nov. 13 } Chrysanthemum Shows at Birmingham, Bournemouth, Bristol, Hull, Hertford, Isle of Thanet, Reading, Lewes, Faversham, Rugby, Barnsley (all two days), and Chelmsford, Ayr, and Yeovil.
THURSDAY,	Nov. 14 } Chrysanthemum Shows at Edinburgh (three days), Winchester, Lincoln, Wimbledon, Barnet, Guildford, Fitchley (all two days), and Caterham and Cambridge.
FRIDAY,	Nov. 15 } Chrysanthemum Shows at Bolton, Sheffield, Bradford, Stockport, Hinckley, and Chorley (all two days).
SATURDAY,	Nov. 16 } Chrysanthemum Shows at Batley, Crewe, and Bacup.
SALES.	
MONDAY,	Nov. 11 } Dutch Bulbs at Protheroe & Morris' Rooms. Plants from Belgium, Roses, &c., at Protheroe & Morris' Rooms.
TUESDAY,	Nov. 12 } Dutch Bulbs at Protheroe & Morris' Rooms. Imported Orchids at Protheroe & Morris' Rooms.
WEDNESDAY,	Nov. 13 } Dutch Bulbs at Protheroe & Morris' Rooms.
THURSDAY,	Nov. 14 } Dutch Bulbs at Protheroe & Morris' Rooms. Plants from Belgium, Roses, &c., at Protheroe & Morris' Rooms.
FRIDAY,	Nov. 15 } Dutch Bulbs at Protheroe & Morris' Rooms. Orchids from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.
SATURDAY,	Nov. 16 } Dutch Bulbs at Protheroe & Morris' Rooms. Sale of the remaining portion of the Normandy Manor Estate, Guildford, at the White Lion Hotel, Guildford, by Protheroe & Morris.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—42°.6.

National Chrysanthemum Exhibition.

THE great exhibition of Chrysanthemums by the National Society, has passed, and the excitement necessarily attending competitive displays of this character is now transferred from the Metropolis to provincial towns, where it will surely be maintained in varying degree, until the remotest part north of the Tweed has enjoyed in its own degree of fulness the reign of the Autumn Queen. No such exhibition as we witnessed during the present week at the Royal Aquarium could have been made in a season unpropitious to the growth of the Chrysanthemum, and that 1895 has been a favourable year has been clearly proved.

The Japanese section, which undoubtedly continues to be the one most popular with growers and with the public, was magnificent. The best collection included a considerable number of novelties, proving that in regard to varieties, progress is still made in the development of larger and better flowers, for the greater part upon types which have existed for some time. A word of warning is needed by raisers and judges alike, that mere size of bloom, unaccompanied by refinement and a good habit of growth, should not be encouraged, though in this respect there would appear to be greater discrimination exercised than was the case some time ago.

Incurveds were as well grown years ago as we grow them now; but the quality of the flowers this year is, we think, decidedly better than it was last season, both in depth and finish. Apart from exhibitors, the general grower has lost his

enthusiasm for this section, which is probably because very much greater care and skill are required to bring the blooms to perfection than are necessary in the case of Japanese varieties. A badly-grown incurved flower is by no means handsome, but is much less so than a Japanese bloom with incurved petals. On the other hand, a perfect incurved flower is not devoid of attraction, and it is certainly worth encouragement as being a very distinct type of flower. A few new varieties are exhibited this season, but the additions are fewer in comparison with the other types. In this respect it is satisfactory that the National Society recognises the desirability of encouraging the cultivation of every form, and whether or not they are to be seen in general collections, the Pompon, the Anemone, Reflexed and Single-flowered varieties, may be always found at this exhibition in more or less, though generally satisfactory, degree of perfection. Such types are pretty, and at least afford some relief from the larger and more showy varieties. The single-flowered ones especially are very attractive, and growers would be wise did they give them a little more consideration than is their wont.

Trained Chrysanthemum plants have always a place at the Aquarium Show, and to many persons they form attractive exhibits as representing a great deal of careful and skilful work. A well-grown naturally-trained bush plant, not mercilessly, but moderately disbudded, is however, an equally pretty object.

The table decorations and various devices for exhibiting the decorative usefulness of the Chrysanthemum were deserving of great praise.

It is interesting during a series of years to observe how different growers come prominently to notice, and for a time hold the field with conspicuous success. At the show under notice, the leading class for Japanese and that for incurved flowers were easily taken by a young gardener who comparatively recently commenced to exhibit. The Societies' competition was won by the Southgate Chrysanthemum Society, and in this case also the whole of the forty-eight blooms were furnished by the same grower. The two leading classes at the Crystal Palace this year, and the same classes at the Aquarium last year, were spoils to the same exhibitor. In 1893, he took the leading class for incurved flowers at the National Society's show, but not that for Japanese. Blooms from the same collection will, we believe, be shown at Edinburgh, with what success remains to be seen.

Paris Notes.

Of all similar gardens known to us the Parc Monceaux at Paris easily takes first prize for town-squares. It has more than once been mentioned in these columns, but its grassy mounds, noble trees, and interesting flower beds, are always charming. The constituents of some of these groups may be enumerated. One consisted of a bed of Rhododendrons, with tall deciduous Magnolias interspersed. Another shrubbery consisted mainly of purple Hazel, kept topped, intermixed with Weeping Silver Birch, surrounded by a line of Scarlet Salvia (*S. elegans*), and bounded by a mixed edging of *Tagetes*, zonal *Pelargoniums*, *Ageratum*, *Verbena*, *Golden Feather*, and other plants of like character. Another very effective arrangement was composed of a centre of tall *Papyrus* (*Papyrus antiquorum*), surrounded by *Cyperus alternifolius* and *Panicum plicatum*, and with an edging of *Centaurea candidissima*, alternating with plants of pink *Iresine*. An adjoining bed was composed entirely of *Cannas*,

and the contrast between the two was delightful. The frost, however, had given notice that it was time to take up the *Cannas*, and the hint was taken in the last week of October both here and in the *Jardin des Plantes*.

Generally speaking, there does not appear to be much novelty in the way of garden decoration. The beds near the Louvre are much as they were in the days of *LOUIS PHILIPPE*; and the same fine "sub-tropicals" which were used in the days of the Empire, are still employed elsewhere, such as the fine *Solanums*, *Wigandias*, *Ferdinandias*, *Musa-Ensete*, *Phoenix*, &c. These are grand plants for the purpose, but we have got more or less accustomed to them, and it is time to look about for others. Our own gardens and parks are not so much, if at all behind now, unless it be in grouping and in the arrangement of colours, points in which the taste of the French is shown to a degree which we cannot or do not rival. Various *Bamboos* are coming into use, and very distinct and beautiful they are.

It is obviously possible to have too much of a good thing. "Ondulations" are everywhere advertised in Paris by the *coiffeurs* for the benefit of the ladies, and the landscape-gardeners also indulge to the full in this pleasing device. It is a question, however, whether it is not overdone, and whether in a small town-square or garden surrounded by stiff architectural lines, a style of landscape-gardening more appropriate to the *genius loci*, would not be preferable. Why, for instance, reproduce in the small garden of the *Elysées* the swelling mounds of the *Parc Monceaux*?

The Limes and especially the Horse-Chestnuts in the Paris streets present a remarkable and in many cases a miserable aspect. In consequence of the season they have made a second growth, and whilst in the case of the Horse-Chestnut, the drought of autumn seems to have scorched the young growth to tinder, the frost of the last few days has seriously hurt the fresh green of the Limes. What will be the result next spring it will be curious to see.

However excellent the Plane may be as a town tree, it has its defects. In the first place it is a forest-tree, and as such is out of place in a street avenue, where it speedily grows too big and has to be tortured into shape and cut into moderate dimensions. Then, as in the case of our own Thames Embankment, the planters planted them much too closely, or, which comes to the same thing, they omitted to thin them sufficiently early, and so many of the vaunted street avenues of Paris show rows of scare-crows or clothes-props. Round-headed trees of moderate height and medium dimensions are generally preferable for street planting, but they are not easily attainable, as the nurserymen do not keep them in stock. *Cratægus linearis* (if that be the right name?) and the ordinary round-headed false-*Acacias* are well adapted for the purpose. Pyramidal trees may also be employed with advantage. *Pawlonias* are much used in Paris, but would be hurt by spring frost in London. *Ailanthus* makes an excellent spreading tree by the Seine, and does not grow too large in these circumstances.

Here is a hint for our florists and market-dealers. Along the quays not only may well-grown plants be bought for a small price, but also small baskets (say, half a bushel) of good potting-soil can also be obtained. All who have to do with amateur gardeners, or who live in great cities, well know the difficulty there is in getting proper mould. The Parisians have solved the difficulty.

The meeting last month of the five Academies

PLATYCLINIS GLUMACEA IN SIR TREVOR LAWRENCE'S GARDEN, BURFORD, DORKING.

which conjointly form the Institute was a grand spectacle. The President of the Republic was surrounded by the ministers and ambassadors in full *tenue*, the Academicians wore their green-embroidered coats and cocked hats, the doctors and professors their gorgeous and variously-coloured robes. Horticulture was represented by M. LÉON SAY, the President of the National Horticultural Society of France. English science was adequately represented by the President of the Royal Society in doctor's robes, and by several other representative men. The whole scene greatly resembled an Oxford Commemoration, but with this very important difference, that whilst noise and rowdiness characterise the behaviour of too many of the undergraduates in our universities, the students gathered at the Sorbonne were quiet as mice in spite of the provocation afforded by an outrageously long address from M. JULES SIMON, which it would have been preferable to have taken as read, as when read it proved most interesting.

PLATYCLINIS (DENDROCHILUM) OLUMACEA.

—The subject of our Supplementary Illustration this week, *Platyclinis glumacea*, is sufficiently represented in collections in this country to be well known and highly appreciated. When properly cultivated, few species of Orchids can rival this species in grace, the plant being of a compact habit of growth, and carrying its pendulous crowded racemes of flowers well above the foliage. The subject of our illustration is from the collection of Sir TREVOR LAWRENCE, Bart., Barford, Dorking, and carried more than one hundred flower-spikes. The cultivation of the plant is comparatively easy, and it may be grown either in a basket or well-drained pot. In potting, a layer of sphagnum-moss should be placed on the crocks, and the plant raised well above the rim, using a compost consisting of equal parts of peat and sphagnum-moss. *Platyclinis glumacea* is at rest at this season, and should be accommodated in an intermediate-house; and when growth recommences it should be removed to the East Indian-house and placed near the roof-glass. The plant requires, when growing, to be liberally supplied with water at the root and overhead, and the undersides of the leaves occasionally syringed, to dislodge red-spider, with which it is very liable to be infested.

ROYAL HORTICULTURAL SOCIETY.—The next fruit and floral meeting of the Royal Horticultural Society will be held on Tuesday, November 12, in the Drill Hall, James Street, Victoria Street, Westminster; and at 3 P.M. a lecture will be given by Dr. MAXWELL T. MASTERS on "Substitutes for Larch." The committees will meet as usual at 12 o'clock.

A HISTORY OF ENGLISH GARDENING—The Hon. Miss ALICIA ANKERST's history of *Gardening in England*, 1 vol., 8vo, with sixty-five illustrations of old English gardens, will be published by Mr. QUARITCH towards the end of the present month.

NATIONAL AURICULA AND PRIMULA SOCIETY.—The annual general meeting of this Society was held in the rooms of the Horticultural Club, Hotel Windsor, on October 30. The expenditure for the year was £77 14s. 4d., against receipts from subscriptions, £68 13s. 6d. The deficiency of £9 10s. was taken from the reserve fund, which now stands at £11 8s. 6d. The exhibition will, with the permission of the Council of the Royal Horticultural Society, be held in the Drill Hall, James Street, Westminster, as heretofore. A full statement of accounts, and schedule of prizes, will shortly be published. *J. Douglas, Hon. Sec.*

NATIONAL CARNATION SOCIETY (SOUTHERN SECTION).—The annual general meeting of the Southern Section of the National Carnation and Picotee Society was held in the rooms of the Horticultural Club, Hotel Windsor, by the permission of the members, on October 30. Mr. MARTIN

ROWAN presided, in the unavoidable absence of MARTIN SMITH, Esq., President. The financial statement showed a balance in hand from last year of £159 13s. 7d.; subscriptions, £241 15s. 6d., inclusive of special prizes; entrance-fees, 7s. 6d.; total, £401 16s. 7d. The expenditure was £205 17s. 6d., leaving a balance in hand for the present year of £195 19s. 1d. Twenty-six members have been lost during the year by death and withdrawal. Against this fifty-eight new members are added. It was decided to hold the next exhibition at the Crystal Palace about the third week in July. Mr. JAS. DOUGLAS is the Hon. Sec.

THE MAGPIE MOTH.—This pretty but destructive moth (*Abraxas grossulariata*) forms the subject of a leaflet recently issued by the Board of Agriculture. The caterpillars of this moth occasionally cause serious injury to the Gooseberry and Currant crops. They are sometimes also destructive to Apricot trees, and are frequently found on the Sloe and Blackthorn. These caterpillars are often confounded by casual observers with those of the larvæ of the Gooseberry and Currant sawfly (*Nematus ribesii*), but they are essentially distinct. Copies of this leaflet are to be obtained, free of charge and post free, on application to the Secretary, Board of Agriculture, 4, Whitehall Place, London, S.W. Letters of application so addressed need not be stamped.

CHRYSANTHEMUMS AT RAVENSCOURT PARK, HAMMERSMITH.—Now that most of the parks under the control of the London County Council have suitable structures for their annual displays of Chrysanthemums, it would be a real boon to Hammersmith (the home of the late JOHN SALTER, who did so much for the flower), with its 105,000 inhabitants, to have something more worthy of such a progressive borough than the present antiquated little conservatory attached to the library, and which contains about 150 plants, of good sorts, but grown and flowered under difficulties by Mr. W. B. GINGELL, the superintendent.

CHRYSANTHEMUMS IN THE EAST OF LONDON.—Twice a year, in association with the summer exhibition at the end of June, and the Chrysanthemum show which is held in the early days of November, the committee of the People's Palace Horticultural Society offer prizes for the best-kept and stocked greenhouses. In each case, and especially so in the summer, a large number of entries is made; and in connection with the Chrysanthemum show, some twenty entries were sent in. Seeing that the range of the area of the competition extends southwards to New Cross, then along the north side of the River Thames through Stepney to Limehouse, Poplar, and on to Cabott Town, Canning Town, then to Stratford, Leyton, and Walthamstow, and then from Victoria Park to Whitechapel, it is obvious a considerable space has to be travelled over in making the awards, and a whole day is consumed in doing so. A large number—indeed, almost the whole of the greenhouses submitted for competition, are of home construction, small, more or less artistic in design, but in which some excellent plants are grown despite antagonistic surroundings. In order to place the competitors on a somewhat equal footing, it has been found necessary to make two distinct classes—the one confined to the more crowded neighbourhoods found in Mile End, Bow, Bardett Road, Stepney, Limehouse, Cabott Town, and such densely-populated neighbourhoods; the other class applying to the more open neighbourhoods, such as those abutting upon Victoria Park, at North Bow, Plaistow, Leyton, and Walthamstow. It would surprise a stranger to observe how generally the Chrysanthemum is grown under glass, in structures heated in a few instances by hot-water pipes or flues, and in many by oil stoves. Some of the cultivators leave home at an early hour for the City, and do not return till evening, having but little leisure to attend to their plants. Others follow avocations close at home, and can give attention during the middle of the day. The favourite plants of the Eastender, in addition to the

Chrysanthemum, are the Tomato, Fuchsia, Zonal Pelargonium, *Plumbago capensis*, tuberous-rooted Begonia, *Anthericum variegatum*, some excellent specimens of which are grown; Ricinus, Ficus, Aralia Sieboldi, Cacti, various Ferns, Coleus, &c., the choice being a very wide one. The People's Palace Horticultural Society, by means of its exhibitions and lectures, is giving an immense impetus to plant culture east of the City.

PEOPLE'S PARK, DEVONPORT.—This beautiful park, acquired a few years ago from the War Office authorities, is now the freehold of the Corporation of Devonport. The total cost was somewhere about £10,000. With characteristic public spirit, the Corporations of Plymouth, Stonehouse, and Devonport, have been liberal in laying-out their new possession, nor did they limit the carrying out of the work to local effort; for while the actual laying-out was executed by local labour, the plan was furnished by and the supervision of the work entrusted to Messrs. ROBERT VEITCH & SON, nurserymen, Exeter. The park opened on Monday, October 28, by the Mayor of Devonport, Mr. J. BRIGHT JAMES, in the presence of a large and influential assemblage of the citizens and borough officials. To commemorate the event a *Quercus Ilex* was planted by the Mayor, who, borrowing the language of another craft, declared the tree to be "well and truly planted." A public luncheon followed, at which Lord ST. LEVAN (the Lord of the Manor), General Sir RICHARD HARRISON, Dr. MAY, the Mayor, and other public officials were speakers. The park is a great improvement and attraction, and its excellent situation has been made the most of by the landscape gardener.

SUICIDE IN KEW GARDENS.—On Tuesday evening, November 5, at the Church Room, Richmond, Mr. A. BRANTON HICKS held an inquiry with reference to the death of Mrs. LUCY MAXWELL BROWNLOW, aged sixty years, lately residing at Exe View, Aliphington, near Exeter, who was found drowned in a pond in Kew Gardens, in front of the museum, on Sunday morning. Mrs. RICHARDS, the wife of a civil engineer, of 31, Gloucester Street, Warwick Square, S.W., stated that the latter was the widow of EDWARD MAXWELL BROWNLOW, of the old East India Company's Navy, and who had come up to London to consult a specialist, and by whose advice she went to stay with a friend at Kew Palace, in order to get away from the noise of London. Evidence was given that on Sunday morning she was missing from her room, and a search was made. The drawing-room window was open, and there were indications that deceased had leaped out, and climbed over a fence 5½ feet high, and thus got into the gardens. Her body was found lying in the water 9 feet from the bank. The jury returned a verdict of suicide while temporarily insane.

THE AGRICULTURAL DEPARTMENT IN ABERDEEN UNIVERSITY.—The first, and an important, step towards the constitution of the Agricultural Department in Aberdeen University was made on Monday, the 4th inst., by the appointment of Mr. JAMES WILSON, B.Sc., Lecturer in Agriculture, University College of Wales, Aberystwith, to the Fordyce Lectureship on Principles of Agriculture. The appointment is in form for a year only, as the funds at the command of the University authorities being in the nature of annual grants, it cannot be put on a permanent footing. With efficient teaching in the different branches of the subject, Aberdeen University should form an excellent centre of agricultural education. Under the new arrangement, the Fordyce Lectureship has been very considerably enlarged in its scope, and instead of £40, as formerly, the salary is now £500.

"GUIDE PRATIQUE DE L'AMATEUR DE FRUITS."—In this work of the nursery establishment of MM. SIMON LOUIS FRÈRES, of Metz, is given an account of the culture and a description of the different kinds of hardy fruits forming the pomological collection of the nursery belonging to the brothers SIMON-LOUIS, classed according to their merit. An alphabetical list accompanies each section, giving the synonyms

of the varieties in French, English, and German. The descriptive matter attached to each variety of fruit is sufficient for identification, and the number of varieties described is enormous. As an instance of the thoroughness with which the identification of synonymous varieties has been done, we find the Pear Fondante du Bois credited with 61, and Doyenné Blanc with 84 synonyms!

THE PROFESSORSHIP OF BOTANY AT CAMBRIDGE.—Professor MARSHALL WARD has been elected to supply the vacancy caused by the death of Professor BABINGTON. The University is to be congratulated on this appointment.

SCOTLAND.

NORTH OF SCOTLAND ROOT, FRUIT, AND VEGETABLE ASSOCIATION.

The annual show of this Association was held on Saturday, November 2, at Inverurie, and, so far as the number of entries is concerned, it proved fully up to the average of previous years; and the fact that over 600 entries were made, shows that there is no lack of vitality in the Society. This year the Association has started under new auspices, Mr. Alexander Greig, Paradise, Inverurie, having taken charge of affairs for the first time as secretary and treasurer. His arrangements on Saturday were quite satisfactory, working as they did with harmony and smoothness.

FRUIT.

Apples were a first-class show. Here Mr. T. Middleton, Monymusk; Mr. A. Middleton, Manser; Mr. C. Noonan, Inverey; and Mr. A. Campbell, Thainstone, gave a good account of themselves. The display of Pears was considered to be over an average, the Ribstone Pippin, King of Pippins, Cellini, and Lord Suffield varieties being especially good. In this section, Mr. Ogg, Fintray House; Mr. A. Gardiner, Kennay House; and Mr. T. Middleton, Monymusk, were the chief prize-winners. The collections of fruit were not so good, Grapes in most cases being indifferently shown. Mr. Ogg, Mr. T. Middleton, and Mr. Campbell, Thainstone, were the best exhibitors.

VEGETABLES.

The display in this section was uncommonly fine, and the following cultivators are well worthy of mention for the excellence of their exhibits, Messrs. J. Ogston, Bourtie; T. Middleton, A. Middleton, W. Alexander, Cluny; John Brodie, Bogentarie; James Grant, Rothienorman; John Paterson, Sannybrae; and W. Mathieson.

TRADE NOTICE.

NEW COMPANY AT BOSTON.

We learn from the *Sheffield Independent* that a new company is being formed under the name of Messrs. W. W. Johnson and Son, Limited, for the purpose of acquiring the business of Messrs. W. W. Johnson and Son, seed growers, and wholesale and retail seed merchants, Boston, Lincolnshire. The amount of the share capital is to be £25,000, divided into £10 shares; 1750 preference shares bearing interest at five per cent., and 750 ordinary shares.

SCOTTISH HORTICULTURAL ASSOCIATION.—

A meeting of the Scottish Horticultural Association was held on the evening of the 5th inst. at 5, St. Andrew Square, Mr. R. W. E. Murray, Blackford House, the President, in the chair. There was a good attendance of members. Mr. Robert Laird, the honorary secretary, read a communication by Mr. James Day, Galloway House, Garliestown, on the Pear. An interesting discussion followed the reading of the paper, for which Mr. Day was given a vote of thanks.

LINARIA VULGARIS, WITH DOUBLE FLOWERS.

LINARIA vulgaris is a common species in Britain, but a double form of the plant is extremely rare. A patch of the latter was discovered by Mr. Haddy, a resident of Tavistock, on September 12 of the present year, growing about 3 miles distant from that town. There were at that time upwards of one hundred flower-spikes, every one of which, the discoverer states, was similar in doubleness to the specimen (fig. 96). If this character becomes fixed on cultivation, and the plant comes true from seed, it will be a pretty addition to our border and rock plants.

FIG. 96.—*LINARIA VULGARIS*, DOUBLE-FLOWERED VARIETY.
 A, Spike, half nat. size.
 B, Bloom, X 2, showing central lobe of chief lip greatly extended and petal-like at tip, with a three-lobed upper lip—interior growths removed.
 C, Same, showing interior petals—these are two to three-lobed, hairy lips three or four in number—sometimes with an abortive stamen attached.
 D, Section, showing that the inner growths are petaloid stamens.
 E, Inner growth, X 4, showing hairy lip-like growths, and aborted stamens.
 F, A central hollow growth.

THE LADY MELON.

This illustration (fig. 97) is a representation of a new Melon named The Lady, which has been raised by Mr. Owen Thomas, The Royal Gardens, Windsor.

Mr. Thomas describes the fruit as of medium size, cream-coloured, with a slightly netted skin, with pale green flesh, tinted with red, which is very deep, and with an unusually small seed cavity. It is also a free setter and bearer, and Mr. Thomas considers it one of the best flavoured Melons.

Messrs. Dicksons, of Chester, have been fortunate in securing the entire stock of the seed, and purpose offering it for the approaching season.

HOME CORRESPONDENCE.

THE PACKING COMPETITION AT THE CRYSTAL PALACE SHOW.—The judges who are selected by the Royal Horticultural Society should have sufficient self-restraint to peruse adverse comments on their awards, some of which are beyond the mark, as for instance, those on p. 499 of the *Gardeners' Chronicle* for October 26. I should, as one of the judges at the Crystal Palace Show, be inclined to take no notice of those remarks, but as they are of a misleading character, I will, in justice to myself and colleagues, briefly reply. I will take the first complaint, viz., that gardeners are not considered to be capable judges of packing, but why not, and why should market-salesmen be preferred? Gardeners who have to pack a great deal of their produce are as capable as any salesman of packing well for travelling long distances. But here my critic is wrong, for gardeners were not the judges, but a gardener and a gentleman who may be termed one of the best authorities on the subject, as he not only offered a prize for packing, but sent examples of properly-packed fruit; indeed, his fruit, owing to the superior packing, obtains a better price in the market than that of other growers, and he grows largely for market. Another point is the distance the fruits are sent. I am not sure that Mr. Harris can mean this seriously, Devon and Cornwall being as far to send as Ledbury, but I do not think the distance is so important a point as my critic appears to do. Most of us who have to send fruit, know that it will travel 300 miles equally as well as 20; indeed, a short distance with several changes is worse than a longer with only one, or perhaps none at all. As regards the fruit here, I pack much of the choicer fruits, and they have to travel more than 300 miles, with three changes during transit, and therefore I know something of the subject. Now, as to the two boxes tied together, the judges at first were not sure if they did right in noticing the boxes at all; it may be convenient to tie several boxes together, but it is certainly not fair to fasten a heavy box to a light one; for instance, Grapes to Pears, or Apples to Peaches, for by that means the heavier box, to a certain extent, protects the lighter one. This matter was thrashed out a few years ago at the Chiswick competition; and each package should be separate. Mr. Harris would do well to look back at previous shows, and I certainly say that it is a fault, and we are not always to consider the market question entirely. The Royal Horticultural Society and others gave these prizes as special or open prizes, and my critic was 3rd in one class, and because he failed in the other, he rushes into print, condemning the judges, who have other than the question of packing for market to consider; and in a competition of this kind they must interpret the sense of the schedule. We could have disqualified some exhibitors by reason of their not stating the cost of grading, boxes, &c., and materials used, and being thus lenient, we are condemned. If we had not considered cost, Mr. McIndoe would have been an easy 1st, as his packing was splendid, but costly; whereas that of Mr. Harris was the reverse, as his fruits were tightly wedged in with moss, and, I should think, difficult to get at. Packing of this sort renders it difficult for salesmen to judge of the quality of the fruit without taking it out of the box, and this trouble, in a busy time, is not liked by the trade. Peaches packed in moss never have a nice appearance when the lid is taken off, and wood-wool or paper-shavings are preferable, as it allows of ready inspection. I should say that the best packing is that which is done readily, and with the least labour and cost. My colleague, who also judged with me last year, expected to find a distinct advance; but if any, it was but slight,

and I may inform Mr. Harris that the Peaches in the prize list, packed in moss, would have failed to receive an award had others complied with the schedule, as in one, a very good box, there was one bad fruit. We may have been wrong in our decision, but we think there is a much neater material for packing choice fruits than common moss. *One of the Judges.*

OUR BEST AND THE MOST POPULAR VARIETIES OF APPLES.—One of the most pleasing features of the recent great fruit show of the Royal Horticultural Society at the Crystal Palace was the extreme popularity of our two best dessert Apples. The only two that exceeded a hundred dishes were Cox's Orange Pippin and the Ribston Pippin. The former was represented by 122 dishes, the latter by 111. The fact speaks volumes for the appreciation of these two excellent varieties, and also for the solid advance of Apple culture within the last quarter of a century, and especially in the latter portion of it. King of the Pippins, too, fights stoutly for a supremacy that it seems to have attained at one time, and staged ninety-eight

Golden Reinette among the single dishes. Can it be that the Ribston Pippin to-day is valued at 122 to 1 as against either of these three golden Apples? *D. T. F.*

FRUITING OF MUSA CAVENDISHII.—I have been repeatedly told that this could only be accomplished by planting out; but this is evidently an error, as we have successfully grown and finished a 7 lb. bunch from a pot plant. The "fingers" weighed six to the pound, and the bunch was cut as soon as the leaves began to turn yellow, the fruit ripening about a week after it was cut. The fingers were short, plump, and perfect in flavour, and the whole matter was so simple and successful, that the statement as to the prime necessity of planting-out is evidently a mistake. Beds in tropical houses are such an unmanageable harbour for vermin, that we have done away with them entirely, and it is evident that they are not a necessity. The fresh crop of Cocoa-nuts is now in, and those who are interested in curiosities will be pleased with the result if they obtain one with the outer husk on, place it on its side, half buried in a large pot filled with Cocoa-fibre or sand.

FIG. 97.—THE LADY MELON. (SEE P. 554.)

dishes. From this stage, size rather than sterling quality led through several varieties, thus strongly asserting its force and power. Fortunately, however, it did not assert its footing until the fourth place was reached, and then that wonderful Apple whose origin and progress read like a popular romance, leaped up to an entry of seventy-nine dishes. This has proved a record year for this fine Apple, which by not a few is highly prized for eating as well as for cooking. The number of dishes rapidly fell from the seventies to thirties, through such sorts as Warner's King, Cox's Pomona, Lord Suffield, Emperor Alexander, 50; Worcester Pearmain, Prince Albert, Bismarck, Blenheim Orange, 32; Wellington, 29. From the thirties we speedily sank to the tens, through such popular sorts as Tower of Glamis, Alfriston, Margil, Lord Grosvenor, Queen Caroline, Gloria Mundi, Annie Elizabeth, Duchess of Oldenburgh, &c. Out of the 200 varieties of Apples shown in the 2000 dishes, forty-five varieties were shown in quantities ranging from ten dishes to over a hundred dishes of one sort; and, as we have already shown, and repeat with peculiar pleasure and emphasis, Cox's Orange Pippin, the Ribston Pippin, and King of the Pippins, headed the list. Over ninety Apples were also represented by single dishes; and it will startle not a few growers to find Golden Pippin, Golden Russet, and

If placed in a warm-house in any corner, or under the stage, it will start growing in about five or six months; when about 2 feet high, it makes an exceedingly handsome and curious decoration for an entrance-hall during the summer months. *Thos. Fletcher, Grappenhall, Cheshire.* [Our correspondent's bunch was a very small one, and did not weigh so much as the tip of a bunch of a planted-out *Musa*, which gardeners usually cut off because it seldom affords fruit of creditable size. *Ed.*]

MORELLO CHERRY-TREES AT SCONE PALACE GARDENS, PERTHSHIRE.—With reference to the above, Mr. Ward and Mr. Fish will, I am sure, regret to hear that the splendidly-trained trees which for many years adorned the north wall of the south kitchen garden here, and which they and so many other old Scone men look back upon with so much pride and pleasure, died some years ago. When I took charge of the gardens fifteen years ago, there was only one remaining, and, as it was in a very sickly condition, it was taken out and a young tree put in its place. The wall at present is furnished with clean healthy trees which bear abundant crops of excellent fruit every year. With one or two exceptions, they were all planted before I came here; how long before I am unable to find out, but they at present appear to be about twenty-five years old,

and as already stated, are in excellent health. This year the crop was exceptionally heavy, and the quality of the fruit above the average. As stated by Mr. Fish, the aspect is almost due north, the divergence being towards the east. The whole wall was originally 15 feet in height, but 3 feet was added to the western half when the large curvilinear orchard-house referred to by Mr. Ward was built about thirty years ago. The garden occupies a low-lying situation, the southern portion having a decided slope towards the north. The soil is a heavy retentive loam, from 18 inches to 2 feet deep, resting on a bed of stiff yellow clay of unknown depth. In this soil and situation fruit trees and bushes are late in coming into blossom in spring, which, in our somewhat changeable climate, is, in my opinion, rather an advantage. The drainage, which is very imperfect, consists of old-fashioned stone or rubble drains, about 2½ to 3 feet deep, and placed at wide intervals. The border in front of the wall is 12 feet in width, and was planted with Lilies of the Valley about twenty years ago, and has never been renewed since. They cover the surface of the ground with a dense mass of foliage every summer, and, like the Morellos, thrive admirably, and bear a heavy crop of fine strong blooms annually. With the exception of careful pruning and training in the usual way every winter, the Morellos are left pretty much to take care of themselves. No manure of any kind is applied at any time, unless it be an occasional watering with liquid from the farm-yard during the summer months; but this is given more for the sake of the Lilies than for the Cherries. We have never examined the borders to see where the roots are, but I have no doubt they have penetrated the stiff clayey subsoil long ago, and judging from their healthy appearance and the fine crop they produce annually, they seem to like it. We therefore let well alone. *A. McKinnon.*

A BOYCOTTED INDUSTRY.—When, some score of years since, the late Dr. Bull and his compatriots adventured into the north of France from Hereford, taking with them the finest specimens of Apples and Pears, and the cyder and perry produced from English orchards, they left behind them a grand industry, and showed our French friends how very far we have advanced in both directions—the growing of the fruit and the manufacture of as good a pair of beverages as it is possible to bring together for the benefit of either tired or thirsty souls, and yet, almost ever since that time, not the demand or the liking for, but the sale of both cyder and perry has been declining—and even now scarcely is the legend "Cyder on draught here" to be found pasted on the windows of London, or other, public-houses or restaurants. Instead thereof, but in quite separate establishments, one can get questionable tea, coffee, and cocoa, &c., and most unquestionable mineral waters—about which there is no doubt whatever, as being well suited for "scouring and dying," this latter, an industry not at all contemplated by the caterers for refreshments. And so it has come to pass nowadays that the humble and thirsty wayfarer must either go thirsty on his way, or assist in swelling the "bills of mortality" all unwittingly. And why is this? why should the good old English beverages of cyder and perry be unobtainable in the land our Bung rules? The great mass of our old hosteleries—the modern public-houses are in the hands of brewers and distillers—are, as it is said, "tied-houses"—and they will have no rivals at the bar. Only what they make and supply is allowed to be sold; and so cyder and perry are boycotted. In years past the Legislature has been doing what it can to make things smooth for "the trade," and in their gratitude they shut out all attempts at competition. It is not for us to point the way to a remedy—that lies without our province; we can only say that it is worse than "hard" that so promising a field for well-doing by occupiers of the land should be spoiled, ruined for the sake of such a questionable substitute. *E. C.*

VIOLET PERFUME.—In a *Tour Round my Garden*, by Alphonse Karr, translated by Rev. J. G. Wood, the reader is told that "the Violet alone refuses to separate its odour from itself; it is to be met with nowhere but in its own corolla. Perfumers are obliged to make, with the root of the Florentine Iris, a certain false and acrid Violet odour, of which every returning spring compels us to acknowledge the insufficiency." I would like to know if this is still the case, or if the difficulty has been overcome? *William Cuthbertson, Rothsay.*

RIPE STRAWBERRIES.—Some two or three weeks ago, I noticed in the pages of the *Gardeners' Chronicle* that a correspondent had been gathering ripe Strawberries from outdoor plants, which is certainly of extremely rare occurrence in the month of October. We have at the present time a magnificent crop of ripe fruits on two of our Strawberry beds, and hope to continue picking for at least another week, should the weather keep mild. *Geo. Burrows, Berwick Gardens, Shrewsbury, October 21.*

CHOU DE BURGHEY.—Your correspondent, W. Jones (on p. 463), draws attention to this conical-shaped Cabbage. I have grown the vegetable for some years, but more because it is a good autumn Cabbage than for obtaining—what shall I say, a Cauliflower-Cabbage. I have never detected the slightest tendency to form a Cauliflower, though I have sown and grown it at all seasons. It is very hardy, and makes a good dish all through the early winter. The second week in June is a very favourable time to sow the seed. A short time ago, when visiting the seed grounds of one of our largest seed-growers, I was informed that this vegetable was by no means a popular Brassica. I grow it largely because it is liked here, and is ready to cut at a favourable time for making a change. One cannot have too many kinds of vegetables wherewith to make variety. *W. A. Cook, Compton Bassett, Calne.*

LATE RASPBERRIES.—I have never known autumn Raspberries so plentiful as they have been this year. We have been gathering daily for some time, and even after 5° of frost. This fruit is not only obtained from the so-called autumn varieties, but from summer fruiters as well, notably Carter's Prolific, and the fruits are of large size, and excellent flavour. It is uncertain whether or not this will affect the crop next season. Of course, the forward buds which the tropical weather during the month of September developed, will have already exhausted themselves, but I find the fruit is from the very uppermost buds, which in our case, would have been pruned away. The effect will be awaited with a certain measure of anxiety. *W. A. Cook.*

SHARPE'S VICTOR AND VALE OF CLEVELAND POTATOS.—I was much interested in "R. D.'s" informing note on this matter on p. 464, as during my courses of lectures in Camba, I strongly recommended Victor as the earliest and best early, for small gardens especially. I read "R. D.'s" letter with special attention on this account, to see if this Vale of Cleveland was the yellow-fleshed Victor. Finding this to be the case, the mystery of the two being distributed under different names becomes the greater. But both seedsmen being honourable men, the matter will doubtless be satisfactorily explained. My chief object in noticing this interesting incident is to caution all concerned against growing the white-fleshed Victor, which in every case I have met with, is decidedly inferior, alike in quality and quantity, to the yellow-fleshed Victor. New varieties of Potatos are often given to sport, and run away rather widely from their original size, colour, constitution, and quality. Messrs. Sharpe and Short, or the representative of the latter, will probably be able to say whether the white or yellow-fleshed Victor was the original kind. Messrs. "R. D." and "A. D." must in the rich experience of their Potatolore have met with numerous sports more striking than the change of the yellow Victor into the white, or *vice versa*. *D. T. Fish.*

COLOUR IN APPLES.—At a recent meeting of the Fruit Committee, as duly reported at the time, Mr. Miles, of Southampton, sent a good-sized and richly-coloured Apple, which he described as a Blenheim Pippin, the remarkably high colour shown being produced by frequent applications of sulphate of iron and soot to the roots of the tree during the past few years. Naturally, this statement was received with some incredulity. To me the Apple represented a moderate-sized, roundish *Mère de Mésage*, and on comparing it later with others of that name, I could discern no difference. Can the sender have been, after all, the victim of a mistake, or has he really discovered a method whereby generally green Apples can be made as red as *Quarrendens*? Perhaps Mr. Molyneux, who is often at Southampton, may be able to solve the problem. *D.*

GRAPE CLASSES AT THE CRYSTAL PALACE.—As a grower of Grapes and a gardener by profession, I would like to know the reason why Gros Maroc and Gros Colmar are bracketed in Royal Horticultural autumn show schedules, as in their habit of growth, time in finishing, and character of the finish,

the two varieties differ very widely. As to flavour, how can that be compared in two Grapes so widely apart in the time they require to finish their bunches perfectly? I can always have Gros Maroc finished and fit for eating six weeks before Gros Colmar, all other points being equal. To my idea, if we must bracket Grapes, Alicante would go much better with Maroc, as they take in ripening and colouring about an equal amount of time, while flavour is not so very wide apart. Cultivators of Gros Colmar are greatly handicapped by the present schedule arrangement. *Robt. Grindrod.*

A DRILL HALL SHOW.—Any person not familiar with an ordinary Drill Hall gathering would naturally assume, on reading the reports so admirably furnished in the press, that these shows must be of a very extensive nature. But if they be not so extensive, they well repay visits by the exceeding variety found in them of most interesting objects. I overheard a remark on the 15th that the show was a small one. I could but think that the observation was singularly misplaced. For an October show, collected without a single penny as remuneration being offered, I thought it a remarkable one, and essentially representative. How many objects of the greatest interest Fellows, as well as the general public, lose who do not attend the Drill Hall meetings! One year's regular attendance constitutes a liberal education in horticulture. Pity it is, that being so attractive, they are as a rule not more popular. *Fellow.*

DIPLOSI PYRIVORA.—Can any of your entomological readers who have studied the above pest render any useful information relative to the prevention of one's Pear trees from being attacked by this insidious and destructive little midge, *Cecidomya sub-genus Diplosia*? Our blossoms seem to be worse attacked by them year by year, and that, too, notwithstanding the precautions taken, viz., last autumn we removed all the loose surface soil to a depth of about 2 inches from around the garden Pear trees, wheeling it right away and replacing with maiden loam, &c.; but the attack was just as bad as ever the following spring. We then used fresh hot gas-lime all round about and underneath the trees, just about the time the first chrysalids began to fall; moreover, we collected all the fallen tiny Pears, and burnt them. I should like to know what more can be done to annihilate the enemy, or whether I may expect to be again tormented by fresh attacks from *Diplosia*, bred on my neighbour's premises, because if so, Pear cultivation, if the plague be not stayed, must soon be reduced to a low ebb, owing to the repeated destruction of the crop. From five to twelve is about the average number of larvæ found in each little Pear, but I have counted as many as sixty in one fruit; and sometimes only one of the larvæ is found in a fruit, but this is sufficient to destroy that fruit. In some cases, every blossom on an entire tree is infested, and the consequent failure of crop. Any scrap of practicable information will be gratefully received by fruit growers and *W. Crump*. [Have you tried spraying the blossom? *Ed.*

TOMATOS.—For some years it has been my practice to make a sowing of Tomato seed about this date for early fruiting in the vinery that is started about New Year's Day. These plants set plenty of fruits before the shade from the Vines becomes heavy. Most gardeners have their favourite varieties for early cropping, and I find Ham Green Favourite excellent for fruiting under Vines. The seed is sown in well-drained pots in rather sandy soil, sandier than that I make use of in the spring, the seedlings being apt to damp off at this season. The seedlings are grown on without check, and with but little water, especially until the pots fill with roots. A place on a shelf near the glass in the plant-stove or other house having a temperature of 55° to 60° will suit them. The plants should not be allowed to grow without support being given the stems, and they must not be over-potted. It is surprising what fine strong plants may be grown in 32's up to the time of affording them their last shift in the spring. *H. Markham, Mereworth.*

CRAB TREES—I am glad to see in your columns that various writers are extolling the beauties of the Crabs. Crabs in the garden look very well when planted on opposite sides of a path, and the stems trained over it, so as to form a covered arched way. When the trees so planted come into bearing, and thousands of fruits hang down from them, the sight once seen is never forgotten. *J. Macers, Marazion.*

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

CHRYSANTHEMUMS at the Aquarium on November 5, 6, and 7, exhibited under the auspices of the National Chrysanthemum Society, were well up to the average in quantity and in quality. It is doubtful if finer Japanese blooms have ever been staged than the best of those exhibited this week in the principal class for blooms of this section. Incurred blooms were also commendable, being in our opinion of better quality depth and finish than those shown last season. Other sections such as reflexed, Pompon, Anemone, and single-flowered, were exhibited well in the few classes devoted to them. Plants were about average in quality, certainly not better than those exhibited on the last occasion of the annual show. On the 1st day of the exhibition, the usual dark character of the building was accentuated by gloomy wet weather, but fortunately on Wednesday circumstances were much more favourable. Reporters for the press always labour under unusual difficulties when reporting a show held in the Aquarium, and the arrangements this year were very far from satisfactory. No doubt much of this inconvenience is unavoidable in such a building, but we state the case, as being our apology for any inaccuracies or omissions that may appear in our report.

CUT BLOOMS.

A SOCIETY'S CLASS.

The battle of the Horticultural Societies for honours in the class for forty-eight blooms, distinct, Japanese and incurred varieties in equal number, was engaged in by five competitors, and the 1st prize of £10 and the Challenge Trophy was won by the SOUTHGATE AND DISTRICT CHRYSANTHEMUM SOCIETY, but the whole of the blooms were furnished by one of its members, viz., Mr. W. H. Lees, gr. to E. A. BEVAN, Esq., Trent Park, Barnet. As this competent exhibitor entered in other large classes under his own name, the unaided efforts he made on behalf of the society were very great. Of the Japanese blooms in this stand we may notice Madame Carnot, Van der Heede, Ed. Molyneux, Thos. Wilkins, Mrs. W. H. Lees, Vivian Morel, Louise, Chas. Davis (capital colour), Sunflower, Era Knowles, Mutual Friend, Col. W. B. Smith, Miss Rita Schroeter, and *Madlle. Théa Bay*, all of which were of excellent character. The Incurred, generally good, included excellent blooms of Empress and Golden Empress of India, Lord Alcester, J. Agate, C. H. Curtis, Queen of England, Jeanne d'Arc, Lady Harding, and Mrs. Heale. The BROMLEY AND DISTRICT CHRYSANTHEMUM SOCIETY were successful in taking 2nd place, and their exhibit was very praiseworthy. Included was the best coloured bloom of Hairy Wooder we remember to have seen. 3rd BRIGHTON AND SUSSEX HORTICULTURAL SOCIETY.

OPEN CLASSES.

Incurred Blooms.—There were but two exhibits in the class for thirty-two blooms, incurred, distinct, and the 1st prize, viz., Challenge Cup and £10, was taken by Mr. W. H. LEES, who again had first-class blooms. The varieties were—*Back row:* J. Agate, Globe d'Or, Mans, B. Bhanant, Empress of India, Prince Alfred, C. Curtis, Lord Wolseley, Queen of England, Baron Hirsch, Miss Haggas, W. Tunnington, J. Lambert. *Middle row:* Lady Harding, Princess of Wales, J. Doughty, Golden Empress, Jno. Salter, Empress Eugénie, Violet Tomlin, Mrs. Heale, Alfred Salter, Lord Alcester, Robert Pettiford, Lord Rosbery. *Front row:* Madame F. Mistral, Jardin des Plantes, Nil D'esperance, Mrs. Coleman, Princess Beatrice, Madame Darier, Chas. Gibson, M. P. Martignac, Lucy Keadal, Hero of Stoke Newington, Befulgence, and Jeanne d'Arc. Though the only other exhibitor, the 2nd prize was well deserved by Mr. W. MEASE, gr. to A. TATE, Esq., Downside, Leatherhead; his stand, however, would have appeared brighter had more light-coloured varieties been included. Globe d'Or, Lord Alcester, Alfred Salter, Empress of India, Princess of Wales, Alfred Lynes, and Jeanne d'Arc, were most noticeable.

The best twenty-four incurred blooms distinct, were from Mr. B. CALVERT, gr. to Col. ARCHER HOUBLON, Hallingbury Place, Bishop's Stortford. The flowers were not very heavy, but were compact and pretty. The heaviest were J. O. Doughty, Jno. Lambert, and Lord Wolseley. There were also pretty blooms of Alfred Salter, Lady Harding, Jeanne d'Arc, Lord Alcester, and Jardin des Plantes. Mr. T. ROBINSON, gr. to W. LAWRENCE, Esq., Elmsfield House, Hollingbourne, was 2nd. His flowers were smaller. The best were Miss M. A. Haggas, and Mrs. S. Coleman. 3rd, Mr. W. E. TIDY, Brockhampton Nurseries, Havant; and 4th, Mr. H. A. PAGE, gr. to F. CRISP, Esq., White House, New Southgate.

Mr. J. H. WALKER, gr. to the Exors. of the late J. MASHALL, Esq., Goldbeaters, Mill Hill, N.W., staged the best twelve blooms, and the exhibit was a commendable one. The varieties were J. Agate, Baron Hirsch, Lord Alcester (very fine), Jno. Lambert, Golden Empress, Jno. Doughty, Jeanne d'Arc, Alfred Lyne, Madame Darier, Brookleigh Gem, Empress of India, and Novelty. 2nd, Mr. R. RIDGE, gr. to C. SWINLEN

EADY, Esq., Otlands Lodge, Weybridge. His best blooms were Princess of Teck and Jeanne d'Arc. Mr. R. JONES, gr. to C. G. SMITH RYLAND, Esq., Barford Hill, Warwick, was 3rd; his blooms were wide but not deep. 4th, Mr. A. JONES, gr. to Miss WYBURN, Hadley Manor, Barnet.

The best incurred blooms of one variety were exhibited by Mr. J. H. WALKER, who selected Jeanne d'Arc, which he showed very well. 2nd, Mr. B. CALVERT, who had Alfred Salter in very good form; and 3rd, Mr. H. A. PAGE, who chose Madame Darier as his variety. There was considerable competition.

Japanese Blooms.—The opinion was generally felt that the Japanese blooms were of better quality than the incurred, although the latter were better than last year. The leading class was unusually strong, and apart from the 1st prize exhibit, the collections caused considerable difficulty to the judges. Mr. W. H. LEES, gr. to F. A. BEVAN, Esq., Trent Park, Barnet, was an easy 1st for the Challenge Cup and £10, and his blooms were fine without exception. The varieties were:—*Front row*: Mrs. W. H. LEES, Reine d'Angleterre, Phœbus, Miss Dorothy Shea, International, Chas. Davis, Mons. Panckoucke, Van der Heede, Madame Ad. Moulin, Ed. Molyneux, Viviani Morel, W. G. Newett, Chas. Shrimpton, Thos. Wilkins, Mrs. C. H. Payne, and Madame Carnot. *Middle row*: Wm. Seaward, Louise, Madame M. Ricard, Mephisto, Wm. Tricker, Mons. G. Biron, H. L. Sunderbrück, G. C. Schwab, Madame Ad. Chatin, M. Ad. Grand, Mutual Friend, Beauty of Castlewood, Viscountess Hambleton, Rich. Deau, Rose Wynne, Deuil de Jules Ferry. *Front row*: Colonel Smith, President Borel, Guirlande, Eva Knowles, Madame A. de Galbert, Mrs. Falconer Jameson, Sunflower, Jno. Shrimpton, Miss Rita Schroster, Mons. Chas. Mollie, Souvenir d'unpetite amie, Hairy Wonder, G. W. Childs, Puritan, Henri Jacotot Fils, and Mlle. Thérèse Rey.

The judges had difficulty in awarding 2nd and 3rd places. Eventually, Mr. W. M. MEASE was awarded 2nd prize; and Mr. W. WELLS, Earlswood Nurseries, Redhill, 3rd.

In the former exhibit, blooms of Miss Dorothy Shea, Silver King, Viviani Morel, Robert Owen, and Mlle. Marie Hoste, were especially fine.

The best collection of twenty-four blooms, distinct, was shown by Mr. W. MESSENGER, gr. to H. A. BERNERS, Esq., Woolverstone Park, near Ipswich. He had an excellent lot of blooms, of which the following were the best, Mrs. C. Harman Payne, Étoile de Lyon, Waham, Mlle. Thérèse Rey, M. Panckoucke, Madame Carnot, M. Grayer, Mrs. G. J. Beer, and Miss D. Shea (a Silver Cup, given by Mr. Jones), accompanied the 1st prize. The 2nd place was given to Mr. G. W. DRAKE, Cathays Nurseries, Cathays Terrace, Cardiff, colour and freshness were remarkable in these moderately-sized but fairly deep blooms. The following were the best, Mrs. H. Payne, Lord Brooke, Madame Carnot, Dorothy Shea, Madame Zurich, Viviani Morel, and Ed. Molyneux, 3rd, Mr. W. M. ALLAN, Gunton Park Gardens, Norwich; and 3rd, W. HERBERT FOWLER, Esq., Claremont, Taunton (gr., Mr. C. Hart). There was some dissatisfaction expressed with the result of the judging in this class.

The best collection of twelve blooms, distinct, was shown by Mr. J. AGATE, Chrysanthemum Nurseries, Havant, and of commendable merit they were, the weakest bloom being Miss Ethel Addison, which showed the centre somewhat. 2nd, Mr. H. A. PAGE, gr. to F. CRISP, Esq., White House, New Southgate, N., whose exhibit very nearly approached the 1st one. 3rd, Mr. J. SANDFORD, gr. to G. W. WRIGHT-INGLE, Esq., North Finchley. 4th, Mr. H. LEVEY, gr. to M. LOW, Esq., Warwick.

Six blooms of any white Japanese variety were best from Mr. R. JONES, who showed Mlle. Thérèse Rey in good character. Mlle. Marie Hoste, shown by Mr. J. SANDFORD, gr. to G. W. WRIGHT-INGLE, Esq., Wood House, North Finchley, was a good stand for 2nd place; and Mr. B. CALVERT, again showing Mlle. T. Ray, was 3rd; 4th, Mr. T. LODGE, gr. to Rev. J. MENET, Hockerill, Bishop's Stortford.

Mr. R. C. NOTCUT, Broughton Road Nurseries, Ipswich, had the best six blooms of any variety other than white, exhibiting a new one called Edith Tabor, a broad-petalled, pale yellow variety, of fine merit; 2nd, Mr. B. CALVERT, who had Col. Smith, very good; 3rd, Mr. J. SANDFORD, with Viviani Morel; and 4th, Mr. C. COX, gr. to Jno. TROTTER, Esq., Brickendon Grange, Hertford.

The leading place in the class for six Japanese blooms, incurred, distinct, was taken by Mr. R. JONES, gr. to C. A. SMITH-RYLAND, Esq., Barford Hill, Warwick; his varieties were Miss Ethel Addison, Col. W. B. Smith, Louise, Ricard, Lord Brooke, and Préfet Roberts; 2nd, Mr. T. CARTER, gr. to A. G. MEISSNER, Esq., Weybridge, who was a very close 2nd.

Hairy-petalled varieties.—The best six Japanese blooms, hairy-petalled varieties, were shown by Mr. W. WELLS, Earlswood Nurseries, Redhill, Surrey. His varieties were—Louis Behmer, White Plum, Lady of the Lake, Hairy Wonder (very wide, but thin bloom), Mrs. Higginbotham, and Mrs. W. J. Godfrey, a pretty white variety; Mr. H. LOVE was 2nd. King of the Hirsutes, a yellow one in this stand, is a good variety.

Reflexed Blooms, large-flowered.—Twelve large-flowered reflexed blooms, in five varieties, were shown by Mr. R. C. NOTCUT, Broughton Road Nursery, Ipswich. But few additions are made in this section. The varieties staged were Pink Christine, Golden Christine, Peach Christine, Dr. Sharpe, Cloth of Gold, King of Crimson, Phidias, White Christine, and Cullingfordi. 2nd, Mr. J. H. WALKER who included blooms of King of the Crimson, R. Smith, and Chevalier Damage; 3rd, Mr. C. BROWN, gr. to R. HENRY, Esq., Langley House, Abbots Bromley.

Anemone blooms, large-flowered.—The class for twenty-four blooms, Japanese Anemones included, was won by Mr. W.

Skeggs, gr. to A. MOSELEY, Esq., West Lodge, Barnet. There was considerable competition in this class, and the 1st prize exhibit was very fine indeed. The varieties were, Duchess of Westminster, Fleur de Marie, Thermidor, Mrs. J. Benedict, Nekon, Grande Alveole, Fabian de Mediana, Gladys Spaulding, Cincinnati (very pretty), Jno. Bunyan, Le Deuil, Acquisition, Mons. Ch. Lebasqz, Mrs. Leven, Enterprise, Descartes (splendid), Jeanne Marty, Queen Elizabeth, Madame Lawson, M. Dupanloup, Delaware, W. W. Astor, Mlle. Natalie Brun (very attractive lilac and rose coloured variety), and Sir Walter Raleigh. Mr. A. IVES, gr. to E. C. JUKES, Esq., Hadley Lodge, High Barnet, was a good 2nd; and we noticed in his stand very good blooms of M. Dupanloup, Sabine, and others. 3rd, Mr. J. MILNER, gr. to Mrs. W. A. HIGGS, Willenhall Park, Barnet.

Mr. W. SKEGGS was the winner also of the 1st prize for twelve large-flowered Anemones, excluding Japanese, and again showed well, but his collection was lacking coloured varieties; Mr. A. IVES was 2nd, and the 3rd place was taken by Mr. Jas. Maule, gr. to H. T. MATTHEWS, Esq., The Mount, Hadley.

Anemone Japanese.—The class for twelve blooms, distinct, gave another 1st prize to Mr. SKEGGS, and his blooms were very large, and most of them good in other respects. His selection was the following:—Le Deuil, Jno. Bunyan, Nelson, Enterprise, Queen Elizabeth, Descartes, Jeanne Marty, Sir Walter Raleigh, Madame Lawson, W. W. Astor (with poor centre), Mlle. Cabrol, and M. Dupanloup. The 2nd place in this competition was taken by Mr. J. JUSTICE, gr. to Sir R. TEMPLE, Bart., The Nash, Kempsey, Worcester. He had a decidedly commendable collection, and was followed by Mr. J. MILNER.

Anemone Pompons.—Twelve Anemone Pompons, distinct, three flowers of each variety in bunches. Mr. C. BROWN staged a very pretty collection in this class, and had 1st prize. His varieties were Francis Boyce (rather too large in comparison with the others), Madame Leutier, Antonius, Madame Montels, Magenta King, Madame Chalonge, Miss Nightingale, Mr. Astie, Regina, Emily Rowbottom, Queen of Anemones, and Bessie Plight; 2nd, Mr. J. MYERS, gr. to the Earl of SANDWICH, Hinchingsbroke, Huntingdon. There were only two exhibits in this class, and both were of good quality.

Pompons.—Mr. C. BROWN was the winner in the class for twelve Pompons, distinct, three flowers of each variety in bunches; his exhibit was decidedly praiseworthy, the blooms being even and good; Mlle. Elise Dordan is still the prettiest flower in this section, but W. Westlake, Black Douglas, Harry Hicks, Mrs. Bateman, and Chas. Dickens, are also capital diverse varieties. 2nd, Mr. B. CARYER, whose collection was but little behind the other one in quality; 3rd, Mr. J. MYERS.

Single-flowered Varieties.—The show of single-flowered varieties was very attractive indeed. The winner of the 1st prize in the class for twelve varieties in bunches or sprays was Mr. J. MYERS, and the whole of the flowers were so good that we append their names:—Jane, Purity, Snow Wreath, Bessie Conway, and Oceana, white; Gold Star and Admiral Symonds, yellow; Mrs. D. B. Crane, a very pretty pink; Nora and Foxhunter, coloured ones; and Miss M. Wilde, rose and white. 2nd, Mr. W. C. PAGRAM; 3rd, Mr. W. WELLS.

AMATEURS' CLASSES.

The best collection of twenty-four blooms of Japanese in not fewer than eighteen varieties, was shown by Mr. JAMES STREDWICK, Silverhill, St. Leonard's-on-Sea. A Silver Cup presented by J. M. COPPEN, Esq., was added to the 1st prize in this class. Mr. STREDWICK'S exhibit was an excellent one, and included good flowers of International, Chas. Davis, Viviani Morel, Miss D. Shea, Wm. Seaward, and others. Mr. C. A. JESSOP, Mildenhall Workhouse, Suffolk, also had an excellent collection, which we considered equal to the one already noticed. The flowers in this case were very fresh-looking, bright, and of large size, Thomas Wilkins, Chas. Davis, Puritan, and Hairy Wonder, were the most noticeable; 3rd, Mr. H. LOVE, 9, Melville Terrace, Sandown, Isle of Wight.

Mr. W. AMES, South Ashford, Kent, was 1st in the class for twelve incurred blooms, distinct, but the flowers were only poor. The 2nd and 3rd prizes were taken by Mr. G. R. CROWNE, Long Ditton, Surrey.

The exhibits of six blooms of incurred, distinct, were better. The 1st prize was taken by Mr. CHAS. E. WILKINS, Wellington, Swanley Junction, and his best blooms were Globe d'Or, Lord Wolseley, and Nil Desperandum. G. D. WELLS, Esq., Hertford Cottage, Hertford Road, East Finchley, was 2nd; and Mr. J. STREDWICK 3rd.

Mr. JAS. STREDWICK took the 1st prize for twelve Japanese blooms, distinct. He had exquisite examples of Charles Davis, Viviani Morel, Miss A. Hartshorn, Col. W. B. Smith, Autumn Tint, &c. Mr. H. LOVE was a good 2nd, and showed fine blooms of Good Gracious, Viviani Morel, Charles Davis, &c. 3rd, Mr. ARTHUR STAMMERS, The Knowles, Maldon, Essex.

Mr. C. H. MARTIN won 1st for six Japanese blooms, distinct, and his specimens of Charles Davis, Sunflower, Van der Heede were praiseworthy; 2nd, Mr. W. PERRIN; 3rd, Mr. J. KNAPP.

For the best six Japanese blooms, of one variety, Mr. H. LOVE was again 1st, showing very well-coloured Sunflower; 2nd, Mr. J. STREDWICK, with splendidly-coloured Viviani Morel; 3rd, Mr. W. AMES, with Chas. Davies.

SINGLE HANDED GARDENERS' CLASSES.

Mr. S. J. COOK, gr. to J. H. HARRIDGE, Esq., Holewood, Hendon, was the only exhibitor of twelve incurred blooms, distinct. The best of these were Baron Hirsch, Jeanne d'Arc, and G. Glenny.

The best six incurred blooms were from Mr. W. C. PAGRAM, whose Jeanne d'Arc, Baron Hirsch, and Brook-

leigh Gem, were fairly good; 2nd, Mr. C. E. WILKINS; 3rd, Mr. C. H. MARTIN, gr. to R. H. LANGTON, Esq., Raymead, Hendon, N.W.

The Japanese blooms were shown better, and the collection of twelve blooms, distinct, from Mr. W. PERRIN, gr. to C. W. RICHARDSON, Esq., Sawbridgeworth, were very good, Madame Carnot, Mlle. T. Rey, Mrs. F. Jameson, and C. Cox especially; the last-named bloom was extra deep, and the only one of the kind we noticed in the exhibition. 2nd, Mr. W. C. PAGRAM; Colonel Chase and Good Gracious were remarked in this stand. 3rd, Mr. C. H. MARTIN.

Mr. H. LOVE had the best six Japanese blooms, distinct, and all the blooms were fairly good, Golden Gate, if not large, was very pretty; 2nd, Miss ANNIE L. GAUNT, Hildersborough, South Tottenham, Madame Carnot, Viviani Morel, and Niveum, were nice in this stand; 3rd, Mr. JAS. STREDWICK.

METROPOLITAN CLASSES.

These are restricted to growers residing within the district governed by the London County Council. The best twelve incurred blooms, distinct, and the only exhibit in this class, came from FRANK BINGHAM, Esq., 6, Bethune Road, Stoke Newington, and his blooms were very commendable for town-grown plants.

Mr. J. BROOKS, gr. to REYNOLDS, Esq., The Grove, Highgate, beat three other competitors in the class for six incurred blooms, with a very nice half-dozen blooms; FRANK BINGHAM, Esq., followed; and Mr. W. Noble, gr. to H. T. PITT, Esq., Stamford Hill, 3rd.

Mr. J. BROOKS was a very good 1st for twelve blooms of Japanese, distinct, which included fine examples of Mrs. Dr. Ward, W. G. Childs, and W. H. Lincoln; 2nd, Mr. W. DAVIES, gr. to W. F. DARNELL, Esq., Devonshire House, Stamford Hill; 3rd, Mr. W. NOBLE.

The best six Japanese, distinct, were from Mr. W. DAVIES, and he was very closely followed by Mr. J. BROOKS; 3rd, Mr. G. TOLTON, 20, Albion Gardens, Hammer Smith, W.

Six large but not extra well-coloured blooms of Charles Davis won the class for six Japanese blooms of any one variety for Mr. W. FARROW, gr. to G. R. PEEBLESS, Esq., Park Hill, Streatham; Col. W. B. Smith (very fine in colour), shown by Mr. W. DAVIES, won the 2nd place; and the same variety from Mr. J. BROOKS, was 3rd.

SPECIAL CLASSES.

These were for prizes offered by trade growers and others for particular exhibits determined by the donors of the prizes. Mr. H. J. JONES, Rycroft Nursery, Lewisham, offered prizes for six acres of exhibition Japanese Chrysanthemums, distinct, three blooms of each, one variety only in a vase, with not less than 1 foot of stem above top of vase, quality of blooms to be the leading feature.

The most successful exhibitor was Mr. D. M. HAYLER, gr. to W. HANNAFORD, Esq., Tenterden Hall, Hendon, whose exhibits staged with foliage and stem were very pretty. The 2nd prize was taken by Mr. C. H. MARTIN; PERCY WATERER, Esq., Fawkham, Kent, was 3rd. The class for three blooms was won by Mr. N. DAVIS; and Mr. T. CARYER was 2nd.

For the special prizes offered by Messrs. B. S. WILLIAMS & SON, for six blooms of the new Philadelphia, there were numerous competitors, some of the blooms being very poor, others excellent. The 1st prize was taken by Mr. W. KING, gr. to J. COLMAN, Esq., Gatton Park, Reigate; Mr. W. MEASE was 2nd; gr. to NORMAN DAVIS, Camberwell, 3rd; and Mr. G. FOSTER, gr. to HANMOND SPENCER, Esq., Glendaragh, Kingmouth, 4th.

GROUPS.

There was only one class provided for groups, that in which the special 1st prize offered by the President, Sir EDWIN SAUNDERS, was competed for. Two of these exhibits were arranged side by side at one end of the building, and they were both of great excellence, each being very effective, but in style of arrangement quite different. Mr. H. J. JONES, Rycroft Nursery, Lewisham, was awarded the 1st prize, and no fault could be found with the decision of the judges. This group was forced of two bays, arranged in an undulating manner, each of which presented a bold front, the centre also being imposing, the recess between the two bays at the front being varied with highly-coloured Crotons, these also followed around each side, and an edging of Isoplepis at the margin. The varieties were chiefly chosen of the Crotons, those with massive foliage, whilst here and there between the taller Chrysanthemums were narrow-leaved varieties, the background being relieved by Cocos Wedelliana, well-furnished with healthy leaves. The Chrysanthemums themselves were the picture of health, with large, massive blooms, the greater part of which were fit for exhibition boards; a few dwarf plants would possibly have added to the general effect in the front, but nevertheless it was a grand group. The varieties most noticeable were Charles Davis, Sunflower, Avalanche, Madame Thérèse Rey, International, Reine d'Angleterre, and W. Seaward. Mr. NORMAN DAVIS, nurseryman, Camberwell, was the other competitor, and he worthily won the 2nd prize; this group did not present so imposing an appearance as the former, the flowers being on the whole perceptibly smaller, yet of first-class quality. The centre at the back was somewhat weak, a tall erect Juniper doing service where a Cocos plumosa or a Bambusa gracilis would have greatly added to the effect. Crotons and Dracenas were here used to give variety, the latter a trifle too freely (D. terminalis the variety), instead of which a few Eulalia japonica would have been better; Cocos Wedelliana, however, told with good effect. The front was well finished off with dwarf plants of Japanese varieties; thus, most prominent throughout the group were Chas. Davis, Madame Carnot (extra fine), Viviani Morel, and Louise. The 3rd prize was awarded to

Mr. French, gr. to Mrs. BARCLAY, Ambleside, Wimbledon Park, for a group more in the old-fashioned style, the front being, however, well finished off with very dwarf plants.

SPECIMEN PLANTS (TRAINED).

These were grouped around the two fountains at either end of the building, being thus seen to the best possible advantage. The plants were not, perhaps, quite so large as usual, but this, instead of being any detraction from, rather added to their appearance. Better all-round specimens could not be possibly desired than those shown in the three following classes by Mr. Donald, gr. to J. G. BARCLAY, Esq., The Green, Leyton, Essex, in each of which he was awarded the 1st prize, viz., for six named specimens of large-flowered varieties, Japanese included; these were of globose form, averaging 4 feet in diameter, the varieties being Chinaman, bright purplish-violet—very fine; *Gloriosum*, distinct—very pretty; W. Tricker, good; White and Pink Christines, both excellent plants, well-flowered; Dr. Sharp, rich in colour, a fine plant.

For six trained specimens (Pompons), with remarkably fine plants, not nearly so dwarf as usual, but all the better, the varieties were Golden Madame Marthe and the white or original form, both densely flowered; William Kennedy, dark rich red, with large flowers; Sœur Mélanie, of similar good quality; and Black Douglas, well known as one of the finest dark varieties.

For six standard (trained specimens), with plants having dense spherical heads on clean stems, each densely clothed with flower; here the varieties were Chinaman, Stanstead Surprise, extra good; La Triomphante, the flowers of good quality; W. Tricker, and Cleopatra, both good plants; and Madame B. Rendalier, very clean and fresh.

Mr. DONALD was also an easy winner for one specimen plant, any type, pyramidal trained, with a well-balanced example of Margot, full of fine blooms. Mr. Davey, gr. to C. C. PAIN, Esq., Cedar Hoase, Stamford Hill, being 2nd with a pretty plant of Elsie.

The latter exhibitor was also 1st for four trained specimens, any varieties, a specially fine plant of Dr. Sharp being his best, as well as let for four standard-trained specimens, here he had a very fine plant of Colonel Smith, clearly proving the value of this variety for specimen culture.

TABLE DECORATIONS, VASES, &c.

These were amply provided for in one of the galleries, and a keen competition was evidenced in nearly every class save the two first in the schedule. In either of these cases the prizes were good, whilst the object of the Committee in providing such classes is a most laudable one, inasmuch as it should be the means of popularising the Chrysanthemum in ways not so frequently adopted. Mr. H. J. JONES staged a magnificent display in the class for a table of cut blooms of Chrysanthemums, any type, shown in any manner the exhibitor thinks best; 18 feet by 6 feet. The wall at the back had, to commence with, been draped with a pale green material, thus forming a good background for the flowers; these comprised splendid blooms of high-class exhibition quality. Some were arranged at the back on tall arcade-like arches; these chiefly consisted of yellow varieties. On each side were two tall vases appropriately filled with large blooms and such foliage as the Oak with its rich autumnal tints, also Bracken, Grasses, Virginian Creeper, &c., all blending most harmoniously together. Other and somewhat similar but shorter vases were employed in front of these, these being filled with equally fine flowers, whilst at the front were three lines of specially fine blooms arranged in glasses fixed into a fire-frame, thus forming an excellent substitute for the more orthodox boards. The best kinds noted were Chas. H. Curtis, a valuable addition to the incurved section, with rich deep canary yellow almost globular blossoms; Madame Carnot, the finest of the white Japanese; Chas. Davis, of rich colour; and Amy Shea. Dwarf well-coloured Crotons as C. Baronne James de Rothschild, with Ferns, added to the effect, as did several fine cut fronds of *Goniophlebium subauriculatum*. One vase was filled entirely with incurved varieties; the excellent arrangement proving that in good hands, these more formal flowers may be well displayed. The Gold Medal of the Society was most deservedly awarded to this fine exhibit.

Mr. R. J. CHARD was the only exhibitor in the next class, for a table of bouquets, wreaths, sprays, &c., to illustrate the decorative value of the Chrysanthemum. This was, on the whole, scarcely up to this well-known exhibitor's standard; more time spent in the arrangement would have remedied this. The best things, but in questionable taste, were the anchor of bronzy-yellow blooms, the wreath, and the harp with several good sprays. A Silver Medal was awarded.

Mr. Hayler, gr. to W. HANNAFORD, Esq., Tenterden Hall, Hendon, was 1st for three vases of twelve blooms in each, with the addition of other foliage; this exhibit was bold and effective, the flowers being informally arranged (quality here was also conspicuous), with the addition of very suitable foliage, as *Cyperus alternifolius*, *Pteris argyrea*, and *Myrsiphyllum asparagoides*; had these vases stood in a better position, they would have been considerably improved in appearance. Mr. PREWETT, Swiss Nursery, Hammersmith, had three somewhat similar vases, between which and the former exhibit there was not much to choose; the flowers, however, scarcely showed to such advantage, but a good use had been made of autumnal foliage. Mr. CHARD followed with much taller vases, the additional height not being any improvement in effect, but rather the reverse.

For three epergnes, there were six exhibits, these showing considerable diversity in taste and arrangement. Mr. PREWETT, Swiss Nursery, Hammersmith, was, however, an easy 1st, his exhibit being a pleasing combination of pale rosy-pink and deep bronzy-red varieties; the design of these stands

was a practical one when placed upon a dinner-table, which is more than can be said in every case; the larger flowers were confined to the base, graduating upwards to the top, whilst not any too much room was taken up by them. Mr. MERIDEW, gr. to Dr. PAUL, Camberwell, came 2nd, four colours being employed here; white and yellow were the two additions to the foregoing, the arrangement being light and effective. Some of the stands of other exhibitors were dressed on the face, the back part being incomplete.

For two vases of Pompons or Anemone Pompons arranged in vases, not lower than 12 or more than 18 inches in height, Mr. WEBSTER, gr. to E. T. PRESTON, Esq., Kelsey Manor, Beckenham, was a most creditable 1st, with rather tall pyramidal arrangements, one of yellow flowers with bronzy foliage, and another with white with green foliage and berries. Mr. MERIDEW was 2nd again in this class, with arrangements of more globular form.

In the class for two hand-bouquets, some excellent examples were displayed, Mr. WEBSTER winning with two very tasteful bouquets, one consisting chiefly of single varieties of light colours intermixed with choice bits of autumnal and other light foliage, the other being composed of yellow and bronze colours. Mr. NEWELL, gr. to Sir EDWIN SAUNDERS (the President of the Society), Fairlaw, Wimbledon, came in a close 2nd, the chief difference being that larger flowers were employed, but with good taste, one of yellow and bronze, and another of pink and red, being the choice of colours; the leaves of *Aspidistra lurida variegata* were used with the latter colours to a good purpose.

A class for ladies only, brought out some capital displays, notably in the 1st-prize exhibit of Mrs. NEWELL, Victoria Road, Wimbledon, who evidently understands the correct principles of decoration, her basket being held, yet free in style. The 2nd prize was taken by Mrs. W. GREEN, JUN., with a smaller arrangement.

In the class for six blooms of any one variety of Japanese, with foliage of any kind, set up in vases less than 18 inches in height, Mr. FELGATE, gr. to the Duchess of WELLINGTON, Burhill, Walton-on-Thames, was a distinct 1st with an arrangement made of the variety Suoflower, both quality and effect being conspicuous. Mr. COOK, gr. to J. H. HARTRIDGE, Helwood, Hendon, was 2nd with another yellow variety.

In the corresponding class for amateurs only, Mr. EDWARD JONES, 25, Malvern Road, Hornsey, was a most worthy 1st with the best arranged vase in this section, it affording an excellent example of a vase arrangement; the variety was Vivian Morel, of pale colour, but fine flowers, grouped with *Azalea pontica* foliage and *Smilax*, &c. The 2nd prize went to Mr. R. E. WILSON, 32, Magravine Gardens, W., the variety being Mrs. Harman Payne; the effect also good.

As a hand-basket of natural autumn foliage and berries arranged for effect, Mr. JOHN MANSEY, gr. to S. H. SMITH, Esq., staged a very tasteful exhibit with considerable variety, and likewise harmonious blending of autumnal tints, the common *Berberis* in fruit, *Mahonia aquifolia* of deep bronzy-red, and *Clematis Vitalba* in seed were all used with good effect. Mr. WM. GREEN, JUN., followed again in this class with another good exhibit, rather more packed than in the 1st prize basket.

FRUIT AND VEGETABLES.

Grapes were not largely shown, but were very good. Mr. W. TIDY, gr. to W. K. D'ARCY, Esq., Stanmore Hall, had the best white, in pretty clear-berried and medium-sized Muscat of Alexandria; Mr. W. TAYLOR, gr. to C. B. BAYER, Esq., Forest Hill, was 2nd, with larger but less-finished bunches; and Mr. J. BURY, Byfleet, Surrey, was 3rd.

In Blacks, Mr. BURY was 1st, with good-sized, handsome, well-finished Alicante; Mr. TAYLOR coming 2nd with large but somewhat ungainly bunches, though well-coloured; Mr. CALVERT, gr. to Colonel ARCHER HOUBLON, Bishop's Stortford, was 3rd.

With Gros Colmar *Grapes*, Mr. T. HALL, gr. to W. GARDINER, Esq., Merstham, was well 1st, his bunches being handsome, well coloured, and with fine berries; Mr. TAYLOR came 2nd; his clusters were larger, though lacking colour.

Pears were very fine and plentiful. Mr. W. ALLAN, of Gunton Park, who always shows these fruits well, was let, with fine samples of Pitmaston Duchess, Marie Louise d'Uccle, Darondeau, Doyenô du Comice, Marie Louise, and Emile de Heyst; Mr. Goldsmith, gr. to Sir E. J. LONER, Horsbam, was 2nd, having also very fine clean fruits of Pitmaston Duchess, Souvenir du Congrès, General Todleben, Marie Louise, Burreil Diez, and Doyenô du Comice; Mr. H. LINAY, gr. to W. M. LOWLEY, Esq., Warwick, was 3rd.

