A PRACTICAL movement is now on foot with the object of inducing the Government to introduce into Parliament a Bill confirming the responsibility of the Crown to protect the sea coast of this country and to afford assistance to local authorities in the construction and maintenance of coast protection works. The movement in question originated in the Conference recently held in Westminster, when the representatives of various municipal and other councils were present. It certainly is the statutory prerogative and the duty of the Crown to protect the land from inundation for the benefit of the commonwealth, and, as a matter of fact, no obligation rests upon anyone else. Moreover, local authorities do not appear to have power to execute protection works unless they also happen to be the owners of the threatened land. We know the difficulty of the problem is largely to be found in the small value of land along the coast

except in the vicinity of towns, but the case of those living near the sea is somewhat hard, as the cost of the necessary works is positively prohibitive in some places, and in others involves exceedingly heavy burdens in the way of taxation. The most unfortunate thing of all is the unrestricted removal of beach material, a habit in which Government departments are among the worst offenders. This suicidal practice should certainly be stopped at once, however indisposed the Government may be to fall in with larger views as to their responsibilities.

Economies in Railway Working. WITH first-class passengers travelling in their own motor-cars, electric trams and omnibuses capturing humbler individuals, and working expenses mounting steadily upwards, railway managers find it necessary to look in all directions for methods of retrenchment. Combination is, of course, no new experiment, and this is the key-note of the new departure which is being announced by the chairman of several leading lines at the half-yearly meetings of shareholders. In certain large manufacturing centres steps are being taken to establish receiving offices, organise a joint collection of goods and parcels, and generally to work in combination instead of in rivalry wherever practicable. The London and North-Western and the Midland Companies, which are in contact in many places, have already entered into an agreement to work on co-operative lines in a number of manufacturing towns; the Lancashire and Yorkshire Company have also joined in the movement, and it appears likely to spread. This amalgamation of forces will bring down town-office expenses, and render unnecessary many duplicate trains, both passenger and goods; and it is claimed that the new arrangements will be advantageous rather than prejudicial to the trading public, while being of undoubted benefit to the shareholders.

Labour Returns. THE labour returns show continued improvement in nearly all the industries with the exception of the building trade, in which stagnation continues. The Trades Union returns for January prove that more workmen are in employ than at this time last year, the figures relating to the unemployed showing that only 4.7 trades unionists were unemployed, as compared with 6.8 per cent. at the end of January last year. Despite the continued improvement in the labour returns during the past few months, more has been heard of the unemployed this year than for many years past, a fact not without significance in view of recent legislation dealing with this question.

The Port of Liverpool. NOTWITHSTANDING the remarkable expansion of traffic on the Manchester Ship Canal, Liverpool does not seem to suffer any diminution of prosperity. The annual statement of Mr. Robert Gladstone at a recent meeting of the Mersey Docks and Harbour Board confirms this fact in a remarkable manner. We have referred on a previous occasion to the activity displayed in dock construction and other harbour works in

Liverpool. At the present time the site is prepared for a scheme of dock extension to come before Parliament during the next session. The first step in this project will be the formation of two new entrances, each 135 ft. wide, into the river, the making of a vestibule dock out of which will open two others suitable for vessels 800 ft. long. These entrances are designed to serve for a still larger extension opposite Seaforth, the works being rendered necessary by great increase of trade and the increasing size of modern ships. New entrances to the basins at Tranmere are now nearly complete, the new river wall is well advanced, nearly 90 acres of land have been set apart for shipbuilding purposes, and the board propose to build a new dock with an area of 11 acres at Birkenhead. Altogether Liverpool seems likely to maintain her position as the second greatest port of the world, and possibly to surpass London, unless something practical can be done for the improvement of the metropolitan port.

Electrolytic Theory. MR. WHETIAM'S lecture at the Royal Institution last week on the "Passage of Electricity Through Liquids" will be appreciated by all who are interested in electrical theory. As one of the foremost workers in this branch of research, and as a writer who has grappled successfully with some of the most abstruse problems in connexion with it, we had expected that he would expose the fallacies of some of the old-fashioned theories. Instead, however, of doing this he gave an excellent elementary description of the main phenomena in electrolysis, and it was only occasionally by a qualifying phrase or a happily chosen analogy that one realised that the lecturer had a quite different conception of the mechanism of the electric-current to that universally adopted until a few years ago. He showed the decomposition of a solution of sulphate of copper into its constituent ions, by means of an image on the screen, and called especial attention to the concentration of the solution where the current entered the liquid, and its attenuation where it left. Faraday called the constituents, into which the electric current separated the liquid, "ions" because they move. In modern theory these ions carry the electric charges, and the actual convection of these charges constitutes the current. In the older theories the analogy used was that of water flowing from one reservoir to another, and being pumped back again. In the modern theory the analogy of a row of men carrying the water in pails between the two reservoirs is given. The lecturer showed on the screen the actual motion of the ions, and explained how their velocities were measured. These measurements have been made by Steele and others, and are found to be in practically exact agreement with the theoretical values of Kohlrausch. Hardy's experiments on the coagulation of a clear solution of albumen by the addition of certain chemical salts were shown, and the reason why the higher the valency of the ion the more efficiently it acted in "curdling" the albumen was explained. It is interesting to notice that both the chemical electrician and

the physiologist are now exploring this field of research.

The Hellenic Society. THE paper by Mr. E. Norman Gardiner read at the meeting of the Hellenic Society on Tuesday, under the title "Heracles* the Pancratiast," dealt with a rather curious subject which has some bearing on the representation of Hercules in ancient art. The "Pankration" seems to have been something like the Japanese "jujitsu" of which we are hearing so much now, and was a contest something between wrestling and boxing, the main object being, in one way or another, to tire out the adversary or put him *hors de combat*. Hercules was the patron or hero of those who were victors in this struggle; and Mr. Gardiner took it that the vase representations of the strife of Hercules and Antæus and of Hercules and the Nemean lion were a kind of typical representation of the Pankration, showing Hercules in the act of lifting Antæus from the ground, throwing the lion over his shoulder, etc. The series of slides shown were very curious and interesting, and the conclusion deduced from them by the lecturer was that the later (and now the popular) idea of Hercules as a kind of giant of over-developed muscle was not in accordance with the original Greek conception, in which Hercules represented rather youthful vigour and resource in athletics. In all the representations that had been shown of his combats the impression was given that the victory was one of science over brute force.

The Leicester Galleries. THE exhibition of paintings and water-colours by Mr. Charles Sims, at the Leicester Galleries, throws rather a new light on the possibilities of this clever painter; in fact, until we caught sight of "The Moth Catchers" (54), an obvious first study for a recent Academy Picture, we felt some doubt whether it was the same Mr. Sims whose work we knew at the Academy. From the variety of the subjects of the small pictures here, and of their treatment, it seems evident that this artist has much more within his powers than his Academy pictures have yet shown. Sketches as many of the works are, there is much both of fine colour and fine suggestion in composition. In this latter respect the sketches numbered 15 and 24 may be particularly noticed; they are very slight but they have the making of pictures in them. Among the larger works "Beech Boughs" (14) and "Washing Day" (26) are good, the latter is a very carefully studied interior both as to figures and accessories. "Bacchus and Ariadne" (34), which seems to have been painted under the influence of Watts, is unsatisfactory in respect of the plump and rather stumpy figure of Ariadne; but the vigorous movement of the figure of Bacchus is finely given, and the whole is a striking symphony in colour. The best thing in the whole collection, and the most complete in itself, is "Sunshine and Wind" (50), showing the figures of a woman and child drifting across a bleak common on a

*The Hellenists are not always very logical in their Anglicising of Greek names. "Heracles" is of course the Roman form, popularised in English by long use; but if "Heracles" does not satisfy them, why do they not adopt "Herakles," the genuine Greek name, instead of "Heracles," which is neither one thing nor another?

stormy day. If this has not been worked up into a large and complete picture (we do not recollect it as such), we hope it will be. In the adjoining room is a miscellaneous collection of oil-paintings, a good many of them by the Norwich artists, among whom James Stark comes out very well, and there are two fine Cromes (19 and 42) of rather unusual subjects for this artist; "Cattle at a Pool" by Vincent (30); "A Gipsy Encampment" by Stothard (46), weak in the figures as usual, but exceedingly powerful in its landscape effect; and a "Wooded Landscape" (33) assigned in the catalogue to "Colkett and Bristow," whose joint production has a great resemblance to that of Stark, and Stark at his best. There is also a very fine painting of a stormy coast scene, "Mouth of a Sussex River" (7), by "Jock" Wilson, whose name we confess to having forgotten, but who is worth remembering if this is a typical example of his powers. Among the few portraits in the collection it is interesting to see a fine example of the work of Reynolds's pupil and follower Northcote—a half-length of a lady, the colour and quality of which raises one's respect for an old R.A. whose repute has rather suffered, probably, by the satirical portrait of him in Haydon's Autobiography, and perhaps by the literary celebrity of Hazlitt's "Conversations with Northcote," which have created a kind of impression that the latter was chiefly occupied in talking about art. Evidently he could paint as well as talk.

Dudley Gallery Art Society. THIS Society, which retains the name derived from its old exhibition room, holds its exhibition this year in the large room of the Alpine Club, where the light at all events is admirable. The exhibition, amid a certain proportion of mediocre work, contains more really interesting drawings than usual; drawings which have character and individuality, and not merely competent execution. There are more, indeed, than we have space to mention. Among those that we have noted as especially good are Mr. Joseph Powell's "Rye from the Marshes" (20); Mr. S. G. W. Roscoe's "Autumn Morning on the Exe" (54); Mr. James T. Watts's small landscape, "Rain on the Moor" (69); and Mr. David Green's "On Gouthland Moor." The landscapes by Mr. R. A. K. Marshall are beautifully finished and very delicate in their distant effects, but too minutely picked out for breadth of effect. Miss Jex Blake and Miss Margaret Bernard show their usual power in a very opposite school of water-colour art, that of broad effects of composition and colour, with no breaking up into small detail. Mrs. Jardine's snow scene, "Zuoz, Engadine" (91), with its effective contrast between the pure white of the snow and the dirty white of the village houses, is fine and truthful. Among the few pictures in which figures are prominent Mr. Innes Fripp has made a good scene out of the "Merchant of Venice" (66); his group of Elizabethan men on the seashore in "Treasure Trove" (181) reminds one pleasantly of Kingsley's "Westward Ho!" and is well composed and carefully worked out; and Miss Janet Fisher in "Bluebells" (160), where a young girl kneels in a wood

to collect the flowers, appeals to a sense of something more than mere execution. Among others we may mention Mr. Duassut's "Essex Lane in Winter" (19); Mr. Roscoe's "The Landslip, Beer" (51); Mr. Newton Benett's "Buscot, Thames" (274), and Mr. Geo. Marks's beautiful little landscape, "Gorse" (209), which is quite perfect.

From the Alps to the Apennines. THE water-colour drawings by Mr. E. Whyley, exhibited under this title at the Fine Art Society's Gallery, belong to some extent to the order of topographical drawings, which are looked at as much for what they represent as for their artistic style; but these are very good work of their kind, and in those in which architecture is the prominent subject, such as "South Porch, Bergamo" (18), "Doorway of San Rufino, Assisi" (61), and "West Door, Verona" (65), the architecture is very well treated—precise in definition without being hard. "Nightfall, San Gimignano" (16) is an interesting sketch, showing the celebrated towers as silhouettes in the twilight. Among those which deal with more extended landscape effect may be mentioned "Morning Mists" (7); "On the Road to Sale Marasino" (12), where the colour treatment of the hills in the background, just a shimmer of green through a hazy atmosphere, is very delicate; and "Flush of Sunrise, Montreux" (49), a successful indication of an effect very difficult to realise, even in water-colour, a better medium for this type of effect than oil.

Etchings after Corot. At Messrs. Dowdeswell's Gallery there is on view a collection of very fine etchings after the landscapes of Corot, by MM. Brunet-Debaines, Krostewitz, Huet, Monnier, and others. As etchings, and as translations of Corot into black and white, there is not much to choose between them; all are good, and Corot's style, which is not dependent on strong colour so much as on composition and aerial perspective, is peculiarly suitable for representation by etching, in which the evanescent character of the great painter's effects can be better represented than in the more pronounced and precise lines which are inseparable from engraving. If we were to select any as particularly successful they would be Monnier's etching of "L'Etang" (10) and Brunet-Debaines' "Pastorale" (3).

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

An ordinary general meeting of the Royal Institute of British Architects was held on Monday at the rooms of the Institute, No. 9 Conduit-street, W. Mr. Leonard Stokes, Vice-President, occupied the chair in the absence through indisposition of Mr. John Belcher.

Furniture.

The minutes having been taken as read, Mr. E. Guy Dawber read a paper on "Furniture," of which the following is an abstract:—

Tracing the development of furniture in England, the author said that nearly all the examples shown in MS. illustrations down to the middle of the XVth century were of an ecclesiastical character. Throughout each successive period the style of the furniture had followed that of the architecture, and if any special piece was required, the same craftsman who built the church, monastery, or castle, made it, or at any rate had such control, that in character and detail it

assimilated with the building. Household furniture in the XVth and XVIth centuries was characterised by simplicity and stability of construction, and, as much of it had to be shifted from one castle to another when any great personage moved, its supply was necessarily limited, and rooms were consequently sparingly furnished. The influx of foreign workmen from Italy and the Netherlands had hindered the development of a distinctive and national taste, and up to the close of the XVIIth century there was hardly a definite and decided tradition. After the design of furniture began to break through its ecclesiastical environment, when the Renaissance in Italy had developed in England, then we find a real national style gradually being evolved. Perhaps the most constructively perfect period of English furniture was the end of the XVth and first half of the XVIIth centuries, and though its design was based almost entirely on classical influences and detail, and the outlines may suggest extraneous origin, it retained a character essentially English, and soon lost any trace of foreign influence. The workmanship was of the best, the construction admirable, and framed in a manner calculated to withstand the roughest usage. During the reign of Charles I. and for many years previous, velvets, brocades, satins, and stuffs had been imported from Venice and abroad, and much furniture from Italy as well as the Netherlands. The Restoration, in 1660, caused a further influx of furniture and workmen from Holland, Flanders, Spain, and France; and to this we owe a great deal of the mixed character and diversity of style so prevalent in the latter half of the XVIIth century.

Marquetry was one of the distinguishing characteristics of late Dutch XVIIIth century furniture, and when treated in a quiet and simple manner was very pleasing; but although it became the fashion for some years in this country, and chairs, cabinets, clock cases, and indeed all surfaces, offered opportunities for the new style of decoration, it never took a firm root, and after a few years died out. Carving—at the beginning of the XVIIIth century—was sparingly used, the tendency being towards greater lightness and grace of line in furniture. In the XVIIIth century many schools of craftsmen and cabinet-makers based their designs almost exclusively on the models of the leading architects of the day. Sir Christopher Wren had gathered around him a school of designers and carvers whose influence upon furniture-makers was very marked. It was the age of constructive joinery and beautiful carving, and whether in oak or deal one single style and tradition permeated the whole country. The architect was the chief director in all matters of style, proportion, and arrangement, and a great deal of the actual furniture was designed by him. It is not too much to claim that the classic spirit so predominant throughout the furniture of the XVIIIth century, is mainly attributable to the influence of architects. Chippendale's first book was published in 1754. In reading it we cannot help admiring the power he possessed of combining the seeming incongruities of the so-called French, Gothic, and Chinese styles which were then so fashionable, and in making out of them pleasing and harmonious pieces of furniture, and imparting to them such symmetry and dignity. We see in his work how all his effect was obtained from outline and carving only, for though inlay, veneer, and painting had long been in use, he discarded them altogether, and worked in the solid mahogany. But he did not originate a style; he only carried on the existing traditions of the day and clothed them in fresh detail of his own, or borrowed from other sources. Whatever we may think of the general design of Chippendale and his fellow-workers, there is no doubt that these famous cabinet-makers thoroughly appreciated the proper limits within which carving, as applied to furniture, should be confined. Lowness of relief, adaptation to the structural lines, the employment of a maximum of plain surface with a minimum of carving, are all strongly-marked characteristics of the work of this period. The author went on to deal with the work and influence of other eminent furniture designers—Shearer, Heppelwhite, the brothers Adam, Sheraton, etc. Two

facts, he said, mainly contribute to the charm and interest of the furniture of by-gone days: the first, that its form and detail were so admirably adapted to the material it was made of; the second, that it was always so singularly suitable to its environment.

