Wyoming Water Supply Outlook

March 1, 1986

Foreword

How Forecasts Are Made

Most of the annual streamflow in the Western United States originates as snowfall. This snowfall accumulates high in the mountains during winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when it melts. Predictions are based on careful measurements of snow water equivalent at selected index points. Precipitation, temperature, soil moisture and antecedent streamflow data are viewed in conjunction with snowpack data to prepare runoff forecasts. This report presents a comprehensive picture of water supply outlook conditions for areas dependent upon surface runoff. It includes selected streamflow forecasts, summarized snowpack and precipitation data, reservoir storage data and narratives describing current conditions.

Streamflow forecasts are cooperatively generated by Soil Conservation Service and National Weather Service hydrologists. Forecasts become more accurate as more data affecting runoff becomes known. For this reason, forecasts are issued that reflect three future precipitation conditions — Below Normal, Average, and Above Normal. These forecasts are termed reasonable minimum, most probable, and reasonable maximum. Actual streamflow can be expected to fall between the lower and upper forecast values eight out of ten years.

Snowpack data are obtained by using a combination of manual and automated measurement methods. Manual readings of snow depth and water equivalent are taken at locations called snow courses on a monthly or semi-monthly schedule during the winter. In addition, snow water equivalent, precipitation, temperature, and other parameters are monitored on a daily basis and transmitted via radio telemetry to central data collection facilities. Both monthly and daily data are used to project snowmelt runoff.

For More Information

Copies of Monthly Water Supply Outlook Reports and other reports may be obtained from the states listed below. Because of the limited space, snow survey measurements are not published in monthly reports. An annual snow survey data summary is published by the Soil Conservation Service for each of the western states. Historical snow survey data may be obtained at those same offices.

STATE	ADDRESS
Alaska	201 East 9th Ave., Suite 300, Anchorage, AK 99501-3687
Arizona	201 East Indianola, Suite 200, Phoenix, AZ 85012
Colorado (New Mexico)	2490 West 26th Ave., Denver, CO 80211
Idaho	304 North 8th Street, Room 345, Boise, ID 83702
Montana	10 East Babcock, Room 443, Federal Building, Bozeman, MT 59715
Nevada	50 South Virginia Street, Third Floor, Reno, NV 89505

Utah	4402 Federal Building, 125 South State Street, Salt Lake City, UT 84147
Washington	360 U.S. Court House, Spokane, WA 99201
Wyoming	Federal Building, 100 East "B" Street, Casper, WY 82602

In addition to state reports, a Water Supply Outlook for the Western United States is published by the Soil Conservation Service and National Weather Service monthly, January through May. Reports may be obtained from the Soil Conservation Service, West National Technical Center, 511 Northwest Broadway, Room 547, Portland, OR 97209.

USDA-SCS FORT WORTH, TEXAS 1985

GENERAL OUTLOOK

SUMMARY:

FEBRUARY WAS A MONTH OF CONTRASTS. FROM RECORD BREAKING TEMPERATURES, BOTH HIGHS AND LOWS, TO RECORD OR NEAR RECORD SNOWPACK DEPTHS. WINTER STORMS DUMPED SNOW IN THE WESTERN PART OF THE STATE IN RECORD AMOUNTS. SOME SNOW COURSES SHOW ACCUMULATED SNOWPACK AS MUCH AS 100% ABOVE NORMAL. HEAVY WINDS THAT ACCOMPANIED THE STORMS ALONG WITH WARMING TEMPERATURES TRIGGERED AVALANCES IN MANY AREAS OF WESTERN WYOMING. STREAMFLOW PROSPECTS FOR THE STATE REMAIN BRIGHT FOR SPRING AND SUMMER. RUNOFF WILL BE FROM NEAR AVERAGE TO MUCH ABOVE AVERAGE IF PRESENT TRENDS CONTINUE.

SNOWPACK:

A series of winter storms pushed the snowpack to record or near record levels in several areas of the state. Most snow accumulation was experienced in the Wind River, Wyoming, Teton, Gros Ventre and Absaroka Ranges in the north and west part of the state, and the Snowy and Sierra Madre Ranges in the south. The snowpack in these areas range from 30% to 100% above normal. Snowpack accumulation for the remainder of the state is near or slightly above average. The exception to the rule is the Casper Mountain and Muddy Mountain areas on the northwest flank of the Laramie Mountain Range in centeral Wyoming. These areas are about 5% below normal.