Apples.—There were eleven collections of six dishes of dessert Apples, the majority very fine, handsome, rich-coloured, and of the best quality. Mr. GOLDSMITH was 1st, having beautiful Ribston, Cox's Orange, and King Pippins, American Mother, Adams' Pearmain, and Blenheim Pippin. Mr. T. TURTON, Earley, was 2nd, having very handsome Jeffersons, Rosemary Buset, Adams' Pearmain, and Ribston, Cox's Orange and King Pippins. Mr. C. ROSS, Welford Park, Newbury, was 3rd.

There were also eleven collections of six dishes of kitchen Apples, these being generally very fine. Here Mr. TURTON was 1st, with very large, handsome, and rich-coloured Mère de Ménaag, Emperor Alexander, Cox's Pomona, Lane's Prince Albert, Peasgood's Nonsuch, and Bedfordshire Foundling. Mr. GOLDSMITH was 2nd, having also very fine Gloria Mundi, Peasgood's, Emperor Alexander, Gascogne's Scarlet, Lord Derby, and Warner's King. Mr. W. T. STOWERS, Sittingbourne, was 3rd.

Very fine collections of Apples and Pears were set up by Messrs. W. CUTBUSH & SONS, Highgate; Messrs. C. LEE & SONS, Hammersmith; and Messrs. SPOONER & SONS, Houghlow, all of whom had splendid samples, and in great variety, also very effectively staged.

Vegetables.—These important products seem at this show to have somewhat fallen from their former high estate, perhaps because these products are not found at their best in November. For the valuable prizes offered by Messrs. SUTTON & SONS, Reading, for collections of nine distinct kinds, the quantities in each case being too severely limited; only five lots were staged. Mr. C. J. Waite, gr. to the Hon. Col. TALBOT, Esher, was 1st, having small Cauliflowers, Brussels Sprouts, rather fair Tomatoes; good, but spotted, Celery; fair Ailsa Craig Onions, Prizetaker Leeks, pretty Satisfaction Potatoes, handsome new Intermediate Carrots, and Peerless Cucumbers. Mr. R. LYE, gr. to the Hon. Mrs. KINGSMILL, Newbury, was 2nd, having very good samples indeed, especially of Tomatoes, Leeks, Onions, Parsnips, and Potatoes; and Mr. J. GIBSON, gr. to E. W. WATTS, Esq., Chiswick, was 3rd.

The Society's classes for Potatoes were well filled, an old exhibitor in the person of Mr. E. S. WILES, now of The Rookery, Farnborough, Kent, coming to the front in the class for twelve varieties, he had very handsome seedling Kidney, Snowdrop, Supreme, Perfection, Satisfaction, Lord Tennyson, Reading Ruby, The Dean, Purple Perfection, Pink Perfection, &c. Mr. CHEPPING, of Sittingbourne, was 2nd, having handsome but less fresh samples; and Mr. C. OSMAN, Sutton, was 3rd. The same three took the prizes in similar order in the class for six kinds; Mr. WILES having Windsor Castle, Snowdrop, Satisfaction, Lord Tennyson, Pink Perfection, and Purple Perfection.

Mr. EMPSON, gr. to the Hon. Mrs. WINGFIELD, Amptill, sent a collection of five clean Carrots in several varieties, as sent out by Messrs. Sutton & Sons, which firm showed a wonderful collection of Potatoes, including five tubers of Satisfaction, Triumph, Windsor Castle, and Magnum Bonum, and large dishes of Early Regent, Ashleaf Kidney, Reading Hero, Perfection, Harbinger, Reading Russet, Reading Ruby, First and Best, and many others, there being with seedlings and Fir-apple examples, about eighty varieties. Mr. J. BERRIDGE, gr. to W. L. UNWIN, Esq., Southall, had a very interesting collection of vegetables, the central figure being a number of plants of the popular climbing Bean, Tender-and-True, in pots, fruiting finely, and numerous Parsnips, Carrots, Potatoes, Beets, Onions, and other roots, also green stuffs, in great variety.

MISCELLANEOUS.

Honorary exhibits were fairly numerous; notice was taken of those following:—Mr. NORMAN DAVIS, nur. Eryman, Camberwell, exhibited a few blooms of Chrysanthemums, representing some new varieties for 1895; Mrs. J. SHRIMPTON was one of the best of these; it is a large buff Japanese, with broad flat petal, very high centre; Jno. SEWARD is a large yellow Japanese, and Dorothy SEWARD a large pale red Japanese, of some promise.

Horticultural sundries were exhibited on a stand by Mr. J. GEORGE, 14, Redgrave Road, Putney, S.W.; and the JADOO Co., Limited, had a group of good Chrysanthemums in bloom which had been grown from the cutting stage in the Jadoo Fibre.

A capital group of Chrysanthemums in bloom was put up by Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea, in which some old and many new varieties were well shown.

Nine Chrysanthemum blooms, in as many varieties, were sent by Mr. ALFRED CHANTRIER, Casa Caradoc, Bayonne (Basses-Pyrénées), but none of them were very noteworthy.

Messrs. H. CANNELL & SONS, Swaleby, Kent, had a large table magnificently furnished with sprays of zonal Pelargoniums of bright colour, and a quantity of Chrysanthemum blooms in considerable variety. Amongst the latter, some bunches of Yellow Source d'Or were conspicuous, and blooms of a good white incurved Japanese, Kentish White.

Mr. W. PIERCY, 39, Beadnell Road, Forest Hill, S.E., exhibited bunches of decorative varieties of Chrysanthemum.

Mr. W. E. TIDY, Brockhampton Nurseries, Havant, furnished a large table with decorative and other varieties of Chrysanthemum blooms.

A grand lot of novelties in Chrysanthemums were shown by Mr. ROBERT OWEN, Maidenhead, including a good chestnut-coloured Japanese, named Beauty of Sholing, and a tiny-flowered yellow Pompon, named Dolly.

Mr. H. SPOESMITH, Claremont Nursery, Woking, had forty-eight blooms of newer varieties of Chrysanthemums.

Messrs. WM. CUTBUSH & SONS, Highgate Nurseries, London, N., showed a miscellaneous group of flowering and foliage plants, and some plants in flower of the white Japanese Chrysanthemum Mrs. Chas. Bick, &c.

Mr. W. J. GODFREY, Exmouth Nurseries, had about a hundred blooms, representing for most part English seedlings raised by himself or others.

A pretty group of Orchids and miscellaneous flowering and foliage-plants was staged by Messrs. B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, N. Twelve blooms of the Chrysanthemum Philadelphia were also shown by Messrs. WILLIAMS.

Messrs. D. and W. BUCHANAN, Forth Vineyards, had naturally-tinted Vine leaves, and a few Grapes and Tomatoes.

HAVANT CHRYSANTHEMUM.

OCTOBER 29.—To this Society belongs the honour of opening the cycle of Chrysanthemum shows, and this, the twelfth it has held, was in no respect behind those it has previously held in regard to good quality.

The cut bloom classes were liberally provided for in the schedule, and for twenty-four Japanese varieties, Mr. PENFOLD, gr. to Sir F. FITZVINGRAM, Bart., M.P., Leigh Park, Havant, was 1st, with large well-developed choice varieties 2nd, Mr.

TIDY, Brockhampton Nurseries, Havant. For eighteen and twelve Japanese, Mr. AGATE, of the Chrysanthemum Nurseries, was 1st, with remarkably fine blooms in both of the classes.

In the incurred section, Mr. PENFORD won in the class for twenty-four, and Mr. AGATE in that for twelve varieties, both exhibitors staging very creditably. Anemone-flowered and reflexed varieties were shown in but moderate numbers, but the Pompons and single-flowered varieties formed an admirable feature. In the first of these classes, Mr. H. SNOOK, 5, Fitzroy Street, Fratton, was 1st for single-flowered; and Mr. AGATE was 1st with some really beautiful varieties shown as triplets in bunches.

Mrs. CONWAY, Havant, was an easy 1st in the dinner-table decorations, in which Chrysanthemums formed the major part. The Hall was rendered quite gay with a number of plants in pots, Mr. TIDY being 1st in the two classes.

Fruit formed also a creditable display, the prizes for Grapes falling to Mr. PENFORD and Mr. W. MITCHELL, gr. to J. W. FLEMING, Esq., Chilworth Manor.

Mr. Cheuton, gr. to Sir W. PINK, Shrover Hall, Cosham, was invincible in the vegetable classes, winning two 1sts.

Mr. W. E. TIDY, who is also the Secretary, had a quantity of cut blooms of Chrysanthemums and other plants not in competition, which were greatly admired.

WATFORD CHRYSANTHEMUM.

OCTOBER 29, 30.—This exhibition, the tenth, was held at the Clarendon Hall, Watford, on the above dates. It was of the usual high character, the exhibits throughout being of the best quality, and the entries fell but very little short of those in former seasons. The fruit was the finest display that has been shown for some years.

GROUPS.

In Division I., the group of Chrysanthemums were conspicuous for their effective arrangement; the first award for a group on a space not exceeding 50 feet was secured by Mr. C. E. KEYSER (gr., Mr. Gleason), while the 2nd passed to Mr. W. K. D'ARCY (gr., Mr. Tidy). The prizes for a group of miscellaneous plants on a like space fell to the latter gentleman and Lord ESHER (gr., Mr. Brown).

In Division II., open to members only, the Chrysanthemum group awards went to Mr. BRAITHWAITE (gr., Mr. Wearing), and the hon. secretary, Mr. C. R. HUMBELL (gr., Mr. Harvey).

Mr. C. G. MOTT (gr., Mr. Plummell), had the best group of Chrysanthemums in Division III., open to members not employing more than three gardeners, and Mr. SHERRY (gr., Mr. Tibbles), 2nd.

In Division IV., open to members employing one gardener, Dr. BRETT (gr., Mr. Camfield) was 1st for a Chrysanthemum group; while Mrs. PART (gr., Mr. Hill) secured 1sts for six Japanese and six incurred blooms, three table plants, and three Primulas. The other bloom prizes were given to Mr. WHELON and Mr. ROWLANDS.

The best vegetable collection in Division IV. was shown by the latter gentleman, while the fruit trophies passed to Mr. BRAITHWAITE, Mrs. J. F. HILL, and Messrs. A. and J. WILD.

CUT BLOOMS.

The open first classes for twenty-four Japanese and twenty-four incurred cut blooms were both well won by Mr. C. E. KEYSER. Both were very good, the finest incurred specimen being a Charles H. Curtis, which was the winner of the special prize for the best incurred variety in the show, and a similar award for the finest Japanese bloom was given to a Madame Carnot. Other very noticeable blooms were Empress of India, Madame Drier, Golden Empress, Cecil Wray, Duchess of Devonshire, Mrs. Harman-Payne, and Souvenir d'une petite amie. In the other cut bloom classes the chief prize-takers were Lord BROWNLOW (gr., Mr. Lowe), Mr. V. M. MARTIN (gr., Mr. Wooster), Rev. H. J. H. BURCHELL-HERNE (gr., Mr. Fowler), Mr. J. LARKIN (gr., Mr. Fortuon), Mr. T. E. BLACKWELL (gr., Mr. Dinsmore), and Mr. BOSANQUET.

The best cut blooms in Division III. were exhibited by Mr. A. ROWLANDS, Mr. G. T. SKILBECK (gr., Mr. Roberts), Mr. F. TAYLOR (gr., Mr. Sharpe), and Mr. R. T. PROWSE (gr., Mr. Bottom), the best Pompons being produced by Rev. H. F. H. BURCHELL-HERNE. For Primulas, Mr. W. F. D. SCHREIBER (gr., Mr. Davis), and Rev. H. E. H. BURCHELL-HERNE were the leading exhibitors. The fruit winners were Mr. A. ROWLANDS, Mr. F. D. THOMAS, and Rev. F. H. HODGSON.

The best incurred and Japanese cut blooms in Division II., not fewer than eighteen varieties, both came from Mr. C. E. KEYSER, the 2nds being Mr. W. K. D'ARCY and Mr. T. E. BLACKWELL. The chief blooms exhibited in these classes were Chas. Davis, International, W. H. Lincoln, Col. W. B. Smith, John Lambert (2), Madame Drier, and Empress of India.

For twelve Japanese blooms, Mr. R. HENTY was 1st; the same gentleman was successful in carrying off both premier awards for twelve bunches of Pompons and twelve bunches of Anemone Pompons.

TABLE PLANTS, &c.

Mr. V. M. MARTIN captured both prizes for twelve table plants, pots not to exceed 6 inches. Mr. S. T. HOLLAND was declared the winner for six Primulas, whilst the 1st prize for Primulas went to Mr. P. BOSANQUET, Mr. R. F. TODDUNTER, and H. H. GIBBS, Esq., M.P.

For the sixth year in succession Messrs. SCRIVENER, whose exhibits were first-class in every detail, were the winners of the 1st prizes for wreaths, crosses, and bouquets. The bouquet of Orchids shown by them was a special feature of the show, and was greatly admired by the judges. The same firm also

obtained the special prize for a bouquet of Chrysanthemums, which contained some very choice flowers. Mr. W. B. KETTLE and Mr. PROWSE took 2nds. Mr. H. H. GIBBS, M.P., won the special awards for vegetables, with Mr. R. HENTY and Rev. F. H. HODGSON as 2nd. Among the amateur cut-bloom winners were Mr. J. FOX, Mr. E. MANSFIELD, Mr. J. DAY, and Mr. H. L. SELL.

The best cottager's exhibit of six Chrysanthemum blooms was that of Mr. J. WOODGATE, Mr. CHILD taking 2nd; and Mr. SHUTLER was the winner of the mixed bunch. Other winners were G. W. KENTISH, E. MANSFIELD, C. CHILDS; while the special awards for vegetables were obtained by W. GOLDING (two), W. HALL, J. PERCIVAL, E. TOWERS, T. J. BURDETT, and G. W. KENTISH.

In the division open to ladies, for single stand of cut flowers and foliage, Miss K. MEAD was 1st; and the same competitor was also successful in carrying off two other 1sts for sprays of flowers and three button-hole bouquets of Violets, as well as 2nd for six button-holes. Miss J. H. SMITH and Miss M. D. SMITH shared the other ladies' prizes.

FRUIT.

Grapes were shown well, the honours being equally divided between Mr. W. K. D'ARCY and HOB. A. HOLLAND-HIBBERT (gr., Mr. Cox). The open vegetable collection prizes were taken by H. H. GIBBS, Esq., M.P. (gr., Mr. Beckett), and Mr. R. HENTY (gr., Mr. Brown).

Messrs. CUTEHUSH's specials for 2lb. of Mushrooms fell to Mr. S. T. HOLLAND (gr., Mr. Richardson) and Mr. H. H. GIBBS, M.P.

TORQUAY AND DISTRICT GARDENERS' ASSOCIATION.

OCTOBER 30.—The Torquay Horticultural Society having ceased to exist, the gap has been filled by the Gardeners' Association this year. It is gratifying to all concerned in the new venture to record that the show proved a most successful one, notwithstanding the unfavourable character of the summer and autumn. The collection of plants and cut blooms which constituted the show held on the above date was a very superior one, and reflected great credit on those who raised them.

There were ten competitive classes, and no fewer than four of the 1st prizes went to the Rev. TALBOT GREAVES, whose box of six incurred varieties was greatly admired. Dr. W. FORD EDGECLOW was awarded 1st prizes in the classes for twelve and six Japanese varieties, besides gaining premier honours in large groups.

The Right Hon. W. H. LONG, M.P., in addition to other prizes, was placed 1st for table decorations.

A very fine collection of Ferns and foliage plants was sent by the committee of the ERITH HOUSE INSTITUTION; and Mrs. RAWSON, Bramhope.

An interesting exhibit was the collection of vegetables raised by the pupils of the Technical Class for Gardening. Some of the samples raised by scholars ten and eleven years of age caused expressions of wonder and surprise to appear on the faces of some of the older amateurs. The collection was kindly presented to the Torbay Hospital.

Messrs. VEITCH & SON, of Exeter, displayed fifty dishes of Apples, and a small but choice collection of Orchids. This firm also had on view some most brilliantly-coloured Cannas, and a new Aster from Colorado.

Mr. W. B. SMALE had a charming collection of Chrysanthemums, Ferns, and foliage plants, which presented a very pretty sight. Amongst the newest varieties were Colonel Chase, a creamy-pink; John Machar and Wilfred Marshall, new yellows; Creole, the nearest approach to blue yet produced; International, Comte F. Lurani, pink; Charles Davis, bronze; and Mrs. Ford Hillier, primrose. Messrs. CURTIS, SANFORD & Co., Limited, had a large exhibit consisting of Chrysanthemums and other plants, and a large collection of fruit, amongst which were a number of fine examples of Apples, the second crop of some trees at the South Devon Fruit Farm; Pears, Raspberries, Grapes, and a number of dishes of Apples. Mr. SMALE contributed some charming bouquets and floral devices.

Messrs. JARMAN & Co., Chard, displayed a quantity of Onions, and dishes of Apples; Mr. W. J. GODFREY, boxes of Carnations, including several very beautifully-tinted blooms of his own raising; and Messrs. TUPLIN, Newton; BEACHEY, JENKIN & Co., Kingskerswell; H. HORN, St. Marychurch; and W. ALLWARD, Torquay, staged miscellaneous collections, possessing considerable merit. The arrangements in connection with the show were admirably carried out by the committee.

ROYAL AGRICULTURAL AND HORTICULTURAL SOCIETY OF JERSEY.

HORTICULTURAL DEPARTMENT.

OCTOBER 30, 31.—The annual fruit exhibitions held by this Society are worth a long journey to see, and that held on the above dates was, if anything, superior to any of previous years. The island has long since been famed for its Pears; and the even quality of the grand collection shown on this occasion proves that the island still holds its own in that respect. Apples have also vastly improved of late, but hardly as yet come up to the standard of large English shows. The show was held in the Society's

Pavilion, a building admirably adapted for the purpose; and the weather on the first day was fine.

GRAPES headed the list, but somehow the Channel Islanders do not excel in this particular line, for the quality was not certainly anything like what is usually seen at an average English show. It being rather late in the season for Black Hamburgs, there were but two exhibitors, 1st going to Mrs. BRAYN (gr., Mr. Boubry); and 2nd to Mr. A. DAVIDSON. The last-named exhibitor was also 1st with good bunches of Gros Colmar, but lacking in colour; 2nd going to Mr. J. DUPRÉ, with smaller bunches. In the any other variety of black, Mr. DAVIDSON deservedly headed the list with certainly the best exhibit in the Grape classes, viz., three bunches of that new Grape, Appley Towers. The centre bunch was perfect in colour and bloom, though rather small; the 2nd went to Mr. H. BECKER for Black Alicantes, small both in bunch and berry, but of good colour. Muscats were poor indeed. Baskets of Grapes were numerous shown, Mrs. BRAYN winning 1st for Black Hamburgs. Mr. DAVIDSON and Mr. BECKER were equal 1st for any other black variety, the former with Appley Towers, and the latter with Alicante. Baskets of white call for no special mention. Baskets of mixed Grapes, Mr. BECKER, Mrs. BRAYN, and Mr. DAVIDSON, were 1st, 2nd, and 3rd respectively.

APPLES were, probably, for colour, size, and quality, the best ever before witnessed in the island. The splendid sunshine throughout the month of September had doubtless something to do with this.

In collections of dessert Apples, six varieties, Mr. H. BECKER was *facile princeps* with Ribston, Cox's Orange, and King of Pippins (splendid), Rosemary and Pile's Russets, and Cornish Gilliflower. Mr. T. DE FAYE was 2nd, with Requette de Caux, Golden Requette, Ribston Pippin, Court of Wick, Cornish Gilliflower, and Hammond's Seedling. Collectors of three varieties: Mr. BECKER was again to the fore, and Mr. E. G. MARETT 2nd.

In six culinary varieties, Mr. T. DE FAYE was 1st, with splendid samples of Warner's King, Waltham Abbey Seedling, Striped Beefing, Requette du Canada, Erabant, Belle Fleur, and Blenheim Orange.

Mr. BECKER and Mr. E. G. MARETT were equal 1st, the former with Calville St. Sauveur, Blenheim Orange, Gloria Mundi, Golden Noble, American Crab, and Requette du Canada; and the latter with Rismarck, Lane's Prince Albert, Hollandbury, Emperor Alexander, Pearmaine, and Requette du Canada. The above collections, both of dessert and culinary sorts, were splendid, far above what is usually shown here.

In the classes for single dishes, Ribston, Cox's Orange, and King of Pippins were represented by specimens of unusual size and colour. Cornish Gilliflower was also of superior merit, and the same may be said of Court of Wick, Pigeonnet (remarkably pretty), Golden Requette, Wellington, Requette du Canada, Royal Russet, Hawthornden, Emperor Alexander, Alfriston, Gloria Mundi, Hollandbury (grand colour), Requette de Caux, Warner's King (splendid), Lane's Prince Albert, Cox's Pomona, &c.

PEARS, as a rule at these shows, are a special feature. There were no phenomenally large specimens, as usually exhibited at these shows, but size and quality ruled throughout. For collections of dessert fruits, six varieties, Mr. J. DAVENPORT was 1st, with large and well-coloured specimens of Doyenné du Comice, Duredeau, Chaumontel, Glou Morceau, Duchesse d'Angoulême, and Baurré Diel; Mr. DE FAYE was 2nd, with equally large and shapely fruit, though not so highly coloured, of Marie Louise, Doyenné du Comice, Maréchal de la Cour, Duchesse d'Angoulême, Baurré Bachelier, and Chaumontel; equal 3rds went to Mr. T. A. NEIL and Mr. BECKER.

In the class for three varieties, the 1st and 2nd in above changed places; equal 2nd and 3rd going to Mr. GLENEN and Mr. BECKER respectively.

For collections of culinary Pears, three varieties, Mr. BECKER was 1st, with Belle de Jersey, Lieutenant Poitoin, and Catillac; 2nd, Mr. DE FAYE, with Baurré Clairgeau, Belle de Viré, and General Todleben.

For twenty-five Chaumontels, 1st, good size and fair colour, Mr. DAVENPORT; 2nd, Mr. C. TALLIS, somewhat smaller than the 1st; 3rd, Colonel TURNER.

Mr. J. DUPRÉ won the 1st in the class for twelve Chaumontels; with Mr. DAVENPORT 2nd, and Messrs. L. P. LE MASURIER and GLENEN equal 3rds. For five Chaumontels, Mr. DAVENPORT was again to the fore, with grand fruit; 2nd, Mr. L. P. LE MASURIER, better colour, but smaller.

The class for twenty-five Glou Morceau was a fine one, as also were the classes for twelve and five. Messrs. T. A. NEIL, DAVENPORT, TALLIS, and ASHELFORD, were the prize-winners. Doyenné du Comice is becoming immensely popular, and threatens to supersede some of the older sorts; Mr. NEIL's 1st prize twenty-five were grand in size, shape, and exquisitely coloured, and the classes for twelve and five were also splendid, and the competition was close indeed. Mr. J. COUTANCHE'S (gr., Mr. Lane) twelve and five Belle de Jersey were marvels of superior culture, very large, perfect in shape, and the colour excellent, these easily scored 1st in each class. Catillac, though fine, were not so large as sometimes seen, but Mr. J. W. THELLAND deservedly won 1st for both twelve and five specimens.

The classes for single dishes were hotly contested, the entries being numerous, and the quality even, made it no sinecure for the judges. The following varieties were represented by large and beautiful fruit, viz., Duchesse d'Angoulême, Pitmaston Duchess, Van Mons, Genl. Todleben, Baurré Bachelier, Durondeau, Marie Louise, Maréchal de la Cour, Baurré Diel, Baurré Superfin, &c. The heaviest Pear was a Belle de Jersey, weighing 3 lb. There were two entries for a collection of fruit collected in the Island, and here Mr. H. BECKER, F.R.H.S., of the St. Saviour's Nurseries, put up a

collection such as seldom seen. The most popular Pears were exhibited in baskets, and there were some hundred or more dishes of splendid coloured Pears, Apples, Peaches, Plums, &c., together with a stand of three bunches of admirably coloured black Alicante Grapes, the whole having a background of Palms and fine foliage plants, the *tout ensemble* having a splendid effect. Mr. Ph. BAILLACHE was 2nd with a collection of Apples only, amongst which were a number of local seedlings, and varieties of inferior quality.

CHRYSANTHEMUMS.

The Chrysanthemum Show was also held at the same time and place. Groups were the principal feature, and the arrangement in most cases was very effective, especially those in which fine foliage was allowed. Mr. G. LE HUQUET won the special for the best in this class; and Mr. T. L. DE FAYE, 2nd. In the class for groups with an edging of green foliage plants only, Mr. LE HUQUET again won the special prize offered; with Mr. A. J. DE ST. CROIX, 2nd; and Mr. A. J. LE QUESNE, 3rd. Trained plants were far behind what is usually seen here, but cut flowers were splendidly shown by Mr. N. ALLAIN, who entered in almost every class of incurved, Japanese, and Pompons, with the result that he won the National Chrysanthemum Society's Silver Medal, and carried off the bulk of the 1st prizes with splendid blooms.

Mr. GLENN, of the Springfield Nurseries, was awarded 1st for a very tastefully arranged table decoration; and Bouvardias and Orchids were exhibited by the Hon. Treasurer, Mr. C. J. NICOLLE, and Mrs. ROBIN.

HIGHGATE AND DISTRICT CHRYSANTHEMUM EXHIBITION.

OCTOBER 31 AND NOVEMBER 1.—The exhibition held on the above dates was one of the best yet held by the Society, a keen competition reigning throughout. The entries and exhibitors were in excess of last year, whilst the blooms were characterised by high finish, quality, and not merely by size, points which the judges duly considered. An improvement might be made another year in the naming of the plants. The trained specimens were placed on stages; a long stake with the name inserted at top was placed in each pot. We would suggest that, in future, boldly-written, correctly-spelt labels be used, and in the line of vision; this arrangement would much add to the convenience and information of those engaged in reporting, and be of material assistance to that not small section of the public which attends such exhibitions for educational purposes.

Groups of Chrysanthemums, arranged in a space of 60 square feet, general effect, formed a leading feature, and in this division Mr. J. Brooks, gr. to W. REYNOLDS, Esq., The Grove, was 1st, with a very finely-flowered and well-arranged lot of plants. Mr. H. Eason, gr. to R. NOAKES, Esq., made a good 2nd; whilst a very creditable arrangement secured the 3rd place to Mr. G. Saunders, gr. to W. HAYES, Esq. Messrs. BROOKS and EASON gained the principal prizes in the classes for six trained plants—Pompons and large-flowering—with examples of high cultural skill. For a single specimen plant (any class), Mr. BROOKS gained premier honours with a finely-flowered example of Maiden's Blush.

A good and interesting class was that for three untrained plants (Pompons). Here the leading prizes were taken by Messrs. J. WRIGHT and T. JACKSON.

Cut blooms, twenty-four Japanese, not fewer than eighteen varieties.—Some fine flowers were shown in this section, and Mr. J. Burch, gr. to J. SMITH, Esq., The Priory, Mill Hill, was adjudged the winner of the 1st prize. Some of his principal flowers were J. Shrimpton, C. B. Smith, W. Tricker, and Alfred Marshall; a close 2nd was Mr. Rowbottom, gr. to H. R. WILLIAMS, Esq. Here were noted good blooms of Vivand Morel, Phœbus, Sunflower, and Eda Prass.

Thirty-six cut blooms, distinct, eighteen Incurved and eighteen Japanese.—A very fine class. 1st, Mr. W. J. BURCH, Mill Hill. Amongst the Japanese specially fine were Mrs. C. H. Payne, Etoile de Lyon, Van der Heede, Phœbus, Vivand Morel, and Madame Isaacs; incurved, Violet Tom'in, Queen of England, Baron Hirsch, and Annie Hoste. A capital lot of flowers gained the 2nd position for Mr. ROWBOTTOM.

Twelve Japanese.—1st, Mr. A. PAGE, gr. to A. TAYLOR, Esq., Priory House, his noteworthy flowers being Princess May, Sunflower, C. Shrimpton, and Colonel W. B. Smith; 2nd, Mr. S. J. COOK, gr. to J. H. HARTRIDGE, Esq., who had, amongst others, fine blooms of Avalanche and Mrs. H. Payne.

Six Japanese.—1st, Mr. C. H. MARTIN, gr. to Mrs. F. C. R. LANGTRY, and whose stand contained some fine blooms of Colonel W. B. Smith and W. H. LINCOLN; 2nd, Mr. A. PAGE, Avalanche in this lot being very fine.

Six White Japanese.—1st, Mr. H. A. PAGE, gr. to F. CRISP, Esq.; here were beautiful blooms of Madame Carnot, Madame Thérèse Rey, and Rose Wynne. 2nd, Mr. J. BROOKS, gr. to W. J. NEWMAN, Esq., who, amongst other fine flowers, had a very fine bloom of Madame A. Moullin.

Six Japanese (white excluded).—1st, Mr. E. ROWBOTTOM, with Colonel W. B. Smith; 2nd, Mr. W. J. BURCH, who had Sunflower.

Twelve Incurved and Twelve Japanese.—An attractive class, in which the first honours were gained by Mr. H. A. PAGE. Amongst incurved, he had fine flowers of Mrs. Henle, Madame Darier, and Nil Desperandum; Japanese, Madame Thérèse Rey, Vivand Morel, Etoile de Lyon, and Edwin Molyneux.

A good 2nd was Mr. ROWBOTTOM, some of whose best flowers amongst the incurved varieties were Queen of England, Golden Empress, and Lord Alester; Japanese, Sunflower, and Utopia.

Thirty-six Pompons, twelve varieties, in threes.—A beautiful and interesting class, in which some fine blooms were staged. 1st, Mr. F. MATTHEWS, Myrtle Lodge, Muswell Hill; noteworthy blooms were Adonis, White Madame Marthas, and Wm. Westlake. 2nd, a fine lot from Mr. S. J. COOK; here were good flowers, amongst others, of Sœur Mélanie, and President.

Twelve Anemones.—Another good class. 1st, Mr. A. JONES, gr. to Miss WYBURN, Barnet, the W. W. Astor and Gladys Spaulding being specially noticeable; 2nd, Mr. J. SANDFORD.

Twelve Incurved, in six varieties.—Some highly-finished blooms gained 1st honours to Mr. J. H. WALKER, Gold Beaters, Mill Hill; Alfred Lyne, Jaane d'Arc, and Brookleigh Gem were shown well. 2nd, Mr. H. A. PAGE, whose best flowers were Jaane d'Arc and Novelty.

Six Cut Blooms, of any Variety (Incurved).—1st, Mr. J. H. WALKER, with a fine bloom of Baron Hirsch; 2nd, Mr. H. A. PAGE, who showed Madame Darier extremely well.

MISCELLANEOUS.

A pretty and attractive class was that for a hand-basket of cut blooms, arranged with Ferns, grasses, and foliage, the principal prize-takers being Messrs. WARD and ROWBOTTOM.

Button-hole bouquets of Chrysanthemums, arranged with Ferns, grasses, &c., brought out some elegant compositions, the leading positions being taken by Messrs. PARKINS and COOK.

For a dinner-table decoration of Chrysanthemums, &c., an effective class, the principal prize-winners were Messrs. SAUNDERS and HAYLES. A very interesting class was that for twelve blooms with foliage, and exhibited without cups or artificial dressing, the prizes being taken by Messrs. BROOKS and WALKER. Some boldly-arranged and very pretty exhibits were staged in response to the prizes offered for two vases of Japanese Chrysanthemums, arranged with any foliage for decorative effect. 1st, Mr. J. BROOKS; 2nd, Mr. E. ROWBOTTOM. Table plants, principally well-coloured Crotons, were well displayed by Messrs. EASON, HAYLES, and TUBBS.

Messrs. B. S. WILLIAMS & SON, Upper Holloway, sent a beautifully freely-flowered group of Chrysanthemums, not for competition, contributing also some fine Palms for the decoration of the hall in which the exhibition was held.

Messrs. M. HUNT & SON, Highgate, sent a very fine non-competitive collection of fruit. Messrs. D. & W. BUCHANAN, Stirling, also sent—not for competition—an excellent exhibit of Grapes, Tomatos, and very large coloured Vine-leaves artistically displayed.

Tomatos, here of fine quality, were shown by Mr. S. J. COOK and Mr. H. A. PAGE. Black Hamburgh and Muscat Grapes by Mr. J. Tubbs, gr. to H. RIGNAUT, Esq., and Mr. J. SANDFORD, gr. to G. W. WRIGHT-INGLE, Esq. Pears and dessert and kitchen Apples were well shown by Messrs. SANDFORD, TUBBS, and WALKER.

The show was well-managed by Mr. W. E. ROYCE, the Hon. Secretary of the Society.

THE CRYSTAL PALACE CHRYSANTHEMUM.

NOVEMBER 2.—The annual exhibition of Chrysanthemums, held on the above date under the auspices of the Crystal Palace Co., was a very successful one, and quite dispelled any fears that may have existed that exhibited blooms, at any rate, will be poor this season. If the exhibits generally had been at all equal in quality to some of the first-prize collections, the exhibition would have been one of the finest ever held in the Palace.

In the first class, for example, that for thirty-six Japanese blooms, in not fewer than twenty-four varieties, the blooms staged by Mr. W. H. LEES, gr. to F. A. BEVAN, Esq., Trent Park, New Barnet, were superb in quality. Nor did the varieties used show any lack of selection. Of yellows we noticed Phœbus, H. L. Sunderbruch, M. Panckoucke, Thos. Wilkins, Sunflower, and Pallanza. The last-named was in the back row, Sunflower in the front. Of whites there were Mrs. W. H. LEES, Mutual Friend, Mlle. Thérèse Rey, and Madame Carnot. International was shown very fine, and exhibited the characteristic rose marking in the petals, which to our mind are desirable, providing the bloom is not a rough one at the same time. Then there were Madame Ad. Moulin, E. Molyneux, Chas. Shrimpton, G. W. Childs, M. Geo. Biron, Miss Dorothy Shea, Col. Smith, Mons. C. Molin, Chas. Davies, and Vivand Morel. Next came the collection from Mr. J. W. McHattie, gr. to His Grace the Duke of WELLINGTON, Strathfieldsaye, Mortimer, whose excellent blooms would have made a good 1st in the absence of Mr. Lee's stand. Among new ones, Mr. McHATTIE included, were Madame Carnot, Duchesse of Wellington, Mephisto, M. Chas. Molin, Pallanza, W. H. Lincoln, and M. Geo. Biron; the 3rd prize was taken by Mr. C. J. SALTER, gr. to T. B. HAYWOOD, Esq., Wood-hatch, Reigate, and there were three or more other collections.

The class for twenty-four incurved flowers, in not fewer than eighteen varieties, also fell easily to Mr. W. H. LEES, his blooms were of excellent build and colour, and being good at this early show, the promise for fine incurved blooms is a good one. Two fine blooms of Chas. H. CURTIS were very effective and pretty, and Jaane d'Arc, Lord Alester, Empress and Golden Empress of India, the new Globe d'Or, Miss M. A. Haggas, Lord Wolseley, Princess of Wales, Violet Tomlin,

Madame Darier, Jno. Salter, &c., were all good; Mr. J. Dumble, gr. to Sir C. PHILLIPS, Bt., Picton Castle, Haverrfordwest, was 2nd; and Mr. C. J. SALTER, 3rd.

The prize for eighteen incurved, distinct, was won by Mr. T. ROBINSON, gr. to W. LAWRENCE, Esq., J.P., Elsfeld House, Hollingbourne, Kent. Of new varieties, D. B. Crane, old-gold-coloured, rather small compact bloom, was included, but the quality in this class was of less merit than in the preceding one. Mr. Jas. Wyatt, gr. to J. PERRY, Esq., Bradenhurst, Caterham Valley, was 2nd; and Mr. T. Caryer, gr. to A. G. HUBBUCK, Esq., Weybridge, 3rd.

The quality of the blooms entered in the class for twelve incurved, distinct, was fairly good. Mr. H. BUTCHER, gr. to C. BUSSE, Esq., Lodge House, Ashford, Kent, was 1st. He had included no novelties, and his best blooms were Jaane d'Arc and Brookleigh Gem. Mr. A. Start, gr. to L. COHEN, Esq., Round Oak, Englefield Green; and Mr. W. COLLINS, gr. to J. W. CARLILE, Esq., Ponsbourne Park, Hertford, were 2nd and 3rd respectively.

The best incurved variety in six blooms was Baron Hirsch, shown by Mr. BUTCHER; and Mr. JAS. WYATT, with the same variety, was 2nd.

The class for eighteen blooms of Japanese, distinct, had about a score of entries, and the quality was high. Mr. C. COX, gr. to J. TROTTER, Esq., Brickendon Grange, Hertford, was 1st, and he included the following new ones:—International, Commandant Blusset, Miss Ethel Addison, Thos. Wilkins, Louise, H. L. Sunderbruch, and a seedling, a large flower, with broad florets recurving at tip, yellow, with marks of rose, rather rough as shown; 2nd, Mr. W. COLLINS; and 3rd, Mr. A. JONES, gr. to Miss WYBURN, Hadley Manor, Barnet.

Twelve Japanese blooms, distinct, were best from Mr. G. SMITH, gr. to R. W. INGLIS, Esq., Craigcudowie, Reigate Hill. He had Ethel Addison, E. G. Hill, Sunflower, and Col. Smith, very good. Mr. H. BUTCHER was 2nd, and Mr. L. Budworth, gr. to E. HILL, Esq., Rockhurst, West Hoathly, Sussex, 3rd.

Vivand Morel was the best Japanese exhibited in the class for six blooms, and they were shown by Mr. W. ROBINSON, gr. to Lord Justice LOPES, Heywood, Westbury. He had four excellent blooms, the other two being unequal; Mr. C. COX followed with Col. W. B. Smith, in fine form; and Mr. G. SMITH with E. Molyneux was 3rd.

In the class for eighteen reflexed and Japanese reflexed blooms, distinct, the exhibitors were disqualified for including blooms in the opinion of the judges, which were not reflexed. Extra prizes, however, were awarded to Mr. C. J. SALTER, Mr. R. C. NOTCUT, Broughton Road Nurseries, Ipswich, and to Mr. W. ROBINSON. This is a class which, as at present arranged, may at any time result in dissatisfaction.

The best eighteen Anemones and Japanese Anemone blooms (distinct) were shown by Mr. H. PRICKETT, gr. to J. M. HARVEY, Esq., Bohm Lodge, East Barnet, and the quality of his collection was admirable, M. Dupanloup, Jno. Bunyan, W. W. Astor, Sir Walter Raleigh, and Dame Blanche, were noticeable. Mr. J. Milner, gr. to Mrs. W. A. HIGGS, Willenhall Park, Barnet, beat Mr. G. Steer, gr. to A. MARDEN, Esq., Stone House, Reigate, for 2nd place.

In the class for twelve Pompons, three blooms of each, distinct, Mr. C. J. SALTER was a very easy 1st, and showed admirably, and he also won the class for twelve Pompon Anemones; being followed in each instance by Mr. H. HARRIS and Mr. J. KNAPP.

Mr. J. Milner, gr. to Mrs. W. A. HIGGS, Willenhall Park, Barnet, won for twelve Japanese Anemone blooms, and the new Descartes, together with W. W. Astor and Rodolph Raçonier were especially fine; 2nd, Mr. H. Y. PRICKETT; 3rd, Mr. J. Justice, gr. to Sir R. TEMPLE, Bart., The Nash, Kempsey, Worcestershire.

Class 13 was an exceedingly pretty one, being arranged for the neglected single varieties. Mr. W. WELLS, Earlswood Nurseries, Redhill, was 1st, and he had some very attractive flowers indeed; Mr. W. C. PAGRAM, gr. to J. COURTENAY, Esq., The Whim, Weybridge, was 2nd.

GROUPS AND PLANTS.

There was little competition in the classes for groups arranged for effect and in those for trained plants.

The best group of 100 feet square was put up by Mr. WELLS, but its arrangement was not of exceptional character. The variety Souvenir d'une petite amie, as single blooms or dwarf plants, helped largely in the effect.

The smaller group (Amateur), upon 50 square feet, was won by Mr. W. Webster, gr. to W. HIGGS, Esq., 19, Bunfield Road, Clapham, S.W., and the exhibit was commendable.

One of the most important group classes was that for a group of Japanese varieties (Amateur), arranged on an oval space, with foliage plants, both coloured and green. Mr. W. Howe, gr. to H. TATE, Esq., Park Hill, Streatham Common, very well carried out this idea; and he was followed by Mr. T. W. WILKINS, gr. to C. RALPH, Esq., Cranbrook Villa, Upper Norwood; and Mr. Chas. Turner, gr. to G. W. BIRD, Esq., Manor House, West Wickham.

The best-trained specimen plant of Chrysanthemum was W. H. LINCOLN, shown by Mr. W. Leake, gr. to J. M. DOUGLAS, Esq., "Kuparra," College Road, Upper Norwood; and the best dozen trained specimens were from Mr. G. H. COOPER, nurseryman, Sydenham Road, Croydon.

The best arrangement of cut blooms of Chrysanthemums was a table from Mr. W. D. ASPHARD, florist, Crystal Palace.

MISCELLANEOUS.

Mr. H. BRISCOE-IRONSIDE exhibited novelties in Chrysanthemums, including a single-flowered one named Vigoni, a fairly large many petalled bloom with golden yellow disc,

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degree of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns: DISTRICTS, TEMPERATURE (Above 42°, Below 42°, Accumulated), RAINFALL (No. of Rainy Days, Total Fall, Percentage of possible Duration), BRIGHT SUN. (Percentage of possible Duration). Rows for districts 0-10.

The districts indicated by number in the first column are the following:— 0, Scotland, N. Principal Wheat-producing Districts— 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending November 2, is furnished from the Meteorological Office:—

"The weather was very changeable during the earlier part of this period, with frequent showers of rain, hail, or sleet in all districts, and occasional thunder and lightning at some of the south-western and southern stations. Towards the end of the week, however, a decided improvement took place, fair dry weather being experienced generally. "The temperature was again much below the mean, the deficit ranging from 5° in Ireland and the Channel Islands, to 6° or 7° over Great Britain. The highest of the maxima were recorded either on November 1 or 2, and ranged from 58° in 'England, S.W.' and 57° in 'England, E. and S.', to 49° in 'Scotland, N.' The lowest of the minima were registered between the 27th and 29th, when the thermometer fell to 19° in the 'Midland Counties and England, N.W.', to 29° in 'England, S.W.', 21° in 'England, S. and Scotland, E. and W.', and to between 22° and 25° in all other districts excepting the 'Channel Islands,' where the lowest reading was 34°. The lowest values reported from thermometers exposed on the grass were 15° at Workop, 16° at Loughborough, 20° at Oxford, and 21° at Stamford and in London. "The rainfall exceeded the mean in the 'Channel Islands,' and just equalled it in 'England, S.,' but was rather less than the normal in nearly all the other districts, and considerably so in the 'Midland Counties.' "The bright sunshine varied considerably in amount over different parts of the Kingdom, but exceeded the normal in most districts. The percentage of the possible duration ranged from 44 in the 'Channel Islands,' 42 in 'Ireland, N.,' to 24 in 'Scotland, N.,' and 13 in 'England, N.W.'"

MARKETS.

POTATOS.

The trade during the past week has been quiet, and prices not so firm; and stocks at the depot have slightly increased. J. B. Thomas.

*Owing to the large increase in our circulation, we are under the necessity of going to press some hours earlier. Our contributors will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.

BOOKS: T. B. We know of no book treating of stove plants only. Other question next week.

BULBS: E. J. The condition is the result of some injury to the base of the bulbs by wire-worm, or some other cause.

CLEMATIS GRAFTING: Rosa, C. flammula, C. vitalba, or any strong-growing species of which seedlings can be raised. Grafting on the roots is done in February and March in gentle bottom-heat in a close house or in a frame within a warm house.

DWARF KIDNEY BEANS: Mignon. These are never grown in this country in cool greenhouses in the winter season, nor could they be so grown. The plant needs a minimum warmth of 60°, and the day temperature should not be less than 70° in bright, or 60° in sunless, weather. Good varieties are Syon House, which does with little attention; Negro Longpodded, Ne Plus Ultra, and for large pots and where space is of no account, Canadian Wonder (Red-seeded Flageolet).

FRUIT STORING: Hopeful. The books dealing with this matter were both right and wrong in their teaching. As a matter of fact, a fruit-room can scarcely be too cold, short of letting the frost get in, as no fruit should be allowed to get frozen. To keep the fruit-room "air-tight" from the first is not the right practice, the fruits on being gathered parting with a good deal of their moisture, and means for the escape of this must be adopted, or the excessive amount of moisture in a close place would certainly cause great loss from decay being set up. Therefore, keep the windows open

and paler yellow ring round same, the remaining part being closely spotted red; Locarno, a large golden yellow coloured Japanese, and others were very good. Mrs. Briscoes-Ironside is a pretty incurved Japanese bloom of attractive flesh colour. All the blooms were shown on the exhibitors' revolving circular flower stand. Messrs. D. & W. BUCHANAN, Kippen, near Stirling, exhibited naturally-coloured Vine leaves, and fine Grapes and Tomatos. Mr. R. C. NOTOUT had blooms of a good yellow Japanese Chrysanthemum named Edith Tabor; and Miss MARY JACKSON, Upper Norwood, had florist's arrangements. Mr. T. S. WARE, Hale Farm Nurseries, near Tottenham, had a large group of plants representing decorative varieties of Chrysanthemums; and Messrs. JNO. LAING & SONS, Forest Hill, London, S.E., had a miscellaneous group of ornamental foliage and flowering plants.

BRIGHTON AND SUSSEX.

NOVEMBER 5, 6.—The thirteenth annual exhibition of this Society was held in the Dome and Corn Exchange on the above dates. Considering the great competition caused by other shows, there was room for congratulation upon the quality and the number of the exhibits. A new departure was made in the groups, and instead of being semi-circular, as before, they were arranged in circles running up the centre of the Corn Exchange. This kind of arrangement calls for more skill in placing the plants, and met with general approval from the visitors.

PLANTS AND GROUPS.

Mr. G. MILES, Victoria Nursery, Dyke Road, Brighton, was 1st for the largest group; and he was followed by Mr. H. HEAD, The Drive Nursery, Brighton; but all of the larger groups were too densely put together as regarded their contents, and not so prettily arranged as the 1st prize group in a class of which the condition was that it must not exceed 9 feet in diameter. Here Mr. J. THORPE, 20, West Hill Road, Brighton, staged a very pretty lot.

For twelve plants, including Ferns and other greenery added for effect, Mr. G. MILES was again placed 1st; Mr. J. Turner, gr. to Sir GREVILLE SMYTHE, Wick Hall, Hove, 2nd, whose group showed better arrangement, but the plants were of inferior quality.

PLANTS.

Mr. E. MEACHEN was 1st for four standards, Mr. T. FAIRS 1st for four pyramidal, and Mr. J. HILLS 1st for four dwarf plants. The last-named exhibitor was a good 2nd in both of the previous classes. Table plants, Cyclamens, and Solanums were good, but not so numerous as usual.

CUT FLOWERS.

In a class for thirty-six Japanese, a Challenge Silver Cup and £5 for the premier prize, brought out a good number of competitors, and the Cup went finally to Mr. STANDING, whose flowers were magnificent. Among the best were E. Molyneux, C. Davis, Sunflower, and Miss D. Shea; Mr. J. Hart, gr. to H. HEAD, Esq., Shoreham, 2nd; and Mr. A. SLAUGHTER, Steyning, 3rd. Mr. M. Standing, gr. to Mrs. JOAD, Patching, near Worthing, also came well to the front in a class for twenty-four Japanese; Mr. M. Tourle, gr. to F. BARCHARD, Esq., Little Horsted, being 2nd in this case. Mr. J. B. Heseman, gr. to Mrs. OXLEY, Fen Place, Turner's Hill, beat Mr. STANDING for twelve incurved varieties.

A class for twelve Japanese varieties brought out a very close and keen competition. Mr. G. Duncan, gr. to C. T. LUCAS, Esq., Warnham Court, Horsham, was 1st; he being followed by Mr. C. Sayers, gr. to the Misses COOK, Nutley, Uckfield. Equal lots would here not have been out of place.

FRUIT.

For three bunches of white Grapes, Mr. G. DUNCAN best Mr. W. TAYLOR, his berries being better finished. Mr. W. Taylor, gr. to C. BAYER, Esq., Tewkesbury Lodge, Forest Hill, was well in front for three bunches of a black variety. The competition for four dishes of dessert Pears was strong, Mr. GOLDSMITH, winning from Mr. HEASMAN here; but in an equally strong class for four dishes of dessert Apples, Mr. A. Kemp, gr. to C. R. SCRASE-DICKENS, Esq., Coolhurst, Horsham, was in front of Mr. GOLDSMITH, who was again 1st for four dishes of culinary varieties.

VEGETABLES

were up to the usual good quality, but they were not quite so plentiful as heretofore. The chief stands—not for competition—were Messrs. W. BALCHIN & SONS, Brighton and Hasocks; and Messrs. J. CHEAL & SONS, Crawley, who had in both instances some grand dishes of Apples and Pears.

ENQUIRY.

"He that questioneth much shall learn much."—Bacon.

COKE v. ANTHRACITE COAL.—Will any of your readers kindly inform "N. F. P." the relative cost of coke and anthracite coal, say, for three, six, or twelve months (the latter preferred)? An opinion from one who has kept an accurate account of the cost in each is alone desired. The use of ashes, &c., would vitiate the comparison.

night and day, unless during very damp or foggy weather. After the lapse of a month or five weeks from the time of putting the bulk of the fruit into store, the amount of ventilation should be lessened by degrees, the fruit being examined from time to time to ascertain if there is any moisture being still deposited in any quantity on it, and if there is, then a moderate amount of air must continue to be admitted. In the third week in November, the room may be closed, and daylight quite excluded. It will be necessary to afford air occasionally after that date, if the quantity of fruit in the store is a large one, and the doors and windows fit closely. It is a good plan to have a few ventilating clappers in the roof or upper part of the walls, for the purpose of letting out the moisture after this date. Very hard, late-keeping varieties of Apples and Pears may be kept in boxes and large plant-pots, or barrels, but the choicer or softer-fleshed varieties keep best when spread thinly on the shelves with nothing between them and the wood. Never use straw, hay, or brown-paper on the shelves. When cider fruit is laid in heaps out-of-doors and in barns, straw is sometimes thrown over them as a protection against frost, and also spread on the ground so as to keep the fruit clean; but in the fruit-room nothing of the kind is required. Straw, hay, and brown-paper, if they are dry at the first, soon become moist, and in this state they are readily infested by moulds which may attack the fruit, and the first two certainly impart mustiness to it.

GROS GUILLAUME VINE AS A STOCK FOR DOXE OF BUCCLEUCH IN AN EARLY VINEY: *F. S.* Not as a general rule (except experimentally) advisable, as it would affect the early ripening of the Grapes, but not much. If you think it desirable, as affording a longer succession of Grapes from the early Vines, it might be worth doing. The stock, if of a black variety, slightly affects the colour of a white one worked upon it, and sometimes the flavour, which may be a good or a bad influence according to variety. The form of the bunch may also be affected somewhat, as well as the keeping qualities of the Grapes; early varieties that may not be good keepers when growing on their own roots, having a longer season of use when grafted on long-keeping varieties. We may, therefore, infer that there is a slight thickening of the skin, or a greater proportion of tannin is present in the latter. The subject is full of interest, and requires working out fully.

INSECTS: *W. C.* The caterpillar is that of the common Cabbage Moth (*Mamestra brassicae*); it will feed on almost anything. Try an application of soot or gas-lime close to the stems of the plants. *R. McL.*—**INSECTS ON GRAPES:** *G. W. Hunt.* In one of the Grapes we found the pupa of a small two-winged fly, impossible to say of what species. It may be that the berries are attacked by something else in the first instance, and that the flies are attracted by the exuding juice. The berries were much crushed, so that examination was difficult; a few grubs separately in a small brass or glass tube would stand a better chance. *R. McL.*

MARKET FLOWERS: *A. B.* Carnations, Pyrethrums, Gladiolus, Schizostylis coccinea, herbaceous Peonies, Crocus, Snowdrops, Scillas, Narcissus, Tulips, Roses, Lilies, especially longiflorum, japonicum, elegans, candidum, and aureum; Lily of the Valley, Solomon's Seal, the best varieties of Michaelmas Daisies, and many more.

*• PLANTS, FRUITS, ETC., TO BE NAMED.—The applications to name flowers, and especially fruit, are so numerous at this season as severely to tax our resources. They entail an expenditure of time, labour, and money, of which our readers can have no idea. We are always willing to oblige our correspondents as far as we can, but the editing of the *Gardeners' Chronicle* is our business, to which everything else must give way. Correspondents are respectfully requested to observe the rules that not more than six specimens can be dealt with at a time. If more are sent, it would be a graceful act on the part of the sender, to send also a small contribution to the *Gardeners' Orphan Fund*. Specimens should be good ones, carefully packed and numbered. Leaves only, or Florists' varieties cannot, as a rule, be named. Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

NAMES OF FRUITS: *W. B.* 1, Emile de Heyst; 2, not recognised; 3, Triomphe de Jodoigne; 4, Beurré Clairgeau; 5, Soz-tte de Bayay; 6, Bergamot Esperen.—*G. S.* Fruits all much decayed. 1, probably Doyenné du Comice, too much decayed to say positively; 2, 3, 4, seems to be different forms of Beurré Diel, but much damaged.—*Vigo.* Apple, Ringer.—*T. Bartlett.*—Pears, three fruits,

Marie Louisa; 2, fruits, Doyenné du Comice.—*G. Howes.* 1, Beespool; 2, Kerry Pippin; 3, Fearn's Pippin; 4, Cox's Orange Pippin; 5, Scarlet Nonpareil; 6, Mère de Ménaage.—*F. W.* 1, King of the Pippins; 2, striped Bæfing; 3, Cox's Pomona.—*G. J. Hazlewood.* 1 and 11, New Hawthornden; 10, Manke's Codlin; 12, Rymer; 14, Warner's King; 13, Pear, Catillac.—*A. Chapman.* Apple, Duchesse's Favourite; Pear, Van Mons Léon Leclerc.—*Claud Lonsdale.* 1, Damelow's Seedling; 2, braised beyond recognition; 3, Marie Louise; 4, Autumn Bergamot; 5, Beurré Diel; 6, Catillac.—*W. H. D.* 1, Beauty of Kent; 2, Betty Geeson; 3, Beauty of Kent?; 4, Damelow's Seedling; 5, A friston; 6, French Crab.—*G. D.* Apples, 1, Bienheim Orange; 2, Stone's; 3, Mère de Ménaage; Pear, 1, Vicar of Winkfield; 2, Beurré Bosc; 3, not known.—*A. L.* 1, Lane's Prince Albert; 2, Bienheim Orange; 3, Sweeney Nonpareil; 4, King of Tompkins Co.; Pear, Duchesse d'Angoulême.—*J. M. P.* 1, Pear not known; 2, Manke's Codlin; 6, Trumpington; others so small, cannot recognise them.—*John Sandland.* Apples, 1, Marie Louise d'Uccle; 2, Marie Louise.—*J. D.* You are right; the Pear should have been sent earlier; and through insufficiency of packing material also, we are unable to name it.—*Henderson & Son.* Pear, Glou Morceau. A worse specimen could scarcely have been sent for identification. We cannot say what are the brown spots on the rind, it was brown all over.—*M. P. R.* Kindly send again.—*Wm. W.* Pear much too over ripe.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to consult the next number.—*P. H.* 1, Rhamnus cathartica; 2, Prunus lusitana, var. azorica. *E. J.* Botley. Crataegus Crus-galli, var. pyracanthifolia.—*J. W.* Cosmos bipinnatus.—*J. W. B.* 1, Cracianella stylosa; 2, Anacyclus tomentosus; 3, Scutellaria altissima; 4, we do not recognise, send again when in flower.—*W. G.* Cypripedium × polyetigmaticum (Spicerianum × venustum).—*E. J.* 1, Maxillaria picta; 2, Cypripedium venustum; 3, Iresine Herbstii; 4, Sida Sieboldii; 5, Festuca ovina.—*R. J. G.* A Golden Rod, perhaps Solidago canadensis. Our wild *S. virga-anea* is sometimes called Aaron's Rod.—*P. H.* 1, Picea; 2, perhaps Abies Nordmanniana; 3, Abies; 4, Pseudotsuga Douglasii; 5, Larix; 6, Picea Menziesii; 7, Abies nobilis; 8, Picea; 9, Abies Webbiana; 10, Abies nobilis; 11, Taxodium distichum. It is mere guess work naming Conifers without the cones. You send more than six.—*J. B. S.* A, Lactea lepida; 2, Nephrodium molle corymbiferum.—*Hortis.* The Orchids you mention are remarkably fine. *C.* is *Ocoidium prætextum*, not *O. crispum*. *E.* *Lælia cinnabarina*. The *Primula obconica* does not appear to be remarkable.—*H. F.* sends *Ocoidium prætextum* and *Cattleya lateola*.—*W. M.* *Cattleya labiata*, autumn-flowering variety, a plant now tolerably plentiful in gardens.—*Northleigh.* 1, Stapelia Rafines, *Bot. Mag.*, 1676; 2, Callicarpa purpurea; 3, Corydalis lutea.

ORCHID CULTURE: *S. H.* All the species you mention may be grown in the cool-house all the year, but they might be benefited by a slightly higher temperature while growing. Dendrobiums of the *D. densiflorum* section as enumerated, often flower on the imported pseudo-bulbs. They should be kept cool and tolerably dry during the winter. In some gardens a position in one of the fruit-houses is found to suit them. *D. Findlayana* should be reared like *D. Wardiana*, after the growths are fully made up. You might get *Burberry's Amateurs' Orchid-Cultivator's Guide*.

PTERIS: Fern. It is not disease which causes the brown markings on the Pteris sent. It is known to growers of these plants for market that a certain strain, which was originally named *Pteris cretica magnifica*, invariably gets affected in that manner in autumn and winter. It does not stand cold or damp, as do the other varieties. Growers can pick it out by the hard feel of the fronds, and the prominence of the veining running from the mid-rib. It is better to get spores of another strain.

RHODODENDRON LEAVES BITTEN OFF THE PLANTS: *W. L.* The work of mice or weevils, probably; we cannot say with certainty. Set mouse-traps. Examine the window-boxes at night for the weevils. The latter are active little beetles, bolting at the merest glimpse of a light.

ROSE BUSHES: *Rosa.* The bushes may be thinned of their shoots at this season or at the proper pruning

time, March. It is advisable not to prune at this season, for should the winter be a mild one, many of the buds would start to grow very early in the spring, and there is always a risk that these will be nipped by spring frosts.

ROSE GRAFTING: *Rosa.* At the end of the month of December and early in January, on potted stocks, gradually forced into growth. The temperature should not exceed 60° by day or 50° by night.

STRELIZIA AUGUSTA: *Munches.* We should think that if you do not re-tab the plant for a year or two, but merely surface the ball after removing some of the old soil, keep the drainage right, and give the plant a good rest in the cooler part of the stove, reducing the quantity of water at the root at that time it will show flowers. The plants should not be afforded much heat, as the temperature of an intermediate-house suits them in the winter; and in summer, in warm parts of the country, they will do well out-of-doors, or in the greenhouse; but with you it will be better to keep them always under glass. Loose potting leads to strong growth, and is therefore unsuited for the plant when it must be grown in houses of the usual size.

TEA ROSE STOCKS: *Rosa.* Seedling Dog-rosea (*Rosa canina*), or plants taken out of hedgerows, &c. The true *Rosa polyantha* is said to make an excellent stock. Tea Roses need no special kind of stock. Some of the strong growers are better on their own roots, and in all cases the union of stock and Rose should be under-ground, otherwise very severe frosts might destroy the entire budded part of the plant.

TRAASTEEN APPLE: *Hibernia.* There is no Danish Apple named Traasteen, but the Danish name of the German Apple Gravenstein is Graasten. Probably, the "G" in some way has been exchanged for a "T." Some varieties of Gravenstein are of a comparatively new date, and all of them are very fine, at least when grown in our northern climate. *N.*

TOMATOS, FRUIT, AND VEGETABLES: *J. Grainger.* Your communication has not been received.

WATER LILIES IN AN OPEN POND: *R. W. A.* *Johannesburg.* *Nymphæa cœrulea* (stellata) having succeeded, shows that the nature of the water is not at fault; but *Nelumbium speciosum* may require to have the seeds sowed in flower-pots in warm water under glass, and the plants put into the pond after the water in the latter has become warmed by sun-heat. This may be done by placing the pot and plant intact into a basket filled with rich loamy soil, and sinking it to the bottom of the pond. The soil in the basket should be covered with stones, so as to keep the soil in its place. Some of the more tender species of Water Lily succeed only near the margins of a lake where the water is warm, refusing to grow at all in deep water, in that which is distant from the bank. Meears, Siebrecht & Wadley, 409, Fifth Avenue, New York, would be enabled to furnish the required seeds.

WHEN TO TAKE SHOOTS OF HARDY PLANTS FOR GRAFTING: *Rosa.* In mid-winter, laying them singly in the earth to two-thirds of their length in a cold place, so as to retard all sap movements to the latest date.

COMMUNICATIONS RECEIVED.—*J. H. Wheeler.*—Fred. Smale, much obliged, but the report was already to hand.—*F. W. Meyer.*—Subscriber.—*F. Novik.*—*J. Backhouse*, with many thanks.—*F. W. B.*—Institute of Civil Engineers.—*M. Georges Mantin*—*G. N.*—*W. W.*—The Linnean Society.—*A. S.*, Reading.—*H. H. D'O.*—*J. C. F.*—*W. W.*, Kew.—*E. M.*—*J. R. J.*—*A. B. R.*—*Dr. Dammer*, Berlin.—*J. L. Barham*—*Prof. Kränzlin*, Berlin.—*W. R.*—*J. D.*—*A. P.*—*A. D.*—*R. L. H.*—*G. W.*—*S. T. W.*—*A. H.*—*W. G. S.*—*F. R. T.*—*Coomber*—*W. H. THE BEST & CHEAPEST FUEL for GREENHOUSE BOILERS, STOVES, & HEATING APPARATUS.

ANTHRACITE SMOKELESS COAL.

G. R. CARTER & SON supply their LARGE, NUT, or COBBLE COALS (the Nuts being about the size of a Walnut, and the Cobbles about the size of a man's fist), delivered by van, at any address within the 4-mile radius of Charing Cross; or in truckloads, at any Railway Station. This Coal is absolutely smokeless, and it requires much less attention than any other description of fuel, burning for twelve hours at least without any supervision, and giving from five to ten degrees more heat than Coke. Quotations on application to—

OF

NURSERY STOCK.

AUTUMN, 1895.

Grown at our Feltham and Hanworth Nurseries.

INSPECTION INVITED.

Terms: Cash with Order. Trees and Plants free on rail. Seeds Carriage Paid.

FERNS, FOLIAGE PLANTS, &c.—Large, well-grown plants, in 5-in. pots, for immediate effect. Maidenhair, gold, ribbon, and crested Pteris tremula, serrulata, albo-lineata major and cristata, 5s. per doz.; Polypodium splendens silver tint, 7s. per doz.; Nephrolepis, very handsome and graceful, for baskets, 8s. per doz.; Aralia Sieboldii, extra fine, special value, 6s. per doz.; Cyrtus alternifolius (Umbrella plant), 4s. per doz.; Palms (Kentia and Latania), 24s. per doz.; do., do., in 4-inch pots, 5s. per doz.; Small Ferns, best varieties, including Gold Ferns and Maidenhairsts, in 2 1/2-in. pots, 10s. per 100; 94s. per 1000.

SPECIAL OFFER IN CREEPERS.—Immense Stock of large, well-grown, and matured plants in 5-in. pots.—Ampelopsis Veitchii (the small Virginia Creeper), self-clinging, with foliage turning a very rich deep crimson in autumn, 7s. per doz.; Ampelopsis Hederacea (the old Virginia Creeper), stronger and more vigorous than A. Veitchii, with green foliage, 7s. per doz.; Passiflora acerulea (blue Passion Flower), first-rate climber for outer walls greenhouses, &c., with about 4-ft. growths, 7s. per doz.; Passiflora grandiflora, larger flowers than above, 7s. per doz.

SPECIAL OFFER—MARECHAL NIEL ROSES.—We have this season an exceptionally fine lot of large, well-grown plants, which are especially suitable for covering walls, roofs of conservatories &c. Plants, 3 to 4 ft., 1s. 7d. each; 5 to 6 ft., 2s. 6d. each; 9 to 12 ft., 3s. 6d. each.

HYBRID PERPETUAL ROSES.—All strong healthy dwarf bushes, with good roots, ensuring an abundant display of bloom next season. Largest stock in the Kingdom, consisting of all the Exhibition varieties. 3 for 2s. 3d.; 6 for 3s. 6d.; 12 for 6s.; 100 for 42s.; 1000 for £19.

SELECTED GRAPE VINES.—Including such well-known varieties as Black Ham Turb, Black Alicante, Foster's Seedling, Lady Downes Seedling, Gros Colmar, Muscat of Alexandria, &c. Extra large fruiting canes, about 10 ft., 4s. 6d. each; planting canes, not selected as above, but same length, 3s. 6d. each; smaller samples, 1s. 6d. to 2s. 6d. each.

SEAKALE.—Extra large selected forcing; 2s. per doz.; 14s. per 100; large roots, 9s. per 100.

ASPARAGUS.—Strong 1-year-old roots, 2s.; 2-year-old, 3s. 6d.; 3-year-old, 7s. per 100.

FRUIT TREES.—Our very extensive Stocks are this year in an especially fine condition, occupying many acres at our nurseries. Fruiting Trees of all kinds, and Trees developed to crop at once.

Table listing fruit trees: Apples, Pears, Plums, Cherries, Apricots, Nectarines, Peaches. Columns include Healthy Young Trees, Dwarf trained, Pyramids, and Standards with prices.

CHEAP OFFER OF PLANTS for PRESENT PLANTING.

—Old Crimson Clove, 3s. per doz.; Carnations in variety, our selection, 3s. 6d. per doz.; do., Ruby Castle (salmon pink), 2s. 6d. per doz.; Pinks, best named sorts, 2s. per doz.; Violas, best named sorts, 2s. per doz.; Pyrethrum (double), best named sorts, 3s. per doz.; do. (single), best named sorts, 3s. per doz.; Delphiniums, best named sorts, 3s. per doz.; Pentstemons, best named sorts, 3s. per doz.; Wallflowers (seedlings), every variety, 2s. per 100; do., do., Double German, 3s. per 100; Myosotis alpestris (seedlings), 2s. per 100; Saponaria ocyroides (seedlings), 2s. 6d. per 100; Pyrethrum (seedlings), single mixed, 2s. 6d. per 100; Pentstemon barbata (seedlings), 2s. 6d. per 100; Digitalis purpurea (seedlings), 2s. 6d. per 100; Pansies (seedlings), finest mixed, 2s. 6d. per 100; Antirrhinum (seedlings), Tom Thumb, 2s. 6d. per 100; Gaillardia grandiflora (seedlings), 3s. per 100; Polyanthus (Gold-laced) (seedlings), 3s. 6d. per 100; Campanula pyramidalis (seedlings), 4s. per 100; C. alliarifolia (seedlings), 4s. per 100; Platycodon grandiflora alba (seedlings), 4s. per 100; Heuchera sanguinea (seedlings), 4s. per 100; Dianthus barbatus (transplanted), 5s. per 100; do., do., nigrescens (transplanted), 5s. per 100; Iberis sempervirens (transplanted), 7s. per 100; Papaver bracteata, 1s. 6d. per doz.; Tritoma Uvaria (Red-Hot Poker) (transplanted), 4s. per 100; Iberis corifolia (transplanted), 6s. per 100; Lavendula spicata (transplanted), 5s. per 100; Geum coccineum (transplanted), 8s. per 100; Double White Daisies (transplanted), 4s. per 100; Arnicula alpina (transplanted), 8s. per 100; Lychnis chalcidonica (transplanted), 5s. per 100; Achillea (The Pearl) (transplanted), 5s. per 100; Hemerocallis flava (transplanted), 8s. per 100; Delityra spectabilis (transplanted), 8s. per 100; Doronicum, "Harper Crewe" (transplanted), 6s. per 100; Ceanothus macrocarpa (transplanted), 8s. per 100; Dactylis elegantissima (transplanted), 5s. per 100; Linum narbonense (transplanted), 5s. per 100; Hypericum Moserianum, 7s. per doz.

AMATEUR FORCING HOUSE.

The utility of this house for forcing or cultivating Cucumbers, Tomatoes, Melons, &c., will be perceived at a glance, it being a structure constantly in request, but almost hitherto unknown. Seed for LIST, post-free.

"INVINCIBLE" HOT-WATER APPARATUS.

MOST EFFICIENT AND CHEAPEST IN EXISTENCE.

Made in six sizes.—No. 1 to drive 75 ft., £2; No. 2, 100 ft., £3 10s.; No. 3, 200 ft., £5; No. 4, 275 ft., £7; No. 5, 375 ft., £7 15s.; No. 6, 500 ft., £9; of 4 in. pipes.

TENANT'S FIXTURE

Requires no sunk stovehole and no brick setting. Will last all night without attention. Will burn house cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed. Cost of complete Apparatus for Greenhouses with 4-in. pipes, flow and return along one side, cut and fitted, securely and carefully packed on rail, at the following respective prices: 7 ft. by 5 ft., £2 15s.; 9 ft. by 6 ft., £3; 10 ft. by 7 ft., £3; 12 ft. by 8 ft., £3 5s.; 15 ft. by 10 ft., £4 5s.; 20 ft. by 10 ft., £5 5s.; 25 ft. by 10 ft., £5 5s.

COOPER'S HYGIENIC HEATER.

Burning Paraffin or Gas Without Smoke or Smell.

If set across three Columns the lowest charge will be 30s.
Page, 2s; Half Page, 4s 10s.; Column, 5s.

GARDENERS AND OTHERS WANTING SITUATIONS.

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for Terms.

SPECIMEN FREE. Price 2d. Published Friday for Saturday.

JOURNEYMAN, Inside, or Inside and Out.—Age 20; good references. No objection to both.—F. SCHOFIELD, The Gardens, Bevingbrough Ball, York.

IMPROVER.—A young Man, age 20, with four years in Flower and Kitchen Garden, seeks a situation as above. Very highly recommended.—B. OTTLEY, Florist and Seedman, Oddington, Stow-on-the-Wold, Glos.

IMPROVER.—The GARDENER, Bill Hill, Wokingham, would be pleased to recommend a strong, active young man, age 18, as above.

MUSHROOM GROWERS.—Young Man wants situation as above, 8 years' experience; has grown large quantities for London Markets; can make own Spawn.—R. S., 108, Union Street, Borough, S.E.

TO GARDENERS.—Strong Youth, age 18, wants a situation in Gentleman's Garden. A knowledge of the work; willing and obliging; can be well recommended.—Apply in first instance to G. BOLTON, Weston-on-Green, near Bicester, Oxon.

TO GARDENERS.—Young Man, age 22, seeks situation in Pleasure Grounds, Inside if required. Leaving through reduction. Good character from present and previous employers.—T. MANN, The Gardens, Leweston, Sherborne, Dorset.

TO NURSERYMEN.—Situation wanted in a Nursery. Age 23. Used to general routine of market work. References.—W. SPENCER, 1, Hope Villas, Hampton, Middlesex.

TO NURSERYMEN.—Young Man, age 25, well up in Cucumbers, Tomatos, Mushrooms, Grapes, Peaches, Pot Stuff, and the general routine of a Market Nursery.—F. SMITH, 29, Bondchurch Road, Hassocks, Sussex.

TO NURSERYMEN, &c.—Young Man (21), seeks situation. Used to Market Nursery, Tomatos, Cucumbers, Ferns, Cut Flowers, &c. Abstainer. Good references.—A. SMITH, 3, Heathfield Villas, Hampton.

TO NURSERYMEN.—Young Man wants situation. Quick at Potting, Tying, &c. Life experience. Good characters if required.—W. H., 11, St. John Row, Whetstone.

TO WHOLESALE SEED MERCHANTS.—The Advertiser offers his services for the season, either as ASSISTANT at the Counter, or as INVOICE CLERK.—J. ADAMSON, Saubury Park, Saubury-on-Thames.

TO FLORISTS.—Young Man, age 22, wants situation as BUNCHER and PACKER, and to fill up time in the houses; seven years' experience.—H., 159, Angel Road, Edmonton.

TO FLORISTS and SEEDSMEN.—Advertiser having finished his Apprenticeship in Nursery, requires a situation in Shop as ASSISTANT or IMPROVER.—ARTHUR PRATT, Messrs. W. Balchin & Sons, Florists, 87, Western Road, Brighton.

SHOPMAN.—Age 28; seeks re-engagement to the Nursery, Seed and Cut Flower Trade, Wreaths, Bouquets, &c.—A. G., "Venture," Woodside Road, Boscombe Park, Bournemouth.

SHOPMAN.—Situation wanted by Young Man, age 23, desiring change. Six years' experience; excellent references.—CROCUS, 41, Wellington Street, Strand, W.C.

Seed Trade.

SHOPMAN (HEAD).—Age 32; eighteen years' experience in Vegetable, Flower, and Farm Seeds; good knowledge of Plants; been used to a brisk Counter-trade. For references, &c, apply SCOTCHMAN, 41, Wellington Street, Strand, London, W.U.

SHOPMAN (ASSISTANT).—Age 23; five years' experience in good Provincial House in Flower, Vegetable, and Farm Seeds, &c.; good references.—RIMMINGTON, Handsworth, Sheffield.

COUNTERMAN.—Young Scotchman wishes situation; 20 years of age; six years' experience.—A. F., Messrs. Stuart & Mein, Kelso, Scotland.

"HOW TO BE HAPPY, THOUGH MARRIED."—That is a secret which many would like to possess. And yet it is so far out of our reach! After all, health is the best guarantee of a happy married life, and with sound health on both sides, it will be mainly one's own fault if happiness does not ensue. Then, husbands and wives, purify your blood, invigorate your nerves, promote the healthy action of your liver, cure your headaches, restore your appetite, banish flatulency, indigestion, and low spirits by the use of the world-famed HOLLOWAY'S PILLS. If at any time you suffer from gout, rheumatism, bronchitis, asthma, or sore throat, use freely HOLLOWAY'S OINTMENT. It has cured millions; it will cure you.

NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

Cannell's Exhibit.

ROYAL HORTICULTURAL SOCIETY.

The Daily News said:—"Florists have mastered the art of growing the finest flowers under the least favourable conditions of the weather. The exhibition held by the Royal Horticultural Society at Westminster will be regarded as wonderful for the time of year. Messrs. Cannell, of Swanley, had Zoal Pelargoniums as fine and showy as summer varieties to be seen at the great shows, and adjoining they had also a superb collection of Chrysanthemums, which included fine specimens of Kentish White, and the soft yellow Oceana. A Silver-gilt Medal was awarded."

SUPERB ORCHIDS, CHEAP.—Thousands

to select from. Write for LIST, free. P. MCARTHUR, The London Nursery, 4, Maida Vale, London, W.

ROSES for SALE.—320 W. A. Richardson,

white, 3s. 6d. doz.; do. do., red or pink, 3s. doz.—J. D. HAMON, Bulb Importer, Jamaica Row, Birmingham.

For Present Sowing.