Towards the close of the XVIIIth century, though the design of furniture was still influenced by the architectural features and character of the houses it adorned, it began to show that the necessity for the two being absolutely in harmony was not considered essential, for a great school of specialists in furniture-making had arisen, and the association between the architect and cabinet-maker was beginning to weaken, until it ceased to exist. About half a century ago, when perhaps domestic architecture in England was at its lowest ebb, things reached such a pass that the fashion in furniture became absolutely regardless of architectural principles or fitness, and only the idea of comfort and luxury prevailed, until the inevitable reaction set in, and people, finding they could no longer get new furniture which was not an eyesore, reverted to the opposite extreme—viz., the older styles of former days. Then came the difficulty which still exists—which particular style amongst those of the past to select. All, perhaps, are equally incongruous in modern houses, yet all appeal to people in different ways; and now that in the mind of the general public architecture and furniture have been definitely divorced from one another, it is the fashion to pick up pieces of furniture, quite indiscriminately, because they happen to be beautiful, quaint, or old, and people fill their houses, utterly indifferent to the effect produced. All this brings us back to one thing worth noticing—that throughout the periods when architecture flourished and was a living art, furniture was the same, and very beautiful work was the result; but when there ceased to be any real tradition in architecture, at the same moment furniture died out. The two are inseparable—they always have been and always will be; and just as to-day we have a real living common-sense style of domestic architecture, so also, with its development, will a real style of furniture arise. There is undoubtedly a great effort being made at the present time amongst many of our ablest designers and craftsmen to remedy this by producing designs for furniture original and artistic in treatment. There is still, however, too much inclination, in aiming at simplicity of form, to neglect the beauties of form altogether. Because mouldings have been excessively or wrongly employed, there is a tendency to abjure them altogether, so losing one of the main factors in creating beauty and interest. Of course, to class the whole of the modern furniture produced to-day in such a category would be absurd, for we have designers and craftsmen who, if only given the opportunity, can design and make furniture which can rival the productions of past ages. But until there is some settled standard of thought and tradition permeating the whole country, any efforts at design in furniture must be but isolated and individual. The author said he did not suggest that an architect should design furniture; but he should have in his mind the house he is building, finished and furnished complete, just as a painter has a mental impression of the last state of a picture he may only be beginning to put on canvas. That impression may be modified and improved in detail as the work proceeds, but the general scheme, the broad idea, will remain. For the architect, however, who is more thorough in his work, and is not content with constructing the mere shell of his house, there is much scope for excellent effects, by planning permanent fittings, such as bookcases, cupboards, side-board recesses, and so on. The reproach that the British is an inartistic nation is being removed. People have either become artistic themselves or have attained to the wisdom of Socrates in admitting that they know nothing, and are content to leave the work to those whose business in life it is to show them what is artistically right and in good taste. With the improvement in domestic architecture, which is so marked, the author felt sure that it would only be a matter of time before the public realised that good, sensible, modern furniture could be equally well obtained at a reasonable cost; and this result would be

greatly helped if architects generally gave more thought and care than they do at present to the finishings and furniture of the houses they design. An architect's training and sense of proportion should enable him to exercise a very helpful power in controlling and directing the taste of the public.

Mr. Percy Maquoid, in proposing a vote of thanks to the reader of the paper, said it was difficult to say anything fresh after the excellent paper which dealt with a very large subject in a simple way, and had brought almost all the types of furniture known to them into a small compass. Mr. Dawber had shown them how one period melted into another, and they had seen from the illustrations the different links, and that, to his mind, was the great interest in furniture. It was the periods of transition which taught the most. He would have liked to have seen a little more of the Elizabethan furniture, but it was extremely difficult to find genuine examples. The court cupboard, for instance, was a very important piece of furniture, and really comprised every necessity for the family. The court cupboard given in the illustration was from the Victoria and Albert Museum, and in connection with this piece of furniture he would like to tell a story. Some time ago a gentleman living in the West sent him some photographs of two chairs of the same date and type of this court cupboard, and asked him to come and look at his furniture. They could imagine his horror when he found the hall filled with furniture made by the same hand, and he had to tell his friend that there was not a single piece of furniture genuine. He asked how the furniture was obtained, and his friend told him he had been getting it piece by piece for the last fifteen or twenty years, and that it came from a family in the North who were greatly reduced in circumstances, and who said the furniture was all made by the carpenters of the family in the reign of James I. This gentleman had spent large sums of money in getting oak furniture, but he was glad to say that he obtained the money back, and the furniture was returned to the "carpenters of the reign of James I." One of the most beautiful specimens in oak that Mr. Dawber had shown was the Charterhouse table, which was especially interesting because it showed the strong influence of the French style of Henri II. of about 1656, and he did not suppose there was any other specimen of English oak furniture that quite represented the style as perfectly as that table. There was one subject on which Mr. Dawber said little. He mentioned the fact that walnut was used, and no doubt very extensively, and some specimens entirely constructed of walnut were before the beginning of the Civil War, and so great an impression had this walnut made on the people that they planted a great many walnut-trees. Walnut was evidently looked on as a rather precious thing, because they never found an inferior piece of furniture made in walnut in Elizabethan or Jacobean times. The date of the Yorkshire chairs given by Mr. Dawber as 1620 seemed a little early, because the applied split baluster which occurred was, he fancied, a little later in date. If they did not put these chairs a little later they would practically find they had no chairs to sit on, because then there would have been no chairs made between the Restoration chairs and these very distinctly made in 1625, and he could not imagine that a local variety would have sprung up so early as 1620 bearing the split baluster. It must have come from Holland, through Suffolk, and got to the north. Also, one missed the very rare specimens of gilded furniture beginning at about 1710 and going on to about 1725 or 1730, the taste for which, he would imagine, came in with the Guelphs. It was very showy, and bore on the knees of the chairs and sofas an ornamentation that he was at a loss to account for. He meant the lions' and the eagles' heads at the end of the arms. There must have been something symbolical about that, for they found it only in that period and very extensively produced. There was also an extremely objectionable fad used which doubtless represented someone at the time, and he would like to know who it was. He agreed with Mr. Dawber about Chippendale,

who was a very able man, but did very little that was really original except to refine and make lighter certain forms which existed before him, and to make these forms more practical and suitable to the costume and appearance of those people who used the chairs. They would remember that in Chippendale's time costumes lightened. The costumes of the first George and Anne were far more clumsy, and the furniture made then was more suitable to the rather dull, clumsy people who used it. Chippendale's time was far brighter and a more intellectual and gay period, and consequently they found a rather lively characteristic introduced into the furniture. Mr. Dawber had shown them some very beautiful specimens of Adam furniture, and he felt that in referring to the merits of Shearer, Heppelwhite, and Chippendale they were inclined to neglect Adam. Where they found Adam in possession of a house designed by him, and with the furniture in its original place, the effect was most beautiful. There was one very beautiful Adam house, where the furniture was also designed by the architect, and that was Lord Jersey's house at Osterley. What had been said with regard to modern furniture was most interesting, and he had no doubt when they found the public would pay as much as their ancestors paid they would get something respectable produced. At present it seemed to him that the wood was rather flat and the mouldings were flat, and there were a great many uprights which suggested that clothes should be hung upon them, and the hinges were much larger than was wanted, and there was a sense of affectation of bareness which did not attract. As to the Nouveau Art, he thought it was the result of a person who was living entirely by himself, neglected by society, and who, when he sat down to design furniture, dined on red herrings and absinthe, and then tried to produce something extraordinary, in which he thoroughly succeeded.

Mr. J. D. Crace, in seconding the vote of thanks, said he felt some interest in being there, because it was now forty-nine years ago that his father read the first paper on the same subject in that room, and it was particularly fixed on his mind because he had a large hand in preparing the diagrams for the paper. The many things which Mr. Dawber touched upon were all interesting, but he thought he made somewhat light of the aid that might be got in tracing the history of furniture from old manuscripts. The illustrations to be found in many of the old manuscripts were by no means exclusively ecclesiastical. Many of the dedication pages in old books showed the domestic surroundings of the person to whom the book was presented, and in that way they often got extremely interesting details. Then there were many interesting specimens of furniture scattered about the country in many old houses of pre-Elizabethan times. He recollected seeing a distinctly original bedstead at Lord Mount-Edgumbe's house, Cotheloe, which had certainly never left the house since the time of Henry VII. He was sorry also that Mr. Dawber did not give a little space to the inlaid work done in Elizabethan times. Elizabethan furniture was often extensively inlaid. They found inlay in the round done in the most charming way at Hardwicke Hall, and done apparently in view of the visit of Elizabeth there, for a sort of complimentary message had been let in on top of the table. There was the Royal device and Cavendish arms, with supporters, two stags, and twining round them were roses and the words:—

"The redolent smell of exultation
We stags exalt to the divine."

There was also an immense amount of furniture of the time of William III. in the same house. Knowle House was also most interesting in the way of furniture. He thought perhaps that Mr. Dawber went rather far in saying that design was altogether given up in the middle of last century, because it was then reviving. It began to revive before the Great Exhibition. In fact, the Exhibition was the outcome of the sense in a number of people of the great want of making design in the articles of life better understood. But there was a great deal of admirable work provided between 1850 up to the end of the century. In fact, they had only to look back to the horrors which

appeared in the shops when he was a young man to look now at an ordinary shop in Tottenham-court-road and congratulate themselves. A great deal of the furniture produced by the ordinary furniture-makers to-day might not be of a very high quality or of a high quality of design, but at any rate it had the right intention. It had the right general notion of what design should be, and did not include the horrors of the early half of the XIXth century. He thought architects would do well to show some interest in the designs of the furniture to be used in the houses they built, because they were very greatly interested in the effect of the total result of a house, and that would always depend to some extent on the accessories.

Mr. Maurice B. Adams said if modern work in this regard was referred to at all there was one period of architecture and furniture which Mr. Dawber had not alluded to but which always struck him as extremely interesting—he meant when Burges, Mr. Street, Mr. Eastlake, and Sir Arthur Blomfield interested themselves in designing furniture, some of the designs so produced being extremely good, and which in the history of furniture certainly ought to claim adequate recognition if they were to consider the work now generally associated with the Arts and Craft School. If they remembered Burges's house at Kensington he thought they would agree with him that it was one of the most remarkable buildings of its kind in this country, and one which he would like to see acquired as a national monument—it really was a most wonderful piece of work, thoroughly worked out from beginning to end by one of the most distinguished architects of the XIXth century. In that house and in his office at Buckingham-street, Burges carried out the idea which William Morris, Rossetti, and Burne Jones also realised—that they could have perfectly plain furniture and then paint it most beautifully inside as well as out, and make it extremely interesting and a supreme work of art. Burges, in his house, acting on the lines of the painted mediæval armour at Bayeux, painted a series of bookcases in his library beginning "A was an architect, B was a builder," and so on all round the room, and then he employed in doing this Marks and Sir E. Poynter, while inside the furniture were painted most lovely representations of plant life, all part and parcel of the story, and to his mind carrying furniture to a much higher plane than the exquisite cabinet-work of Chippendale and others which had been presented. In reading Burne-Jones's life he would find that his idea was to design something exquisitely beautiful in itself, well proportioned, and all that, but the object of the thing mainly was to produce a surface on which most beautiful painting could be placed. Whether or not it was desirable to paint chairs and such-like articles was another matter, but he did think that, in a history of furniture up to the present time, it would be a pity if they left out all mention of such work as that belonging to that much-abused period of the Gothic revival. There was some very nice modern work at that time by Bruce Lambert, and Brydon followed much in the same way. They were friends and Scotchmen, and they did some exceedingly nice work which would bear criticism from the modern standpoint. There was very much more intelligence and thought in it than there was in the semi-barbaric rabbit-hutches which they saw with huge iron hinges and with interiors hard to get at, and which were of little use. It was a subject which he had taken a great deal of interest in all his life. Some years ago when his friend, Mr. Aldam Heaton, read a paper on "Furnishing" it was rather disparaged by one or two members of the Institute as being a subject which practical architects could not turn their attention to. He thought that was a great mistake, and when they went into some of the modern houses which architects were building all over the country they found that where the architects had been allowed to have a voice in the furnishing of the house the result was exceedingly satisfactory, whereas, on the other hand, they found in some houses a mass of the most trashy furniture which could be introduced. But in designing furniture for a house they must remember that the persons who used them

must not appear incongruous, and the present unfortunate system of rapid changes in the fashion of dress made it extremely difficult to design anything which would exactly accord with living modes and manners. Mr. Macquoid had done well to insist that it was not only the architecture of the period which influenced the furniture, but also the costume and style of the people who used it. He had known Mr. Dawber for a great many years, and he believed the first time he came across him was when he was making some sketches of furniture in East Anglia in ancient buildings. He was not surprised to find that Mr. Dawber was still interested in furniture.

Mr. H. D. Searles-Wood said he would like to throw out the suggestion that at the Congress a visit to Burges's house and perhaps some other houses might be arranged.

Mr. A. Penty said it always struck him that little of the old furniture was wholly satisfactory. They saw a chair, for instance, of which the legs were beautiful, while the back was the reverse of beautiful. In some cases they got a real feeling of vigour, but with this vigour there was a lack of refinement, and then, again, in other work they got refinement but the vigour was gone. He could not but feel that somehow or other there never seemed to have been the same standard of design maintained in furniture as in architecture. He did not know the reason for that, but so it always seemed to him.

Miss E. Rowe said that Mr. Macquoid had alluded to the spindle ornamentation being too early for 1620, and she would like to ask Mr. Dawber whether in his observations he had noted that in Nasb's "Mansions of England" there was a drawing of the Moncaunte room showing the interior porch, and that was, she believed, about 1580. He would see that the spindle ornament was given in that.

The vote of thanks was heartily agreed to. Mr. Dawber said that when he undertook to read a paper on "Furniture" he realised that the subject was an immense one, and covered an enormous amount of ground. The speakers, with one exception, had been kind enough to tell him of his shortcomings, and to a certain extent he knew them. It was quite impossible to say everything, or even to trace properly the history of furniture, in the time he had at his disposal. He knew Hardwick Hall very well indeed, and had sketched the furniture. He could not quite agree with Mr. Macquoid as to what he said about the split baluster of the Yorkshire chairs. He had two Derbyshire chairs which were better examples than those he had shown, and they had the split balusters, and he put them down at 1610 to 1615, and all the researches he had made led him to the belief that that was the real date. At the same time he admitted that it was with besitation that he ventured to express his opinion before such an authority as Mr. Macquoid.

The New Premises.

The Chairman said that a meeting had been called for the following evening to consider the question of acquiring new premises for the Institute, but, as Mr. Belcher was indisposed and one or two little troubles had arisen, the Council felt that all they could honestly do would be to postpone the meeting. They would have to meet, because the meeting had been advertised, but the only business which would be transacted would be the adjournment of the meeting. On Monday, March 5, a special general meeting would be held for the election of the Gold Medallist, to be followed by a business meeting for the election of members. Mr. Saxon Snell had given notice that he would call attention to the Henry Saxon Snell Bequest and as to what steps had been taken by the Council to formulate a scheme for the proposed scholarship or prizes, and also that he would move a resolution.

COUNCIL SCHOOL, TEVERSAL, NOTTS.—A new council school has just been opened at Teversal. It affords accommodation for seventy-five children, and the main room can be divided by a partition. There are also cloakrooms, and the school itself is surrounded by a playground. The cost has been 1,700l. Mr. J. Sander, the County Architect, prepared the plans for the work.

ROYAL ACADEMY LECTURES.

At his fourth and concluding lecture on "Reason in Architecture," delivered on Thursday last week, Mr. Jackson said that it might be objected to the argument of his preceding lectures—if all architecture was based merely on the fit expression of structure, what room was left for art? That was a vital question to which in fact the previous lectures were intended to lead up. Sound building was not everything; and though architecture must rest on a reasonable basis and not on caprice, it did not follow that no room was left for art. Everything depended on the spirit in which the suggestions and opportunities of structure were received; and that depended on whether the artistic spirit was or was not present in the builders. The suggestions of structure might be treated gracefully or ungracefully; some ages were artistic, others utilitarian and commonplace. To a dull mind the use of recessed orders of arches would have suggested nothing but economy of material; the artistic mind found in it the suggestion for mouldings and the grouping of pier-shafts; and the practical difficulties of vaulting, which led to the introduction of the built-up vaulting-rib, were by the artistic mind etherealised into the roof of King's College Chapel. In like manner the weighting of buttresses practically required nothing but a mass of stonework, but it was treated as a pinnacle, and became a feature of beauty; and so with the flying buttress. The gradual approach to each other of the original small narrow windows of the Romanesque builders, left between them a thin shaft of stonework till there was but a led to the blending of the lights into one window, and to the introduction of tracery to support the leaded glass—a feature as unexpected as it was admirable. But for the artistic spirit the development of the capital might have stopped at the Byzantine cushion form. A recent writer on architecture in the *Edinburgh Review*, he noticed, had maintained that the new development in architecture after the fall of the Roman Empire was owing to the ideas of the new races who had supplanted the Romans; that they must have had the idea of this architecture in their minds before they built it; and so on. That, he could only say, was putting the cart before the horse. At the root of each fresh departure in architecture was a reason founded on convenience and quite outside of aesthetics, and a reason which refused to be lost sight of; when it was lost sight of, the style decayed and fell. Construction to the architect, in fact, was like natural form to the painter; as long as it was correctly expressed, there was room for development beyond the structural basis. The solution of the problem would be different with different people, and that solution demanded to be expressed as much as the constructional basis itself. The marble quarries of Greece suggested trabeated structure and fine mouldings; the Romans, who used the arch, erected in their aqueducts splendid arched structures; their weakness was the retention (in other erections) of trabeated forms where they had no constructive meaning. There was something in personal character and social conditions which influenced architectural development. During the Xth and XIth centuries clerical influence induced a certain conservatism, but after the XIIIth century, when the lay influence came into building, the development was wonderfully rapid. The next generation after the Norman nave at Peterborough saw the west front built, and after that a whole succession of original styles was developed in three and a half centuries. Contrast this with the case of the Roman arch, which was just as good a suggestion in architecture, but was not developed into anything further. The Roman Empire, like the Roman architecture, bore the stamp of Rome everywhere, and every colonial city was but a miniature of Rome; and so the central type governed everything in Roman architecture, which hence became monotonous. The time of jarring nationalities succeeded, to whom the monotony of Roman architecture was unsuitable; architecture must in any case have taken a new direction, Gothic architecture was the style of individualism; it could take almost any shape and yet remain the same style, and was therefore exactly suited to the social instincts of the period; but the influence of construction was behind all this.