PRECIPITATION:

February total precipitation at almost all stations were near normal or much above normal. Excessive snowfall occurred in extreme western Wyoming. Amounts up to 7 1/2-inches of water equivalent were common in the Star Valley area northward into the Tetons. Elsewhere, averages were normal to slightly above normal. Seasonal comparisons were mostly 25% to 100% above normal. Extreme northwest areas, including the Snake drainage were almost 200% above normal. East of the Big Horns...the Little Missouri and Tongue drainages were up to 130% above normal.

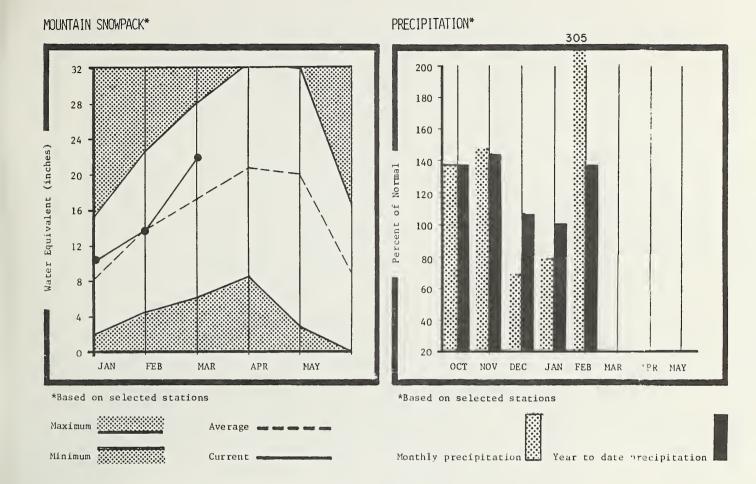

RESERVOIRS:

Major reservoir storage in the state is generally less than at this time last year. When compared to the long term average, present storage is about 8% above normal.

STREAMFLOW:

Streamflow prospects for the spring and summer brightened during the month of February. Most encouraging was the improvement of flow prospects for the Lower Clarks Fork and Shoshone drainages. users in these drainages can expect normal to slightly above normal streamflows. The Upper North Platte, Sweetwater and Upper Laramie drainages in the south and south central part of the state can expect runoff to average from 30 to 50 percent above normal. The Upper Bear River, Upper Green River and Upper Wind River drainages can expect runoff to be 35 to 100 percent above normal. Streamflow predictions for the remainder of the state show normal or slightly above normal flows can be expected. These forecasts are dependent upon average snowfall accumulations for the remaining portion of the snow season. The forecasts in this bulletin are a result of coordinated activity between the Soil Conservation Service and the National Weather Service in an effort to provide the best possible service to the water user.

SNAKE RIVER BASIN

WATER SUPPLY OUTLOOK:

Streamflow forecasts for this basin show expected flows to be 20 to 36 percent above average. Snowpack buildup for the month took a jump with all stations well above average. Some were as much as 50% above average. Precipitation set records at several stations. The monthly precipitation was about 200% above normal, with the year to date precipitation being 37% above average. Reservoir storage with the exception of Jackson Lake is above average.

For more information contact your local Soil Conservation Service office.

UPPER YELLOWSTONE AND MADISON RIVER BASINS

WATER SUPPLY OUTLOOK:

Snowpack buildup continues to be above average in the basin. Runoff estimates show that water users can expect near normal to above normal streamflows this spring and summer. February was a wet month for the basin as monthly precipitation amounts were 196% above normal. Year to date precipitation is about 50% above normal. Reservoir storage remains above average with about 73% of the usable capacity being used.

For more information contact your local Soil Conservation Service office.

WIND RIVER BASIN

WATER SUPPLY OUTLOOK:

Streamflow prospects remain bright for the spring and summer. Flows are predicted to be from 39 to 50 percent above average. Precipitation for the month was the big story in this basin. February precipitation was 249% above average. This precipitation led to a snowpack that is between 50% and 90% above normal. Several snow courses had record depths. All reservoirs in the basin show above average storage quantities.

For more information contact your local Soil Conservation Service office.

BIGHORN RIVER BASIN

WATER SUPPLY OUTLOOK:

Precipitation during the month has greatly brightened the runoff prospects. Streamflows are expected to be near normal or slightly above normal, with the Greybull and Shoshone drainages being nearly 20% above average. Precipitation for the month in the basin was about 230% above normal. Snowpack accumulation remains above normal with the Greybull drainage being 84% above average. Reservoir storage is above normal for this time of year.

For more information contact your local Soil Conservation Service office.