SUTTONS' PRIZE CYCLAMEN, mixed, 5s. per packet, 2s. 6d., post free. November is the best time to sow Cyclamen Seed. The *Gardening World*, February 24, 1894, says:—"While some cultivators grow their Cyclamens for spring flowering, Messrs. Sutton & Sons make a point of having a display in the autumn which will last through the winter. The seeds were sown in November, 1892, and came into bloom in about eleven months. They have been flowering freely ever since, and will continue in presentable and handsome condition till six months have elapsed."

SUTTONS SEEDS GENUINE ONLY DIRECT FROM SUTTON AND SONS, THE QUEEN'S SEEDSMEN, READING.

CHRYSANTHEMUMS.

H. CANNELL AND SONS' Stock is the largest and completest in existence, and in the finest possible condition; will certainly give satisfaction in all parts of the world. As a proof they append the following:—

M. C. Gabain, Havre, France.

November 9, 1895.

With the plants you have sent me, it will interest you to learn, at the exhibition held here, I was awarded the "Grand Prix d'Honneur," i.e., the highest award over all other exhibitors, a valuable Sèvres Vase, presented by the French President; also two Gold and one Silver Medals. It was gratifying to receive the assurance from all competent judges that nothing finer than my display had ever been seen in Paris, or elsewhere. Amongst the most admired was your Sunflower.

SEND FOR A CATALOGUE.

SWANLEY, KENT.

CHRYSANTHEMUMS.

*ALL GROWERS WHO DESIRE THE BEST VARIETIES ONLY
should obtain a copy of W. J. GODFREY'S CATALOGUE.*

It is the **MOST RELIABLE LIST** published. (Ready early in December).

Before the blooming season hardly began, Catalogues for 1896 were distributed containing long lists of Foreign Novelties, with descriptions appended, as applied by the various raisers. Not a tenth part of these had bloomed in this country, and not one in twenty will be worth cataloguing another season. Those growers who are tempted into trying them will be sorely disappointed.

W. J. G. has on trial of this season's Novelties 220 varieties from Continental raisers, 76 from America and Japan, all the English introductions, and several hundred second-year seedlings of his own raising. **ONLY THE VERY BEST** of these will be catalogued, and no expense and trouble are being spared to sift the few "grains from the chaff." Strong, healthy, country-grown cuttings can be supplied at once, if desired, and at same prices as offered by other responsible firms.

GODFREY'S NOVELTIES FOR 1896

will consist of really sterling varieties, every one of which has been thoroughly tested the second year.

W. J. GODFREY, EXMOUTH, DEVON.

WHAT HAS RECENT CHRYSANTHEMUM SHOWS PROVED?**WHY THAT THE****XL ALL LIQUID MANURE**

Is a Great Assistance to the Prize Winner.

Mr. W. H. LEES of Trent Park Gardens, New Barnet, was the first to take this Manure in hand. He has used it freely, and his unparalleled success, both last year and this year, at the most important shows, tells its own tale, and this cannot be too widely known amongst all lovers of Chrysanthemums.

This Manure is just as valuable to the Market Grower, who has to produce dozens of blooms upon each plant, as it is to the Exhibitor, who only leaves two or three to develop. The use of it in either case produces size, brightness of colour, and substance—thus securing for the Market Grower the top price in the market as well as giving the Exhibitor the premier honours at the exhibition-table. Analysis and all particulars post-free from the Manufacturer of the XL ALL Specialties—

Address—

V. LEMOINE & SON, Nancy, France.

NEW RASPBERRY.**(STEELE'S VICTORIA.)**

A New Variety of great merit, introduced by us last year. This was raised by Mr. Steel, of Ealing, and is the finest market variety grown for Covent Garden: free-grower, heavy cropper, large handsome fruit, fruiting very early, and lasting well through the season until very late. The fruit is essentially a Dessert Fruit, being large, handsome, and very superior flavour. Strong Canes, 6s. per 100; 50s. per 1000. Now ready for Delivery. Special Quotations for large quantities on application.

WATKINS & SIMPSON,
Seed Merchants, 13, Exeter Street, Strand, W.C.

MANCHESTER WHOLESALE FLOWER MARKET.**CUT FLOWERS FOR FLORISTS.**

RICHARD SMITH & CO. WORCESTER

RESULT

Proves more than volumes of print. My Collection of Chrysanthemums has again succeeded in winning the President's Prize for Group of Plants, and the Gold Medal for Table of Exhibition Blooms, at the National Chrysanthemum Society's Show, November 5, 1895. In addition to many other prizes my collection has now been awarded

4 GOLD MEDALS

in two years—the highest award obtainable in each case. I have much pleasure in announcing that I have secured some Grand Seedlings from our two most noted and successful English raisers, Chas. E. Shea, Esq., and H. Briscoe-Ironside, Esq., which, together with my own Seedlings will form a collection

UNRIVALLED.

My GENERAL GUIDE is now ready, with reduced prices for all last season's novelties, and contains the following Cultural Articles:—How to Grow Japanese for Exhibition; How to Grow Incurved for Exhibition; How to Grow Specimen Plants; How to Grow for Decoration; How to Dress Incurved for Exhibition; and How to Save Seed. A large number of Growers attribute their

SUCCESS

to following the advice given in my Guide, which can be obtained, post-free, for eight stamps.

My LIST of NOVELTIES for 1896 will be ready in December.

RYECROFT NURSERY, LEWISHAM, S.E.

SELECT NOVELTIES IN FLOWER SEEDS for 1896, OFFERED BY HURST & SON, 152, HOUNDSDITCH, LONDON. SEED MERCHANTS.

WALLFLOWER RUBY GEM.

This grand Novelty is certainly the most brilliant and effective variety of single Wallflower hitherto sent out.

The colour is a beautiful clear shade of Ruby-Violet, with a bluish satin-like sheen (quite unlike the old purple Wallflower, which is more dark and dull in colour) and when seen in a mass the effect produced is very striking. It has the habit of the ordinary dark Blood Wallflower of medium height, and the flowers are extra large and of good substance.

A coloured illustration of this Novelty will be issued with our General Seed Catalogue for 1896.

Large Packets, retail, 1s.; Smaller Packets, retail, 8d.

GRAND NEW CRIMSON

PERPETUAL-FLOWERING CARNATION, URIAH PIKE.

(Grown by Mr. GEORGE MAY Teddington, from whom we have bought the entire stock of seed grown this year, and now offer the same for the first time.)

Awarded Six First-class Certificates, besides the Silver-Gilt and Silver Metals of the R.H.S.

This is undoubtedly the GRANDEST CRIMSON CARNATION ever offered, at the same time the most decided acquisition to the Tree or Perpetual-flowering class that has ever been raised; an ideal Carnation, faultless in form and colour. It is possessed of an extremely robust and vigorous constitution such as no other Perpetual-flowering Carnation can boast, and no collection can be complete without it. In point of colour this noble Carnation reigns supreme, being a well-defined GLOWING CRIMSON VELVET SELF, and in this respect ABSOLUTELY UNIQUE.

Packets of 50 Seeds, retail, 2s. 6d. each; Packets of 25 Seeds, retail, 1s. 6d. each.

FOR PRICES TO THE TRADE, SEE OUR NOVELTY LIST.

SWEET PEA CUPID.

We call special attention to the new dwarf SWEET PEA CUPID, a most unique Novelty of American origin, for which we have been appointed by the Vendors, MESSRS. ATLEE, BURDE AND CO., PHILADELPHIA, Sole Agents for the distribution to the Trade in Great Britain, the Australian Colonies, and India.

A brief Description of Cupid (the only dwarf Sweet Pea ever known).—The foliage is very dark green; blossoms pure wax-white, of unequalled substance, and fully as large as "Emily Henderson." The plant does not grow over 5 inches high, and never more than 12 to 15 inches in diameter. The stems are about 4 inches long bearing two or three blossoms, all very near the end of the stem. It is a wonderfully free bloomer, and begins to flower as early as May and continues until November. The seed is white, and of usual size.

Packets of 20 Seeds, retail, 1s. each; Half-size Packets of 10 Seeds, retail, 8d. each.

Electros, for use in Catalogue, supplied free on application.

IMPORTANT NOVELTY OF LAST YEAR.

PRIMULA FIMBRIATA RUBRA SUPERBISSIMA.

This grand new Primula may be described as the red counterpart of P. alba magnifica sent out several years ago, and which was one of the most sensational Novelties of recent times.

The fringing of the extra large bold flowers—which are of great substance—is of the same heavy character as in P. alba magnifica, and which distinguishes that variety from all others; whilst the colour is that of the best type of the ordinary "rubra," relieved by a rich golden-yellow eye, the well-shaped truss being borne well above the foliage, which is deeply cut and of a good rich green.

Per Packet retail, 2s. 6d.; Larger size Packets, retail, 3s. 6d.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 16, 1895.

JOHN EVELYN.

THE long roll of English amateur horticulturists contains no more attractive a name than that of John Evelyn—or "Silva Evelyn." Lucy Aikin described him as "that model of a meritorious English gentleman." "I know no man," says the poet Cowley, "that possesses more private happiness than you do in your garden, and yet no man who makes his happiness more public by a free communication of the art and knowledge of it to others. All that I am able yet to do is only to recommend to mankind the search of that felicity which you instruct them how to find and to enjoy." Columns might be filled with the things which Evelyn's contemporaries have said about him; but it is more particularly with Evelyn in connection with Sayes Court and the newly-established Deptford Park that forms part of the old estate that we are concerned.

The manor of Sayes Court, originally known as West Greenwich, has a very ancient history, which, indeed, goes back to the time of the Conqueror. But it is not at all necessary for us to penetrate very far into the dim mists of obscurity, and it must suffice us to point out that the name of the place dates from the early part of the twelfth century, when, by marriage, it passed into the possession of Geoffrey de Say, who was one of the most distinguished men of his time. The estate remained in possession of this family until early in the fifteenth century, when, in default of a heir male, it passed into the possession of Sir John Phillip. After various changes it was, towards the close of the sixteenth century, in the possession of the Browne family.

It will be interesting to quote the description of the place as it appeared to eye-witnesses in 1608 and in 1651, respectively. The survey, which bears the date of July 25, 1608, reports as follows in Sayes Court:—This house containeth eighteene severall roomes and two storis high, and nyne bayes and gardens, and orchards containing by estimation two acres and a halfe, also a stable on the west end of the stables and a loft or gardener of four bayes valued by the jury by the yeare (in good repaire), iiii l."

Forty-three years later, another survey—dated June 2, 1651—was made of the place, and from this it will be seen that its value, at all events, had considerably increased since 1608. The survey says:—"Manor house built with timber, with the appenances thereunto belonging commonly called Sayes Court, Deptford consistinge of one hall, one flor, one kitchen, one buttery, one larder, with a daryehouse, alsoe one chamber and three cellers. In ye second storie eight chambers with foure closetts, and three garretts, two stables, and one other little stable joyninge to the aforesaid manor howe, which aforesaid manor house, together with the

Crawley, SUSSEX.

said garden, orchard, and court yards, contained together two acres, two roodes, and sixteen perches. xiiij l."

Whilst in Paris during 1646-7, Evelyn became acquainted with the English Ambassador there, Sir Richard Browne, and on June 26, 1647, he was married to Mary, Browne's only daughter, and finally settled with his wife at Sayes Court in 1652. The Brownes held a lease from the Crown of the manor, which had been seized by the Parliamentarians. Evelyn obtained the King's leave to compound with the occupiers, the King also promising, in the event of a Restoration, to secure it to him in fee farm. He succeeded in compounding for £3,500; he also obtained leases from the King after the Restoration.

Although Sayes Court itself had only a comparatively small garden of a couple of acres attached to it, the manor itself would appear to consist of 260 acres, according to a letter which Evelyn quotes in his *Diary*, under date, October 21, 1642. The diary began to alter and improve the place soon after he took possession. Under the date January 17, 1653, Evelyn has an entry in his *Diary* to the following effect:—"I began to set out the oval garden at Sayes Court, which was before a rude orchard, and all the rest one entire field of 100 acres, without any hedge, except the hither Holly hedge, joining to the bank of the mount walk. This was the beginning of all the succeeding gardens, walks, groves, enclosures, and plantations there." The late Mr. Nathan Dews, the author of a very interesting and complete little *History of Deptford* states, that among the MSS. at Wotton, is the following notice of Evelyn's work at Sayes Court:—"The hithermost grove I planted about 1656; the other beyond it, 1660; the lower grove, 1662; the Holly hedge, even with the mount hedge below, 1670. I planted every hedge and tree not only in the gardens, groves, &c., but about all the fields and houses since 1653, except those large, old, and hollow Ems, in the stable court, next to the sewer; for it was before all one pasture-field to the very garden of the house; from which time also I repaired the ruined house, and built the whole end of the kitchen, the chapel, the buttry, my study above and below, cellars, and all the outhouses and walls, still-house, orangerie, and made the gardens, &c., to my great cost, and better I had don to have pulled all down at first, but it was don at several times." In *Sylva*, 1633, Evelyn further records:—"I planted all the out-limits of the garden and long walks with Holly—400 feet in length, 9 feet high, and 5 feet in diameter."

Evelyn's residence at Sayes Court extended from 1652 to May, 1694, a period of forty-two years. He was a pronounced Royalist, but occupied himself very little with public affairs during the Commonwealth, and confined himself, in fact, to the cultivation of his garden, to writing books, and to corresponding and associating himself with the learned men of the day.

It would require columns merely to enumerate the many celebrated men who visited Evelyn at his renowned retreat at Deptford. Among others, we may especially mention John Dryden, the poet; the Marquis of Argyll, who shortly after had the misfortune to lose his head on the scaffold; Lord Lothian, Earl of Southampton (Treasurer of the Navy), the Queen-mother, with the Earl of St. Albans, "and many great ladies and persons." Abraham Cowley wrote his six Latin books on plants during his residence at Deptford, and the gardens at Sayes Court are said to have helped him greatly in this. Mr. Leslie Stephen states that Evelyn was on friendly terms with John Wilkins, the warden of Wadham College, and afterwards Bishop of Chester; and with Robert Boyle, to whom in 1659, he addressed a letter proposing a scheme for building a sort of college near London, where a few men of science were to devote themselves to the promotion of experimental knowledge. The outcome

of this proposal was the Royal Society, the first meeting of which was held in January, 1660-1. Both Charles II. and James II. showed Evelyn much favour, which perhaps was a questionable sort of a compliment; Evelyn had no sympathy with the profligacy of the court of the former, and still less, if possible, with the rascalities of the latter. His attention and time became more and more devoted to scientific and other subjects apart from politics; and when the Revolution came, he retired entirely into private life.

The decadence of Sayes Court dates from the time when Evelyn left it to settle with his brother George at Wotton in 1694. While he was in residence at Sayes Court, Evelyn was constantly receiving distinguished visitors, as readers of the celebrated *Diary* are well aware. On April 30, 1663, Charles II. came "to honour my poor villa with his presence, viewing the gardens, and every room of the house, and was pleased to take a small refreshment. There were with him the Duke of Richmond, the Earl of St. Albans, Lord Lauderdale, and several persons of quality." Two years later, another distinguished diarist, Samuel Pepys visited Sayes Court, as the following entry in his *Diary* shows:—"1665, May 5. After dinner, to Mr. Evelyn's; he being abroad, we walked in his garden, and a lovely noble ground he hath indeed. And among other varieties, a hive of bees, so as, being hived in glass, you may see the bees making their honey and combs mightily pleasantly." Pepys' *Diary* contains frequent mention of Evelyn. An exceedingly fine series of unpublished letters from John Evelyn to Samuel Pepys was in the possession of Mr. S. J. Davey, of Great Russell Street, five years ago. One of these contains a very quaint request that Mrs. Pepys should call in "Plantar de choux herbari prietaream Sr. Roger L'Eitrange—anything but Sr. Politick." Another of these unpublished letters, dated 1668, has reference to America; in it he mentions a captain whom he had the pleasure of meeting when he last dined with Mr. Pepys, and suggests that, as this gentleman is about to take command of some forces in New England, he would do him a favour if he would collect for him some of the vegetables and natural productions growing in that country. He encloses a list of the names of the plants he requires, and also those growing in Virginia, and of which he is anxious that Captain Nicholson should obtain some seeds.

The Great Frost of 1683-4 dealt very hardly by Mr. Evelyn's sylvan retreat. In his *Diary*, under date of February 4, 1684, he writes:—"I went to Sayes Court to see how the frost had dealt with my garden, where I found many of the greener and rare plants utterly destroyed. The Oranges and Mirtles very sick, the Rosemary and Laurels dead to all appearance, but the Cypress likely to induce it."

The things which the Great Frost did not destroy were eventually exterminated by Admiral Benbow and Peter "the Great." "I went to Deptford," writes Evelyn, on June 1, 1696, "to dispose of our goods, in order to letting the house for three years to Vice-Admiral Benbow, with condition to keep up the garden." How far the last clause in the agreement was kept up, the following lines will show:—"I have let my house to Captain Benbow, and have the mortification of seeing, every day, much of my former labour and expense there imposing for want of a more polite tenant." In 1698, the final blow was given to the beauties of Sayes Court. The Czar of Russia, Peter the Great, "being come to England, and having a mind to see the building of ships, hir'd my house at Sayes Court, and made it his Court and Palace, new furnish'd for him by the king." One of the Czar's pleasant pastimes, it appears, was trundling of a wheelbarrow through Evelyn's favourite Holly-hedge, to which reference has already been made. "Is there," asks Evelyn, under the heavens a more glorious and refreshing object of the kind than an impregnable hedge of almost 400 feet in length, 9 feet high, and 5 feet in diameter, which I can still show in my ruined garden at Sayes Court (thanks to the Tzar of Muscovy), at any time of the year, glittering with its armed and variegated leaves, the taller standards at ordinary

distance, blushing with their natural coral. It mocks the rudest assaults of the weather, heats, or hedge-breakers—*et illum nemo impure lacessit*."

The damage inflicted on the place by this precious pair of tenants was appraised by a committee comprised of Sir Christopher Wren, Mr. Sewell, and George London, the king's gardener, at £350 9s, of which amount £55 was in respect of the garden. London reported that the "several disorders" here came under two heads, "one is what can be repaired again, and the other what cannot be repaired." London reported that (1) all the grass work is out of order, and "broke into holes by their [the Russian Court] leaping and shewing tricks upon it;" (2) the bowling-green is in the same condition; (3), all the ground which used to be cultivated for "eatible" plants is all overgrown with weeds, and is not manured nor cultivated, "by reason the Zar (*sic*) would not suffer any men to work when the season offered; (4), the wall fruit and "stander" fruit trees are "unpruned" and unnailed; (5), the hedges nor wilderness are not cut as they ought to be; and finally (6), the gravel walks are all "broke" into holes and out of order.

If this succession of calamities were insufficient to drive away the gentle Evelyn, he would have been more than human. He removed the remainder of his goods to Wotton on May 24, 1700, and Sayes Court has never since been inhabited by any member of the family. The subsequent history is soon told, and its vicissitudes might almost employ the pen of an elegiac poet. In 1759, the house was let to the vestry of St. Nicholas, Deptford, to be used as a workhouse. In 1820 the old building was in great part demolished, but the workhouse remained on the site till 1848. In 1881 all that survived of Sayes Court was converted by its owner, Mr. W. J. Evelyn, into the almshouses, for the accommodation of old residents on the Evelyn estate. In 1886, Mr. Evelyn gave part of the old grounds to form a public garden, with an endowment for keeping it in order; and in August last, the remainder of the grounds was added to this public garden, after being tastefully laid out from the designs of Mr. H. E. Milner, the well-known landscape gardener.

Of the gardens, therefore, which once formed the glory of Sayes Court, and the pride of John Evelyn, only 7 acres have entirely escaped the builder. But the inhabitants of Deptford may consider themselves exceedingly fortunate in possessing this most desirable breathing-place in the heart of this densely populated neighbourhood. That it is being appreciated is demonstrated by the fact that in a fortnight from the day of its informal opening (August 12, 1895), nearly 8000 people passed through its gates. Mr. Evelyn has had it laid out entirely at his own cost. At present a considerable variety of trees and shrubs is flourishing in the gardens, nearly all of them being deciduous, as the smoke and dirt of the place would scarcely permit of anything in the shape of evergreen shrubs or trees flourishing there. Several varieties of *Barberis*, notably *aquifolia*, *Aucubas*, *Laurels*, *Box*, two varieties of *Cotoneaster*, *Pyrus Malus*, *Cræægus*, *Lilac*, *Privet*, *Weigelas*, *Mountain Ash*, and *Philadelphus coronarius*, all flourish here in a highly satisfactory manner. The gardens are under the charge of Mr. Callaghan, who has been in Mr. Evelyn's employ for some years. The place presents much of the "unclothed" appearance of a newly-laid-out park; but in the course of the next five or ten years it will partake somewhat of the character it possessed two centuries and more ago—it will be "most bocareque," as one of John Evelyn's visitors then described it. The Elm, Poplar, and Plane trees have all been growing here for many years, and they thrive exceedingly well. Mr. Thankfull Stardee's photographs (fig. 98, p. 577; fig. 99, p. 579; and fig. 100, p. 581) give perhaps a more "bocareque" appearance than it really possesses, but beyond this they are faithful to nature.

Apart from this slice of an estate which must always remain famous in the annals of English horticulture, and a reminder of one of the most charming and lovable figures in the history of the seventeenth century, it may be pointed out that the

London County Council purchased, in 1894, of Mr. W. J. Evelyn, a space consisting of seventeen acres; this space is almost half-a-mile west of Sayes Court, adjoining the Grand Surrey Canal. The price paid for it was £36,000, and the place is now rapidly being formed into a public park. But this piece of ground formed no portion of the gardens in which John Evelyn so delighted, although it has been the property of the Evelyn family since they acquired the estate. *W. Roberts.*

(To be concluded.)

NEW OR NOTEWORTHY PLANTS.

MASDEVALLIA ECLYPTRATA, *Krzel., n. sp.**

This is a very singular-looking plant. The bright green leaves have petioles of about the same length. The flower-stalks bear on their summit a very large

excepting this very superficial affinity, all the main characters are as different as possible. Not even the petals and the lip are similar, though those parts never show such a variation as the sepals. The Royal Garden at Berlin flowered the plant in August of this year. About the home of the plant I am not quite sure, and I believe it is better to confess my ignorance on a point I am not responsible for, than to publish doubtful suppositions. *F. Kränzlín.*

KEW NOTES.

GUSTAVIA PTEROCARPA.—This is one of the handsomest of the dozen species of *Gustavia*, a genus of tropical American Myrtaceæ, remarkable for its large glossy leaves and handsome flowers, sometimes 6 inches across, and not unlike the Magnolias. *G. pterocarpa* was introduced about thirty years ago, and distributed under the garden name of *G.*

tropical countries, the Creoles counting it the most delicious of all fruits, and they ought to be judges.

DIOSPYROS KAKI.

Ripe fruits of this, the Chinese Date Plum, may now be seen on two plants in the succulent-house at Kew. They are as large as good-sized Oranges, and of a rich scarlet colour. The conditions of this house seem to suit these plants, which have fruited annually since they were planted in the border among the Agaves, where they get plenty of air and sunshine.

LYCORIS AUKEA.

The handsomest bulbous plant in flower at Kew in November is this *Lycoris*, of which there are about a dozen pots, each bearing three spikes of flower in the Begonia-house now (see fig. 94, p. 545). The flowers may be likened to those of *Nerines*, but they are three or four times as large as the largest *Nerine*, their colour being rich golden-yellow. At Kew the plants are grown in an intermediate-house all the winter and spring, and when they show an inclination to go to rest, they are stood outside in full sunshine, where they get whatever rain falls. In October they are removed into the house again, and a few are placed in a stove to induce them to flower early. Thus treated there have been flowers of this plant on exhibition in the houses for the past month or more. I am convinced now that this beautiful Chinese plant, which, by the way, was introduced into England over a hundred years ago, remains unknown to most cultivators, only because the few who have attempted its cultivation have failed through not giving it sufficient heat. In a tropical climate like that of Hong-Kong it is a popular garden plant, growing with the same freedom as *Daffodils* do here. *W. W., Kew.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM MACULATUM.

With reference to the remarks under *Odonoglossum crispum Devonianse*, at p. 503 of the *Gardeners' Chronicle* for 26th ultimo, I beg permission to say that I have at present in bloom a plant of *Odonoglossum maculatum* bearing three fine flower-spikes out of one bulb, two being on the apex, and one on the side. *C. B., The Acacias, Worthing.*

ORCHIDS AT THE DELL, EGHAM.

With the older plants of this grand collection of Orchids in unabated vigour, and the inclusion of every worthy new plant, either species or hybrid, it is not enprising that Baron Sir H. Schroder, at The Dell, Egham, attracts the gardener and the botanist from all parts of the world.

In the large commodious plant-houses a succession of floral displays is to be found, the component parts of which vary with the seasons. Early in the year we recall the splendour of the groups of *Masdevallias* and *Odonoglossums*, whose united money-value would represent a moderate fortune; then, a charming display of *Cœlogyne cristata*, usually set up with Maidenhair Ferns, the two most attractive specimens noted being a *Cœlogyne cristata alba*, some 5 feet across, and bearing upwards of 600 flowers; and a still larger Chatsworth variety of *Cœlogyne*, with about 1000 blooms. And so on in succession, each class of plant represented in such beauty and completeness as to leave a strong impression on the mind of the beholder.

At the present time it is needless to say that the main show is made up of those two admirable plants, the autumn-flowering *Cattleya labiata*, and the varieties of *Dendrobium Phalenopsis Schroderianum*, which everyone regards as being among the best introductions to gardens ever made. Of the *Cattleya labiata*, one of the new houses is filled with their glowing warm rose and crimson flowers, scarcely two of which, it may be remarked, are exactly alike. Among them is a very beautiful albino, *C. labiata Countess Fitzwilliam*, with flowers of snowy whiteness, with a chrome-yellow base to the labellum, the disc of which is pale pink or bluish-white. In the same house are some plants of The

FIG. 98.—VIEW IN THE EVELYN PARK AT DEPTFORD. (SEE P. 576)

sheathing bract, which includes the basal half of the calyx. The dorsal sepal is very short, the lateral ones are united except at the very top, and exceed the dorsal by twice its length, or even more; all are contracted into filiform tails of 2 to 3.5 cm. in length. The colour of the principal part of the flower is a rich orange-yellow, more yellow at the base, more orange, or even brick-red, at the top. The mouth of the calyx is comparatively narrow.

The very large bract is like that of *M. eucullata*, Lind., and perhaps the plant may be here and there confounded with this species—the "Widow-flower" (*La vidna*) of the natives of New Granada, but

Leopoldi. A plant of it has long been in the Palm-house at Kew, where it flowers annually, and is in flower now. It is a shrub 6 feet high, with a straight, woody stem, branched above, and clothed with oblanceolate leaves 18 inches long by 6 inches in width. The flowers are borne in terminal clusters, a dozen in each cluster, and they expand in slow succession. They are in the form of a shallow cup 4 inches in diameter, composed of four fleshy, ovate-concave petals, white, tinted with rose, and a conspicuous corona-like ring of yellow stamens. They are deliciously fragrant. *G. gracillima*, a species with linear leaves and rose-tinted flowers, was in flower in the same house a few weeks ago.

ANONA CHERIMOLIA.

A plant 4 feet high, grown in a pot, has this year ripened several fruits in the Palm-house at Kew. They are about the size of an ordinary Apricot, dark-brown in colour, their pulp being yellow, and delicious both in aroma and taste. Has any one ever tried to grow this fruit in English fruit-houses? If it could be grown as Peaches, for instance, are grown, and would fruit freely, it could scarcely fail to become popular. It is largely cultivated in

* *Masdevallia calyptrata*, Krzel. n. sp.—Foliis lanceolatis apice obtusatis in petiolum sequilongum angustatis; scapis unifloris folia sequantibus v. brevioribus; bractea maxima ovarium et basin cyathi supra dimidium amplectente carinata acuta; cyatho 2 cm. longo compresso antice subclauso, labio superiore v. parte libera sepali dorsalis triangula brevi in caudam filiformem 3.5 cm. longam protracto, labio inferiore (v. sep. lat.) multo longiore; sepalis apice tantum liberis ibi triangularibus et in caudas 3 cm. longas protractis, toto cyatho aurantiaco v. luteo et dense purpureo-suffuso; petalis longe rhombeis apice oblique resectis arosulis transversis triangularibus; labello subrhombico, antice obtuse acutato incrassato; gynoemio equilongo, margine audacitini profundo integro. *F. Kränzlín.*

Dell hybrid *Cattleya* × *Baroness Schroder* (*Trianaei* × *Jongheana*) in bloom and bud. This cross-bred plant has charming rose-pink flowers, with a yellow and white tube to the lip, and is the most lasting of late-flowering hybrid *Cattleyas*. A strong plant was noted of another fine thing raised at The Dell, viz., *Lælia* × *vitellina*, whose fine Indian yellow flowers are very attractive, and has flowers in sheath.

The adjoining house is a moist, warm one, which has been arranged in every way likely to make it suitable for the culture of *Phalænopsis*, and in it these plants at the present time seem to be quite at home, promising a good show of flowers at the proper season. At present, those in bloom are *Phalænopsis Lowii* and *P. violacea*. *Phaius tuberculosa* also grows and blooms in a most satisfactory manner in a shady corner of this house; and plants of *Miltonia Roezlii* and others requiring similar temperature and atmospheric conditions, seem to be suited in this house.

In the next range of three span-roofed houses, in the first of which is a fine batch of the bronzy-leaved *Begonia Gloire de Sceaux*; in the second, suspended over groups of coloured *Crotons* and other foliage plants, is a most charming display of the elegant sprays of *Dendrobium Phalænopsis Schroderianum*, *D. superbiens*, and others of its class; and in the third, the centre stage of which is filled with the collection of varieties of *Lælia anceps* well-furnished with flower-spikes, is a grand group of *Dendrobium formosum giganteum* laden with its large white and yellow flowers.

Passing through the lofty *Camellia*-house we find evidence of an important condition of success in Orchid culture, viz., to grow the plants well in the season of growth and rest them afterwards, in the great number of deciduous *Dendrobiums* suspended in the cool dry air of this house. Each one made splendid growth in the warmer houses, and here they are placed to become well ripened, and in consequence fitted for flowering. In this house in full sunlight *Lælia majalis* thrives and flowers freely.

In the large *Odontoglossum*-house, the vigour so often noted in the specimens, many of which are unique, is unabated, and the plants are well furnished with stout spikes. Among other things in flower are the beautiful orange-lipped *Ocycidium Loxense*, with a fine branched spike of striking large flowers; *Ocycidium superbiens*, with white, purple, and brown flowers; and various others of the class which here grow to a great size, one plant of *Ocycidium macranthum* having had nearly 180 flowers; and *Odontoglossum Edwardi*, gigantic branched spikes of its violet-coloured blooms.

In the warm tank-house, about the centre of which the Pitcher-plants are suspended, is another charming display of *Dendrobium Phalænopsis Schroderianum*, with the pure white *D. Darrii*, the fragrant white *Angræcum Leonis*, and a few other species. On one side the plants of *Vanda teres* produce every summer a great show of bloom. Here a peculiarity in the nearly white *V. t. Aurora*, which is now in flower and in buds of various stages of maturity, is noted, viz., that it is almost perpetual-flowering, for as fast as a leaf or two is made, an inflorescence appears. On the other side is a group of finely-grown *Habenaria Suzanna*, some of the best spikes having each five of their beautiful and singular flowers; also *H. carnea* and *H. nivosa*, all of which are well under management in this house, which seems to suit them admirably.

Next we pass to the *Cypripedium*-houses, in which there is a never-failing show. The varieties of *C. insigne* are coming on, and soon three flowers will be expanded on the clear yellow *C. insigne Sanderæ*, which is first favourite. There is also a good show of *C. Spicerianum*; varieties of *C. × Leeannum*, *C. Charlesworthii*, *C. × oceanium superbum*, still the best of its class; *C. × marmorophyllum*, *C. × Char. Canham*, the richly spotted *C. × Southgatei*, *C. × Antigone*, *C. × Niobe*, *C. × Galatea*, and a number of others, and the rare *C. Stonei platyænum*, and other cherished treasures are increasing steadily in size and strength. Arranged on one side of the house are a number of specimens of *Pleione maculata*,

P. Wallichiana, and *P. laganaria*, literally covered with flowers.

In the large stove-house, the centre of which is thinly arranged with gigantic *Anthurium Veitchii*, *A. Warocqueanum*, and *A. Andreanum*, furnished with fine scarlet spathes, is a splendid collection of *Calanthes*, some of which are coming into bloom, while all are furnished with stout spikes. The best of these, without doubt, is that gigantic and richly-coloured hybrid, *C. × Baron Schroder*, raised at The Dell, and which it seems difficult to surpass in beauty. It is a marked instance of the benefit to be derived by using only the very best varieties in raising crosses. Here are the violet-flowered *Utricularias* from *Roraima* suspended from the roof, and the lighter blue *U. Eadresii*, all of which give such a profusion of bloom in their season; the pretty *Pachystoma Thompsoni*, *Oncidium papilio*, *O. hæmatochilum*, *Cœlogyne Massangeana*, *C. speciosa*, *Cycnochea chlorochilum*, and with some beautiful selected plants of *Dendrobium Phalænopsis Schroderianum*, the pure white *D. Phalænopsis virginalis*, which has no other colour than a faint blush on the lip.

In the large *Cattleya*-house, the Baron, full as ever of interest in his Orchids, pointed out some of the old inhabitants of the house whose long-continued good health he attributed to growing them well, but not overdoing them—a course which, as he says, must either result in sacrifice of flowers or collapse of the plant after a time. Among these were the first plant of *Cattleya Bowringiana* ever purchased, and which is now a fine healthy mass with five grand spikes; the original plants of *Lælio-Cattleya × Dominiana* and its variety *rosea* (*C. Dominiana* × *L. purpurata*) first flowered in 1873, and which are now among the noblest of hybrid Orchids; one of the earliest plants of *L.-C. × exoniensis* and various others which are regarded by the Baron and his gardener, Mr. Ballantine, as old acquaintances. The house is bright with flowers of *Cattleyas*, *Lælia Perrini*, *Lælio-Cattleya × Cassiope*, *L.-C. porphyrostele*, *L.-C. × Enterpe*, and other hybrids, and among plants of special interest noted were the Lamberhurst hybrid *Cattleya* (*intermedia* × *citrina*) and *Lælio-Cattleya × Digbyana Mossæ*, recently figured in the *Gardeners' Chronicle*.

Passing to the lofty rockery-house, clad with Ferns, &c., we come to the lean-to range of cool intermediate-houses, in the first of which the plants of *Miltonia vexillaria* are grown; we find in the second division some of the rarer *Odontoglossums* in flower. Of these the most beautiful were the violet-spotted *O. Pescatorei Schroderianum*, of which there were three fine, branched spikes; *O. × Wilckeanum Godefroyæ*, a grand yellow flower, densely spotted with rich brown, and which we always think is no *Wilckeanum*, for its form differs, its flowers are more flatly displayed, and more beautiful than those of *Wilckeanum* is; the very pretty *O. Wattianum*, *O. Sanderianum*, *O. Bctonense album*, *O. cirrosum*, and just passed a grand *O. crispum*, which has borne thirty-two noble flowers on its spike. Then follow the house of *Masdevallias*; a house of noble specimens of *Cœlogyne cristata* and *C. c. alba*, with a row of finely-flowered *Lælia præritans*, and one specimen of the superb *L. p. alba* with pure white flowers marked with purple on the lip. Beyond are the house of *Vanda tricolor* and *V. anavis* in splendid condition, with *Vanda Kimballiana* and *V. cœrulea*, *Cypripochis elegans*, and *Cymbidium giganteum*, making a good show. Then we enter the small house set apart for *Lycaste Skinneri*, followed by a house in which are a number of *Ocycidiums* in flower, and some plants of *Dendrobium cruentum*; and then a long lean-to house, filled with foliage *Begonias* on the stage, and numerous specimens of species of *Dendrobium* hanging from the roof.

In the next range in which *Fittonias*, &c., are planted where possible are the collections of *Aspides*, *Saccolabiums*, and warm-house *Vandas*, among which some excellent examples of *V. Sanderiana* were in bloom. Here, too, is evidence that curious botanical plants are not slighted, for among a collection of

such plants in bloom were *Cataetum Christyanum*, *C. saccatum*, *C. Gnomus*, and several specimens of *C. prurum*, *Galeandra Baneri*, and other pretty species. As in other collections, difficult subjects are often encountered at The Dell, but with such the Baron and his gardener, Mr. Ballantine, have an unflinching method, and that is, to "stick to them" until they are made happy.

ADHATODA CYDONIÆFOLIA.

How seldom at the present day is this old stove-climber seen in collections! it having been elbowed out by the numerous foliage-plants with which our modern stoves are more or less filled. Of course, these latter are valuable additions to well-grown collections of plants. Still, where there is a bit of spare room, I think no plant-lover would regret adding to his collection the one named above. It is best seen to advantage when grown as a pillar-plant, though where this position is not available, it can be trained up the roof of any ordinary plant-stove. Our plant is in such a position, being affixed to three longitudinal wires up the roof under a rafter, just as Vines were trained to in old-fashioned vineries. It is planted in a brick enclosure under the hotwater-pipes that run beneath the side-stage. It is best to raise this enclosure, say a couple of bricks in depth, above the surrounding surface, to prevent the soil therein from becoming sodden. The mixture of soil we use is two parts sandy loam, to one part turfy peat, with some broken clinkers added to keep the soil sweet. Good drainage was put in the base, covering this with a thin turf, to prevent it from becoming clogged. After the enclosure is full of roots, weak doses of manure-water are afforded during the summer months, at which time the plant is in full growth. Its period of flowering is during the months of October and November. The drooping sprays covered the whole length with dark green opposite, ovate leaves, from the base of which spring small clusters of purple and white *Jasica*-like flowers, have a very pretty effect. Unfortunately, they are but short-lived when used for indoor decoration, though we have occasionally used them for laying on the cloth along with suitable foliage in decorating the dinner-table. Unlike purple flowers generally, the peculiar shade of this *Adhatoda* comes out very well under artificial light. When the flowering period is past, say in January, we cut our plant back to the main stems, keeping the roots on the dry side for a few weeks at the same time. When it begins to grow again in March we water as before. So far as I know, the plant in question is not subject to serious attacks by any of the many insect pests that too frequently infest stove-plants in general. We have tried it as a basket-plant, but have not succeeded so well as we could wish. *H. J. C.*

POTATOS.

I much regretted being compelled to leave the Drill Hall at the close of Mr. A. H. Sutton's most interesting and well illustrated lecture on Potatos, which he delivered on the 29th ult. True, very much that he said, offered no room for criticism, and but little suggested discussion. Just one or two points, however, merited notice, and could I have remained, I should have referred to them then. First, in mentioning the need for removing the stamens from flowers before attempting cross-fertilisation, Mr. Sutton laid down what is held to be an essential axiom in relation to all self-fertilising flowers that is indisputable; but I have found the garden Potato to be an exception, and I use that term to differentiate it from the various species to which Mr. Sutton made special reference. The great characteristic of the flowers of garden and field Potatos is their pollen-barrenness, which may not be absolute, but is comparative. So nearly is it absolute, however, that not more than one variety in fifty produces pollen enough to set its own flower, hence they all drop, and there is no seed-production. No doubt that feature is due to the exhaustion

arising from the great production of tubers the plants now exhibit. Seeing that in Potatoes the processes have to run coterminous, and are not found in diverse seasons as in the case with so many other things, the result is not remarkable. Thus it is that Potato-flowers, when pollen can be obtained from any source (and just a few varieties do have plenty of pollen), may be fertilised freely without interfering with the stamens, unless it be those few varieties that do produce pollen freely, and it is rare indeed that these are employed for seed-production. They may, and have made, excellent pollen parents. Certainly pollen sufficient to produce fertilisation of one or two flowers may be obtained by perseverance from many apparently-barren blooms, as I have frequently found; but never in any case has any individual flower of these varieties produced fruit by self-fertilisation. It is a curious aspect of florescence seen in huge areas of Potatoes in full bloom one week, and the next not only not a flower is to be found, but not even a berry—

on what has been proved to be the most disease-stricken soil in Surrey. I do sincerely hope it will be tested also at Chiswick on the Potato trials henceforth, for it is most distressing to see apparently fine cropping varieties turned out rotten with disease. But there can be no doubt whatever that a benefit resultant from dressing even disease-resisting varieties of Potatoes with the Bordeaux Mixture arises from the longer preservation of the foliage, thus helping, as only through the agency of leafage can it be helped, to develop greater starch production in the tubers, though no material addition may be made to the bulk of the crop. There can be no doubt whatever but that starch is more fully developed in the tubers after they have reached their maximum size, and the process of ripening is proceeding, than at any previous period in their growth. Thus the retention of leafage for but three weeks longer on the plant becomes, for this purpose, a matter of vital importance. That there is so much complaint every year as to the absence of

has in it a considerable body of yellow flesh, both for its nutty quality and flavour. Who does not remember the old Victoria, so good, one of the best flavoured of Potatoes, with its (when well cooked) yellow body coated with whitish flour-like crystallised sugar. Have we to-day its equal, or that of the Ashleaf, for flavour? Mr. Robert Fenn, when he raised his old early market Rector of Woodstock, Woodstock Kidney, gave us delicious flavour, but so soon as he utilised the white with Americans as parents of crosses to secure size, he found flavour to decrease. It is the same with all our varieties. The very best flavoured Potatoes I have raised, The Dean and Renown, were out of Woodstock Kidney, and they have good flavour, as also has Reading Russet, which is so excellent when fully matured and cooked well, but these all have yellow bases. We have got varieties that produce crops as well as size in tubers, that satisfy all needs—indeed, to-day Potatoes are cheap almost beyond all precedent. We can now afford to devote more attention to starch and flavour production, but if we will have these elements we must have yellow flesh also.

I finally suggest to chemists whenever they analyse Potatoes they do so in a cooked state, as we partake of them as a food, and not raw. What are the changes cooking brings about I cannot say, but they are considerable. Still further, perhaps, they will tell us what ingredients we can apply to soils that shall give us starch and flavour, where now it is lacking. A. D.

FIG. 99.—VIEW IN THE EVELYN PARK AT DEPTFORD. (SEE P. 576)

THE SHOW TULIP.

I THINK it possible the garden show Tulip may once more grace the tables of our exhibitions in large numbers, for Mr. P. Barr seems to have set his heart on the revival of this once immensely-popular flower; and we all know, that should he really be in earnest in the matter, that it will soon be an accomplished fact. Such I glean is his intention from a letter received from him some little time since. For several years I used to act as censor to the Vale of Evesham Floricultural Society, which held its monthly meetings in the Town Hall. This was, strictly speaking, a society of the old school of florists who studied the properties of flowers to the very letter, and who never could believe their own eyes; for every flower had to be examined through a pair of spectacles before they could trust it to be staged. However, I admit gaining many "wrinkles" from some of the members of the old school, and passed many a convivial hour in their society. The members held four shows annually, at times suitable for their favourite kinds of florists' flowers. I regret to say, that since I left the neighbourhood, now some years ago, most of the principal members of this old school have departed this life, and the rising generation seems to be lacking in energy in upholding such shows as were the pride of their fathers; and this particular society, like so many others, is now numbered with the things of the past. Should Mr. Barr take the Tulip in hand, his own extensive bulb grounds at Toames Ditton would be very suitable for their culture, and a grand display might be given annually there, which would no doubt, as of yore, draw florists from all parts of the United Kingdom. Now, we do not expect people to get so excited in these days over the Tulip as to go mad, as was evidently the case when the culture of the Tulip was at its highest, about 1636. We do not expect to hear of the gambling speculations that were once carried on during the Tulipomania; the bulbs were then sold by weight in perils or grains, and some brought prices which would have purchased a small estate. A variety called *Semper Augusta*, I have read, was sold for 2000 florins, and it once happened that there were only two roots of it to be had, one at Amsterdam, the other at Haarlem. For a bulb of this variety one person agreed to give 4000 florins, together with a new carriage, two grey horses, and a complete set of harness; and another agreed to give 12 acres of land for a bulb; and in one instance Tulips brought a profit of more

nothing but the bare stems to show where the flowers have been.

The suggestion of the lecturer that with so many fine comparatively disease-resisting Potatoes in cultivation, even in most adverse seasons, it does not pay to apply dressings of the Bordeaux Mixture generally to them, is quite true. That is specially so in relation to field culture. I conducted trials of all the best early and late varieties of Potatoes in commerce during the past summer, in Surrey, on numerous plots and diverse soils. In the majority of cases disease gave about 3 per cent. of injured tubers only, but there were two cases, both on the light porous and evidently over-charged nitrogenous soil of the allotment-ground at Richmond, where the disease played havoc with all sorts, early and late, disease resisting and otherwise; none were unharmed, and the bulk to the extent of two-thirds, at least, very bad. The soil is so much like that at Chiswick, where also disease was apparent, that it is evident there are conditions under which it would pay well to employ the Bordeaux Mixture freely; and if I have to superintend any Potato trial at Richmond next year, I trust it will be solely for the purpose of testing this liquid compound,

quality in Potatoes, is largely due to the fact that the foliage is destroyed by the disease ere it can complete its proper work of maturing, there can be no doubt.

This matter naturally leads on to the consideration of another, respecting which a long paper might be written as to the connection between colour of Potato flesh and flavour. Mr. Sutton referred to the diverse varieties of Potatoes grown on the Continent, not only for food, but also for furnishing starch and sugar to be converted into alcohol. Comparing them with ours, the continental Potatoes have yellow flesh, we prefer white flesh tubers, and grow those almost exclusively. We here show that same stupidity which characterises the nation in its preference for flabby white boneless bread over that of wholemeal, which is coarser in texture, but more healthful. It is a fact, I think, indisputable, that yellow flesh and flavour, if there be too abundant starch, are allied. The white flesh tubers give us mealiness or flouriness when they are matured, but they lack both starch, which is the chief flesh-forming principle, and flavour—why this odd antipathy to yellow flesh? Curiously enough everybody likes and extols the Ashleaf Kidney, which

than 60,000 florins to a dealer in four months. Noblemen have been known to give sweeps 2000 florins for Tulip-bulbs; and we are told that in one town in Holland in three years more than 10,000,000 florins were expended in this trade. In another instance, a person who possessed a yearly income of £2800 was reduced to begging in the short space of four months by purchasing flowers and bulbs. It is also said that a person who possessed a very fine Tulip, hearing that there was a second root of the same kind at Haarlem, repaired thither; and after purchasing it at an enormous price, placed it on a flagstone, and pounded it to pulp with his feet, exclaiming with exultation, "Now my Tulip is unique!" Now, of course, we do not, in these hard and enlightened times, expect any such folly, or high trade prices to rule; we shall not have maid-servants, footmen, sweeps, &c., speculating as of yore; but high prices may again come to the fore. The difficulty seems now to be, in getting a first-class collection together. The last beds of valuable Tulips I saw were at Mr. Groom's, Clapham Rise, about the year 1852. He had at that time one bed, 130 feet long, containing the cream of his collection—1700 bulbs, and altogether 200,000 in and out of flower, and the prices he asked were exceedingly high, ranging from 100 guineas downwards. Mr. Middlecot, of the Greyhound Inn, Dulwich, also had a fine amateur collection, which he used to cover with an awning during the flowering season; but they are also things of the past, and we must look to the northern florists for help in forming a collection, and if these would only advertise their bulbs, they would, I believe, find a ready sale for them.

Raising Tulips from seed is a very slow process, the bulbs taking from five to seven years before they flower, and several years longer before they break into their proper colours. It is best to sow the seeds in pans or boxes; cover the seed with about a half-inch layer of leaf-mould and loam; keep them from heavy rains, but not to let the soil get very dry. Wait with patience for the seedlings to flower, then select such flowers as you think most eligible in respect to shape, colour, &c. They must be handsomely cupped, with clean bottoms, these being indispensable in a good flower, whether roses, bizarres, or byblœmens; select from these those that nearly approach Glenny's properties of a good Tulip. *Edw. Bennett, Lyne, Chertsey.*

ABOUT CHRYSANTHEMUMS.

(Continued from p. 548.)

DEVONHURST, CHISWICK.

A good collection of Chrysanthemums may be seen in the garden of E. H. Watts, Esq., and when the plants are in flower it is thrown open to the inspection of the residents of the district at a small charge, the sum thus obtained going to some charity. This season it is the London City Mission that will benefit.

The Chrysanthemum plants are arranged in semi-circles, and surrounded as they are with foliage plants, a very pleasing effect is produced in the greenhouses. Mr. J. Gibson, the gardener, is a believer in small shifts when repotting the plants, and in firm potting at all times. The size of pots employed is mostly 8 inch. The plants are very dwarf in stature, and the bloom buds are reduced to three on a plant; the cutting-back system is not practised here. Liquid from the cow-shed is the only manure applied to the plants, and that very sparingly. The plants were clothed with clean healthy foliage, and produced just the kind of wood from which first-class flowers are obtained.

Many good varieties were noted, viz., M. P. Martignac, incurved, a good golden-yellow, in the way of Jardin des Plantes; the rosy-blush Princess of Wales was in fine form; Baron Hirsch, orange-cinnamon, good shape, full bloom, and early in coming into flower; Empress of India was in capital condition; also C. H. Curtis, an incurved flower of pure yellow. One of the finest of recent introductions is Commandant Blussé, Japanese, a magnificent purple-amaranth

flower, dwarf habit; Duchess of Wellington, clear yellow, with long narrow florets; Mons. Panckoucke is another bright pure yellow, not quite so rich in colour as Thunberg, but in other respects superior to it, having Sunflower and Phœbus as good companions; Colonel W. B. Smith, golden bronze, shaded terra-cotta, very fine.

One of the very finest, Viviani Morel, rosy-pink, is pure white on an early bud; International, pale yellow-tinted rosy-lilac, fine spreading flowers. No collection seems to be complete without Charles Davis, a golden sport from Viviani Morel, beautifully tinted bronzy-rose; Colonel Chase, pale blush, long drooping florets; Niveum is a light pink, changing to pure white, a good exhibition flower, and one that should also be an acquisition for market purposes, others were William Seward, Kentish Yellow, Duchess of York, Jules Ferry (seedling from Louise Boehmer), Gairlande, M. Gruyer, Mrs. W. H. Lees, Madame Carnot, Philadelphia, King of Chrysanthemums, M. Paul Lacroix, Robert Owen, and Mrs. E. G. Whittle, *J. B.*

MESSRS. PEARSON & SONS, CHILWELL NURSERIES.

These well-known nurseries, situate about 4 miles from Nottingham, are just now a centre of attraction to crowds of gardening enthusiasts and others from the home and neighbouring counties wishful to see and admire the noted collection of Chrysanthemums which is on view. Here they have the opportunity of inspecting all the latest varieties, and judging any novelties without the fear of becoming confused by the glowing descriptions to which raisers are addicted. A feature adding attractiveness to the display consists in the spacious houses in which the plants are staged; and as the pot Vines and other fruit trees, which have occupied them during the summer, have been to a great extent disposed of to customers, space is available for the exhibition without interfering in any way with the numerous houses filled with stove and greenhouse plants.

In the principal show-house, 100 by 30 feet, the plants are arranged in semi-circular groups along each side with an immense bank at either end. Large-flowering varieties compose the main portion of these groups, the choicest kinds of Pompons forming a suitable edging. Rather a contrast to each other are two adjoining houses, each 100 by 24 feet, the first brilliantly gay with blooms grown especially to cope with the large demand for cut flowers, and the second containing late varieties to come into bloom about Christmas.

A short distance from the above-mentioned houses is the house (not open to the public) devoted to plants for exhibition purposes; and where may be seen some splendid blooms, which will, no doubt, figure at many of the forthcoming shows. Amongst the most conspicuous of these blooms are to be noticed Pallanza, M. G. Montigny, M. H. J. Jones, Noces d'Or, Duchess of York, Louise, W. Firkins, M. Panckoucke, Colonel W. B. Smith, W. Seward, Commandant Blussé, Primrose League, E. Molyneux, M. S. H. de Clermont, Descartes, &c.

LIST OF GARDEN ORCHIDS.

(Continued from vol. xiii. p. 684.)

91. GALEANDRA, Lindl., in *Bauer Ill. Orch. Gen.*, t. 8; *id. Gen. & Sp. Orch.*, p. 186; *Benth. et Hook. f. Gen. Plant.* iii., p. 536; Rolfe in *Gard. Chron.*, 1892, ii., p. 430; Cogn. in *Mart. Fl. Bras.*, iii., pt. 4, p. 293.—Terrestrial or epiphytic herbs, with fusiform, leafy, or sometimes very short pseudo-bulbs, narrow grass-like leaves, and terminal simple racemes of large or medium-sized flowers, sepals and petals spreading, sub-equal. Lip infundibular, sub-entire or somewhat three-lobed, prolonged into a spur behind; side lobes loosely embracing column; disc smooth, villose, or with somewhat thickened nerves. Column clavate; anther crested; pollinia 2, affixed to crescent-shaped gland. Species about 20, ranging from Brazil to S. Mexico.

(1.) G. BARBATA, Lem., in *Ill. Hort.*, iii. (1856), *Misc.*, pp. 86, 89; *Id.*, vii., t. 248; Rolfe, in *Gard. Chron.*, 1892, ii., p. 430.—Brazil,

Amazon district. Introduced by Messrs. James Veitch & Sons, and described from a plant which flowered in the establishment of M. Verschaffelt, of Ghent, in 1856.

(2.) G. BATEMANI, Rolfe, in *Gard. Chron.*, 1892, ii., p. 430; *Veitch Man. Orch.*, pt. ix., p. 5. *G. Baueri. Batem. Orch. Mex. & Guat.*, t. 19 (not of Lindl.); *Bot. Reg.*, xxvi., t. 49; *Pact. Mag. Bot.*, xiv., p. 49, with plate; *Orchid Album*, vi., t. 267; *Puydt, Les Orch.*, pp. 196, 197, fig. 193.—South Mexico. Sent by Ross in 1833 from the neighbourhood of Oaxaca to Mr. Barker, of Birmingham, in whose collection it shortly afterwards flowered. It was then confused with *G. Baueri*, Lindl., a very distinct species from Guiana, and the mistake was not found out till quite recently, when it was found necessary to give it a new name. Bateman remarked that it was found some thousand miles away from its original habitat, but, singularly enough he appears not to have noticed that it was a different species. A second error also occurs. The author states that Miss Drake prepared the exquisite drawing "assisted by native specimens more recently discovered by Mr. Skinner in Guatemala," but these evidently belonged to some other species, as the old bulbs are fusiform in shape. Puydt has reproduced the error. It is now rare in cultivation.

(3.) G. BAUERI, Lindl., in *Bauer Ill. Orch.*, *Gen.*, t. 8; *id.*, *Gen. & Sp. Orch.*, p. 187; *Bot. Mag.*, t. 4701 (var. *floribus luteis*); Rolfe in *Gard. Chron.*, 1892, ii., p. 431; *Veitch Man. Orch.*, ix., p. 6; Cogn. in *Mart. Fl. Bras.*, iii., pt. 4, p. 297. *G. cristata*, Lindl., *Bot. Reg.*, xxx., *Misc.*, p. 72.—Guiana. The original species of the genus, described by Lindley from a specimen collected in French Guiana by Martin, but afterwards confused with the preceding one by Bateman and others. It afterwards flowered with Messrs. Loddiges in 1840, and was re-described by Lindley under the name of *G. cristata*. It also flowered at Syon House in 1853, when it was thought to represent a distinct variety of the preceding. The New Granadan *G. dives* is sometimes considered identical, but this is doubtful, as will be seen in a note under that species.

(4.) G. CLAESI, Cogn., in *Journ. des Orch.*, iv. (1893), p. 202; *Lindenia*, ix., p. 17, t. 391; *Orch. Review*, i., p. 348.—Brazil. This species flowered at Kew in October, 1888, when I thought it was probably new, but did not describe it. Afterwards it was introduced by M. Claes, probably from North Brazil, and flowered in the establishment, L'Horticulture Internationale, Brussels, in 1893.

(5.) G. DEVONIANA, Schomb., ex Lindl., *Sert. Orch.*, t. 37; *Schomb. Reise*, iii., p. 912; *Pact. Mag. Bot.*, viii., p. 145, with plate; *Bot. Mag.*, t. 4610; *Maund. Bot.*, v., t. 231; *Lem. Gard. Fleur.*, ii., p. 195; *Ill. Hort.*, xxi., p. 110, t. 176; *Warn. Sel. Orch.*, ser. 1, t. 37; *Lindenia*, ii., p. 67, t. 80 (var. *Delphica*); Rolfe, in *Gard. Chron.*, 1892, ii., p. 431; *Veitch Man. Orch.*, ix., p. 7; Cogn., in *Mart. Fl. Bras.*, iii., pt. 4, p. 295.—Brazil, in the Upper Amazon district, British Guiana, and Venezuela. This, the largest and handsomest species in the genus, was originally introduced by Schomburgk from the Rio Negro, and flowered with Messrs. Loddiges, of Hackney, in May, 1840. Schomburgk speaks highly of its beauty, and records clumps of it growing from 5 to 6 feet high, and 3 to 4 feet in diameter. He also met with it both on the stems of *Mauritia flexuosa* and on the ground. It has since been found in other localities.

(6.) G. DIVES, Rchb. f. and Warse., in *Bonplandia*, ii. (1854), p. 98; iv., p. 323; Rolfe, in *Gard. Chron.*, 1892, ii., p. 431.—New Granada. This has been united with *G. Baueri*, Lindl., from Guiana, but judging from dried specimens, it appears to be somewhat different. It was described in 1854, and was probably first introduced to cultivation by Hartweg, who sent specimens to the Horticultural Society.

(7.) G. FLAVEOLA, Rchb. f., in *Gard. Chron.*, 1887, i., p. 512; *Lindenia*, ii., p. 87, t. 90; Cogn., in *Mart. Fl. Bras.*, iii., pt. 4, p. 297.—Venezuela. Introduced by Bungeoth, and flowered at L'Horticulture Internationale, Brussels, in 1887.

(8) *G. HARVEYANA*, Rehb. f. in *Gard. Chron.*, 1883, ii., p. 716; Rolfe, in *Gard. Chron.*, 1892, ii., p. 431; Cogn. in *Mart. Fl. Bras.*, iii., pt. 4, p. 302.—Habitat not recorded, but probably Brazil. It was described in 1883, from the collection of E. Harvey, Esq. of Aigbarth, near Liverpool.

(9) *G. JUNCEA*, Lindl. *Scrt. Orch.* (1838), sub t. 37; and in *Hook. Lond. Journ. of Bot.*, ii., p. 672; Rehb. f. in *Walp Ann.* vi., p. 649; *Rodr. Gen. et Sp. Orch.*, ii., p. 175; Cogn. in *Mart. Fl. Bras.*, iii., pt. 4, p. 306; *Phaius rosellus*, Lepm., in *Fl. des Serres*, iii., t. 301.—Brazil and Guiana. Introduced by Kegel to the establishment of M. Louis Van Houtte of Gand, Belgium, where it flowered in 1847. It is probably not now in cultivation.

(10) *G. LACUSTRIS*, *Rodr. Gen. et Sp. Orch. Nov.*, i. (1877), p. 86; Cogn. in *Mart. Fl. Bras.*, iii., pt. 4, p. 304, t. 71, fig. 1; *G. Des-cagnalliana*, Rehb. f., in *Ill. Hort.*, xxxiv. (1887), p. 63, t. 22; Rolfe, in *Gard. Chron.*, 1892, ii., p. 431.—Upper Amazon, Brazil.

it is said to grow in large tufts, and to keep on flowering on the old pseudobulbs for years.

(14) *G. STANOEANA*, Rehb. f. in *Ronplandia*, iv. (1856), p. 323; Rolfe, in *Gard. Chron.*, 1892, ii., p. 431; Cogn. in *Mart. Fl. Bras.*, iii., pt. 4, p. 301.—Brazil, in the Amazon district. This species flowered in the collection of Consul Schiller, at Hamburg, in 1856, but seems to have since been completely lost sight of.

92. *CYRTOPERA*, Lindl. *Gen. & Sp. Orch.* (1833), p. 189.—Habit and general structure of *Eulophia*, from which it is distinguished by the presence of a foot to the column. It is reduced to *Cyrtopodium* by Bentham in the *Genera Plantarum*, but is certainly distinct. Species about twenty-five, found throughout the tropics.

(1) *C. ANDAMANENSIS*, *Eulophia andamanensis*, Rehb. f., in *Flora*, iv. (1872), p. 276; *Hook. f., Fl. Brit. Ind.*, vi., p. 8.—Andaman Islands and Tenasserim. Plants were sent to Kew by the Rev. C. Parish, where they flowered in June, 1862. The species has also

Fl. Brit. Ind., vi. p. 7.—W. Tropical Himalaya, Travancore and Hong-Kong. Flowered in the establishment of Messrs. James Veitch & Sons, of Chelsea, in 1870. A very handsome species.

(4) *C. FLEXUOSA*, Rolfe, in *Kew Bull.*, 1894, p. 363; *Orch. Review*, ii., p. 359.—E. Trop. Africa. Sent from Mt. Kilimanjaro to Kew by Consul C. S. Smith, and flowered in the collection from May to August of last year.

(5) *C. NUDA*, Rehb. f., in *Flora*, iv. (1872), p. 274. *Eulophia nuda*, Lindl., *Gen. & Sp. Orch.*, p. 180; *Hook. f., Fl. Brit. Ind.*, vi., p. 5; Rolfe, in *Gard. Chron.*, 1891, i., p. 701.—India. Flowered in the collection of Sir Trevor Lawrence, Bart., Barford, Dorking, in May, 1891.

(6) *C. PAPILLOSA*, Rolfe, in *Kew Bulletin*, 1893, p. 336; *Orch. Review*, ii., p. 53.—Natal. Imported by Mr. James O'Brien, of Harrow-on-the-Hill, and flowered in the collection of Sir Trevor Lawrence, Bart., Barford, Dorking, in August, 1892.

(7) *C. PLANTAGINEA*, Lindl., *Gen. and Sp. Orch.*, p. 189; Rehb. f., in *Gard. Chron.*, 1882, i., p. 700. *Cyrtopodium plantagineum*, Benth., in *Journ. Linn. Soc.*, xviii., p. 320.—Madagascar. Flowered at Kew in June, 1871, and in the collection of Baron Hruby, of Bohemia, in 1882.

(8) *C. SANGUINEA*, Lindl., in *Journ. Linn. Soc.*, iii. (1859), p. 32; *Bot. Mag.*, t. 6161. *Eulophia sanguinea*, Hook. f., *Fl. Brit. Ind.*, vi., p. 8. *Cyrtopera rufa*, Thw., *Enum. Pl. Zeyl.*, p. 302.—India. Flowered at Kew in 1874 or 1875, and again recently.

(9) *C. SQUALIDA*, Rehb. f. in *Bonplandia*, v. (1857) p. 38; Lindl., in *Journ. Linn. Soc.*, iii., p. 31. *Eulophia squalida*, Hook. f., *Fl. Brit. Ind.*, vi. p. 6.—Malaya. Flowered at Kew in June, 1887.

(10) *C. WOODFORDI*, Lindl., *Gen. and Sp. Orch.*, p. 189. *Cyrtopodium Woodfordi*, Sims, in *Bot. Mag.*, t. 1814; Lindl., *Bot. Reg.*, t. 1508. *Lisochilus amazonicus* *Rodr., Gen. et Sp. Orch. Nov.*, i., p. 89. *Cyrtopera amazonica*, *Rodr. l. c.*, ii., p. 180. *Cyrtopera Velloziana*, *Rodr. l. c.*, ii., p. 179. *Cypripedium epidendricum*, *Vell. Fl. Flum.*, ix., t. 64. *Paphiopedilum epidendricum*, Pflitz. in *Engl. Bot. Jahrb.*, xix., p. 42.—Tropical America. Sent from St. Paul, Brazil, by E. J. A. Woodford, Esq., to Mr. Anderson, Curator of the Apothecaries Garden at Chelsea, where it flowered in 1815 or 1816. *R. A. Rolfe.*

(To be continued.)

FORESTRY.

THE EDUCATION OF THE FORESTER.

ANY kind-hearted foreigner visiting this country and chancing to read an account of Mr. W. H. Long's reception of the forestry deputation in Edinburgh recently, would probably come to the conclusion that estate-owners throughout the country were in some need of scientific advice on forestry matters. Were he to give the first landowner he met the benefit of his sympathies on this point, it is hard to say whether the attitude of the latter would be one of astonishment or of momentary consternation at the possibility of unsuspected calamities. Mutual explanations would disclose a fact which enthusiasts on this question would do well to realise, viz., that the great majority of British woods owe their existence to the game they harbour, and not to the timber they grow, or are capable of growing. There will, of course, be nothing novel in this statement to those who possess the slightest acquaintance with the management of British estates. But many seem to imagine that this state of things will one day be altered, and British forestry attain to the position it holds on the Continent. Estate proprietors, we are told, take little interest in the economic side of wood management owing to the deplorable lack of technical knowledge on the part of their foresters. The latter are very good men in their way, say they, with intelligent ideas as to the practical part of their work, but are sadly deficient in (and here our patrons almost break down) scientific knowledge. "Jock ne'er did much gude at the schule," said an old Scotch farmer to a

FIG. 100.—VIEW IN THE NEW EVELYN PARK AT DEPTFORD. (SEE P. 576)

Sent by Mr. E. S. Rand of Pará to Messrs. Linden of Brussels, who flowered it in 1887.

(11) *G. LAGOENSIS*, Rehb. f. et Warm, in *Otia. Bot. Hamb.* (1881), p. 88; Warm, in *Vidensk. Medd. Kjobenh.*, 1881-86, p. 87, t. 6, fig. 6; Rolfe, in *Orch. Review*, ii., p. 300; Cogn. in *Mart. Fl. Bras.*, iii., pt. 4, p. 296.—Brazil. Introduced by Messrs. F. Sander & Co., from the Rio San Francisco, and flowered in their establishment in July, 1894.

(12) *G. MINAX*, Rehb. f., in *Gard. Chron.*, 1874, i., p. 786; ii., p. 98; Rolfe, *l. c.*, 1892, ii., p. 431.—Habitat not recorded. Flowered in 1874, in the collection of A. Sillem, Esq., of Sydenham. It is said to be near *G. dives*, but nothing is known of it beyond the original description.

(13) *G. NYVALIS*, Hort., *Gard. Chron.*, 1882, i., pp. 536, 537, fig. 85; Rolfe, *l. c.*, 1892, ii., p. 431, fig. 70; *Ill. Hort.*, xxxii., p. 63, t. 555; Rolfe, in *Orch. Review*, i., p. 274; Cogn. in *Mart. Fl. Bras.*, iii., pt. 4, p. 299.—Brazil, in the Amazon district. This originally flowered in the collection of Sir Trevor Lawrence, Bart., Barford, Dorking, when nothing was known of its origin. It has since transpired that it was discovered by Mr. E. S. Rand, of Pará, on the Rio Negro, above Mansôa, where

flowered in the collection during the present summer, not, of course, from the original importation.

(2) *C. BITOBERCOLATA*, Rolfe.—Leaves linear-lanceolate, acute, about 18 inches long. Scapa about 2 feet long, many flowered; bracts linear, acuminate, $\frac{2}{3}$ — $1\frac{1}{2}$ inches long; pedicels, $\frac{3}{4}$ —1 inch long; sepals linear-oblong, sub-obtuse, 9—10 lines long, light green; petals oblong, sub-obtuse, 6—7 lines long, white; lip three-lobed, 8—9 lines long, green, side lobes veined with dull purple-brown; side lobes rounded, front lobe broadly oblong, obtuse, undulate, disc with a pair of erect tubercles near the base, and about four irregularly crenulate purple-brown keels in front of the same; column clavate, 4 lines long, striped with purple-brown in front, its foot 2 lines long.—Habitat not known. Flowered in the Glasnevin Botanic Garden in June, 1890, and on subsequent occasions. Mr. Moore had purchased it at Stevens' Sale Rooms in 1881.

(3) *C. FLAVA*, Lindl., *Gen. & Sp. Orch.* (1833), p. 189; Royle, *Ill. Bot. Himal.*, pp. 366, 370, t. 88, fig. 1; Rehb. f. in *Gard. Chron.*, 1870, p. 1407; *Cyrtopera Cullenii*, Wight, *l. c.*, p. 21, t. 1754; *Eulophia flava*, Hook. f.

lawyer to whom he wished to article his son, "and ye'll find him an awfu' bear." "Send him along, Mr. Brown, send him along," was the legal gentleman's reply. Substitute practical work for fiction, and estate proprietors are pretty much of the lawyer's opinion when engaging foresters, not because the purely practical man is more capable than one with a technical training, but because the practical experience is wanted, while the other is not. There are few estates in England on which the woods are expected to yield more than suffices for their maintenance as game preserves, and any surplus above this can form but an insignificant proportion of the revenues of a large estate. Any increase of this surplus gained by skilful management can only be a slow business at the best, and at the present day, proprietors are generally well satisfied if they leave their estates in as good condition as they found them; under these circumstances, it is rather difficult to see where the asserted or supposed demand for scientific foresters exists. Those who do want them are apparently under the impression that advertising does not pay, for they never express their needs through that medium, and those foresters who have had a little training in that line would do well to take the hint. For the present, at any rate, it is one of those talents which thrive best under a bushel, leaving the dark waters of practical forestry to be illumined by those distinguished amateurs who are always eager to teach the practical man the elements of his calling. The latter may derive occasional escape of comfort from visions of a promised land, where the rabbits cease from nibbling and the pheasants make no nest; but he should never forget that he is still in the desert, with no immediate prospect of getting out. When estate-owners want highly-trained foresters, they will neither hesitate to say so, nor grudge the expense of keeping them. Until they do these things, however, the young forester would be wise not to indulge in dreams which have little prospect of realization. Let him get as much technical knowledge as he can, but he must not expect to find a market for it at the outset. Such knowledge should be regarded as a reserve fund, and not as a working capital, otherwise he may find a difficulty in disposing of his wares. The disinterested friends of both estate-owner and forester may feel proud of a well-finished *protégé*, but the latter will find that certificates and diplomas will not be accepted as substitutes for experience in the rough field of practical work. When an appointment has been secured, and he attempts to put his scientific ideas into practice, he may find obstacles in the way that he little suspected, and be compelled to tread in the empirical footsteps of his predecessor after all. Until estate-owners regard their woods in the same light as their home-farms or their kitchen gardens, they are scarcely likely to call in scientific aid in the management of them, or in other words, to pay for an article they do not want. Properly-managed woods undoubtedly add to the value of an estate, but they neither necessarily enrich those who are responsible for their improvement, nor fall in with their individual tastes and fancies regarding game-preserve management. Until they do so, their systematic treatment remains little short of impossible, and the technical training of foresters pure and simple an unnecessary proceeding. Every now and then we may come across an estate, the owner of which is both willing and anxious to have his woods managed on economic principles, but at present such are in a very small minority. *A. C. Forbes.*

VARIORUM.

THE BEN DAVIS APPLE.—This is what a farmer from Stenben County remarks in the *Kansas Farmer* about Ben Davis Apple, after seeing the wonderful orchards of Clay County. The fruit of this variety is evidently peculiar for its lack of flavour, and it appears to be largely in demand by

planters in some parts of the States:—"The Ben Davis ain't an eater. It's a cooker, and its crop never fails. And the Ben Davis never rots. Bruise any conventional Apple, and that settles it. The bruise turns to rot, and the rot takes hold of all the rest of the Apple. The Ben Davis doesn't put up with any such nonsense. Bruise it if you want to, but that bruise will simply dry up, and that's the end of it. The rest of the Apple will stay just as round as ever. And the Ben Davis never freezes. Or, if it should freeze it don't mind it. Freezing doesn't affect it in the least. It is just as solid after it is cooked as it was before; it never falls to pieces under cooking, whether whole, halved, or quartered. Then, having no trace of flavour of its own, it readily takes any other flavour and becomes a novelty to the housewife and the fruit canner. Imagine having a big, whole Apple placed before you, and, when you taste it, finding that its flavour is that of the most luscious Peach, or juicy Pear, or Apricot, or Orange or anything else the hostess has seen fit to make it! That's where the queer Ben Davis Apple comes out strong and metaphorically knocks the socks off all other Apples on the Egypt Apple belt. Chicago and the South and West are dead stuck on this Apple and its genus, and buy it at any price. It will keep sound from one picking season to the next."

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By RICHARD PARKER, Gardener, Goodwood, Chichester.

POT VINES.—Supposing that the vinery has been put into thorough order for the season, and everything is in readiness, a start should be made forthwith if ripe Grapes are required by the family about the end of the month of April. Before placing them in the vinery, wash the canes with warm soapsuds made with soft-soap, to remove insects or their eggs that may have collected in the crevices of the bark. Carefully remove a little of the surface-soil with a sharp-pointed stick, replacing it with fresh rich loam, to which a sprinkling of Thomson's Vine Manure and crushed bones should be added, making it quite firm with the blunt end of a potting-stick. If the ball of soil and roots be thoroughly moistened before it is top-dressed, but little root moisture will be required by the Vines until they begin to grow. The plants should be arranged in such a manner as to bring up the pots near the trellis, and to do this it may be necessary to fix up a stage over the front hot-water pipes, which will also allow of fermenting-material being placed between the pots. The forcing in the early stages must be very gradual, fire-heat being used only when the temperature of the house is likely to fall below 50°. It is a great assistance in inducing Vines to "break" evenly, to place a bed of fermenting-dung and leaves inside the house, as it not only gives off a genial warmth, but charges the air of the vinery with ammoniacal vapour. The canes should be bent down in such a manner as to check the flow of sap to the terminal buds, if once these get a start in growth, the back buds may remain in great part dormant; it is therefore very necessary to watch the development of the buds, and to take means to ensure the whole of them "breaking" at the same time. The house should be kept shut up generally, giving a little ventilation only at midday. The canes may be syringed twice a day, and if a night temperature of the house can be kept from falling below 50° with the use of the hot-water pipes, so much the better, for at least ten days or thereabouts.

EARLY PEACHES.—The earliest of the pot-trees which have been prepared some time before they shed their foliage by top-dressing, &c., may now be brought under cover. More care will be found necessary with these plants than with Vines during the early stages, as any great degree of excitement often causes the buds to drop wholesale. To guard against this evil, fluctuations of temperature must be carefully avoided, and the trees should not lack water at the roots. The trees should be syringed twice daily, and the house kept humid by damping the paths, walk, &c. Draughts should be guarded against by affording air only at the top of the houses; and sun-heat utilised as much as possible, closing the house early in the afternoon. When fire-heat has to be applied, it should be of

a very moderate degree for a time, only as much as will keep the temperature from descending lower than 45° during cold weather during the first fortnight. The time apparently lost at the first can be made up without injury accruing to the trees by forcing harder when the days get longer, and there is more sunlight.

THE FLOWER GARDEN.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

THE ROSES.—During open weather the transplanting of Roses from the open ground may be proceeded with, if the soil be not in a condition too moist to trample upon without sticking to the shoes. When the soil is too wet, it usually sets hard about the roots, and the plants do not thrive. The manure made use of should not be placed near the roots if it be not decayed. Charred soil, wood-ashes, and the like may be employed instead of manure, these being valuable materials to mix with the soil about the roots when planting or top-dressing. Hybrid perpetuals and many of the Bourbon Roses are better for being planted in the autumn; but hybrid Chinas, Teas, and other tender Roses in the spring. When planting is ended, afford the beds a 2-inch mulching of short dung, but do not let it touch the stems of the Roses, it being chiefly the roots which require protection from frost. Severe pruning back at the time of planting should not be practised, but thinning out and shortening of the strong shoots may be afforded, so as to restore the balance between top and root. Broken or badly-bruised roots may be cut back, as also any very strong fibreless roots. The general pruning of established Roses is better left till the spring has arrived; but it may be found advisable in some gardens to prune a few plants of H.P.'s at the present time, for should the winter be not very severe, these plants would bloom some time before the spring-pruned ones, and thus a longer season of Roses be obtained.