No new style was ever invented; it came about unconsciously, and to parade what was called "Art Nouveau" as a new style was to ignore all the teaching of history. All the revivals of modern times were of outside appearances only; sash windows were Classic, it was understood, mullioned windows were gothic; precedents were wanted for everything from Palladio to Pugin; chimneys were no part of original Classic architecture; they were therefore to be disguised as vases or obelisks. This idea of architecture had been accepted by the public, and rules for carrying it out had been formulated by the authorities who had control over our art schools. In lesser arts the same principles applied; forms should be founded on utility, in which sense the humblest utensil might have interest; the forms of old pottery, and of the bronze vessels found at Pompeii, which were generally admirable to the eye, were founded on convenience and utility. The same principle should hold good in what was called "Applied Art." Why were we to see floorcloth looking like squares of tiles, and brooches made in imitation of horseshoes, or a diamond brooch in the shape of a pig? That was not design, it was the unintelligent imitation of form. To return to architecture, how did our modern practice accord with the fact that new materials were coming into use? There were plenty of constructional suggestions in these days, but we still stuck to our old architectural forms. There was a demand for glass shop fronts, and they had to be supplied; yet we still continued to build above these glass fronts as if there were no glass below. We should face the facts; show the girder and the iron column which carried it, and not conceal the girder and stanchions behind a mask. And it was inconsistent that the upper portion of a building should ignore the construction of the lower portion. Projecting oriels and domes and other such features were impertinences in a building of which the real construction was iron. Why not treat iron in some such way as wood used to be treated in half-timber work? Iron construction really resembled carpentry a good deal; why not make the superstructure of a shop a visible iron framing, with the iron exposed to view as the wood was in the street buildings of Chester? Of course we could not tell how long iron was going to last; and apart from any special demand being made for it, he thought an architect who wished to go down to posterity would be wise to keep iron out of his buildings as much as possible. But to see miles of streets resting on concealed girders was a lesson to us, at all events, that we had thrown away an opportunity.* The recollection of constructional basis might also act against the common mistake of crowding buildings with ornament, so that the eye in vain seeks for repose in any plain spaces. Terra-cotta had had a bad influence in this respect, a fine material in an artist's hands, it had encouraged the use of cheap repetition of ornament. Self-restraint in ornament was one of the lessons much needed in this day; the sense that in this respect, often, the half was more than the whole. One temptation to pretentiousness in ornament was that it was popular; and moreover it saved thinking; it was easy to cram on ornament. If all architectural design were referred to the test of construction, ornament would take its right place, which should be like that of the drapery to a statue. Ornament should have structural meaning too; as applied to a capital it should have an upward and supporting tendency; in friezes and cappers it should have a flatter character. Doorways invited decorative treatment, and in the earlier Gothic doorways of France the tympanum was sometimes decorated with sculpture which was thought of sufficient

* It is possible that another way out of this may be found, by persuading the better class of shopkeepers to believe that in the long run a good architectural treatment of a front may be a better advertisement than the whole sheet of plate glass. We can give one instance in point, of recent occurrence. An architect was desirous to carry the upper part of the front over a shop on a genuine elliptical arch over the ground floor window, instead of inserting a girder and filling the whole space with plate glass. He showed the client that the architectural effect was much better and more complete in that way, and asked him if it was worth while to spoil the whole front for the sake of getting in two triangular bits of plate glass which were not really necessary. The argument was accepted.—Ed.

value to be preserved and reset in a later building. Windows also were opportunities for decoration in a typical Venetian palace the decoration was nearly all concentrated on the windows. That was an example of ornament rationally applied to emphasise important and permanent features. Good ornament was too precious to be wasted where it was not wanted; and when ornament made us forget what it decorated, it was an excess. All architecture should be brought to the bar of reason, not of precedent. The latter was easier to follow, no doubt, but it only led us round and round in a circle. Unfortunately it was the element most generally understood, and an architect who deserted precedent would be likely to find himself unpopular. But there was already a movement in favour of greater liberty. The search after character was to be recognised now as an object, though it was sometimes carried too far, leading to an exaggerated simplicity or a forced effort at originality; the latter a great mistake; the dull proprieties of the old school were preferable to that; originality must have an obvious reason. The real value of the study of old architecture was to form ideas of style. The letter of old work was dead, though the spirit survived. But there were still many people who looked on imitation as the test of architecture, and would gravely ask you where such and such a feature "was taken from." Ancient architecture should be to the modern architect what ancient art was to the sculptor and painter—a subject for study, not for imitation. Imitation had only the same kind of value in architecture as "Elegant Extracts" or dictionaries of quotations in literature. The modern architect should go straight on his own way and be himself, and bring his art into accordance with modern requirements. If he was required to use iron construction, let him treat it accordingly, and quit brick and stone forms. Each one who followed this principle would do something towards putting modern architecture on its proper basis—that of reason.

On Monday Mr. Colton gave the first of two lectures on Sculpture, to be followed by one from Mr. Goscombe John; but we defer a report of the first to next week, when a brief résumé of the three lectures will be given.

MICHELANGELO'S WORK AT SAN LORENZO AND IN THE SISTINE CHAPEL.

It would, of course, be an impudent and profitless proceeding to attempt to deal in one short paper with the personality and work of so revolutionary a figure as Michelangelo proved himself alike in all the arts, but, having had occasion for another purpose to have some slides sent from Italy of the Sistine Chapel roof, and being able to add to these a few of the master's own sketches for his work at San Lorenzo, it seemed to me that it might be possible briefly to consider some of his methods, and find, at any rate in his architecture, a moral for our own times.

For his times and ours are not so dissimilar as they may at first sight appear. In both we find the same struggle going on—the struggle of the romantic spirit to assimilate classic forms. In the work of Brunelleschi, Alberti, and the earlier Renaissance architects we see them employing classic detail, as a decorative adjunct only, to buildings in plan, substance and idea romantic and picturesque; and the result is always graceful and charming, like the Italian temperament itself. Just as they played with Gothic architecture, producing, without any real appreciation of its relentless logic, things of refinement and exquisite beauty, like the façades of Siena and Orvieto, so they now played with their

* We can give one amusing and typical instance of this. When the National Portrait Gallery was in progress, we received a letter from a correspondent (if we remember right, he was an architect) complaining that the late Mr. Christian, in carrying out this building, which is a kind of annex to the National Gallery, was not repeating the capitals of the National Gallery correctly, but was introducing a modified classic capital different from them, and urging us to make a public protest against this nefarious proceeding.—Ed.

† A paper read before the Liverpool Architectural Society on Monday, February 5, by Professor C. H. Reilly, M.A., A.R.I.B.A.

Classic orders and entablatures, encrusting them with the graceful arabesques of their fancy or the delicate grotesques of their humour.

But while this was happening the scholars were at work on their own revival of learning, and most unfortunately, as it seems to us now, they hit upon the writings of that pedantic old Roman, Marcus Vitruvius Pollio. From that moment they began to invade the domain of architecture, much as in church work the country parsons, with knowledge culled from Rickman's styles and Parker's glossary, do to-day, and then, as now, only too many architects were ready to follow their directions. Instead, therefore, of applying to the ample Roman remains about them their senses and emotions, and trying to get at the real significance of the work, they accepted the authority of this Roman architect, whose writings they partially understood, as the final and ultimate test of all good building. They did not even stop to inquire whether what was good in the 1st century under the Roman Empire still remained perfect in the XVIth century under the Christian Church, any more than our own cathedral committee seem to have considered whether work of the XIIIth century adequately expresses the thoughts and ambitions of the XXth. This, then, was the state of affairs when Michelangelo first turned his attention to architecture.

And, to digress for one moment in order that the moral may be more clearly pointed, I think we have reached to a not very dissimilar state ourselves. When the Romantic spirit swept over Europe in the early XIXth century its strongest manifestation was in the revival of Gothic architecture. Of this revival we are still feeling the effects, even in those of our buildings which purport to be classic.

It shows itself in our love of picturesque detail; in the tower, without which no modern municipal building seems complete; in the accidental manner in which we attach to classic façades such non-classic features as turrets, high-pitched gables, steep and semicircular pediments. In fact, we are reaching a stage of so-called classic design so free from the dignity and repose which are of the essence of the classic spirit, that many who love that spirit, which our own XVIIIth century architects—our Chambers and Gibbs, made so essentially English when all the world was given over to rococo licence and barbarism—many advocate now the practical renunciation of all self-consciously designed detail at all, and bid us to rely for beauty on the abstract, bald form our construction leads us to, together with such added beauty as may be attained by judicious choice of material and surface. This is, indeed, a hopeless attitude—one which, if adhered to, may not, indeed, prevent us from producing satisfactory domestic architecture on a small scale, but will for centuries prevent us, until new forms have grown up with all the present significance of the old classic ones, from interpreting in our architecture the pride and grandeur of our national or even of our civic life. No; the real danger, I think, lies in the possibility, owing to the intervention of the Gothic revival and the break which it has caused with our own English classic tradition, that some genius like Michelangelo, only half endowed with the classic spirit, but strong enough, like him, to impose his fashion upon us, may arrive, and by combining the old detail into new forms, as he did, send us still further on the road of this free and freer Classic, till we produce in the XXth century the very rococo mannerisms we refused to admire in the XVIIth and XVIIIth.

For this was the well-known result of Michelangelo's work at San Lorenzo.

He was commissioned to add a new sacristy as a monument to the Medici on the northern side of the church to balance Brunelleschi's sacristy on the southern side. He was also commissioned later to build on the western side of the cloisters a room for the famous Laurentian Library—the collection of books and manuscripts made by various members of the Medici family. Both these commissions came from Clement VII., a Medici Pope. Another Medici Pope, Leo X., had, earlier, as the result of an open competition, commissioned him to erect a new façade to the church. To this day, however, this has not been built, though Michelangelo

wasted several years of his life quarrying marble for it. The blocks are still to be seen, I believe, at Carrara. Till he commenced the sacristy, this—the proposed façade—was his only architectural work as far as we know, and the model for it, which can be seen at Florence, shows what a jejune and spiritless thing it was—a mere frame for sculpture.

But, coming to the sacristy itself, which, when forty-seven years old, and protesting that architecture was not his trade, he was compelled to undertake, we find it to be in plan a simple square compartment of 40 ft. either way, exactly similar to Brunelleschi's old sacristy across the chancel. In the centre of one side is a square recess of 16 ft. covered with a semicircular dome on pendentives. The main chamber is of very lofty proportions. It consists first of a cube of 40 ft. to the top of the attic cornice. The square on plan is then reduced to a circle by means of large pendentives at a height of 62 ft. above the ground, above which, again, is a semi-circular dome carrying the lantern. In each of the four walls above the attic, and under the circular arches dividing the pendentives, are four windows, from which the interior receives its light, and for the purpose of lighting the monuments below the light could not be better distributed. The acoustic properties of the building are, however, the very reverse of this, but for these it was not designed. Like most Italian buildings, the structure was complete in brick first, and then overlaid with its marble and plaster covering. The main scheme of this covering consists in a lofty Corinthian order and attic in dark ash grey ("pietra serena," with the interstices filled with white plaster or white marble. So far it is very simple and very satisfactory, the dark cornices, pilasters, and archivolts, although, as we shall see of Michelangelo's "improved" profiles, nobly outline the shape of the interior. But when this was done the architect set about to design a scheme of doorways, niches, and subsidiary pilasters, which have no organic connexion either with the uses or structure of the building, or the idea of a mausoleum. At the end of each wall is a square-headed doorway with a curved pedimented niche above it, so that there are to this one compartment eight apparent entrances. The detail of this door and niche, combined into one feature, is unlike anything preceding it in architectural history. It is a highly complex design executed, like the monuments themselves, in polished white marble of exquisite finish, but it is not till you see the mouldings plotted that you realise to the full all the deliberately designed variations which have been introduced. It must not, therefore, be considered that, because Michelangelo was loth to undertake this work, he did not, when he had once set his hand to it, make the architecture as intensely personal as the sculpture. Like it, it is overlaid with thought, and serious effort. It is, and it was meant to be, part of one whole with the sculpture. His sketches show this very clearly, and no doubt it is difficult for us nowadays to form a correct estimate of the architecture when only two out of the fourteen niches are filled.

On either side between the main black pilasters containing the doors are the monuments themselves. They each consist of a lofty basement, in front of which is the curved sarcophagus, with its reclining figures, and a main story divided into three niches by four coupled pilasters. The centre niche in each case contains the seated figure of the duke or captain, and is square-headed. The two outer niches, which are shallower, and, curiously, have no outer pilasters to contain them, are finished with curved pediments. These pediments, together with the curved sarcophagus, form an interesting triangular composition. This part of the work, as may be seen by comparing the mouldings with those of the library, is twenty years later than the preceding, which was finished in 1529. The enriched mouldings, than which no more exquisite ones exist, vary in either monument, as do the capitals of the pilasters, and, like them, have been thought to be part of some subtle allegorical scheme. Whether this is so or not, they certainly form an admirable foil to the broad surfaces of the figures.

But, considering this architectural

background as a whole, and allowing for the pilasters being finished with candelabra or similar ornaments on the curious pedestals above the cornice, it must be admitted, even when we have accepted the artificiality of the scheme, that the scale is trivial. Perhaps it was purposely reduced in an attempt to enhance that of the sculpture, but, if so, it is only another proof of amateurishness.

Considering these things, it is interesting to note what in a critical age, when artists and men of taste abounded, was the effect of this architecture on Michelangelo's contemporaries. Vasari, himself an architect with no small practice, says: "Michelangelo wished to build the new sacristy upon the same lines as the older one of Brunelleschi, but at the same time to clothe the edifice with a different style of decoration. Accordingly he invented"—mark the word—"for the interior a composite adornment in the newest and most varied manner, which the antique and modern masters joined together could have used. The novelty of his style consisted in those lovely cornices, capitals, basements, doors, niches, and sepulchres, which transcended all that earlier builders working by measurements, distribution of parts, and rule had previously effected, while, following Vitruvius and the ancient relics, such men were afraid to supplement tradition with original invention. The licence he introduced gave great courage to those who studied his methods, and emboldened them to follow his path. Since that time new freaks of fancy have been seen, resembling the style of arabesque and grotesque more than was consistent with tradition. For this emancipation of the art all craftsmen owe him an infinite and ever-enduring debt of gratitude, since he at one blow broke down the bands and chains which barred the path they trod in common." Knowing where this path led his successors to, we may devoutly hope no one with a similar influence will point the way for us.

Of the figures themselves it is perhaps presumptuous to speak. The first sight of them, particularly of the seated figure of Lorenzo, as Rogers has well said, "fascinates and is intolerable." Unlike Greek sculpture, they have a tragic force, a sense of brooding and destiny, making them, while intensely personal, sublime and remote in their austerity. The two dukes sit, the one easily, gracefully above the immovable forms commonly called Night and Day, and the other, generally styled Lorenzo, with hand to chin, rapt in intense thought, above the half-stirring figures of Dawn and Twilight. The dukes do not pretend to be portraits, and are in their contrasting attitude and bearing part of the larger allegory of time and destiny contained in the figures below. These latter, awkwardly poised as they are on the elliptical surface of the sarcophagi, are so full of power and thought that, like the figures on the Sistine roof, they seem elemental forms, beside which the architectural and decorative feature, the very building itself, in a little while, sinks into insignificance. "It is easy," as Symonds says, "to remark that their strained postures and written limbs have perverted the taste of lesser craftsmen. Yet if Michelangelo was called upon to carve Medicean statues after the sack of Rome and the fall of Florence—if he was obliged in sober sadness to make sculpture a fit language for his sorrow-laden heart, how could he have wrought more truthfully than this?" To imitate him in both sculpture and architecture without sharing his thoughts was the real decadence. That this was something of his meaning is shown from four lines of verse he sent in reply to a friend who tried to compliment him on the lifelikeness of his figure of Night. Night is speaking—

"Dear is my sleep, but more to be mere stone,
So long as ruin and dishonour reign.
To hear nought, to feel nought, is my great gain,
Then wake me not; speak in an undertone."