POWDER AND TONGUE RIVER BASINS

WATER SUPPLY OUTLOOK:

Streamflow forecasts are near to slightly above average. Snowpack buildup is near normal. Precipitation for the month was 141% above average. For the year precipitation is about 24% above average. If current conditions continue, water users can expect sufficient water supplies for the spring and summer.

For more information contact your local Soil Conservation Service office.

BELLE FOURCHE AND CHEYENNE RIVER BASINS

WATER SUPPLY OUTLOOK:

Precipitation during the month was only about 91% of normal which led to a reduction in the snowpack percentage. The snowpack remains above average by nearly 31%. However, this is a reduction from the previous months percentage. Reservoir storage on the Belle Fourche drainage is below normal. The remaining reservoir storage in the basin is near to slightly above average.

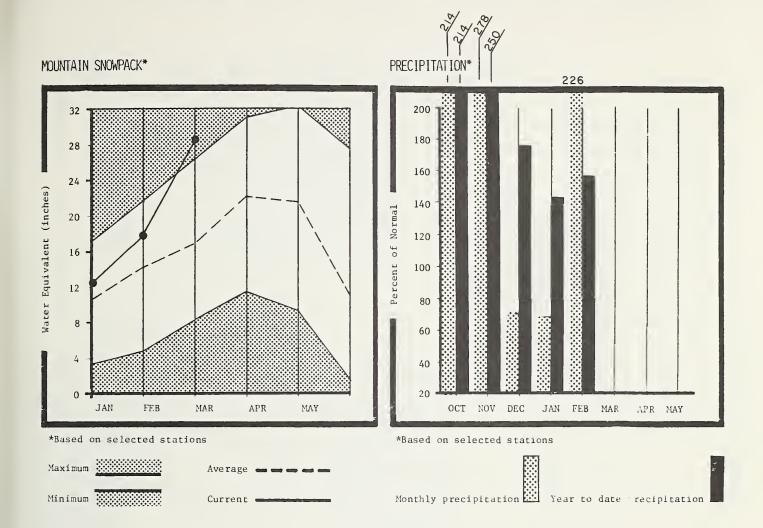

For more information contact your local Soil Conservation Service office.

UPPER NORTH PLATTE AND LITTLE SNAKE RIVER BASINS

WATER SUPPLY OUTLOOK:

Streamflow prospects in the Little Snake River Basin improved during the month. Forecasts predict flows to be nearly 30% above normal. Streamflows expected for the Upper North Platte Basin remain above average. Precipitation during the month was much above average at 126%. Year to date precipitation is about 60% above normal. Snowpack accumulation also is above average with the Little Snake River Basin being between 13% and 34% above average and the Upper North Platte Basin being 40% above average.

For more information contact your local Soil Conservation Service office.

LOWER NORTH PLATTE, SWEETWATER, AND LARAMIE RIVER BASINS

WATER SUPPLY OUTLOOK:

Streamflow outlook remains rosey for the basin except for the Deer and LaPrele Creeks. These drainages are predicted to be about 4% below normal. Flows for the remainder of the basin should be above average. Snowpack continues to be above average for most of the basin. Precipitation for the month was about 32% above normal and is about 21% above average for the year. Reservoir storage is above average in Seminoe and Pathfinder, and below average in the remaining main stem dams.

^{*}Corrected for upstream diversions or changes in reservoir storage. Average is for 1961-80 period.

UPPER GREEN RIVER BASIN

WATER SUPPLY OUTLOOK:

Above average streamflows can be expected by the water users this spring and summer. Precipitation for the month was over 300% of normal and is nearly 81% above average for the year. The heavy precipitation led to a continued snowpack buildup that is above average. Snowpack is between 43% and 67% above normal for the basin. With the exception of Fontenelle Reservoir, all basin reservoir storage is above normal.

For more information contact your local Soil Conservation Service office.

LOWER GREEN RIVER BASIN

WATER SUPPLY OUTLOOK:

Accumulated snowpack remains above average for the basin. It ranges from 19% to 50% above normal. Expected streamflows for spring and summer likewise are above average. Precipitation for February was above average by 141%. For the year it is about 34% above normal.

For more information contact your local Soil Conservation Service office.

UPPER BEAR RIVER BASIN

WATER SUPPLY OUTLOOK:

Snowpack in the Smiths Fork and Thomas Fork portion of the basin is about 52% above normal. The snowpack for the rest of the basin is nearly 36% above normal. Precipitation for the month was 184% above average. Precipitation for the year is 24% above average. Forecasted streamflows for the spring and summer are 42% above normal.