BEDS OF BOURBON, CHINA, MOSS, NOISETTE, OR CABBAGE ROSES, the shoots of which have been pegged to the ground, should now be freed from the pegs, the soil of the beds pricked over, and a top-dressing of manure and charred refuse afforded. The stronger shoots may be pegged down as before, and the weak ones removed. Other prunings of these Roses should wait till the spring.

HYBRID TEA ROSES.—Most of these are tender succumbing often to severe frost, and it is advisable that the planting and pruning be deferred till the spring. If beds of these varieties can have protection from a wall or shrubberies, and be further protected with Spruce-boughs, bracken, or litter in hard weather, much loss of plants may be averted. Beds of Tea Roses should always be well drained, and the soil deep and rich.

PILLAR AND CLIMBING ROSES.—The hardiest and best Roses are the Ayrshire, Boursault, and evergreen varieties, the Polyanthas, and Turner's Crimson Rambler. The Banksian Roses in white and yellow varieties are not everywhere quite hardy, requiring the protection of a mat, as well as to be planted against warm walls. The pillar Roses should now have the weak and over-abundant shoots thinned out, half-a-dozen being enough to retain, and these should be cut to various heights. When a shoot is removed, it should be taken clean away at the base, from which point all the shoots of a pillar Rose ought to spring.

SWEET-BRIAR ROSES.—The new Lord Pezance's hybrids should not be forgotten, as their fragrance, variety of colour, and form of blooms, recommend them as hedge plants, and as pillar Roses and bushes. The present season is the time to plant them.

STOCKS FOR BUDDING ROSES NEXT SEASON.—Dog Roses, Manetti, seedling Briars, and Rosa polyantha should now be planted. The strong roots of the Dog Rose should be pruned hard back before planting them. The distance for dwarfs is 1 foot by 2 feet; standards of various heights, 1½ feet by 2½ feet.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

PLANTING FRUIT TREES.—Planting operations should now be proceeded with in favourable condition of the land, and when it is dry enough to tread upon without sticking to the boots or shoes. In planting have some turfy loam at hand, and work a barrowload or two in about the roots during the

planting of wall or other choice fruit trees. Nothing that can be given to the tree is so potent in the production of roots as maiden loam; and if it be desirable or necessary to shift the plants, the operation may now be done with the minimum of injury. Unless the soil is naturally of a calcareous nature, plaster and mortar-rubble will be very beneficial if added to the soil in which stone-fruits are to be grown. If the fruit trees were ordered in good time from the nurseryman, they should now be coming to hand. When a bundle of trees arrives, it should be unpacked and laid in singly, never in bundles, till they can be planted. If the stations are not prepared for them, lose no time in getting them in readiness for the reception of the tree. Directions have been given in previous Calendars in regard to planting, so that nothing further needs to be said here on this matter. Mulch at once with some rather light strawy manure. After the planting is finished, see that the nursery labels are replaced by others of a more permanent kind. Newly-planted wall-trees must not be nailed or otherwise fastened in position till the spring, when the ground will have settled sufficiently, but a few loose ties may be given them. Bush-fruits may now be planted on well-manured and trenched ground. Bushes of Gooseberries, and black and red Currants, may stand at 5 feet apart; and white Currants, not being strong growers, may stand at 4 feet. After planting, afford a thick mulching of spent-manure. The space between the newly-planted bushes may be profitably utilised by early Potatoes, salading, Violets, &c., for two or three years, without detriment to the fruit-bushes.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorset.

HINTS ON TREATMENT.—November is generally considered the period at which the winter treatment of Orchid plants should commence. For the next three or four months vigilance will be required on the part of the cultivator in maintaining a regular temperature in the houses, in avoiding as far as possible sudden fluctuations, and preserving the balance between the degree of warmth and the required amount of moisture. These are important matters which, owing to our changeable weather, are difficult of accomplishment at times. From the present time for the next few months to come the heating apparatus will have to afford most of the warmth in the various houses, and should be carefully made use of, an excess of fire-heat frequently being the cause of the deterioration of the plants. The injurious effects of much artificial heat being used should be as far as possible counterbalanced by the admission of fresh air and the use of water in damping the paths, &c., and thus moderate the otherwise too dry air of the houses. It is also good practice during spells of frost to cover the houses with canvas, mats, &c. Archangel mats are cheap and convenient stuff, the ends of which may be neatly tied, and several mats sewn together in different lengths, as required for each house; these may easily be rolled along the lower part of the roof, the coldest part of a glass-house, putting them on at dusk and taking them off at daybreak. As a safeguard, these coverings should be made secure in some manner, and when wet or frozen, they should be thoroughly dried before using them again. The night temperature of the house should, for the present, range as follows:—East India-house, 60° to 65°; Cattleya-house, 55° to 60°; Mexican and intermediate-house, about 55°, and the Odontoglossum-house, about 50° to 55°, the higher degree of warmth being afforded only when the air outside is mild; the lower degree being adhered to when there is frost, or the wind is very cold and piercing. The day temperature, as maintained by fire-heat, should range between and up to the higher figures indicated; and on light, bright days, as much higher as the sun-heat will raise it, with the ventilators open to some extent. In ventilating the houses in cold weather, the openings at the top of the house should be opened slightly, there being then less risk of the plants getting chilled. Owing to the recent heavy rainfall, the need for damping-down has been less during the day, nor will there be any reason to do so to any great extent unless frosty weather compels the use of a great degree of fire-heat. A moderate damping down morning and evening will suffice for the East Indian division, and a good damping in the morning will suffice for the Cattleya, Mexican, and intermediate-houses, merely sprinkling the floors in these

houses in the afternoon. In the cool-house, where little or no fire-heat is at present used, except, perhaps, at night, one good damping-down in the morning will suffice for dull days, but sprinkling the paths after a sunny day. At this time of year it is very necessary that each house should become dry about noon, and the failure to insist on this simple precaution is sure to be followed by ill-matured growths, "spot," and other maladies.

PLANTS UNDER GLASS.

By W. H. SMITH, Gardener, West Dean Park, Chichester.

THE ROSE-HOUSE.—The present is a good time to prune the plants and thoroughly cleanse them and the house. To do this the more effectually, the former should be taken down from the trellises, which will allow of a cleaning of the roof with hot soap-suds. In pruning remove entirely all the weak shoots, and shorten back those which are strong, pruning each variety so as to suit its peculiar mode of growth and flowering. When the trellis and pillar Roses have been fastened again in their places, a good syringing with soap-suds containing one wineglassful of petroleum to 4 gallons of the suds, at a temperature of 90° should be afforded. The crust of the beds and borders should then be removed to the depth of 3 to 4 inches, and a top-dressing afforded of rich fresh loam and bone-meal. Any Roses that may be in an unsatisfactory condition should have their roots examined, and if the soil be impoverished or scoured, fresh soil should be pricked out carefully and replaced with new, spreading the roots carefully through it, and making all quite firm about them. Any required planting should now be carried out, taking care that the Rose plants are vigorous and healthy. Potted H.P.'s intended for forcing may now be pruned, that is thin out the weak shoots and shorten strong ones to one-half and one-third their length. Examine the drainage, and if it be faulty put it right, and afford a top-dressing of rich loam, well ramming it into the pots. Roses for increasing the stock of pot plants may be potted up forthwith, selecting for this purpose either home-grown or nursery plants. Whether worked or own-root Roses, no harm will be done by shortening back some of the stronger roots, as by so doing many fine feeding roots will be induced to push. The size of pot found useful is the 32, but the plant should not be crammed in pots much too small to hold the roots. The potting-stick should always be used in potting Roses, and for this reason, the soil must not be very damp, or it will have its texture spoiled. If the loam is inclined to be clayey, use rough manure and a little coarse sand.

THE CONSERVATORY.—Introduce fresh plants as they come into flower, and remove stale ones so that the house may be kept bright-looking. If the house be not kept at a low temperature, plants of Poinsettia pulcherrima may be used to brighten it, also some Roman Hyacinths, Mignonette, Bouvardias, Richardias, Cypripedium insigne, Primulas, and the winter-flowering Begonias John Heal and Gloire de Lorraine. When arranging the plants in this house, overcrowding should be carefully avoided, as owing to the lack of light they soon suffer, losing leaves and damping off. As foils to the flowers, employ such fine foliage plants as Grevillea robusta, Acacia lophantha, Chamærops excelsa, C. humilis, Kentia Fosteriana, K. australis, Aralia Sieboldi, Casuarina ericoides, &c. The temperature in a house of this kind should now be at 60° by day, and 55° by night, affording both top and bottom ventilation in moderate amount. The floors should be kept dry, and spilled water or that which runs from the pots, should be mopped up early in the day. When the flowers of the Chrysanthemum begin to fade, remove the plants and cut down the stems, placing the plants in a light, airy house to strengthen the shoots before beginning to propagate from them next month. Now these plants are in flower, see that they are correctly named.

RICHARDIAS.—Should these plants be in demand at the end of December, plants may now be placed in a warmer house, if from appearances it is surmised that they will not flower by that time. A vinery or Peach-house just started affords a suitable place for hastening the opening of the spathe. If roots are plentiful, the plants may have rather liberal doses of manure-water, and occasionally fumigate them to kill aphids.

ZONAL PELARGONIUMS.—The hot summer was well suited to the needs of these plants, and they are in consequence flowering admirably. Whilst they

continue in bloom the air of the house should be kept rather dry; and as a means to secure the desirable dryness, a slight amount of fire-heat should be used, and fresh air admitted at the top and bottom of the house. The necessary watering of the plants should take place in the morning, and if the plants are in full bloom, clear water only should be used.

THE KITCHEN GARDEN

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

CHICORY.—Keep up a supply of this useful plant for salad purposes. Place the roots in large pots and put in the Mushroom-house. Here they will not require any covering, and the atmosphere just suiting them. By putting in a good-sized potful each week, a continuous supply may be had the winter through. Where a Mushroom-house is not to be had, Chicory may be put into any house with a temperature of about 55°, covering them up by placing an inverted empty pot over them, and over this a piece of Frigi Domo to exclude all light from them.

DANDELION.—The large French leaved of this variety if grown in rows and treated similarly to Chicory, make nice roots for lifting and storing ready for use through the winter, and are a nice wholesome addition to a salad. These may be treated in precisely the same way as Chicory; or if preferred in a green state, any warm greenhouse will suit them.

MUSTARD AND CRESS.—Make sowings of this regularly every week, so that a supply of nice young, tender growths may be always at hand. Cutting-boxes are favourites for this purpose, and can be easily pushed on in a warmer house if supply is not equal to demand at all times.

RADISHES.—Sowings of these may be made from now onwards, to follow on after those from outside are finished. Pits filled with heating material, on which may be placed about 5 inches of soil, having the surface within 1 foot of the roof-glass, make nice places for growing these, and if one hot-water-pipe runs through the pit, so much the better to keep the atmosphere at the right temperature of about 50°. These, if sown among other crops, such as Potatoes, are often neglected.

MINT AND TARRAGON.—Get up a supply for the winter of these roots, and pot them, or put them into cutting-boxes and store them away in a cool pit where they will always be accessible in the coldest of weather. Introduce these into a moist heat of about 55°, but near the roof-glass, so that they shall not get drawn up weakly.

RHUBARB.—Although Apples are plentiful this season, Rhubarb in many places is welcomed as a change. Young roots prepared on purpose for forcing, and which have attained their fourth year, will be of a nice size, and may be lifted from now onwards and introduced to the Mushroom or forcing-house, for very early work lifting and placing in a forcing-house will be the handiest through very severe weather. If a few roots are introduced about every three weeks, a continuous supply may be obtained; but where this accommodation is not provided, various means may be adopted to attain the same end. Pits filled with warm manure, also shallow pits dug in the ground and filled with about 3 feet of manure, prepared so that a gentle heat will be maintained for a long time, and covering the top with hoops, mats, and then long litter—but these depend on the outside temperature to a great extent, and cannot be relied on to come in to a certain date at all times. The old plan of covering this with pots, and filling around and above them with hot manure on the ground where growing, I think, produces some of the best yet grown, and is more suitable for later batches; but this is best grown in some out-of-sight part of the garden, and near to the manure-heap. Johnston's St. Martins, Kershaw's Paragon, Royal Albert, and Myatt's Linnæus, are all good varieties for this purpose.

MR. WILLIAM COOMBER.—We are informed that the Council of the Royal Botanic Society has decided to dispense with the services of a garden superintendent of their gardens in Regent's Park; and Mr. COOMBER, who has filled the post for many years, will therefore be open to a re-engagement.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

SATURDAY, Nov. 16—Royal Botanic Society.

SHOWS.

SATURDAY, Nov. 16 { Chrysanthemum Shows at Batley,
Crewe, and Bacup.

TUESDAY, Nov. 19 { Leeds Paxton Chrysanthemum
(two days).
Chester Chrysanthemum (two
days).

WEDNESDAY, Nov. 20 { Chrysanthemum Shows at York
(three days), South Shields, Dun-
dee, Tonbridge (all two days),
and Helensburgh.

THURSDAY, Nov. 21 { Chrysanthemum Shows at Norwich,
Aylesbury, Glasgow, and War-
wick.

FRIDAY, Nov. 22—Manchester Chrysanthemum.

SALES.

Dutch Bulbs at Protheroe & Morris'
Rooms.
Roses, Hardy Bulbs, and Plants,
Ferns, &c., at Protheroe & Morris'
Rooms.

MONDAY, Nov. 18 { Highly attractive and extensive
sale of Nursery Stock at the Alma
Nurseries, Farnham, by order of
Mr. S. Bide, by Protheroe &
Morris (five days).

TUESDAY, Nov. 19 { Dutch Bulbs at Protheroe & Morris'
Rooms.

WEDNESDAY, Nov. 20 { Dutch Bulbs at Protheroe & Morris'
Rooms.
Great Consignment of Japanese
Lilies, Palm Seeds, Roses, Spiræas,
&c., at Protheroe & Morris'
Rooms.

THURSDAY, Nov. 21 { Dutch Bulbs at Protheroe & Morris'
Rooms.
Plants from Belgium, Roses, Ferns,
&c., at Protheroe & Morris'
Rooms.

FRIDAY, Nov. 22 { Dutch Bulbs at Protheroe & Morris'
Rooms.
Orchids from Messrs. Charlesworth
& Co., at Protheroe & Morris'
Rooms.

SATURDAY, Nov. 23 { Dutch Bulbs at Protheroe & Morris'
Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSU-
ING WEEK, DEDUCED FROM THE OBSERVATIONS
OF FORTY-THREE YEARS, AT CHISWICK.—41°.7.

Crabs in the
Garden and
Wood.

THE subject of Crabs has been written about by various correspondents in these pages of late, and we have been thereby reminded of the great usefulness of the common Crab, *Pyrus Malus acerba*, *Malus*, the felted-leaved Apple, and *P. sylvestris*, the smooth-leaved variety; and, for that matter, of any seedling Apple trees, as wind-breaks or screens, mixed with other trees, or alone in belts against sea-breezes. We know of scarcely any materials for this purpose which are better than the Maples, viz., *Acer tataricum*, *A. pennsylvanicum*, *A. platanoides*, *A. campestre*, Sycamore, Crabs, Black Thorn, and Dogwood; and such hardy interlacing Creepers as *Clematis Vitalba*, *C. glauca*, a Siberian species; *C. grata*, Chinese; and *C. Flammula*; Brambles, and *Lycium barbarum*; the Thorns and Creepers to form the hedge—the first line of defence. Behind a screen, say of 20 yards in width, planted with the above-named plants, the more tender plants can be raised in perfect safety; and so long as they do not top the screen-plants, the wind will not harm them. It may not be generally known that the common Crab, green when unripe, but yellowing when allowed to ripen on the tree, makes the very finest of jelly, no variety of Apple being its equal in colour or transparency. The fruits for this purpose should not be peeled, and they should be cooked whole.

The berried Crabs (*Pyrus malus baccata*) are very beautiful in fruit and blossom, but so far as we know them, their habit of growth is slender and upright, although being heavy bearers, the branches become pendulous with the weight of the crop, and as they fruit pretty

regularly, this habit becomes in part fixed. These varieties may not therefore form so good material for the outermost lines of wind-screens, but rather for the inner face. Crabs, like other trees, require space all round, or at the very least on one side, if they are to flower well, and the planter must determine which he will have—fruit and flowers, or merely growth. He should have trees enough to afford both.

The berried varieties are not to be despised as ornaments for the conservatory in the spring, being quite as good in their way as the more commonly grown double-flowered Japanese varieties of *Pyrus* and *Prunus*; and like those, bearing gentle forcing. We have only to inspect a picture by a Japanese artist to discover the varied beauty which lies in the flowers of the Crab.

The shrub-like *P. pumila* of which we know the St. John's Apple, otherwise Paradise, a native of the Caucasus, and the Doucin, are varieties employed for the so-called dwarfing stocks for garden Apples, and they form good filling-in material between high trees, if afforded head-room.

What is Natural
Selection?

THE expression natural selection can hardly be considered to be as felicitous as it is familiar. The phrase must be taken in an arbitrary or metaphorical, rather than in a literal sense. Given a tendency in plants or animals to vary, the variations which harmonise best with the conditions under which the plant is growing may become permanent, and may even become accentuated, so that from the originally slight variation the full-blown species may ultimately arise. Under natural circumstances, the growth and development of a species is a very slow process; but the gardener does, in comparatively short time, the same sort of work which in Nature occupies ages in its accomplishment. The hybridist and gardener do actually select that variation which suits their purpose, and they continue to do so from generation to generation till the variation becomes "fixed." The variation is encouraged and protected, just as in ordinary cultivation the plant is freed from the competition of rivals, and protected from the intrusion and assaults of enemies.

The term adaptation is more expressive of what really happens in these cases than is selection. But the question arises as to the origin and cause of the adaptation. Does the protoplasm of the plant or animal, or, let us say briefly, does the plant adapt itself to outward conditions, or do the outward conditions compel the plant to adapt itself to them or to suffer extinction? In other words, does the power or faculty of variation precede the action of the conditions, or is it generated or called into operation by the influence of those conditions? These are the questions which the Rev. GEORGE HENSLOW has set himself to answer. In a very interesting and suggestive volume he states the case clearly, and as it is one on which cultivators should have valuable information to offer, it is desirable to bring the book* under the notice of our readers. Mr. HENSLOW's volume is one sustained argument, but it is illustrated by so many points in which botanists and cultivators take special interest, that it will be perused by them with pleasure.

Mr. HENSLOW's contention is that a change of circumstances—or, as he calls it, a "new environment"—does not "select" at all, but itself induces a plant to form variations. These varia-

tions are definite, and not indefinite—a definite variation being one having a definite relation to the action of the environment in the way of effect to cause.

It is pretty certain that there is no true selection; in any case, the word must be used metaphorically only, and this being so, it becomes a question whether there is in reality such a great difference between Mr. HENSLOW's views and those of other people. Whichever view be taken, the power to vary and the faculty of adaptation to circumstances are the necessary factors. It is the order or sequence of events concerning which differences arise. Mr. HENSLOW maintains that the protoplasm varies in sympathy with, and as a direct consequence of the action of external conditions. The protoplasm, therefore, must have an innate capacity of varying, which results in variations of structure. These variations in structure are the potential beginnings of a new species, so that, in Mr. HENSLOW's words, "the origin of species issues out of the direct action of the environment through the responsiveness of protoplasm in the organism itself." It is not, according to Mr. HENSLOW, the fierce competition and struggle to which plants are subject which enables the survivors to adapt themselves to new conditions, but the direct action of those conditions. In support of his contention, the desert plants in the vicinity of Cairo are mentioned. These occur in quantities, but are never so crowded that any struggle or rivalry occurs between plant and plant, the real contest being between the plant and the physical difficulties offered by soil and climate. But we may ask—Do desert plants never vary? Our author seems to be of opinion that they do not, so long as the same environment is maintained, and no doubt, as a general rule, that is so. But how is it, if the variability does not precede the action of external conditions, that the gardener is able to select minute variations among plants growing, as far as can be seen, under the same conditions. Again, if variations do not occur "spontaneously," how are we to account for the production of "sports?" These often occur simultaneously over wide areas, under the same conditions as those to which the bulk of the plants, which do not vary, are subject. These sports are mostly accidental reversions or un-mixings of heretofore blended characters, but what brings about the change at a particular time is not known. That it cannot be direct action of the environment is, we think, shown by the facts just mentioned.

Mr. HENSLOW's arguments for the self-adaptation of plants as the initial stage in the production of species are supported by a vast number of facts, derived from the study of the outer conformation and internal organisation of plants. In this way, the structure peculiar to plants growing in desert regions or on the sea-coast, in the arctic regions, or on mountain-tops, is passed in review. Aquatic plants, climbing plants, and other plant categories are pressed into the service. In addition to the facts obtained by observation, Mr. HENSLOW brings forward corroborative evidence in the shape of experiments. Apart from the use made of them by the author in support of his arguments, it is very convenient to have such a mass of information got together, and so conveniently arranged; whilst the care which Mr. HENSLOW has taken to give chapter and verse for his statements, and thus to enable others to verify his references, is deserving of ample acknowledgment. A good index further facilitates the work of the student, to whom we cordially recommend the perusal of this most suggestive book.

* *The Origin of Plant Structures, by Self-Adaptation to the Environment.* By Rev. GEORGE HENSLOW, &c. (KEGAN PAUL, TRENCH, TRUBNER & CO.)

BEGONIA MRS. J. HEAL.—To successfully bridge over the interval between the end of the flowering season of the tuberous-rooted summer Begonias and that of the true winter-flowering species, was felt by gardeners to be a most desirable feat, and one that remained for a long time un-

accomplished. The credit of having obtained the first of the late-flowering new varieties belongs to Messrs. J. VEITCH & SONS, Chelsea, who by crossing *B. socotrana* with some of the late-flowering Andean tuberous-rooted Begonias, laid the foundations for future development. One of the earliest crosses was John Heal with bright rose carmine flowers appearing in a loose raceme. This variety by other crossings with tuberous-rooted varieties gave

Adonis, and now we have one of their latest novelties, Mrs. J. Heal, producing crimson blossoms. A plant was shown by Messrs. VEITCH at the Royal Horticultural Society's meeting on October 15 of the present year. The blossoms—chiefly male, fortunately—measure 2 to 3 inches in

di-
LISTER, Bart., be elected President, in the room of Lord KELVIN, who retires.
LINNEAN SOCIETY.—At the meeting held on Thursday, November 7, Mr. C. B. CLARKE, President, in the chair, Mr. GEORGE MASSEE was admitted

FIG. 101.—BEGONIA × MRS. HEAL: FLOWERS CRIMSON.

diameter, and are chiefly produced in the axils of the leaves. It is one of a race of Begonias, which is likely to be in considerable demand for brightening the warm greenhouse, and furnishing subjects for indoor decoration during late autumn and winter.

THE ROYAL SOCIETY.—The anniversary meeting of this Society will be held on the 30th inst., when it is proposed that Sir JOSEPH

a Fellow. Several volumes of *Cryptogamic exsiccata*, recently received from Madame WEDDELL, as a bequest from her late husband, a foreign member of the Society, were shown, and some remarks made thereon by the Botanical Secretary. A portrait of the French naturalist, GUILLAUME RONDELET, Prof. of Anatomy and Chancellor of the University of Montpellier, 1545, recently presented to the Society by Dr. H. WOODWARD, F.R.S., was exhibited by the Zoolo-

gical Secretary, who gave an account of his life and work, supplemented by remarks from the President. Mr. C. T. DRURY exhibited and made remarks on a Scolopendrium raised by Mr. E. J. LOWE, bearing archegonia and antheridia upon the fronds, constituting a more advanced phase of apospory than any previously noted. Some remarks thereon were made by Mr. GEO. MURRAY. Dr. MAXWELL T. MASTERS exhibited specimens of the fruit of *Pyrus Sorbus*, *Aberia caffra*, and *Coccos australis*, from the gardens of Mr. THOMAS HANBURY, at La Mortola, Mentone; and some fruits of *Coccos australia*, from M. C. NAUDIN'S garden at Antibes, Alpes Maritimes. Mr. G. E. SCOTT ELLIOT communicated a paper entitled "A Revision of the Genus *Pentas*," in which some account was given of the distribution of these plants in Africa, with a rectification of the synonymy, and descriptions of five new species. The genus as a whole showed in a remarkable manner the way in which local species occur whenever a different climate restricts the distribution of a wide-ranging form, and several examples of this were mentioned. A discussion followed, in which the President and Mr. W. P. HIERN took part.

— An evening meeting will be held on Thursday, November 21, 1895, at 8 P.M., when papers will be read: 1, D. MORRIS, C.M.G., M.A., &c., "Development of a single seed in the fruit of the Coconut Palm (*Cocos nucifera*);" 2, A. J. EWART, "Assimilation in plants under abnormal conditions;" 3, A. C. SEWARD, "On a new species of *Pinites* from Wealden (England)."

THE CHISWICK GARDENS.—We are officially informed that the Council of the Royal Horticultural Society have appointed Mr. S. T. WRIGHT, of Glewton Court Gardens, Ross, Herefordshire, to succeed Mr. BARRON, as Garden Superintendent at Chiswick. It will be remembered that Mr. WRIGHT was the author of one of the Society's prize essays on "The Commercial Aspects of Hardy Fruit Culture in the United Kingdom."

BECKENHAM HORTICULTURAL SOCIETY.—On Friday evening, Mr. EDWIN MOLYNEUX delivered a lecture, entitled "Salient Points in *Chrysanthemum* Culture," before the members of the Beckenham Horticultural Society in the Beckenham Public Hall. Over 300 were present, and the greatest interest was shown in the subject. Some fine exhibits by Messrs. CANNELL, the Bromley *Chrysanthemum* Society, and by a large number of private growers, made the room look gay, and rendered the subject additionally interesting.

AYRSHIRE GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—The first meeting of the fifth session of this association was held in the Carrick Street Hall on Thursday evening. There was a fair attendance of members present. Mr. H. MAXWELL, The Knowe, Vice-president, presided. The President (Mr. A. PRINGLE, Middleton) read an excellent paper entitled "A Few Notes on the Dahlia," for which he was accorded a vote of thanks. Mr. M. GANLY, Glendon, exhibited a magnificent *Cypripedium insigne*, for which he was unanimously awarded a Certificate of Merit. It was intimated that the next meeting would take place on Thursday evening, 5th December, at 7.30. A vote of thanks to the chairman brought the meeting to a close.

ROYAL BOTANIC SOCIETY.—At a meeting of the Fellows of this society, held in the museum of the Royal Botanic Gardens, Regent's Park, on Saturday, Major J. W. M. COTTON presiding, Mr. C. DUNNELL RUDD was elected a Fellow. The Coffee trees growing in the greenhouses having fruited well this year, the secretary tried the experiment of roasting and grinding the seeds and making coffee. The beverage was offered to the Fellows at the meeting, and a very favourable verdict was passed upon it. The society's show of *Chrysanthemums* was announced to be held this week. It was also stated that in future the gardens and conservatories would be open to the public on Mondays and Satur-

days throughout the year upon payment of 1s. for admission. The receipt of the following donations was reported:—Seeds of the very scarce plant, the large-leaved variety of *Coca* (*Erythroxylon*), from South America, and a fine cone of the edible Chili Pine (*Arancaria imbricata*) from the gardens of Sir GABRIEL GOLDNEY at Corsham, Wilts. A curious Tapioca root (*Manihot utilisima*), grown in the society's gardens, was also on view.

STOCK-TAKING: OCTOBER.—As was anticipated, the tide of commerce is still a flowing one, and the loss in both imports and exports during the preceding months of the year has been wiped off by the increase in both sections—resulting in a gain, last month, of £1,185,783 in imports, and £1,680,870 in exports; all this, be it remembered, in the face of the breaking up of the Sultan's empire, and a consequent paralysis in trade in Asia Minor, due to the disappearance of Armenian merchants, either by the sword, or by the flight of the merchants from a land overflowing with horror. The value of our imports in October of last year was £35,668,385; that for the month just ended was £36,854,168. The increase for the ten months just closed, compared with the same term last year, is exactly £478,489. The following items of imports for the month are from the Trade and Navigation Returns for October:—

IMPORTS.	1894.	1895.	Difference.
Total value of imports	£ 35,668,385	£ 36,854,168	+1,185,783
(A.) Articles of food and drink—duty free	12,261,764	12,411,811	+150,047
(B.) Articles of food and drink—dutiable	3,007,324	2,832,950	-174,374
Raw materials for textile manufactures	3,955,525	4,036,812	+78,316
Raw materials for sundry industries and manufactures ...	4,535,252	4,533,819	-2,443
(A.) Miscellaneous articles	1,449,735	1,251,295	-175,441
(B.) Parcel Post	92,317	78,958	-13,359

There is an unsatisfactory item in the recorded increased import of manufactured goods, as to a considerable part this means a withdrawal of manufactures to places where less wages are paid—to France for instance; where, whilst the cost of living has increased all over the country, the price paid for labour has also gone down—a double result of Protection. Fortunately, this is being recognised amongst thinking men over the Channel, just as it is by some American statesmen—the Hon. Mr. BAYARD from Washington having just delivered himself at Edinburgh, of the statement that protection produces jobs and jobbery, not statesmen and purity of morals. Our hop-growing friends, if not the brewers, will be glad to learn that the imports of Hops last month fell off some £70,016 in value, as compared with October, 1894; possibly our Continental friends, finding freights so low in English ships, are taking to making their own beer, and shipping it off to other lands. And here we are reminded of one of those savage attempts to settle trade differences—the lock-out and strike in the shipbuilding trade in Belfast and on the Clyde. Possibly a decision to settle by arbitration will have been arrived at ere this. As to fruit and vegetable imports, we take out the following figures:—

IMPORTS.	1894.	1895.	Difference.
Fruits, raw:—			
Apples bush.	1,229,146	479,121	-750,025
Cherries "
Plums "	34,701	23,756	-10,945
Pears "	204,377	40,093	-164,284
Grapes "	465,701	345,418	-120,283
Unenumerated "	115,950	114,990	-960
Onions "	611,784	745,237	+133,473
Potatoes cwt.	39,389	62,893	+23,414
Veg-tables, raw, unenumerated value	£ 77,133	£ 74,820	-£ 2,318

The "minus" quantities recorded tell their own tale, and there appears little doubt of the deterrent influence on colonial imports exercised by our last fruit harvest; what influence also the late abnormal weather may have on both home-grown and foreign fruits remains to be seen (perhaps has already been). It is pleasant to notice the interest being taken in light railways by the President of the Board of Trade and some of his colleagues; in France they may have seen much in the matter of motors to set them thinking. The subject of

EXPORTS

is certainly one more interesting than usual just now. The rapid expansion of enterprise in our colonies is being felt more and more by our manufacturers, and those employed by them. To our American friends, textile manufactures cannot be supplied quickly enough, and they in turn are getting better money for their raw material. Doubtless Free Trade is being more and more appreciated over there as the months go by. The value of our exports in October, 1894, was £19,147,996; the figure for last month are £20,828,866, or a gain of £1,680,870; the gain for the past ten months over the same period last year being no less than £6,888,736. The attention of all the "protected" world is respectfully requested to this brief record, and to the improving condition of our productive energy. Should the three great powers quickly and quietly settle the Turkish business in both Europe and Asia Minor—they are big and powerful enough to do so—an even brighter tone may characterise the record of the exports for the current month.

RUST IN BEGONIAS.—Cultivators have for long been pestered with this disease, the precise nature of which has not been known till recently. Mr. MICHAEL, the authority on the *Acarinae*, informs us that the disease is caused by a mite, a species of *Tarsonymus*, which is so small and so translucent that it requires a trained eye to detect it. Its habits of life also tend to conceal it. The creatures are most destructive to healthy plants, burrowing between the two surfaces of the leaf, and eating out its substance. A closely-allied species, *T. buxi*, a few years ago destroyed all the Box trees in some of the Italian botanic gardens. The Sugar-cane in Barbados also suffered greatly from a similar insect (see *Kew Bulletin*, April, 1890). They are most difficult to destroy, but frequent spraying with insecticides may be beneficial, and in our last issue Mr. WATSON tells us that fumigation is very efficacious. All badly-affected plants should be destroyed by fire. The best figures of *Tarsonymi*, Mr. MICHAEL tells us, are to be found in CANESTRINI, *Prospetto dell' Acarogama Italiana*, iii., Padova, 1883, t. 23; BEALESE, *Sottofamiglia dei Tarsonimidae Bull. Soc. Entomol. Ital.*, 1886, t. xv., figs. 2 and 8, male only; and KRAMER, *Ueber Dendroptus Archiv. fur Naturgeschichte*, 1876, tab. viii., figs. 9, 10, 11.

ACER LORBERGI.—A most distinct and handsome Maple under this name was sent to me, remarks Mr. W. E. GUMBLETON, of Belgrove, Queenstown, many years ago by the late LOUIS VAN HOUTTE, of Ghent, and being of a fine vigorous habit of growth, it has now developed into a fine tall specimen. Its greatest merit, however, consists in the specially brilliant autumn colouring which its foliage assumes at this time of year, when every leaf becomes a clear canary-yellow, making the tree an extremely conspicuous and beautiful object in the shrubbery, and well worth planting by every lover of distinct and beautiful foliaged trees. The name is not recognised in the *Index Kewensis*, so that it may be known under some other name at Kew. I enclose a leaf for your inspection, and shall be glad of your opinion as to the beauty of the colouring and correctness of the name. [Very beautiful; name later on. Ed.]

BIRMINGHAM BOTANICAL AND HORTICULTURAL SOCIETY.—We are informed by Mr. W. HILLHOUSE, honorary secretary of the above, that it is intended to hold a Daffodil (*Narcissus*) show, with other spring flowers, in the Botanical Gardens,

Edgbaston, in the month of April, 1896 (two days' show), at such date as may be determined by the season, of which the longest possible notice will be given to all who have intimated a desire to exhibit. A list of regulations for the guidance of exhibitors, together with a schedule of prizes, have already been drawn up, which may be obtained on application to Mr. W. B. LATHAM, the Curator of the gardens.

EALING GARDENERS' ASSOCIATION.—We understand that Mr. W. ROBERTS, gardener to J. HARRIS, Esq., Braemar, Ealing, has been appointed Hon. Secretary to this body, one that has done—and is doing—much good by its meetings and discussions amongst the gardeners and amateurs of Ealing and district.

HOME CORRESPONDENCE.

COVENT GARDEN PRICES FOR FRUIT AND VEGETABLES IN 1822.—It may interest your readers, amateur and professional, to know the prices retail that were obtained for the above seventy-three years since. Of course, we had not the facilities in those days we have now—no hot-water, or cheap fuel and glass, &c.; and it cost more to erect one 50-foot house than one of 300-feet could be erected in these days; but the prices, under any circumstances, appear fabulous; for instance, 21s. for a brace of Cucumbers in February; 36s. for 1 lb. of Grapes in May; 30s. ditto in June. This seems to be as early as Grapes could be had, and none after November. Cherries, 30s. per pound in April; 20s. ditto in May; Melons from 5s. to 20s. in June; Strawberries, 30s. per pound in April; 20s. ditto in May; Pine-apples, 12s. per pound most of the year through; Figs, 18s. per dozen in August; 10s. ditto in September; Peaches, 42s. per dozen in July; 21s. ditto in August; Apples, dessert, best, 40s. per bushel in January; cooking, 18s.; Asparagus, 21s. per 100 in February; April, 15s. ditto; Peas, £3 per half-sieve; 30s. to 5s. in June; 3s. to 1s. in July ditto; Seakale, 4s. per punnet in March. This, I think, will be sufficient to show what prices were then realised without going further into the prices of other crops. Love-apple (Tomatoe), none sold, although quoted in the market all the season. It is something remarkable how the taste has grown for Tomatoe during the past twenty years; about that time when I first began Tomato-growing on a large scale, I used to supply Mr. P. Barr with them at 1½d. per pound; also Mr. Charles Best of the Horse Shoe Hotel in quantity at the same price; since then, 2s. 6d. and 3s. per pound have been given. Had it not been for the Tomato coming in request, many growers would have become bankrupt. It is this one thing that has kept them on their legs, and many have made it a source of profit; farmers and clergymen have also erected houses for Tomato-growing for market. *Edw. Bennett, Lyne, Chertsey.*

REGULATIONS AT THE DRILL HALL.—Will any one kindly say why plants put before the Committee meetings of the Royal Horticultural Society at the Drill Hall for Certificates should have to be accompanied by the owner's name written on a card, and handed round for inspection, as well as the plants? A friend and I paid a few visits to these meetings during the past summer, and we thought the method a very peculiar one. Why not enter the plants under numbers in the way that competitive exhibits are entered? Could not the plants meant for Certificates be numbered, and placed by themselves, before being submitted to the committee, instead of being, as at present, staged among other plants already showing exhibitor's or owner's name? True, these plants are not intended for competition in a sense, but is not the decision of the committee in regard to Certificates looked upon as equal symbolic value to 1st and 2nd prizes at a show? We also noticed if the owner of a plant was present at the committee meeting, he moved away from the table when his plant came up for judgment; but under the number system he could surely retain his seat, and have the advantage of hearing opinions on points which may, or may not, have escaped his notice; also voting a Certificate for his plant if he wished. *Visitor.*

FRUITING OF MUSA CAVENDISHI IN POTS.—With reference to this matter, it would appear, from what Mr. Fletcher states in last week's *Gardeners' Chronicle*, that the fruiting of *Musa Cavendishi* in

pots is either new or difficult, but our experience is that it is neither new nor difficult, having successfully fruited several plants in pots. We have just finished two good bunches of fruit, estimated to weigh from 30 to 40 lb. each, "but as the 'fingers' are gathered as they ripen on the plant, I cannot give exact weight," the separate fingers weighing 6½ oz. each, and the plants are grown in a No. 1 (18 inch) pot. We have at the present time six plants at the back of a lean-to stove, four of which are in 18-inch pots, and two in tubs, the latter being from a cask cut in two, measuring 26 inches across and 19 inches in depth. The two plants in the tubs are now fruiting, having just set about nine hands each, with from fifteen to twenty-four fingers per hand. Our mode of treatment is very simple: the soil, consisting of turfy loam with which horse-droppings were mixed when it was stacked, with plenty of sharp river-sand, and a liberal sprinkling of artificial manure. The plants are always kept well up to the light, and abundance of water afforded them, giving them liquid-manure two or three times a week, from the time the pots are filled with roots until the fruit is fully grown. *H. Ruse, Westbourne, Liskeard.*

— In your last issue, on p. 555, I see Mr. Fletcher writing of *Musa Cavendishi*. I am pleased to add we have one in fruit here; it has been grown in a tub 23 inches in diameter by 15 inches deep; the stem is 3 feet 6 inches in height; it has ten leaves, which average 4 feet by 22 inches. I was disappointed in not getting a better bunch, which only contains forty "fingers," and after reading Mr. Wythe's able article on the Banana, I have been wondering if I had a good variety, or if it was bad culture. *J. Barnard.*

— It is without a doubt a mistake, as Mr. Fletcher remarks in his note on the *Musa* in last week's *Gardeners' Chronicle*, p. 555, to suppose that it cannot be fruited successfully in pots, as I have seen it fruited at two different places in pots, with fruit equal to any produced by plants in beds. We have here at present in a 20-inch pot, a plant carrying a large bunch of fruit, and although late in the season, I have no doubt it will fruit perfectly. Cutting away the tip, referred to by the Editor in his footnote, was resorted to in this case also. *Andrew F. Pearson, Rachen Gardens, Peeblesshire.*

SHARPE'S VICTOR POTATOS.—The articles lately inserted in your columns respecting our Victor Potato are reviving rather ancient history, and after the lapse of so long a time one's memory may not be so fresh upon every point as it might have been some years ago. It is beyond doubt that Sharpe's Victor was raised by Mr. Richard Nisbet, Awarbys Gardens, near here, and from the two parent Potatoes as he stated, viz., an early short-top round and the Alma Kidney. As he was well known to be an honourable truthful man, we should accept anything he said with the most implicit confidence. The true Victor, as raised by Mr. Nisbet, is a yellow-fleshed Potato, but a little inclined to sport into a white variety. For a few years after it was first sent out, Mr. Nisbet grew all that we sold, and it is almost certain he never heard the name of the Vale of Cleveland. As far as my memory serves me, Mr. Short did send us a few, probably a bag, of a Potato he had raised, a white-fleshed Kidney, rather longer than Victor, these were sent to our farm to grow, but we did not think them of any value (it might be that the season or soil was not suitable), and they were doubtless consumed on the farm, as we never saw them again. It is not impossible for two independent horticulturists to make use of the same parents in raising a new variety of vegetable. Mr. Nisbet raised our Duke of Albany at the same time as Victor, and some years after a white Beauty of Hebron was sent out, which we cannot distinguish from the Duke—no doubt this was an accidental cross between identical parents. *Charles Sharpe & Co., Ltd. (Jno. C. Gould).*

CRABS AS ARCHES.—I like J. Meers' (p. 556) ideas on the above. Barring the birds, Crabs—skillfully planted and trained—would form charming arches, alike in flower, fruit, and foliage. We have long been familiar with arches of Apples, Pears, Cherries, and Plums, but the smaller size of the Crabs would give them an easy victory for elegance. Possibly the Quarrenden, the Golden Pippin, the Gladstone, and other high-coloured small Apples might go with the Crabs. Here, if any further foliage is needed in Crab avenues, a few trees of *Prunus Pissardi* or of the purple Filbert will give a bronze or red hue. Beyond Crabs, are the Acer *Negundi argenteum variegatum*, or the Silver Maple, as it is called, can be trained over an arbour or arch

as readily as a Vine; the golden-leaved variety of this plant is nothing like so free and useful. If more variety is desired, Clematis, *Ampelopsis Veitchi*, and the Gold and Silver Ivies can be so used to enrich Crabs without seriously injuring either their health or fruitfulness. *D. T. F.*

POPULAR APPLES.—Your correspondent, "D. T. F.," is not justified in his deductions as to the relative popularity of certain dessert Apples by the representatives of them he found at the Crystal Palace fruit show. There were special classes for Ribston, Cox's Orange, and King of the Pippins; and these classes alone brought to them in the order named—forty-one, forty-nine, and thirty-six dishes respectively. Golden Pippin, Golden Russet, and Golden Reinette had no such encouragement. So much it is fair to say with respect to these excellent, but yet far too little grown varieties. Then we had this year one of the best seasons almost ever known for the development of Ribston, Kings, and Cox's, for finer, clearer samples, and better crops have rarely been seen. It is not always so with these somewhat spoilt children of pomologists. *A. D.*

— I should like to supplement the brief list given in last issue by "D. T. F." as regards dessert varieties. Wyken Pippin, I consider good in flavour, a free doer, and a certain bearer. Court of Wick is another good Apple, bears well, has good flavour, and keeps late; Scarlet Nonpareil is another favourite of mine, a very sure cropper with me, juicy, and keeps well into April; Kerry Pippin is another good variety, bears well each year, the flavour good and peculiar, and with me the tree does not canker—in fact, none of the above do here. I send you a fruit of each, and please give your opinion as to their merits. I should say, Kerry Pippin was ripe and gathered at the end of August. I do not reckon King of the Pippins the best of flavour, though a good market variety. *Bicton.* [Our correspondent kindly sent a few fruits of the above-named Apples for our inspection, which quite bear out his contention, Wyken Pippin especially being finer than we have ever seen it; Court of Wick is also of unusual size, and good of flavour. *En.*]

THE TRUTH ABOUT PRICES.—With pleasure I answer the courteous enquiry of "D. T. F.," why Cox's Orange Pippin did not occupy a higher position in the essay mentioned? Over a series of years it has not paid so much from an equal number of trees on the same amount of land as those varieties named before it in the essay. The value of Cox's Orange Pippin is certainly high, ranging, as a rule, from 30s. and upwards per cwt. Already this year I have disposed of a quantity at the figure named; but take one season with another, the crop has not been heavy enough with me to warrant it taking a higher place. I fully endorse the remark of "D. T. F." on Ribston Pippin as one of the finest dessert varieties grown; but though grown both on the Paradise and free stocks, I have never yet made a profit on them. On p. 525, "Mid-Kent" states that "a glance at any market report will show the fallacy of the essayist's statements;" or, in other words, that the statements are incorrect. Probably any remark in contradiction would share the same fate as my previous utterances, therefore I will only say that the essay was written early in the August of the present year; but if "Mid-Kent" will write to Mr. John Mills, Smithfield Market, Manchester, he can easily prove whether my statements are incorrect or otherwise. Even in a season of low prices like the present one, I have had no difficulty in making 25s. per cwt. for Peasgood's Nonsuch in bulk, and could have sold many more. I may add, that the prices quoted have been made in the open market by the above salesman until this year. Since then most of the fruit has been sold on receipt of the telegram that I despatched at the time the fruit was put on rail, the buyers who have purchased the fruit from Mr. Mills for years, knowing that they could depend upon the fruit being honestly packed, and according to the wire received by Mr. Mills, and have been only too glad to buy the same before it reached the market. *The Essayist.* [Mr. John Mills' invoice for 24 cwt. 3 qrs. 15 lb. of Apples, which our correspondent sends for our inspection, entirely bears out his contention, and it is quite correct, and in proper order. *Ed.*]

THE PRESTON HALL MUSCAT GRAPES.—Your correspondent's remarks on the Muscat Vines at Preston Hall, p. 526, show nothing that is extraordinary in the way of Grape culture. We have, at this place, a viney which was planted with Muscat Vines in the month of February, 1895, that measure

on an average $3\frac{1}{2}$ inches in circumference 5 feet from the ground. These Vines were cut back after planting, and the measurement is that of the young canes. *A. Young, Marston Gardens, Frome.*

PACKING COMPETITION AT THE CRYSTAL PALACE.—Possibly not intending it, your correspondent, "One of the Judges," confirms the contention of Mr. F. Harris for the need of revision in regulations governing these competitions. Take his first point, the qualification of the judges. A few years since, when Messrs. Webber & Co. provided special packing prizes, a leading authority (a gardener) advocated and used boxes for Grapes. Being myself at the time just introducing the system of basket packing, now generally used, and determined to give the box system a trial, and send up to a Covent Garden firm two boxes packed as advocated. When received, my sale-note was endorsed "Grapes arrived in good condition, but if in baskets, would have realised 20 per cent. more; best buyers now refuse to look at box Grapes." Now, as to packing material, on advice from a leading firm, I adopted dry moss for Peaches, &c.; and with me the half-yearly moss harvest comes as regular as a farmer's annual hay harvest. After reading your correspondent's letter, I made inquiry of salesmen as to any better material being now available. I have a reply saying they still prefer dry moss before anything else; the fruit travels well, and does not heat. The wood-wool often used is very fair, but in it the fruit is liable to speck. On these two instances I maintain with Mr. Harris, gardeners are not the most suitable judges of packing competitions, particularly when for market. The system adopted for Apples by the donor of the special prize is very suitable for sample sales, or choicest specimens, but in my opinion is not adapted for bulk. The regulations governing distances would be difficult, but might be made more equal, say all fruit had to pass through a London main-line station as Paddington, Charing Cross, &c. On disqualifying, your correspondent is rather free. Instead of disqualifying boxes tied, the judges would have done better to call an official and request the boxes to be placed in proper classes. Being consigned to the Secretary as requested, it became his duty to see that each one was in its proper place, no regulation stating that each package must travel singly. Nor is one of the judges more happy over the other possible disqualification, not applying items of coat, &c., as in but one class is this imperative; in the other three it is quite optional, as I read the schedule. I am aware such matters were to be taken in consideration when judging, but being easily-inspected packages, I concluded that the judges were men of sufficient competence to estimate these. Will your correspondent tell us if all packages he inspected were first examined for railway parcels label, and found each to have one attached? *Robt. Grindrod.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 12.—Chrysanthemums were again a prominent feature at the meeting of the Society held on Tuesday last, in the Drill Hall at Westminster, and many novelties were submitted for competition by the Floral Committee. Orchids were shown in ordinary quantity, and there was a fair amount of fruit before the Committee for this section.

Floral Committee.

Present:—W. Marshall, Esq., in the Chair; and Messrs. J. Frazer, O. Thomas, H. Herbst, R. Dean, G. Stevens, E. Mawley, J. D. Pawle, C. E. Shea, H. H. D'Ombrian, J. Walker, H. Cannell, H. Turner, C. T. Druery, G. Paul, H. Selve-Leonard, W. Bain, C. Jeffries, C. E. Pearson, and H. Briscoe-Ironside.

Sir T. LAWRENCE, Bart., Burford, Dorking, gr. Mr. Bain, showed a few plants in flower of *Pentstemon Cohen*, a half-hardy perennial species so named from its Cobaea-like flowers. The spikes were upwards of two feet high, flowers pale lilac in colour with purple streaks in the corolla. The plant has been known long in gardens, but is not widely cultivated. It is figured in *Bot. Mag.*, t. 3465. (Award of Merit.)

H. O. O'HAGAN, Esq., River Home, Kempton Court (gr., Mr. C. Last, was awarded a First-class Certificate for *Dracena latifolia*, one large plant, and several small ones of which were exhibited in fine condition. The thick leaves of this plant are nearly 4 inches wide, and those on the plant shown were about 2 feet and a half long, dark green in

colour, and suitable apparently for sub-tropical hedging, as well as for other purposes.

An Award of Merit was given to W. MARSHALL, Esq., Anchinraith, Bexley, for *Polystichum constrictum* (Mareball) from *P. aculeatum* \times *angulare*, a dense-growing dark green variety, very erect in growth, and more resembling *P. aculeatum* than the other parent.

The effect made by a group of zonal *Pelargoniums* in sprays, from Messrs. H. CANNELL & SONS, tastefully put up with Ferns mingled, was very bright and distinct. Several new varieties were included, among which we noticed an unnamed seedling, rich salmon pink with white eye, as being very fine. Duchess of Marlborough, another seedling, is pale pink and white. Volcanic is one of the largest and deepest coloured of the purple crimson section, and Owen Thomas, of the same strain, is good. (Silver-Gilt Banksian Medal.)

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea, again exhibited trusses of flowers representing varieties of their javanicum \times jasmiflorum hybrids of *Rhododendrons*. These hybrid varieties are exceedingly delicate and pretty. Ruby was the darkest coloured, and partakes of *Curtisii*, one of the parents of this variety; *Lutea roseum* is a very pretty pale rose-coloured flower, rather large; *Taylori* is rosy-pink, and *Favourite* bright-rose; *Princess Frederica* is very delicate, and *Minerva* is similar but a little deeper. *Maiden's Blush* is just a pleasing flushed pink, but the latest variety is named *Numa*, obtained by crossing *R. Curtisii* \times *R. indicum* \times *javanicum*. *Numa* has fine deep coloured flowers, after the style of *Curtisii*, and resembling in great measure the appearance of those of an *Azalea*, a habit obtained from *R. indicum* \times *javanicum*, itself the result of a cross between *R. \times Lord Wolseley*, and *Azalea indica* var. *Stalla*. The leaves in the case of *Numa* are much smaller than those of *Rhododendrons*, but larger also than of the *Azaleas*. (Award of Merit.)

CHRYSANTHEMUMS.

Among the collection of novelties from A. BRISCOE-IRONSIDE, Esq., Burgess Hill, were three blooms of a large Japanese incurred named *Arona*—blooms of good depth and plenty of fulness—colour buff, with light red shading on top side of florets (Award of Merit). *Bellina*, a white flower, and *Prinsepino*, yellow, appeared useful kinds for decoration purposes.

One of the most effective groups of cut Chrysanthemums was one from Mr. Wythes, gr. to Earl Percy, at Syon House, which included upwards of one hundred flowers in eighty varieties. Many of the blooms represented good culture, and most of them were choicé and good. (Silver Banksian Medal.)

Messrs. H. CANNELL & SONS, Swanley, obtained an Award of Merit for the yellow Japanese incurred *Oceana*. The florets of this variety are very broad, and the flowers are medium size as shown, and very pretty. An excellent lot of blooms of miscellaneous varieties was also exhibited by Messrs. CANNELL, amongst which we may mention a few examples of *Kentish White*, a white Japanese incurred, which appears to be popular with many visitors, but fails to obtain awards. Altogether there were about eighty blossoms shown in this collection.

A small group of Chrysanthemum flowers from Mr. Penney, gr. to Mrs. HOWARD, Isleworth, contained some pretty flowers, and they were staged tastefully. (Bronze Banksian Medal.)

Mr. THOS. S. WARE, Hale Farm Nurseries, near Tottenham, showed a group of cut Chrysanthemums with long stems, and staged amid plants of Maidenhair Ferns. The group would have been more effective had the foliage been retained by the Chrysanthemum stems. Mr. WARE had also a plant of Chrysanthemum, A. H. FEWKES, with three good flowers upon it. (Silver Banksian Medal.)

Mr. Slogrove, gr. to Mrs. CRAWFORD, Gatton, Reigate, was the exhibitor of twelve very well-grown flowers each of Thunberg and Mdlle. Marie Hoste. (Bronze Banksian Medal.)

Dr. GEO. WALKER, 12, Lingfield Road, Wimbledon, showed his little yellow Pompon *Dolly*, certificated the day before by the National Chrysanthemum Society, but no award was given on this occasion.

Mr. R. OWEN, nurseryman, Maidenhead, exhibited a number of novelties, and obtained an Award of Merit for *Vicar of Bray*, an English seedling Japanese, a good heavy bloom of old gold and dull red. *Robin Adair*, a pale lilac coloured large Anemone, also received an award, as did Mrs. R. C. KINGSTON, a very large flowered incurved variety of bright pink or rose.

An incurved pink Japanese, named *Austine Anderson*, was shown by HENRY TATE, Esq., Allerton Beeches, Liverpool. No award was made.

Messrs. B. S. WILLIAMS & SONS, Upper Holloway, London, N., exhibited half a dozen blooms and a few plants of *Philadelphia*.

An excellent collection of Chrysanthemum blooms was put up by Mr. W. G. GODFREY, Exmouth Nurseries, including numerous novelties. An Award of Merit was made to Cecil Clinton Chalfont, a full yellow-coloured Japanese flower, useful for decorative purposes. *Annie Heard*, a medium-sized white single-flowered variety, received a similar award. The white hirsute Mrs. W. J. Godfrey and other fine flowers were included. (Silver Banksian Medal.)

Half-a-dozen plants in bloom of *Ewan Cameron* shown by Mr. GOBLE, Walnut Nursery, Ryde, Isle of Wight, seemed to indicate the usefulness of this variety for decorative purposes. The flowers are single, large, pure white, and very free.

Mrs. JONES, Sudbury (gr., Mr. Jones), staged a group of flowers of some of the single flowering varieties, and they were good and attractive, but the effect would have been greater had a few Ferns been interspersed. The flowers had been well grown (Bronze Banksian Medal).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair, and Messrs. Jas. O'Brien (Secretary), A. H. Smce, Sydney Courtald, W. Cobb, E. Hill, T. W. Bond, W. H. White, T. Statter, F. Sander, H. Williams, T. B. Haywood, and H. Ballantine.

Sir TREVOR LAWRENCE, Bart., Burford, Dorking (gr., Mr. W. H. White), always foremost in exhibiting novelties of both botanical and floral interest, showed *Luddemannia trifolia*, Rolfe, n. sp., a most remarkable plant of the growth of *Acaena*, and with a pendulous inflorescence some 2 ft. in length, and bearing thirty-three wax-like flowers of a bright orange colour, the sepals being tinged with copper-brown, and the base of the lip, which was distinctly three-lobed, having a dark purple blotch. It is one of Mr. Lehmann's Andean discoveries, and a plant worthy of attention (First-class Certificate). Sir TREVOR LAWRENCE also exhibited the handsome *Cypripedium \times Polletianum*, "Burford Beauty" (*calophyllum \times oenanthemum*), a variety far superior to the original, and which received an Award of Merit.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, were awarded a Silver Floral Medal for one of the best and most interesting groups lately exhibited. The most attractive feature was the gorgeous *Lelio-Cattleya \times callistoglossa ignescens* (C. Warszewiczii *Sanderiana* \times L. *purpurata*). It is the beau ideal of a charming garden hybrid, its large lavender-tinted sepals and petals and rich purple-crimson lip constituting it a noble flower (First-class Certificate). Another fine plant which secured a First-class Certificate was *Cypripedium \times Milo grandis* (*enanthemum superbum* \times *insigne* *Chantini* \times ♀), the massive appearance of the fine glossy flower being rendered all the more striking by reason of the large, divided lower sepals. The pretty *Lelio-Cattleya \times Semiramis* (C. *Gaskelliana* \times L. *Ferrini* ♀), with fine soft rose flowers with purple-veined lip, received an Award of Merit. Among other good things in Messrs. VEITCH'S group were *Lelio-Cattleya \times Decia* (C. *aurae* \times L. *Ferrini* ♀), *L. C. \times Pallas superba* (C. *Dowiana* \times L. *crispa* ♀), with blush sepals and petals, and rich purple lip with silvery margin, and wonderful kaleidoscopic display of colour in the throat; *Cattleya \times leucoglossa*, the pretty rose coloured *Phalenopsis \times Vesta* (*rossa leucaspis* \times *Apollonite* ♀), that charming novelty *Epidendrum \times Wallisio-cliffare*, with yellow flowers having a conspicuous white labellum; some good plants of *Miltonia spectabilis* *Moreliana*, and a number of rare *Cypripediums*, &c.

Messrs. F. SANDER & Co., St. Albans, also staged a very effective group of rare Orchids, which secured a Silver Banksian Medal. Their most beautiful exhibit was *Cypripedium \times Countess of Salisbury* (*bellatulum \times harbatum superbum*, Sander's var.) and which (although the species employed in obtaining it are similar to C. \times Chas. Richman and others) was a most delicate, charming and distinct flower, the difference being doubtless due to the fine qualities of its parents. It had the usual firm wax-like flowers of its class, the ground colour white with innumerable dark chocolate dots over its surface and a ray-like flush of rosy purple on the upper sepal, a similar rosy flush being over the petals, and in a lesser degree the lip. It was awarded a First-class Certificate. Another fine plant in Messrs. SANDER'S group was *Cattleya \times "Miss Clara Measures"*, a white variety of the C. I. Cookson class, but with a more purple shade in the colouring of the lip; and fine objects were a pan of *Habenaria Susanæ*, with many spikes of its extraordinary white flowers; a pan of the new *Anæctochilus Sanderianus* with olive-green foliage of various shades, netted with pale gold; the handsome *Cypripedium \times A. J. Herrington* (*lesanum \times enanthum superbum*); the neat and singular *Saccolabium acutifolium*, of the C. *bellinum* class (Botanical Certificate); *Cymbidium \times Winnianum*, the charming *Trichopilia brevis* with huge convolute white labellum and Indian yellow sepals and petals barred with chestnut-brown; *Bollea Rozellii*, *Dendrobium album*, *Cœlogyne fuscescens*, *Catastium Chrysanum*, and a rich and varied collection of varieties of *Cattleya labiata*, &c.

C. L. N. INGRAM, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), exhibited three very pretty and distinct hybrids raised in his gardens by Mr. Bond, viz., *Cattleya \times Lady Ingram* (*Eldorado \times auræa*), with fragrant flowers, having pale yellow sepals and petals and lip, with golden yellow tube and rose-veined front lobe. It had a three-flowered inflorescence; *Cattleya \times Cecilia* (*Lawrenceana \times Trianae*), a delicately-tinted flower of much the form of C. *Lawrenceana*, and of a soft lilac colour, with shades of purple and crimson in the tube; *Lelio-Cattleya \times Othello* (C. *maxima peruviana* \times L. C. \times *elegans Turneri*), a slender plant with large rose-coloured flower with purplish front lobe to the lip. Each of the three received an Award of Merit.

THOS. STATTER, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), staged a fine group of noble cut spikes of varieties of *Cattleya Dowiana aurea*, all being of superb quality; *Cypripedium \times Edwardii*, C. \times *vexillarium*, &c. (Silver Banksian Medal.)

Messrs. B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, N., were awarded a Silver Banksian Medal for a neat-looking group of Orchids, in which were fine specimens of *Pescatorea Rozellii rosea*, P. *klabochoom superbum*, *Catastum \times splendens aureum*, *Cypripedium Pitcherianum*, Williams' var., which is a noble flower, and the best of a very distinct section of hybrid *Cypripediums*; the

of India, Lucy Kendall, Miss M. A. Haggas, John Lambert (very fine), and other good old and new varieties; 2nd, Sir C. H. ROUSE BROUGHTON, Bart., Lindlow (gr., Mr. C. Bellis), who staged excellent Lord Alcester, John Lambert, M. Bahnan, Nil Desperandum, Empress of India, W. Carpenter, Brookleigh Gem, Baron Hirsch, very fine yellow Charles H. Curtis, &c.

Twenty-four blooms, Japanese, not less than eighteen distinct varieties, 1st, H. H. FRANCE HAXHURST, Esq., Overley, Wellington, Salop (gr., Mr. S. Bremmell), who staged excellent flowers of Vivand Morel, Amos Perry, W. Seward, Van der Heede, G. W. Newet, Sunflower, International, fine creamy-white, &c.; 2nd, Sir C. H. ROUSE BROUGHTON, Bart., whose stand contained fine blooms of Madame Carnot, Duke of York, Van der Heede, C. Davis, Louise, Pallanza, Sunflower, Mrs. C. H. Payne, Viscount Hambleton, and Richard Dean.

For twelve blooms of incurved varieties, distinct, 1st, Lord WROTTESLEY, Wrotesley Hall, Wolverhampton (gr., Mr. Simpson), who staged excellent blooms of Lord Alcester, Princess of Wales, Prince Alfred, John Lambert, Baron Hirsch, Flora Macdonald, Empress of India, Brookleigh Gem, &c. Sir C. H. ROUSE BROUGHTON, Bart., with John Lambert, J. Doughty, Jeanne d'Arc, Baron Hirsch, Mrs. Heale, Nil Desperandum, &c. Eleven competitors entered the field in this class, and the contest was strong throughout.

For twelve blooms of Japanese, distinct, 1st, A. C. KERRISON, Esq., Pipe Hall, Bilston (gr., Mr. H. Tauntrum), who showed good blooms of C. Davis, Beauty of Exmouth, E. Molyneux, &c.; 2nd, Lord WROTTESLEY, with good Etoile de Lyon, Thomas Watkins (a good yellow), Louise, J. C. Schwabe, M. M. Hoste, &c.

For twelve blooms of the Rundell family.—1st, JOHN BARRETT, Esq., Bury St. Edmund's (gr., Mr. A. Bishop); 2nd, Lord WROTTESLEY.

For twelve Anemone Chrysanthemums, only one competitor—Mrs. SWINDLE, The Quarry, Stourbridge (gr., Mr. T. W. Davis).

For six bunches of Chrysanthemums.—1st, Mrs. WIGHT BOYCOTT, Rudge Hall; 2nd, Mrs. SWINDLE.

Local Classes for Exhibitors to reside within 5 miles of Wolverhampton.—For twelve blooms, incurved, 1st, Lord WROTTESLEY.

For twelve Japanese blooms, 1st, A. C. KERRISON, Esq.

For the lady's sprays of Chrysanthemums, 1st, H. ENGLAND, Esq.; 2nd, Mrs. W. BOYCOTT.

For the most artistically arranged vase of Chrysanthemums, 1st, Mr. J. HUGHES, Tettenhall.

For the most artistically arranged basket of Chrysanthemums, 1st, R. BURRELL, Esq.

Premier incurved, John Lambert, sent by R. H. LLOYD, Esq. Premier Japanese, Madame Carnot, very fine, shown by R. W. D. HARLEY, Esq.

For three plants, Japanese varieties, 1st, Alderman THOMPSON, with Etoile de Lyon, carrying thirty-five good blooms, Florence Davis with fourteen blooms, and Mons W. Holme; 2nd, Mrs. EARP, Dunstall Hill, Wolverhampton (gr., Mr. Hugh Jones).

For one specimen Pompon, 1st, Mrs. EARP, with fine-bloomed Sœur Mélanie; 2nd, Alderman THOMPSON.

For twelve Chinese Primulas, 1st, Miss PERRY.

Six zonal Pelargoniums, 1st, Miss PERRY, with well-flowered Colonel Seely, Edith, Little Ajax, Hayne's Pink; 2nd, S. T. MANDER, Esq., with International, Charles Mason and Mrs. Davidson.

For six table plants, 1st, S. T. MANDER, Esq., with six well-coloured Crotons; 2nd, Sir C. H. ROUSE BROUGHTON, Bart. (gr., Mr. C. Bellis), with nice Aralia Veitchii, and fine-coloured Crotons.

FRUIT.

There was a very fine display of Grapes, Apples, and Pears. In the class for two bunches of Black Grapes, J. HARRIS, Esq., The Hayes, Stone (gr., Mr. Bates), was 1st, who staged grand bunches of Gros Colmar.

For two bunches of White Grapes, Mrs. EARP was 1st, with good Muscat of Alexandria.

VEGETABLES.

Special prizes were offered by Messrs. WEBB & SONS, Stourbridge, for collections of vegetables, and the highest was taken by R. T. LLOYD, Esq.

Amongst the local exhibitors who employ only one gardener, Messrs. ONIONS, of Cannock Road, CAVE, and BARBER, were all successful.

In the non-competitive section, Messrs. DEVERILL staged a fine collection of their famous Onions.

MISCELLANEOUS.

Mr. JOHN E. KNIGHT, nurseryman, Wolverhampton, put up a fine group of Palms, Araucaria, Chrysanthemums, Crotons, Ferns, Ficus elastica, and wreaths; also a collection of vegetables, which included some fine roots of Mangels grown in the district by Col. COTTON, yielding 50 tons per acre.

Messrs. TOM B. DOBB & Co., Queen Street, Wolverhampton, put up a seasonable group of hardy shrubs, with statuary, Palms, &c., and a fine collection of vegetables grown from their seeds. Mr. JOHN WATKINS, of Hereford, staged fifty dishes of very fine Apples; and Messrs. RIVERS & SONS, Snarbridge, sent forty dishes of Apples and Pears. Amongst local exhibitors, F. SANDERS, Esq., of Onken, Wolverhampton, sent twenty-four dishes of fruit; and Mrs. STOCKHART, of Tettenhall, sent fine Pitmaston Duches Pears. This table was a centre of great interest, the fine colour of the fruit, in addition to the size, made many exclaim: "With such Apples and Pears as these we shall not want fruit from America," &c.

CIRENCESTER CHRYSANTHEMUM.

NOVEMBER 6.—This show took place in the Corn Exchange on the above date, and was in all probability the best ever held by the society, though it does not appear to be supported by the townspeople as it deserves to be—a fate usually experienced in purely agricultural districts.

There were two open classes only, the one for six specimen plants of Chrysanthemums, the best coming from Mr. H. R. Saunders, gr. to JAMES TAYLOR, Esq., Rendcomb Park, who had admirably grown and flowered bush plants of John Shrimpton, Edwin Beckett, and Source d'Or; and of incurved, Mrs. Dixon, White Venus, and Mrs. Haliburton, this being the only exhibit.

The other open class was for thirty-six blooms, eighteen incurved and eighteen Japanese. Mr. Geo. Price, gr. to Mrs. BULLEY, being the only exhibitor, with fine examples of Lord Alcester, Mrs. B. C. Kingston, Baron Hirsch, Violet Tomlin, Golden Empress, Madame Darier, &c., among the incurved; and among the Japanese, Col. W. B. Smith, Ella Prass, Vivand Morel, E. Molyneux, Duke of York, Miss Dorothy Shea, Charles Davis, Rose Wynne, &c.

Groups of Chrysanthemums made a very good feature, and being relieved by the addition of foliated plants, lessened the effect of stiffness usually seen, but there was too much crowding. The best came from Mr. W. Larner, gr. to JOHN HYDE, Esq., Southleigh. One other group set up by Mr. D. Elkins, gr. to A. CATOR, Esq., had to be disqualified as containing plants of Chrysanthemum frutescens, but an extra prize, equal to the 2nd, was awarded to him. A class for a smaller group brought several pleasing exhibits from local growers. Mr. Kirby, gr. to H. F. GARE, Esq., the Hon. Secretary, taking the 1st prize. Some fairly good specimens of plants of incurved and Japanese types were staged in their several classes.

CUT BLOOMS.

In the way of cut blooms, the best eighteen Japanese came from Mr. D. ELKINS, A. H. Neve, Charles Davis, Sunflower, W. Seward, Boule d'Or, and others, being in excellent character; Mr. G. PRICE was 2nd. With twelve incurved, the same exhibitors were severally 1st and 2nd. Sizes of each were also good. Mr. PRICE had the best six blooms of an incurved variety, showing Violet Tomlin in excellent character; Mr. HUMPHRIES, gr. to J. L. BURGESS, Esq., following 2nd, with Baron Hirsch, which promises to be a very useful incurved. Mr. PRICE also had the best six blooms of a Japanese variety, having Col. W. B. Smith in splendid form; Mr. ELKINS coming 2nd with Mdlle. Thérèse Rey.

Some good blooms of Anemone-flowered types, as also Pompons and singles were staged; of the latter, Mary Anderson, Miss Palmer, Jane and Miss Holden were very pretty.

Vases and Epergnes of Chrysanthemums relieved with foliage made a charming feature, Mrs. SARE leading the way with very tasteful arrangements. Baskets of blooms were also very pretty, and those formed of autumn berries and foliage, shown by children, delightful. All these were instructive objects lessons in the way of home decoration.

Groups of stove and greenhouse plants, Primula sinensis, double and single Mignonette, zonal Pelargoniums, Poinsettias, plants for table decoration, and other subjects lent variety to the show, and extended its interest.

Fruit also found a place in the schedule, and vegetables also. Mr. SAUNDERS had the best three bunches of white Grapes; Mr. PRICE taking the 1st prize with the same number of black. Mr. T. Arnold, gr. to Earl BATHURST, was 1st for six varieties of dessert Apples, as also of culinary; and with the same number of Pears, showing very good samples. The best collection of nine varieties of vegetables came from Mr. J. Baker, gr. to Col. PORTER. Nor are the cottagers forgotten, for classes for Chrysanthemum, and also for vegetables were provided for them, and they exhibited in a very creditable manner.

A very interesting group of Coniferous plants, also a fine and varied collection of Apples, were shown by Messrs. J. JEFFERIES & SON, Cirencester. Mr. O. ORPET, nurseryman, Dyer Street, had a collection of stove and greenhouse plants. Mr. H. DYER, Springfield, also had a collection of Chrysanthemums of an attractive character.

HITCHIN.

NOVEMBER 7.—A successful exhibition of Chrysanthemums and fruit was held in the Corn Exchange at Hitchin, Herts, on the above date.

Among the best things shown were the groups of Chrysanthemum plants from Mr. J. F. PARSONS, gr. to W. SPENCER, Esq., Codecote Lodge, Hitchin, 1st; and those from Mr. PRISMAN, gr. to S. LUGAS, Esq., Hitchin, 2nd. The plants of the first named exhibitor were very good, and possessed of fine large flowers.

Mr. W. Springham, gr. to J. H. TUKE, Esq., Hitchin, had the best specimen plants.

Groups of miscellaneous plants formed a pleasing and desirable feature of the show, and the highest prize fell to Mr. J. F. PARSONS, for a creditable arrangement, in which Palms, Grebids, and Salvia, played the chief parts.

Cut blooms were numerous shown in competition, and the quality generally was good. P. ROSANQUET, Esq., Parfield (gr., Mr. J. Turk), was 1st in the class for twenty-four Japanese varieties, distinct, his flowers being large, richly coloured, and consisting of leading varieties; F. FENWICK

HARRISON, Esq., King's Walden, Bury, Hitchin (gr., Mr. J. Hartless), was 2nd.

For twelve Japanese varieties, M. PRICE, Esq., Manor House, Knebworth (gr., Mr. Pateman), took the leading prize with a good set.

For twelve incurved varieties, distinct, Mr. HARTLESS was 1st, with creditable examples. For six incurved, one variety, Mr. HARTLESS won with really good specimens of Lord Alcester.

White-flowered Japanese varieties were well represented in the class for six, one variety, and Mr. J. F. PARSONS won with Mdlle. M. Hoete.

For any coloured variety, Mr. TURK staged Snaflower in capital condition. Pompons were best shown by Mr. TURK.

Table decorations, of which the Chrysanthemum formed the chief feature, were abundantly shown, no fewer than nine tables being set out with them. In this competition, Miss C. E. FOSTER, Bancroft, Hitchin, was deservedly awarded the 1st prize.

Some excellent fruit was noted.

ASCOT.

NOVEMBER 6, 7.—The grand stand of the Ascot racecourse was chosen as the place for holding the Chrysanthemum exhibition, which was about the average of such shows as regards the quality of the various exhibits. Cut blooms were, as is now usual, the more important section so far as attractiveness goes.

For eighteen incurved and eighteen Japanese varieties, distinct, for which a Challenge Cup was offered in addition to a money prize, Mr. W. Lane, gr. to Miss J. D. SMITH, King's Ride, Ascot, was placed 1st for substantial shapely blooms in both sections; and Mr. F. J. PAUL, gr. to Mrs. BOWRING, Forest Farm, Windsor, was a close 2nd.

For eighteen Japanese, Mr. A. STURT, gr. to N. L. COHEN, Esq., Round Oak, Englefield Green, Egham, was easily 1st with the best blooms in the show; and Mr. E. JOHNSON, gr. to A. GILLIATT, Esq., Duffield House, Stoke Poges, Slough, was 2nd.

For twelve Japanese varieties, 1st, H. White, gr. to the Marchioness CONYNGHAM, Ascot; and Mr. Farmer, gr. to H. P. LESCHALLES HYAMS, Windlesham, 2nd.

For six Japanese, Mr. Hawthorne, gr. to ST. GEORGE'S SCHOOL, Ascot, won. Mdlle. Marie Hoste in the class for six Japanese, any white variety, placed Mr. E. Smae, gr. to Captain HANBURY, Ascot, in the 1st place; as did Vivand Morel for Mr. FARMER, in the class for six Japanese of any variety and colour.

The best twelve incurved Japanese blooms were those staged by Mr. F. PAUL, and the incurved blooms, it may be said, made a good display generally.

For eighteen distinct varieties, Mr. F. J. PAUL was an easy 1st; Mr. A. STURT being 2nd.

In the class for twelve blooms of incurved varieties, the 1st prize fell easily to Mr. FARMER; and for six incurved, the highest award went to Mr. BIRD for blooms of Lord Walseley in excellent form.

The truly reflexed varieties of Chrysanthemums were well shown by Mr. W. Neate, gr. to Miss MACHAR, Sunningdale, who was placed 1st for twelve blooms, distinct; Mr. H. WHITE being 2nd. Mr. E. R. SMEE had the best six varieties of this section; and he was also the winner of the highest prize for Anemone-flowered varieties.

The premier Japanese blooms were those of Madame Carnot and C. H. Curtis, both of which were shown by Mr. PAUL, and very fine examples too.

Plants were good, and Mr. HAWTHORNE was 1st for four trained specimens; and Mr. NEATE was 1st for plants grown as bushes; also for four Pompons. For a group of Chrysanthemums, Mr. LANE won with plants carrying extremely fine blooms; and Mr. HAWTHORNE was 2nd with a group better arranged, but which lacked quality in the flowers.

Fruit and vegetables were very well represented by a number of horticulturists of the district. Messrs. J. STANDISH & Co., arranged an interesting group consisting of miscellaneous plants. Mr. THORNE, gr. to Major JOICEY, Sunningdale, had a pleasing group of choice miscellaneous plants, creditable alike to himself as cultivator, and an acquisition to the exhibition.

BRIXTON, STREATHAM, AND CLAPHAM.