Concerning the actual technique of the carving, whether the figures are finished or not, there has been ample controversy. To me it seems clear, as has often been suggested, that parts have been left with roughened surface purposely to hold the eye, while other parts have been finished to the glossiest polish so that the eye may glance freely from them. On the figure of Day, for instance, the planes are all broad and flat and the surface slightly rough, so that the

eye can study the figure carefully and take time the while, whereas Night is finished to highest polish, and can only be seen, as it were, in flashes. If this was Michelangelo's intention, we have the beginning of that method of suggestion in stone which Rodin has carried to such remarkable lengths. But it must be remembered that in all Renaissance sculpture there is an attempt to express individuality, which is quite foreign to Greek work. Michelangelo, particularly, with his passionate love of the human figure, while contenting himself with a type for the face, strove to make the body suggest every thought and emotion the human mind might seek after; and, feeling that this was the highest limit of art, as in painting he would have nothing to do with landscape, so in his architecture he would not permit any but the most conventional of wreaths and enrichments beside his sculptured forms.

The other and purely architectural undertaking at San Lorenzo was the construction of the Laurentian Library over the western cloister and the vestibule with staircase leading to it. If Michelangelo had been an architect by instinct and training, rather than by compulsion, he would not in this case any more than in the sacristy, have adopted the plan suggested to him by his clients. But, having once conformed to it, in both cases his architecture was reduced for him to little more than a system of panelling. The chief interest of the library, then, which is a long, narrow compartment some 110 ft. by 30 ft., and of the vestibule adjoining, some 30 ft. square and nearly a double cube in height, is the further development they show of his distinctive style and the numberless pitfalls he was preparing for his followers. As others have pointed out, this vestibule suggests rather an exterior than an interior. The tall Doric columns, if such they can be called, set back in pairs in rectangular recesses in the wall, serve no purpose that pilasters would not more effectively do, and at the same time preserve the continuity of the wall surface.

It is amusing to note what Vasari, who completed the building for Michelangelo, and may have been responsible for some of its eccentricities, says: "In the library of St. Lorenzo Michelangelo afterwards made a plainer demonstration of his intention by the splendid distribution of the windows, the arrangement of the upper chamber, and the marvellous entrance-hall into that enclosed building. The grace and charm of art were never seen more perfectly displayed in the whole or in the parts of any edifice than here. I may refer in particular to the corbels, the recesses for statues, and the cornices. The staircase, too, deserves attention for its convenience with the eccentric breakage of its flight of steps, the whole construction being so altered from the common usage of architects as to excite astonishment in all who see it." This passage shows well the mastery which Michelangelo's false architecture achieved even in his lifetime, for when eccentricity is praised and astonishment made an aim, Art the coy maiden is likely to make way for the bolder creature, Artifice. And, indeed, this is what happened, for the gigantic internal orders unrelated to the structure, the superimposed pediments, the baluster architraves, here first used, became a fashion for the next two centuries in most parts of Europe, and so entirely was the restraint of precedent discarded that anyone who could put a classic feature to a new and strange use was sure of fame. But in his own work, and even in the additions by Vasari, we find all these features in themselves so well proportioned, so delicately moulded and refined, that, though nothing can remove the sense of unreality that always attaches to these rooms, after you have been in them awhile you forget that any other kind of detail exists outside. It was his followers, to whom, as Vasari said, he had opened a path hitherto barred to them, who took these new features and applied them everywhere and in every scale and proportion, in much the same way as the White Star cable end is used nowadays on every Free Library, who produced the decadence.

Of his work in the Sistine Chapel we shall be better able to judge from the photographs. It is a long, narrow room, 132 ft. by 44 ft., and 68 ft. high. It is vaulted with a single tunnel vault in plaster, with cross vaults to

the windows. When Michelangelo was called upon by Julius II. to decorate this vault in 1508—that is, when he was thirty-four years of age—the room was perfectly bare, except for a dado of primitive frescoes and a row of twenty-eight Popes by Botticelli. Over the altar, where his "Last Judgment" now hangs, were three small frescoes by Perugino. In this building Michelangelo locked himself up, dispensed with the scaffold Bramante had somewhat clumsily provided, constructed a new one of his own, and in less than four years covered the whole roof with the portentous vision of prophets, sibyls, nude figures, and episodes in Old Testament history we think of whenever the Sistine Chapel is mentioned. I do not mean to dwell on this marvellous creation, except to point out that, just as at St. Lorenzo he treated architecture as a scenic addition to his sculpture, so now, discarding all the ordinary canons of decoration, and caring nought for the building he was called upon to enrich, he produced, not a painter's or an architect's conception of a painted ceiling, but a sculptor's dream of 343 mostly nude figures in every conceivable attitude and combination. For this he had certainly two very good excuses—the first, that, as architecture at St. Lorenzo, so painting here, he protested, was not his trade; and the second, that the building itself was a barn-like structure, with no architectural features to command respect.

The result is that on looking up the real roof seems to have been removed and a new hypothetical one of his own imagination constructed in its place. This rises in great arches from pedestals between the windows. Through these arches is to be seen the sky, and in the sky are visions of the Creation, the Deluge, and the Fall. On the pedestals from which the arches spring are seated youthful geni, and below them, with attendant children, crouch the prophets and sibyls—colossal figures some 12 ft. high in sitting posture, and, painted as they are on the quicker curve of the vault, they represent in drawing perhaps the greatest technical achievement of man.

Most of us are familiar, at any rate from illustrations, with this thunderous vault, its angry titans, and its visions of perfect human beauty as in the form of Adam receiving life from the Creator. We know it, but we never think of it as pertaining to a building, as part of a surface decorated. Indeed, with such work on such grounds it would be absurd to criticise. Starting from them, it has risen to another plane, even to another sphere, and the result is a thing apart, divided by the impassable gulf of Michelangelo's genius from the rest of the world. So that the painters who followed him, like the architects, but for a different reason, were bound to fail. Michelangelo could only succeed on the path he took by creating a new heaven and a new earth, and that is not given to all men to do.

PROPOSED NATIONAL COLLECTION OF DRAWINGS OF ANCIENT ARCHITECTURE.

Two or three weeks ago we published a note stating that the Spiers Testimonial Committee had handed over to Mr. R. Phené Spiers the sum of 79l., being the balance in hand of the fund after paying the costs of the medallion, presentation of books, dinner to Mr. Spiers, and publication of his volume of essays, "Architecture East and West." We now understand that Mr. Spiers proposes to hand over this sum to a small committee, consisting of himself, Professor Lethaby, and Mr. R. Weir Schultz, to deal with as the nucleus of a fund, to be added to by subscription or otherwise, for the purpose of forming a collection of drawings of ancient architecture in continuation of the work of the Spiers Testimonial Committee, such drawings to be deposited at the South Kensington Art Library or at the British Museum, and to be available for access by students of every kind. The committee now invite architects and others who possess such drawings to place them at their disposal for this purpose.

They will also be glad to receive any information from architects or others interested in the proposal as to the existence of such drawings, or of sketch-books or other material of a similar kind. Photographs of

buildings which no longer exist or which have been materially altered will also be received for the collection.

It has long been felt that in the past there has been a great loss of valuable records owing to the want of suitable means of collecting and preserving the same when such have no longer any particular use or value to the owners.

The committee have reason to believe that such a collection would be very much appreciated for purposes of reference, and arrangements would be made for preserving and cataloguing the same in the names of the authors and donors.

The committee will be glad to receive notification of available drawings, and will make arrangements for the collection of these. Communications to be addressed to Mr. R. Phené Spiers, 21, Bernard-street, Russell-square, London, W.C.

Mr. Spiers himself, Mr. E. F. Knight, Professor Lethaby, Mr. Schultz, Mr. Sidney Barnsley, Mr. A. H. Christie, Mr. E. W. Gimson, Mr. F. W. Troup, Mr. Cecil Brewer, and others have already promised drawings.

Sir Aston Webb and the other members of the testimonial committee have expressed their cordial approval of the proposal.

Sir Aston Webb writes—"I need hardly say I entirely sympathise with the proposal to collect reliable records of our fast vanishing ancient buildings, and shall be pleased to place any records I have at the disposal of the committee, or to join in contributing to the necessary funds. I think Mr. Spiers' desire to place the balance of the testimonial fund as the nucleus of a fund for this object is a most generous one, which I am sure all will appreciate."

We need hardly say that we are entirely in sympathy with the scheme; adding also our appreciation of the generosity of Mr. Spiers in thus turning the surplus of the testimonial fund to account for the general good of the profession.

THE ROYAL SANITARY INSTITUTE.

A SESSIONAL meeting of this Institute was held on Wednesday last week at the Parkes Museum, Margaret-street, W., the chair being taken by Mr. O. Claude Robson, Engineer to the Willesden District Council.

The Intercepting Trap.

The subject for discussion was: "Is the Intercepting Trap a Failure?" and the Chairman, in calling upon Dr. W. Butler, Medical Officer of Health, Willesden, to open the discussion, said that physically and materially the subject was a small one, but it affected a very large principle indeed. It affected not only the comfort and health, but the actual life of the community at large, as doctors would no doubt tell them. The interceptor was an old friend, but they had not been favoured as much as they would have liked with full discussions of the matter, and he believed that the present discussion would prove of much value, not only to sanitarians but to the public at large.

Dr. Butler first considered the purpose of the interceptor in a modern system of drainage, after which he said that he should endeavour to show that the conception of a drainage scheme in which the drain was disconnected from the sewer was wrong in principle, and that in practice it was as mischievous as in theory it was faulty. It was based on the assumption that it was safe to have a condition of things in the public sewers that it was unsafe to have in the house drains which communicate with the sewers, and that they might recognise the existence of a danger zone on one side of a trap against which the other was assumed to be safely secured by a seal of sewage. It must, of course, be conceded that the inside of a sewer could never be regarded as a sanitary situation, but from this to the assumption that its gaseous contents might be contemplated as so potentially charged with danger that they might not even be admitted to a gas-tight system of tubes having no unsealed opening save to the outer air above the houseposts, was a most serious confession of sanitary failure. The truth was that accumulations of considerable volumes of sewer gas were dangerous and insidious, whether they be permitted to stagnate in the sewers or in the house drains. If the sewers were efficiently ventilated, as unques-

tionably they should be, there was no ground to suppose that the atmosphere of the sewer was more harmful than that of the house drain, and the disconnection of one from the other was not only harmful, but irrational also. For it presupposed what sanitarily could not be presupposed—namely, a dangerous atmosphere in the sewers; and it was an attempted defence, by means of a trap, against this danger, which in its very adoption cast doubt upon the efficiency of the means, since the same were used in the defence of the house against the still dangerously regarded atmosphere of the house drain.

Perhaps the most universally objectionable feature of the siphon was that it prevented the efficient ventilation of the sewers. That the public sewers were inefficiently ventilated in those cases where their communication with the soil-pipe ventilators of the house drains was intercepted, was shown in many ways. It was a common experience with municipal officers that daily complaints were received, during the summer months, of the offensive smells proceeding from the openings to the sewers in the crown of the roadway, placed there originally with the intention of acting as fresh-air inlets to the sewers, and now in many districts being sealed off because they were found to act as vents for the foul gases of an insufficiently ventilated sewer. Visual demonstration of this fact might be had during frosty weather, when a stream of condensed vapour might be observed proceeding from these openings into the sewers. It might also be shown with regard to most sewers that the number of upcast shafts which it had been possible to erect were quite insufficient to cause such a negative pressure in the sewers as should result in anything like continuous aspiration of air into the sewers through the road openings. But, short of effecting this, the road grids became a nuisance owing to escape from them of the gaseous contents of the sewer at the street level, and under conditions, owing to inadequate sewer ventilation, in which these gaseous contents were apt to contain a large admixture of sewer gas. He thought it would not be disputed that what was most urgently needed in respect of most public sewers, was an increased number of exit ventilators intentionally so acting. And could these be provided in sufficient numbers—as practically at present they could not be—the problem of sewer ventilation would be solved, and the atmosphere of the sewers would then be rendered as innocuous as rapid change in the aerial contents of the sewers could render it. Such sufficient numbers of upcast ventilating shafts would be provided where each house drain and soil ventilating pipe in direct aerial communication with the sewers. The aspirating effect of so many outlet ventilators to the sewer, up which the lighter air of the sewer would tend constantly to ascend, would be a rapidly inflowing current of fresh air to the sewers at all lower openings; and thus at one and the same time both the sewers and the house drains would be effectively ventilated and any accumulation of gases of decomposition, either in the sewers or the drains or their escape in improper situations rendered impossible.

The interception of the drains from the sewers, however, had deprived the sewers of what should be their natural outlet and on occasion inlet ventilators. It had necessitated the provision on each house drain of an untrapped opening, situated in a large portion of cases in immediate proximity to the doors or windows of the house, and acting, if not as often as not, at least with a frequency un contemplated in the theory of its advocates, as an outlet ventilator to the drain. Further, to provide access to the segment of the drain between the interceptor and the sewer another complication in the shape of a raking arm with a readily removable stopper had had to be added. An inspection chamber was a proper equipment of every drain, but the interceptor, necessarily placed as near to the sewer as practicable, had necessitated the placing of the manhole where the drain was deepest, and where, apart from the consequently increased cost, it necessarily formed a capacious reservoir for the storage of gases at the very site where they were most likely to accumulate owing to the couple of gallons or so of stagnating sewage contained in the

trap at the bottom. Everyone of these complications introduced into drainage systems to meet the exigencies of the interceptor were extremely apt to go wrong and produce nuisance. The interceptor itself was essentially insanitary. It retained within the precincts of the house premises between two and three gallons of sewage which was of that aggravated character which resulted from the undue retention of solids, and thus breaks with the primal principles of domestic sewage disposal. The plating down of the street gratings to prevent the offensive smells from the sewers, which the introduction of the interceptors had occasioned, would, especially where shafts had not been erected in their place, make this forcing of the trap a more frequent occurrence than was contemplated. Where no facilities whatever even for inadequate ventilation of the sewers were provided, the daily recurring increases of pressure of the imprisoned gases must necessarily force them through the yielding traps into the house drains. And this contingency to which every house drain disconnected from the sewer by a trap was subject was a greater danger than was incurred when sewers and house drains were the channels for the constant flow of continuously renewed currents of air. This was a breakdown of the interceptor in its intention, the frequency of which it was impossible to estimate. But it failed in other directions which were not contemplated. A straight pipe with a proper fall showed little tendency to choke, but if in the course of such a pipe an acute kink or bend be introduced, especially if it be of such a character as to remain filled with floating solids, the tendency to become choked at this point would have increased enormously. During last year he had a systematic inspection made of all the readily accessible manholes in his district. These amounted to some 6,745, and comprised the inspection chambers of about a third of the houses in Willesden. In no single instance was a drain found to be choked but at the interceptor, but no fewer than 288, or $\frac{4}{10}$ per cent. of all the drains inspected, were discovered to be stopped at this point. In 118 of these cases the manholes were filled with fetid sewage, emitting its foul vapours through the drain inlet ventilator in close proximity to the doors and windows of the houses, into which they were duly aspirated. In the 170 remaining cases where the drain was blocked, the manhole remained free of sewage, because of another accident of the system—namely, the unstopping of the raking arm, which permitted of the escape of the drain contents to the sewer, and incidentally of the sewer gas into the drain. In 654 cases this accident was observed to have occurred. That was to say, in nearly 10 per cent. of all the drains examined the interceptor, apart from its incidental drawbacks, failed absolutely of its object, the drains in these cases being in direct communication with the sewers. But for the drains to be accidentally in direct communication with the sewers in only 10 per cent. of the houses was much more serious than for 100 per cent. of the drains to be intentionally directly connected with the sewers. In the one case the sewer was adequately ventilated, in the other the sewer air was presumably ten times more concentrated than where all the house drains ventilated the sewer. In the one case, moreover, the sewer air, diluted and comparatively innocuous, found vent above the roofs, and away from all openings to the houses; in the other a concentrated sewer air was laid on at the ground-level at the very threshold of the houses. The untrapped opening to the drain, intended as an inlet ventilator, became in these cases at least a serious danger to health. But to such an extent was the inlet ventilator recognised as a common cause of nuisance owing to its waywardness of acting upon occasion as a vent for foul gases, that it had become common practice to fit it with a mica flap to prevent reflux currents from the still suspiciously regarded drain. In 3,193 cases of those he investigated, however, the fresh-air inlet was wholly unprotected by any properly acting appliance. This might appear a trivial matter, since at its inception no valve was considered necessary. But it must be remembered that admission to the house of air from the interior of the drain was still, and properly, he thought, regarded

as dangerous. Most people who would remain unmoved at the forcing of the intercepting siphon would feel alarm at the unsealing of the yard gully, and a crack in a drain pipe covered with two or three feet of clay was regarded as a most serious insanitary condition by people who were undisturbed at an unprotected gaping opening to their drains a couple of feet below their open window.