NOVEMBER 6, 7.—This old-established society has not been left behind in the advance made of late years in the growth of the Chrysanthemum, but on the other hand, it is decidedly progressing, the enterprise displayed by the executive committee, and the practical knowledge of W. Roupell, Esq., the Hon. Secretary, have been productive of excellent results. It would be scarcely possible to find a better show around London outside of the National Chrysanthemum Society itself, than that recently held in the capacious hall at Streatham, a building which is well suited to the purpose, being well-lighted, lofty, and otherwise commodious.

Plant Groups.—These were divided from each other by collections of foliage plants, thus adding to the effect. The 1st prize was won in fine style by Mr. Poulton, gr. to C. T.

CARLEY, Esq., with pleasing harmony of white, pink, yellow, and bronzy-red; the flowers also were of extra good quality, and quite fit for the exhibition board. Mr. Murrell, gr. to Mrs. BURTON, who was 1st last year, staged even better than he did then, but he was fairly beaten by his rival. The great feature of this group was the dwarf growth of the plants, those in the front being little more than 1 foot in height.

For six trained specimens of Japanese, Mr. Weston, an old exhibitor, gr. to D. MARTINEAU, Esq., showed a fine set bearing a profusion of well-developed blooms, his best being Margot, Miss Watson, Madame Rendatler, Madame Levin, and La Triomphante.

With six reflexed or incurved, Mr. Cherry, gr. to Mrs. GABRIEL, showed well, and received the premier award, two of his best being Mrs. Geo. Rundle and Mrs. Dixon.

The best six Pompons were from Mr. CHERRY, also the varieties of Cedo Nulli standing him in good stead, also Commander Schneider and Frémý. Mr. WESTON was a close 2nd, Black Douglas being one of his best.

Mr. Swain, gr. to E. JONES, Esq., was 1st. for three pyramids or standard of Pompons, showing all of the latter style and of the Anemone section.

Mr. SWAIN was also 1st for three plants of large-flowered varieties, his plant of Viviani Morel being of rich colour and with fine blooms.

An excellent class was that provided for twelve Japanese, in 4½ inch pots, each plant to carry one bloom, this produced a good competition. Mr. T. Stevens, gr. to B. F. SMITH, Esq., was 1st; and Mr. MURRELL a close 2nd; the best varieties being Viviani Morel, Comte de Surani, and Chas. Davis.

CUT BLOOMS (*Japanese*).

Mr. Howe, gr. to H. TATE, Esq., showed a grand stand of twenty-four blooms, of large size and very fresh, and uniform throughout, the best were Col. Smith, Viviani Morel, Ed. Molyneux, Eda Prass, Chas. Davis (extra), Colonel Chase, Marie Hosta, Viscontess Hambleton, H. L. Snoderbruck, and a perfect bloom of Lord Brooke. Mr. MURRELL followed with another excellent stand, Mr. Seward, Deuil de Jules Ferry, and Excelsior here were of special note.

Mr. HOWE was also 1st for twelve blooms on long stems as grown, he staging again some fine flowers, Lady Sanders, a broad petalled pure white, was extra good. Mr. MURRELL again followed, and that quite closely, for 2nd place. In both instances the foliage was good, thus adding to the effect.

For twelve broad-petalled varieties, Mr. HOWE was placed 1st, with an admirable lot of flowers, the best of which were Colonel Smith, Lord Brooke, Mrs. W. Howe, and Louise; Mr. STEVENS came 2nd, almost on a par with the preceding, Lord Brooke here being especially good.

For six of any white variety, Mr. MURRELL was a worthy 1st, with almost faultless flowers of Madame Thérèse Rey, very pure in colour; Mr. HOWE being 2nd, with Madame Carnot.

For six of any other colour, the positions were reversed, Mr. HOWE winning with a splendid set of Lord Brooke.

In a class for twelve varieties, Mr. STEVENS won with an even stand, the best being Madame Hosta, Sunflower, and Charles Davis; Mr. POLTON, followed up strongly for 2nd place, Louise and Sunflower being conspicuous.

Incurv d. Sc—The best twenty-four incurved, very uniform, and of medium size and fresh, came from Mr. STEVENS, Baron Hirsch, Princess of Wales, and Empress Eugénie being the best blooms; the 2nd prize lot, from Mr. ROPE, lacked size.

Mr. STEVENS was also 1st for twelve Anemones, with a strong board, the best being Delaware (extra), Nelson, and Judge Benedict; Mr. Fulbrook, gr. to B. B. BAKER, Esq., also staged well, his best being Lady Margaret and Glück.

Mr. WESTON had a fine dozen trebles of Pompons, very bright and well set up, not, too, in a formal manner; Mr. MILSON, gr. to G. A. PAYNE, Esq., following closely, some of the flowers being over-blown.

A keen competition was evinced in the class for twelve blooms, any varieties, open only to single-headed gardeners or amateurs, eight lots being staged. Mr. FARRON, gr. to G. R. PEARLESS, Esq., won with a fine dozen, proving him to be quite capable of entering the open classes; the best here were Chas. Davis, Viviani Morel, Rose Wynne, Mrs. C. H. Payne, and Silver King. Mr. W. Smith, gr. to the Rev. S. N. Ranson, showed well for 2nd place, the blooms being bright and even.

OTHER EXHIBITS.

At this show these are always no important feature. Ferns are especially good, the 1st prize going to Mr. Hill, gr. to G. W. RYDER, Esq., who staged Platycyrtum grande in robust health; also Gymnogramma schizophylla gloriosa, G. Lauchena, and Adiantum Farleyense. Mr. Jones, gr. to N. N. SHERWOOD, Esq., who fallowed, had Gymnogramma peruviana argyrophylla and G. schizophylla gloriosa, both in fine condition.

Orchids are also shown well, Mr. Ranson having a strong half-dozen, Vanda Sanderiana, Oncidium varicosum Rogersi, and Liparis longipes, the latter a lovely Orchid, with long pendulous spikes of minute but sweetly-scented flowers.

Falsiged plants were shown well, the best coming from Mr. Chalk, gr. to A. NORMANDY, Esq. Primulas, table plants, and small Palms were also well shown.

The best basket of cut Chrysanthemums arranged for effect was shown by Miss CROOK. Mr. Stevens, gr. to M. A. VOSS, Esq., had the best arrangement of other flowers, amongst which Orchids were a feature.

Fruit was also staged in first-rate condition; so also were vegetables in baskets—still a good method of exhibiting these products.

Miscellaneous exhibits of fruit and flowers came from Messrs. J. PEED & SON, and of flowers from Mr. J. E. KNIGHTS. H.

CHESHUNT, WORMLEY, AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT.

NOVEMBER 7.—The fortnightly meeting was held on the above date in the Society's room at Turnford, and a large number of members was present. Mr. F. S. HUTCHASON presided. After the transaction of routine business matters, Mr. J. H. DEAN contributed a useful paper on PEARS FOR MARKET AND PRIVATE USE. In the course of his paper he dealt with the positions that trees planted for market purposes ought to occupy, and said that out of the hundreds of varieties, comparatively very few are fit for market purposes. These ought not to exceed twelve, and in quantity sufficient to keep the market supplied with varieties in succession.

The twelve varieties which he recommended for standard trees are Citron des Carmes, Jargonelle, Williams' Bon Chrétien, Bauré d'Amanlis, Hessele, Clapp's Favourite, Louise Bonne of Jersey, Fertility, Bauré Superfin, Princess, Durondeau, and Doyenné du Comice, these giving a succession of good Pears from the middle of August to early in November, which is late enough, as storing for long periods of time does not pay the market man. Standards of from 5 to 6 feet in height of stem were recommended. Another system practised by some growers for a market supply is that of bushes worked on the Quince, which allows a large number of choice kinds to be grown in a small area, if needs be, the varieties to be taken being Williams' Bon Chrétien, Dr. Jules Guyot, Clapp's Favourite, Louise Bonne of Jersey, Bauré Superfin, Marie Louise (double grafted), Conseiller de la Cour, Pitmaston Duchess, Doyenné du Comice, Conference, Bauré Clairgeau, Durondeau, Emile d'Heyst, Josephine de Malines, Bauré Bâté Père, and Duchesse d'Angoulême, which forms a select list of good large and choice Pears, which would command good remunerative prices in the market.

Referring to Pears grown for private use, he said this was practised by many, but really understood by few, as a great many take up a nurseryman's catalogue and make a selection without any regard to the position they are to occupy. Mr. DEAN went on to speak of cordons, espaliers, walls, &c. At the close a discussion ensued, and Mr. CLEVER referred to the slitting of the bark of standard trees to make them prolific; Mr. GILBER to orchards planted under glass; Mr. HARRISON, Pears for succession; Mr. SIMONS, prolonging the season under glass. Mr. W. L. YATES spoke of the varieties Chaumontel, Winter Nela, Aston Tower, Bauré Bose, and Easter Bauré. A vote of thanks having been accorded Mr. DEAN for his excellent paper, the meeting terminated.

The next meeting will be held on Friday, November 22, when Mr. A. Pearce will contribute a paper on "The Tuberos Begonia."

PUTNEY, WANDSWORTH, AND DISTRICT.

NOVEMBER 7, 8.—The eighth annual exhibition, held at the Cromwell Hall, was, in all respects a most satisfactory one (save in attendance of the public, the weather being most unpropitious), the hall being crowded with plants and cut flowers of superior quality.

Group of Chrysanthemums.—The competition in this class was keen, the premier position being given to a splendid lot, in which fine Japanese flowers predominated, to Mr. J. WILLIAMSON, gr. to T. S. JAY, Esq., Putney Hill; a most creditable 2nd being Mr. W. JENNER, gr. to Miss S ALLENSWOOD Wimbledon Park.

A Silver Cup given as a 1st prize (special) by Mr. E. LUCKHURST, was well won by S. W. LAMBERT, Esq., Northumberland Avenue; 2nd, also a good lot, A. LASK, Esq., Sandown Lodge. Four large-flowered, in 12-inch pots: 1st, Mr. C. BEADLEY, gr. to J. BOSWORTH, Esq., Cedar Court, Roehampton, in fine condition, being Empress Eugénie, Mrs. Dixon, and Prince of Wales; 2nd, Mr. J. PORTBURY, gr. to W. N. FROY, Esq., Ripon House. Specimen reflexed: 1st, Mr. C. BENTLEY, with a finely-flowered plant of Mrs. Forsyth; 2nd, Mr. J. PORTBURY. Two Japanese, single stem: 1st, Mr. C. BENTLEY, with a very fine Avalanche; 2nd, Mr. J. PORTBURY. Specimen Pompon: 1st, Mr. C. BENTLEY, with Black Douglas; 2nd, Mr. J. PORTBURY. Specimen large-flowered (standard): here the leading prize was taken by Mr. PORTBURY.

In the class for a standard Pompon, height not less than 30 inches, some evenly-flowered plants gained the prizes to Mr. J. PORTBURY, and Mr. C. Pearce, gr. to W. S. PAGE, Esq., The Limes.

Interest attached to the classes provided for amateurs who do not employ a gardener regularly. For a specimen, large-flowered, single stem, trained, the 1st prize went to a capitately-flowered example from S. W. LAMBERT, Esq.; 2nd, J. PEPPER, Esq., Eton Lodge; these exhibitors gaining the same positions in the class for a specimen Pompon.

Cut blooms.—Twelve incurved, distinct, 1st, Mr. J. PORTBURY, with fine flowers, but unfortunately not named. 2nd, Mr. P. POTTER, gr. to J. D. CHARRINGTON, Esq., Gifford House, who had, amongst others, fine bloom of R. Parkes, Golden Empress, and Baron Hirsch. Six incurved: 1st, Mr. C. BENTLEY, noteworthy flowers in this stand were Lord Wolsley, Mrs. Heale, and Refulgens; closely following, being Mr. W. J. WRIGHT, gr. to H. A. TUFNELL, Esq., the Grove, Wimbledon Park. Six Anemones (three Japanese): some very fine blooms were displayed here, particularly in the 1st prize lot, from Mr. W. J. WRIGHT, who had particularly good W. W. Astor, Sir

Walter Raleigh and Nelson; 2nd, a bright lot, Mr. J. PORTBURY. Twenty-four Japanese: here again were some grand flowers, 1st, Mr. W. J. WRIGHT, very fine being J. S. Dibbess, Mdle. T. Rey, Edwin Molyneux, and Lady Sanoders; a good 2nd being Mr. J. PORTBURY, who staged fine blooms of G. C. Schwabe, Mrs. W. H. Fowler, and Madame C. Mulin.

For twelve Japanese: 1st, Mr. J. PORTBURY, some of whose finest flowers were Chas. Davis, Mdle. T. Rey, E. Molyneux, and Annie Hartshorne; 2nd, a very deserving lot, Mr. P. POTTER.

Six reflexed: 1st, Mr. C. BENTLEY, noteworthy here were Amy Furze, Pink Christine, and Cloth of Gold; 2nd, Mr. J. WRIGHT.

Twelve Pompons, distinct, in bunches of three, a very pretty class: 1st, Mr. W. J. WRIGHT, who had fine flowers of Mdle. Elise Dardan, Mdle. Martha, and Prince of Orange; 2nd, Mr. C. BENTLEY.

In the classes for single-headed gardeners some very meritorious flowers were shown.

Twelve incurved: 1st, Mr. J. Dark, gr. to J. HOOKER, Esq., whose stand contained fine blooms of Mr. Bonn, Baron Hirsch, and Gem; 2nd, Mr. E. Pearce, gr. to W. S. PAGE, Esq.

Twelve Japanese: 1st, Mr. J. Holmes, gr. to W. B. ROGERS, Esq., some of whose best flowers were Sunflower, G. C. Schwabe, and Charles Davis; 2nd, Mr. J. DARK.

The premier Japanese bloom was Mdle. Thérèse Rey, shown by Mr. W. J. WRIGHT. Premier incurved was May Tomlin, from Mr. PORTBURY.

Bouquets of Chrysanthemums were very tastefully shown. Adiantum cuneatum, arranged with white and yellow flowers, were very effective as found in the 1st prize exhibit from Mr. E. PEARCE; 2nd, Mr. P. POTTER.

Some good groups of mixed plants, flowering and foliage, added attractions to the show, the principal prize-winners being Messrs. POTTER and BENTLEY. A good competition resulted in the classes devoted to Primulas, but we have seen better flowers.

FRUIT made an effective exhibit. For three bunches of Black Hamburg Grapes, good samples from Messrs. A. METHVEN and C. BENTLEY gained the awards; whilst in the corresponding class for Muscat of Alexandria, the chief prize-winners were Messrs. G. HUTTON and C. ALEXANDER.

Dessert Apples were finely shown by Messrs. J. PORTBURY and W. TEW.

In the class for three dishes kitchen Apples, some wonderful fine examples of Sand Ingham, Bismarck, and Alfriston gained the chief award for Mr. P. CAVANAGH, gr. to Madame STUART, Roehampton; 2nd, Mr. C. ALEXANDER.

Pears were successfully shown by Messrs. A. METHVEN and W. TEW.

Non-competitive exhibits were numerous and good. Messrs. JAMES VEITCH & SONS sent fine foliage and flowering plants, as did Mr. W. ICETON; Messrs. S. MAHOOD & SONS, a good group of Chrysanthemums in flower; Mr. G. STEVENS, various good devices in Chrysanthemums, wreaths, crosses, &c.; and Mr. H. Berry, gr. to HUGH C. SMITH, Esq., a fine collection of Apples.

FOREST GATE CHRYSANTHEMUM.

NOVEMBER 7, 8 9.—This Society has only been established four years, and, in spite of its youth, it may be congratulated on the excellence of the exhibition held in the Town Hall, Stratford, and opened by the Countess of Warwick. The groups contributed by amateurs and gardeners constituted quite a feature, and the classes for cut blooms were keenly contested with fine specimens. In the group competitions, quality and effect were the leading features ruling the judges' awards.

In the class for thirty-six plants, Mr. W. J. SMITH, Plaistow, gained premier honours with a fine bank—Japanese and incurved flowers—especially good; Mr. C. T. COURT coming in 2nd with a very creditable lot.

Twenty-four plants.—Here fine arrangements secured the leading prizes to Mr. T. JONES, Plaistow, and Mr. H. J. FICKLE, Forest Gate.

Twelve plants.—The Japanese in the 1st prize lot contributed by Mr. T. J. FITZGERALD, were exceptionally fine, a close 2nd being Mr. W. C. LIVERMORE.

For the best three bush plants, any variety, Messrs. BRIGHTWELL and TICKLE were the chief prize winners with well-grown and flowered examples, the group occupying a space of 50 square feet. A keen competition reigned in this, the gardeners' class. The Japanese in the 1st prize lot, staged by Mr. R. Kenyon, gr. to A. F. HILLS, Esq., Woodford, 1st, were noble flowers; a good 2nd being Mr. J. WARD, Buxton Road; while a beautiful lot sent by Mr. C. FITCH, Leytonstone, was very highly commended. We would suggest that in future the Committee request the exhibitors to name their plants. It would add much to the interest and instruction of visitors and others.

Cut blooms.—Twenty-four Japanese, a beautiful lot of flowers gained Mr. T. SMITH 1st position, noteworthy flowers being Charles Davis, Mrs. E. G. Hill, Sunflower, and Beauty of Exmouth; closely following being Mr. H. BRIGHTWELL, 2nd.

Twelve incurved.—Here of Stoke Newington, Baron Hirsch, and Golden Queen of England were amongst some of the best flowers in the 1st prize lot, from Mr. T. J. FITZGERALD; 2nd, Mr. T. SMITH, who had Brockley Gem and Golden Beverley, very good, Mr. FITZGERALD repeated his success in the class for twelve Japanese flowers, with, amongst others, very fine blooms of W. Seward, Colonel W. B. Smith, and Charles Davis; 2nd, a charming lot, Mr. S. WILSON.

Twelve Japanese and twelve incurved, a class bringing out some of the finest flowers in the show. Premier honours were

gained by Mr. R. KENYON, with a grand lot; some of his best Japanese included Stainstead White, Vivian Morel, Mons. Panckoucke, and Madame Carnot whilst amongst incurred well worthy of mention are Prince Alfred, Jeanne d'Arc, and Brookleigh Gem. A very good 2nd was Mr. J. W. SIMMONDS, Wanstead.

Six Incurred.—Some very neat blooms were shown here. Mr. J. WELLS took 1st place; John Lambert, Mrs. G. Rundle, and Jeanne d'Arc were noteworthy flowers.

Six Japanese.—Very fine flowers of Chas. Davis gained the premier award for Mr. S. BOOTH, whilst scarcely inferior were the beautiful blooms of Sunflower staged by Mr. W. J. SMITH.

Six Anemone, large-flowering.—Very distinct and beautiful were the blooms staged by Messrs. TICKELL and BRIGHTWELL, who took the chief prizes.

Another pretty and attractive class was that for six bunches of Pompons, staged with foliage, the prizes being taken by Messrs. SMITH and BALLARD; whilst in the corresponding class for bunches of large-flowering varieties, with foliage, the leading prize was taken by Mr. T. SMITH, with a very effective exhibit.

Ladies' Classes.—Some charmingly tasteful exhibits were noted here. For a Vase of Chrysanthemums, arranged for effect, with Ferns and other foliage, a very gracefully-disposed exhibit from Mrs. A. C. BISHER won the leading prize; Mrs. A. WILLET being placed 2nd.

Very effective were the baskets of Chrysanthemums, arranged with their own and other foliage, Miss FORSTER taking the premier position; and Mrs. E. EMERSON 2nd.

A special prize was offered by Mr. H. J. JONES, Lewisham, for twelve Japanese and twelve incurred blooms. This was well won by Mr. S. WILSON, Stratford.

The premier Japanese bloom in the show (Lord Brooke) was sent by Mr. W. T. SMITH, Plaistow; whilst the incurred was found in Baron Hirsch from Mr. TICKLE, Stratford.

A good collection of fruit (Grapes, Apples, and Pears), not for competition, was sent by Mr. R. Kenyon, gr. to A. F. HILLS, Esq., the tables being decorated with foliage plants (affording a foil to the glare of colour), contributed by Messrs. TITMOUSE and KENYON.

Mr. G. PRITCHARD, Forest Gate, sent a most interesting and varied collection of Cacti, which attracted much attention, as being the culture of an enthusiastic amateur of these curious and beautiful plants.

DEVON AND EXETER.

NOVEMBER 7, 8.—This exhibition, with regard to the number of the entries and quality of exhibits, was one of the best yet held by the society. To meet the wishes of those who thought an extension of time would be an improvement, the show was kept open for two days instead of one as formerly, but the wet and stormy weather, which persistently dogs the footsteps of this long-established society, prevented country visitors from attending, and there was a falling off in the receipts.

Considering that the value of the prizes offered is not very tempting, the competition throughout is often, and was on this occasion, very keen.

CHRYSANTHEMUM GROUPS.

In Class I, for Chrysanthemums in pots, not fewer than eighteen varieties, arranged in a circle of 9 feet diameter, quality of bloom to be the first consideration, effect also to be considered, the 1st prize went to Mrs. A. D. SIM, Knowle (gr., Mr. Williams); the 2nd prize to W. BROCK, Esq., Parkerswell (gr., Mr. Rowland). This was a close contest, for, while Mrs. SIM showed the larger blooms, Mr. BROCK's as a group was more effective. As proof of this the National Chrysanthemum Society's Certificate was awarded to the 2nd prize group.

In the winning collection the best were W. H. LINCOLN, Vivian Morel, Col. Smith, Waban, and Lord Brooke. In the 2nd were W. TRICKER, W. SEWARD, Harman Payne, and W. H. LINCOLN.

Chrysanthemums in pots, not fewer than twelve varieties, arranged with foliage plants in a circle 9 feet in diameter, taste in arrangement to be the primary consideration, Mr. BROCK was 1st, and Mrs. SIM, 2nd. Both collections were excellent; Mr. BROCK's the more graceful and richer-looking of the two, the blending of Chrysanthemums, Crotons, Palms, and Asparagus being a fine bit of work.

A miscellaneous group of plants, not more than twelve to be Chrysanthemums, in 6-inch pots, arranged for effect on a stand 7 feet square, raised 1 foot from the ground, and not more than 10 feet in height. Mr. BROCK was 1st, Mr. T. CHAPMAN (gr., Mr. Emmet), 2nd. The winning collection was well put together, and the effect was light, graceful, and harmonious. The plants used were Poinsettias, Bouvardias, Salvia Piteheri, Richardias, Tuberoses, Adiantums, Cypridiums, edged with Panicum variegatum and crowned with Cocos plumosa.

The 2nd prize group was spoiled in effect by a belt of Scarlet Pelargoniums in the centre, over-weighting it with a colour which requires discrimination in the using. In the small classes, Poinsettias and Bouvardias were good, Solanums fair, Cyclamen and Primula weak, and Violets fair.

A new class introduced was that of six plants for dinner-table decoration, three to be in flower, and three to consist of handsome foliage, the pots to be 5-inch ones, and Jadoo fibre to be used. Unless one's attention had been drawn to it there was nothing to show that the plants were growing

in this new material; indeed, they were vigorous, healthy foliage, and the flowering plants well bloomed.

Another class was for plants in 3-inch pots and Jadoo fibre instead of soil, and these were very good indeed.

CHRYSANTHEMUMS—CUT BLOOMS.

In the class for thirty-six Japanese, distinct, the competition was very close, the Silver Cup and 1st prize eventually falling to VINCENT STUCKEY, Esq., Langport (gr., J. L. Lloyd); and the 2nd to W. H. FOWLER, Esq., Taunton (gr., G. Hawkins). Mr. STUCKEY's lot, to which was awarded the N. C. S.'s certificate, contained Madame Carnot (this flower took the prize for the best bloom in the show, though in the opinion of many, a bloom of Robert Owen in Mr. HAMMOND SPENCER's group (3rd prize) was superior to it). Violet Rose, Mdle. T. Rey, Nyanza, Lady Saunders, C. H. Payne, G. C. Schwabe, M. Charles Molto, W. G. Newitt, Louise, Good Gracious, Mrs. Tibbie Allen, Waban, and President Borel.

In the 2nd prize lot were fine blooms of Madame Carnot, Silver King, Robert Owen, Madame Ada Chatin, and Beante Toulousaine.

In the 3rd prize group, Hairy Wonder was very good, and Robert Owen was a grand, well-finished bloom, and, as has already been stated, quite equal to, if not superior, to that to which was awarded the prize for the best bloom in the show.

In the eighteen and twelve bloom classes there were some good flowers, nearly all containing some of those above-mentioned.

For six white—one variety—the prize went to Madame Carnot, shown by H. HAMMOND SPENCER, Esq., Teignmouth (gr., G. Foster). They were good blooms, but uneven as regards size. The 2nd prize fell to Sir JOHN SHELLEY, Shobrooke Park (gr., Mr. Mairs) for six Beauty of Exmouth, exceedingly well finished but rather small.

For six yellows, Sir JOHN SHELLEY was 1st with W. H. LINCOLN, and for six any other colour Mr. HAMMOND SPENCER was 1st with Col. Smith.

Incurred were poorly represented, the entries being few, and the blooms small. In the 1st prize lot—Sir W. H. WALDRON, Bart., M.P. (gr., Mr. Heath)—were John Lambert, Lucy Kendall, Lord Wolsley, Prince Alfred, and Baron Hirsch.

In the Anemone-flowered section, Col. HALFORD THOMPSON, Teignmouth (gr., Mr. Symes) showed fine blooms of W. Dupont, M. C. Lebossez, Sir Walter Raleigh, and Grande Alveole. The best single flowered were shown by MARK FARRANT, Esq., St. Thomas (gr., Mr. Protheroe) Queen of Singles, Gold Star, Snowflake, and Mrs. Kellock being noteworthy.

In the class for twelve Chrysanthemum blooms, distinct, introduced in 1894 or 1895, 1st prize went to V. STUCKEY, Esq., who, in a very good lot, included Madame Carnot, Mme. Aut. Condouner (a rosy lilac, with thin petals of the Lilian Bird type), Mutual Friend (a grand white, good in every way), Nyanza (a fine dusky, reddish brown), Philadelphia, Miss Rita Schroeter, and Mrs. W. J. Godfrey.

Taken as a whole, cut blooms were very fine, and the competition keen.

FRUIT.

Fruit judging at an Exeter show is always a formidable business, and this year it was rendered doubly difficult by the large number of entries, and the unusually high quality in nearly every class shown.

In the premier class for twelve dishes dessert, and twelve dishes culinary Apples, all distinct, Sir JOHN F. DAVIE, Bart., Croedy Park (gr., Mr. Seward), was 1st with a grand lot, which included Cox's Orange Pippin, American Mother, Ribston, King of the Pippins, Adam's Pearmain, Melon Apple, Claygate Pearmain, Gloria Mundi, Loddington Seedling, Lord Derby, Mère de Ménage, and Ecklinville Seedling.

In the twelve dishes class, Miss FAIR, Teignmouth (gr., Mr. Stiles) was 1st with a splendid lot, which included Cornish Aromatic, of fine colour, Striped Beeing, Peasgood's Nonsuch, Cox's Pomona, Emperor Alexander, Mère de Ménage, King of the Pippins, Warner's King, &c., all of which are fine exhibition varieties, and when, as in this case, they are large and well coloured, the chances of winning rise proportionately.

The class for six dishes culinary was a tremendous one, and no finer fruit has been staged at Exeter than that with which Sir J. DAVIE won the 1st prize. Peasgood's, Cellini, Lord Derby, and Lady Heniker were very fine.

The 1st prize for six dishes Dessert Apples was well won by Sir T. D. AGLAND, Bart., Killerton (gr., Mr. Garland) with very fine fruit of Adam's Pearmain, Cornish Aromatic, King of the Pippins, Red Ribbed Greening, Blenheim Orange, and Cox's Orange Pippin.

In the single dish classes some wonderfully fine fruit was staged. For a dish of any other variety (culinary) than those named in the schedule, the prize was awarded to THOMAS WILSON, Esq., Pennsylvania, Exeter (gr., Mr. Cross) for a grand dish of Lord Derby—typical fruit—and the prize for five dessert ("other than those named") went for a fine dish of Autumn Pearmain shown by Sub-Dean AGLAND, Broadclyst (gr., Mr. Baker).

The prize for flavour was awarded to Major TRACEY, Pytte House (gr., Mr. Clarke) for a dish of small fruits of Margil Pears, were a strong class, premier honours for nine dishes—six dessert and three culinary—going to Sir T. D. AGLAND, 2nd to Sir J. SHELLEY. The "any other variety—dessert" was won with Marie Louise by W. F. RICHARDS, Esq., Broadclyst (gr., Mr. Bawden); and the prize for flavour with Doyenné du Comice by Sir DUDLEY DUCKWORTH KING, Bart., of Wear House (gr., Mr. McCormick). Mr. JOSEPH HAM of

Broadclyst a grand dish of Catillac (1st prize) weighing over 9 lb. for the five fruits, the heaviest being 2½ lb.

Grapes made a poor show, the only nice exhibit being the Black Alicante (1st prize) shown by Sir W. WALDRON. Alwicht Seedling was also staged fairly good. This is a variety not much grown in Devonshire. Muscats were very weak.

The Cottagers' Classes produced some very creditable exhibits. The thin border line between the employer and the working amateur gave rise to one or two protests, which will have to be dealt with by the Committee.

The class for baskets of autumn foliage and fruit produced some very pretty designs. The 1st prize basket, staged by Mrs. M. C. DRAYTON, being a masterpiece of rich colouring and artistic arrangement.

MISCELLANEOUS.

The Trade exhibits were, as usual, a great help to the show. In Messrs. ROBERT VEITCH & SON'S collection were a fine collection of fruit, good Orchids—Cattleyas, Phalaenopsis, Sapphonites, Pleione, &c. The pretty little Saintpaulia ionantha, and the handsome Physalis Franchetii.

The EXETER NURSERY Co. showed a bank of Chrysanthemums containing many of the new varieties, all being well grown and full of bloom. In their florist department they had a wreath and a cross made entirely of Cypridiums.

Mr. W. J. GODFREY, Exmouth, staged some of his new Carnations Goldmine, Sunrise, and Reginald Godfrey, and the new Chrysanthemums Clinton Chalfant, golden yellow; Mrs. W. J. Godfrey, a fine broad petalled milky white flower; also a fine stand of trusses of Pelargoniums of considerable merit.

MESSRS. JARMAN & Co., Chard, had a collection of Vegetables and Fruit, amongst which were some good specimens of well-known sorts.

Mr. CHAS. SCIATTA of Heavitree Bridge, and Mr. WATKINS of Hereford, had large collections of fruit on show.

The Rev. J. R. DUMELLOU, of Membury Parsonage exhibited three bunches of Black Hamburg Grapes, which were grown on a south wall in the open air. The bunches were large, well-coloured, and the berries of a good size. The Vines were planted six years ago, and the fruit has ripened three years in succession.

Mr. T. BARTLETT, Exeter, had some pretty floral work in the way of wreaths and crosses.

NATIONAL CHRYSANTHEMUM.

Floral Committee.

NOVEMBER 11.—Judging from the very large number of new varieties submitted for the opinion of the Floral Committee on this occasion, the flow of the tide of novelties appears to wax in volume, for a good portion of the northern gallery of the Royal Aquarium was filled with them, and careful as the committee may be in the matter of granting certificates, the high quality of many of the new introductions compels recognition.

Certificates of Merit were awarded to Ewan Cameron, a pure white finely-formed single variety of dwarf growth, and very free, the award being made to it as a highly promising market variety, from Mr. E. C. GOELE, Walcot Nursery, Ryde, Isle of Wight. To Mrs. A. E. Stubbs, also a single pure white, the petals somewhat pointed; and to Japanese Mrs. George West, a fine incurred type, bright amaranth in colour, with a lilac-rose and silvery reverse, broad petalled, large, and full, both from Mr. H. J. JONES, Rycroft Nursery, Lewisham. To Japanese John Lightfoot, delicate lilac-pink, the basal petals suffused with pink towards the points, and tipped with purple; and to incurred George Haigh, a sport from Robert Pettifield, pale dull rosy-purple surface, with bronze and gold reverse, large and full, and very promising, both from Mr. ROBERT OWEN, Castle Hill Nursery, Maidenhead. To decorative Japanese Clinton Chalfant, a bright yellow flower partaking of the reflexed type, very bright and free, and promising to make a fine market variety—the plant shown was of excellent habit; and single Annie Head, also white, very free and excellent for cutting, both from Mr. W. J. GODFREY, nurseryman, Exmouth, To Japanese Oceana, a larger golden incurred Japanese, broad-petalled, and very massive, a great acquisition, from Messrs. H. CANNELL & SONS, nurserymen, Swanley. To Japanese Arona, a flower of the build and in the way of Col. W. B. Smith, but narrower in the petal, and more gold on the reverse, novel and distinct, from Mr. H. BRISCOE-IRONSIDE, Burgess Hill, Sussex. Singular to state, among some new varieties sent by MRS. E. CALVAT, of Grenoble, was one named M. Alfred Recours, very like Mr. IRONSIDE's Arona, but with scarcely so much gold on the reverse, thus illustrating the fact that two raisers wide apart geographically, may yet raise seedlings very much alike and in all probability both will be sent out in due course.

Certificates of Merit were awarded also to Japanese Mrs. H. Hicks, a magnificent variety, of which six blooms were shown, the largest, a massive flower, was nearly white; younger flowers were tinted with lilac-pink, the petals broad—extra fine. Pompon Dolly, a rather large bright golden variety, with handsome, well-formed, reflexed flowers, from Dr. WALKER, Wimbledon. Mons. Chenoa de Leche, a very large reflexed Japanese, the prevailing colour shaded rosy-cinnamon, with golden centre, and golden points to some of the petals—very distinct and fine; Le Moucherotte, a bright yellow Japanese, of a very pleasing tint, the basal petals slightly stained; and to Baroune de Badières, delicate mauve-

pink, with silvery-white reverse, a fine full flower—all from Mr. WILLIAM WELLS, Earlswood Nurseries, Red Hill. To incurved Major Bonaffon, bright yellow, with plenty of small petals symmetrically arranged—a very promising exhibition variety, from Mr. W. MEASE, The Gardens, Dawside, Leatherhead. This was shown by three other exhibitors also.

Of flowers of decided promise, and which are pretty certain to gain Certificates in the future, mention may be made of incurved L'Amethysta (W. H. LEES), bright amaranth, with silvery-rose reverse, a distinct and highly promising variety; Harold Wells (W. WELLS), a large incurved sulphur spot from Sir Trevor Lawrence, very promising; Mrs. C. Johnson (W. WELLS), pale ground, the long reflexing pale florets flaked and striped with rosy crimson, distinct and novel; incurved Mrs. Hepper, white, fine form and good petal; and Mrs. Filkina, a small bright yellow decorative Japanese, with thread-like petals—both from Messrs. H. CANNELL & SONS; Mrs. W. J. Godfrey, a large, white, broad-petalled incurving Japanese with slight hairs; and Mayor of Exmouth, novel in colour, of a kind of pale cerise, chestnut-bronzy reverse—both from Mr. W. J. GODFREY, Exmouth; and Miss Madeline Davis, a silvery-pink Japanese, with long incurving florets, though somewhat loose, from Mr. H. WEEKS.

WINDSOR.

NOVEMBER 8.—A pretty exhibition of the Chrysanthemum and other subjects was held in the Albert Institute at Windsor, on the above date. Chrysanthemum plants were arranged in groups, and made a huge display; the quality of the blooms to be a chief point.

Mrs. E. B. FOSTER, Clewer Manor (gr., Mr. Cole), took the 1st prize; and Lord BOSTON, Heasor Park (gr., Mr. J. Wood), the 2nd.

Specimen plants were excellent; the best four coming from Mrs. BOWRING, Ascot (gr., Mr. Paul), who e plants were 6 feet in diameter and well flowered; and Sir H. D. GOODR, Bart., Clewer Park (gr., Mr Skeet), was 2nd, with well-grown, standard-trained plants

Amateur cultivators showed in strong force in the twelve plants' class, there being no fewer than nine competitors. The 1st prize went to Mr. H. EDWARDS, Windsor, for an excellent exhibit.

Cut blooms, of fine quality, were staged in large numbers; and for thirty-six distinct, half to be Japanese, and half incurved varieties, N. S. COHEN, Esq., Englefield Green (gr., Mr. A. Sturt), succeeded in winning the 1st p ace with handsome blooms of leading varieties; Miss A. S. RIDGE, Highfield, Englefield Green (gr., Mr. G. Lane), being 2nd.

A Challenge Cup, with a good money-prize, was offered for twelve incurved and twelve Japanese varieties, which Mr. LANE won with remarkably fine blooms; Mr. A. STURT being a good 2nd.

For twelve incurved, Mr. F. J. PAUL won the premier place with a meritorious exhibit.

For six Japanese, any one variety, Mr. CAWTE, Dedworth Green, was 1st, with E. Molyneux. Anemone-flowered varieties were very well shown by Mr. A. STURT. Mr. W. Neate, gr. to Miss MACKER, Ascot, was 1st for twelve blooms of the reflexed varieties.

Special prizes were offered for a vase or basket of twelve blooms cut with long stems, and in response there were even really meritorious exhibits, which well showed the value of the Chrysanthemum when used in this manner. Mr. CAWTE was 1st, with a device consisting of a neatly-covered circular basket, set out with Ferns, moss, &c.; Mr. J. WOOD was 2nd.

The exhibits of Grapes, Apples, and Pears were of much merit, and vegetables were largely exhibited.

TOOTING, BALHAM, AND MITCHAM HORTICULTURAL.

NOVEMBER 8.—This Society may be congratulated upon holding a very pretty exhibition on the above date, which took place in the Baths, the spacious hall being quite filled with many objects of great horticultural interest, as in addition to Chrysanthemums there were several specimens of plants in bloom at the present time, also fruit and vegetables. Groups of plants found a place round the sides of the Hall, and the fruit and cut flowers on tables. There were several baskets of vegetables—not a good way of showing them, as they would appear to greater advantage if neatly laid out on ordinary exhibition tables.

The best group of Chrysanthemums, which won the Silver Cup given by the tradesmen of Balham, came from Mr. H. Poulton, gr. to C. F. CALEY, Esq., Ivy Mount; the blooms very fine, but sadly needing the relief of some foliated plants to reduce the piked appearance of the group. A group from Mr. H. Beckett, gr. to G. S. MILLER, Esq., Logie Wood, ran it very close indeed in point of quality and effect. Some pleasing groups of foliated plants were also staged; and some well-grown and bloomed specimens of large-flowering and Pompon Chrysanthemums came from Mr. E. CHERRY, which were awarded 1st prize.

The Silver Cup given by the tradesmen of Tooting for twelve incurved and twelve Japanese Chrysanthemums, fell to the lot of Mr. W. Howe, gr. to H. TATE, Esq., Streatham, who had good blooms of Empress Eugénie, Baron Hirsch, Empress of India, Robert Petfield, and Prince Alfred; and of Japanese, E.

Molyneux Col. W. B. Smith W. Seward, Duke of York, Golden Gate, and Viscountess Hambledon. J. WILD MAN Esq. was 2nd, having a slight pull in the incurved blooms, but losing materially in the quality of the Japanese. Mr. WILDMAN had the best twelve incurved; Mr. HOWE coming 1st with twelve Japanese. Sixes of incurved and Japanese were also well shown. Some good bunches of Pompons were shown by Mr. E. CHERRY.

At each end of the hall was a large table filled with floral decorations, showing the manner in which flowers may be employed. The competition was a special open class. The 1st prize was awarded to Messrs. HARWOOD BROS., for contributions of a very high order of merit, showing not only excellent taste and judgment in arrangement, but perfect execution. Wreaths, crosses, a charming lyre, bouquets, a shower bouquet of white flowers, and an ordinary bouquet of Orchids, were specially good. The 2nd prize went to Mr. G. B. FISCHER, of Clapham; but the floral decorations were sparse, and what there was fell far below those of the Messrs. Harwood in point of quality.

Excellent Exotic Ferns in Lours were staged; Primulæ, table plants, herried plants, &c.

Fruit was represented by good Apples and Pears; Tomatos were also staged. Messrs. SUTTON & SONS' special prizes for six kinds of vegetables; and those of Messrs. HARWOOD BROS., for the same number, brought good collections. Unfortunately, the weather was somewhat unpropitious.

Miscellaneous groups of plants were contributed by Messrs. HARWOOD BROS., Balham Nurseries; B. PEED & SON, Roupell Park Nurseries; and R. NEAL, The Nurseries, Wandsworth, who had two large groups, and there were smaller contributions; to all these Certificates of Merit were awarded.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns: TEMPERATURE, ACCUMULATED, RAINFALL, BRIGHT SUN, DISTRICTS. Rows show weather data for various districts including 0 0 aver, 1 0 aver, 2 3 +, etc.

The districts indicated by number in the first column are the following: - 0, Scotland, N. Principal Wheat producing Districts - 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c. Districts - 6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10 Ireland, S. - Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending November 9, is furnished from the Meteorological Office: -

"The weather during this period was very unsettled in all parts of the Kingdom. Rain fell almost daily, the amounts in many instances being large. The atmosphere was generally mild and humid, and much mist and wet fog prevailed at times. A brilliant display of aurora was observed over Great Britain during the evening of the 9th.

"The temperature just equalled the mean in 'Scotland, N. and E. and in Ireland, S.,' but was above it elsewhere; in 'England, E. and the Midland Counties,' the excess was 4°; in the 'Channel Islands,' 5°; and in 'England, S.,' 6°. The highest of the maxima were recorded either on the 8th or

7th, and ranged from 63° in the 'Channel Islands,' 62° in 'England, S.W.,' and 61° in 'England, E. and S.,' to 55° in 'Ireland, N.' The lowest of the minima were registered, as a rule, on the 3rd, when the thermometer fell to 21° in 'Scotland, N. and E.,' and 23° in 'Ireland, S.,' and to between 27° and 32° in nearly all other districts. In the 'Channel Islands,' however, the lowest reading was 40°.

"The rainfall was considerably in excess of the mean in most districts, but only just equalled the normal in 'Scotland, E. and England, N.E.,' and was rather less in 'England, N.W.; the excess was very large in most parts of England.

"The bright sunshine was much less prevalent than of late over 'England and the Channel Islands, where the amount recorded was less than the normal. The percentage of the possible duration ranged from 27 to 41 in Ireland, from 18 to 26 in Scotland, and from 9 to 25 over England. In the Channel Islands only 18 per cent. was registered."

MARKETS.

COVENT GARDEN, November 14.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

Table of PLANTS IN POTS - AVERAGE WHOLESALE PRICES. Lists items like Adiantum, Ferns, Ficus elastica, etc. with prices.

Table of CUT FLOWERS - AVERAGE WHOLESALE PRICES. Lists items like Arums, Azalea, Bouvardia, etc. with prices.

Table of FRUIT - AVERAGE WHOLESALE PRICES. Lists items like Apples, Grapes, Pears, etc. with prices.

Table of VEGETABLES - AVERAGE WHOLESALE PRICES. Lists items like Cauliflowers, Mushrooms, Cucumbers, etc. with prices.

POTATOS. The trade during the past week has been quiet, and prices not so firm; and stocks at the depot have slightly increased. J. B. Thomas.

SEEDS.

LONDON: November 13.—Messrs. John Shaw & Son's, Seed Merchants, of Great Maze Pond, Borough, London, S.E.,

describe to-day's market bare of interest. Notwithstanding the unusually low and attractive prices, which now prevail for Clover and grass seeds, country buyers appear to be in no hurry to operate. Canadian Alsike is stronger, and perennials also tend upwards. There is no change in Rye. Winter Tares are neglected. As regards Canary seed, whilst the home demand continues slack, higher quotations are cabled from Turkey. The new Hempseed offers cheap. Blue Peas and Haricot Beans command former terms. Rape-seed keeps steady. Fine white Mustard is firmer. Linseed is dull. The Board of Trade Returns give the imports of Clover and grass seeds into the United Kingdom for the first ten months of this year as 315,683 cwt., value £388,741; as against 261,400 cwt., value £335,233, for the corresponding period of 1894.

POTATOS.

BOROUGH: November 12.—Quotations ranged from 40s. to 90s. per ton.

SPIALFIELDS: November 12.—Quotations:—Magnums, 40s. to 50s.; Imperators, 45s. to 60s.; Sutton's Abundance, 50s. to 65s.; Snowdrops, 50s. to 70s.; Bruces, 45s. to 55s.; Hebroons, 60s. to 80s.; Main Crop Kidneys, 45s. to 70s. per ton.

STRATFORD, November 12.—Quotations:—Bruces, dark soil, 35s. to 40s.; do., light, 40s. to 50s.; Reading Giants, 45s. to 51s.; Snowdrops, 55s. to 60s.; Sutton's Abundance, 55s. to 65s. per ton.

FABRINGDON: November 14.—Quotations: Snowdrops, 70s. to 100s.; Hebroons, 60s. to 80s.; Imperators, 50s. to 60s.; Magnums, 45s. to 55s.; Early Rose, 55s. to 60s. per ton.

TRADE NOTICE.

Mr. JAMES ADSHEAD has taken over the nursery and florist business of James Firkins, Albert Nursery, Eccles, and which will in future be known as Adshead & Henball's.

"Owing to the great pressure on our space, several reports of Horticultural Exhibitions cannot appear in this issue."

ADDRESS: H. O. D. M. A. Alegatière, Chemin de la Croix, Marion, Montplaisir, Lyon (Rhône).

BOOKS: *Encyclopedia, Nicholson's Dictionary*, published by Upcott Gill, 170, Strand, is a very useful encyclopaedia for a gardener to possess. We do not know the price of the bound volumes.—*J. Dobson, Vines and Vine Culture*, by A. F. Barron, published at 171, Fleet Street, E.C. (*Journal of Horticulture*). *Animals of the Farm in Health and Disease*, a pamphlet of 65 pages, to be obtained at the Royal Agricultural Society of England's House, 12 Hanover Square, London, W.—*S. E. J. Chrysanthemums and their Culture* 8th Edition, by Edwin Malynax, published at 171 Fleet Street, E.C.—*My Gardener*, by W. H. Ward, published by Eyre & Spottiswoode, East Harding Street, E.C.; or *Villa Gardening* by E. Hobday, published by Macmillan & Co., Bedford Street, Covent Garden, W.C., the former being the newer book.—A larger and more expensive work is the *Gardeners' Assistant*, by R. Thomson, published by Blackie & Sons, Paternoster Buildings, London, E.C.

BEST ROSES FOR "BUTTON HOLES": *Beginner*. There are not fifty best button-hole roses. W. Allan Richardson, Ma Capucine, D'antoinette, Niphetos, Marshal Niel, The Bride, Harmonie, A. K. Williams are among the best. See also p. 497 in *Gardeners' Chronicle* for October 23 last. We cannot afford space for naming fifty fine varieties for the garden. You must consult a catalogue published by some good rose grower.

CATTLEYA LARIATA WITH NEW ROOTS FORMING AND SWELLING LEAVES: *D. G.* Keep them gently moving in a temperature, which at night is not less than 60°, or by day higher than 65° or 70°. The same will hold good for these C. Mosses which are in a forward state.

CATTLEYA TRIANETI: *D. G.* Being newly imported, after trimming away dead parts and thoroughly washing every part, put them loosely into pots of a suitable size, surrounding the roots with clean crocks; place in a warm, moist house, and beten-

sionally syringing them. The minimum temperature need not be less than 60°. When root growth becomes visible, pot them in the usual manner, and whilst inert the sun should not be allowed to shine directly upon them.

CHRYSANTHEMUM SPORT: *S. S. S.* The bloom you send may have a little more colour than Source d'Or usually has, but we do not regard it as valuable.

CHRYSANTHEMUM SPORT: *W. Gee*. The variety Chas. Davis is usually yellow on the crown bud, but we do not recognise the bloom you send as that variety, though it is near it. In case it may be a sport, send blooms to the next Floral Committee of the National Chrysanthemum Society, or to the Royal Horticultural Society, or even to some large grower.

DENDROBIUM WARDIANUM: *D. G.* It should improve and grow larger, your treatment cannot be quite right.

DRESSING FOR VINES: *T. B. Clay*, a bucketful; crowding, quarter of this quantity; gas-tar, one pint; soot and sulphur, a handful or two, adding water sufficient to make a thickish mixture. Strain through a fine sieve before using it. If tar be not liked use petroleum, at the rate of two wine-glassfuls, instead of it. The mixture must be applied when the Vines are at rest.

EUCHARIS: *Wm. G.* We know of no remedy when the mites have gained access to the interior of the bulbs. Had the attack been commencing only, you might have soaked the bulbs in nicotine, or a strong solution of soot water, soap, and paraffin.

EUCHARIS-MITE: *Wm. G.* Your bulbs are attacked by mite, but not at present to great extent. The bulbs being perfectly sound, it may be possible to keep them, if energetic measures are taken at once.

GARDENIAS: *T. W. Paat*, ½; fibry loam, one year in attack, ¼; leaf mould, ¼; and sand in sufficient quantity to make it rather porous. Some gardeners use a larger proportion of loam if it is of a light nature, and broken sandstone is found to be of use, together with sand in making borders for the plants. It is a plant that requires firm potting and plenty of drainage materials.

GARDENERS' ORPHAN FUND.—W. Hont has thanks for 4s. forwarded to the secretary to this fund.

HARDY HIMALAYAN RHODODENDRONS: *F. S.* At Kew there bloomed R. talgens, R. Thomsoni, R. dahuricum, R. alta-clarensis. At Nant-y-Glyn, R. exoniense, R. cinnamomeum, R. campanulatum, and alta-clarensis, flowered in the open air. See pp. 356 and 363 of *Gardeners' Chronicle*, March 25 1893.

HOCULETTA PICTA: *W. M.* An inspection of the names of plants on p. 470 would have shown you that the plant had been noticed, and the name altered to H. Brocklebankiana.

IMPORTED LILIA AND CATTLEYA: *D. G.* If you prefer to buy knowing what you are getting, make visits to the sale rooms when flowering lots are advertised. Otherwise put reliance in the Orchid dealer, and buy established plants which have flowered or of which he can guarantee the species. There is an element of chance, that is not unpleasant to many persons, in buying up unflowered lots.

INSECTS: *J. L.* Grubs of the common cockchafer, small variety. Encourage the rooks.

LAWN SAND: *Subscriber*. Those who have used this substance speak highly of it. We imagine it is some kind of artificial manure, which, by encouraging the growth of the grasses, causes in time the destruction of the weeds which even in bad turf are in the minority.

MAIZE: *T. S.* The presence of a few grains on the male inflorescence of this plant is not uncommon, and it is an undesirable malformation.

MUSHROOM BEDS: *G. L. B. L.* To all your questions we can only answer "No." The productivity of an old bed may be revived somewhat, if it have not quite left off bearing, by watering it with warm water—say, at 85° to 90°—in which a little salt, at the rate of two table-spoonfuls to three gallons, is dissolved.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to con. ult the next number.*—*Mrs. L., Gosford Hall*. Seeds of the Black Walnut (*Juglans nigra*).—*Lizbeth*. *Oocidium longipes*.

* PLANTS, FRUITS, ETC., TO BE NAMED.—The applications to name flowers, and especially fruit, are so numerous at this season as severely to tax our resources. They entail an expenditure of time, labour, and money, of which our readers can have no idea. We are always willing to oblige our correspondents as far as we can, but the editing of the *Gardeners' Chronicle* is our business, to which everything else must give way. Correspondents are respectfully requested to observe the rule that not more than six specimens can be dealt with at a time. If more are sent, it would be a grateful act on the part of the sender, to send also a small contribution to the *Gardeners' Orphan Fund*. Specimens should be good ones, carefully packed and numbered. Leaves only, or florists' varieties cannot, as a rule, be named. Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

NAMES OF FRUITS: *J. W. M.* Apples, 1, Egg or White Paradise; 2, Queen Caroline; 3, Golden Noble; 4, Gravenstein; 5, Warner's King; 6, Round Winter Nonsuch.—*J. Southern*. Apples, 1, Lord Lennox; 2, Fearn's Pippin; 3, Waltham Abbey Seedling; 4 and 5, DameLOW's Seedling. Pear, Bessé Clairgean.—*T. J. J. S. C.* Pears, 1, 2, 3, 4, and 5 all Benrié Diel, varying somewhat in size, colour, &c. Apple, King of the Pippine.—*M. H. P.* Apples, 1, Old English Codlin; 2, 4, Hawthornden; 3, Yellow Ingestre; 5, King of the Pippins; 6, Cox's Orange Pippin.—*G. Sears*. Apples, 1, Hollandbury; 2, Peasgood's Nonsuch. Pears, 3, Léon Leclerc de Laval; 4, Gansell's Bergamot; 5, Vicar of Winkfield.—*Raby*. Pear Doyenné du Commerce.—*W. W.* Your Pears were absolutely rotten and crushed when they arrived at this office.

NATIONAL AMATEURS GARDENING SOCIETY: *W. P.* The aims and objects are the fostering of a love of gardening amongst dwellers in towns and the holding of exhibitions of the plants, flowers, fruits produced by its members. There is plenty of scope for its endeavours, and already there are indications that the lessons imparted have been made of use.

SMALL BORDER: *Flora*. You will be acting well if you take up the old Roses, and trench the present sites of the clumps. The trenching may be done 2 or 3 spits deep, if the soil is deep enough to stand it; if not, dig down to the bad soil, giving it a stir up, and leave it where it is. Mix plenty of rich manure (pig's is good for Roses) with the soil; and if the land is not too dry when finished plant it with finer varieties of Roses than those taken out. If too wet to plant, defer the latter job to March, but dig the ground. Read our Flower Garden Calendar in this week's issue. The intervening spaces may be planted with Hyacinths, Tulips, early and late varieties, Anemones, Ranunculus, Crocus, Scillas, Wallflowers, Arabis, Canterbury Bells, Lilium candidum, L. croceum, L. el-ganz, L. longiflorum, L. Martagon, L. dahuricum, and others. Aim at getting in this way an early display; and for later flowering there are hosts of tender bedding plants, Annuals, Dahlias, Hollyhocks, and Michaelmas Daisies. The fence might be planted with Chrysanthemums, Sweet Peas, Trojeolum aduncum, and other varieties; Sweetbriar, Jasmine in variety, climbing Honey-suckles, Clematis in variety, &c.

SOME INSECTS IN A VINERY: *F. A. G.* The insects arrived very much broken. The reddish beetle is *Aphodius simularius*, the dark ones are *Trox scaber*, and the grub apparently belongs to the latter. Both were probably introduced with manure or decaying animal matter, and are not likely to injure the Vines. Still, as they are "in thousands," you may as well try to get rid of them. *R. McL.*

TOMATOS CAUSING DISQUALIFICATION OF A TRAY OF VEGETABLES: *J. G.* If there was no rule in the schedule excluding them, their presence in the exhibit ought not to have caused the disqualification of the collection. They are fruits in the sense that Cucumbers, Vegetable Marrows, or Capsicums are fruits.

WINTER MOTH: *J. E.* The bands should have been in their places at the beginning of October. It is now, we fear, too late for them to do much good. Smear cart grease on to broad bands of grease-proof paper, and after smoothing the roughness of the bark for about 1 foot in width, fix one round each tree at 2 feet from the ground.

COMMUNICATIONS RECEIVED.—*Challouer* (Shenton (with thanks)).—*Editor Bright's Examiner* (with thanks).—*W. W.*—*P. J.*—*G. S. S.*, Boston.—*W. E. G.*—*Ab. de B.*—*L. C.*—*Rugby*.—*D. CHRYSANTHEMUMS. — — CHRYSANTHEMUMS.

NORMAN DAVIS

BEGS TO SAY HIS PRELIMINARY LIST OF CHRYSANTHEMUMS IS NOW READY.

This is a carefully-prepared Alphabetical List of the cream of recent introductions, so far as in commerce, free from sensational and unnecessary long descriptions. It will be found a useful List for reference; sent post-free.

SPECIAL NOTICE.—GRAND NATIONAL JUBILEE SET OF NOVELTIES.

Soon as the shows are over I shall prepare a LIST of NOVELTIES for 1896. This List will be a short one, as I am anxious that the set shall be composed of nothing but the best flowers of the choicest description. Several of my purchases have already been shown in public, and received unanimous approval. In addition to the beautiful varieties raised by Mr. H. WEEKS, of Derby, and two exceptional sterling Novelties from America, it is with great pleasure that I am able to announce that I have made arrangements with WILLIAM SEWARD, Esq., of Hanwell, to distribute his set of six magnificent seedlings, which have justly been the admiration of all who have been privileged to see them. The whole of these will form a grand Jubilee Set, worthy of the occasion, and undoubtedly the finest collection of Novelties ever introduced.

IMPORTANT.

We beg to inform all readers of this Paper that the Fourth Edition (100 000 copies) of our Revised PRICE LIST, consisting of 400 pp. and about 1200 Illustrations, bound in cloth, is Now Ready. We shall have much pleasure in forwarding to every person one post-free on application. This List is the most complete in the Trade, and has cost several thousand pounds to produce.

CONTENTS OF SECTIONS.

SECTION.	PAGES.
I.—Conservatories, Greenhouses, Vineries, Orchid Houses, Plat and Forcing Houses, Frames, Pits, Hand-Lights &c.	17—64
II.—Poultry, Kennel, Rabbit, and Pigeon Appliances, &c.	65—98
III.—Rustic Work	99—134
IV.—Iron Buildings and Roofing, Church Furniture, &c.	135—178
V.—Heating Apparatus, Cooking Stoves, &c.	179—228
VI.—Horticultural Manures, Fertilisers, Insecticides, Worm and Weed Destroyers, Sunshades, Soils, &c.	229—243
VII.—Lawn Mowers and Edge Cutters, Tennis Markers, Garden Rollers, &c.	247—268
VIII.—Horticultural Timber	269—280
IX.—Horticultural Sundries, Wirework, Fountains, Vases, Statuary, &c.	281—342
X.—Vegetable and Flower Seeds, Plants, Dutch Bulbs, &c.	343—383

The Subscription List will be open on the 16th November, 1895, and will close on or before the 19th November, 1895 for Town, and 20th November, 1895, for the Country

Each holder of four £1 shares will be entitled to purchase from the Company to the extent of £10 per annum, at special discount prices, Photographic Apparatus and Accessories, Magic or Optical Lanterns and Accessories, Horticultural or Special Apparatus for Gardening, including the Company's Patented and other Specialities for Insecticide Distributing, and Blight Preventing Apparatus, also Patent Safety (Gold Medal Award) Petroleum Lamps, and in respect of every additional four shares a like advantage.

DAWKINS & CO., LIMITED.

Incorporated under the Companies Acts, 1862 to 1890.

SHARE CAPITAL - - - - £10,000

DIVIDED INTO 10,000 SHARES OF £1 EACH, of which £2,000 is reserved for Working Capital.

PAYABLE AS FOLLOWS:—

5/- PER SHARE on Application.

5/- PER SHARE on Allotment.

5/- PER SHARE in One Month from Date of Allotment.

5/- PER SHARE in One or More Calls as required.

DIRECTORS.

STEPHEN H. MARTIN, Ludgate Hill, Birmingham, Hardware Merchant.

JOHN SHAW, Park Vale, Alcester Road, Moseley, near Birmingham, Commercial Traveller.

HENRY STRANGE, Tenby Street, Birmingham, Brassfounder.

Managing Director—*WILLIAM ARTHUR DAWKINS, of Homestead Kings Norton, near Birmingham.

* Will join the Board after Allotment.

Bankers—THE LONDON AND MIDLAND BANK, Limited, Birmingham and Branches.

Solicitors—T. EDWARD SILVESTER, 8, Church Street, Birmingham.

Auditors—JAMES RHODES & CO.

Secretary—WILLIAM PERKINS.

Registered Office—40, EDMUND STREET, BIRMINGHAM.

PROSPECTUS.

The Company has been formed to acquire and carry on the established business of Mr. Wm. ARTHUR DAWKINS (known as W. A. Dawkins & Co.), Manufacturers of Photographic Cameras and Apparatus, Optical and Lime-light Lanterns, Horticultural Apparatus and Garden Specialities, and Petroleum Lamps, and General Dealer in Mechanical and other Apparatus, now carried on at 58, Caroline Street, Birmingham, and at the Wholesale and Retail Depot, 40, Edmund Street, Birmingham, including the following Patent Rights:—

- (1) An invention in and relating to Petroleum Lamps, granted to Thomas William Wilson and Harry Butler jointly, on 8th March, 1892, and numbered 4,583, and contracted to be sold to the Vendor.
- (2) An invention in and relating to Garden Syringes, entitled "Improvement in Syringes," the acceptance of the complete specification in respect of which is dated 21st September, 1895, and numbered 11,502.
- (3) An invention for improvements in and relating to Photographic Cameras, granted to the Vendor 22nd June, 1894, and numbered 12,119.

It will be seen that the business comprises three distinct departments: (1) Manufacture of Photographic and Optical Lantern Apparatus and Accessories; (2) Manufacture of Horticultural Implements; (3) Manufacture of Lamps, and for every four shares to his or her name a shareholder will be entitled to purchase from the Company £10 worth of goods per annum at special discounts, varying from 10 per cent. to 30 per cent., according to the nature of the goods purchased, the higher rates of discount being allowed on goods manufactured by the Company.

The successful working of the principle of mutual benefit to shareholders has been proved, as is well known, by the wonderful strides made during the past decade by Co-operative Societies in all branches of trade, and the business of this Company is one admirably adapted to the application of this principle. Price Lists of Lanterns, Photographic and Horticultural Apparatus will be sent annually to Shareholders.

The enormous increase in the use of the Photographic Camera as a popular companion by amateurs and tourists, aided by the present day facilities for cheap Railway Tours and Excursions, leads the Directors to believe that the trade produced by the demands for this class of Apparatus among the Shareholders alone will ensure to the Company a large output of Cameras annually, while a large demand may be expected for the Optical or Magic Lantern by patrons of the Camera as a means of showing their photographs during the winter evenings.

The fact of the Company being the actual manufacturers of nearly all the articles sold in this department, will enable the Directors to give the Shareholders the benefit of manufacturing profits, and at the same time to save the considerable profits hitherto solely enjoyed by agents and middlemen.

The Directors have also decided to add to the already extensive Lantern-Slide Lending and Hiring Department opened by the Vendor, a complete set of popular ancient and modern subjects, tours, and humorous slides of high-class quality. The Shareholders will be entitled to hire slides and apparatus at two-thirds of the rate charged to the public.

In the Horticultural Department, also of the Company's business, it is anticipated that there will be a large annual demand for Horticultural Specialities among the Shareholders. The Patent Syringe is already well known to many amateur gardeners, and in connection with this and other distributing apparatus the Company have acquired the formula of a reliable speciality, well known as "Garden Pest Exterminator," and which has for some time past been manufactured and supplied by the Vendor. For the convenience of Shareholders and customers the List in this Department also includes high-class Garden Seeds.

The Directors beg to call special attention to the principle and construction of the Patent Petroleum Safety Lamps, an illustration of which accompanies this prospectus. It will be seen that the object is to provide an improved means of attachment of the burner to the vessel containing the oil by means of a straight guide, at the end of which is a bold coupling screw, which renders cross-screwing in attachment impossible, and forms a securely locked joint. In case of any accident or upsetting of the lamp the burner retains its relative position, and any possibility of explosion or fire is prevented. Users of Petroleum Lamps will have doubtless observed that ordinary Lamps of present make are provided with a connection of burner with vessel by means of either a small tapered screw or side catches. In the former case the great disadvantage is that the frequent crossing of thread or screw deceives the operator, as the screw does not engage and no proper connection is therefore made, and by frequent repetitions of this process the thread is ultimately destroyed. If under such circumstances the Lamp by any means be upset the burner immediately separates from the vessel and the lighted wick ignites the spilled oil, and this is the cause of the majority of Lamp fatalities. The latter arrangement, viz., side catches, is even more uncertain, as frequently while one catch is being watched in connection, the other unobserved fails to grip, and leaves no alternative but a certain catastrophe in case of upsetting, and renders explosion by ignition extremely probable. The great features of the Improved Safety Connection principle are its simplicity and consequent cheapness in manufacture, its ease in manipulation, and its absolute safety. This Lamp has been exhibited at two Exhibitions only, and has gained the following awards—(1) Certificate of Merit, at the Trades' Industrial Exhibition at Birmingham, Spring, 1892; (2) First Prize, Gold Medal at Trades' Industrial Exhibition at Lincoln, December, 1892, and January, 1893.

The Vendor has submitted the Patent Specification to Mr. J. Fletcher Moulton, Q.C., the eminent authority on Patent law, for his opinion as to the validity of the Patent. The following is a copy of his opinion:—

I am of opinion that the title to the Patent, No. 4,583, of 1892, sufficiently discloses the nature of the invention, that the Title, the Provisional Specification, and the Complete Specification refer to the same invention, that the Specification and claims are sufficient, and assuming that the invention is new, I am of opinion that the inventors have a valid patent.

(Signed) J. FLETCHER MOULTON (Temple).

The Directors anticipate large and substantial returns from the manufacture of this Lamp, and also from grants of Licences to manufacturers under the Company's Patents. The wholesale market has not been tested, nor has any advertising been done, but a number of lamps have been offered for sale by retail, and the result of the Vendor's experiment in this direction was highly satisfactory.

The Vendor finds that to reap the full benefit of the Patent, labour-saving tools must be procured, and this his limited capital will not enable him to do. He has, however, expended considerable time and money in developing the manufacture of the Lamp, and tools have been designed by him which will reduce the cost of manufacture to a minimum. His general business is now also ripe for further development, and will well warrant the introduction of further capital.

The Plant, Stock-in-Trade, Fixtures, Manufacturing Machinery and Tools, have been valued by Mr. T. S. Fallows (Ex-Mayor of Birmingham), who reports as follows:—
59, Temple Row, Birmingham, 27th September, 1895.

DEAR SIR,

I have attended at your works and retail premises, Caroline Street and Edmund Street, Birmingham, and have taken in detail a complete inventory of the whole of your finished and unfinished Stock-in-Trade, Plant, Machinery, Tools, Patterns, Shop, Office, and Warehouse Furniture and Fixtures, and have made a careful valuation of the same. I find the value of the whole, taken as a going concern, amounts to the sum of One Thousand Two Hundred and Seventy Pounds One Shilling and Threepence.

Yours truly, THOS. S. FALLOWS.

Messrs. W. A. Dawkins & Co.,

Photographic Instrument Makers, Edmund Street, Birmingham.

The Patents have been valued by Mr. W. P. Thompson, M.I.M.E., F.C.S., the well-known Patent expert, who reports as follows:—

DEAR SIR,

6, Lord Street, Liverpool, 2nd November, 1895.
In accordance with your instructions I have carefully examined the Patent, No. 4,583, of 1892. I understand from you that a search has been made, and that nothing militating against its novelty has been discovered. Assuming, therefore, the novelty of the invention, and as far as I can judge it is new, I am of opinion that the Patent is valid and covers the invention claimed. I also think the invention a good one for the purpose for which it has been designed, and that 3d. would be a fair Royalty to pay on these Lamps. On the basis of this Royalty, and a reasonable valuation for extra trade profits owing to the monopoly, I should value the Patent at £3,260. The American Patent, which I understand has now been applied for, should also be very valuable. I value the inventions and Patents for the Syringe and your Photographic Camera at £190.

W. A. Dawkins, Esq.,

40, Edmund Street, Birmingham.

Yours truly, WM. P. THOMPSON.

The total purchase price fixed by the Vendor for the Plant, Machinery, Stock-in-Trade, Patent and other rights (including the Lamp) is £2,060; payable as to £1,460 in cash, as to £600 in fully paid up Shares.

The Directors have secured the services of Mr. Wm. Arthur Dawkins, the Vendor, a Managing Director for a period of five years, upon terms mentioned in an agreement, date the 6th day of November, 1895, and made between John Henry Smith, as Trustee for and on behalf of the Company of the one part, and the said W. A. Dawkins of the other part. In his agreement of sale the Vendor undertakes that all improvements in connection with the existing Patents that he may hereafter discover shall be the property of the Company without further consideration.

After payment of the purchase money and the promotion expenses it will be seen that upwards of £7,000 will remain for working capital, and having regard to the smallness of the purchase money as compared with the valuation of the Lamp Patent alone, the Company should meet with success.

The Vendor is the promoter, and will be repaid the promotion expenses and registration fees by the Company in pursuance of the terms of the Agreement (No. 2) set out below.

The following agreements have been entered into, viz.:

- (1) An Agreement dated the 3rd day of September, 1895, and made between Thos. Wm. Wilson and Harry Butler of the one part, and William Arthur Dawkins of the other part.
- (2) An Agreement dated the 6th day of November, 1895, and made between the said W. A. Dawkins of the one part, and John Henry Smith, as Trustee for and on behalf of the Company, of the other part.
- (3) An Agreement dated the 6th day of November, 1895, and between John Henry Smith as Trustee for and on behalf of the Company of the one part, and the said W. A. Dawkins of the other part, whereby the said W. A. Dawkins agrees to serve the Company for five years.

There are also various trade and other contracts which may constitute contracts within the 38th Section of the Companies Act, 1867, or contracts to the disclosure of which applicants for Shares might be held to be entitled. Of all such contracts, every applicant for Shares shall be deemed to have had sufficient notice.

Application for Shares should be made on the form enclosed, and forwarded to the Company's Bankers with the amount of deposit. If no allotment is made the deposit will be returned in full, and when the number of shares allotted is less than the number applied for, the balance will be applied towards the amount due on allotment and any excess returned to the applicant.

Copies of prospectus and forms of application can be obtained at the Registered Offices of the Company, or its Bankers, Auditors, and Patent Agents. Forms of application, copies of Prospectus, Memorandum and Articles of Association, agreements, and the original valuations can be seen at the office of the Solicitor to the Company.

Samples of the Lamp and original awards may be seen at the Registered Offices

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.
Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail geared Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,
H. BALLANTINE, Head Gardener to Baron Schröder.
R. WARNER & Co. have made and erected a similar Mill and set of Pumps for Lord Northbourne.

THE MESSAGE OF PEACE is always appreciated and respected by all true men, for many of us hope the time is not far distant when it may be universally adopted by all nations. When this comes to pass, happiness and prosperity will be the rule and not the exception. In the meantime, **HOLLOWAY'S PILLS** and **OINTMENT** have largely helped to make "origin nations understand that Englishmen delight in alleviating pain and suffering. These wonderful remedies have been tried in many lands for the relief they have afforded and the cures effected. They are specially adapted for all complaints affecting the liver, stomach, and kidneys, and at this season no family should be without a supply.

Also **GARDEN TOOLS** and Effects, including iron roller, three lawn mowers, garden water-barrel on carriage (nearly new), two wheelbarrows, 90 ft. garden hose, garden chairs, seats and tables, trellis arches, &c. Catalogues may be had three days prior to the Sale of Messrs. JACKSON AND SONS, Valuers, &c., Sittingbourne.

Chesterfield.

TO BE SOLD.—LEASEHOLD NURSERY and **GLASS ERECTIONS**, in one lot, as a going concern, known as The Ashgate Nurseries, Chesterfield, comprising about 10 acres of Ground. Houses heated by Hot-water Piping. No Stock need be taken, as this can be sold by auction. Particulars may be had of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, E.C.

FOR SALE, a small valuable long leasehold **NURSERY**, 6 miles from Covent Garden. Seven large Greenhouses, well stocked; two Vineries, Cucumber-house, Plant-houses, five-roomed Cottage. Low Ground Rent. Lease eighty-six years to expire. Eighty-five feet Glass. Facing main road. All particulars of **FLORIST**, 11, Dafoine Road, Tooting, Surrey.

FOR SALE, MARKET NURSERY and **FLORIST BUSINESS**. Close to a Provincial Town of 40,000 inhabitants, and within easy reach, on Main Lines, of Manchester, Liverpool and other large centres of population. 9 acres choice Land, dwelling-house, fourteen modern Glass-houses (nearly 1400 feet run), Vineries, Tomato, Cucumber, Plant, and Forcing-houses. All efficiently heated and stocked; in full working order, and in one of the best positions in the kingdom. Address, **PROVINCIAL Gardeners' Chronicle Office**, 41, Wellington Street, Strand, W.C.

Hooton Estate, Cheshire.

TO NURSERYMEN, FLORISTS, and OTHERS.
TO BE LET, the Productive Gardens of **HOOTON HALL**, extent nearly 5 acres, having an excellent stock of Standard Apple and Pear Trees. The Glass comprises Greenhouse, three Vineries, Peach, Orchard, Tomato, Cucumber, and Melon Houses; there are the usual Potting Sheds, Fruit Room, Office, Gardeners' Bothy, Stabling, &c., also good Gardeners' House. For further particulars, apply to Messrs. SMITHS, GORE, AND CO., 6, Newgate Street, Chester.

To Fruit Growers and Market Gardeners.

TO LET, at Enfield Highway, Middlesex, a **LARGE ORCHARD** or **FRUIT GARDEN**, of 40 acres, or thereabouts, planted with Apple, Pear, and Plum Trees, and Gooseberry and Currant Bushes; and also adjoining same 10 acres or thereabouts of **MARKET GARDEN GROUND**, with House and necessary Outbuildings, within easy reach of the London Markets. Immediate possession can be given. Apply for rent and other particulars, and for permission to view, to Messrs. WITHERS and WITHERS, of Maltravers House, Arundel Street, Strand, London. Solicitors; and W. C. ELMS, Esq., 18, Lower Phillimore Place, Kensington, Surrey.

WATERCRESS BEDS.—TO LET, about one acre, thirty miles from London, on Great Eastern Railway; two minutes walk from station.—Apply by letter, 149, Loughborough Road, Brixton, S.W.

TECOMA SMITHII—The finest new flowering plant; as easily managed as a Chrysanthemum. It produces in Autumn large heads of brilliant red and yellow blossoms. New seed of all Seedsmen.

MR. A. F. BARRON.

THIRD LIST OF SUBSCRIPTIONS.

Treasurer: H. J. VEITCH, Esq., 544, King's Road, Chelsea, S.W.

It is especially requested that subscriptions and communications relating to this matter may be addressed to Mr. E. Wyne, 1, Danes Inn, Strand, London, W.C.

Table listing subscribers and amounts, including T. Glen, W. G. Head, Capt. Bax, etc. Columns for name, amount in £ s. d.

FOR ORCHIDS and GARDENERS to Grow them, apply to SANDER'S, St. Albans. The finest stock of Orchids in the World.—30 minutes from St. Pancras.

SEAFORTHIA ELEGANS.—Good strong Plants from store boxes, 8s. per 100. 70s. per 1000, free on rail.—WILLIAM WHITELEY, The Nurseries, Hillingdon Heath, Uxbridge.

Awarded First-class Certificate of Merit.

GLOXINIA, "AIGBURTH CRIMSON."

THIS is the finest high-coloured variety ever sent out. As its name indicates, it is a vivid-crimson self, of the highest merit. The flowers are erect, of the finest form and substance, of great size, and abundantly produced; the habit of the plant is all that could be desired.

This charming variety was raised in our Nursery in 1893, and was exhibited for the first time at the Liverpool Summer Show, August, 1894, and was much admired by all who saw it, and was unanimously awarded a First-class Certificate of Merit.

Having proved that it is reproduced quite true from Seeds, we now offer Seeds from carefully-fertilised flowers at 2s. 6d. per packet, post-free.

Liberal terms for this sterling novelty, per dozen or per 100 packets, to the Trade, from Messrs. NUTTING AND SONS, Messrs. HURST AND SON, London; or of the Raisers—

ROBT. P. KER & SONS, BASNETT STREET, LIVERPOOL.

EXHIBITION.

RESULT

Proves more than volumes of print. My Collection of Chrysanthemums has again succeeded in winning the President's Prize for Group of Plants, and the Gold Medal for Table of Exhibition Blooms, at the National Chrysanthemum Society's Show, November 5, 1895. In addition to many other prizes my collection has now been awarded

5 GOLD MEDALS

in two years—the highest award obtainable in each case. I have much pleasure in announcing that I have secured some Grand Seedlings from our two most noted and successful English raisers, Chas. E. Shea, Esq., and H. Briscoe-Ironside, Esq., which, together with my own Seedlings will form a collection

UNRIVALLED.

My GENERAL GUIDE is now ready, with reduced prices for all last season's novelties, and contains the following Cultural Articles:—How to Grow Japanese for Exhibition; How to Grow Incurved for Exhibition; How to Grow Specimen Plants; How to Grow for Decoration; How to Dress Incurved for Exhibition; and How to Save Seed. A large number of Growers attribute their

SUCCESS

to following the advice given in my Guide, which can be obtained, post-free, for eight stamps.

My LIST of NOVELTIES for 1896 will be ready in December.

H. J. JONES,

RYECROFT NURSERY, LEWISHAM, S.E.

THE BEST & CHEAPEST FUEL for GREENHOUSE BOILERS, STOVES, & HEATING APPARATUS.

ANTHRACITE SMOKELESS COAL.

G. R. CARTER & SON supply their LARGE, NUT, or COBBLE COALS (the Nuts being about the size of a Walnut, and the Cobbles about the size of a man's fist), delivered by van, at any address within the 4-mile radius of Charing Cross; or in truckloads, at any Railway Station. This Coal is absolutely smokeless, and it requires much less attention than any other description of fuel, burning for twelve hours at least without any supervision, and giving from five to ten degrees more heat than Coke. Quotations on application to—

G. R. CARTER & SON, 53, 54, & 55, COAL EXCHANGE, LONDON, E.C.

CHRYSANTHEMUMS.

ALL GROWERS WHO DESIRE THE BEST VARIETIES ONLY should obtain a copy of **W. J. GODFREY'S CATALOGUE.**

It is the **MOST RELIABLE LIST** published. (Ready early in December).

Before the blooming season hardly began, Catalogues for 1896 were distributed containing long lists of Foreign Novelties, with descriptions appended, as supplied by the various raisers. Not a tenth part of these had bloomed in this country, and not one in twenty will be worth cataloguing another season. Those growers who are tempted into trying them will be sorely disappointed.

W. J. G. has on trial of this season's Novelties 220 varieties from Continental raisers, 76 from America and Japan, all the English introductions, and several hundred second-year seedlings of his own raising. **ONLY THE VERY BEST** of these will be catalogued, and no expense and trouble are being spared to sift the few "grains from the chaff." Strong, healthy, country-grown cuttings can be supplied at once, if desired, and at same prices as offered by other responsible firms.

GODFREY'S NOVELTIES FOR 1896 will consist of really sterling varieties, every one of which has been thoroughly tested the second year.

W. J. GODFREY, EXMOUTH, DEVON.

W. W. JOHNSON & SON,

SEED GROWERS and MERCHANTS,
BOSTON, LINCOLNSHIRE.

NEW PEA, "BOSTON UNRIVALLED."

A NEW, PERFECTLY DISTINCT, and VALUABLE ACQUISITION.

An unusually prolific, dwarf, wrinkled, Second Early Marrowfat, of the best table quality. Height, $2\frac{1}{2}$ to 3 feet; pods large, 5 to 6 inches in length, of the "Telephone" shape and colour, but more even in size than that well-known variety, there being from 9 to 11 fine peas in the pods. These mostly hang in pairs, literally covering the haulm, which is robust, and not subject to mildew.

A first-class Pea for either Private Gardens or Market Growers, and as an Exhibition variety must rank as a decided improvement and great acquisition in profitable Horticulture.

Retail, per Sealed Half-pint Packet, 1s. 6d.; per Sealed Pint Packet, 2s. 6d.

Trade Price and List of Testimonials on application.

NORMAN DAVIS

BEGS TO SAY HIS PRELIMINARY LIST OF CHRYSANTHEMUMS IS NOW READY.

This is a carefully-prepared Alphabetical List of the cream of recent introductions, so far as in commerce, free from sensational and unnecessary long descriptions. It will be found a useful List for reference; sent post-free.

SPECIAL NOTICE.—GRAND NATIONAL JUBILEE SET OF NOVELTIES.

Soon as the shows are over I shall prepare a LIST of NOVELTIES for 1896. This List will be a short one, as I am anxious that the set shall be composed of nothing but back row flowers of the choicest description. Several of my purchases have already been shown in public, and received unanimous approval. In addition to the beautiful varieties raised by Mr. H. WEEKS, of Derby, and two exceptional sterling Novelties from America, it is with great pleasure that I am able to announce that I have made arrangements with WILLIAM SEWARD, Esq. of Hanwell, to distribute his set of six magnificent seedlings, which have justly been the admiration of all who have been privileged to see them. The whole of these will form a grand Jubilee Set, worthy of the occasion, and undoubtedly the finest collection of Novelties ever introduced.

PLANTING SEASON.

PAULS' NURSERIES, Waltham Cross, Herts.
—WM. PAUL AND SON, Rose Growers by appointment to Her Majesty The Queen, Tree, Plant, Bulb and Seed Merchants. Close to Waltham Cross and Theobald's Grove Stations, G.E.R.

PAULS' NURSERIES, Waltham Cross, Herts.
—STANDARD and HALF-STANDARD ROSES, from 18s. per dozen; Dwarf, from 6s. per dozen; Climbers, from 6s. per dozen; Pot Roses, 10s. 6d. per dozen, and upwards.

PAULS' NURSERIES, Waltham Cross, Herts.
—BOOKS on ROSES, by WM. PAUL, F.L.S.:—"The Rose Garden," 4to, 9th edition, 20 coloured plates, 17s. 6d.; the same, 8vo, without plates, 8s. 9d. "Roses and Rose Culture," 1s. "Roses in pots," 2s.

PAULS' NURSERIES, Waltham Cross, Herts.
—FRUIT TREES of all kinds, cultivated in large quantities. Trees may now be selected and marked for delivery as required; also Fruit Trees in pots, Grape Vines, Figs, and Strawberries.

PAULS' NURSERIES, Waltham Cross, Herts.
—Hardy ORNAMENTAL and EVERGREEN TREES and SHRUBS in great variety. Intending planters cannot do better than make their selections now.

PAULS' NURSERIES, Waltham Cross, Herts.
—TREES for foliage and flowers, including Pauls' Double Crimson Thorne, Scarlet Chestnuts, Gold, Silver, and Purple Maple, Purple Beech, Oaks, Planes, Limes, Poplars, Elms, &c.

PAULS' NURSERIES, Waltham Cross, Herts.
—RHODODENDRONS, off Loam, for the Garden or Woods, are made an object of special Culture; also Azaleas, Kalmas, Heaths, and other American Plants.

PAULS' NURSERIES, Waltham Cross, Herts.
—HARDY and GREENHOUSE CLIMBING PLANTS of all kinds. Lapageria-house now in bloom; Camellias, the finest stock in the country; also Azaleas and other greenhouse plants.

PAULS' NURSERIES, Waltham Cross, Herts.
—BULBS of all kinds for forcing and the open garden. Seeds of every description. Seakale and Asparagus for forcing. Mushroom Spawn, and every garden requisite.

PAULS' NURSERIES, Waltham Cross, Herts.
—Priced Lists free. Inspection invited. Estimates cheerfully given. Gardeners of character and experience recommended.—Postal address, WM. PAUL AND SON, Waltham Cross, Herts.

THE LATENT VITALITY OF SEEDS.

M. CASIMIR DE CANDOLLE has lately published an interesting paper entitled *La Vie Latente des Graines* (Archives des Sc. Phys. et Nat.; Bibl. Univers., 1895), in which he comes to the conclusion that if the external conditions necessary for the vital activities of seeds be absent for a long time they may be totally arrested, but yet the seeds may be alive and re-enter an active course of existence after, perhaps, an indefinite period. His experiments were conducted in a cold room of a meat refrigerator, having made a preliminary one as follows:—Three lots of Peas and Haricot Beans were placed (1) in free air; (2) in a tube of air, but sealed; (3) in pure carbonic acid. After two years (1) had increased in weight, and nearly all germinated; (2) had lost weight, while a smaller proportion germinated; air now containing 11.4 per cent. of oxygen, and 3.8 per cent. of carbonic acid; (3) none came up. He asks the question whether the enfeebled vital activities had ceased before the end of the experiment, so that respiration and assimilation had completely stopped; if so, the protoplasm must become quite inert. He believes that to be the case. He now experimented with an intensely cold temperature, having previously determined that Peas, Haricots, and Fennel seed would germinate after an exposure of four days to a temperature of 148° F. He wrapped up some Wheat, Oats, seeds of Fennel, of the Sensitive plant, and of Lobelia Erinus in tin foil. All were well packed in a cylindrical iron box of 3½ cubic feet capacity; the lid being hermetically sealed. This was placed in an open wooden box for protection. The whole was subjected to an intermittent stream of intensely cold air coming direct from the refrigerator, from May to September, 1894, or 118 days.

The cold air was continued from eight to twenty hours per day; the average time being fourteen hours. On the greatest number of occasions (sixty-eight times), the cold was prolonged for twenty hours. The lowest temperature reached was -65° F., and the highest -36° F.

In the intermediate periods the warming was very slow, for the temperature scarcely passed freezing-point at the end of two to three hours, after stopping the machine. Conversely, the cooling of the box was very rapid, as it was directly exposed to the current of cold air.

M. De Candolle asks the question whether the box could check the cooling. As an experiment in this direction, he completely filled a box with corn. The lid, being hermetically sealed, was then pierced to allow the bulb of a thermometer to pass through it, and the hole was then plugged with cotton-wool. He then observed the thermometer outside a window. The rate of cooling varied much according to the initial tem-

SWANLEY, KENT.

peratures, and in proportion as the exterior air was calm or agitated. Thus, in a strong north-east wind, the temperature of the room being 18° Fahr., and 17.5° Fahr. outside, it took twenty-six minutes to ascend to 21° Fahr. On a calm day when it was 53.6° Fahr. in the room, and at freezing point outside, it took one hour and eight minutes to descend to freezing point.

But, as M. De Candolle observes, this experiment does not bear much, if any, analogy to the cooling by the air from a refrigerator, for the box was placed in the direct current from it. Moreover the seeds were surrounded by a metallic paper, greatly facilitating the conductivity of the box. He thinks, therefore, that not more than a quarter of an hour would be required to put the temperature of the box in equilibrium with that of the cold air. On taking out the seeds, they were at once sown. Nearly all the Wheat, some of the Oats, and some Fennel seeds quickly appeared. Of sixty-six seeds of the Sensitive plant, thirteen only came up; while of numerous Lobelia seeds, only ten germinated.

The failure of the seeds of the Sensitive plant was not solely due to the cold, as many failed to germinate, while many Lobelia plants grew in a control experiment. The conclusion the author arrived at was that life, as expressed by vital functions, was completely arrested for a time; the protoplasm was inert, and could not either respire or assimilate. The cause of some being killed was that their protoplasm had not yet become completely inert.

If this result be true, then, one would expect that seeds could be maintained with impunity in a medium unsuitable for respiration, provided there were nothing which could exert a deteriorating effect upon the internal chemical processes, as does carbonic acid.

He, therefore, tried the effect of plunging seeds in mercury: thus, 8 grains of Wheat were placed below 2.5 cm. of mercury for one month (October 19 to November 19). Of these four only germinated. Of 5 grains of Wheat under 13 cm. of mercury, from November 27 to December 28, four grew. Of 5 grains of Wheat under 5 cm. of mercury, from February 5 to May 5, all grew. Similarly 13 grains of Cress, under 5 cm. of mercury, for two months, all germinated.

This experiment, therefore, as that with a low temperature, shows that seeds can exist in a state of complete vital inertia; and that the internal changes of metabolism can be arrested, as long as the necessary external conditions of temperature, moisture, &c., are withheld.

M. De Candolle thinks that this state of chemical and vital inertia may last, perhaps, indefinitely. He then gives the following cases in illustration:—M. A. P. De Candolle mentions a case where grains of the Sensitive plant germinated very well after upwards of sixty years repose (*Physiologie*, p. 621). Girardin has seen Haricot Beans germinating which were taken from the herbarium of Tournefort, where they had lain for a century. In 1850 Robert Brown sowed, for curiosity, some seeds from the collection of Sir Hans Sloane, 150 years old, several germinated, as for example, one of *Nelumbium speciosum*, of which the plant is still preserved in the Natural History Museum. He refers to the popular notion of "Mummy Wheat" having germinated, only to refute it, adding, that it appears that the grains were sterilised before being placed in the tomb—but he does not give the proof of this. The present writer finds the starch grains to be perfectly sound, and to colour readily with iodine; so that the grains could not

at least have been boiled. The most extraordinary case to which he refers was observed by Prof. De Heldreich (*Garten Flora*, 1873, p. 323), the Director of the Botanic Garden at Athens. In botanising about the mines of Laurium he discovered in 1873 a new species of *Glaucium*, *G. Serpieri*. It made its appearance from under a thick layer of volcanic scoria, to which he would assign a date of 1500 years. He concludes with a reference to the investigations of M. Peter, who took soil from the interior of forests, and, after taking every precaution, found that soil from ancient forests gave rise to woodland species only; but soil from recent forests supplied species of open plains and fields, according as the forest had replaced these respectively. Admitting that his experiments did not decide the question, M. Peter thinks it would be safe to allow at least fifty years of duration of arrest of vital activity in the seeds buried in the soil of forests.

NEW OR NOTEWORTHY PLANTS.

CIRRHOPE TALUM ROTHSCHILDIANUM, *n. sp.*

At the meeting of the Orchid Committee of the Royal Horticultural Society on October 15, the Hon. Walter Rothschild exhibited what was unanimously agreed to be the handsomest of the plume-bearing section of *Cirrhopetalum*, and under the above name it was awarded a First-class Certificate—an honour only once before accorded to a member of this singular genus. The plant was received from an explorer somewhere in the hills beyond Darjeeling a few years ago, but owing to its long and slow journey it, together with a few others, chiefly new botanical Orchids, arrived in so withered a condition that only this season, after careful nursing, has it succeeded in flowering. As the cultivated pseudo-bulbs are scarcely one-third the size of the imported ones, it is but reasonable to infer that the flowers, beautiful though they are, will still improve as the plant gains strength. The pseudo-bulbs vary in form from ovate to Pear-shaped, each bearing a single fleshy light green leaf, more or less distant on the rhizome. Scape erect, 8 inches in height, bearing at the top a one-sided umbel of flowers, each over 6 inches in length, and exceeding 1 inch across the broadest part of the lower sepals. The prevailing colour of the flowers is bright crimson-purple, some blotches of clear yellow appearing on the sepals. The cucullate upper sepal is yellow with purple lines, and with marginal fringe and a very sensitive plume of a purple colour at the apex. The petals are narrower, but similarly coloured and decorated. The lower sepals show little other colour than rich crimson-purple, the same hue pervading their slender tail-like appendages, which sometimes intertwine, and at others are free. The triangular, grooved, hinged labellum is purple, and the whole flower so remarkably attractive as to command attention even from those who profess to care for nothing but the showiest Orchids. Its nearest affinity seems to be *C. Collettii*, Hemsl.

CATTLEYA LABIATA BROOMEANA, *n. var.*

This is one of the finest of that best and most useful section of *C. labiata* known as "autumn-flowering." At a glance its gorgeous flowers remind one of *C. Warszewiczii* (gigas), there being in this a similar broad expansion in the front of its velvety crimson-purple lip, which also bears on each side the roundish cream-coloured blotch usually seen in *C. Warszewiczii*. The broad petals expand to nearly 8 inches, and both they and the sepals are of a warm rosy-purple, the venation being distinctly traced by a darker tint of the same colour. It was flowered by Joseph Broome, Esq., Sunny Hill, Llandudno (grower, Mr. Shill), who is not only very fortunate in getting fine varieties of *Cattleyas*, but is also an adept at cultivating them up to their best. *James O'Brien*.

ANNUALS.

Nor only in every gardening paper, but also in conversation with any member of the ancient craft, do we frequently hear the pithy remark on some floral or fruit exhibit: "Ah, they're what I call well done;" or Mr. —, gardener to His Grace the Duke of Blankshire, exhibited in most classes, and it is needless to say all his exhibits were thoroughly "well done."

To confine my remarks to one very humble class of plants, though one more often ill done than the opposite, "annuals," it will be found that there is scarcely anything a gardener or amateur takes in hand that will more liberally repay care and proper cultivation.

The average amateur, and, I may as well say it as think it, nine out of ten professed gardeners, look upon annuals from such an obtuse angle that rarely do you see a genuine attempt to get the best results out of these most varied and in most cases elegant, not to say beautiful, denizens of our gardens.

For the hardy kinds—to scratch a seed-drill or circle in the soil of the border or bed, or to sow the seed broadcast, and then rake in, constitutes the total that is supposed to be necessary to get a good result, the young seedlings come up, and then are left to take care of themselves. It may be, if the annual sown is what is termed half-hardy, that the seed is sown in a box or pan, and placed to germinate in a hot-bed, or on a shelf in the greenhouse, but even then eventually the poor tender nurselings are left till they being sown thicker than should be, become drawn, and get woody and hard, while the pan or box gets full of roots; and when the time comes to transfer the seedling plants to the beds or borders, they are sickly, spindly, and showing immature buds or blossoms—in fact, they are only fit to be put on the rubbish-heap, as they cannot now repay further trouble, and if planted out will only lead to disappointment. Poor things, they are "ill done."

But let us look on the opposite of this. I have in my mind's eye a young man, whose ambition and desire it is to neglect nothing he has under his care; and who, like the deacon's wonderful chaise, has no weak point, a maxim with him being, and it is a capital one—"Worth doing, worth doing well."

Beginning at the foundation, he treats his soil to a generous coat of half-decayed dung, leaving this on all the winter, and then digging it in. As soon as the soil has "sagged," i.e., settled down to its usual level, selecting a dry and still day, he just stirs the surface with the Dutch-hoe, and then drawing a drill, of a depth adapted to the size of the seed to be sown, he commits the wonderful germs to the care of mother earth, rakes in the soil carefully, and then gently treads the earth firm around and above the seed. If the weather be warm and showery, the minute cotyledons (seed leaves) will soon appear above the surface, and continuing growth will be rapidly followed by the true leaves. Now the first thinning is made; and after this is done, should the weather be dry, a slight watering with a fine-rose pot will again settle the disturbed soil, and give the young nurselings a further impetus to grow. Room to develop themselves fully is thus secured, and the greater distance in reason the plants remain apart, the better the final result. The last thinning may be made when the first buds appear, when, if these directions are followed, the seedlings will be sturdy, evenly balanced and grown, and able to take care of themselves, rarely needing any sticks or ties.

The grower will now be rewarded by plants amply clothed with healthy, well-developed foliage, making them even at this stage pretty objects, for the majority of hardy annuals have elegant foliage. When, however, they flower abundantly, with each flower well developed, the ample reward for all the care will be reaped. Many who never saw annuals so grown will be astonished, and all will at once concede that they are "well done." The dwarfed *Clarkias*, *Godetias*, crimson Giant *Mignonette*, *Eschscholtzias*, *Schizanthus papilionaceus*, &c., making single specimens 18 inches high and the same through; while such coarser-growing subjects

as the annual Chrysanthemums, Malope, Lavatera, Bartonia, Cacalia, Calliopais, Calendula pluvialis, Campanula macrostyla, Centaurea depressa, Entoca,

flower, and Whitlavia will range from 1 to 2½ feet. One can scarcely realise the vast difference in appearance they present when cared for, instead of

being neglected; on the one hand being really handsome, effective, and useful, but on the other little better than mere weeds. Thomas Bunyard.

THE WHEAT CROP OF 1895.

UP to October 20, 1894, on which day the experimental Wheat was sown, the autumn was favourable for agricultural operations. After that date much rain occurred in some parts and but little in others. The winter also was protracted and severe, and to a certain extent injured the Wheat plant.

The following Table shows, in the usual form, the produce of Wheat on the selected plots in the experimental field at Rothamsted for 1895, which is the fifty-second year of the successive growth of the crop on the same land. It also gives for comparison, the average produce of the same plots over 10, 33, and 43 years, 1852-94 inclusive.

YEAR.	Unmanured Plot 3.	Farmyard Manure Plot 2.	Artificial Manures.				Mean.	Mean of plots 3, 2, and 7, 8, 9 (or 10).

(1) Equal to 31 bushels at 60 lb. per bushel.
 (2) Equal to 29½ bushels at 60 lb. per bushel.
 (3) Equal to 26½ bushels at 60 lb. per bushel.
 (4) Equal to 27½ bushels at 60 lb. per bushel.

The seed having been sown in October, the Rothamsted experimental crops suffered comparatively little from less of plant during the very severe weather in January and February. Following the much more than average produce of 18 bushels grown on the unmanured plot in 1894, the Table shows that in the present year the yield was only 10 bushels, which is considerably below the average yield of the plot. On the other hand, the land manured every year with farmyard dung gives this year a produce of 43½ bushels, of more than 63 lb. per bushel, which, if reckoned at 60 lb., is about 11 bushels more than the average of that plot; and the crop was generally selected by those who visited the field as much better than that by any of the other manures. The selected artificially-manured plots give in fact an average produce considerably below that of the dung; partly owing to injury in the spring to the plant on plot 16, which receives besides mineral manures a large quantity of nitrate of soda; and as happens in some seasons with such large applications of nitrate, the surface soil became very moist, and when it was rolled in the spring it clotted, and the result was injury to the plant, and defective growth, whilst the leaves had a very dark green colour.

The chief features of the experimental crops this year are high quality of grain, and a very small quantity of straw, and much the same may be said of the crops of the country generally. Whatever may be the actual weight of the bushel grown, farmers are in most districts required to deliver 63 lb., and fortunately this year a measured bushel will very frequently weigh 63 lb., and British grain will be in request by millers. The shortness of straw is, however, a great misfortune, especially since the value of the straw for thatching and other purposes, is stated to be a chief reason why many farmers continue to grow Wheat. As the average weight per bushel of the grain on our selected plots was close upon 63 lb., the average produce of 29½ bushels corresponds to 31 bushels at the official weight of 60 lb. In comparing the estimate of 31 bushels so arrived at, with others given respectively of weight per bushel, which this year would in many cases be as much as 63 lb., and in others perhaps reckoned at that weight, it should be borne in mind that such estimates would this year frequently represent about 1½ bushel more if reckoned at 60 lb. per bushel.

Adopting, for the sake of argument, the average produce of our selected plots as indicating the average produce of the United Kingdom, the question arises what will be the yield of the country, and what will be our requirement from other sources? A careful study of the climatic conditions of the harvest-year would point to the conclusion that they were at any rate not unfavourable for a full average crop of grain where the soil conditions were favourable. Indeed, the Table shows that without manure the produce was much

below the average, with farmyard manure much above average, with the highest artificial manure also above average, but with the others below average. It would seem that the result was much the same in the country at large; that is where the condition and the cultivation of the land were good, more than average crops have been obtained, and where they were bad there have been less than average crops. The very small area of Wheat grown this year is doubtless partly due to the wetness of the autumn; and if we knew how much was got in badly, or sown too late, we might be able to make a more confident estimate of the yield of the country. At any rate there is reason to fear that it will prove to be below the yield we have recorded.

Although there is at present more labour and time spent than formerly to ascertain the produce of our Wheat crop, the question as to who is to benefit from the information when it is obtained, must now frequently suggest itself to the reader of the reports. From the time our experiments commenced until comparatively recently, the yield of the home Wheat crop was an important factor affecting the supplies which we received from other countries; and the rise and fall in our own produce was watched with great interest by both home and foreign growers as well as by dealers. After the bad Wheat crop of 1860, the imports of wheat increased from 4½ million quarters in the previous harvest year to 10½ million in 1860-61; while after our great Wheat crops of 1863 and 1864, the imports fell from nearly 9½ millions in 1862-3, to a little over 7 millions in 1863-4, and to about 5½ millions in 1864-5. It will be of interest to show on the other hand how little the yield of our home-grown wheat influences the foreign supplies at the present time. The Board of Agriculture estimate of the yield of the Wheat crop of 1894 in the United Kingdom was 30.7 bushels of indefinite weight, which would probably represent about 32 bushels at 60 lb. per bushel, our own estimate being 33 bushels at 60 lb. per bushel. As the imports with which we have to compare the home produce are reckoned at 60 lb., it will be more convenient to adopt by way of illustration our own estimate, which was obviously not much higher than that of the Board of Agriculture would be at the same weight per bushel. Now, deducting 2 bushels per acre for seed reckoned on the area of the 1894 crop, we last year estimated that 7½ million quarters would be available for consumption from the home crop, and that rather more than 21½ millions would be required from stocks and imports, to meet the requirement for consumption at 6 bushels per head, and that the total requirement so estimated would amount to 29½ million quarters. But the actual imports within the harvest year 1894-5 were nearly 24½ million instead of only 21½ million quarters, as estimated to be required. According to these figures, the total available supply from home and foreign sources would amount to about 32½ million quarters, leaving a surplus of more than 3 million quarters to be otherwise consumed or to be added to our stocks. We now know, however, that the area under the crop in 1895 was more than 500,000 acres less than in 1894, upon which the above calculations are founded. Adopting the number of acres now recorded as under the crop in 1895 (though it is said that some which was sown was afterwards ploughed up) the amount required for seed was less than was last year estimated, leaving of course more available for consumption; and if we assume the previous calculation to be so corrected, the result would be that the total available supply from home and foreign sources would amount for the last harvest year to 32½, instead of 82½ million quarters, and the surplus would be rather more than 3½ million quarters.

It may be stated that our imports of Wheat last year reached an amount equal to feeding five-sixths of our population. With favourable seed times, our own area under the crop may indeed increase more or less beyond that of the past year; but unless growers over some large areas of the world find that it does not pay them to deliver Wheat into our ports at the prices current at the time, our own growth of the crop cannot be expected to show much life, or to be the important factor in British agriculture which it was before the severe competition of foreign producers in recent years. *J. B. Lawes, Rothamsted*
October 31, 1895.

BERLIN.

GERMAN v. BRITISH CYCLAMENS.

At a recent meeting in Berlin there were exhibited Cyclamen persicum grown from English seeds. Besides these, some German sorts of the same plant were exhibited. The English sorts were the following:—*C. persicum* hybr. and *C. p. h.* purple, from Messrs. H. Cannell & Sons of Swanley; *C. p.* Crimson Queen, Duke of Connaught, *giganteum roseum compactum*, and *Rosy Morn*, from Messrs. Carter & Co., London; *C. p.* Brilliant, *Crimson King*, and *Mauve Queen*, from Mr. George Reid of London. The German sorts were:—*Käthchen Stoldl*, pure white; *White*, with carmine eye; *Rosa*, from Marienthal, and a bright dark-purple form from Mr. C. Stoldl at Hamburg. The plants were grown by a Cyclamen specialist, M. Schwarzburg, at Pankow, near Berlin, who grows every year at least 4000 to 5000 plants. The object of the exhibition was

to ascertain whether the English sorts are so much better than the German ones, that it would be desirable to introduce English Cyclamen blood into German cultures. A year ago similar trials were made with English *Primula chinensis*, which gave the results that the English sorts were in some ways much better than the German ones. This I mention to show that the German gardeners do not hesitate to acknowledge the best even when it come from abroad, and that they by no means assert that all German things are best. On this occasion not one of the English Cyclamens could rival the German varieties; indeed, the flowers were so little satisfactory compared with those of the German sorts that they would rank after all others. But not only were the flowers compared, but also the leaves. I do not know whether in England sorts with self-coloured leaves are preferred [No]. Here, in Germany, leaves are desired which have a rich marbling; the more they resemble those of *C. hederifolium* the higher they are valued. The English sorts were robust and very healthy plants, but the foliage was green, and therefore also, like the flowers, of less value. As Mr. Schwarzburg remarked, the reason for the superiority of the German sorts is that German Cyclamen growers do not buy their seeds, but raise them themselves. They select from their whole stock of many thousand plants only some twelve to twenty plants, for seed-growing. By regular selection during many years, they have raised sorts which are accounted excellent for their pure colours (the English sorts by no means showed this quality), for their very large size (the German sorts are mostly about one-third to one-half larger than the English ones) [!], for the good bearing of the flowers, and for the good colouring of the leaves, which are also of good habit. Mr. Schwarzburg said it may be possible that English growers have a different method of cultivation to that of the German gardeners, and that he would much like to learn the English plan, so as to make a further trial. During the debate a seed merchant, who is also a specialist in Cyclamen culture, Mr. Van der Smissen, of Steglitz, near Berlin, remarked that there are in Germany four centres of Cyclamen culture—Berlin, Hamburg, Frankfurt-on-Maine, and Dresden. The latter place produces sorts which differ notably from those of the three other places. He remarked also that the German seeds cost about one-third less than the English sorts. Whilst among the above-named English sorts are some, of which a thousand seeds cost £3 15s., the best German sorts cost £1 per 1000 seeds. To these general remarks, your correspondent would add a hope that English Cyclamen growers will visit the great international exhibition in the spring of 1897 at Berlin, where they may show what first-class English-grown Cyclamens are. Perhaps some English Cyclamen growers will be kind enough to send some good flowering specimens now, that they may be compared with ours. Should it interest any of the English growers to learn how Cyclamens are cultivated here, I shall be glad to give information. Plants with 100 and more flowers are by no means rare. Only by interchange of knowledge is progress possible. It is not for one or another to hold a monopoly, but it is for all gardeners to make use of the experiences of the successful ones. That is why it is so much wished that English gardeners should come to the large exhibition with their products. We shall learn from them, and we also can promise that English gardeners may here learn a few things from us.

The autumn here is this year quite an abnormal one. Curiously enough, though the average day temperature for some weeks has already been above the normal one, a great many trees and shrubs are still green, a fact quite unprecedented here at the beginning of November. In many places *Dahlia variabilis* is still flowering in the open air, whilst in other years these plants are killed by frost four weeks earlier. The reason is, that we have not yet had a severe frost, and that the plants are gradually accustomed to a lower temperature. It would be interesting to

try if plants grown from seed which ripens now, would be more resistant to our climate than the mother plants. A plant that very seldom fruits here is *Sophora japonica*, which this year bears much fruit; whether these will ripen is another question. *Paulownia imperialis* has flowered here this year, also a very rare occurrence. I do not know whether it has ever done so before.

Chrysanthemum nipponicum is a plant that some time ago was sent over to us as a very fine novelty. It is in flower here now, but it is worth nothing. The plant itself, with its thick fleshy leaves, is interesting, but the flowers are not good.

Saintpaulia ionantha, or, as it is called here, the Violet of Usambara, is, on the contrary, a most delightful and very satisfactory plant. Seedlings raised in January were in full flower in June, and are still flowering now, Nov. 1, in my room. Certainly this Gesneraceous plant is one of the best novelties brought forward of late years. Besides seeding freely, it is easily to be propagated, like a *Gloxinia*, by leaves. The culture is quite easy. It is to be hoped that East Africa, especially Kilimandzaro and Usambara, will furnish us with some other worthwhile plants for our gardens. Prof. Volkens, who has lived for one and a half year on Kilimandzaro at an elevation of 1550 mètres, at Maraungu, showed at the last meeting of the Berlin Horticultural Society, a good many most interesting plants, which grow at an elevation of 4000 mètres and higher, and which would be quite hardy here also. The most interesting one was a new species of *Rubus* of the Blackberry group, with fruits 2 inches in diameter, and of a yellow colour. Also a new *Anemone* is very remarkable. Very large is the number of Monocotyledonous plants from Kilimandzaro which are worth growing by us. Amongst the Polygonaceæ, the most remarkable is *Rumex nervosus* var. *usambarensis*, a climber with stems 8 inches in diameter, with enormous pure purple fruit-stalks. It grows at an elevation of 2800 mètres. The Kilimandzaro plants are of the highest value, especially for English gardeners. Professor Volkens remarked that for eight months the sun is not to be seen, because clouds, and fogs, and rains darken the sky. The rains are not thunderstorms, as in other tropical regions during the rainy seasons, but mild rains. The total rainfall observed during one year, at an elevation of 1550 mètres, was 1900 mm. The highest temperature is not equal to that which we have in the summer months. Potatoes grew very well, also all our other vegetables. Vines do not ripen; it is possible that the damp is the cause of this. Barley grows very well; but when the main stalk begins to show its ear, the plant ramifies, and young shoots grow up, so that afterwards all stages, from young shoots to ripe ears, are on the same plant, which gives much trouble in harvesting. Professor Volkens thinks that this may be altered by selection of the plants and by raising local sorts *U. D., November.*

FRUIT GROWING FOR SMALL GARDENS.*

First, having settled upon the size of the plot of ground we can spare for growing Apples and Pears, the next point to decide is what shape our trees shall take, as the number of trees to be planted in a given plot will depend upon their shape; then, having finally settled upon the number of trees we are able to plant, the next most important step to decide is the kinds to grow, and in what proportion. This we shall find a most difficult task, for, although we may know of several good kinds ourselves, it will not help us much, as most of these are grown entirely for the markets in large orchards, and are wholly unsuitable for growing in small gardens, owing to the large size the trees attain, besides which many of these orchards have been planted for the last generation or so, and other kinds of better flavour, and better keeping qualities have superseded them. As an instance, we probably all of us know what a good

* Extracts from a Paper read before the Streatham Hill Agassiz Society, on Oct. 25, 1895, by Mr. J. C. Waltham.

Apple a Blenheim Orange is, and I have known several, for this reason, who have grown it without making any enquiries about it, and have been terribly disappointed, for the Cox's Orange Pippin has entirely taken its place; first, because it comes into bearing when only three to four years old, whereas the former cannot be got to bear until it is fully twelve years old; and, secondly, it bears more regularly, and keeps a month longer and better than the Blenheim Orange does, and without doubt is a far superior Apple all round. Again, if we look through a catalogue, we find some 150 to 200 apparently more or less good varieties, so that we do not get much information from this source. By far the best plan, when it can be adopted, is to go to a good grower, and get him to give you a sample or two of each of the best kinds ripening each month, and most suitable to the growth of trees you propose to plant; by this means one is able to judge for oneself of the quality of the fruit, and suit one's own individual taste.

TRAINING.

There are some five or six methods in general use for training the trees. First, we have the orchard standard, which, owing to its size, is quite unsuitable for small gardens, as they not only take away too much nutriment from the ground, but prevent light and air from getting to the plants, &c., in its vicinity. As it does not come into bearing until some five or six years old, the amateur standard is not infrequently grown. It is similar to the above, but the straight stem is covered with short spurs, which are allowed to produce fruit until the upper portion of the tree is in full bearing, when they are cut off, thus giving us a bearing tree some two or three years earlier.

Where space in a small garden is very limited, the walk is often bordered by espaliers; these are trees grown on a straight stem, with branches about 9 inches apart running at right angles to it in the same plane, and are trained and kept into position by being fastened to wires stretched from post to post. They usually bear well, and if heavily laden, there is no chance of the branches being broken, nor is the fruit so easily blown off in a high wind; but the greatest objection to this method of growing trees is that it screens the garden far too much from light and air, and plants will not thrive unless there is plenty of air passing through a garden; in fact, they act, in this respect, as a second wall to the garden, as the branches are so close together. Many Apples and Pears will do very well on this principle when grown against a south or west wall, but are very liable, when the stalks are long, to get damaged by rubbing against it; besides which, the sun can only get at one side of the fruit, and the branches are reduced in bearing surface by exactly a half, as those buds next the wall cannot, of course, come to maturity. Such trees should be planted about 15 feet apart, and should never be tied permanently to either wall or wire until they have been in the ground for some four to six weeks, and have had time to thoroughly settle, as otherwise many of the smaller branches will probably become damaged through the strain put upon them by the tree sinking. Trees are also grown against wires or walls in the shape of fans, but there is more trouble in training these than espaliers, and they do not cover a given surface so well and evenly as the former do. For Gooseberries, Cherries, Peaches, &c., this method is, however, more suitable, as the growth of these kinds of fruit trees is not so robust as with Pears and Apples.

Borders are sometimes edged with trees in the form of a letter T, the two side branches forming the top of the T are fastened to a wire about 9 inches to 1 foot from the ground. But these are not much good, as they have to be transplanted so often to prevent them cankering; they are also very liable to be choked by surrounding plants, and the fruit and wood do not become properly ripe. They should be planted about 12 feet apart.

Hedges are made of cordon trees about 2 feet apart, which are also used for covering walls. These are trees with straight stems upon which no branches

are allowed to develop; so soon as the would-be branch is about 6 inches long it is cut, and not allowed to grow any longer, thus the stem in time becomes thickly studded with spurs, as they are usually called, upon which the fruit is borne. They have to be continually transplanted, unless they are allowed to grow to a great height, otherwise they grow too fast and will canker through being pruned so much to keep them within bounds. It is a growth of tree which is not to be recommended except under special circumstances, such as a high narrow wall where no other kind of trees would be suitable, or where several kinds of fruit are being tried for experimental purposes and little room can be given to them. They are usually grown in an oblique form, so that the fruit hangs away from the stem as much as possible; they sometimes take the form of the letter U.

We now come to the bush tree, which requires but very little attention, fruits well, but is very liable to spread about too much for a small garden, but there are a few kinds of fruit that will grow in no other way; when such kinds are required, there is no other alternative than to grow them in this form. (That now before you is a Jargonelle Pear about fifteen or sixteen years old, bears regularly every year, and has only been transplanted once during that time.) If they are planted closer than 4 to 5 feet apart, they would require to be taken up every three or four years.

The best of all trees, and undoubtedly that most suitable for small gardens, is the pyramid. This tree has a straight stem through the centre, with the branches radiating out from it on all sides, and when once fairly started, will keep growing in this shape with but very little trouble and attention other than pruning regularly twice a year. These trees, if not allowed to grow too thickly, produce the finest-flavoured fruit that can be got, and, if proper sorts are grown, will fruit regularly every year. The plan I myself adopt is to plant them 5 feet apart all ways, and not allow any branches to grow lower than 12 to 15 inches from the ground; dwarf Beans, Peas, Spinach, Lettuce, &c., are then grown in rows between them.

Having decided upon the shape of the tree we wish to grow, the next point to settle is whether we will graft our own, buy young trees, or those which are already set with fruit-buds.

GRAFTING.

Grafting is very interesting work, but not to be recommended except for experimental purposes, as one-year-old trees, or "maiden," as they are termed, cost only 10s. to 1s. 6d. each, and will commence to fruit in two or three years; fruiting trees cost from 3s. each upwards, and will bear the next year if kept well watered during the dry season, thereby saving both time and labour. It may not, however, be out of place here to describe the method of grafting. Young well-rooted trees about the size of one's little finger, usually known as stocks, are procured from any grower, and when well-established, are cut down in an oblique form to within an inch or so of the ground, the cutting or scion is taken from the tree just as the sap is rising, and also cut in an oblique form, the two freshly-cut parts are then bound tightly together, care being taken to see that the bark of one is touching the bark of the other, so that the sap which rises between the hard wood and the bark can make an easy passage through from one to the other; it will not matter if the barks on the opposite side do not touch, but the nearer they are the better. Clay, well-kneaded with horse-hair, is then packed closely round the joint in the shape of an egg to keep the air out. If this is covered over with a Rhubarb leaf it will allow it to dry more gradually, and probably prevent it from cracking; all cracks must be filled up as soon as they appear. Various stocks are used according to the tree which is to be grafted on to them. Apple is grafted on to Quince, Pear on to Paradise, and Cherry on to Mahaleb, Plum on Mussel. Old, worn-out trees can profitably be made use of by cutting back half the branches to within 6 inches of the

stem; on to these are grafted some two or three scions. The year following the other half should be cut back and grafted in the same way; they not unfrequently commence to bear the next year.

PLANTING.

As the future of the tree depends largely upon the way it is planted, too much care cannot be expended upon this. The holes to receive the new trees should be dug some time before they arrive, so that the earth can be got into condition by allowing it to absorb as much oxygen as possible; and it should be only just as deep as will allow the tree to be buried to the same depth as formerly, but must be large enough for all the roots to be laid out straight on all sides. Care should also be taken that the roots do not become dry or touched by the frost during removal; and before they are planted all damaged roots should be trimmed with a sharp knife, otherwise they will become diseased and will injure the tree. Before planting, tie the upper fibrous roots around the trunk, then place the tree firmly in the centre of the hole, spread out the lower roots evenly all round, and if large and stiff, stake them in position should this be necessary; work in loose earth around and between them, fill in to the upper lot of roots and tread down lightly. The upper roots should now be untied, laid out all round, and covered with loose loam, to which a little lime has been added, and the whole trodden firmly down. When a second person's assistance can be procured to keep the tree straight, it will make the work all the easier. If the trees are received from the nursery directly the leaves have fallen, and at once planted, they will get thoroughly settled in by the autumn rains before the frost comes, and will commence growing as soon as the other trees do in the spring, and will then experience hardly any check at all, which they would do if planted in the spring.

As the woolly aphis or American blight is about the only enemy which attacks Apple trees, I might just say here that the best way to get rid of it is to brush the part affected with a hard paint brush dipped in a weak solution of paraffin and water.

PRUNING.

Trees, like children, to be properly trained, must be taken in hand when young, and although we can follow a general routine in cultivating them, yet the details of their cultivation must depend, in each case, upon the individual variety. For instance, some varieties grow very erect, and if allowed to continue in this form will choke themselves, produce very little fruit, if any, and this of a very inferior quality. But as our object is to get open trees so that light and air can get at every part of them, it would be no use in this case pruning to a bud on the inside of the branch, as the last bud always forms the leader for the next year, and would therefore grow directly into the centre, and the tree would be still more crowded; we must therefore prune to buds on the *underside*, and the branches will then grow outwards and away from the centre. Again, some kinds have a propensity to droop their branches, so that if the last buds left are under ones, as in the former case, they will very soon grow down to the ground; in this instance a top bud must be left to continue the branch. When the branch is sufficiently long to allow of its being duplicated at the end without fear of crowding, it should be pruned to a point where the last bud is on one side, and the next one is exactly on the opposite side; these two buds can then be allowed to grow, and will form a V at the end of the original branch; but when the two ends of the V are about 1 foot apart, the direction should then be again altered into a parallel direction by pruning to an inside bud on each arm. The aim always to be kept in view being, never to allow the centre or any part of the tree to become crowded. As a general rule, the last three buds on a branch will shoot out and form new growths, while the remainder, if the tree is healthy and not too vigorous, will develop into fruit buds, so that with this knowledge in view we can always prune our trees to form branches in whatever direction we like. It is a

moot point as to when trees should be pruned; some say during summer and autumn, whereas others do not agree with this, affirming that the tree is harmed thereby, and that all pruning should be left till the autumn; again, those who advocate spring pruning give it as their opinion that the newly-cut parts are liable to be injured by the frost coming before they have time to heal over when carried out in the autumn.

There is no doubt that there is some foundation for all these assertions, but, on the other hand, if the pruner has a little common-sense and judgment, they can all be overcome. Naturally, if the tree is pruned all over at the end of June, it is, as it were, suddenly thrown out of gear, as there are no free channels for the sap to flow through, and no doubt a great deal of injury will be the result, but the method I myself have pursued, and with the best results, is to prune only the side-shoots back to two eyes, and not touch the end shoots at all. The sap, then, is checked but very little, and the surplus which is not required for continuing the branch onwards flows into the fruit, which is then large enough to take almost any quantity, and the two buds in most cases will lie dormant, and form fruit-blossoms for next year; if, however, there is not sufficient fruit on the tree to absorb this surplus sap, only the upper of the two buds will shoot, and must be cut back in the autumn to two buds again, while the remaining bud will be sure to develop into a fruit-bud. Here, then, is a distinct gain of one year, for if the shoot had to be left till the autumn to be pruned to the two eyes, it would then have been far too late for them to develop into fruit-buds by the following spring; the remainder of the tree is then pruned in the autumn directly the sap has ceased to flow, and the newly-cut parts will dry before the frost comes on, when no harm will result. When the tree is in the condition it should be in, hardly any pruning will be necessary, other than cutting back the new wood at the ends of the branches to 6 inches from the start. There is still another advantage in summer pruning that should not be overlooked, and that is, that light and air will more freely circulate in and about the tree, and its bearing properties be considerably increased through the wood being ripened, that is becoming hard through the sap being, to a certain extent, dried up, and the fruit is better matured.

SELECTION OF VARIETIES.

As already pointed out, a difficulty that always arises is the choice of varieties most suitable to small-growing trees, and therefore a little guidance as to the best kinds to grow will not be out of place. Tastes vary very considerably; but for my own part, I prefer Apples which are crisp, juicy, and sweet, and with the later kinds, good keepers, and not liable to get woolly (early kinds should invariably be eaten direct off the trees, as they soon lose their freshness); in the case of Pears, they should be luscious, juicy, and remain ripe for some time before going rotten or sleepy.

The following varieties of dessert Apples fulfil the above conditions as nearly as possible, are reliable and constant croppers, and will give a continual supply for ten or eleven months, viz.:—August, Devonshire Quarrenden (which, however, will not thrive in cold, damp localities) (Irish Peach)*; September, Worcester Pearmain (Lady Sadeley); October, Mother; November to January, Cox's Orange Pippin (King of Pippins); February to June, Starmer Pippin; April to May, Allen's Everlasting. Should only one be required, Cox's Orange Pippin should be grown in preference to all others, as it keeps so long (November to January), bears well, and is of medium size. I have had over thirty good-sized fruits on one of these trees when only four years old. Although the above list is very condensed, I consider it far better to plant several trees of a small number of varieties, provided they are good kinds and constant bearers, than few trees of several varieties. Highly-coloured Apples, grown prin-

cipally for show, are usually soft and woolly; some, however, prefer them.

Cooking Apples are usually so cheap, that they are hardly worth growing, unless one has plenty of room; but the following varieties are good bearers, and worth growing where practicable:—August to September, Duchess of Oldenburg; September to October, Lord Grosvenor; October to January, Bismarck; (November to December, New Hawthornden), (November to March, Wellington); November to April, Lane's Prince Albert. As Apples are dearer in the spring of the year than during summer, Lane's Prince Albert should be grown in preference to the others, where all cannot be grown, as they give a supply from November to April (six months).*

(To be continued.)

FORESTRY.

THE EDUCATION OF THE FORESTER.

MR. FORBES' letter on this subject in your last number raises a question which has often been discussed in your columns before, but seldom with any practical result. It is perfectly true that, with the exception of a few great estates in Scotland, a few Royal and Government forests in England, and here and there a property whose owner is in the happy position of being entirely independent of the income derived from it, there is no such thing now-a-days as scientific forestry in England, no demand for scientific foresters, and, as far as I can see, no reason why there should be. The reason is a very simple one. Scientific forestry does not pay. Royal Commissions may be appointed, and schools of forestry instituted, lectures and articles on the subject without end may be written, but all will be perfectly useless, because the people who have to manage properties know that the whole thing is purely speculative, and in my humble opinion there is far less opening for scientific wood management or forestry than there was a century or two centuries ago, when, if there were not many scientific foresters, there were plenty of excellent woodmen who knew their business and did it. In those days there was some certainty of a fair return for their labour and outlay. Now there is none. If any one can show a profit-and-loss account of the woods and plantations on any property in England which during the last ten or twenty years have been so managed as to pay a fair rate of interest on their original cost, it would do more to encourage scientific forestry than all the talking, lecturing and writing in the world; but either such a thing does not exist, or the conditions are so exceptionally favourable that they are no guide to ordinary practice. Is there any sort of timber or wood product which cannot be produced in some other country far cheaper and in many cases better than in England? If so, I have not discovered it, and I have seen more of the forests of North America, Europe, and India, than nine out of ten of those who talk about scientific forestry.

There was one tree which for a long time did seem as if it would prove a source of profit to many English planters. I mean, of course, the Larch; but what is the present condition of half the Larch plantations in England under twenty years old? and what have the scientific foresters done, or what can they do to stop the progress of a disease which seems to be spreading and increasing everywhere? As far as my experience goes, absolutely nothing.

Mr. Forbes says very truly that the majority of British woodlands owe their existence to the game they harbour, and I believe it is a literal fact that the most scrubby, ill-manged, neglected woodlands, if well situated for game preserving, are worth far more to-day to sell or to let, and give more satisfaction to their owners than the most scientifically-managed forests where there is no game.

* The paper was illustrated with practical demonstrations of the various methods of grafting, samples of well and badly-grown branches, besides a good collection of the above-named fruit.

Another reason for the neglect of forestry in England is the absence of any certain market for the produce. It is true that the owner of a large quantity of clean, sound timber not too far from a good road, and a manufacturing or mining district, may get a price of some sort for it; but what can the average English landowner get for the few scores or hundreds of trees that he has to cut from time to time? What can he get for his bark or his underwood compared to what he got in bygone times?

As a rule, he only cuts heavily when he wants money badly, and in ordinary times cuts only what he wants for estate purposes, firewood, fencing, and so on. He could very often buy it better and cheaper, but he does not like to turn his woodmen off, and at any rate the money stays on the property. But he hates the very name of a timber merchant, who is most difficult to deal with in such transactions as an average landowner has to do with. If he can get enough out of his woods to pay expenses, and the young trees which he plants are not totally crippled or destroyed by rabbits, drought, spring frosts or insect pests, he thinks himself lucky, and though he may plant for ornament or shelter, he now hardly ever plants for profit.

I have often thought that a time must come when the price of English timber will rise considerably—and no doubt this time will come; but whether the successors of the men who planted it will get any adequate return for its original cost is as much a matter of speculation as the price of coal a hundred years hence. The finance bill of last year has done more to check scientific forestry, or any other so-called improvements of the kind which English landowners have hitherto done so much of, than the supporters of the bill have any idea of. When they have starved out the land-owner they will want the State to do what he used to do, but the goose will be killed by that time, and it will be too late to cry out. *H. J. Elwes, Colesborne, Cheltenham.*

WEST INDIAN PLANTS.

CYRTOPODIUM WOODFORDI, Benth. (CYRTOPERA WOODFORDI, Lindl.).—In one or two districts of Grenada this Orchid is fairly common. Along the roadside on stiff loamy soils it grows naturally, and also near at hand oftentimes its greenish-purple scapes may be observed quite at home in swampy flat patches of land, peering out of the Sedges and other swamp-loving plants. Its leaves simulate *in situ* somewhat those of a common Grenada grass, namely, *Panicum palmifolium*. I am told by an old white settler—one C. W. Prosin by name—that the lower portion of the plant yields a viscid sap, by whose aid broken wares may be repaired. Grisebach records (at p. 630) in his *Flora of the British West Indies*, upon the authority of Craeger, that in colour the flowers are "white, with a yellow spot on the lip." This reference seems to me to raise a doubt as to whether Craeger did not mean *Cyrtopodium cristatum* of Grisebach instead, for—if my memory serves me correctly—this latter terrestrial is a pure white with a yellowish tint somewhere about the flower. When I saw it growing in the Aripis savanna of Trinidad (B. W. I.), about three years since, it brought to mind the Lily of the Valley. Our Grenadan *C. Woodfordi* certainly shows no tendency to white; but, on the other hand, is decidedly of a brownish green-purple colour. When collecting herbarium material last year, I noticed the flowering stem to be succulent and pliable, and the leaves brittle. It flowers during the months of August and September, and possibly October. *W. E. Broadway, Botanic Garden, Grenada, B. W. I.*

POLYPODIUM (EUPOLYPODIUM) XIPHOPTEROIDEFOLIUM, Jenm. n. sp.

Stipites tufted, wiry, filiform, stiffly erect, brown, naked, slightly scarious, margined to the base, $\frac{3}{4}$ to $1\frac{1}{2}$ or inches long; fronds bipinnatifid, firm, erect, dark green, naked, 4 to 6 inches long, $1\frac{1}{2}$ to 2 inches wide, suddenly reduced at the base to minute deltoid spur-like segments, the apex terminating in a pinnatifid pinna 1 to $1\frac{1}{4}$ inches long, broadest at the base, but otherwise similar to the lateral ones; pinnae spreading, linear, $\frac{3}{4}$ to $1\frac{1}{4}$ inch long, $1\frac{1}{2}$ to 2 lines wide,

* Those in parentheses give a more extended list of good kinds.

broadly adnate and narrowly decurrent, forming a slightly interrupted wing to the brown wiry slightly flexuose rachis, terminating in a minute obtuse lobe, cut two-thirds to the dark filiform mid-vein into obtuse obliquely deltoid decurrent segments $\frac{1}{2}$ to $\frac{3}{4}$ line wide and deep, with an open, oblique, sub-acute sinus between; veins simple or forked,

the latter abruptly pass. Though the fronds are larger, the pinnae are only half the number of those of *melanotrichum*. The cutting of the pinnae is exactly like that of *Xiphopteris* fronds. *P. achilleifolium*, Kaulf., of Ecuador and Brazil, is the only other species of this small group. *G. S. Jenman, Demerara, Oct. 24, 1895.*

Winton, and represents a specimen of the Banks' Palm-lily planted as a seedling on the Island of Ulva, Paterson's Inlet, Stewart Island, by the late Mr. Charles Traill in 1888, and flowering for the first time in 1894. Its present height from the base of the stem to the apex of the panicle is about 11 feet; the leaves are between 5 and 6 feet long, and about 3 inches broad in the middle, being narrowed into a rounded leaf-stalk, which becomes slightly expanded at the base; a longitudinal red band runs down the middle of most of the leaves, and increases the beauty of the plant. The huge open panicle, which in old plants is drooping, and often from 7 to 8 feet in length, is characterised by the long, slender, and rather distant branches usually forming a right angle with the rachis, and is at once singular and beautiful, resembling a large specimen of ramifying white coral. The common Palm-Lily, *C. australis*, differing in its short stiff leaves, and smaller more compact panicles; although scarcely less beautiful than *C. Banksii*, is certainly less graceful, and presents a strong contrast with that species, while it attains a much larger size, specimens 60 feet high, with a trunk 6 feet in diameter, being occasionally observed; *C. Banksii* rarely exceeds 10 feet in height. *C. australis* is distributed throughout the Colony from the North Cape to Stewart Island, but *C. Banksii* is only found in the North Island, and in the northern part of the South Island as far south as Westland. Stewart Island is separated from the South Island of New Zealand by Foveaux Strait, and has a very interesting flora, containing many endemic plants of great beauty; its climate is mild and remarkably equable. Although the atmosphere is almost constantly saturated with moisture, the actual rainfall is scarcely larger than that of Cook Strait, say about 42 inches per annum.

An account of its flowering plants and Ferns was published in the *Transactions of the New Zealand Institute*, xii. (1888), pp. 213, 234. Stewart Island is of especial interest as forming the extreme southern limit of arborescent Ferns, which extend to the South Cape, lat. 47° 20', instead of to 45° 50', as usually stated in our text-books.

The tree Fern on the right hand side of the drawing is *Dicksonia squarrosa*; the trees shown at the back are the Kamahi, *Weinmannia racemosa*, *T. Kirk, Colonial Museum, Wellington.*

FIG. 103.—CORDYLINÉ BANKSII, ON STEWART ISLAND.

not excurrent; sori terminal on the short spur-like anterior branch, one to each segment.

Gathered in Cuba, by Eggers, matted with other species, and apparently not detected. Near to *P. melanotrichum*, Baker, of Roraima, British Guiana, but distinguished by the obtuse—not finely subulate—final segments, forked veins, the sori on the short, nearly basal spur, much longer petioles, with minute spur-like segments apart near their top, darker colour, and the distinct terminal pinna similar to the lateral, and into which

CORDYLINÉ BANKSII, ON STEWART ISLAND.

This fine "Palm-lily" is one of the most beautiful and interesting plants in the New Zealand flora. Although occasionally cultivated in the southern portions of the British Isles, it is not so well known as it ought to be, from the beauty of its inflorescence, and the picturesque effect of its long drooping leaves. The drawing presented herewith, fig. 103, is from a photograph taken by Dr. J. R. Riley, of

VEGETABLES.

KITCHEN GARDEN CROPS IN 1895.

We may now compare notes with previous years, and it is well to do so for future guidance. In this district we suffered somewhat severely from the extreme cold in February, not only so, but the ground was rendered unworkable till quite late, which prevented us from getting many of the crops sown and planted at the time we should have preferred. April was a somewhat cold month, there being only one night throughout it in which the thermometer registered over 45°, and only two days that might be considered hot, or when the thermometer in the shade registered as many as 70°, the consequence being that vegetables made but slow progress during the whole time, and this, together with the drawbacks of the previous two months, began to make things look rather serious. May was a very dry month, when only 0.14 of an inch of rain fell with us, the same being the case in June, when 0.36 fell, while July was by far the wettest month of the whole year.

Asparagus was by no means so plentiful as in some former years, while Peas suffered so much from the slugs in April, that they made but a poor show for a long time, and were therefore much later than usual. Many of the varieties, however, did exceedingly well, even till the end of the season; particularly fine were Sutton's Late Queen, Veitch's Main Crop, and Eckford's Memorial. Cauliflowers got well established during the showery weather in April, and these produced heads, the like of which

we have seldom had, all kinds being satisfactory alike. The first to turn in were Early Forcing from seed sown in pans early in January, and these were followed by Walcheren that had been protected in a cold frame during winter, and planted out in the open quarter at the end of March; after which Mammoth and Autumn Giant that were raised on a slight hot-bed and planted out in April, the roots having time to take a good hold of the soil before the hot weather set in, and on that account, they did not bolt as did some of the summer varieties planted out at the same time. We can therefore recommend this plan to others situated like ourselves with a certainty of success. Root crops of all kinds are very good this season. Carrots are excellent, particularly those that were not sown till late. With us, Carrots sown about the middle of June will usually grow large enough even for exhibition by the end of September, and finer samples need not be than those sown at that date this year, the bountiful showers during the latter part of July being just the thing for them. Seed sown during the second week of that month on ground that had been cleared of an early crop of Potatoes, have produced a fine sample of useful roots. Those who are troubled with the Carrot-maggot, and have to find supplies to carry them on through the winter, would do well to adopt this plan. For these late sowings we use Model, Intermediate, and Gem. Beet-root that were sown early have grown far too coarse, being more of the stamp of Mangel Wurzel. Those who have good ground would do well to confine themselves to growing the dark-leaved kinds, which need not be sown before the end of May or early in June. Seakale Beet is one of those useful vegetables not so well known as it deserves to be, for at this season of the year, when both Beans and Peas outside are over, and before forced Asparagus and Seakale come in, there is always something needed for a change, and few vegetables than this, particularly if a good strain be obtained, the pearly-white leaf-stalks being very tender. Globe Artichokes have done well this autumn, and continued forming heads from young plantations till they were cut down by the frost, which, with us, was very severe for about a week, there being 14° registered on the night of October 26, and 11° and 10° the two following mornings. Jerusalem Artichokes, especially the white variety, have grown very strong, and will, no doubt, prove useful during the coming winter.

Turning to the winter green crops, Brussels Sprouts form the principal, as these continue to give a supply during bad weather, when Broccoli outside are cut down. There are now so many fine varieties that it is difficult to say which is best. Those, however, who have good ground would do well to grow the smaller kinds, unless the others are planted late, as they grow far too large. With us it is seldom that Brussels Sprout seed is sown before the second week in April, and then a north border or open quarter is selected on which to sow it, otherwise the plants would be too forward. Plenty of sprouts are then usually ready for use by the time Peas and Beans outside are getting over. Celery is a vegetable so much esteemed in most places, that a good supply should always be had. Last winter, the one that withstood the frost best with us was Major Clarke; this fine solid variety when well grown, is hard to beat. Broccoli with us are not so good this season, the hot dry weather in September affecting them very much, and if we should have a severe winter, many of them will no doubt succumb. Borecoles are much more hardy, and on that account ought to find more favour in our gardens. There are some very useful kinds amongst these, such as Al, Arctic, Favourite, and Exquisite. Runner Beans have become so numerous that one would almost wonder how more can be added, but when we come to consider that half-a-dozen or so varieties may be had out of one pod, the marvel is that they are kept so true. A variety we grew this season under the name of Exhibition, produced an abundance of straight, well-shaped pods about 13 inches in length. We hope, therefore, to give it another trial next season. *H. C. Prinsep, Sussex.*

WALCHEREN CAULIFLOWER.

Although I have cultivated several varieties of Cauliflower for wintering in frames and for an early supply, I have so far found none to be equal to the Walcheren, and were I limited to one variety, I would give my preference to that one when true. Early London Cauliflower may be a few days earlier, but it is more apt to "button;" at least, that is my experience. It is a mistake to get these plants for frames too early, quite small plants being best. Lift and transplant them into frames, hand-glasses, or to a spot where hard frost can be warded off, and give the soil a gentle stir occasionally between them, and plenty of air at all times when there is no actual frost. It is seldom that they will then fail to turn in well about the first week in June, earlier or later according to the season.

At all times Cauliflower should be planted where they are to form their heads, on deeply-trenched, well-manured land, and not left too close together. Walcheren is more hardy than many, and is of a compact habit of growth. I always plant them out at 7 inches apart in frames for the winter. The Erfurt type is useful for sowing in pans in heat in late winter and early spring, and if duly attended to, it will come into use at an early part of the summer, but great care must be taken they do not get a check, or nearly every plant will "button." *H. Markham, Kent.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Bursford, Dorset.*

HINTS ON CULTURE.—Plenty of light at all times is necessary for the healthy growth of Orchids, and at this season more than at any other. The glass in all the Orchid-houses should be kept clean by washing it inside and out. The wood-work should likewise come in for an occasional cleaning; a white, clean surface increases the light in the houses. Examine every plant for insects, and sponge the leaves with clear water; wash the pots, and keep everything about the plants trim, clean, and tidy. Whilst re-arranging the plants in the cool-house, examine each for slugs, which are nearly always present in the sphagnum-moss, sparing no trouble in getting rid of them; failure to do this will lead to numbers of young roots and succulent flower-spikes being lost. Lettuce-leaves, small shallow pans filled with bran, slices of Potato, &c., are useful as baits for slugs, and these should be placed on the stages and the moss, and often examined. When the flower-spikes of *Odontoglossums* push, a piece of rough wadding should be wrapped around them, as over which slugs seldom pass. As to *Odontoglossums* of the cool-house, the majority are in full growth, and it will be noticed that at the base of many of the leading breaks there is a brown-coloured outer sheath, which sometimes clasps the growths so tightly as to prevent the young roots from emerging, and it should be carefully slit in several places, and pulled off in small pieces. Failure to do this causes the roots to come up inside the sheath into the air, and make no further progress, instead of the sphagnum-moss. The plants of *Miltonia vexillaria* now growing freely will require similar attention, as also the new growths, which should be examined occasionally, and the tender young leaves that stick to each other and become crumpled gently separated from each other. Among Orchids of small growth the pretty yellow-flowered *Oncidium cheiroporum* is now opening its flowers, and till the flower-spike is fully developed, the plant should be hung up close to the roof-glass in the intermediate or Cattleya-house, so that it may obtain plenty of light. It is a plant that should be sparingly watered at all times, and especially during the winter, or the pseudo-bulbs and leaves will rapidly decay. After the flowers fade, the plants may be afforded rest by applying just sufficient water to keep the pseudo-bulbs plump-looking, and when growth recommences fresh material should be placed about the plant. Shallow well-drained pans, with a thin layer of peat and sphagnum-moss to root in, suit this plant. *Oncidium Phalaenopsis*, *cucullatum*, *olivaceum*, and *nubigenum*, although their flowers are small, are very lovely, and they keep fresh-looking for several weeks; still, it is inadvisable to retain them on the plants too long, or they will suffer in health. Like many other species of *Oncidium*, these fail in some instances to grow as satisfactorily as their owners would wish; and being

purely cool-house plants, they require a light position in the *Odontoglossum*-house, and plenty of water at all times. The same kind of treatment will suit *Mesospidium vulcanicum*, *M. sanguineum*, *Odontoglossum roseum*, and *Cochlidia Noeiziana*. These species should be potted rather high up in well-drained pots filled with peat and sphagnum-moss, and the best time for repotting them is just when root activity begins.

FRUITS UNDER GLASS.

By RICHARD PARKER, *Gardener, Goodwood, Chichester.*

GENERAL WORK.—The practice of placing numbers of plants of *Chrysanthemums* in every available fruit-house is reprehensible, because it leads to an improper treatment of the Vines, Peaches, Figs, &c., permanently planted in them. For instance, fire-heat has to be used in frosty weather, the ventilation is also not what the Vines, &c., require, the borders are made unduly wet, and the surface trodden down and made impervious to the air. To lessen the evils of housing the *Chrysanthemums* as much as may be, they should be removed as soon as they are past their best, so that the freest ventilation may be afforded the permanent occupants, and the necessary operations of cleaning, pruning, tying, &c., pushed on without loss of time.

PEACHES AND NECTARINES.—Trees in borders which will be started in December, will require to be thoroughly cleaned with soft-soap and hot-water or Gishurst Compound, or simply a weak solution of tobacco-water, whichever may appear to be the more suitable. Having done this, and scrubbed all wood-work, limewashed the walls, and rendered the glass clear and bright, the training of the trees may be proceeded with. This operation finished, the borders should be raked clear of rubbish and clods, and not disturbed with a digging-fork unless their hard condition renders it necessary, digging however shallow, destroying many roots situated near the surface; moreover, a firm soil is productive of the finer roots. A dressing of fresh loam 2 inches thick laid on the border will do much to encourage the roots to the surface, and will not promote gross growth. The hot-water-pipes, if not new, may require a coat of lamp-black and linseed oil (no turpentine), and to have valves and joints put into good order. The house should be kept cool until forcing begins.

CUCUMBERS.—With short days and gloomy skies growth gets less and less vigorous, and aphides, red-epider, and thrips attack the foliage, rendering much attention necessary to keep their numbers so low that but little injury is done by them. A mild fumigation once a week with the XL All Vaporiser will check aphides, &c., which is a safe means. Guard against high temperatures with their consequent dry air, which should be avoided, as red-epider and thrips are not then so much encouraged. Some fresh horse-dung spread on the borders occasionally has a beneficial effect on the growth of the plants.

THE FLOWER GARDEN.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

PLEASURE GROUNDS.—Now that the greater portion of the foliage has fallen, much sweeping of lawns and walks is entailed, and which cannot be neglected if the garden is to have a neat and tidy appearance. What is swept together should be wheeled to the leaf-heap at once, as to leave them is to have to do the work over again. There should always be three heaps of leaves: that which is old, and therefore in a state of mould; that which is less decayed; and lastly, the freshly-fallen leaves. The autumn, whilst frosts are not intense, may be utilised in taking up the turf on uneven lawns, making the land level by digging it a few inches deep, and then levelling it, or by the addition of soil. Make it quite firm before relaying the turf. When worm-casts are so numerous as to be unsightly, choose a dry day for sweeping them up, and then a light wood roller used frequently for the purpose of keeping them down. Poor grass should receive a dressing of charred garden-refuse, quicklime, or rather fresh-slaked lime and loam, which will greatly improve it. If put on the turf on a dry day, and brushed or raked about, and afterwards rolled, it is readily distributed regularly. No work on a lawn should be carried on in frosty weather.

WALKS AND ROADS should have the edgings, when these consist of turf, neatly cut, and the material of which the walk or road is made weeded and rolled after rain, or whenever the surface gets loosened. The regravelling of walks may now be undertaken, and old gravel may be turned and the

surface made good again. In parts of the country in which gravel is not cheaply obtainable, the roads are made of flint or Macadam and sea-gravel or sand; and such walks and roads should not be dug up or disturbed, but be dressed with Weed-Killer, or weeded by hand, made level, and rolled once a week. When much snow has fallen, do not sweep the gravel walks, but use triangular snow-ploughs of various sizes. The broom throws the small stones and grit on to the lawn and grass verges, to the detriment of the mowing-machine.

FLOWER-BEDS which will not be planted till the spring should be deeply dug, and the surface left in a rough state.

CHARRING REFUSE.—On dry days, burn in a smothered or open fire the prunings of trees and shrubs and other garden refuse, passing the ashes when cold through a wire screen or coarse-meshed sieve. This fine powdery material is excellent for mixing with the potting soil in which Pelargonium and other bedding plants are grown, as also when mixed with manure as dressings for the Rose beds and herbaceous borders. Compost for a variety of purposes may be got together at this season, throwing the materials into conical heaps, so that they may not become unduly moist. When the weather permits, the digging, carting, and stacking loam and peat, sand, &c., for future use, may be proceeded with. The decaying leaf-heaps may be sifted, and the usable portion put under cover in readiness for use, the rest being again thrown into a heap to decay still further.

PLANTS UNDER GLASS.

By W. H. SMYTH, Gardener, West Dean Park, Chichester.

THE FORCING-HOUSE.—Batches of Lilac, Lily of the Valley, early varieties of Tulips, *Deutzia gracilis*, *Spiræa*, Tea and other Roses, *Weigela* (rosea and others), *Azalea indica*, *A. mollis*, hybrid *Rhododendrons*, *Hydrangea hortensis* and *H. paniculata*, *Staphylea colchica*, *Choisya ternata*, *Dielytra spectabilis*, and the double-flowered variety of *Prunus sinensis*. All plants, excepting Lily of the Valley should be syringed overhead three or four times daily, less or more according to the weather, and the air of the house maintained in a moist state. Buds of Roman Hyacinths and other plants now coming into flower should be less syringed, and removed into a slightly less warm-house, for the purpose of inuring them to bear the temperature of the conservatory and apartments. In establishments requiring great quantities of cut bloom, *Narcissus*, Tulips, Lily of the Valley, Roman Hyacinths, *Freeseias*, and *Helleborus niger* should be planted in suitable boxes, with a view to economising space in the forcing-house. *Rhododendrons* may still be lifted from the open ground, and potted in leaf-mould and peat. A Peach-house just started is a capital place for the forcing of Lilacs, *Kalmias*, *Gueldeas Rose*, &c., which are plants that should be very gradually forced into bloom at this season. The temperature of the ordinary forcing-house should be 60° at night, less in very cold weather, 70° by day in cloudy weather, and 75° or higher with sun-heat. Lily of the Valley requires a bottom-heat of 85°, and to be forced in darkness, crowns being employed, not clumps, which do well enough after February. Only force *Azaleas*, *Rhododendrons*, Lilacs, and *Staphylea* which possess prominent flower-buds, or which have been suitably prepared. The watering-can must be carefully used, applying no more root-moisture than suffices to keep the ball moderately moist, or excessive leaf and shoot-growth will occur, to the detriment of the appearance of the plants. If the shoots start to grow on *Azalea indica* and *Rhododendron*, pinch them back or break them out.

CARNATION SOUVENIR DE LA MALMAISON.

When early blooms are wanted, some of the forwardest plants should be placed in a house with a temperature of 55° by day to 50° by night. Only those plants which are throwing up a flower-stem should be chosen at this date. Afford a light overhead syringing in bright weather, and examine them for signs of the Carnation disease, cutting off all affected parts as soon as detected, and burning them. Fumigation should be resorted to once in three or four weeks, as means of checking the increase of aphides. Young stock of this variety of Carnation should not receive too much water at this season, and if the plants can be plunged in Cocoa-nut fibre refuse, they will scarcely need any water. It is safer to err in affording too little than too much water. A good place for the plants in the winter is a low pit to which artificial heat can be applied, and which

should be used in very damp or frosty weather. If young plants affected with the spot disease (*Cladosporium*) are carefully examined once in three weeks, and all affected parts removed with the knife, the plants usually grow out of it.

EUCHARIS GRANDIFLORA.—The flower-spikes in most cases should be pushing up, and copious root-watering, together with the use of liquid-manure occasionally, must be resorted to. As a mild kind of manure, I can advise the use of soot-water, if made weak, for keeping the leaves of a deep green colour. The house should be kept in a moist condition, and be syringed twice or thrice a day. If the bed in which the pots of bulbs are plunged is getting deficient in heat, some fresh stable-litter and tree leaves in a fermented state should be added to the old materials. It is an easy matter to keep the air of the house cooler if the blossoms come in at too early a date.

THE HARDY FRUIT GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

PRUNING AND NAILING FRUIT TREES.—The work of pruning and nailing, or otherwise securing the branches and shoots, should be pushed forward, whenever practicable, instead of being (as is often the case) postponed till the colder days of midwinter, it being possible for the work to be done with less discomfort than at that season. The Cherry, Pear, and Plum trees should be first taken in hand, following with Apple, small fruit bushes, and lastly, the Apricot, Peach, and Nectarine, the nailing, &c., of these being usually deferred to the spring months for the sake of somewhat retarding their flowering. If these trees were properly attended to in the matters of pinching and regulating the shoots during the summer and early autumn months, but little pruning will now be required. The side-shoots of the sweet Cherries that were shortened back in the month of August to 6 or 8 inches, should now be still further reduced, leaving two or three buds on the base of each. In doing this make a short clean cut from below the terminal bud, but not so close as to endanger it. Look well to ties, shreds, and nails, and see that no nail is close enough to the rind as to be a cause of canker. All of the larger branches should be secured with rather large and soft tarred-string, with plenty of space allowed for the swelling of the shoots. Shoots for extending the area covered with the trees may be fastened with shreds and nails or ties of well twisted bast. The shoots of newly-planted trees should not be shortened at this season, but loosely fastened to the walls or stakes, so as not to interfere with the settlement of the plant in the soil of the border. Prune such plants in the spring before growth has begun.

PRUNING AND TRAINING OUT-DOOR GRAPE VINES.—These Vines should be pruned as soon as the leaves have fallen, early pruning being especially called for if large branches are removed to make space for the accommodation of young shoots, of which some should be laid in yearly. Such old wood, if not taken off in good time, is liable to "bleed" excessively when the sap rises in the spring, to the detriment of the Vine. To still further guard against "bleeding" it is advisable to dress all large wounds with styptic, or patent knotting, when the wood is dry, so as to close the cells. In ordinary pruning, cut to a stout plump bud near the base of the lateral shoot, long spurs not being desirable in these Vines. In training the main rods on walls, the intervening spaces should not be less than 2 feet in width, and fasten these rods with stout tarred-string or leather strips. If an increase of the stock of Vines be wished for, cuttings from 9 to 12 inches in length, taken off with a heel, should be chosen; cutting the buds out of the part to be inserted in the soil, and leaving one or two on that part that is above it, and inserting them where it is wished to have Vines—or, they may be put into a cutting-hed and transferred when just about to start into growth the second year.

THE KITCHEN GARDEN.

By JOHN LAMBERT, Gardener, Powis Castle, Welshpool.

THE GLOBE ARTICHOKE.—The plants of the Artichoke, owing to much rain having fallen on a soil abnormally warm, were still quite green, and producing usable heads when they were cut off by frost. Being so green and soft, there is the more reason for well protecting them against injury by hard frost. After removing all the stems that have borne flower-heads, and a few of the leaves, afford the land a dressing of rich farmyard manure, forking it in lightly, and afterwards place stable-litter or tree leaves around the plants to a depth of not less than

8 inches, making this secure by spreading a little soil over it. When the tops are quite decayed, remove them, and cover the remainder of the plant, in very severe weather with light litter, removing this material on mild days.

THE JERUSALEM ARTICHOKE.—These should be left in the ground till towards the end of the year, the stems being cut off at 3 inches above the ground. Lay them evenly over the soil, which they will serve to protect from frost; or if that be thought too slight a covering, some long litter may be used. The tops this season are very strong, and almost all have flowered. When lifting the crop generally or for current use, carefully pick out those intended for consumption—that is, the best and largest—and select the tubers of a fair size and good shape for next year's sets. The white-tubered variety has the nicest shape, and it is a good cropper as well as an improved variety.