It might be thought that the result of the inspection of nearly 7,000 manholes yielded exceptional results due to accumulation of stoppages long unrecognised. It was true that in many of the stoppages there was evidence of antiquity in the insanitary condition discovered, but in many parts of the district there had been previous systematic inspections which yielded results quite as bad, though in lesser numbers, owing to the more limited area of investigation. Nuisances of the character discovered were, moreover, constantly being abated, being, as they were, the natural occasion of prompt complaint. He had, however, had a re-inspection made of about 500 manholes with a view to seeing whether the results yielded by the first inspection were confirmed. The re-inspection was made within eight months of the first survey, and included 216 manholes where originally no defects were discovered and 288 where defects originally found had been made good. In nearly 15 per cent. of the manholes re-examined, the most serious defects were discovered. Both in these and in those primarily discovered the defects were traceable to the interceptor, and the modifications which it entailed. In an examination of over 7,000 manholes it was found that in 95 per cent. the interceptor failed of its object of disconnecting the drain from aerial continuity with the sewer. It failed not only of this, its essential purpose, but was directly responsible for a high percentage of blocked drains, and manholes converted into leaking cesspools. The untrapped drain-opening in the forecourt which it necessitated, normally served as an outlet for the emanations of the drain, and set at ridicule all insistence on the need for effectual trapping of yard gullies and the elaborate precautions taken to secure a gas-tight drain.

In the very frequent abnormal conditions where the drain was choked, and the raking arm patent to the sewer, it was an unmitigated nuisance. It was for these reasons that he was bound to answer the question they were discussing in the affirmative. Dr. Butler concluded by giving what he considered the essential principles of sanitary drainage.

Mr. R. Read, City Surveyor, Gloucester, said that his answer to the question was "Yes." The intercepting trap was patented by Mr. W. P. Buchan, of Glasgow, about 1875, and, without any special investigation, was adopted by the Local Government Board, and introduced into their model by-laws in 1877. Ever since then this official recognition had caused it to be taken for granted by large numbers of people, and had deterred many from investigating the question for themselves. The trap used up the fall required by four or six ordinary pipes, it was inserted at the lower end of the underground portion of the house drain, forming an obstruction therein nearly 8 in. deep to the flow of the sewage, it caused the sewage to deposit from 25 per cent. to 35 per cent. of its solid matter in the trap after each discharge in dry weather, and paralysed the flow of the sewage through the whole length of the underground portion of the house drain. During dry weather the contents of the trap were always more or less putrid, and contaminated both the drain and the sewer to which it was connected. The intercepting trap necessitated in the front of the house, near the front door or windows, the so-called fresh-air inlet, which acted alternately as an outlet and an inlet with every discharge from the drain. A mica or aluminium flap valve was generally fixed to these inlets in order to prevent them acting as outlets, but the constant flapping action accompanying every discharge from the drain very soon damaged this, to such an extent that it became quite useless, and the result was that in most cases the householders promptly stopped up the opening to get rid of the nuisance which ensued. The trap was liable to frequent stoppage, and was provided with an inspection chamber,

or manhole, to facilitate its clearance; but these inspection chambers were, as a rule, only opened when a serious stoppage occurred, which caused the sewage to show above ground. The great majority of stoppages in modern drains occurred at the intercepting trap, and many of these occurred unknown to the householder, because they cleared themselves by the accumulation of sewage in the inspection chamber and drain, until a sufficient head of sewage was produced to force the obstruction through the trap; the result of these temporary stoppages being that the brickwork of the inspection chamber, amounting to about 4 sq. yds. or 6 sq. yds. area, and a considerable length of the drain became plastered with a slimy deposit of decomposing sewage. When the pressure of the head of sewage was not sufficient to force the obstruction, of course the sewage showed at the yard gully, and men had then to be sent for to open and clear the drain. The trap was introduced into the lower end of the house drain, on the erroneous assumption that it was a safeguard to the house, but it was no protection to the house at all; on the contrary, it was a useless and dangerous obstruction, which provided at every man's front door the very conditions and dangers which it was the object of modern sanitation to prevent. These traps now formed part of many thousands of existing drains, and while they absolutely prevented the adoption of a proper system of ventilation, they also provided a reservoir of putrid sewage on every house drain to contaminate everything passing through it, and thus caused noxious gases and smells to be generated in the drains and sewers, which could not be got rid of by any amount of flushing of the sewers alone, and the more numerous the traps the greater the nuisance. The trap necessitated the use of at least 50 per cent. more water in the flushing cisterns to the water-closets, and even a three-gallon flush was not sufficient to prevent stoppages, as had been shown by experiments carried out by the Institute. More recently the experiments of Dr. Porter on an actual 6-in. drain in connexion with a factory proved that the intercepting trap could only be entirely cleared out by a six-gallon flush. The great object of a system of drains and sewers was to discharge the sewage at the outfall in the shortest possible time. Why, therefore, should we put an obstruction into every drain to defeat this object? The intercepting trap was wrong in principle, and was no remedy for either a badly-constructed drain or sewer; it could not protect the house from the action of a defective drain, and it was liable to be forced at any moment: the true safeguard to the house and its inhabitants being a sound drain laid with a good fall, gas-tight joints, and properly ventilated, the full size above the roof of the house. On such a drain the intercepting trap was a useless and dangerous obstruction, but its absence allowed the drain to be laid with a better fall, to remove the sewage quickly while in a fresh state, and to keep itself clean.

Mr. W. F. Loveday (Borough Surveyor, Stoke Newington) said he had consistently held the views put forward by Dr. Butler and Mr. Read. There was one little criticism he had to make as to what Dr. Butler said about the faulty interceptor. If they had an interceptor with the cap off, it did not follow that the interceptor was to be condemned as an interceptor; but the bogey of sewer gas and house gas having been considerably exploded in recent years, and bacteriologists being unable to find any germs at all in the gas, the necessity for the interceptor no longer existed. When sewers were properly ventilated the necessity for the interceptor ceased altogether.

Mr. Roehching said that in our imperfect state of knowledge, when we could not assign to every effect its true cause, we could not afford to give up the belief that prevention is better than cure. The escape of sewer gas into the street was less of an evil than its escape into the houses. He did not think the term "intercepting trap" so appropriate as that of "disconnecting trap." Those who wished to urge upon them the abandonment of the disconnecting trap must first prove that sewer gas was beneficial to health, or that the air in our public sewers was always as good as the air in our

house drains, and that every disconnecting trap was an unmitigated nuisance. We were bound to exclude from the house anything which might be harmful to health, but, if it could be proved that sewer gas was beneficial to health, then the necessity for the disconnecting trap was done away with. It was the unexpected which happened, and we must make sure that the air in our house drains would not get polluted by sewer air, seeing that it was impossible to say what the air in our public sewers would be like from time to time. In the case of a private drain, well made and maintained, we could be reasonably sure that the air would be sweet and free from smell, but we could never be sure of the air in a public sewer, and if by any chance the air of the house drain was at fault, then the faults must be corrected. He looked upon the disconnecting trap as a useful tell-tale. They had had the disconnecting trap for twenty-five years, and it had been put down and was being put down every day in large numbers, both in this country and abroad, and there were many millions in use; that being so, was it thinkable that, had the trap been an unmitigated nuisance, it would have been used to this day? It would have been abandoned long ago. Where it had failed, carelessness was generally the cause. There was no such thing as an absolute apparatus, and yet, even according to Dr. Butler's investigations, the trap was efficient in 90 per cent. of cases; just why it failed in 10 per cent. of cases he could not explain. Granting, however, for the moment, that the disconnecting trap was a failure, was Dr. Butler's method a perfect one? He did not think it was. It was well known that pipes were forced by siphonage, or pressure of air. They could not be sure that the flow of air was always constant. From experiments with houses where there was no disconnecting trap, they found that there was no such thing as a constant flow from the street to the house—first it was from the street to the house, then from the house to the street. It was impossible to say that, if houses had no disconnecting traps, the public sewers could be ventilated through them; at one time they might be, but not generally. Owners and tenants of houses looked to the employment of disconnecting traps for the ventilation of their own houses, and they left it to the public authorities to see to the ventilation of the public sewers without recourse to the house drains. As an engineer, he would like to point out that, in works of engineering, they allowed for a strain four or five times more than was necessary, in order to guard against contingencies over which they had no control. Why should that factor of safety be omitted in the carrying out of sanitary works? The interceptor was a convenient and cheap factor of safety which he hoped would not be abandoned. An Englishman's house was his castle, and they ought not to let it be invaded by sewer gas any more than by anything else.

Dr. C. Sanders (West Ham) supported Dr. Butler and Mr. Read. He represented a town where the drains, which had been relied on modern principles, did not contain pure air. The modern system of drainage provided a sink-hole, and the only remedy at present possible was the one very largely adopted—i.e., the occupiers covered up the inlet ventilator. He should like someone to tell him the difference between sewer air and drain air. Personally, he did not know any difference. He hoped that the bogey of sewer air percolating into the house would, if the methods of Dr. Butler and Mr. Read were adopted, disappear after this discussion.

Mr. C. Chambers Smith (Engineer and Surveyor, Sutton) said he could not agree with Dr. Butler and Mr. Read, and, after Mr. Roehling's remarks, he thought it would be agreed that the bottom had been knocked out of their case. Dr. Butler's main objection to the trap was that it got blocked up, but the apparatus which was perfect and never required attention had yet to be discovered. An intercepting trap was as necessary as a gully trap, and who would say that, because the gully trap got blocked up, it should be abolished? It would be interesting to know the number of gully traps which got blocked in Willesden, and whether Dr. Butler would condemn them, and for the same reason? The point that the

fresh-air inlet might be directly under the window of a house was not a strong one, for the objection could be met by carrying the inlet above the eaves of the house roof. Another point was, that the necessity for ventilating sewers had not been proved. Who said they must ventilate them? [Dr. Sanders: The public.] The public did not know anything about the matter, and only wanted the nuisance from sewer grids abolished. There were many towns where the sewers were absolutely unventilated.

Mr. F. Wood (Borough Engineer and Surveyor, Fulham) said that, if used properly and judiciously, the intercepting trap was not a failure; when it was a failure, it was because its application was at fault. The water-closet was a trap, but no one would suggest that this be dispensed with, and the pan left freely open to the main sewer. The trap intercepted the gas from the sewer, and he believed it did it effectually, and if that were the object, then the trap was not a failure. Still, the whole system of house drainage was wrong, and the more one examined it, the more one was convinced of the fact.

Mr. W. Green (Finchley) said that, in his opinion, the intercepting trap was the greatest mistake in sanitation that was ever made, and he hoped that it would be abolished as a nuisance. He had been wondering why in cities where there were no intercepting traps the people persisted in living. Were water-closets always trapped? If not, where was the harm in letting the sewer ventilate through the house drain? He had known drains stink as badly as sewers, and, in his experience, the air of sewers could be kept as fresh as the air of drains. They could get circulation, not only through the drains, but also through the sewers if they adopted the right principle—i.e., to have a ventilating pipe from every house drain, without an interceptor.

A member said he thought the case against the intercepting trap had been a little forced; but no doubt ventilation would be improved if the trap were abolished. As sewer air was so bad, they must protect themselves against it. The trap was not a perfect appliance, and, if drains were properly ventilated, there would be no need for the trap.

Mr. A. Martin (Westminster) said that the subject was very important, and he suggested that it might be practicable to invite written expressions of opinion with regard to it.

The Chairman then proposed a vote of thanks to Dr. Butler and Mr. Read. He considered that the 10 per cent. of stopped drains referred to by Dr. Butler, showing masses of festering filth therein, was ample evidence in favour of their views. Indeed, after Dr. Butler's figures, he thought that even Dr. Buchan might have changed his views. He did not think that the intercepting trap should be considered as part of the house drain pure and simple. Where did the house drain end, and where did it leave off? If two houses drained into one drain, that drain became a sewer. The interceptor should be considered in conjunction with the general system of sewage, and, if that be so, they must remember that one of the first principles in designing any water-carriage system was to remove from all houses or inhabited areas all dirt or noxious matter as speedily as possible. In designing a scheme of drainage, one's object was to see that there was no obstacle or obstruction to retard the rapid flow of sewage to its ultimate outlet. If that be so in the main sewers, why should they in the smaller have these miniature cesspools? The advocates for the interceptor say they are necessary to prevent sewer gas entering our houses, whilst the opponents suggest its passage by the house drains and the upcast shafts connected therewith. They were told that the upcast shaft was a source of danger; in his district he had many hundreds of them attached to houses, and, as far as he could recollect, there had not been more than two or three complaints with regard to nuisances arising from them, and he believed that these were sentimental complaints. The Chairman then proceeded to sum up the discussion.

Mr. Roehling seconded the vote of thanks, which was heartily agreed to.

Mr. Read, in reply, said that the intercept-

ing trap was the cause, to a great extent, of the sewer gas in the sewer. The interceptor caused an obstruction, and the water in the drain dribbled in on one side and out at the other. There was no rust, but stagnation in both drain and sewer, and, as long as that condition prevailed, they would always have sewer gas. If they let the sewage run through clean, they had a sewer with a good velocity, giving no trouble, and they got good ventilation. With the trap in its present position they would never secure proper ventilation, for in order thoroughly to ventilate a sewer one must have the outlets largely in excess of the inlets.

Dr. Butler also replied, and said that, after hearing the discussion, he was more convinced than ever of the utter futility and danger of the trap—it required only a discussion such as they had had to clinch one's opinions on the matter. He was brought up in the orthodox faith as to the value of the trap, and he held to that faith until the force of circumstances drove him from it. There was little to be said for the interceptor on theoretical grounds, and on practical grounds everything was to be said for the abolition of it. He agreed with Mr. Roehling that we must try to keep the sewer air out of our houses, but what he said was that the intercepting trap not only failed to keep the sewer gas out, but was responsible for letting it in. Mr. Roehling advocated the use of the trap because it was a tell-tale. He (the speaker) objected to it because it was not a tell-tale—except on the numerous occasions on which it went wrong.

A vote of thanks to the Chairman brought the proceedings to a close.

CARPENTERS' HALL LECTURES: SOME POINTS OF ARCHITECTURAL INTEREST IN OUR PARISH CHURCHES.

ON Thursday last week the first of the usual spring series of lectures at Carpenters' Hall, London-wall, on matters connected with building was given by the Rev. Walter Marshall, M.A., F.S.A., the title being "Some Points of Architectural Interest in our Parish Churches," the Dean of Chichester presiding.

Mr. Marshall stated that he proposed dealing particularly with wooden roofs and screens, and, having described in detail the various members of a roof and the use of each, he said that, of the beauties that medieval architecture presented to the architectural student, there were few more striking than the open-timber roofs which adorned so many of our churches and halls, and testified to the constructive skill and artistic feeling displayed by the carpenters of that age. The effect of these roofs with their bold receding arches, massive, richly moulded and carved timbers, spandrels fitted with intricate tracery, profusely ornamented cornices and exquisitely-carved bosses, should rivet the attention of every spectator. When they added to this the blaze of rich colouring, of which most of the roofs showed traces, the result attained would be a degree of splendour which it was difficult to imagine in these days of more sombre treatment. Yet these roofs were hardly noticed by the average spectator. There was an absence of open-timber roofs in the early period of Gothic architecture which appeared very unaccountable at first, because one would naturally suppose that, as timber roofs of a necessity preceded stone vaulting, the most beautiful and elaborate forms of roofs would also occur prior to the magnificent examples of groined vaults in stone which still remained in all our cathedrals and many parish churches. The reason for this deviation from the usual course of events was not far to seek when we remembered the serious fires that destroyed Canterbury and other cathedrals about that time; the builders, finding that it was possible to use stone for roofing purposes, soon became so proficient in the use of that material that the mason seemed to have excluded the carpenter almost altogether, both from constructional and ornamental work.

The best examples of timber roofs occurred in our parish churches and a few old palaces and halls. They were, as a rule, somewhat acute in their pitch, but not invariably so, and the timber used was nearly always oak or chestnut. The scantlings were of stouter

proportion than those generally in present use and gave a feeling of robustness and security to the roof, as well as providing an insurance against the ravages of time which seemed to have left very little impression upon the enduring oak or chestnut. Most of the damage was the result of neglect or of the ruthless vandalism of the Reformation, and, later times, in defacing and removing the carved work, though, in this respect, the roofs, owing to their inaccessibility and the fear of consequences if the structure were meddled with, had fortunately come off lightly. But there was nothing to hinder the abundant use of that most effective weapon and safe cure in the hands of a fanatic or ignoramus—the whitewash brush!

Roofs might be best divided into five classes:—(1) Tie-beam roofs; (2) trussed-rafter (or single frame) roofs; (3) hammer-beam roofs; (4) collar-braced roofs; (5) aisle roofs. In many instances these classes became combined in one roof.

Tie-beam roofs occurred at all periods. In Norman times they were the only description of roof in use, but very few examples remained—in fact, he did not know of one. Restoration had swept them all away. In Old Shoreham Church was what might be a portion of a late Norman roof of the tie-beam type; this tie-beam had the characteristic billet moulding of the square form. It might be that the rest of this original roof was in existence, but at present the plaster hid it if it was there.

The "trussed-rafter" form of roof was probably chosen for the purposes of gaining head-room, or because of the difficulty in placing a wooden roof over a stone vault. Its superiority over the tie-beam, both constructionally and in point of beauty, necessarily led to its being preferred and generally used. These roofs were frequently lined and often covered with lath and plaster, although it might be doubted whether their beauty was increased by either process, certainly not by the latter. The form of the arch in this roof was often perfected by the addition of braces, curved or straight, the underside of the rafters, and the roof was generally formed in panels by ribs running horizontally with carved bosses at the intersection. The roof at Minster Lovell (Oxon) showed this treatment with straight braces admirably, because the open and panelled portions of the roof were side by side. The most striking class of roofs was those constructed with hammer-beams. The origin of these roofs was often supposed to be that of the tie-beam which had been cut off, merely leaving the ends supported by braces; but, perhaps, the more likely theory was that derived from the mode of securing the feet of trussed-rafters. The collar-beam was retained in some cases, but not in others; but, instead of cross-timbers, thin curved braces were used connecting the collar, principals, and struts together, forming an arch which was not only important as binding the roof together, but greatly enhanced its beauty. Many buildings had double ranges of hammer-beams, of which there was a magnificent example at March. So far as these roofs were concerned, England stood unrivalled amongst all other countries, and whatever superiority they might claim in other respects there were few churches, he believed, in Europe which could boast of such specimens of timber roofs as were to be met with in almost every county of our land.

The other type of roof was known as "collar-braced," and was a simplification of the "hammer-beam," where sometimes the strut and collar were omitted. It was going only one step further to leave out the hammer-beam itself. It was found this could be done, and we had the collar-braced roof as the result.

Aisle roofs were generally of the lean-to order. The earliest examples were simply a continuation of the rafters of the nave, but the introduction of clearstories necessitated a distinct roof, generally of a flat pitch, in order to leave as much space as possible in the aisle wall for the windows. Aisles very rarely had gabled roofs, and then only of low pitch if clearstories existed. A very fine example was to be seen to the north aisle of Wymondham, where the spaces between the trusses were boarded under the common rafters and formed into panels with richly-cusped tracery and elaborately-carved bosses

at the intersection of the moulded ribs. Another example of an aisle roof, but not gabled, was Mildenhall; in that case the bold and vigorous carving of dragons and grotesques was most remarkable. But the feature of that church was its incomparable nave roof, in which the alternating arrangement of the trusses was most happy, as the appearance of crowding, so noticeable in some of those elaborate roofs where the trusses were not far distant from each other, and everyone a repetition of its neighbour, was here entirely absent.

Colour played an important part in the decorative splendour of mediæval roofs, but the general practice was only to tint the mouldings and the carvings. These bright touches of colour did much to light up the sombre effect of the woodwork, and thus greatly enhance its charm.

Proceeding with that portion of his lecture devoted to screens, Mr. Marshall said that, although in our churches there are to be found screens of various kinds, when he spoke of screens generally our thoughts always turned to the rood-screens, and he was sure they must have derived much pleasure from visiting a church where the rood screen still remained, and must have felt how very much they added to the sense of completeness of the internal effect of a building. But, in considering rood-screens, they must be careful to make a clear distinction between those in a cathedral or collegiate church and a parish church. In the cathedral or collegiate church the screen—almost invariably of stone—was of a much more solid construction than in the parish church. In both types of buildings it answered the purpose—one amongst several—of dividing the nave from the choir. But in the cathedral this division was, of necessity, far more marked than in the parish church, because the choir was reserved for the use of the clergy, provision for the laity being made in the nave. They might, therefore, consider the choir of a collegiate church before the Reformation as a church within a church, and thus that choir was not only cut off from the nave by the solid screen, as at Tattershall (Lincs.), but also when there were aisles to the choir they were also shut off by screens, but not generally of so solid a character as the rood-screen.

Almost all parish churches before the Reformation were provided with a chancel screen, and a rood loft placed upon it; however, the screen seemed to have been used first without the loft, because the earliest examples of screens did not seem to have carried any loft, as, for instance, the beautiful screen at Stanton Harcourt (Oxon), which must be of late XIIIth century or early XIVth century date, and is probably the earliest example of a chancel screen existing in England. It seemed impossible to say the precise period when those rood-screens were introduced. He was inclined to think about the XIIIth century, because, frequently in Norman and Transition Norman churches there was distinct evidence that the jambs of the chancel had been cut away for the fixing of the screen, and also, in some cases, for the insertion of the rood loft staircase. The fine church at Walsoken showed this very clearly. They must have noticed that the tops of most rood-screens to-day presented an unfinished appearance, which was owing to the destruction of the rood loft in accordance with the Royal Injunctions of 1564. No part of the church seemed to have been so signally devastated as the rood lofts and roofs, for not only were they taken down, but, in places, all trace of the supporting beams entering the wall had been, as far as possible, removed.

It was in the reign of Edward VI. that the Royal Arms were first placed on the screens, on a beam over the nave, or on the wall above the chancel arch. At Hurst (Berks), there was a very good example of a Gothic screen across the chancel and north aisle of chancel of XVth or even late XIVth century date; the loft was taken down according to order, and in the place of the rood-screen were now the Royal Arms of the XVIIth century, with characteristic strapwork ornamentation on either side.

The lecture was illustrated by lantern photographs, and, at the conclusion, a vote of thanks to Mr. Marshall, proposed by the Dean of Chichester, was unanimously carried.

COMPLIMENTARY DINNER TO PROFESSOR ADAMS.

A COMPLIMENTARY dinner was given on Tuesday in the Holborn Restaurant, W.C., to Professor Henry Adams, M.Inst.C.E., M.I.M.E., F.S.I., F.R.San.Inst., etc., by students who had worked under him at the City of London College, where he was Professor of Engineering for thirty-five years. The chair was occupied by Mr. J. L. Crouch, and the company included Messrs. H. C. Adams, A. Brackett, H. C. Chevalier, O. C. Hills, Vernon Inkpen, G. C. Lambert, E. Prebble, and others.

After the loyal toast, the Chairman said he would give them the toast of their dear old friend, Professor Henry Adams, and in doing so he would say a few words as to the origin of the dinner that evening. In the autumn of 1904 Professor Adams severed his connexion with the City of London College, with which he had been associated with such distinction and to the advantage for so many years. More than one of his old pupils thought that something should be done to commemorate his retirement, and when a movement was made in that direction letters were received from all parts of the country and all parts of the world expressing the wish of the writers to take some part in the movement, if only the writing of a name on an address or in an album. Many letters were received from those who wished to be allowed to subscribe to some testimonial, but Professor Adams was opposed to that; he was always ready to do something for his students, and little for himself. What they decided to do was to present Professor Adams with an album containing signatures of his students, and to present it at a little complimentary dinner. Their recollections of Professor Adams were of the pleasantest. His kindness had been extended to all of them, and they appreciated it fully. Professor Adams had had many pupils who now occupy important official positions, and those members of his college class who survived would remember him to the end with the greatest affection and gratitude for the example and character he set one and all.

The toast was received with musical honours, after which Mr. A. Brackett presented Professor Adams with the album, a gold watch-chain, and a memento of the evening for Mrs. Adams. In making the presentation, Mr. Brackett asked why that should be the last time the students of Professor Adams met. He hoped there would be future meetings.

Professor Adams, in thanking those who had in any way taken part in the proceedings, said he knew, of course, that his connexion with the college would terminate, but he never anticipated such an ending as this, and really he would have preferred, had the circumstances permitted it, a scholarship at the college to have ended that connexion. The good fellowship which existed between him and his students would always exist, he hoped, and he was glad to think that so many of them had attained such good positions in life, though he must say that he only tilled the ground; the seed was there. He became a teacher in the City of London College, and in 1867 the drawing class, the professor of which, being in delicate health, used to send him his keys and ask him to take the class, and at the end of the session that professor retired. In 1879 the council gave him a separate class—building construction, which developed into the engineering department, and he had worked at the college ever since until 1904. He thought he could claim some success as a teacher, and perhaps that success was due to the fact that he never taught for a living—being in active practice all the time—and that he had always tried to put himself in the place of the student in his endeavour to make them grasp a subject. During his thirty-five years at the City of London College he had given over 10,000 lectures to some 4,000 students, and he had provided at his own expense 1,500 lecture diagrams and smaller diagrams. Since his separation from the college he had been appointed a chief examiner in building construction to the Board of Education. He also founded the art class at the Bow and Bromley Institute, had been lecturer on land

surveying at the Architectural Association for many years, and he had lectured elsewhere. When the Surveyors' Institution first founded their examinations, the principal prizes for some years fell to his students. His advice to his students had always been: "Never shirk responsibility; hard work never hurt anybody"; and he thanked them all for their kindness to him and for the many pleasant hours they had had together.

Other toasts were "The Chairman" and "The Press," and subsequently several gentlemen gave their testimony as to the value of Professor Adams' work and their indebtedness to him.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION:

HOTELS AND RESTAURANTS.

A MEETING of the Discussion Section of the Architectural Association was held at No. 18, Tufton-street, S.W., on Wednesday, the 14th inst., Mr. F. Lishman being in the chair, when

Mr. Stanley Hamp read a paper on "Modern Hotels and Restaurants," which ran briefly as follows:—

The evolution of the great grand hotel of the present day has been steadily growing through the later years of the last century in a slow but curious fashion. About the middle of the last century there were few first-class West-end hotels, and those existing were something like the present "private hotels," but with a coffee-room open to the general public. The opening of the Great Western Hotel at Paddington was a harbinger of the coming change, and with the advent of Northumberland-avenue came the reign of the "monster" hotel. The Langham and the Gorton Hotels were others of this type and date. The location of a hotel is all-important; whether destined to be a commercial hotel or a "hotel de luxe," it must have the best and most suitable position, according to the *clientèle* for which it is intended to cater. The building itself should present a pleasing exterior, the usual tawdry and showy character being avoided, and the building designed simply and architecturally.

The usual accommodation of the modern hotel may be stated as follows:—On the ground floor a lounge or winter garden; dining-room and coffee-room, with service adjoining; reading and writing-room, small drawing-room; smoking and billiard-room, with bar attached; hall-room, with reception-room attached; office and manager; gentlemen's lavatory, and ladies' retiring and toilet rooms. Private dining-rooms are often needed, and in the provinces a large hall for banquets and meetings, with separate service and kitchen arrangements. In commercial hotels a sample-room is needed, with an office, lift, and separate entrance. A café, as at the Savoy, is sometimes added; in Eastern hotels a bazaar, and there should be verandah lounges on each floor. The upper floors are usually devoted to bedrooms, bath-rooms, water-closets, and service-rooms, the latter fitted with sinks, etc., and adjoining the service lifts. In the basement should be the kitchen and offices, stores, wine-cellars, etc. The office should be near the main entrance, as also porters' room and perhaps a cigar counter. Two main entrances are needed—one to the lounge, the other so arranged that visitors on arrival need not cross the lounge to gain access to their rooms; near this entrance should be both the passenger and luggage lifts. The dining-room, especially in large towns, should have an orchestra, and a floor for dancing where no separate ballroom is provided. Certain of the rooms on the upper floors should be in suites. Doors between rooms should be removable and double, and sash windows made reversible for cleaning. Heating coils are needed in principal rooms and corridors; in the latter also hydrants and fire-alarms. The "lounge" is quite a modern introduction in England, and among the first examples was that at the Burlington Hotel at Boscombe, by Mr. T. Colcutt. It forms a popular place for afternoon tea, as well as for coffee and cigar after dinner, and undoubtedly increases the amenities of hotel life. Another feature of modern hotels is the frequent provision of Turkish and medical baths. The telephone has now become such a recognised feature that we find it even in the

private rooms of hotels, especially in America. The lifts must be arranged near the entrance-hall and office. The shutters to the shafts should be fitted with electric contacts, so that the car cannot run while any door remains open. A furniture or luggage box at bottom can be provided. Letter-shutes, with openings to all floors, may be arranged to communicate with ground floor. Electric lighting is now in use in the majority of large hotels, many of these having their own generating plant. When power and lighting are needed on a large scale, it is usually economical to adopt the latter plan. The system of fire-alarm preferable of adoption is that giving notice to the staff only. Frequent fire drills create a ready and efficient staff, and such hotels as the Grand, Metropole, or Savoy may be regarded as practically safe. The position of that important department, the kitchen, used to be a moot point. With modern ventilating appliances the old objections to the basement have vanished, and it is now recognised as the most convenient place. The stores and larders are arranged along the sides of the kitchen, and receive the goods after they have been checked by the clerk. The kitchen staff may be practically divided into five working sections. The first embraces roast, soup, and game; then come entrées, vegetables, fish, and, lastly, pastry and bread. This latter is often a separate department. The ice department usually follows the pastry and confectionery, but should be away from the general kitchen traffic. The plate-cleaning, knives, and general scullery should be near service and kitchen, and near the latter also the pot scouring and cleaning scullery. The vegetable kitchen has its own scullery and store in connexion, and following these the fish larder and store. The chef's room is near kitchen and stores. In addition, there should be larders, stores, staff-room and lavatories, and wine-cellars. The service-room on the ground floor, if there is only one, should serve coffee-room, dining-room, and restaurant. Kitchen service lifts, wine lifts, and luggage lifts are all required, the latter running to all floors. The linen store and mending-room are heated by artificial means.

Mr. Hamp then described in some detail a notable New York hotel, the Manhattan, in Forty-second-street, a fourteen-story building, notable for its admirable lighting. Returning to general planning, he advocated the provision of a Masonic temple. Grill rooms, often in the basement, and a wine bar near entrance are necessary features, and gentlemen's lavatory and ladies' toilet-rooms, well screened, are essential.

Mr. A. H. Belcher, in opening the discussion, expressed his preference for corridors showing clearly from end to end, as being easy for visitors to follow. He referred to the position of kitchens at the Great Eastern Railway Hotel, these having formerly been on the top floor. Now that ventilation difficulties had been overcome, he regarded the basement as the best position. Provision must now be made for cycles and motors.

Mr. A. Horsnell seconded the vote of thanks.

Mr. W. Woodward made some interesting references to the new Piccadilly Hotel, especially pointing out the very thick retaining walls needed in Piccadilly-place. Like Mr. Belcher, he favoured long corridors and basement kitchens. He instanced experimental fire-alarms in various hotels, giving an average of three minutes between the call being given and the hose being ready for use on the top floors.

Mr. A. T. Bolton singled out the *Hôtel Angléterre* at Athens for special praise for its very wide corridors, useful as promenades. Great economy could be effected by a private water supply from a bore well. Service-rooms should be one-third or one-fourth the size of dining-room.

Other speakers mentioned the gain of having the lounge surrounded by galleries entered from the corridors, the economy of using marble skirtings in corridors, and the need of careful provision for the furnace shaft.

The Chairman said that we had still one good example of the "galleried" inn left to us—the George, in Southwark.

Mr. Runtz, the Special Visitor, began by tracing the relation between improved communication and the rise of hotels. The railway

brought us the terminus hotel; probably the motor meant an equally great change to the country hotels, and here the old postings yard was capable of ready adaptation to garage purposes. Supplementary kitchens are wanted for banqueting-rooms and service of breakfasts to the bedrooms. There should be but one trades entrance, with clerk in full control. The "lounge" orchestra can be placed in the mezzanine. He favoured the provision of Turkish baths if compactly planned, and considered all bathrooms should be decorated brightly and look cosy, and be fitted with hot towel-rails. "Prince's" kitchen he singled out as a fine example of good arrangement. Turning to detail and finishing, he welcomed the return of "homeliness" in treatment, and especially praised the new Savoy Hotel for its fine detail and simple colouring.

Mr. Hamp briefly replied, and the meeting terminated.

DESIGN FOR BACON'S IDEAL PALACE.

HIS design, sent in competition for the Soane Medal, gained its author, Mr. Robert Atkinson, of Nottingham, what may be called the second prize in the competition, viz.: a certificate of Honourable Mention and ten guineas. It is certainly, we think, the second best of those submitted, and in one or two points, as we noticed in our review of the students' drawings, it realises Bacon's directions as to plan more precisely than the winning design. The exterior is hardly sufficiently domestic in character for a dwelling-house even on a large scale. That it does not represent anything that could have been built in Bacon's time, did not, however, we suppose, in any way disqualify it, as no special requirement was made in the instructions, in so many words, that the design should represent the architecture of the period; it was perhaps a defect in the drawing up of the instructions that this point was not precisely defined. As the matter stood, it was, as far as the wording was concerned, open to the competitors either to represent what Bacon would have had built in his day, or to design a modern mansion on the basis of his requirements. Mr. Atkinson has adopted the latter interpretation. He writes:—

"Having read the essay, the first and perhaps the chief difficulty was to determine whether the building was to be of Bacon's period entirely or a modern one, keeping as closely as possible to his description. The idea of passing two or three rooms to get to the innermost does not commend itself, and to build a house in this manner would serve no useful purpose.

Having decided on a modern house and the elevations in a modern spirit, the idea of getting the whole of the building on a good basement occurred to me, thus giving ample room for kitchens, etc.

The scheming of the various forecourts, concealed galleries, offices, and lay-out of gardens was not less difficult to deal with."

ST. LEONARD'S CHURCH, WALTON-LE-DALE, LANCs.

THE nave and transepts of this church have just been re-erected. The tower and chancel date from the XVth century. The old nave was a good specimen of the Churchwarden period, with galleries boxing it in, and was in a ruinous state.

The new church had to be made almost exactly the same on plan, the graves being close on all sides. Owing to this and to the desire to avoid internal columns the span of the roof is 42 ft.