PEAS.—Where seed is not as yet sown out-of-doors, the matter should be borne in mind, and a dry day chosen for getting it into the ground. The site of the early Pea crop should be, if possible, a well-drained south border, which should be dressed with well-decayed manure or leaf-mould before digging or bastard-trenching it. The drills should be about 8 inches wide, and before and after the Peas are sown, sifted refuse-soil from beneath the potting-bench should be placed in the drills; a covering of the depth of 1 inch of the staple will be sufficient, making in all a covering of about 2 inches in depth. Above each drill a half-inch layer of fine coal-ashes may be placed as a deterrent to the slugs. The distance at which the drills are drawn will depend on the height to which the variety of Pea grows; and Dr. Maclean, Sangster's No. 1, Veitch's Chelsea Gem, Dickson's First and Best, and Sutton's Improved Ringleader are excellent as early Peas. Mice must be trapped, or the seed rolled in a mixture of red-lead and petroleum before sowing.

BROAD BEANS.—A sowing of the Mazagao and Beck's Dwarf Green Gem varieties may now be made when the ground is not too moist to be trodden upon. Sow either in drills, or dibble in, the distance at which the rows stand apart being determined according to the purposes the ground between them may be put to, and whether large or small-growing crops, or none at all, are to be grown in the spaces. In wet land, ridges should be thrown up, and the drills drawn either on the top or at the sides of the same, and as soon as the young plants appear, afforded protection by drawing the soil up to them, and placing branches of the common Yew or Fir on either side of the rows.

A NEW PERFUME OIL.—Under the name of "Kuromoji," the essential oil of *Lindera sericea*, is stated by the *Chemist and Druggist*, to be slowly acquiring some degree of popularity among manufacturing perfumers. Several lots, it seems, have recently passed through the Liverpool market, and gone into consumption. It having been noticed by some of the buyers that the several parcels of oil differ in odour from one another, enquiries were set on foot to discover the cause, and these enquiries have elicited the fact that the Kuromoji oil is not produced on a large scale by essential oil distillers, but by small farmers in Japan, each of whom distils the yield of the shrub growing on his own estate. These small stocks are then bought up by dealers in various centres, and mixed together, almost precluding the possibility of getting exact uniformity in aroma. The oil is obtained from the young shoots and leaves of the plant, which is a Laurineous shrub of from 4 to 6 feet high, growing in the mountainous districts of Japan. The old wood is much used for making toothpicks. The oil, which has a pleasant, aromatic, balsamic odour, is of much value in perfumery, especially for soap making. It is stated to have been introduced into Europe in 1880. On the authority of the same journal from which the foregoing is gathered, referring to the interruption, owing to the war, of the Camphor trade of Japan and Formosa, it is said that efforts are being made to get Ceylon planters to take up the cultivation of the Camphor tree, a few specimens of which have been growing for some years in the botanical gardens of the island. It is thought that in the parts of Ceylon where the climate is comparatively dry Camphor trees would be a profitable culture. The great objection from a planting point of view, is of course, the long time which must elapse before the trees become productive; but the same objection was raised years ago against the cultivation of Cinchona.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

SATURDAY, Nov. 23.—Royal Botanic Society.

TUESDAY, Nov. 25.—Royal Horticultural Society's Committees, at the Drill Hall, Westminster.

SHOWS.

TUESDAY, Nov. 25.—Tredegar Chrysanthemum (two days).

FRIDAY, Nov. 28.—Alderley Edge Chrysanthemum, at Wilmslow (two days).

SALES.

MONDAY, Nov. 25.—Continental Plants, Roses, Dutch Bulbs, &c., at Protheroe & Morris' Rooms.

TUESDAY, Nov. 25.—Dutch Bulbs, at Protheroe & Morris' Rooms.

WEDNESDAY, Nov. 27.—Dutch Bulbs, at Protheroe & Morris' Rooms. Great Sale of Fruit Trees, at Perry Hill, Cliffe, near Rochester, by order of Mr. W. Horne, by Protheroe & Morris.

THURSDAY, Nov. 28.—Dutch Bulbs, at Protheroe & Morris' Rooms. Greenhouse Plants, Roses, and Plants from Belgium, at Protheroe & Morris' Rooms.

FRIDAY, Nov. 29.—Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids, from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41°.4.

The Royal Botanic Society seems to have fallen upon evil times, and to be going through a crisis similar to that which befell the Royal Horticultural Society a few years ago. Other points of similarity between the two Societies may be found in the retirement of the Superintendents in both cases, and in the abolition of the office of garden-manager at the "Park."

We see that application is to be made to Government for a pecuniary subsidy to aid in carrying on the work of the garden. We do not wish to undervalue the work of the Society, but we imagine that before such an application can be entertained, the society must be able to show some reason for the allotment of a portion of the national revenue for its support. The garden is charming, the houses contain some interesting plants, and useful work has for years been done in supplying students with specimens. As for the flower-shows, they have become so stereotyped that it is not a difficult matter for the reporters for the press to concoct a sufficiently accurate report of any particular show by referring to the account given of the corresponding show the year before. An inspection of the prize-list, to see if perchance any new exhibitor is forthcoming, is nearly all that is necessary, as we know from experience. The policy of the Society, hitherto, has been to exclude the public by a high rate of subscription, to pander to fashion by evening *fêtes*, and even to descend to frivolities, appropriate enough in a tea-garden, but quite unsuited to a Society calling itself Botanic. The result of similar procedures was sadly exemplified some years since at the Royal Horticultural Society, which, however, never

sank quite so low as to offer prizes for the decoration of donkeys. We have not a word to say against such diversions in their proper places and at suitable times, *dulce est desipere in loco*, but we demur to any portion of the taxes being devoted to their promotion; and we protest against the incongruousness of mixing up such amusements with the pursuit of horticulture, and still more with that of botany!

The work that the Royal Botanic Society has done for botany is not large; and as for horticulture, it must be admitted that the influence it has exerted, and still exerts, is quite inconsiderable, as compared with that exercised by the sister society. If any Government aid is to be granted at all, it should be given first, and in fullest measure, to that society whose record is, in spite of many vicissitudes, and occasional backsliding, so highly honourable to it.

THE ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral Meeting of the Royal Horticultural Society will be held on Tuesday, November 25, in the Drill Hall, James Street, Victoria Street, Westminster; and at 3 P.M. a lecture will be given by Mr. JAMES MASON on "Asparagus Culture." The committees will meet as usual at 12 o'clock.

HORTICULTURAL CLUB.—The usual monthly meeting and *conversations* took place on Tuesday evening, November 12; the chair was occupied by Mr. GEORGE PAUL. There were present Messrs. PHILIP CROWLEY, H. SELFE LEONARD, GEO. MONRO, PETER KAY, H. TURNER, J. WALKER, &c. An address was given by Mr. D. T. FISH, on "Flowers, Fruits and Plants in the Life and in the Home," it ranged over a wide area and many interesting facts were brought forward; at its conclusion a hearty vote of thanks was proposed by the chairman. The table was decorated with Chrysanthemums from the Royal Nurseries, Slough; and some dishes of well-grown fruit of Emile d'Hayst Pear were added to the dessert by the kindness of Mr. JAMES WALKER.

NATIONAL ROSE SOCIETY.—A prize of five guineas, presented by ALEXANDER HILL GRAY, Esq., will be awarded by the above Society for the best essay on the "Hybridisation of Roses." Intending competitors are requested to forward their essays to one of the Hon. Secretaries—H. HONEYWOOD D'OMBRAIN, Westwell Vicarage, Ashford, Kent; EDWARD MAWLEY, Rosebank, Berkhamsted, Herts, on or before March 1, 1896.

NATIONAL CHRYSANTHEMUM SOCIETY.—The General Committee met at Anderton's Hotel, Fleet Street, on the 18th inst., Mr. B. WYNN presiding. The Secretary reported some correspondence he had with Mr. J. RITCHIE, the chairman of the Royal Aquarium Society in reference to the imperfect lighting of the building on the occasion of the exhibition at the Aquarium, especially in the matter of lighting up earlier in the day; and an amendment was promised in respect of this matter. The Secretary also reported, that in addition to the Challenge and other Cups, Medals, &c. the money prizes awarded at the November show amounted to £245 14s, and he read a list of the medals awarded to miscellaneous subjects by the arbitration committee, all of which were passed; an interim financial statement was submitted of a decidedly satisfactory character, the Secretary reporting that the cheques for the November prize-money would be sent out within the next ten days. A statement was made on behalf of the Catalogue revising committee by Mr. C. HARMAN PATNE, setting forth the course determined upon by that body. A start would be made from the Catalogue issued at the time of the Centenary Celebration in 1890, thus superseding the two Supplemental Catalogues issued in 1892 and 1894; a new alphabetical arrangement will be made, and the services of some thirty experts residing in various parts of the country will be requested to

assist in compiling selections of the best varieties in their several sections. It is proposed to issue the Catalogue in September, 1896. Three new Fellows and twenty-two members were elected. The usual vote of thanks to the chairman closed the proceedings.

BOTANICAL MAGAZINE.—The plants figured and described in the November number are:—

Angracum Kotschyii, Rehb. f., in *Gardeners' Chronicle*, 1880, ii., p. 456 and p. 693, fig. 131.—A native of Eastern Tropical Africa. The pendulous racemes have numerous white long-spurred flowers, each about 2½ inches across. Sir Trevor Lawrence; t. 7442.

Spathoglottis Kimballiana, Hort. Sander.—A native of Borneo. Leaves 5-7 nerved, 4 cent. (1½ inch) broad; flowers 8 cent. (3 inches) across, segments oblong-ovate, rather obtuse, pure yellow, internally red, mottled externally, lateral lobes of lip ear-shaped. Flowered at Kew; t. 7443.

Catasetum Lemosii, Rolfe, in *Kew Bulletin* (1894), 394.—A native of Hede Marago, Province of Para, where it was discovered by Dr. LEMOS. Flowers greenish, male only known; t. 7444.

Amazonia erecta var. *late bracteata*.—A Verbenaceae shrub, native of Tropical South America, and remarkable for its ovate, rose-coloured bracts, from the axils of which proceed short racemes of pendulous flowers, with a cylindrical narrow tube, and an irregularly 5-lobed limb, with short white segments, traversed by pink veins. Introduced by Messrs. Sander; t. 7445.

Selenipenium Sargentianum, Rolfe, in *Orchid Review* (1893), p. 239; *Gardeners' Chronicle*, 1894, ii., 781, f. 100. F. Sander; t. 7746.

THE BOOK GARDENER.—"In my younger days," writes Mr. MEEHAN, "progressive young men were often informed by the eminently practical youth that he could grow Potatoes just as well without any knowledge of the countries they came from, the true nature of a tuber, or the differences between a Cabbage and a Cauliflower. In many cases they could do so, but it was interesting to note as the years rolled by that while these excellent practical men never rose above raising Potatoes and Cabbages, most of those with a broader education became eminent and useful members of society." In the same number of *Meehan's Monthly* from which we have taken the above, is a story of a practical gardener twitting a companion who was reading his *Meehan's Monthly*, with, "Oh, is that the sort of gardener you are? a book-gardener;" and then comes the moral. The unthinking man never advanced in his profession. He is practical still—at the spade and the shovel.

THE REIGATE AND DISTRICT CHRYSANTHEMUM SOCIETY.—This vigorous Society has been unfortunate this year in holding its show on a wet day (November 8), and in consequence suffering a considerable diminution in its gate-money. This is the more to be regretted from the fact, that the Society hands over each year a certain sum of money to the Royal Gardeners' Benevolent Institution, and Royal Gardeners' Orphan Fund. In point of excellence the exhibits equalled those of any previous year—groups, cut blooms, and plants, being capital.

CAMPANULA MIRABILIS.—Under this name M. CORREYON speaks in the *Revue Horticole* of a species discovered in the Caucasus by M. ALBOFF, and described in the *Bulletin de l'herbier Boissier*, t. 3, p. 5. It is described as an exceptionally beautiful species, closely allied to *C. medium*, and growing naturally on calcareous soil. It is supposed to be a survival from some previous geological era, most of the representatives of which have vanished. M. CORREYON has seedlings, so that we may hope in due time to make the acquaintance of this wonderful Campanula.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, November 25, when a paper will be read by Mr. R. M. D. SAUNDERS (Fellow), on "Landlords and Tenants in Ireland." The chair to be taken at 8 o'clock.

MEETING OF THE BRUSSELS ORCHIDÉENNE.—The meeting held on Nov. 10 was a most interesting one, and largely attended. Among the visitors was M. L. DE BRUYN, the Minister of Agriculture, who rarely fails to attend the monthly meetings of this society. Among the more remarkable

for the first time in 1894. These details, furnished by the exhibitor, are given in hopes that others may follow his example. C. × Mantini obtained a First-class Diploma of Honour. M. Flor. Panwels staged a splendid *Cypripedium Charlesworthi*, the standard of which is unusual in development and colouring;

splendid *Vanda Sanderiana*, with two trusses, one of five, the other of eight fine blooms; and *Oncidium Forbesi*, with a pretty truss of beautifully tinted flowers. Md. Triende Terdonck showed *Cypripedium nitens*, which was very beautiful. M. Knight, Director of the Royal Parks, staged a large specimen of Catt-

FIG. 104.—CATASETUM CHRISTYANUM: FLOWERS, CHOCOLATE BROWN WITH A GREEN LIP. (SEE P. 618.)

Orchids I may mention the following:—From M. Georges Mantin, Château de Belair (Loiret): flowers of the hybrid *Cattleya* × *Mantini* (G. Mantin) = *C. Skinneri* (Bateman), var. *Bowringiana* (Veitch), sub-var. *floribunda colorata* (G. Mantin), × *C. labiata* (Lindl.), var. *Dowiana* (Batem.), sub-var. *anrea* (Williams), fertilised in October, 1889, flowered in October, 1890, sown in November, 1890, bloomed

M. Stepman showed a group of *C. Charlesworthi*, comprising six specimens, one of which bore an unusually dark standard. M. Linden sent a very fine example of *C. regale*; a specimen of *C. insigne montanum* Lindensæ, of a yellow colour, much admired by connoisseurs; *Cattleya Warocqueana*, bearing a great resemblance to *C. gigas*; *C. maxima gigantea*, with the petals veined with purple; a

leya Warocqueana, a fine variety with thirty flowers. M. de Lombaerts sent a beautiful *C. aurea*; M. Warocqué, *C. Warocqueana fulgens*, of a pretty deep rose colour; M. Madoux, *C. Gaskelliana*, of a distinct shade of pale colouring; MM. Lucien Linden et Cie., cut flowers of *C. Trianaei*, very good varieties; M. Van Imshoot, *C. Warocqueana marmorata*, of a beautiful dark colour, and with all the divisions of

the flowers indistinctly streaked; and *Lælia Lawrenceana* (Botanical Certificate). M. Madoux also staged a *Lælio-Cattleya* species, with divisions of unusual width and beautiful colouring; M. Coppens, a very distinct *Cattleya Eldorado alba*. In the houses of l'Horticulture Internationale there are now in bloom numerous varieties of *C. maxima gigantea*, *C. Warocqueana*, *C. gigas*, *Cataetum*, and *Mormodes*. *Ch. D. B.*

TECHNICAL EDUCATION.—A course of four lectures on the cultivation of vegetables and fruit was concluded on Monday evening last at the Public Hall, Fawley, under the auspices of the Hampshire C. C. The lecturer, Mr. GARNER, of Cadland Gardens, Southampton, illustrated his lecture with diagrams, showing both good and bad specimens of vegetables, also the right and wrong way of pruning both the branches and roots of fruit trees, as standards, bushes, and espaliers. The winter treatment of soils and its preparation for the reception of seeds in spring was explained, and the economical uses and application of manures of different kinds were with the above listened to by a large attendance of the public at each lecture.

REGULATIONS AT THE DRILL-HALL.—In reference to a note on this subject on p. 587, it is pointed out that our correspondent has been misinformed. The rule which is generally observed, and only occasionally infringed by inadvertence, is that the entry-cards are not brought up to the table, so that the committee is supposed not to know, and often does not know, upon whose exhibit they are adjudicating. We can confirm this in the case of the Orchid Committee, where the chairman exercises care to prevent the entry-card being seen till after a decision is arrived at. "First-class Certificates" are confined to new and rare plants, and are not given to florists' flowers unless they represent an entirely new type. "Awards of Merit" only are given to ordinary seedlings, &c. Some arrangement should be made to preclude members of the Committees seeing the exhibits before the meetings.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The monthly meeting of this society was held at 25, Westgate Road, on Tuesday evening, Nov. 12, Mr. JOHN BULLOCK occupied the chair, and there was a good attendance of members. Among the specimens exhibited on the table was a collection of Apples from Mr. TOWN, care of Messrs. WATSON & Co., nurserymen; *Chrysanthemum* blooms by Mr. LABE, Northdene, Gateshead; and three splendid pots of Cyclamen by Mr. LAWSON, Heathdale, Gosforth, all of which were much admired. Mr. LAWSON, Heathdale, read a practical paper on the Onion, which was followed by discussion.

SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.—The monthly meeting was held at the Parish Room, Shirley, Southampton, on the 18th inst., when Mr. E. J. WILCOX presided over a good attendance of the members. The "Culture of the Mushroom" was the title of a paper read by Mr. F. D. WOOLF, of Totton, who is a grower for market of some experience. A long and interesting discussion followed, and a hearty vote of thanks to Mr. WOOLF closed the proceedings.

KEW IN SEPTEMBER.—The fine weather in September induced many persons to visit the gardens. On Sunday, September 22, the number reached 22,427. The highest shade temperature in September was 28.8° C. (84° F.), on the 24th. It was remarkable as following a minimum on the grass of 0.55° C. (31° F.). This, says the *Kew Bulletin*, gives a range of temperature during the twenty-four hours of 53° F. The hot weather lasted exactly a week, the maximum temperature never falling below 24.4° C. (76° F.), from the 23rd to the 30th.

CAUSE OF "FINGER-AND-TOE" IN TURNIPS.—The connection of an attack of "Finger-and-Toe" in Turnips, &c. with a previous impoverishment of the soil in lime, is well shown by two soil analyses

just completed at the South Eastern Agricultural College, Wye (County Councils of Kent and Surrey). One portion of a 16-acre field in the south of Kent was badly affected by "Finger-and-Toe," the rest being only slightly attacked. Samples of the soil taken from that part of the field where the disease was prevalent, showed on analysis only .13 per cent. of available lime, while the soil from the rest of the field contained .43 per cent. Wherever "Finger-and-Toe" (Anbury or Club Root) shows itself, the land probably wants a dressing of chalk or lime.

PROFESSOR HELLRIEGEL.—The death of Professor HERMANN HELLRIEGEL, at the age of sixty-four, removes the discoverer of the important fact that leguminous plants are capable of absorbing free nitrogen from the air, through the agency of micro-organisms existing in the nodules on their roots. During his career he devoted his attention almost exclusively to researches dealing with chemical and physiological questions relating to the nutrition of plants. For some years he acted as director of the agricultural experiment station at Dahme, Brandenburg, and after occupying other positions, made the great discovery of his life at the experimental station founded by the Verein für Zucker-Industrie, jointly with the government of the Duchy of Anhalt. *Pharmaceutical Journal*.

DWARF FORM OF LILIUM AURATUM.—Mr. L. CUMMING of Eastfield, Rugby, sends us a photograph of some plants of *Lilium auratum* growing only a foot high, and bearing well-developed flowers. The bulbs were imported ones, and now, when in bloom, manifest no trace of weaklines or unhealthiness, the only unusual feature being the shortness of the stem. Mr. CUMMING questions whether this habit would be of permanent character, and if a similar peculiarity has been observed in other Lilies of this variety. The dwarf habit would have, for certain positions, a value of its own, and such plants would prove a welcome addition to those already known to us.

"RUBBER."—A new source of this precious material is brought under notice in the last number of the *Kew Bulletin*, where an Apocynaceous plant, *Kickxia africana*, is figured. This is one of the most beautiful forest trees of western tropical Africa. The rubber it produces is of high quality. A very important rubber industry was started at the Gold Coast by Governor MOLONEY in 1882, and ten years after the exports are noted as amounting to the annual value of £200,000—a remarkable and striking instance of the creation of a new industry by official action. Similar measures have been taken at Lagos, in which colony the tree above mentioned grows. Indeed, it extends from Sierra Leone to the Gold Coast, and beyond the banks of the Niger to the Bight of Biafra. The development of the rubber industry at Lagos is shown by the circumstance that in January the weight, in round figures, was 21,000 lb., the amount gradually increasing till in June of the same year the weight exported was upwards of 268,000 lb., and the value over £12,000.

"ORCHIDS, THEIR CULTURE AND MANAGEMENT."—A second edition of Mr. WATSON's useful treatise has just been published by Mr. UFCOTT GILL, 170, Strand. This is a book specially suitable for amateurs and beginners. The general principles of cultivation are clearly laid down, and if the grower once grasps these intelligently, the rest is a question of attention merely. The arrangement of the genera is alphabetical, and slight descriptions are given of the most noteworthy species. The book is copiously illustrated, and well fulfills its object.

"ORCHID GUIDE BOOK."—Mr. H. A. BURBERRY has just published a second edition of his work, entitled, *The Amateur Orchid Cultivators' Guide Book*. We commend it to growers and to would-be growers as a simple and reliable authority. It is not too much encumbered by notes about florists' varieties of Orchids, but gives clear descriptions of the sorts best suited for cultivation, and the means to be adopted to succeed with them. It is illustrated with

coloured and other plates, and is of handy size; this, the new edition, being altogether an enlarged and improved one.

SYNOPTICAL FLORA OF NORTH AMERICA.—The first fascicle of this work (prepared at the herbarium of Harvard University), in continuation of that commenced by the late Dr. ASA GRAY and Dr. WATSON, and, on the death of the latter, by Dr. ROBINSON, is now ready, and includes the orders Ranunculaceæ to Frankeniaceæ. A second fascicle, dealing with the orders Caryophyllaceæ to Polygonaceæ, was begun by Dr. ASA GRAY, and is being continued by Dr. ROBINSON (the Editor), assisted by Professor J. M. COULTEB, Professor WILLIAM TRELEASE, and Professor L. H. BAILEY. This part is in advanced preparation, and will be issued at an early date.

CATASETUM CHRISTYANUM.

(FIG. 104.)

THIS remarkable species was originally described by the late Professor Reichenbach in the *Gardeners' Chronicle*, May 6, 1882, when he mentions its affinity to the less showy *C. saccatum*, Lindl. It is, indeed, perhaps the most extraordinary of a large section of the genus *Cataetum*, having the curious bearded or fringed lip, and which invariably attract considerable attention when in flower, no matter how many showier things may be in bloom at the time in the same house. For a long time the plant was very scarce, but recently Messrs. F. Sander & Co. have imported it, and our illustration was prepared from a plant exhibited by them at the meeting of the Royal Horticultural Society, Oct. 29, 1895. In colour *C. Christyanum* varies in the different specimens, the sepals and petals being usually chocolate colour, and the lip greenish-yellow, with dark purple fringe; but in some the petals are slightly freckled with green. It is pleasant to note that in several collections the *Cataetums* are given a proper amount of attention, and in each case they amply reward their cultivators with their singular flowers.

There appears to be but little difficulty in growing *Cataetum* if the proper cool resting season after the leaves wither is observed. It was the neglect of this which unjustly got for them, in former times, the character of being difficult subjects to grow.

ABOUT CHRYSANTHEMUMS.

(Continued from p. 580.)

AT CASTLE HILL NURSERIES, MAIDENHEAD.—After a journey to see Mr. R. OWEN's collection at these nurseries, we have a very good opinion of many seedlings now in bloom. Possibly some weeding out has already been done—though we do not know this to be the case; but whether or not, the percentage of promising varieties among the unnamed seedlings appeared to be good—certainly higher than that which usually rewards the raiser of new *Chrysanthemums*. Mr. OWEN has a few nice span-roofed houses, in which the plants are sheltered; and though there is consequently no effort made to mass the whole of the plants to produce a general effect, the display in each house is by no means inconsiderable.

The first novelty to be noticed was a sport from Robert Petfield, which has been called *Chas. Haigh*. As far as could be seen, this is a sport in respect to colour only, the habit of growth of the plants and the quality of the bloom will probably be about equal to the type. In colour, the bloom is pale rosy-purple, and on the reverse side the petals are gold or bronzy at the tips. Whilst speaking of incurveds, mention should be made of Mrs. R. C. KINGSTON, one of the very largest of the newer incurveds. The florets are not broad, but the flower is high and good, colour full rose tipped with white. *Chas. H. Curtis* (H. J. Jones) was noticed in more excellent form than we have seen it on the plant previously. *Copper King* is a promising seedling from America, flowers deep but not very large; and Miss E. SMITH, an incurved and twisted Japanese, a pretty mixture of silver and rose. *Lady Ridgway* is an English seedling of warm buff, base of the florets rose coloured, the flower globular, florets not long but very numerous. Mrs.

Higginbotham is a first-class, large, hairy variety of rosy-lilac and silver. Pride of Maidenhead, a long-petalled loose Japanese, white with lemon centre. Jno. Lightfoot, a silver-coloured Japanese, with lilac-rose-margined florets, gradually spreading over same as the flower develops; florets forked. Certificated by the National Society on the 11th inst.

Amongst a number of unnamed seedlings was noticed a very wide-petalled Japanese, slightly twisted, and an incurved Japanese white, both of which were full of promise. Graphic is a Japanese incurved with a very large flower, and broad florets, upper surface striped rose, below silvery. A seedling Anemone-flowered variety from America, pale lilac in colour, lacking grace; and Freedom, an American seedling, Japanese of warm blush, were noticed; and two Continental introductions are Madame Lebeque (Chantrier), a globular Japanese reflexed, white, with amber-coloured centre, when fresh; and Dame Blanche (Crozy), a white, smooth Japanese, in the instance under notice, having more yellow on the otherwise white flowers than we had previously seen.

AT DOVER HOUSE, ROEHAMPTON.

The collection of Chrysanthemums annually cultivated in the gardens of J. P. Morgan, Esq., is like in most respects to some others we have seen in well-appointed private places. Though none are required for exhibition purposes, the system practised is essentially—but not quite—the same as where the first prize in a particular competition is the expected finale of all the care and labour expended on the plants during the year. Naturally, therefore, when the plants are grouped together in the vinerias or other convenient structure, they furnish a display quite worthy the visit even of the specialist, for he will be sure to see good exhibition blooms of many of the choicer as well as of the latest varieties; and, moreover, the plants present a better cared-for appearance, by reason of their dwarf character and their retained foliage, than is sometimes the case when the grower's sole object has been to secure flowers for his exhibition stands.

To some minds, perhaps, it may seem wasteful to grow large blooms at the expense of numerous small ones, when the purpose is but to provide material for cutting. We do not think so, but, on the contrary, are of opinion that the best culture of ordinary varieties, if the object is to furnish vases in living-rooms with blooms, is to use medium-sized pots—pots 9 inches in diameter are quite sufficient in most cases; grow the plants well and fairly strong, and thin the blooms to three, four, five, or six to each plant, according to the habit of the variety. By such means excellent blooms are obtained, of good size and colour, and these are more handsome, and will last very much longer, and are, therefore, no more expensive than thin, small, poorly-developed flowers. We said ordinary varieties advisedly, because there are some which we generally style decorative varieties, and there are the single-flowered and the Pompon-flowered sorts, which are admittedly more effective, when little, if any, thinning is practised.

The collection under notice numbers about 1500 plants, and Mr. J. F. McLeod has added almost all the novelties that have proved themselves worthy a place in a collection containing already as many as 387 varieties. It is thought, and reasonably enough, that this number is needlessly large, and Mr. McLeod intends to seriously reduce it before another season. As most of the varieties which have done well here this season have been noticed pretty fully in other collections, we shall only mention a few that were conspicuous a week ago. In the first place, a word is deserved by Golden Gate, a very pretty Japanese flower of soft yellow smooth florets, and no doubt a very good one to cultivate for cutting from; the plants only grow moderately high. Jno. Shrimpton, with usually four blooms on each dwarf sturdy looking plant, is likewise very useful, the habit being so good. Sunflower is not always kind, but here we noticed a number of good blooms. Robert Owen, Mdle. T. Rey, Viviani Morel, President Borel, Mrs.

F. Jameson, G. C. Schwabe, H. L. Sunderbruch, Florence Davis, Empress and Golden Empress of India, Golden Beverley, Hairy Wonder, and Jno. Salter were all good. A variety much in Mr. McLeod's favour is Lady Saunders, a tolerably short-growing good habited Japanese, bearing smooth white flowers with warm lemon centre when first opened. Madame Calvat, a moderate-sized Japanese flower with broad florets, and Duke of Wellington, may also be remarked. Anemone-flowered sorts included the old Fleur-de-Marie, and the new and excellent Descartes; also La Marguerite, violet-purple; Delaware, white, with pale lemon centre; and Marguerite Solleville, lilac, tipped with shaded white. Liberal and excellent culture is afforded everything that is given a place in this garden, and there will soon be a capital display of early-flowered Cyclamens.

AT MR. STEVENS', POTNEY.

For very many years has Mr. Geo. Stevens been growing Chrysanthemums at Putney, and during these years he has raised and introduced not a few sterling varieties. He may have been engaged in the work thirty seasons, perhaps more; certainly, not appreciably fewer. Now, however, his concern chiefly rests in the cultivation of blooms for the market, and for the florist's business, represented by his shop in the High Street. There can be no question that Chrysanthemum culture for market was rewarded a few years since by much higher prices than can now be realised; true, the public are buying these in common with almost all kinds of flowers more freely now than they have ever done, but parallel with this is the better supply. Of late years, not only have a greater number of growers to be reckoned with, but many of these cultivate the plants in prodigious and hitherto unheard-of numbers. These large producers are also content with such a return that must make many of their contemporaries wonder how and by what means they secure any profit at all. The outcome of all this is, without doubt, a boon to the public, who are now able to get their "bunch" of Chrysanthemums for as few pence as once they paid shillings. On the other hand, the growers themselves are driven to the strictest economy in labour and other respects, and they must grow only varieties which by reason of their adaptability to the production of a quantity of bloom, will furnish a profit at the present market prices. In spite of this, there is little doubt that the 4000 plants which Mr. Stevens cultivates give a good account of themselves when the blooms are upon the market, but he is inclined to grow fewer large blooms than formerly, owing to the desire of the buyer to have as large a number as possible for the price he pays.

Among varieties in bloom a week ago in this collection were Florence Percy, white, included owing to its disposition to free flowering. Mdle. T. Rey, a very useful sort for supplying a number of better-class blooms; Wm. Stevens, a variety raised by Mr. Stevens some seven years ago, and similar to Source d'Or, but of better colour; W. H. Lincoln, than which few varieties are better suited for market supply; Rubra perfecta, a pretty little crimson flower; Golden Gem, of which a number of plants were in bloom; and Mrs. C. Orchard, another of the Source d'Or class. Boule de Neige is still kept in good quantity for the production of white blooms at a late date, though the flowers are not so pure as could be wished; and L. Canning is grown largely. As interesting as any, perhaps, was a batch of Niveum, with a number of good blooms upon each plant. It will likely prove very desirable from the market growers' point of view for the supply of what they term "better-class blooms." P.

AILANTHUS BARK.—Mr. David Hooper, in the *Pharmaceutical Journal* for October 26, has an article on the medicinal qualities of the bark of this tree. The bark is intensely bitter, and is used in dysentery and as a vermifuge. It would in all probability be as good an insecticide as quassia.

HOME CORRESPONDENCE.

SPORTING IN POTATOS.—I cannot admit, in response to "D. T. F.'s" suggestion, that I have met with numerous sports in Potatos in my time. So far from that being the case, I have very rarely met with a sport; indeed, in my own personal experience, never. Mr. Fenn has a striped Potato which he says sported from the white Rector of Woodstock; and Mr. Chopping, of Sittingbourne, has a pretty mottled Potato which is said to have sported from Vicar of Laleham. I know only so much of them. The sportiveness I have chiefly met with in relation to Potatos is their tendency to appear from time to time under diverse appellations—but Nature has nothing to do with that. Diversities come only as the product of intercrossing the flowers, but that is not sporting. If I were told that a white flesh Potato had sported to a yellow one, or *vice versa*, I should simply laugh at the suggestion. Naturally sceptical, I am not credulous, and always doubt what personal observation leads me to regard as the reverse of fact. A. D.

THE TRUTH ABOUT PRICES.—My scepticism as to the amount of the prices mentioned in the prize essay is not to be regretted, since it has produced positive proof that such things are; but let no general market grower flatter himself that he can obtain them. He may strive to grow his fruit well, and insist on his gatherers rejecting all unsound Apples, so that they may not infect his stored heaps. He may sort and pack carefully, and allow no unfair trading, so that he will gradually acquire a good character. Then his goods become known and appreciated, and are enquired for and cleared off the salesman's stand, while others are neglected; but he certainly will not get double the prices ruling in the market. *Mid-Kent.*

REGULATIONS AT THE DRILL-HALL MEETINGS.—It is much easier to suggest what should be done to secure absolute anonymity for products of any description sent or brought for consideration by the committee at the Drill-Hall meetings, than to carry them out. No doubt all that "Visitor" suggests could be done, but, all the same, in the majority of cases it would be known whose exhibits were presented. It is so difficult for anyone to take produce to the Hall and stage it without being seen and noticed by members of the committees. Still further, it is very possible for many members to tell intuitively from whom things come. If anonymity cannot be absolutely secured, what use is it to attempt securing it at all. But again, what harm is done if it be known to whom the respective products belong? It would be a matter of surprise to learn that such knowledge made any material difference to the awards. I can speak for the Fruit Committee, at least, and say that it treats everybody, members or non-members, known or unknown persons, alike; merit in the products alone secures awards. It must be understood that in entering for the respective committees' awards, there is no competition. At ordinary exhibitions, such secrecy as to exhibitors may be desirable; although I think few men would, as judges, be influenced by personal knowledge of the competitors. In any case, I do not think any evil results at the committees from the present system. If there be any, I have not seen it. A. D.

ANONA CHERIMOLIA.—Amongst the Kew notes in last week's issue of the *Gardeners' Chronicle*, mention is made of the successful treatment of this plant. When living at Warwick a friend gave me a plant of it, thinking I might be able to fruit it. I kept it in an intermediate-house, and gave it special attention, but without success. I have an idea that if it was treated as Peaches are in a Peach-house (as your correspondent recommends), good results would be obtained. I should like to know what age the plant now fruiting at Kew is, and what is the size of the pot that it is in. *Geo. Burrows, Berwick, Shrewsbury.*

LILIUM AURATUM AT BRICKLEHAMPTON HALL GARDENS.—A bulb of the above Liliium was purchased in the early spring from Messrs. Sutton & Sons, of Reading, and potted in an ordinary compost, used for the generality of greenhouse plants here. It was kept in a cold frame until it started into growth, when it was turned out-of-doors, and plunged up to the rim of the pot in coal-ashes. During the summer it was attended to regularly with water; when the pot was filled with roots, we gave it weak manure-water occasionally. As soon

as the buds began to appear, and the first flowers ready to expand, it was removed into the conservatory, where it remained until the blooming period was over. On August 12 it contained thirty-two expanded flowers, and one bud unopened, when the photograph was taken in the conservatory. The thirty-third flower opened shortly after, and before any of the others began to fade. It was a grand sight; the grateful odour exhaled filled the house with a most delightful perfume, and it was the admiration of all visitors during the time it was in flower. *Edward Lott, Bricklehampton Hall Gardens.*

TODEA SUPERBA.—A magnificent specimen or the above was noted last week at Brinkburn, Darlington, the seat of H. F. Pease, Esq. The plant measures from tip to tip over 6½ feet, and at the present time it is carrying five years' growth, and the fronds are of the most intense dark-green colour, a feature which distinguishes healthy plants of this species. I was informed by Mr. Wand, the gardener, that the plant is twenty-seven years old. So fine a plant indicates very careful attention during a long period of time. The house is unheated, and the temperature in it last winter was as low as 12°, or 20° of frost. In the same house is a grand mass of the Killarney Fern (*Trichomanes radicans*) in a 24-inch pan measuring over 5 feet across. *J. C.*

THE CRAB FOR FLOWERING AND FRUITING.—I am very glad to see Mr. Harrison Weir and others trying to bring the Crab so prominently before the readers of the *Gardeners' Chronicle*. I quite concur with "D. T. E." that many of our shrubberies are too much filled with evergreen shrubs, which are very good in their way, but when nothing else is planted our gardens and landscapes are apt to become somewhat monotonous. A judicious mingling of deciduous trees and shrubs would have an entirely different and more agreeable effect. Crabs being both useful as regards their fruit and ornamental, either in fruit or flower, should be more commonly planted in the shrubbery than is now the case, and also at the margins of ornamental plantations, where they would show out well in contrast with the more sombre hues of other trees. But why should we not plant a number of the strongest and hardiest of our Apples, such as standards, amongst the shrubbery and ornamental borders, for nothing looks better in the spring, nor could there be anything more useful in autumn. I have seen Apple-blossom greatly in demand for decorative purposes when it could be had. But no one would care much about cutting blossom from a tree they expected fruit from; but, on the other hand, if there was a number of Crabs and Apples planted amongst the shrubs and odd corners, the blossom could be taken without fear of in any way curtailing the supply of fruit in the garden. I once planted a large shrubbery with a groundwork of the common Laurel and Rhododendrons, dotting it over with standard trees of the Apple, Crab, Craegus, Almond, Prunus, and Libanum, and the effect was exceedingly fine. *D. L. M.*

CEDRUS LIBANI BLOOMING OUT OF SEASON.—According to my experience, the Cedar of Libanon blooms in May and June. I was therefore surprised to see, about the middle of last month, a tree of middle size growing in Tooting Graveney, the branches of which were laden with a great number of its yellow flowers. Are Cedars generally blooming at this unusual season about the country, or is the above an exceptional occurrence? *William Earley.*

DIPLADENIA AMABILIS.—When well done this species ranks amongst the most showy and useful stove climbers we possess. When at Chevering Park Gardens, Sevenoaks, a few days ago, I found the roof of the stove adorned with this plant and the beautiful *Dipladenia boliviensis*, and a grand specimen of *Allamanda Hendersonii*, all of them flowering profusely, especially the *Dipladenia amabilis*. This plant is growing in a 20-inch pot, and covers a roof-space of 12 feet by 6 feet. It has had upwards of 150 racemes of flowers, the strongest of which bears no fewer than from thirty to forty blooms, it being a wonderful example of good cultivation, and one which naturally enough attracted my attention. All-round gardening is done well at Chevering Park, and reflects great credit upon the head gardener Mr. C. Sutton. *A. O.*

THE ROYAL HORTICULTURAL SOCIETY AND CHISWICK GARDENS.—No doubt when Mr. Barron formally retires from the management of Chiswick, new arrangements will be made in connection with

the management of the gardens, but that such arrangements must necessarily be improvements is open to question; at the same time, it is to be hoped that some steps may be taken in order to render the Royal Horticultural Society and its doings more truly national. The importance of horticulture, and especially commercial horticulture, is daily becoming more apparent; and the aim of the Royal Horticultural Society in the future should be to foster horticulture as a national industry. The Society should encourage, by all means in its power, all efforts made to improve culture, to increase and improve varieties, and to extend the use of fruits and vegetables as essentials of daily national life and health, and also the free use of plants and flowers as important factors in the sum of human happiness. There can be no doubt that fruits, flowers, and vegetables, when put before the public in a fresh and proper way, constitute an important element in the production of a contented and healthy state of national life. Amateur horticulture should, of course, be encouraged by all the means at the disposal of the Royal Horticultural Society, but at the same time much prominence should be given to the importance of commercial horticulture. In these times of enormous foreign imports of fruits, flowers, and vegetables, not to mention eggs, poultry, and butter, it becomes us as a nation to seriously consider whether or not we can compete more thoroughly with the foreigner. Preferential railway rates in favour of the foreigner exist at the present, but is it too much to hope that a time is coming when this will not be the case? Is it too much to hope that British agriculturists will rise to the occasion, and go in for producing more of those articles that are always in demand? And is it too much to hope that the Royal Horticultural Society will become alive to the importance of fostering, by all means in its power, the important industry of British horticulture, in all its branches? The immense importance of fresh, well-grown fruits and vegetables is daily becoming more evident to the people generally. A better general state of health can be maintained by the judicious use of fresh fruits and vegetables than by any amount of medicine. The sooner this comes to be universally acknowledged the better for our people, and if the Royal Horticultural Society will make it its endeavour to spread abroad the glad tidings of peace and good health to men and women, through the extended use of fruits and vegetables in a proper condition, the Society will have done much to earn the national gratitude and to deserve national support. *John Thomson, Clovenfords, N.B., Nov. 13.*

— Thank you for your leader on Chiswick. It is said that history repeats itself, but another Lindley is not likely to appear there, I should say. I think it is time the Royal Horticultural Society Council gave the Fellows some notion of their proposed new movement. One thing is pretty clear, there will be no peace and progress till the governing body puts itself more fully in touch with gardeners generally. As it is, the Royal Horticultural Society is simply a trade society—it scarcely touches the amateurs or gardeners of England beyond a radius of 30 miles of London. My idea is, that such a society should have branches or agencies in all large centres of the British isles, and especially it should bind all *bona fide* gardeners into a national society, or union, or guild, call it whatever you will. Pottering about in London, giving medals to nurserymen, and helping them to advertise their goods, is all very well in its way, so is the carrying on of trials for the trade at Chiswick; but there is a higher and wider field untouched. We want union, we want science, we want progress and extension, and if country gardeners will not come to the society in London the Society must go to them. *F. R. H. S.* [An elaborate scheme for the institution of local secretaries and branch societies was formulated at the time of the exodus from Kensington, but nothing has been heard of it since. Perhaps the failure of the last provincial show at Liverpool discouraged further efforts in that direction. It was certainly worthy of a better fate. Ed.]

A FREAK OF NATURE.—The production of a green pitcher on *Nepenthes Curtisii* in these gardens is an occurrence worth commemorating. The plant, a small one, carries only six normal pitchers, besides the green one. This freak may not be uncommon, although no similar case has hitherto come under my notice. By stopping the shoot immediately above the leaf which possesses the green pitcher, and thus cause a shoot to break from its axil, it is possible that a sport may be secured. *Thos. Coomber, The Hendre, Monmouth.*

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

NOVEMBER 12.—*Present:* Dr. M. T. Masters (in the chair); Mr. McLachlan, Mr. Michael, Rev. W. Wilks, Dr. Bonavia, and Rev. G. Henslow, Hon. Sec.

Death of Prof. Riley.—Mr. McLachlan spoke of the great loss sustained by the death of this eminent entomologist of the Museum of Natural History, Washington. He was the State Entomologist of the Agricultural Department, and formerly for that of Missouri.

Hybrid Asters.—With reference to the specimens sent to the last meeting by Rev. C. W. Dod, Mr. Dewar reports as follows:—"Although not quite prepared to agree with him fully, neither am I disposed to materially differ from his suppositions. The chief difference was one of colour; the flowers of the supposed hybrids are undoubtedly somewhat larger than I have before seen; the colour, however, is quite distinct from that of typical *A. Thomsoni*. The cross between *A. Thomsoni* and *A. Pyreneus* (?) is in every respect, except its large flowers, typical *A. Thomsoni*. The other cross (?) differs little except in colour of flower from seedlings. *A. Thomsoni* is a very variable species, becoming of course considerably more so by cultivation." Mr. Dod having kindly forwarded fruiting specimens of *A. Thomsoni* (*Clarke*) and of the hybrid to the Secretary, he found that they differed as follows:—The leaves selected from similar places were much larger and broader in the former, with more serratures; the hairs on the stem were shorter, but the involucre bracts were less hairy, the tips being nearly glabrous. The pappus was markedly shorter than that of the hybrid; a few bore ripe achenes. In the hybrid several of the ray florets were bisexual with perfectly free stamens, the anthers being more or less rudimentary; a few of the ray corollas were of the killed form. All the ovaries, disk and ray, were abortive. The above characters might be varietal only, but the presence of stamens, &c., perhaps indicate the effect of crossing.

Fungus on Pears.—With reference to the specimens received from Messrs. Veitch of Exeter, at the last meeting, the following report was received from Kew:—"The fungus on the Pear is *Monilia fructigena*, *Pers.* The individual patches of fungus are limited in extent; the first formed exhausts the necessary food for a limited distance beyond its fruiting area. Its spores germinate and grow just beyond this sterile zone, hence succeeding crops are more or less concentric, and separated by narrow sterile zones without fungi." They thus resemble *Fairy-rings*.

Cocos australis.—Dr. Masters exhibited orange-coloured Plum-like fruit received from Antibes, and sent by M. Naudin, and also by Mr. Hanbury from La Mortola. It is a native of Paraguay and Chili. It was the first occasion of its ripening in South Europe. The flavour resembled that of a Pine Apple.

Cypripedium, Hybrid.—Mr. Veitch sent plants of *C. Mioua* and cut flowers of the parents—viz., *C. × Arthurianum* (male) and *C. Spicerianum* (female). The former is the result of a cross between *C. usigne* × *C. Fairieanum*. Two offspring from the same pod showed considerable "dissociation," in that one more resembled the male, and the other the female; but the peculiar purple and white stamens of the male was lost, the green one of the female parent being present in both. The spotted perianth of the male was very pronounced in one, while the white sepal of the female was reproduced with no spots, though the purplish labellum of the female appeared on both.

Woodstockian, Hybrid.—Mr. Veitch also sent a new form, *Numa*, the result of crossing the "bigener," *indico-javanicum* by *R. multicolor* var. *Curtisii*. *Indico-javanicum* resulted from crossing Lord Wolsley (a hybrid containing the three true species, *R. jasminiflorum*, *R. javanicum* (twice), and *R. Brookianum* var. *gracile*) with *Azlea indica*, "Stella." This produced rather contracted flowers of a brick red colour. This was crossed with the small crimson-flowered (1 inch) *R. multicolor* var. *Curtisii*, *Numa* bears large flowers (2 inches) of a deep red orange, with a shorter tube than that of the female parent. Hence the effect of the male is to transmit the form of the corolla; but that of the female, the colour as well as the foliage, which is lanceolate, larger and broader than the leaf of *R. multicolor* var. *Curtisii*.

Black-skinned Apple.—Dr. Masters exhibited an Apple, the rind of which was of a deep purplish black colour, the cellular tissue within being light brown, apparently due to fermentation. It was forwarded to Kew. Mr. Michael remarked that he had known Bleheim Oranges to assume a similar appearance.

Flies, Dead, adhering to Barley.—Mr. Henslow exhibited a specimen prepared by the late Professor J. S. Henslow, in 1840, of flies attacked by a fungus, and which had died upon ears of Barley. It was also forwarded to Kew for further investigation.

KINGSTON CHRYSANTHEMUM.

NOVEMBER 12, 13.—Held, as usual, in the roomy but very cold Drill Hall, and, for the time of year, in fair weather auspices, the Kingston Society is to

* Figured and described in *Journ. R.H.S.*, vol. xiii., pt. ii., p. 21 (1891).

be congratulated on having a capital show. In some features, perhaps, notably in the popular Challenge Vase class, there was a falling off in the competitions, but in the fruit classes a great advance. The schedule includes so many classes, numbers of which are merely local, that we present results only in those of wider interest.

Plants.—The miscellaneous groups were relieved from their usual dulness here by a very light graceful arrangement set up by Mr. Ridge, gr. to SWINFEN EADY, Esq., Q.C., Weybridge, who was a good 1st. Mr. F. Hopkins, gr. to Mrs. WOODERSPOON, Walton, was 2nd; and Mr. Takell, gr. to B. F. S. McGEACH, Esq., Kingston, 3rd.

Chrysanthemum groups were of the usual very solid order, simply plants and flowers crowded into a semicircular mass. Mr. French, gr. to Mrs. BARCLAY, Wimbledon, was 1st, having the best front; Mr. G. H. Sage, gr. to Earl DYSART, Ham House, coming 2nd, having the freshest blooms, but a bad front; Mr. Forbes, gr. to D. NICHOL, Esq., Surbiton, came 3rd.

Treated Plants.—Six very fine specimens, superbly bloomed, were shown by Mr. Swan, gr. to MURRAY SMITH, Esq., Weybridge, who had Florence Davis, W. Tricker, Mrs. Stevens, Pink Christine, Mrs. Dixon, and Mrs. G. Ruade. Mr. Pead, gr. to R. S. BOND, Esq., Surbiton, was 2nd. Mr. SWAN also had the best three trained plants. The best three standards came from Mr. King, gr. to A. F. PERKINS, Esq., Holmwood, who had good specimens of Vivand Morel, Pink Christine, and Chinaman. Mr. SWAN was again 1st with four trained Pompons, having Black Douglas, Rose Margaret, W. Westlake, and Marguerite St. Coe; Mr. J. Plowman, gr. to C. LAVERS SMITH, Esq., Long Ditton, was 2nd, with better flowered plants; Mr. PEAD came 3rd.

Cut Blooms.—Only four growers competed for the seventh grand Challenge Vase this time. The competition comprised twenty-four Japanese and twenty-four incurved flowers. Last year the Cup was won by Mr. Higgs, gr. to J. B. HANKEY, Esq., Fatcham Park, Leatherhead, who takes the 1st place this time, and thus in two years wins the trophy outright. He had fine incurved, the varieties as they ran from back to front being L. Lambert, Lord Wolseley, Jeanne d'Arc, W. Tunnington, Princess of Wales, Violet Tomlin, Lord Alcester, C. B. Whitnall, Lord Rosebery, Mrs. B. C. Kingdon, and others of recognised merit. Of Japanese, the best were Mdlle. Thérèse Rey, Charles Davis, Mons. Panckoucke, Deuil de Jules Ferry, Sunflower, Vivand Morel, Col. C. B. Smith, M. Marie Hoste, W. M. Seward, and other popular varieties. Mr. Hunt, gr. to P. RALLI, Esq., Ashstead Park, was 2nd, but had some fine Japanese, including Golden Gate, Violet Rosa, Sunflower, Col. Chase, Madame Marie Hoste, V. Morel, &c.; Mr. Neville, gr. to F. W. FLIGHT, Esq., came 3rd, his stand including a good Madame Carnot; Mr. Quarterman, gr. to C. E. SMITH, Esq., Cobham, was 4th. The executive will now have to provide a new Vase for next year.

Incurved Blooms.—In the class for twenty-four, Mr. Mease, gr. to A. TATE, Esq., Leatherhead, was a good 1st, having fine flowers of Lord Alcester, Major Bonnajon (selected as the premier incurved in the show), J. Lambert, C. H. Curtis, Empress of India, Lord Rosebery, J. Doughty, Golden Empress, Jeanne d'Arc, Princess of Wales, Globe d'Or, &c. Mr. HIGGS was 2nd, with very fair flowers. In the class for twelve blooms, Mr. KING was 1st with fine flowers; Mr. RIDGE coming 2nd; and Mr. COOMBS, gr. to W. FURSE, Esq., Teddington, 3rd. In the class for six blooms, Mr. QUARTERMAN was 1st, having good Queen of England, Lord Alcester, John Lambert, Empress of India, Violet Tomlin, and Miss M. A. Haggas. Mr. MILLHAM, Leatherhead, was 2nd.

In the class for six blooms of any variety, Mr. HIGGS was 1st with large, but rather rough, Empress of India; Mr. Felgate, gr. to the Duchess of WELLINGTON, Walton, having Violet Tomlin, 2nd; and Mr. KING was 3rd with Robert Patfield.

Japanese flowers were very plentiful, the best twenty-four coming from Mr. MEASE, who had very good Vivand Morel, Mr. Owen, Silver King, Good Gracious, W. G. Newett, Golden Gate, Charles Davis, Mrs. W. H. Lees, Duke of York, &c. Mr. G. ELLIOTT, gr. to P. W. GRAHAM, Esq., West Molesey, was 2nd, having some very fine flowers. Mr. Standing, gr. to Mr. GOOD, Worthing, was 3rd.

Mr. KING had the best twelve Japanese, including fine Vivand Morel, Sunflower, Lord Brooke, Louise, Mdlle. Thérèse Rey, Viscountess Hambleton, &c. Mr. COOMBS was 2nd, and Mr. Holden, gr. to C. W. IZOD, Esq., Esher, 3rd.

Mr. MILLHAM had the best six Japanese; Mr. QUARTERMAN being 2nd. In the class for six Japanese of one variety, Mr. KING was 1st, with fairly good Mdlle. Thérèse Rey; fine Golden Gate and Madame Carnot (the premier Japanese bloom) from Mr. C. HUNT, who was 2nd; and the first-named from Mr. HIGGS, 3rd.

Other Sections.—Mr. MEASE was again to the front with the best twelve reflexed, having the usual varieties.

Japanese Anemones were very good indeed, the best twelve coming from Mr. Turner, gr. to O. F. MURRAY, Esq., Epsom, who had Sir W. Raleigh, John Bunyan, Enterprise, W. W. Astor, Madame Jules Benedict, &c., very fine. Mr. O. J. Waite, gr. to the Hon. Col. TALBOT, Esher, was 2nd; and Mr. Springthorpe, gr. to A. A. BEAVAN, Esq., 3rd.

Mr. J. PLOWMAN had the best Anemone Pompons, and the best twelve Pompons in trebles. With three varieties of the Rundle family, six blooms of each, Mr. READ was 1st.

Singles were very fine indeed, and beautiful. The best box of twelve varieties came from Mr. FORBES, who had Admiral Seymour, Charming, Rose Pink, Parity, Mary Anderson, &c.; Mr. PLOWMAN was 2nd.

Mr. MILLHAM had the best six table plants; and Mr. Port-

bury, gr. to W. N. FROD, Esq., Putney, the best nine plants; whilst the best six Bouvardiae came from Mr. PEAD.

Mr. FRENCH had in well-fruited, long red Capsicums, the best berried plants; and Mr. MILLHAM the best six double Primulas.

FRUIT.

These exhibits were plentiful and good. The best four dishes of various kinds came from Mr. W. Davies, gr. to J. B. CHAPPELL, Esq., Teddington, who had Alicante Grapes, small Pine, Cox's Orange Apples, and Baurré Diel Pears; Mr. G. H. SAGE was 2nd.

Black Grapes were in fine form, the best, pretty, well-finished Alicante coming from Mr. G. ELLIOTT; Mr. J. BURY, Byfleet, coming 2nd, with other good Alicantes.

The best whites, all being Muscat of Alexandria, were from Mr. Taylor, gr. to S. BAYER, Esq., Forest Hill; Mr. COLE, Feltham, coming 2nd.

There were fifteen lots of six dishes of Apples, Mr. WILL TAYLER, Hampton, coming 1st, with beautiful examples of Cox's Orange, Bibston, and King of the Pippins, Empress Alexander, Annie Elizabeth, and Blenheim Pippin; Mr. Tubbs, gr. to B. CURRIE, Esq., Frimley Manor, Farnborough, was 2nd.

The best four dishes of Pears, came from Mr. DAVIES. He had good Doyenné du Comice, Glou Morceau, Baurré Bosc, and Baurré Dieu.

Mr. C. J. WAITE had the best basket of vegetables.

A nice collection of fruit was shown by Mr. WILL TAYLER; and Messrs. TUTTOK and SHEPHERD, exhibited a capital dish of Héricart de Thury Strawberries from the open ground quite ripe.

FARNHAM, SURREY.

NOVEMBER 12.—This exhibition was held in the Corn Exchange and the Assembly Rooms, each of which was well filled, whilst by judiciously engaging two rooms there was no overcrowding in any section of the show.

Groups were a feature. Mr. Cresswell, gr. to Miss KENNEDY, Aldershot Park, was deservedly 1st, both from point of quality and arrangement. Mr. Gaymer, gr. to Mrs. ANDERSON, Waverley Abbey, Farnham, was a good 2nd.

In another group class for trade-growers only, Mr. MORTIMER, Swiss Nursery, Rowledge, was an excellent 1st with plants not so severely disbudded, each plant bearing several fine flowers, with buds also showing colour. Mr. S. BENE, Alma Nursery, Farnham, who was 2nd, had done even less thinning, this group being very bright and showy.

Specimen Plants were not shown to much extent, but the miscellaneous group by Mr. Butler, gr. to Mrs. MARSHALL, Farnham, was both bright and good.

The Challenge Class for cut blooms was won by Mr. GAYMER; this being the third time he has won the Cup, it now becomes his property. Very fine blooms were noticed in both sections, the best of the Japanese were those of Fairy Wonder, Madame Thérèse Rey, Mr. W. H. Lees. Of incurved, Empress of India, Miss Haggas and Princess of Wales. Mr. Fry, gr. to Sir W. ROSE, Moor Park, Farnham, was a capital 2nd. In another class, also twenty-four Japanese and twelve incurved, these same two exhibitors occupied similar positions.

The best six blooms of one variety of Japanese were those of Vivand Morel, shown by Messrs. DOLLEY & SON; Mr. OSMAN, Ottershaw Park, Chertsey, having six good blooms of Jeanne d'Arc in the incurved class.

The best Grapes were of Blacks, Alicante, shown by Mr. MORTIMER; and of Whites, Muscats, by Mr. OSMAN.

The best vegetables in two classes came from Mr. Pownay, gr. to Colonel FITZROY, Hale Place, Farnham, twelve varieties in each case being required. The best six dishes of dessert Apples were shown by Mr. PRAWELL, gr. to T. J. WOODROFFE, Esq., Frensham; and the best six culinary by Mr. Turner, gr. to R. H. COOMBE, Esq., both exhibits being good.

LIVERPOOL.

NOVEMBER 12, 13.—The autumn exhibition of this Society was held in the St. George's Hall, and was very satisfactory. The quality of the cut blooms of Chrysanthemums was better than has been the case during the last few years. Fruit, usually good at Liverpool, was excellent. The arrangements were very good under the direction of Mr. Dickson, the Secretary. Cut blooms receive most encouragement, and they were staged in large quantity.

The principal prize was that for forty-eight blooms, to be composed equally of incurved and Japanese varieties. There were seven competitors; the 1st prize being somewhat easily won by Mr. J. JULLICOE, gr. to F. GOSSAGE, Esq., Camp Hill, Woolton, with blooms possessing much merit.

The incurved were particularly fine and well staged, and included Lord Alcester, Emily Dale, Queen of England, Beauty, Princess of Wales, and Lucy Kendall. Mr. G. Eaton, gr. to W. H. SHIRLEY, Esq., Allerton House, was 2nd.

For eighteen incurved blooms, Mr. J. HEATON, gr. to R. P. HOBSTON, Esq., M.P., Nursery Road, Aigburth, won with excellent blooms, including leading varieties. Japanese blooms in eighteen varieties were distinctly meritorious, as well were they staged. Mr. J. HEATON again won the premier position with large brightly-coloured blooms. Mr. J.

Williams, gr. to J. PROCTOR, Esq., was 2nd. Mr. C. SHERLOCK, gr. to E. EDMONSON, Esq., Woodlands, Aigburth, won the premier position for twelve Japanese in a brisk competition. Anemone-flowered varieties were best shown by Mr. G. EATON, in the class for six blooms, the centre, or disc, being thoroughly well developed. A like remark applies to the reflexed varieties, also staged by Mr. EATON.

The class for exhibitors who have not previously won a prize at this show was an extremely good one. Mr. J. HEATON staged extraordinary blooms in the class for six incurved, and the same number of Japanese blooms.

Japanese blooms staged with long stems for effect were well shown by Mr. B. CROMWELL, gr. to F. SUTTON TIMMIS, Esq., Cleveley, Allerton, who was 1st. He had good blooms displayed on an extra-sized sloping stand.

PLANTS.

Plants were contributed in large numbers. For three trained specimens, Mr. T. GOMAN, gr. to J. A. BARRETT, Esq., Lynton, Mossley Hill, Liverpool, was 1st with plants freely flowered and not too stiffly trained. For one untrained specimen, Mr. W. LYON, gr. to A. MACKENZIE SMITH, Esq., Luca, Boltonmoor, won.

The best group of Chrysanthemums was from Mr. J. BRACEGIRDLE, gr. to W. H. WATTS, Esq., Elm Hall, Wavertree. The plants were dwarf and carried good blooms, nor were they too closely packed.

Orchids made a pleasing display.

FRUIT, &c.

Fruit formed a remarkable feature. For six dishes Mr. CROMWELL secured the premier award with capital Grapes, Muscat of Alexandria and Alicante, Marie Louise Pears, a Melon, and a dish of Ribston Pippin Apples. Mr. R. HANAGAN, gr. to T. COMBER, Esq., Saughton, Chester, won for six dishes of Pears, and for a like number of Apples. Mr. J. DAVIES, gr. to W. E. KING, Esq., Bodenham Manor, Leominster, was an easy 1st with beautifully-coloured examples. Exhibits of Grapes were numerous and good. For four bunches, distinct, Mr. T. ELSWORTHY, gr. to A. R. GLADSTONE, Esq., Court Hay, Roby, won the premier position with excellent examples of Alicante, Alanwick Seedling, Golden Queen, and Muscat of Alexandria.

Messrs. P. P. KERR & SONS staged a remarkably fine lot of Cyclamans, and the Liverpool Horticultural Society had Orchids in variety.

THE WEST OF ENGLAND CHRYSANTHEMUM.

NOVEMBER 12, 13.—The annual exhibition of the above Society took place on Tuesday and Wednesday, at the Plymouth Guildhall, and in every way the show was a great success. This year, by a better system of grouping and arrangement, the whole of the exhibits are placed in the hall, and the result has been a finer effect, and it gave much greater pleasure in viewing the show as a whole.

CUT BLOOMS.

The entries in the majority of the classes were numerous, and as a consequence the competition was very keen, so much so that in several instances it was but by a matter of a few points only that the winners secured their coveted positions.

In the class for Horticultural Societies within the four counties of Devon, Somerset, Dorset and Cornwall, the class being for thirty-six blooms, to consist of twenty-four Japanese and twelve incurved, the Teignmouth Horticultural Society was awarded 1st, the 2nd falling to that from Newton-Abbot. The class for forty-eight Japanese, not fewer than twenty-four varieties, was a very strong one, the flowers all through being exceptionally fine. The premier position was ultimately awarded to J. B. FORTESCUE, Esq., Boconnoc, Cornwall (gr. Mr. C. Page). Here we noticed Mrs. J. DENNE, G. C. SCHWABE, E. MOLYNEUX, Violetta, and Col. Chase amongst the best. H. HAMMOND SPENCER, Esq., Teignmouth (gr. Mr. G. Foster), was 2nd, having, amongst others, Madame Carnot, Mrs. C. H. Payne, and Richard Dean, very fine. W. HERBERT FOWLER, Taunton (gr. Mr. G. Hawkins) was third; his Silver King, Viscountess Hambleton, L. E. SAUNDERS were especially fine in a very good display.

For twenty-four incurved blooms, H. HAMMOND SPENCER was 1st, C. G. PRIDEAUX BRUNE, 2nd. The incurved blooms were mostly neat, pretty flowers; but every season, classes for these seem to suffer in size, through the greater size of the leading Japanese flowers.

For six Japanese white, W. HERBERT FOWLER, was well 1st with grand blooms of Madame Ad. Chaton; and H. HAMMOND SPENCER 2nd with Madame Carnot.

For six Japanese, any colour but white, J. B. FORTESCUE, Esq., was 1st with M. Panckoucke; and Miss FRIPP, 2nd with Duchess of Wellington.

Twelve Japanese, T. WILKINSON was 1st, beating numerous competitors; and W. H. VEALE, 2nd.

The class for twenty-four blooms Japanese and incurved was well filled, but the immense size of the former kinds, placed in close proximity to the smaller incurved varieties, somewhat detracts from the interest of this class. Sir JAMES JENKINS, Mannamead, was 1st, whilst G. HAWKES, and H. ENDICOTT, gr. to Mr. E. ALLEN, Ivybridge, were close up as 2nd and 3rd.

Several classes of cut blooms were set apart for amateurs, and 1st prizes were secured by T. F. USHER, and other

awards falling to J. NEWTON, F. M. BRIDSON and GEORGE HOSKIN.

O. FOSTER was awarded 1st in a special class where the prizes were offered by Mr. W. J. Godfrey, of varieties sent out in England during 1894-5 to include Mrs. W. J. Godfrey and Miss Rita Schroeter.

GROUPS.

A number of these were arranged round the Hall, and in the principal class filling a space of 100 square feet, Mr. C. WATTS, Plymouth, was 1st, with a fine display, the quality good, and arrangement and general effect most pleasing. Some Crotens, Bamboos, Eulalias and Ferns were used with discrimination and advantage. Mr. Chelwell deserved praise for his arrangement; and W. B. Greenslade, gr. to A. GROOMBRIDGE, was placed 2nd.

Other groups confined to residents within 15 miles of Plymouth, were shown by BENNETT BROS., who were first, and Mr. W. B. GREENSLADE, 2nd. Primulas were shown by Dr. SQUARE, who was 1st, and Sir JAMES JENKINS, 2nd; whilst for some double Primulas, Major-General CAMPBELL was 1st; Mr. S. H. PHILLIPS, 2nd.

MISCELLANEOUS.

Some nice Orchids were shown, including fine varieties of *Cattleya labiata*, *Cymbidiums*, *Cypripediums*, *Dendrobium Phalenopsis*, &c., the 1st prize falling to Dr. ALDOUS, Mannamend; 2nd to F. H. HONORS.

Some fine collections of Apples and Pears were staged by Miss FRIPP, 1st; and Mr. F. BRADSHAW, 2nd. Grapes were only represented in one class, Mr. G. CHAMBERLAIN, Ivybridge, 1st; Mr. C. NORRINGTON, Abbotshfield, 3rd.

Prizes for vegetables were offered by Mr. W. J. GODFREY and JARMAN & Co., Chard, the 1st prize in both classes being secured by Mr. F. BRADSHAW; Mr. G. WATTS being successful with Mr. Lethbridge prize, and Lady WALKER securing that offered by Messrs. Sutton & Co., Reading. Messrs. A. T. Westlake, Plymouth, J. Lethbridge, W. Thorn, South View Nurseries, Compton, Messrs. Jarman & Co., Chard, and Messrs. Veitch & Son, Exeter, staged groups not for competition, the latter having many choice Orchids, amongst them being a number of plants of *Cypripedium Charlesworthii*, and good forms of *Cattleya labiata*. Mr. W. J. Godfrey had a fine stand of new and choice Chrysanthemums, as well also as a pretty display of Carnations, including the new ones recently sent out by him.

DEVON AND EXETER GARDENERS' ASSOCIATION.

NOVEMBER 13.—At the meeting held on Wednesday, presided over by Mr. P. C. M. Veitch, and well attended by the members of the association, the Rev. Dr. Dangar (Principal of the Diocesan Training College at Exeter), gave a lecture on "Carnations," and their propagation and cultivation.

In the course of his remarks he said, with regard to the mode of propagation, three methods at once presented themselves—(1) by seeds, (2) by cuttings, (3) by layers. As to raising from seed, this at once raised the question as to what seed one meant to sow. In England it was difficult to raise seed at all from double flowers. In some few especially favourable seasons this could be done, but the large growers on the Continent had the best chance by reason of their long summers. To attempt to raise Carnation seed under glass generally ended in failure. They needed out-of-door treatment. But given the seed, they should sow in a cool frame early in February in a box containing crocks in the bottom, a layer of well-rotted turf, and on the top a compost of loam, sand, and dung finely sifted. One should sow in rows, water after sowing, and place in a cool frame, quite at the top and near the glass. Much sun-warmth was required, and plenty of air. His plan described above gave both. The moment that weeds appeared they should be pulled up. In May, or early in June, the plants would be quite large enough to handle, and to be potted into 3 or 4-inch pots, and placed back in the same frame. There they should remain until the pots were nearly, but not quite, full of roots. It was best to plunge the pots in ashes—(a) to draw the warmth, and (b) to keep out worms, slugs, &c. In September, or possibly earlier, but in a rainy time, plant out, and in the following July the plants would bloom. They could not force nature; if they sowed the seed in autumn, as soon as it was ripe the plants would come up, but they will not, as a rule, get a flower worth looking at until the following July year. Some people said it was a mistake to increase Carnations by cuttings. That was not his experience. He took his cuttings at the end of the first week of summer rain, so as to get some growth in the grass. If potted singly in four-inch pots, with the same compost as had been detailed above, and if well pressed down into the soil, a very large percentage would strike. They should be placed in a cool frame, previously well lime-washed, and rendered free from insects, and the cuttings should be kept just damp. Most of them would strike in two or three months, but some might remain dormant until the spring. Layering, known to all Carnation growers, was the one usually adopted, but the lecturer said he thought it not so satisfactory as cuttings, especially in very light land, where the damp was so apt to run out of the surface soil, nor in land infested by slugs or other depredators. They were all fond of the soft tissues of Carnations. As to planting out, into blooming quarters,

growers would have noticed how constantly it happened that beds of Carnations on the flat, where over-much water was provided on a clay soil, did badly, whereas those on a bank did well. In a very hard winter whole beds on a slope had escaped when those on the level had perished. A Carnation is a capricious plant, but, after all, one of the most beautiful flowers.

CARDIFF CHRYSANTHEMUM.

NOVEMBER 13, 14.—The ninth exhibition of this society was held on the above dates in the Park Hall, Cardiff. The show of Chrysanthemum blooms was more than usually good, particularly the Japanese varieties, and the competition in many of the classes was very keen. The groups were excellent, and devices, bouquets, &c., of the florists' art, remarkably tasteful; making, as is always the case at Cardiff, a fine feature of the exhibition.

Messrs. PAELPS & Co. and CASE BROTHERS, both of Cardiff, had fine large displays in this way, and were suitably awarded a Silver Medal. Mr. W. J. GODFREY, Exmouth, and Messrs. CLIBRAN & SON, Altrincham, each exhibited several stands of cut blooms of Chrysanthemums, many of them being extra good novelties; Aroma, the variety shown by Mr. GODFREY, being singled out for special award; as also Messrs. CLIBRAN'S Lord Lisburne, a good Japanese of terra-cotta colour, and Messrs. CUTBUSH and Sons' Mrs. Bick. In the fruit classes Apples were well shown. Mr. J. WATKINS and Messrs. CRANSTON had collections similar to those shown by them at Hereford last week. Amongst Mr. WATKINS' dishes a new kitchen or dessert variety, named Lady Emily, was conspicuous. It is of middle size, of handsome colour, good quality, and said to be a heavy cropper. He also had Byford Wonder in splendid condition.

CHRYSANTHEMUMS, CUT BLOOMS.

For Twenty-four Japanese distinct.—1st, Mr. G. W. DRAKE, Catharp-terrace, Cardiff, with grand blooms of Madame Carnot, Mrs. H. Payne, W. H. Lincoln, Robert Owen, Madame A. Mohin, &c. 2nd, R. A. BOWRING, Esq. (gr. Mr. H. A. Joy), whose best blooms were, Madame Carnot, Etoile de Lyon, Chas. Davis, Viscountess Hambleton, and Lord Brooke.

Twenty-four Incurred Varieties, distinct.—1st, Earl of LISBURN, Cross Wood Park (gr. Mr. Williams), with well-finished blooms of Prince Alfred, Miss M. A. Haggas, John Lambard, Mrs. Robinson King, Princess of Wales, &c. 2nd, Sir C. E. G. PHILLIPS, Picton Castle (gr. Mr. Dumble), with good blooms of favourite varieties.

Twelve Japanese varieties, distinct.—1st, J. C. HANSBURY, Esq., Pontypool (gr. Mr. J. Lockyer), with fine well-coloured blooms of Edwin Molyneux, Mrs. H. Payne, J. S. Dibbens, Vivand Morel, Chas. Davis, Etoile de Lyon, &c.; 2nd, R. A. BOWRING, Esq., with Lord Brooke, Duke of York, Duchess of York, Madame Carnot, Mlle. T. Rey, &c.

Twelve Incurred varieties, distinct.—1st, J. MASTERS, Esq., Lanely (gr. Mr. J. Howe), with good Princess of Wales, Golden Empress, Mrs. J. Gardener, Miss M. A. Haggas, Lucy Kendall, &c.; 2nd, Sir C. E. G. PHILLIPS, with Baron Hirsch, &c.

Twenty-four distinct blooms, for which a Challenge Cup, value £5 5s. was offered, to be won twice before it comes the property of the exhibitor. A similar cup was won last year by Sir C. E. S. PHILLIPS. 1st, R. W. D. HARLEV, Esq., Hereford (gr. Mr. Robinson), with grand blooms of Madame Carnot, Vivand Morel, Niveum, Duke of York, E. Molyneux, Mons. Panckoucke, Miss D. Shed, Mrs. H. Payne, Mons. C. Mofin, Empress of India, Golden Empress, Lord Alcester, and Queen of England. Madame Carnot in this stand was selected as the best bloom in the show, and was awarded the N. C. S. certificate; 2nd, Sir C. E. G. PHILLIPS, who also had a splendid lot of well-finished blooms.

The N.C.S. certificate offered for the best Chrysanthemum plant in the show, was won by R. DEAN, Esq., Newport, with a well cultivated, and profusely-flowered plant of Louis Boehmer.

LEWES CHRYSANTHEMUM.

NOVEMBER 13, 14.—Both the Town Hall and Corn Exchange were filled with good exhibits; but the cut flowers and miscellaneous groups formed the features of most interest. Groups of Chrysanthemums were generally not good.

The group covering a space of 60 square feet placed Mr. C. Fennell, gr. to Mrs. THORNE, The Grange, Lewes, 1st. It was a closely-arranged lot. The mixture of Ferns, stove and greenhouse plants, was well done, Mr. J. Adams, gr. to the Rev. Sir G. SHIFFNER, Coombe Place, Lewes, was 2nd.

Cut flowers caused strong competition, and in the class for 24 Japanese, Mr. J. HARWOOD was 1st, and Mr. A. SLAUGHTER, 2nd, in a very strong class. Mr. J. HEASMAN, gr. to Mrs. OXLEY, Turner's Hill, was a good 1st for 24 incurved varieties, and Mr. C. Sayers, gr. to the Misses COOK, Nutley, was 1st for 12 of these varieties. Mr. A. SLAUGHTER, Jarvis Villa, Steyning, put up a grand lot in a class for 12 Japanese, and Mr. J. Coles, gr. to H. F. WALKER, Esq., Balcombe, beat him for 6 Japanese distinct. The competition in these two classes was strong. Mr. J. HEASMAN, was 1st for 6 incurved distinct; and Mr. J. Hopkins, gr. to Mrs. THORNTON, Framfield, a good 1st with grand blooms of Empress of India in a class for six of one variety. In a strong amateur's class, Mr. A. SLAUGHTER was 1st for 6 Japanese.

HULL CHRYSANTHEMUM.

NOVEMBER 13, 14.—Many fine exhibitions have been held in the Artillery Barracks under the auspices of the Hull Chrysanthemum Society, but never has there been one of better quality throughout than this one. Messrs. Harland & Dixon are to be congratulated upon their success. Cut blooms though perhaps slightly less numerous than on some previous occasions, were better in quality than ever.

In the class for twenty-four incurved blooms there was a brisk competition, and Mr. W. H. LEES, gr. to F. A. BEVAN, Esq., Trent Park, New Barnet, won 1st place with a clean lot of medium sized splendidly staged blooms. Mr. J. P. Leadbetter, gr. to A. WILSON, Esq., Tranby Croft, Hull, was 2nd. For twelve incurved, similar positions were taken by these two exhibitors.

Japanese classes were much the stronger. In that for twenty-four blooms, distinct, Mr. LEES was invincible. A bloom of M. Panckoucke was awarded the premier position in the show as the best Japanese bloom. Messrs. J. P. PEARSON and Sons, Chilwell, Notts, exhibited well, and were 2nd. In the class for twelve blooms, Mr. H. Thompson, gr. to C. J. RINGROSE, Esq., Cottingham Grange, Hull, was 1st with a good collection. For thirty-six blooms in twelve varieties, to be shown in vases, three in each, Mr. LEADBETTER made a creditable display, and was 1st. Anemone-flowered varieties were especially well shown by Mr. F. Mason, gr. to A. SMITH, Esq., Woodleigh, Hessle. Mr. R. Walker, gr. to Col. CLITHEROW, Hotham Hall, Brough, had extremely fine specimens of reflexed varieties in his first prize stand of twelve blooms; Mr. WALKER also presented the best Pompon blooms. Mr. WELLS, Earlswood Nurseries, had a remarkably fine stand of single-flowered varieties. Amateurs staged very commendable stands of blooms in classes set apart for them.