The walls are, externally, of local Houghton stone, and internally, of beautifully-marked Runcorn stone. The roof, seating, pulpit, etc., are of oak. The roof covering is green Westmorland slates. There are three old stained-glass windows refixed. The total cost of the church is nearly £10,000; the contractors being Messrs Hatch & Sons, of Lancaster, the glazing and adapting of old windows by Mr. H. G. Murray, of Caroline-street, Eaton-square. The architect was the late Mr. John P. Seddon, this being the last work carried out by him.

Fifty Years Ago.

FROM THE *Builder* OF FEBRUARY 23, 1856.

CANNING TOWN.

In the view of Canning Town, as it appears from near to the iron bridge, the green level shown extending over a great extent along the margin of this flat land, in every direction, houses, shops, public-houses, and churches are now to be seen skirting the level, and gaining every week further and further upon the space, which is chiefly level feet below the high-water mark of the Thames. The new town, which already consists of several long streets, will, in the course of a few years, spread out and meet the approaching houses, and all this level will be planted with dwellings and inhabited by many thousands of people. The artificial bank of ooze creek and the embankment of the Thames are all that prevent the houses here from being flooded every high tide. To provide for the effectual drainage of this district by the ordinary means is impossible. The houses here have been erected without the means of either carrying off the refuse or properly getting rid of the damp. In course of time the *débris* of these and other houses will raise the level; but, in the meantime, it is sad to think of the sacrifice of human life which must take place without prompt measures. With some difficulty we managed to reach the place on foot from the turnpike road, and to find the condition of the streets insupportable—many of them, although the day was tolerably fine, were almost impassable, and vehicles sank almost up to the axletrees in the mud. In many parts were great pools of stagnant water. Several of the inhabitants said that, if we had come a few days before, during the rain, it would not have been an easy matter to get along the streets at all. Most persons complain already of the drainage. We understand that it is proposed to take the sewerage to a certain depth, and dump it into the Thames by steam power. If something is not done, in two or three years' time the ground will be poisoned by cesspools, water will stand on the surface, and vills of a serious nature will follow.

In a score of years or less, Canning Town will be an important place, with its churches, bathing and cal stations, and its masses of rich and poor. Let us hope for the introduction of measures proportionate to the extent of the future requirements. Flesh and blood are precious materials.

THE LONDON MASTER BUILDERS' ASSOCIATION.

The annual dinner of the London Master Builders' Association was held on Thursday last week at the Whitehall Rooms, Hôtel Metropole, Charing Cross, Mr. Frederick Higgs, President, in the chair. There were also present—Messrs. W. E. Riley, Superintendent Architect London County Council; E. L. Gomme, Clerk to the London County Council; Walter Lawrence, President of the Quantity Surveyors' Association; G. Macfarlane, President National Federation of Building Trade Employers; W. F. Wallis, President Southern Counties' Federation; Alex. Ritchie, J.P., C.C., A. C. Blomfield, J. M. Severidge, A. C. Bulmer Booth, E. J. Brown, H. W. Burrows, J. Carmichael, J. W. Chessum, G. Corderoy, W. Clarkson, J.P., R. A. Denell, S. B. Depree, F. L. Dove, F. E. Dornier, W. Downs, W. Farthing, E. Gabriel, T. Gregory, G. Bird Godson, R. C. Glead, W. Hunt, H. H. Holliday, G. Hubbard, T. Holloway, H. F. Higgs, E. B. Anson, E. Keynes-Purchase, W. Lawrence, F. W. Lorden, F. M. May, D. W. McInnes, F. G. Minter, L. J. Maton, W. H. Nightingale, H. Northcroft, A. E. Parker, C. W. Reeves, F. G. Rice, R. M. Roe, R. Sawyer, W. Shepherd, H. J. Treadwell, A. W. Turnbull, C. Wall, Howell J. Williams, L.C.C., F. E. Williams, W. Woodward, T. Costigan, Secretary, and others.

The loyal toasts having been honoured, Mr. F. W. Lorden, Vice-President, proposed the toast of "Municipal Bodies." In referring to the London County Council, he said that that body did an enormous amount of work, and, speaking generally, they did it in an excellent way, and the same remark applied to other municipal bodies. Builders did not mind the Building Act, or amendments of the Act, if

it was applied and carried out in the same way. As to the Works Committee of the London County Council, certain builders had regarded that as a competitor, but was it? He did not think it was, for the London County Council could not do the work as cheaply as the contractor, and they could not do it better. The Master Builders' Association included within its ranks all the principal builders and contractors of London, and it should include all kinds of builders except the jerry builder, and the jerry-builder they declined to have.

Mr. G. L. Gomme, in response, said he could assure them that, so far as the Association was formed for the purpose of doing good building, no one would do other than properly recognise them. There were beautiful old buildings existing in London the names of the builders of which they did not know, but they did know the names of the builders who were rebuilding London, and when they saw some of the work which was being carried out to-day they could not deny that the builder and his workmen were worthy of the best traditions of their class. As to the Works Department, he might remind them that the London County Council did occasionally apply to the master builders when they had a difficult or delicate job, such as the restoration of No. 17, Fleet-street; and the master builder, Mr. Downs, who carried out that work under Mr. Riley was sympathetic with the work, which he understood and carried out thoroughly. Some beautiful buildings were being erected in London, which were a joy to see; and he should like to suggest that if the master builders of London would say that they would never take in hand a piece of work which was bad, even at the prospect of a high price, some time or other we should find London, so far as its buildings were concerned, in the same position as that it holds in the country's history. He hoped that in the rebuilding of London there would be swept away some of those jerry-built houses which were a disgrace to any city, and that they would be replaced by buildings like some of those they had about them.

Mr. W. F. Wallis then proposed "The London Master Builders' Association," which, he said, was to them in the south of England an object of envy and admiration, seeing how strong it was, how up-to-date, and how much in touch with its work. Taking into consideration the great progress which the Association had made during the past year, it need not now fear comparison with any similar association in the kingdom. The Association was over thirty years old, it was doing a good work, and it had been loyal to its motto of "Defence, not defiance." There had been peaceful times for the Association in recent years, but they did not know what the future held for them. The Labour Party in the House of Commons was likely to be an effective body for working out the aims and objects of the working class, and no one knew what line it was likely to take. Of the President, it could be said that he had worthily followed in the footsteps of those who preceded him. There had been as many as seventy committee meetings of the Association during the year, and these the President had attended, as well as spending a good many hours in the office with their excellent secretary, Mr. Costigan, and the President was to be congratulated on the excellent results of his year's work.

The toast was drunk with musical honours. The President, in response, said that the objects of the Association had been fully set forth in a little pamphlet which had been published by the Association. It was one of the chief branches of the National Federation of Master Builders, which was the organisation of the building trade throughout the whole of Great Britain and Ireland—not such a perfect organisation as they hoped to see it, but still one which covered the country and which in the north, was tolerably complete. London occupied an important position in the Federation, and it derived benefits from the connexion—or would do so in the event of difficulties with workmen, when the Federation would be called on to assist. The Association was the business representative of the trade. It was recognised by Government and the municipalities and they frequently came to the Association for information, etc., as to

custom and other matters relating to the trade. Shortly, the Association was the employers' trade union. Workmen had taught them a lesson—i.e., that unity is strength. The Association made rules to govern the operations of the trade; it defended trade interests wherever assailed, and it settled disputes with workpeople. There had been many difficulties which, in the past, would have given rise to strikes, but which had been settled by amicable conference. The Association gave advice and assistance to members on trade matters of all kinds—legal advice in law cases, technical usage, etc.—and that was of great help to builders, and in cases of vital interest affecting the trade generally they would have no hesitation in materially assisting the member of the Association interested. The Association fostered friendship and good feeling between members, and that was a good thing.

They had also revised and unified the trade rules during the year, and they had found the leaders of most of the trades very reasonable. The President, then explained what had been arranged with the various trades, and the nature of the rules and regulations in force. Proceeding, he said that most disputes had been settled, and something had been done to oppose the harassing legislation proposed by certain public bodies. The Association had had to spend a lot of money in opposing a certain Bill in Parliament, and, in his opinion, the procedure at present necessary to oppose Bills involved a scandalous waste of public money, and ought to be revised. Their friend, Mr. Shepherd, did yeoman service, but they ought not to have been put to the trouble and expense they had to face in order to oppose the Bill. The Association expected to get new offices, and he hoped that in those offices there would be accommodation and opportunities for members to make appointments to meet clients, and to use the board-room for trade disputes or arbitration. It had been a pleasure to him to act as President during the past year, and he greatly appreciated the support he had had from the members of Council and their friend the secretary, Mr. Costigan, as well as from his partner and subordinates, who had allowed him to devote so much time to the Association business.

Mr. F. L. Dove, Treasurer of the Association, then proposed "The National Federation of Building Trade Employers." The Federation supplied a long-felt want. Many local builders' associations had done sterling work in trade disputes, but it was found that the workmen were better organised all over the country, and they fought the employers in detail, first in one town and then in another. As a result, the employers organised the whole trade throughout the country, though not without much difficulty. The Federation was now in a strong position, and each year the prospect of strikes and lock-outs grew less and less, as both men and masters were well organised, and both had money at their disposal.

Mr. G. Macfarlane, President of the National Federation, responded to the toast, and said that it had been found that, single-handed, no local builders' association could do combat with the strong trades unions, and the object of the Federation was to stop the hammering of town after town that had previously taken place, and if they were strong enough the trades unions would hesitate to attack them. They were faced by a strong labour movement which might have a serious effect on the building industry, and some of the new members of Parliament would endeavour to get a change made in the laws of the country which would affect the trade. They might take it from him that the Taff Vale decision would be overruled, but if it was, he hoped that something fair and just would be put in its place. As to conciliation, law suits were never satisfactory to either party, and generally the winner was a loser. The other day a woman had awarded her 200l. for the loss of her husband, and when all the expenses and costs were paid she received 20l. Diplomacy was far better than warfare, and the way the Association in London managed in the matter of conciliation, and the way the President had managed the work, was very creditable. As to the Workmen's Compensation Act, he did

* See our issue for October 21, p. 427

not know what their experience in London was, but in the north the Act had proved to be the most prolific Act for litigation of any he knew, and it had been a gold mine to lawyers. The success of the Federation depended upon the associations, and he hoped they would all pull together in one direction. They should not let London or provincial jealousy spring up amongst them; unity was what they wanted. The Federation was doing its best to organise the various associations throughout the country, but there were numbers of large employers whom they could not draw into the fold, and it was a shame that these men should not help them, seeing that they benefited from the work of the Federation.

Mr. Howell J. Williams, L.C.C., then proposed "The Architects and Surveyors." The architectural profession was one of the most noble in the country. A good deal had been heard lately about Imperialists, but who were really the great empire-builders but the architects? What would London and other great cities be but for architects?—and yet how miserably were their rewards! In other professions, particularly the legal profession, there were great rewards for its followers, but these were wanting in the architectural profession because architects had their heart and soul in their work and had not taken that interest in the legislation of the Government to make it possible to secure those adequate rewards for their own profession. He advised architects to seek more seats in the House of Commons. He did not think there was any profession more harassed in this country at the present time than the architectural profession. They had to face Building Acts here, amendments, by-laws, sub-by-laws there, and such bodies as borough councils, guardians, etc., everywhere. As to the Building Act, he had repeatedly urged that what was wanted was not an amendment of the Act, but a codification of the Acts in such a form that one could easily know what was desired. Instead of that one had to turn to an amendment which referred to an amendment, which in turn referred to a previous amendment. He believed the London County Council tried to do what was right in the interests of London, but he urged upon them to remember that the people they should go to to assist them in any piece of legislation were those who knew most about the matter. Every town had a right to control the building work which went on around it, but a great deal depended on the way the control was exercised, and upon that sweet reasonableness in administration which was so necessary and yet so often absent. He believed in the *entente* in everything, even in the building trade. As to the attempt to Americanise the bidding trade of London, he warned everyone to discourage that system. What we wanted was the old system brought up-to-date; the architect to create, and the builder to carry out. As to the surveyors, it was a most unhappy state of affairs when there was no quantity surveyor on a large job. Litigation was avoided where a quantity surveyor was engaged, and the quantity surveyor, though a new institution, had come to stay. As to district surveyors, he was opposed to doing anything which would destroy the position and independence of the district surveyor, whatever else might be done by the London County Council in the matter. The independent district surveyor was really essential as a buffer between the architect and builder, and the unreasonable administration of Acts of Parliament. He hoped that no architect or surveyor would be party to such an outrage upon the public as was to be seen in Fleet-street where was being erected a building, the front of which was being treated with horrid plaques of colour; to prevent such an outrage, further powers should be granted even to the London County Council. As to the visit of the London County Council to Paris, what he had noticed was that in Paris art led the way before commerce, whereas in London, unfortunately, commerce came first and art afterwards. He was afraid that London would never be what Paris is, for difficulties were in the way, but with the rising generation of architects everything was possible—even a new London County Council hall.

Mr. W. E. Riley, who responded for the architects, said that it was remarkable that,

while he was constantly meeting people who told him all about the canons, and all the details about it, they never heard a man tell his lawyer where the lawyer was wrong—if he did, he would have to pay for it. Architects and builders were supposed to be in opposite camps by those who did not know. There were fourteen builders in that room with whom he had had close relations in building work, and he had never had a quarrel with any one of them. Any feeling of opposition they had could be got rid of by the exercise of a little forbearance. In nearly every instance in which he had carried out contracts he had insisted on a good arbitration clause. He disliked to see in any specification the words: "Make all clean and perfect." It was a most foolish expression, and the man who put it in did not know what he wanted. It really meant that the builder must do what he had forgotten to tell him to do. As a rule they did not sufficiently appreciate the very great necessity there was for them to try and get more sympathy in the interpretation of what they wanted done by the builder. He had never seen a good design on paper which would not be seriously impaired by bad building, and he had never seen a bad design which was so had on paper that it would not be materially improved and given character to by sound and good building, and in that lay what he called the true art of building. As to the recent depressed state of the building trade, he hoped things would soon brighten up.

Mr. G. Corderoy briefly replied for the surveyors.

The remaining toast was "Our Guests," suitably proposed by Mr. Alex. Ritchie, J.P., C.C., and acknowledged by Mr. G. Hubbard.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Fulham Borough Council 6,000*l.* for laying out cemetery, and 15,000*l.* for street improvement; Hackney Guardians 10,000*l.* for poor law purposes; Hammersmith Borough Council 15,210*l.* for electric lighting; Wandsworth Borough Council 5,850*l.* for street improvements; Woolwich Borough Council 10,000*l.* for baths and wash-houses, and 1,580*l.* for advances under the Small Dwellings Acquisition Act, 1899.

The Works Committee.—The Works Committee submitted statements of works completed during the half-year ended September 30, 1905. In statement I. are included the accounts for thirteen works, in respect of which complete specifications and bills of quantities have been prepared. The cost of two works has exceeded the final certificate; the net balance of cost below certified value is 27,785*l.* 9*s.* 4*d.*, or over 10 per cent. Statement I. showed that the total estimated cost of the thirteen works was 265,103*l.*, and that the actual cost was 237,317*l.* Statement III. shows the results of the execution of jobbing works during part of the year 1904-5 and of the year 1905-6. The cost of works executed in the year 1904-5, and not previously reported, is 15,474*l.* 15*s.*, and the balance of cost below schedule value is 1,500*l.* 19*s.*, or 9 per cent. The balance of cost below schedule value in the case of the works executed in 1905-6, and now reported, is 190*l.* 6*s.* 3*d.*, or 8 per cent. In their general observations the committee state that: "The total cost of the works included in the statements now presented does not represent the turnover of the department, because much of the expenditure on these works occurred previous to the half-year in question, while, on the other hand, much of the expenditure during the six months was upon works which are still unfinished. The approximate expenditure on works executed by the department during the half-year was 305,000*l.* The expenditure in the previous half-year, reported by us on August 1, 1905, was 402,300*l.*, but this figure is hardly comparable, as all indirect charges, such as those for plant depreciation and general and establishment charges, are always brought into account in the second half of the financial year. The turnover for the financial

year 1905-6 will probably exceed the turnover for the previous year. The number of estimated works referred to us for execution and not yet included in the half-yearly statements of completed works submitted to the Council is fifty-three (the several sections of Aldwych and Kingsway being regarded as one work), representing an estimated expenditure of approximately 1,442,000*l.*" They recommended: "That the excess, amounting to 148*l.* 10*s.* 10*d.* and 589*l.* 14*s.* 11*d.* of actual cost over final certificate in respect of the erection of workshops at Shoreditch Technical Institute and the enlargement of Windsor-road school respectively, be approved."

In answer to a question, Mr. Torrance, chairman of the committee, said that the committee did not want to be put in competition with the contractor.

Mr. E. Collins said that had the work been put out to tender large sums of money might have been saved.

Mr. R. A. Robinson said that there were many responsible contractors who could do the work more cheaply than the Works Committee. That had been proved over and over again. The committee took its work in an exclusive way. When the Works Department was first started they were told that the work would be done 10 per cent. cheaper than if let to contractors; but not only did the committee fail to do that, but it did the work at a greater cost.

Mr. Ward counteracted these statements, and said that by the present system the responsible officers would always be able to make a close estimate of the probable cost of work.

The recommendation was then carried.