PLANTS.

Specimen plants formed a prominent feature of the show. Vast improvement was shown in this section. For three trained plants, any varieties, Mr. J. Clark, gr. to A. MAYFIELD, Esq., Beverley Road, Newland, Hull, was 1st with freely flowered and not too formally trained specimens. Mr. F. POPE, Butcher Row, Beverley, had six really meritorious examples of bush-grown plants in the class for that section. "Cut-back" plants receive considerable encouragement here; for six of these Mr. C. C. Coates, gr. to W. WHEATLEY, Esq., Anlaby Road, Hull, 1st, the plants being but a little over 3 feet high and carrying good blooms.

GROUPS AND TABLE DECORATIONS.

Groups of Chrysanthemums interspersed with foliage plants are exhibited splendidly at Hull. A Challenge Vase value twenty guineas being annually offered in this class Mr. Coates was successful on this occasion for the third time and the vase now becomes his property. Five extreme good groups were entered. Not only is the arrangement praiseworthy in these groups, but the plants employed are of the highest quality, producing a splendid effect, arranged as they are around the sides of the central building. Miscellaneous plants arranged for effect added much to the interest of the show. Mr. G. Wilson, gr. to Sir J. RICKITT, Bart., Swanland Manor, Brough, exhibited one of the most effective groups possible, and secured the premier award.

Table decoration under artificial light adds to the interest of the show, open as the competition is to ladies only.

Upon this occasion Mrs. F. TOPHAM, Hotham Hall, Brough, was the most successful exhibitor, Mrs. T. FAWLEY JUDGE, Helmsley, Cottingham, following, both having tastefully-arranged tables.

BOURNEMOUTH AND DISTRICT CHRYSANTHEMUM AND HORTICULTURAL.

NOVEMBER 13, 14.—This admirably managed society held its annual exhibition of plants, cut blooms, fruits, vegetables, &c., in the Winter Gardens attached to the Hotel Mont Doré, Bournemouth, on the above-mentioned dates, and must be pronounced as one of the best hitherto held by the society, a fact which redounds to the credit of the excellent committee and energetic secretary (Mr. James Spong) and every one connected with the show.

CUT BLOOMS.

The class for 36 cut-blooms, one-half Japanese and the others incurved, and not more than two of any one variety, was well won by Mr. N. Molyneux, gr. to J. CARPENTER GARNIER, Esq., Rooksbury Park, Fareham, Hants; Mr. Woodford, gr. to Major BLOUNT, and Mr. Prosser, gr. to H. J. MILES, Esq., The Knolls, Wimborne, 2nd and 3rd.

Mr. Grace (gr. to W. R. NEAVE, Esq., Fordingbridge) had the best stand of twelve Japanese, distinct varieties, including, among others, very fine blooms of Colonel Smith, President Borel, and Madame Carnot. Seven lots were staged in this class. Mr. N. Molyneux led in the corresponding class for a like number of incurved blooms, staging very fine specimens of popular varieties. Mr. GRACE taking 2nd place with a good even lot of blooms.

Mr. Boots, gr. to F. RICARDO, Esq., had the best 6 blooms

of Japanese (grand examples of Vivand Morel) as well as the best 6 blooms of incurred (Hero of Stoke Newington). Mr. GRACE coming in 2nd in each class with Vivand Morel and Robert Petfield in fine form. Mr. BOOTE was also 1st out of six stands staged for 12 Japanese, distinct, to which stand the N. C. S. Bronze Medal was also awarded. Charles Davis, Mons. H. Payne, Etoile de Lyon, and Vivand Morel being the most prominent blooms in this stand.

GROUPS, covering an area of 100 square feet in the open and 50 square feet in the amateur classes, were remarkably good. The plants were well-grown dwarf, clothed with large, rich-looking foliage from the pots upwards, and surmounted with large, fresh, fine blooms. In the open class, foliage plants were allowed in the arrangement, Messrs. G. WATTS & SONS, Palace Nurseries, Bournemouth, were accorded premier position; Mr. INGRAM, Parkston Nurseries, taking 2nd place. The 1st and 2nd prize groups were very close to each other in point of merit.

Mr. W. STRETCH put up a grand group in competition for the Challenge Cup; Mr. G. Eldridge, gr. to G. W. YOUNG, Esq., was a good 2nd.

GRAPES.—Mr. J. MENZIES, South Lytchetts, Pool, had the best 3 bunches of Grapes in the open classes in Gros Colmar, fine in bunch, berry, and colour; and Mr. Mitchell, gr. to J. W. FLEMING, Esq., Chilworth Manor, Romsey, was 2nd, with Black Alicante. Mr. James Chalk, gr. to Geo. READ, Esq., Westwood, Salisbury, had the best 3 bunches of white Grapes, showing Muscat of Alexandria good in every respect; and Mr. MITCHELL was second. Mr. MENZIES was a successful exhibitor in the minor classes for Grapes.

APPLES AND PEARS made a good show. Mr. Osborne, gr. to Rev. H. HOPKINS, took 1st for three dishes dessert Apples, and Mr. Masley, gr. to Miss EVANS, was 1st for a like number of dishes of culinary varieties, the former staging excellent fruits. Pears were creditably shown by Mr. MENZIES and others. Vegetables were shown in great quantities, and in fine condition.

TUNBRIDGE WELLS, MID-KENT, AND EAST SUSSEX CHRYSANTHEMUM.

NOVEMBER 13, 14.—A pretty show was arranged in the Corn Exchange and Assembly Rooms. Groups of Chrysanthemums and others of mixed plants were very good, but specimen plants were poor. Nor were the Solanums and Poinsettias so good as usual. Taken collectively, there was considerable falling-off in the cut-flower classes, some of these, including that for twenty-four incurred blooms, not obtaining one competitor.

A Silver Cup for eight plants in pots, not to exceed 12 inches in diameter, was secured by Mr. J. Smoother, gr. to Mrs. HALL, Broadwater Down. A second Silver Cup for a group 12 feet by 8 feet, occasioned considerable competition, and the winner, Mr. J. Howes, gr. to W. COBB, Esq., Dulcote, Broadwater, had plants carrying really fine blooms. This group was more formal than that from Mr. J. SMOOKER, who was 2nd, but the flowers were better.

A group of miscellaneous plants from Mr. Berwick, gr. to J. GODDEN, Esq., Tunbridge Wells, was prettily arranged; but that from Mr. L. Dupond, gr. to C. B. POWELL, Esq., Southborough, was even more tasteful in arrangement, yet lacking in colour. For six dwarf-trained plants, Mr. J. SMOOKER was well in front, also for single specimens of incurred and Japanese.

CUT BLOOMS.

Nine competed in a class for twelve Japanese cut blooms, Mr. J. Howes, gr. to W. COBB, Esq., Broadwater Down, being 1st with some grand blooms, although closely followed by others that gained no award. The exhibits in this class were to be arranged on a table 4 feet by 2½ feet, with Ferns and other foliage for effect. The result was a very pretty lot, but we could not agree with the judges in their 2nd award. The blooms were not good, but the arrangement far behind that in others.

Twelve incurred blooms were shown in good form by Mr. J. Legg, gr. to Rev. E. H. BOARDMAN, Groombridge, who was followed by Mr. C. HARRIS, gr. to O. A. SMITH, Esq., Hammerwood, East Grinstead; Mr. J. SNOW, The Gardens, Wadhurst, being 1st for six varieties.

Mr. HARRIS was 1st for twenty-four Japanese, closely followed by Mr. J. W. Moss, gr. to Mrs. ROBINSON, Matfield. For twelve Japanese, Mr. E. Dove, gr. to J. W. HARCASILE, Esq., Hill Court, Edenbridge, won; Mr. HARRIS again coming in front for six blooms; and Mr. J. SNOW for six of any one variety, with Mrs. H. Payne.

MISCELLANEOUS CLASSES.

For six berried plants, Mr. G. TICKNER won with a well-grown lot of Solanums; and Mr. W. AUSTIN was in front for six Poinsettias.

A class for six Orchids brought out some good pieces from Mr. C. Earl, gr. to Sir J. GOLDSMID, Tonbridge; and Mr. J. Howes, gr. to W. COBB, Esq., Broadwater Down.

Fruit was bright and sound, but not numerous. Mr. F. Bridger, gr. to Lord DE LISLE, Penhurst, was almost invincible in these classes, taking premier honours for six dishes of dessert Pears, and for three dishes of the same; for six dishes of dessert Apples, for one dish, and for six dishes of cooking Apples. Mr. LEGG was 1st for three dishes of dessert Apples; but Mr. BRIDGER again came to the front for three dishes of kitchen Pears, and also for a similar quantity of cooking Apples.

Vegetables were very good, the 1st prize for a collection

open to members only, going to Mr. W. H. Wickens, gr. to J. WHEELWRIGHT, Esq., Nevill Park, who just beat Mr. STANDEX.

Mr. J. CHARLTON put up a grand collection of vegetables and horticultural sundries not for competition and a good lot of fruit came from Mr. A. Wilson, gr. to the Marquis of ABERGAVENNY, Eridge Castle.

BRISTOL CHRYSANTHEMUM.

NOVEMBER 13, 14.—The above show was a great success in every way. Exhibits were good and numerous, competition being in most cases keen. Cut flowers and specimen plants, likewise groups, were well done. The show was varied by the introduction of classes for miscellaneous plants and flowers. Great interest was taken in the competition for the Challenge Vase, value 12 guineas, £5 being added to the 1st prize. This was well won by Captain MARLING (gr., Mr. McDonald), who was also successful in other classes.

Fruit was well shown also, the various classes being well filled; the Grapes, although not sensational, were of good quality; likewise the Apples and Pears.

The vegetable competition being strong, for the special prizes offered by Messrs. SUTTON & SONS, drew a strong competition of first-rate quality; as did also those offered by the Society, Messrs. BROWN & SON, Messrs. W. GARRAWAY & CO., and others.

LICHFIELD CHRYSANTHEMUM.

NOVEMBER 13, 14.—The second exhibition was held on the above dates in the St. James's Hall. The Mayor, T. Ashmall, Esq., informed the large audience that Lichfield had held flower shows without a break for seventy successive years. Judging from the present display the exhibition should become a popular one.

The best group of Chrysanthemums (open) was one from General DYOTT, Freefold Hall (gr., Mr. Dix), who showed well-grown plants of Vivand Morel, W. Seward, Mrs. H. Payne, Beauty of Exmouth, and others. 2nd, W. F. GORDON, Esq.

Plants of Japanese varieties, distinct, were best from Sir CHARLES FOSTER, Bart., Longdon; 2nd, General DYOTT.

Plants of Chrysanthemums suitable for table decoration were good from Mr. A. O. WORTHINGTON; and a group of miscellaneous plants from Col. SWINPIN BROWNE, Lichfield, containing nice specimens of Cattleyas and Dendrobiums, with Palms, Crotons, &c., was deserving of commendation.

The best twelve cut blooms of Japanese Chrysanthemums were from General DYOTT; as was also the best collection of twelve cut blooms incurred.

Of Fruit, there was a large display in the class for two bunches of Black Grapes. Mr. JOSEPH HARVEY was 1st.

Apples, in three dishes, dessert varieties, were good from General DYOTT. Mr. C. H. INGE won for three dishes of kitchen Apples.

General DYOTT was 1st for a collection of vegetables in eight dishes.

Amongst the non-competitive exhibits, Messrs. RIVERS & SONS, Sawbridgeworth, had fine collections of Apples and Pears.

EDINBURGH BOTANICAL.

NOVEMBER 14.—The first meeting of the sixtieth session of this Society was held at 5, St. Andrew Square, on the evening of Thursday, Professor F. C. Bower in the chair. Owing to the unfavourable weather prevailing the attendance was small. After the election of office-bearers for the session, which were balloted for and elected unanimously as proposed by the Council, the public business was proceeded with.

The principal item on the list was the address by the retiring President, Professor F. C. Bower, F.R.S., who gave a paper on the life and work of Robert Brown; and in a very interesting manner pointed out the important work and principal traits in this great botanist's life, from his earliest efforts. The death of Professor Babington, who was one of the early members of this Society, was noticed with sympathetic regret, and Professor Bower was asked to furnish an obituary notice of this old and celebrated botanist, for the Society's Transactions. In the absence of the writer, Dr. David Paul, a communication on "Fungi observed in Glen Urquhart, Inverness-shire," was read by the Assistant-Secretary, Mr. J. TERRAS, B.Sc., which, from the list given, seemed to be a happy hunting-ground for these forms of plant-life. The Assistant-Secretary also read the Report of Vegetation made in the Royal Botanic Garden by the Curator, Mr. R. Lindsay, for the past three months. During October, it was found that plants in flower were much injured by frosts, the following having during the month come into bloom in the rock-garden, viz., *Campanula garganica*, *Morina longiflora*, *Stachys densiflora*, *Verbascum Chaixii*, *Helleborus niger grandiflorus*, and *Veronica Bachofenii*.

In the meteorological observations recorded at the Royal Botanic Garden during October, the following few items from Mr. A. D. Richardson's report were noted. The mean of barometer readings reduced to 32°, and taken at 9 A.M., was 29°708 inches, or the same as the average for five previous years. The highest reading of the protected maximum thermometer

was 62°8, on the 1st; minimum, 25°2, on the 24th. Frost occurred on six days. Hygrometer in screen: Mean of dry-bulb, 41°1; wet-bulb, 41°8; dew point, 35°6. Radiation thermometer: Maximum in sun, 107°7, on the 12th; minimum on grass, 14°9, on the 28th. Frost occurred on grass on eighteen days. Rain, &c., fell on seventeen days. Total fall, 3·230 inches. Greatest fall in twenty-four hours, 0·620 inches on the 1st. A few plants and specimens from the houses of the Botanic Garden were exhibited, including *Melastoma malabathrica*, *Vitis heterophylla humulifolia*, *Vanda Kimballiana*, and others; and notes upon plants of interest therein, were read by Mr. R. L. Harrow. The new President for the session, Dr. A. Aitken, M.A., D.Sc., &c., occupied the chair during part of the evening.

EALING HORTICULTURAL.

NOVEMBER 14.—The eighteenth annual exhibition of Chrysanthemums, &c., took place in the Victoria Hall on the above date, bringing together a satisfactory display, both of plants and cut flowers.

The 1st prize and Silver Medal of the National Chrysanthemum Society for a group, arranged for effect, was well won by Mr. C. Long, gr. to E. P. OAKSHOTT, Esq., Orchard Dece, who was also placed 1st for three specimens (incurred, Japanese, or reflexed), with finely-flowered plants of John Shrimpton, and E. Beckett. A good 2nd was Mr. C. Edwards, gr. to W. OWEN, Esq., The Elms. In three Pompons, Mr. LONG was again well to the front, with Sœur Melanie, Mr. Westlake, and Antoinette, closely followed by Mr. C. EDWARDS.

CUT BLOOMS.

Twelve incurred: a grand lot of flowers of well-known varieties gained the premier position to Mr. C. EDWARDS, whilst scarcely inferior were the blooms staged by Mr. C. LONG.

Six incurred.—1st Mr. H. Knightley, gr. to — ROBINSON, Esq., Southall; Lord Wolsey and Miss M. A. Haggas, amongst others, were here shown well.

Mr. C. EDWARDS was 1st for twelve Japanese varieties, very good being those of C. H. Payne, Beauty of Castlewood, and Silver King.

Nine Japanese.—A fine lot of flowers gained Mr. C. EDWARDS the 1st prize, noteworthy being Madame Carnot, Philadelphia, and Lord Brooke.

Six Japanese.—The leading prizes here were won with fine blooms by Messrs. LONG and EDWARDS, who maintained the same positions in the class for three Japanese.

Twelve hunches, Pompons.—This was a pretty class, Mr. C. EDWARDS being placed 1st; and Mr. C. LONG 2nd.

In Pompons, some fine flowers were contributed by Mr. W. Roberts, gr. to J. HARRIS, Esq., Braemar, noteworthy being Prince of Orange, W. Westlake, and Sœur Melanie.

The two Medals for premier blooms (Japanese and incurred) were awarded to Mr. C. EDWARDS, who staged in the former a fine flower of Lord Brooke, and in the latter a well finished bloom of Lady Dorothy.

WINCHESTER.

NOVEMBER 14, 15.—An excellent show was held in the Guildhall on the above dates, of which cut blooms formed the more important part.

The winner of the 1st prize in the highest class both for forty-eight Japanese and incurred, in eighteen varieties, was Mr. NEVILLE, gr. at Twyford, Winchester. His blooms were of middle size, and neatly staged. Mr. J. AGATE was 2nd.

Mr. J. Bowerman, gr. to C. HOARE, Esq., Hackwood Park, Basingstoke, was the winner in the twenty-four cut bloom class, Japanese, with a very even stand; and Mr. G. Best, gr. to F. D. LEYLAND, Esq., The Vine, Basingstoke, was 1st for twelve Japanese, distinct. Mr. N. Molyneux, gr. to J. C. GARNIER, Esq., Rookesbury Park, Farnham, succeeded in gaining the 1st prize for twelve incurred, with medium-sized, neatly-finished examples.

Single-flowered and Pompon varieties were best shown by Mr. AGATE. For the former he received a Certificate of Merit, and for the latter he won premier place.

Plants.—Specimen plants were best staged by Messrs. H. & J. VANE, who were 1st in all the classes. The best group of Chrysanthemums was a good one from Mr. G. H. Street, gr. to Dr. FEARON, The College, Winchester. Mr. ELAN, gr. to W. A. GILBERT, Esq., Fair Oak Lodge, Bishopstoke, arranged a nice group of miscellaneous plants.

Messrs. HILLIER & SON, Winchester, had a meritorious collection of Apples and shrubs; Messrs. JEFFRIES, miscellaneous plants; Mr. B. LADHAMS, Shirley, wreaths, bouquets, &c. By far the finest exhibit, not for competition, was that from Mr. E. Molyneux, gr. to W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham, who staged several dozen cut blooms, Japanese and incurred, along with two dozen hunches of single and Pompon-flowered varieties in vases.

WIMBLETON AND DISTRICT HORTICULTURAL.

NOVEMBER 14, 15.—This exhibition took place on the above dates, and there was good competition in most of the classes. A praiseworthy feature was made by the groups of plants in flower. In the cut bloom section some of the Japanese flowers were very fine, but incurred varieties were not remarkable.

A Silver Cup, given by the tradesmen of Wimbledon for a group (semi-circle, 10 feet in diameter) was well won by Mr.

S. Mynett, gr. to J. CARLISLE, Esq., Ashburton House, Putney Heath; the Japanese flowers in this collection were excellent. A good 2nd was Mr. A. Newell, gr. to Sir E. SAUNDERS.

In the class for a smaller group, a bright lot of plants secured 1st position to Mr. F. Kiehl, gr. to R. T. BAYNES, Esq., Glenovarne, who was closely followed by Mr. G. Coleman, gr. to G. T. GILES, Esq., Copse Hill House.

A group from which Pompons were excluded, and open only to cottagers who must have grown the plants from cuttings, was remarkably well shown by Mr. C. HULL, Denmark Road. The best specimen large-flowered plant was one of Colonel W. B. Smith, shown by Mr. W. Thornton, gr. to T. E. CROCKER, Esq., Draxmont; 2nd, Mr. C. Bentley, gr. to Captain BOSWORTH, Roehampton.

Cut blooms.—An important class was that for twenty-four incured and twenty-four Japanese blooms, and a grand collection from Mr. W. Mease, gr. to A. TATE, Esq., Downside, Leatherhead, gained the 1st prize. Amongst some of the best Japanese were Madame Hoste, Madame Thérèse Rey, Silver King, and Golden Gate. Incured, B. Petfield, Queen of England, Chas. Gibson, C. H. Curtis, and Empress of India.

Mr. MEASE was well to the front again for twelve Japanese and twelve incured blooms, in the former section he had fine flowers of Etouille de Lyon, Marie Hoste, and Golden Gate. Amongst the incured were Princess of Teck, Hero of Stoke Newington, and Golden Empress of India; 2nd, Mr. A. Ratcliff, gr. to J. B. JOHNSTONE, Esq., Coombe Cottage, Kingston.

Twelve incured blooms were shown best by Mr. A. RATCLIFF, the blooms of Flora Macdonald, Lord Rosebery and Lucy Keedall were good; Mr. W. J. Wright, gr. to H. A. TUFFNELL, The Grove, was 2nd.

Mr. A. Alderman, gr. to C. CZERNIKOW, Esq., Effingham Hall, Dorking, had the best twelve Japanese, and included amongst others, fine blooms of Mille, Marie Hoste, Sunflower, and Madame Ricourd. A good even lot of flowers securing 2nd place, was staged by Mr. A. Skeggs, gr. to Mrs. DAUS, Copse Hill. The last-named exhibitor had premier place for six incured; Mr. C. BENTLEY being 2nd.

Mr. A. ALDERMAN had very fine blooms in the class for six Japanese; and Mr. A. SKEGGS was 2nd.

The best six Japanese of one variety, were of Robert Owen, from Mr. G. Mileham, gr. to A. T. MILLER, Esq., Emlay House, Leatherhead. 2nd, Mr. A. SKEGGS, with Mille, Marie Hoste, Mr. W. J. WRIGHT won for six large Anemose-flowered varieties; the best were W. W. Astor, Sir W. Rae, and Madame Ghyb.

The six best reflexed were from Mr. MEASE, and fine flowers were noted of Cloth of Gold, and various coloured Christines. A very pretty class was that for twelve Pompons, and good flowers of Mille, Martha, President, Antonius, Aglais, and others, secured the 1st prize to Mr. W. J. WRIGHT, who was closely followed by Mr. C. BENTLEY.

In the section for amateurs who do not employ a gardener regularly, some good blooms were shown. The leading prize-winner for twelve incureds here was Mr. G. WALKER, jun., Lingfield Road. Mr. W. G. P. CLARK, Hitchin, won for six incureds. The best twelve Japanese were from Mr. W. G. P. CLARK; 2nd, Mr. E. H. DOUET, Surbiton. Mr. CLARK led also for six Japanese, the best being W. H. Lincoln and Vivand Morel; 2nd, Mr. J. BROWN, South Wimbledon. Six Japanese, of one variety, were well shown by Messrs. CLARK and BROWN, who had Vivand Morel, and won in the order named.

The classes devoted to cottagers brought out some good flowers.

Miscellaneous.—There was a good competition in the class for Primulas, the principal prizes being taken by Mr. A. NEWELL and Mr. T. P. Macgregor, gr. to Dowsager Lady HAY, Putney Hill. The best group of miscellaneous plants was from Mr. R. Bradford, gr. to W. HOPE HALL, Esq., Addington, Wimbledon; 2nd, Mr. T. CHANDLER, gr. to Rev. Canon HATGARTH, The Vicarage. Mr. F. Chandler, gr. to Mrs. WILSON, Burfield, won 1st for a smaller sized group.

Table plants were shown well, Crotons being finely coloured. The principal prize winners were Messrs. A. ALDERMAN and W. MEASE.

The best six berried plants (Solanum), were from Messrs. J. FRENCH and J. LAW. Baskets of foliage and flowering plants were well represented, the leading prizes being taken by Mr. W. THORNTON and Mr. T. P. MACGREGOR.

There was a good competition in the vegetable classes, Messrs. C. BENTLEY and W. THORNTON being the principal winners.

Fruit was well shown. For three dishes dessert Apples, Mr. WILL TAYLER, Osborn Nursery, Hampton, took 1st place, having, amongst others, some fine King of the Pippins; 2nd, Mr. A. ALDERMAN. Mr. TAYLER was an excellent exhibitor of kitchen varieties; 2nd, Mr. C. BENTLEY. The principal prizes for Pears were taken by Messrs. W. TAYLER and A. MEEHVEN.

Non-competitive.—These exhibits were numerous and good. Messrs. THOMSON & SONS, The Nurseries, Wimbledon, sent some charming floral devices in Chrysanthemums, Orchids, &c., also a nice group of flowering and foliage plants. Mr. Alderman, gr. to G. HATFIELD, Esq., Morden Hall, sent a very fine collection of Apples and Pears, tastefully arranged amongst cut Chrysanthemums and small decorative foliage plants.

Mr. A. Luff, gr. to J. F. SCHWANN, Esq., J.P., Oakfield, Wimbledon Park, sent a good selection of Apples and Pears, with well-finished Muscat of Alexandria Grapes. A nicely-arranged group of Cyripediums in flower was contributed by Mr. R. Bradford, gr. to W. HOPE HALL, Esq., Wimbledon Park. Mr. WILL TAYLER sent a good lot of Apples and Pears; also clusters of Grape Reine Olga de Wurtemberg, which produces delicious fruit on open walls. The show was well managed by the Secretary, Mr. W. S. THOMSON.

BECCLES AND DISTRICT CHRYSANTHEMUM AND FLORICULTURAL.

NOVEMBER 14, 15.—The sixth annual exhibition held in the Town Hall, notwithstanding it clashed with other shows in the county, was satisfactory.

The plants in pots were superior to those shown in former years, not only in the better quality of the blooms, but the plants were furnished with good foliage down to their base. For three plants in pots (Japanese), Sir B. BEAUCHAMP, Langley Park, was 1st; and Alderman MASTERS, Beccles, 2nd.

In the classes for plants of incured, reflexed, and Pompon varieties, Alderman MASTERS, Mrs. H. READ, and Mrs. W. W. WORSWICK were the principal exhibitors, the prizes being awarded in the order named.

Groups of Chrysanthemums were an attractive feature of the show, Mrs. H. READ taking the 1st prize for a remarkably fine lot; 2nd, Mr. E. LAWRENCE, also good.

For cut blooms, Japanese, in twelve varieties, Mr. NEWMAN, Yarmonth, was 1st; 2nd, Alderman MASTERS. Good examples of Vivand Morel, C. Davis, Stanstead White, Mrs. H. Payne, Mille, Thérèse Rey, G. C. Schwabe were seen on their respective stands.

Miss TAYLOR, Starston, was 1st for six Japanese blooms, showing good specimens of Colonel Smith, Beauty of Exmouth, and Princess May. Incured varieties were shown well by Mr. STITTON, Yarmonth, with Mrs. H. READ and Alderman MASTERS.

Amateurs, or those not employing a gardener regularly, also contributed largely towards the success of the show.

SCOTTISH HORTICULTURAL.

NOVEMBER 14 15, 16.—The ninth annual Chrysanthemum show of the Society was opened in the Waverley Market on Thursday, the 14th inst. It must have been apparent to visitors who have been in the habit of seeing the annual exhibitions that this one was at least as good as any previous display. The market presented a full and well-furnished appearance from all sides, and a view from the gallery, owing to the brilliant colours being toned down by the foliage plants and Ferns, as well as by occasional groups, was distinctly pleasing.

In the large classes for cut blooms, more than the usual number of exhibitors competed, and their flowers were of high merit. Plants, although better than in previous years, still lack the dimensions occasionally seen in some other leading shows.

Fruit also was indicative that the past season has been favourable to its proper development. Vegetables, which we usually expect good at Edinburgh, were excellent, and the competition in most classes keen. Several of the nurserymen contributed to the display by the exhibition of specialities in plants, flowers, and other miscellaneous exhibits.

Mr. CAMPBELL, of High Blantyre, arranged a table of Carnations and Ferns, and a circular stand of Crotons, Palms, Heaths, &c.

Mr. H. JONES of Rycroft Nurseries had a table of excellent kinds of Japanese and incured varieties of Chrysanthemums.

A table of highly-coloured Kale, from the original stock of the late Miss BOPE of Wardie Lodge, Edinburgh, was interesting; while some enormous Marrows and other vegetables were staged from Mr. J. SCARLETT of Inveresk; examples of preserves from these being also shown.

There was a table of articles for sale in aid of the Gardeners' Orphan Fund, which we hope was successful.

Messrs. DOBBIE & Co., Rothesay, staged a table of Chrysanthemums, including some of the newer varieties.

PLANTS.

For six distinct varieties of Chrysanthemums there were four competitors. It was the principal class for pot-plants, and Mr. D. CAVANAGH, St. Edward's, Murrayfield, was deservedly 1st, though Mr. J. HOLMES, Winton Castle, Peccaitland, was a good 2nd.

Pompons.—In the class for four trained plants, those from Mr. HUNT, Colbridge, Murrayfield, were very commendable; Mr. J. HOLMES again taking 2nd honours. Mr. D. CAVANAGH was also 1st with four Japanese, his plants of Vivand Morel, Val d'Andorre, and Margot, being very good; 2nd, Mr. J. HOLMES. Mr. D. JARDINE, Ravelston, Blackhall, staged fine specimens in the class for two plants of Japanese. The 1st prize for a plant of a white-flowering Chrysanthemum was awarded to a well-grown plant of Bouquet de Dame, from Mr. D. CAVANAGH.

Mr. S. ABBOTT, Prestonfield House, Edinburgh, carried off 1st honours for a yellow variety, with a magnificent plant of W. H. Lincoln.

In the class for a specimen plant of an Anemose-flowered variety, Mr. J. HOLMES was 1st with a pretty specimen of Dorothy Souillet; and the best Pompon was shown by Mr. G. WOOD, Oswald Houe, Edinburgh. Some remarkably well-grown plants were shown by amateurs, in some cases almost equalling those from professional gardeners. The classes were also well contested.

Mr. R. MELROSE, 8, Great Stuart Street, Edinburgh, was 1st in the class for two plants of large-flowered varieties; and Miss G. MUNRO, Bee Cottage, Peccaitland, 2nd. Mr. R. H. McBEAN, 6, West Montgomery Place, Edinburgh, was successful in carrying off the 1st prizes for two Pompons, one large-flowered variety, and also one plant of a white-flowered Japanese variety, his exhibits being good in regard to the blooms and the training.

CUT BLOOMS.

These classes on the present occasion, as always, were the principal attraction of the show. That for forty-eight Japanese, distinct, secured a large share of the attention of visitors, and as not a bad bloom was to be found upon the boards of the 1st prize exhibit, this was scarcely a matter of surprise. The 1st prize, of a plate value £20, presented by the Lord Provost, Magistrates, and Town Council, and called the City of Edinburgh Prize, was won by the wonderfully successful exhibitor, Mr. W. H. Lees, gr. to F. A. BEVAN, Esq., Treot Park, New Barnet, and his blooms included Madame Carnot (awarded the prize to the best Japanese bloom in the exhibition), Mrs. Wheeler, Reine d'Angleterre, G. W. Childs, Abbé Menjehall, Primrose League, E. Molyneux, Madame Octa is Mirabeau, G. C. Schwabe, Mons. C. Molina, Mons. Panckucks, Mrs. W. Godfrey, Duchess of Wellington, C. Shrimpton, Mons. Greyer, International, Phœbus, Beau's Toulonaise, Rose Wynne, Madame Girond, Madame A. de Guilbert, Etoile de Lyon, Mephisto, Madame Moulin, J. Shrimpton, Lady Saunders. Mrs. C. H. Payne, Mutual Friend, Henri Jacotot Fils, Sunflower, Pres. Borel, Floreace Davis, Niveum, Richard Dean, Wilfrid Marshall, Madame Adam Chatio, Charles Davis, Madame M. Ricord, Mrs. F. Jameson, Mrs. W. H. Lees, Beauty of Castlewood, Colonel Chase, and others. The 2nd prize fell to Mr. J. BEISANT, Castle Huntly, Longforgan, who in the two previous years has gained the premier position. Mr. J. CARRUTHERS, Hillwood, Corstophine, 3rd.

In the class for twenty-four Japanese, or the Scottish Challenge Cup class (open to Scottish gardeners and amateurs only), Mr. D. NICOLL, Rosie, Forgandenny, took 1st prize with excellent blooms, followed by Mr. J. BEISANT. Mr. J. CARRUTHERS staged the best lot of twelve blooms.

For twelve incured blooms, Mr. J. CLARK, Bannerfield, Selkirk, was 1st, and his stand included a bloom of C. Curtis, which received honours as the best incured shown. Others noted were Lucy Kenda's, Mrs. Colman, Princess of Wales, Lord Alcester, and Alfred Salter; 2nd, Mr. J. MARTIN, Winchcombe.

In the classes for six blooms of the following varieties, Mr. L. GEODES was 1st, namely, E. Molyneux, Stanstead White, and Mille, Thérèse Rey. Three magnificent blooms of Duchess of York were staged by Mr. J. KYLES, Corstophine.

Blooms arranged in vases were this year more numerous, and were generally admired. In the class for twelve vases of Japanese blooms, Mr. J. LEES, with splendid flowers, secured 1st prize; Mr. J. CLARK, Selkirk, being 2nd.

For six vases, Mr. J. KIDD, Carberry Towers, Musselburgh, was 1st. For one vase, to contain twelve Japanese blooms, Mr. J. CARRUTHERS was 1st.

In the class for an epergne of Chrysanthemums (open to ladies only), Mrs. R. LAIRD, Edinburgh, staged an effective arrangement.

Mr. A. BRYDON was the principal winner of prizes in the amateur classes for cut flowers, securing 1st place for twelve and for six Japanese blooms, as well as for six blooms of a white Japanese variety. Mr. T. M. WHITEHEAD took 1st prize for six incured blooms.

The three best blooms of one variety not in commerce were from Mr. A. KIRK, Alloa, who won the Society's Silver Medal with a variety named Mrs. A. KIRK, a variety with pink florets, striped with a light yellow band.

FRUIT.

Some first-class Grapes were noted, and these were the principal exhibits. In the class for four bunches, distinct varieties, Mr. J. LESLIE, Perth, was 1st with fine bunches of well-finished berries of Muscat of Alexandria, Alicante, Gros Colmar, and Gros Maroc; Mr. W. MURRAY, Polmont, was 2nd. Mr. J. LESLIE was also 1st in the class for two bunches with Black Alicante and Muscat of Alexandria. The Muscats from Mr. J. MCNEIL, Peebles, secured him the 1st prize for two bunches; Mr. D. KIDD being 2nd. For two bunches of Gros Colmar, Mr. H. A. WALKER, Colinton, was 1st, with fine large berries, well coloured, followed by Mr. A. YOUNG, Peebles.

Pine apples were not numerous; the two best were from Mr. MCINTYRE, The Glen, Inverleithen; Mr. T. BOYD, Falkirk, being 2nd.

Mr. MCINTYRE also won the 1st prize for a collection of twelve dishes of fruit, including Grapes, Melons, Figs, Apples, &c.; Mr. D. MURRAY, Culzean Castle, Maybole, was a good 2nd.

The best collection of eighteen varieties of Apples, and six varieties of Pears, produce grown in Scotland, was a very meritorious lot from Mr. J. CAIRNS, The Hirsch, Coldstream, some of his finest examples being King Pippin, Galloway Pippin, Sandringham, and Blenheim Orange; 2nd, Mr. J. RENNIE, Brro.

Mr. J. DAVY, Gartleston, secured 1st place in the open class for eighteen varieties of Apples, and six varieties of Pears, with exceptionally fine fruit throughout; Mr. A. WILSON, Ayr, being 2nd.

In the only class for Pears, Mr. F. THOMSON, Yetholm, was 1st for six varieties.

The class for market-growers was one for six varieties of Apples in baskets, as packed for market; and Mr. D. LOGAN, Coldstream, was 1st; followed by Mr. D. McCUTCHEON, Ayr.

VEGETABLES.

The vegetables were extremely good, and occupied a very considerable space. The 1st prize-winner for a collection was Mr. R. F. RAE, Sunlaws, Roxburgh, who had in his exhibit Pears, Tomatoes, Onions, Beet, Bussels Sprouts, Cauliflowers, Celery, Leeks, Cabbage, and Cucumbers, all worthy of praise. For the collection of six distinct kinds, Mr. J. WALTER, Dollar, was 1st, and Mr. A. DICKSON, Innerleithen, 2nd.

The best Tomatos were those from Mr. J. PATERSON, Kirkcaldy, whose twelve even fruits were very fine. Leeks of enormous size were extensively shown. The best eight were from Mr. D. LOGAN, Coldstream. This exhibitor also won 1st prize for Calery with grand heads. Carrots, Turnips, Beetroot, and other reasonable vegetables were well shown.

A good collection of vegetables, open to market growers only, was staged by Mr. W. SMEALL and Mr. D. LOGAN, who carried off 1st and 2nd prizes.

NURSERYMEN'S CLASSES.

Some good exhibits both of cut flowers and plants were made by nurserymen. The 1st prize for thirty-six Japanese Chrysanthemums was gained by Mr. R. WOOD, Carnoustie, who had some first-class flowers. Mr. W. WELLS, Redhill, Surrey, was 1st for twenty-four incurved blooms, and showed good varieties, and of large size and fine colour.

For the best collections of Conifers two good groups were brought by Messrs. R. B. LAIRD & SONS and Messrs. J. DICKSON & SONS, Edinburgh. These two firms taking prizes in the order mentioned. Some fine plants of Retinosporas, Cupressus, Juniperus, were noted amongst the many interesting forms.

MISCELLANEOUS CLASSES.

Four competitors arranged groups of plants in circles, the best being by Mr. P. HUNT; Mr. G. WOOD was a close 2nd. The classes for table and berried plants, Pelargoniums, Primulas, and other stove and greenhouse plants, were used for decorating the centres of the tables, and were all freely contested.

Wet weather was general during the three days on which the show was open, but a large number of visitors attended during the last two days.

STOCKPORT CHRYSANTHEMUM.

NOVEMBER 15, 16—This society is gaining in strength and importance each year. It is held in the Volunteer Armoury, a large building in every way suited for an exhibition of plants and flowers. The Chrysanthemums covered a large amount of table space, notwithstanding the five-two shows held during the week in northern England, the Japanese section particularly being grand. Fruit was select and good, particularly some of the dishes of Apples and Pears.

Among the prize-takers for plants in pots were Captain T. H. SYKES, Messrs. G. H. GADDAM, J. C. CHORLTON, and J. BROWN. They were generally a creditable lot of plants, with good blooms finely developed, and the foliage strong and vigorous.

In the Japanese cut-flower section the competition was spirited and close, Mr. Roderick, gr. to Captain SYKES, and Mr. Richardson, gr. to JAS. E. PLATT, Esq., carrying off chief honour, although the respective gardeners to the Corporation of Stockport, G. H. GADDAM, Esq., J. EVANS, Esq., J. LEES, Esq., G. L. DEWHURST Esq., and others, showed well in all the classes. The more prominent Japanese blooms were Primrose League, an immense pale primrose; Mr. G. W. Clarke, lilac and white; Duke of York, a pronounced pale purple and white, the florets head-like, and the colours blended in captivating style; Lord Brooke, orange and brown shaded Gloriosa, a very fine yellow; Chas. Davies, orange and sienna, are of the best; Vivian Morel, good wherever shown; Mrs. H. Payne, E. Malynaux, Princess May, Stanstead White, a grand flower; M. Panckoucke, President Borel, Madam Hoste, and S. C. Schwabe. Among the incurved we noted Lord Alcester, Princess of Wales, John Doughty, Queen of England (still a leading flower), Golden Empress, Lord Wolsley, Empress of India, C. B. Whitnal, Jeanne d'Arc, John Lambert, Violet Zumber, Madame Darier, Prince Alfred, and Baron Hirsch. Among others, Harry Wonder is noted. Mrs. J. B. Benedict was one of the more prominent of the quilled or Anemone section, with yellow florets in centre, and flushed pink guard-petals.

There were a few good Orchids from Mr. Roderick, particularly the Chantini form of *Cypripedium insigne*; and the table plants were choice. The bouquets comprised many good flowers, and were of various forms, from the circular compact one presented to the Mayoress at the opening, to the spray ones, with Smilax and Asparagus, which now lead the fashion.

There was one capital exhibit of a group of *Araucaria excelsa*, chiefly table-size plants in perfection of contour, from Mr. JOHN BIRKET, a local dealer. The plants were all from cuttings. Mr. J. WOOLEY had a nice assortment of showy flowering plants, and several gentlemen in the district sent contributions of Palms, Ferns, &c., to decorate the platforms.

The Fruit consisted of good Alicante Grapes from Captain SYKES and others; the Muscats were far above the average. The Pears and Apples from Mr. McKellar, gr. to JAS. WATTS, Esq., Abney Hall, were select, high coloured, and generally good.

LONGTON CHRYSANTHEMUM.

NOVEMBER 12.—The Sixth Annual Show of this Society was opened in the Town Hall, on the above date. The object of the promoters is to encourage the growth of the queen of winter flowers amongst the artisans of the district. Since its formation the growth of the society has been rapid, and the quality and numbers of the flowers staged on this occasion were very satisfactory.

In the open division the best twenty-four blooms incurred distinct were from Mr. J. McPHAIL, Supdt. Queen's Park, Longton, who staged excellent blooms of Empress of India, Queen of England, Charles H. Curtis, Baron Hirsch, Jeanne d'Arc, Empress Eugénie, &c. 2nd, Mr. J. STOPES, Derby. Mr. J. McPHAIL was also 1st for six incurved blooms distinct and for twenty-four Japanese distinct. In the latter class he had good blooms of Edwin Molynaux, Sunflower, Good Gracious, Viscountess Hambleton, &c. 2nd, Mr. STOPES.

In the amateur section, where the classes are confined to residents in the borough of Longton, seventeen competitors entered for six blooms distinct. The 1st Prize, a Silver Cup and Certificate of the National Chrysanthemum Society, was awarded to Mr. A. TAMS for a fine stand containing C. H. Curtis, Queen of England, Baron Hirsch, Empress of India, Lord Wolsley, Lord Alcester. 2nd, Mr. H. WARREN. All the competitors in this class receive a prize.

For a group of Chrysanthemums for which the Certificate of the National Chrysanthemum Society, together with the prizes was offered Mr. B. BRIAN won with a well-arranged lot. 2nd, J. SPENDELOW.

The three best plants of Japanese varieties distinct were from Mr. J. WARREN.

The other and minor classes were generally satisfactory.

Some fine bunches of Gros Colmar Grapes were sent by T. TAMS, Esq., the Hayes Stone (gr., Mr. Bates).

Messrs. HILL & SONS, Spotacre Nurseries, staged cut flowers and plants.

YEOVIL CHRYSANTHEMUM.

NOVEMBER 13.—The eighth annual exhibition of plants, cut blooms, fruits, and vegetables, in the municipal buildings on the above-mentioned date, was one of the best held by the Society, and much credit is due to the Committee and Hon. Sec. (Mr. E. H. Oakley) for the unsparring efforts put forth to achieve this result.

As usual, Mr. A. Crossman, gr. to J. BRUTTON, Esq., Yeovil, secured premier position for a grand group of Chrysanthemum plants in pots, this being the seventh year in succession in which Mr. Crossman has won the chief place in this class. Mr. BISS, gr. to J. BRADFORD, Esq., had the best group of miscellaneous plants, which were arranged with excellent taste and effect.

Cut blooms made a fine show in themselves. Three-hundred and twenty-four excellent flowers were staged in the chief class—thirty-six Japanese in not fewer than twenty-four varieties—for the Mayor's prize £5, were best from Mr. Thomas Wilkins, gr. to Lady THEODORA GUEST, Inwood House, Henstridge. His collection was of high merit, and included grand blooms of the most prominent varieties, and were large, solid, fresh, and uniform in size, and admirably set up. Mr. ALLSOPP, gr. to Lord PORTMAN, Bryanston, Blandford, and Mr. LLOYD, gr. to VINCENT STUCKEY, Esq., Langport, also showed well in this class. In other classes Mr. COPP, gr. to W. E. S. ERLE DRAX, Esq., Holnest House, Sherborne, and Mr. WILKINS were winners of 1st prizes, the former for twelve incurved blooms, distinct varieties, and the latter for a like number of Japanese. Fruit made a good display. Seven collections of six kinds were staged. The contest between Mr. LLOYD and Mr. H. W. WARD, Longford Castle, Salisbury, was a keen one. Ultimately the prizes were awarded in the order in which the exhibitors' names appear. Mr. WARD was 1st in several classes for Grapes, and Mr. LLOYD in another one.

It is satisfactory to be able to speak well of the produce grown and shown by the cottagers residing around Yeovil. So good, indeed, were their exhibits this year, that the mayor promised to contribute another five guineas to the list of prizes to be competed for by cottagers next November.

MARGATE AND ISLE OF THANET.

NOVEMBER 13, 14—This exhibition was one of the very best held in Kent during the present season. Not only were the Chrysanthemums (both plants, groups, and cut flowers) of high excellence, but the fruit also and vegetables were strongly represented. The arrangements were better than last year, the cut flowers being placed in a better light. Many other societies would do well to follow the plan adopted at Margate, of placing the semicircular groups back to back, thus forming circles down the centre of the hall.

The class for a group of Chrysanthemums brought out a strong competition. Mr. CORNFORD, The Gardens, Quex Park, Birchington, was deservedly 1st, with a splendid group, both in quality and arrangement. The dwarf-grown plants with which the group was finished added greatly to the effect. Mr. ROBERTS, gr. to SEBAG MONTEPIORE, East Cliff Lodge, Ramsgate, staged well for 2nd place, the large massive blooms of yellows, bronzes, and whites telling with fine effect.

For a miscellaneous group of flowering and foliage-plants, Mr. CORNFORD was again to the front with a light and tasteful arrangement.

Specimen plants were strongly represented in a number of classes, the chief of which were the following:—For six trained specimens, any variety, Mr. Miller, gr. to J. T. FRIEND, Esq., Northdown, Margate, was 1st with extra large and profusely-flowered plants of Madame Lacroix, Bouquet

Fait (very fine), M. Berthe Rendatler, Mr. Geo. Glenny, Mrs. Dixon, and La Triomphante (especially good). Mr. CORNFORD followed in this class.

With four trained plants of incurved varieties, Mr. CORNFORD was 1st, the Rundle family being well represented. The same exhibitor was 1st for three specimens of reflexed varieties; Mr. J. BURLEY, gr. to A. B. WARRE, Esq., West Cliff House, Ramsgate, following with smaller plants.

In the class for four Japanese, the competition between the 1st and 2nd prize exhibit was very keen, the positions of the two previous winners being reversed.

Mr. BURLEY again won for a single specimen Japanese with an admirable plant of Val d'Adour.

The best single incurved was from Mr. E. HAWKINS, gr. to Sir E. WYATT, Maionette, Broadstairs.

An excellent and very suggestive class was one provided for five plants in 8-inch pots, suitable for table decoration, but the mistake made in more than one instance was, that of formal staking and training. The 1st award went to a pretty, graceful set of plants, from Mr. H. MILLER, no training being attempted; Mr. J. BURLEY, who was 2nd, followed in somewhat similar style.

Cut flowers.—The competition was very keen, and the quality first-rate. For twenty-four incurved varieties, Mr. ENDEN, gr. to Major BELL, Thur, Birchington, was 1st; the finest blooms were those of Beauty, St. Patrick, Lord Alcester, Mrs. Heale, and Violet Tomlin; Mr. CORNFORD was 2nd.

Mr. ENDEN occupied the same position for twelve varieties with similarly good flowers; Mr. HOLLYMAN, gr. to G. FISHER, Esq., St. Peter's Court, St. Peters, following.

For six blooms, Mr. Standing, gr. to W. GAY, Esq., Grove House, Westgate, was 1st.

Mr. ENDEN had the best three blooms of any incurved variety with Mrs. Heale.

With twenty-four varieties of Japanese in a very strong class, Mr. F. MILLER was 1st with an even exhibit, both colour and size being strong points. Mr. HOLLYMAN followed closely in this class. For twelve varieties, Mr. HOLLYMAN turned the tables on his opponent, and won.

Mr. CORNFORD was 1st for six varieties, his best being Marie Hoste and Van der Heede, rich in colour. Mr. HOLLYMAN 2nd.

For six blooms in as many kinds of white varieties, Mr. ENDEN won with Marie Hoste, Thérèse Rey, Florence Davis, Beauty of Exmouth, and Stanstead White, as the best; Mr. CORNFORD, 2nd.

Mr. ENDEN was 1st for reflexed varieties, the Christines and Cloth of Gold being very fine; Mr. CORNFORD followed. Mr. ENDEN was the most successful also for Anemone-flowered varieties, Delaware, Sabine, and Dame Blanche being the best.

For twelve trebles in bunches, Mr. Wilkins, gr. to H. WEIGALL, Esq., Southwood, St. Lawrence, was 1st with a fine display, the flowers of medium size, and good colour. Another, and an extra strong class, was that open to all comers, in which Mr. FAIRWEATHER, The Gardens, Bifrons Park, Canterbury, was 1st with twelve Japanese and twelve incurved blooms. Mr. G. RAY, The Hill, Green Street, Teynham, was a worthy 2nd.

The best basket of Chrysanthemums came from Miss J. REEVE, a beautiful arrangement.

Mr. Leadbetter, gr. to A. G. HUBBUCK, Esq., Chislehurst, showed forty-eight blooms of the best varieties of Japanese, in extra fine condition, the best of the newer kinds being very prominent.

FINCHLEY CHRYSANTHEMUM.

NOVEMBER 14 15—The Chrysanthemum Society at Finchley held its tenth annual exhibition in the New Lecture Hall at that place, where better accommodation exists than the Society has heretofore enjoyed. The exhibition was not less excellent than the best of those held previously, the blooms of Japanese varieties being especially noteworthy among other exhibits of a general satisfactory character.

The Trophy Cup offered by the Society for the best collection of thirty-six blooms was won by Mr. J. H. WALKER, gr. to Goldbeater, Mill Hill N.W., with an exhibit containing blooms of finer quality than any exhibited at previous shows. This being the third successive year Mr. WALKER has held the Cup, it now becomes his own property. Mr. WALKER also took, on the occasion under notice, twelve other 1st prizes. Mr. D. M. HAYLER, gr. to Mr. W. HANNAFORD, was another of the more successful exhibitors, taking eleven 2nd prizes. In all there were sixty-six classes, including those for fruit, vegetables, and miscellaneous plants.

BRADFORD CHRYSANTHEMUM.

NOVEMBER 15, 16.—Bradford witnessed the ninth annual exhibition of its Chrysanthemum Society on the above dates, in the St. George's Hall, where it was opened by the President, Alverman W. WOOD, Mayor of the Borough. Generally the show was more than satisfactory, and the exhibits covered a larger space than at any of the previous exhibitions.

The leading class for twenty-four Japanese blooms, in which the Silver Challenge Cup was linked with the 1st prize, was well won by W. H. TATE, Esq., Wootton, Liverpool (gr., Mr. W. Haigh), and he was followed by C. J. ORMROD, Esq., Brighouse, Bradford (gr., Mr. A. Barber), both of whom managed to beat a collection from Mr. W. WELLS, Earlswood Nursery, Surrey. The last named exhibitor, however, occupied 1st position for twenty-four incurveds, and included specially

good blooms of Mrs. R. C. Kingston, Princess of Wales, and Jno. Salter; W. H. Tate, Esq., was 2nd in this class, and 1st for twelve blooms, Japanese; and the same class in the incurved section and other prizes.

In the local classes, the Challenge Cup was won by J. W. COCKERHAM, Esq., Bingley (gr., Mr. T. Barrell), who had a very creditable collection of twelve Japanese blooms.

THE WORCESTERSHIRE BRANCH OF THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

NOVEMBER 18.—The inauguration ceremony took place on the above date, in the Guildhall, Worcester. Earl Beauchamp, the president, occupied the chair, supported by Col. Long, M.P., A. Baldwin, M.P., Canon Coventry, Col. Stallard, Rev. Thatcher, R. S. Carrington, Esq., and other county gentlemen. There was a crowded meeting of gardeners, and great enthusiasm prevailed.

His Lordship, when explaining the objects of the meeting, pointed out the necessity for forming a branch in the district, stating that pensioners of the parent institution, now residing in the county, were actually receiving considerably more money annually in the shape of pensions than was yearly subscribed in the county. The duty of gardeners to embrace this means of "self-help," who by reason of their occupation in hot-houses and exposure to extremes of temperatures, were so prone to rheumatism and other ailments at early stages of life, leading to possible incapacity for active work, was clearly set forth.

The deputation consisted of Messrs. Harry Veitch, Ingram (Secretary), and Vallance, of the Bristol Auxiliary. Mr. Veitch clearly explained the great advantages of the Institution, and gave statistics, showing the progress which has been made, and the amount of money paid to deserving cases, and also alluded pathetically to the large number of deserving candidates seeking relief, for which the funds are inadequate. It was also shown with what care every case was dealt with in committee. Mr. Veitch incidentally remarked that one pensioner, now deceased, had paid into the Society some eighteen guineas, and had received therefrom in pensions upwards of £500.

Colonel Long, M.P., who represents the Evesham division, including the body of market gardeners, then proposed, "That this meeting having heard the claims and objects of the Institution, hereby resolves to form an auxiliary branch of the Gardeners' Royal Benevolent Institution for Worcestershire and district, and to enrol members forthwith, subject to the rules of the parent Society, and the usual by-laws for local management hitherto granted to existing auxiliaries."

This was seconded by Mr. Crump, Madresfield, and, being supported, was carried unanimously, amidst great applause. Votes of thanks to the deputation were given, and acknowledged, Mr. Vallance specially dealing with the usefulness of an auxiliary as a means of spreading knowledge to gardeners of the Society's existence and aims, as well as to furnish local information to head-quarters. Mr. Ingram also pointed out the necessity for additional auxiliaries in counties, and hoped the Worcestershire example would be copied.

The Rev. Canon Coventry moved a hearty vote of thanks to the chairman, and brought an enthusiastic and successful meeting to a close. A committee of management was at once formed, and business of a routine character followed.

THE HERBACEOUS BORDER.

HERBACEOUS PEONIES.

If it is intended to increase the stock of these handsome flowering plants, the present time is suitable. The early autumn months are the most favourable during the whole year. I have seen it recommended that these Peonies be planted in the early part of the year, when young growths a few inches long have been made. Such a time is about the worst that could be selected, and will assuredly prove disastrous to the plants. Unlike a large number of hardy plants, these Peonies do not produce roots in continuous succession, but in decisive hatches at fixed periods. Did they produce root-fibres continually, the check by shifting would be little more than momentary. But it is not so, and unless they are planted at a suitable time, they take two, and sometimes three years to recover. If a full growth be not made, the crown bud will be only partially developed, and the ensuing year's growth is proportionately feeble. When the planting is done in the early autumn, the main roots are more or less preserved intact; and this item in the cultivation of the plants I regard as very important, and upon it depends much of their future success.

Few plants produce a more showy display than Peonies when in full bloom in the early summer

months. Some of the best effects are produced when large beds can be devoted to them on the lawn, or again, when planted in the fore-front of large shrubs. Do not plant them near to large trees, or they will be sure to lack nourishment as well as moisture. In all cases a very rich soil must be given them, preferably one of loam, though in this respect they are by no means exacting. Dry hot sandy soils are not suitable for them, unless a depth of 6 inches of clay can be added and well mixed. The soil should be trenched fully 2 feet deep, and a very liberal dressing of manure added at 1 foot deep, as the roots quickly descend when they have the opportunity. Plant the roots quite firmly, and cover the crowns about 2 inches deep with soil, adding a heavy mulch of manure when the work of planting is finished. It is necessary to do the work well, as when established the plants are best left alone for at least a dozen years. Such old-established beds will, however, be much improved by a heavy mulch of manure early in the autumn of each year. The crowns should be encouraged far into the autumn, as they plump up considerably at this season. J.

WITLEY COURT.—We are reminded by the "Journal," that Mr. Austen, the gardener at Witley Court, will soon retire from his post and go into business; Mr. Young will leave Abberley as Mr. Austen's successor.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—
 0, Scotland, N. Principal Wheat-producing Districts—
 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
 4, Midland Counties; 5, England, including London, S.
 Principal Grazing, &c., Districts—6, Scotland, W.;
 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
 10 Ireland, S. * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending November 16, is furnished from the Meteorological Office:—
 "The weather during this period was again extremely unsettled, frequent and considerable falls of rain, alternating with intervals of clear sky and sunshine.
 "The temperature was above the mean, the excess ranging from 1° in 'Scotland, E.' and over Ireland, to 5° in the 'Midland Counties' and 'England, S.W. and E.,' and to 6° in

England, S.' The highest of the maxima were recorded on the 16th over England, and earlier in the week over Ireland and Scotland. They were very high for the time of year, having ranged from 65° in 'England, E.,' 64° in 'England, S.,' and 62° or 63° in the other English districts, to 55° in 'Ireland, N.' and 'Scotland, N.' The lowest of the minima occurred about the middle of the period, and varied from 28° in 'Scotland, N.,' to 37° in 'England, N.W.' and to 41° in the 'Channel Islands.'

"The rainfall was a little less than the mean in 'England, E.,' and only just equalled it in 'England, N.E.;" in all other districts, however, there was an excess, that in nearly all localities being very large.

"The bright sunshine was more prevalent generally than that recorded during the preceding week, and exceeded the normal amount in all districts. The percentage of the possible duration ranged from 37 in 'England, E.,' 36 in the 'Channel Islands,' and 34° in 'England, S.,' to 16 in 'England, N.W.,' and 10 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, November 21.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

Trade slow; stocks increasing. Best samples, 70s. to 80s.; Lincolns, 50s. to 65s.; black lands, Bedford's, 35s. to 45s. J. B. Thomas.

SEEDS.

LONDON: November 20.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E.,

report to-day's market bare alike of buyers and of business. Clover and grass seeds show this week no change of importance. Rye and Tares continue slow. Canary seed is firmer abroad; Turkey refuses for the moment to make offers. The new Hemp seed comes remarkably cheap and good. Peas and Haricots are held at former figures. Some Malagasy Butter Beans are now selling at unprecedentedly low rates. Linseed favours sellers. There is no alteration in either Mustard or Rape seed.

FRUITS AND VEGETABLES.

BOROUGH: Nov. 19.—Quotations:—Cabbages, 2s. 6d. to 3s. per tally; Turnips, 2s. to 3s. 6d.; Carrots, 2s. to 3s. 6d. per dozen bunches; Apples, 3s. to 6s. per bushel; Walnuts, 4s. to 5s. 6d., and Chestnuts, 4s. 6d. to 6s. 6d. per bag.

SPITALFIELDS: Nov. 19.—Quotations:—Cauliflowers, best, 5s. to 8s. per tally; do., seconds, 2s. to 3s. do.; Greens, bunch, 1s. to 1s. 6d. per dozen; Collards, 1s. 3d. to 1s. 6d. per tally; Savoys, 2s. to 4s. do.; Sprouts, 1s. to 1s. 6d. per half-sieve; Spinach, 2s. to 2s. 6d. per bushel; Carrots, 2s. per dozen bunches; Turnips, 1s. 6d. to 2s. do.; Parsnips, 5d. to 8d. per score; Celery, 9d. to 1s. per bundle; Carrots, 2s. to 30s. per ton; Onions, 3s. 6d. to 4s. per cwt.; Beetroot, 1s. to 1s. 3d. per bushel; Apples, cooking, 3s. to 3s. 6d. per bushel; Dessert, 4s. 6d. to 5s. 6d. do.

STRATFORD, Nov. 19.—Cabbages, 1s. 6d. to 4s. 6d. per tally; Savoys, 2s. to 5s. do.; Greens, 1s. 3d. to 1s. 6d. per bag; do., 1s. to 1s. 6d. per dozen; Cauliflowers, 6d. to 1s. 3d. per dozen; do., 2s. 6d. to 6s. per tally; Scotch Kale, 9d. to 1s. per sieve; Turnips, 1s. to 1s. 6d. per dozen bunches; do., 30s. to 35s. per ton; Carrots, household, 2s. to 3s. do.; do., cattle-feeding, 1s. to 2s. do.; Parsnips, 4s. to 5s. do.; Mangels, 12s. to 15s. do.; Swedes, 15s. to 18s. do.; Onions, Ghent, 5s. to 60s. do.; do., Ports, 4s. 3d. to 4s. 6d. per case; Apples, English, cookers, 2s. 6d. to 3s. 6d. per bushel; do., dessert, 2s. 6d. to 3s. 6d. do.; Pears, English, 3s. to 3s. 6d. per sieve; Beetroot, 2s. 3d. to 2s. 6d. per bag; Celery, 6s. to 9s. per dozen; Horse-radish, 1s. 3d. per bundle; Parsley, 1s. to 1s. 6d. per dozen bundles. There has been a plentiful supply during the week, and a fair trade done at the prices shown above.

FARRINGTON, Nov. 21.—Quotations:—Cauliflowers, 6s. per tally; Greens, 9d. bunch; Sprouts, 1s. 6d. per half-sieve; Celery, 4s. per dozen rounds; Turnips, 2s. per dozen bunches; Carrots, 2s. do.; Leeks, 2s. do.; Horsa-radish, 1s. per bundle; Beets, 1s. 6d. per bushel; Herbs, 2s. per dozen bunches; Parsnips, 1s. per score; Savoys, 5s. per tally; Apples, Blenheim Pippins, 4s. 6d. per bushel; Pears, Bishop's Thumb, 2s. 6d. half sieve; Stewing do., 2s. half bushel; Canadian Apples, Ribston, 14s. per barrel; Newtown Pippin, 14s. to 16s. do.; Gravensteins, 11s. do.; Tonkins King, 15s. do.; Californian Pears, 10s. to 15s. per case; English Grapes, 1s. to 1s. 2d. per lb.; Spanish Almeida, 10s. and 14s. 6d. per barrel; Tomatos, (English), 4s. 6d. per 12 lb.; Walnuts, 6s. 6d. per bag; Chestnuts, 9s. and 12s. do.

POTATOS.

BOROUGH: November 19.—Quotations ranged from 40s. to 90s. per ton.

SPITALFIELDS: November 19.—Quotations:—Sutton's Abundance, 50s. to 70s.; Hebrons, best, 60s. to 80s.; Main Crop Kidney, 50s. to 70s. Bruce, 40s. to 60s.; Reading Giants, 35s. to 55s.; Imperators, 45s. to 55s. per ton.

STRATFORD, November 19.—Quotations:—Bruce, dark soil, 35s. to 40s.; do., light, 40s. to 60s.; Reading Giants, 40s. to 50s.; Sutton's Abundance, 45s. to 70s. per ton.

FARRINGTON, November 21.—Quotations: Main Crop Kidney, 75s. to 85s.; Jeanie Deans, 65s. to 75s.; Sutton's Abundance, 65s. to 75s.; Bruce, 45s. to 55s.; Magnums, 45s. to 65s. per ton.

LONDON AVERAGES: Nov. 20.—Snowdrops, 70s. to 90s.; Hebrons, 70s. to 90s.; Dunbars, 90s. to 100s.; Regenta, 60s. to 70s.; Sutton's Abundance, 60s. to 65s.; Puritans, 55s. to 60s.; Imperators, 55s. to 65s.; Magnums, 40s. to 50s.; Early Rose, 55s. to 60s. per ton.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, best, 80s. to 110s.; do., inferior, 50s. to 70s.; hay, best, 60s. to 80s.; do., inferior, 36s. to 60s.; mixture, 70s. to 87s. 6d.; and straw, 20s. to 44s. per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending November 17, and for the corresponding period in the previous year:—1895: Wheat, 26s. 1d.; Barley, 25s.; Oats, 14s. 4d. 1894: Wheat, 19s. 1d.; Barley, 22s. 7d.; Oats, 13s. 10d.

“**BUILDING WORLD.**”—This is the title of a new illustrated weekly journal, which is published by Messrs. CASSELL & Co. (Ld Belle Savage, E.C.): The paper deals with all branches of the building trade, including carpentry, plumbing, whitewashing, &c., the useful information thereon given being supplemented by various illustrations. For the price asked—a penny—the paper is certainly a good and valuable one.

TRADE NOTICE.

JOHN CRANSTON having removed from the King's Acre Nurseries, will feel obliged by all communications being now addressed—JOHN CRANSTON, Little Birch, near Hereford.

Address: W. Cockin, The Dell, Egham.

AZALEA INDICA GRAFTING: C. H. J. Grafting is usually practised on potted stocks of Azalea ptinceae and purpurea, two easy-rooting strong growers. Modes are side, whip, tongue, and cleft. Grafting must be done in the spring in a close case placed in a house having a minimum warmth of 65°. It is as well to use grafting-wax to warm the point of junction.

BOOKS: G. A. K. See p. 436 of our issue for Oct. 12, the present year.—*Enquirer*. The *Dictionary of Gardening*, by Mr. G. Nicholson and others, published at the Bazaar office, 170, Strand, would afford the information required. *Hardy Ornamental Trees*, &c. A. D. Webster; 1, Clement's Inn, Strand.—*E. Grimsdick & Sons*. Obtain *The Nursery Book: a Complete Guide to the Pollination of Plants*, by L. H. Bailey, New York Publishing Co., through any foreign bookseller.—*Joe*. *Propagation and Improvement of Plants* (Barbidge), *How Crops Grow* (S. W. Johnson), *The Fruit Manual* (R. Hogg), *Plant Life* (Dr. Masters).

BOTTLING TOMATOS: J. G. Bottle Tomatos as you would any other kind of fruit. Your best chance of success will be to gather them before they are very ripe and juicy. Tomatos do not, as a rule, keep well, unless as they are plentifully mixed with vinegar and spices. We gather from your note that you wish to bottle the fruit whole, and without any adjunct.

CATERPILLAR IN APPLE TREE STEM: *Enquirer*. The specimen sent is the caterpillar of the Wood Leopard Moth. When holes in fruit or other trees with what seems like saw-dust lying on the ground beneath are noticed, the grub is at work within, and to kill it force a piece of wire up into the hole, or inject strong tobacco-water.

CATTLEYA AND LÆLIA IN AN UNSATISFACTORY STATE: W. S. Either the house in which are the Cattleya and Lælia must be too hot and close, or in some other way unsuitable to the plants, or else they would develop pseudo-bulbs. Examine the arrangements for heating and ventilation. The term, “established in sheath or bud,” applied to a number of plants, would mean that they were not freshly imported, but cultivated plants, and that each would have either a flower-sheath, from which buds might be expected, or visible buds.

CHRYSANTHEMUMS FOR BLOOMING IN THE OPEN IN NOVEMBER: W. Price. The Pompons of all varieties are excellent, giving quantities of bloom, and looking well when planted in beds by themselves. Most of the Queen of England varieties in incurved make a good show, and not being tall growers, requiring unsightly long stakes to support them, they are admirable for planting on sheltered borders and against walls. Japanese varieties are Dr. Macary, Peter the Great, Elaine, Margot, Daimio, Lacroix, Geo. Gordon, Harlequin, and probably many others.

CORRECTIONS.—In the Royal Horticultural Society's Report, November 16, *re* Luddemanua trifolia, *read* L. triloba; and for *Cypripedium Pollettianum* Burford Beauty, *read* C. P. B. variety.

EIGHT HUNDRED FEET OF GLASSHOUSE UNHEATED: *Alpha*. It might be filled with *Rhododendron hybridum*, *Crocus*, early *Tulips*, *Hyacinths*, *Narcissus*, *Syllas*, *Spiræas*, and *Christmas Roses* (*Heleborus niger*). There would be no need to use pots for any of these.

ERICA: C. H. J. When the growths are about half mature, and they should be taken from the more exposed wood at the sides and top of the plants. They should not exceed 1 inch in length, and the leaves on the lower half must be carefully removed. Strike in pure silver-sand, overlying sandy peat, in pots of not more than 5 inches in

diameter. Water well, allow the cuttings to get dry, then cover with a bell-glass, and place in a low pit or house, having a temperature of 60°. Shade them from direct sunshine. Remove the glass daily, and wipe it dry, replacing it in about a quarter of an hour. Apply water when necessary, and carefully guard against damp; therefore let no decaying culling remain in the glass.

GRAPES: W. A. Madresfield Court, Frontignan (grizzly), and Foster's Seedling, being early varieties, succeed together under one kind of treatment.

INSECTS: W. P. N. The grubs of a species of weevil.

JUDGING VEGETABLES AT A SHOW: H. H. P. We think that the exhibitor of collection B, ought to have been disqualified for showing nine kinds where only eight were required, and the first prize given to A., not because his were the better productions, but simply for the reason that B. was “out of it” owing to disqualification. If there is a schedule its rules should be abided by, and those transgressing them suffer in consequence.

MANURING TOMATOS: T. P. R. Stable manure in a partially rotten condition, and quicklime, will be suitable, but the land should not be rendered very rich, or your plants will run too much to leaf, and they may suffer badly from diseases of one sort or another. The Tomato likes a dryish, loamy soil; and manure at the time there is the greatest call on the energies of the plant, and this is best afforded by top-dressings of artificials or stable drainings.

MARQUERITE WITH MITES UPON ROOTS: J. K. We notice numbers of mites upon the roots, but they are not likely to cause any injury to the plants.

MUSCAT OF ALEXANDRIA: D. K. The two names given are identical with the above, which has many more synonyms. The only distinct variety is the Canon Hall Muscat.

NAMES OF FRUITS: *Subscriber, Worksop*. Apple Ribston Pippin.—*Sigma*. The Pear is Baronne de Mello; Apple resembles King of the Pippin, but we are not certain; fruit damaged.—*H. B., Durham*. 1, Waltham Abbey Seedling; 2, Old English Coolin; 3, New Hawthornden; 4, Worcester Pippin; 5, not known; 6, Tibbet's Pearmain.—*J. Rose*. Apple American Mother.—*Rosa*. 1, Pear Uvedale's St. Germain; 4, Benrié Del; 2, Cox's Orange Pippin; 8, Kerry Pippin; 6, Fearn's Pippin; 5, a pretty but worthless fruit.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to consult the next number.*—*E. H. C.* *Astor ercoides*.—*J. B. S.* *Pennis umbrosus*.—*G. S. F.* 1, *Dendroium speciosum*; 2, *Brassavola nodosa*.

NEAPOLITAN VIOLETS IN FLOWER AT THE END OF DECEMBER: *Hilda Moy*. If they will not flower with cold frame treatment, you cannot hasten them by using heat without spoiling the plants. For early blooming, de Parme and Marie Louise are better; as double-flowered varieties—Neapolitan coming into bloom in quantity late in the winter. The proper sort of summer treatment of planted-out runners has much to do with the flowering of Violets, but we do not know what this was in your case.

PEACH-HOUSE FOR MARKET CULTURE: T. P. R. Span-roofed house, with rather 12-feet long, no side-lights, low side wall of weather-boarding, tarred, and sprinkled with sand and lime. The roof should be fixed, a 2 feet space on either side being left for ventilation, and which can be closed by over-lapping lights, to be opened and shut by screw or lever. There should be ample ventilation by means of hit-and-miss shutters or clappers. Hot-water-pipes should not be placed between the stems of the trees and the walls, but 2 feet away from the former. No laid pathway is required, lattice or spar gangways sufficing. If early forcing is intended, have double wooden walls with a 6-inch space between, or employ bricks or concrete, whichever is the cheapest. For training the trees employ stout iron wire (not galvanised) run through eyed spikes 15 inches long, driven into the rafters, no need to have screw ends, these lengths of wire being at not more than 8 inches apart. Train the trees fanwise, and plant them at 20 feet apart, with riders, have 5 or 6 feet stems midway between the fans, to be cut away as the latter encroach upon them, and finally removed altogether. Use plenty of loam, lime-rubble, and road-grit as well, if the soil be naturally heavy,

and see that the drainage is good. Plant the trees within 6 inches of the side walls, and let the roots run outside and inside. The borders need not be made up to their full width for two or three years.

PEACHES PRESERVED WHOLE: J. D. R. A clever cook tells us that these fruits are preserved by immersing them for half-a-dozen times in boiling, thick syrup, letting them remain in it each time for five minutes, and laying them on a sieve to drain each time that they are taken out of the syrup. They are then placed in cold, thin, sugary syrup, and corked down securely, the end of the bottle being then dipped in melted wax. The fruit must be without bruise or blemish, and not ripe enough for dessert purposes.

POPULAR APPLES: Sir C. S. The Apple referred to was Peasegood's Nonsuch, said to have been raised from a seed sown by a young lady at school, nursed up with skill and care under the same fostering, and finally planted in her wedded-home garden, where the new Apple exceeded the most sanguine expectations of the raiser and her friends, and it is already recognised as one of the most popular and profitable market Apples of the day. *D. T. F.*

PRICES OF BOOKS: N. 1. We are unacquainted with this book; 2, the price of this book we do not know. It is published at New York, by G. P. Putnam's Sons, and you should enquire at their London branch, 27, King William Street, Strand, W.C.; 3, £10 10s.; 4, about 15s. Publishers should advertise their wares like other people, and not expect us to give them gratis advertisements in addition to editorial notices.

QUASSIA-WATER FOR KILLING APHIS, &c.: T. A. B. Boil 4 oz. of Quassia chips in 1 gallon of water, and add 4 oz. of soft-soap, which should be dissolved in it as it cools. In about ten minutes after it has been applied to a tree, &c., syringe it off with clean water.

SCHEDULE: COLLECTION OF VEGETABLES, EIGHT DISTINCT VARIETIES: W. B. For varieties write kinds; for instance, Cauliflower is a kind or sort of vegetable; but Early London is a variety of Cauliflower. If you show two varieties of any one kind in a collection, you ought to be disqualified; and we note that you include in your list two varieties of Potatoes, two of Onions, two of Carrots, and two of Turnips. We should greatly doubt if the schedule-framers intended that exhibitors should construe it in that light.

SEEDLING APPLE: J. House. A showy fruit, soft in flesh, and not of much flavour. Nice for home use, but not fit for market purposes, apart from its high colour.

TRICHOPILOIA STAVIS: Suavis. The white Trichopilola *suavis alba* is still a rare plant. Some varieties open white, but soon show colour, and such are "not true." To be "alba" no rose colour should appear in the flower at any stage.

COMMUNICATIONS RECEIVED.—E. F. Green.—Chas. Last, with thanks.—G. D.—C. W. C.—C. K.—C. L.—W. Gee, next week.—J. Batters.—R. D.—J. D.—W. W. J. & Son.—H. B. P.—J. R.—M. T.—D. T. F.—W. A.—E. DIED.—We regret to announce the death, at the age of seventy years, of Mr. ROBERT HENDERSON Young, nursery foreman to Messrs. T. Kennedy & Co., Dumfries, on November 12, the fortieth anniversary of the day on which he entered the service of the firm.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of more than 80 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

WINTER DRESSING.

Guaranteed to clear out Mealy Bug.

Cleanse and prepare your Fruit Trees and Plants, both indoors and out, for a healthy start next season, and destroy Scale, Bug, Red Spider, American Blight, and the Larvæ of other insects, by using the

XL ALL LIQUID INSECTICIDE WASH

(Patent),
A pure Nicotine Preparation (under a new system), from duty-free Tobacco. Absolutely safe, and no fear of injury to the buds. In use goes twice as far as any other Insecticide.
Per Pint, 2s.; Quart, 3s. 6d.; ½ Gallon, 5s.; 1 Gallon, 10s.

POSITIVE PROOF.

Mr. E. HILL, *The Gardens, Tring Park, Tring*, writes:—"Nov. 15, 1895. I cannot speak too highly in favour of your XL ALL Liquid Insecticide (Wash), as a Winter Dressing for Mealy Bug on Vines and Fig Trees. We gave it a trial last winter with the most satisfactory results, and if applied according to directions, it is perfectly safe in the hands of a novice, and I am justified in saying that for the purpose mentioned it is the best remedy that has yet come under my notice."

To be obtained from all Nurserymen, Seedsmen, Florists, and Sundriesmen; or, direct from—

G. H. RICHARDS, Sole Proprietor, Old Shot Tower Wharf, Commercial Road, Lambeth, London, S.E.