Rating of Site Values.—The following recommendation of the Local Government, Records and Museums Committee was agreed to:—"That a petition be presented to the House of Commons praying that a Bill may be introduced by His Majesty's Government to provide for the separate assessment and rating of site values; that the Parliamentary Committee do prepare such petition; and that the seal of the Council be affixed to the petition when ready."

Mr. H. P. Harris said the Government programme had been announced in the King's Speech, which contained nothing about a Site Values Bill, and, as many of the subjects mentioned in that speech would not be carried into law, it was hopeless to expect that any measure would be carried which was not there mentioned. The rates would not be relieved by the Equalisation of Rates Bill, which would only redistribute the pressure, neither would a Site Values Bill reduce the burden. That burden would, however, be relieved if the Government would carry out the recommendations of the Royal Commission, and if they therefore moved the report be referred back, with an instruction to the committee to approach the Government on the lines which he had suggested.

On a division, the amendment was rejected by fifty-three votes to twenty-five. The recommendation of the committee was thereupon adopted.

Cost of Erection of Schools.—The Education Committee reported as follows:—

"We submitted on December 5, 1905, a report with reference to the preliminary plans of the schools proposed to be erected on the undermentioned sites:—

(i.) Kensington—Lawn-lane: New school for 798 children, three-story building; total estimated cost of erecting school, including furniture, possible extras, plans, supervision, etc., 20,322*l.* equivalent to 25*l.* 9*s.* 6*d.* a place; estimated cost of building only, 18,700*l.* equivalent to 23*l.* 8*s.* 7*d.* a place.

(ii.) Wandsworth—Fontaine-road: New school for 840 children, two-story building for boys and girls, one story for infants; total estimated cost of erecting school, including furniture, possible extras, plans, supervision, etc., 21,414*l.* equivalent to 25*l.* 9*s.* 10*d.* a place; estimated cost of building only, 19,871*l.* equivalent to 23*l.* 13*s.* a place.

(iii.) Wandsworth—Franciscan-road: New school for 804 children, three one-story buildings; total estimated cost of erecting school, including furniture, possible extras, plans, supervision, etc., 19,600*l.* equivalent to 24*l.* 9*s.* 9*d.* a place; estimated cost of building only, 18,085*l.* equivalent to 22*l.* 9*s.* 9*d.* a place.

(iv.) Poplar—Janet-street: School for the accommodation of sixty mentally defective children; total estimated cost of the building, 3,722*l.*

We then recommended that estimates in respect of the preparation of working drawings, etc., which had been submitted by the Finance Committee in response to our plans should be approved. The Council, after some discussion, postponed the consideration of this recommendation, our chairman undertaking that an inquiry should be made into the cost of public elementary schools with a view to ascertaining whether it would be possible

to effect any economies in the matter of school building.

Have obtained reports from the architect (Education), copies of which have been sent to the members of the Council, and which we think will be of interest to the Council. So far, however, we have had no opportunity of erecting schools does not appear to be excessive.

The late authority on several occasions considered to whether it was possible to reduce the cost of building schools, the last occasion being in 1903. The question then arose upon observations made by the chairman of the Croydon School Board upon the public opening of the Portland road school, to the effect that the cost of building (exclusive of site and furniture) had been 13s. 11s. 4d. a place, as against a cost of 28s. 10s. and 30s. 11s. 4d. in two London schools.

In order that a comparison might be made between two schools, where the conditions of planning, etc., were as nearly as possible identical, the Invicta road school, Westcombe-park (Greenwich), was taken as corresponding fairly in general arrangement and size with that of the Portland road school, Croydon. The Portland road school, which was erected in 1902, accommodates 1,310 children, the cost of which the chairman of the Croydon School Board was reported to have stated to be £17,500. The Invicta road school, which was built in 1893, has 955 places, and cost 20s. 7s. 4d. a place. The graded portion of both schools consists of a two-story building, the latter being accommodated in a separate one-story building. A comparison was made, item by item, of the various branches of the work done at these schools, and the cost of building joints and girders to materials, quantities, and prices. The sub-committee which then reported arrived at the conclusion that the facts before them showed that, having regard to the extra cost provided and the character of that accommodation, and the conditions under which the London School Board are required to work, the London Board had done their work done as cheaply as the Croydon Board as the Croydon Board at their Portland road school.

In the course of the inquiry it was ascertained that it was cheaper to build a school in two separate blocks, consisting of a two-floor building for the graded school and a one-floor building for the infants' department, than in a single block of three or four floors. This was ascertained by the fact that, although, in the case of a three-story building there is a saving in having to provide one roof only instead of two, this saving is more than counterbalanced by the additional cost of the greater thickness of brickwork required for the walls, the extra cost of the scaffolding to the upper floors, and the cost of hoisting joints and girders to a great height, etc. In planning new London County Council elementary schools, this practice is adopted wherever the site is of sufficient size for the purpose.

As regards the question of the estimated cost of the buildings referred to above, it should be pointed out that the three new schools (i.) (ii.) and (iii.) have been planned for future enlargement (the accommodation being given below), and provision is made in the preliminary plans and estimates now under consideration for the building of halls of sufficient size for the schools when enlarged, it being impossible to enlarge the halls after they have been erected and the building planned for the specified accommodation. This cost for the Lawnton school also includes a provision for the erection, with the first portion of the school, of the cloakrooms, lavatories, and teachers' rooms required for the complete school; in the plans of the Fountain-road school, additional staircases for the complete school are included for boys and girls, and in the case of the infants' school, additional cloakrooms, lavatories, and teachers' rooms are provided for the complete school, the cloakrooms and lavatories for the complete school are included in the plans and estimates. This provision for future requirements, while it adds to the initial cost, is a very considerable saving to the Council, as when the additional class-rooms are erected the cost is about 7s. 10s. a place. The architect's (Education) estimates for the cost of building in each case, calculated on the accommodation of the complete school, are as follows:—

Name of School.	Area of Site, Square feet.	Accommodation of Completed School.	Estimated Cost of School Building Only.	Estimated Cost a Place.	Total Estimated Cost including Furniture, Possible Extras, etc.	Total Estimated Cost a Place.
(1)	(2)	(3)	(4)	(5)	(6)	(7)
(i.) Lawnton	32,380	1,111	16,502 0 0	14 17 0	23,099 0 0	20 15 9
(ii.) Fountain	86,900	1,140	17,205 0 0	15 1 11	27,347 0 0	23 19 0
(iii.) Francisca-road	75,200	1,124	14,958 0 0	13 0 9	23,511 0 0	20 18 4

In this connexion we have had before us a letter from the architect (Education) dated 23rd 1905, drawing attention to the high estimated cost of certain schools, the preliminary plans of which have recently been submitted to them for approval. The Board state that the average cost per head in five instances works out at nearly 20s. per head for the schools when completed for the full numbers proposed; that there is nothing in the plans as to which they would raise any question, except in regard to the provision of special rooms for instruction in science and drawing; and inquire whether the Council cannot secure that the charge per place for the erection of new schools can be reduced. The Board add that they recognise that the cost of building in and near London is distinctly higher than it is in many other parts of the country, yet they find that even close to London satisfactory schools can be built at a cost per scholar materially lower than that proposed in the case of the schools, plans of which have recently been submitted to them.

We have given careful consideration to this matter, and the Council have had in communication with the Board of Education with a view to obtaining further particulars of some of the cheaper schools erected by educational authorities in those districts are contiguous to London. The

Board, however, did not see their way to furnish the Council with these particulars, but suggested that if inquiry were made of the authorities in question no doubt they would be willing to supply the information necessary to assist the Council in its inquiry. Acting upon this suggestion we have communicated with the undermentioned authorities asking them whether they would be good enough to furnish particulars as to the cost and accommodation of any school recently erected under their jurisdiction, and to lend the Council the plans and specification of any such school—Boroughs of Wimbledon, Hammersmith, and East Ham; County Councils of Middlesex, Surrey, and Kent; County Borough of West Ham, Urban District Councils of Chislewick and Willesden.

This information will give a basis for a fuller investigation of the question, and although at the present we are convinced that the Council should proceed upon the lines at present had down, the Council may be assured that the question will continue to engage our serious attention, and that we will not fail at once to recommend any possible changes in the direction of economy.

The committee recommended that working drawings, etc., be prepared.

Mr. Dickinson Wood, M.P., moved that the matter be referred back with a view to getting more information. In his opinion, the cost appeared to be excessive. Sir Melville Beachcroft seconded.

Canon Jephson explained that one reason why the cost in London was so high was that the Council jobs had been carried out in cement and the school at Croydon was built with mortar. He had visited schools in Switzerland, France, and America, and he believed that the elementary school buildings in London were the best. Whether they were too expensive was a matter for the Council; but he earnestly hoped that these schools would be built, for they were absolutely necessary.

Mr. Stephen Collins, M.P., said that the difference between erecting buildings in mortar and cement would not come to more than 10s. per place. The great difference between the cost per place needed a much more satisfactory explanation.

In the course of subsequent discussion, Mr. Saunders said that if the Council wanted decent buildings, which would not spoil the neighbourhood and which would be carried out in a sanitary manner, they must not think of erecting them more cheaply. It was not right that for the sake of a few pounds the architectural appearance of our schools should be spoiled.

The amendment was carried on a division by sixty-eight to fifty-one.

Theatre, etc., Works.—Sanction was given to the following works:—

- Hollan Hall.—Gallery at the north end of the hall (Mr. W. Gwyn).
- His Majesty's Theatre.—Exits from orchestra, etc. (Messrs. Romaine-Walker & Besant).
- Hollern Empire.—Gates across the open passage from the Hollern Empire into Wheatstone Park (Messrs. F. Metham & Co.).
- Royal Victor Hotel.—Alterations in connexion with exits (Mr. E. Stephens).

Payment of District Surveyors by Salaries.—The Building Act Committee again reported as to the future payment of District Surveyors by salaries instead of fees. They stated that

office of district surveyor, and in this connexion it should be noted that the order of reference to the Building Act Committee [paragraph A 21 (1)] provides that the districts are to be reorganised by the Committee as opportunities occur, so that the average of the fees received may in no case amount to less than 500l. per annum.

(4) Delay in introducing payment by salaries will, so far as can be seen, result in increased cost, and we are supported in this opinion by the fact that, while in 1890 the cost would have been 40,638l., the cost had risen in 1905 to 50,748l.

(5) There are now eight districts vacant, two districts where the district surveyors are not acting owing to ill health (one is mentally weak) and six districts where the surveyors are over seventy years of age, so that the present time is an exceptionally favourable one for the introduction of a new system of payment.

Having regard to the near approach of the next financial year and the obvious advantage of any system of payment by salaries commencing at the beginning of the financial year, we are of opinion that the matter should be dealt with at the earliest possible moment, and with a view to members of the Council having before them all possible information on the subject we have given instructions for a copy of a memorandum, prepared by our chairman, answering in detail the various criticisms made with regard to our proposals, to be sent to each member of the Council.

We understand that the Finance Committee are prepared to report on the proposals, and we recommend:—

(a) That as from and including April 1, 1906, all district surveyors be paid a fixed salary by way of remuneration instead of fees; that the amount of salary to be paid to each of the present district surveyors be equal to the amount of the average of the fees received in his districts during the seven years ending December 31, 1905, as provided in section 156 of the London Building Act, 1894; and that the Building Act Committee do submit the necessary recommendations to give effect to this decision.

(b) That with regard to the existing and all future vacancies the Building Act Committee do submit to the Council such recommendations, giving full particulars of their proposals in every case as will be in general accord with the 'model' scheme described in the report of the Building Act Committee, dated February 12, 1905.

The report of the Finance Committee was practically the same as their previous report, printed in our issue for February 3.

The consideration of the matter was adjourned.

White Hart Lane Estate.—Erection of Cottages on the Tower-gardens Section.—The Housing of the Working Classes Committee recommended, and it was agreed:—

"That the tender of Mr. G. E. Pulford for the erection of twenty-nine first-class cottages, eight second-class cottages, and twenty-three third-class cottages for the sum of 13,435l., and the tender of Mr. D. Barnes for the erection of three first-class cottages, thirty-six second-class cottages, and twenty-three third-class cottages for the sum of 10,855l. on the first part of the Tower-gardens section of the White Hart Lane estate be accepted; that payments to the extent of 80 per cent. of the work done be made to Mr. Pulford and Mr. Barnes in fortnightly instalments upon the architect's certificate that a further 15 per cent. of the value be paid on the completion of each cottage, and that the remaining 5 per cent. be paid within one month after the completion of each cottage."

The Council adjourned at half-past seven o'clock.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

- Lines of Frontage and Projections.**
- Islington, East.**—The retention of an addition in front of No. 198, Essex-road, Islington (Mr. W. H. Winder for Mr. T. Singlehurst).—Consent.
- Strand.**—Projecting balconies at Nos. 93 and 94, Long-acre, Strand, abutting upon Wilson-street (Messrs. F. Chambers & Son for Messrs. Odhams, Limited).—Consent.
- Brixton.**—A deviation from the plan approved for the erection of blocks of buildings on a site on the north-west side of Coldharbour-lane, Brixton, abutting also upon Lilford-road and Kenbury-street, so far as relates to an increase in the height of the buildings next Coldharbour-lane (Mr. E. E. Bird).—Consent.
- Marylebone, West.**—Buildings on the north-east side of Maida-vale, St. Marylebone, to abut upon Maida-vale and St. John's-wood-road (Mr. V. S. Galloway for the Governors of Harrow School).—Refused.
- Paddington, North.**—One-story shops in front of Nos. 431 and 433, Edgware-road, Paddington (Messrs. Gardiner & Theobald for Messrs. Matthews & Sons, Limited).—Refused.
- Paddington, North.**—One-story shops in front of Nos. 435 and 437, Edgware-road, Paddington (Messrs. Gardiner & Theobald for Meux's Brewery Company, Limited).—Refused.
- Paddington, North.**—One-story shops in front of Nos. 439 to 451 (odd numbers only), Edgware-road, Paddington, to abut also upon Maida-hill,

* See our issue for December 16, 1905.

West (Messrs. Boehmer [& Gibbs] for Mr. W. Hirsch).—Refused.

Width of Way.

Greenwich.—For the retention of buildings between Nos. 7 and 9, Coldbath-street, Greenwich, with a forecourt fence at less than the prescribed distance from the centre of the roadway of such street (Messrs. Cooper & Goulding).—Consent.

Bethnal-green, North-East.—Buildings on the north-east side of Wharf-road, Bethnal-green, with external walls at less than the prescribed distance from the centre of the roadway of such street, as shown on the plan (Messrs. M. W. King & Son).—Consent.

Width of Way and Working-Class Dwellings, Holborn.—Deviation from the plans approved for the erection of dwelling-houses to be inhabited by persons of the working-class, on a site abutting upon Leather-lane, Portpool-lane, Verulam-street, and Baldwin's-place, Holborn (Mr. R. Robertson for the Housing of the Working Classes Committee of the Council).—Consent.

Formation of Streets.

Wandsworth.—That an order be issued to Mr. E. B. I Anson, sanctioning the formation or laying-out of new streets for carriage traffic on the Mortimer estate, Streatham High-road, Streatham (for Mrs. Mortimer).—Consent.

Norwood.—That an order be issued to Mr. C. Death sanctioning the formation or laying-out of a new street for carriage traffic to lead from Trinity-road to Norwood-road, Lambeth.—Consent.

Lewisham.—That an order be issued to Mr. W. Wilkinson sanctioning the formation or laying-out of a new street for carriage traffic in continuation northward of Oatfield-avenue, Wells-road, Sydenham (Mr. T. Covell).—Consent.

Hammersmith.—That an order be issued to Messrs. H. Macintosh & R. J. W. Newman refusing to sanction the formation or laying-out for foot traffic only of streets to lead from Uxbridge-road to Bulwer-street, Shepherd's-bush, and the erection of a building in connexion therewith.—Refused.

The recommendations marked † are contrary to the views of the local authorities.

ARCHITECTURAL SOCIETIES.

LIVERPOOL ARCHITECTURAL SOCIETY.—This Society held an adjourned meeting at its rooms, Harrington-street, on the 19th inst. when the discussion was resumed on the paper by Mr. T. T. Rees on "Architects and City Improvement."* Mr. S. P. Morter presided. Mr. T. Myddelton Challcross opened the discussion and criticised the various sections of the paper in detail. He dealt at length with streets, buildings, and open spaces, and suggested that prizes might be offered for the best suggestion of improving Liverpool in its future expansion. With regard to street advertisements, Mr. Challcross said there seemed a need for the fixing of some standard to be attained by advertisers in their own interests and those of the general community. He suggested improvements to the city might be effected by the remission of some portion of the rates to those who voluntarily gave to the community such benefits as air spaces and ornamental trees, and so on, or to the householder who took steps to lessen the smoke nuisance. Mr. Hastwell Grayson followed, and advocated the establishment of a movement on the lines of the Cockburn Society of Edinburgh. This Society did much good work in Edinburgh on the lines aimed at by those who wished to see the city beautified. For instance, when an insurance society desired to raise a building of red brick, the Society, by influencing public opinion, obtained the substitution of stone for brick, Edinburgh being essentially a stone city. Objectionable advertisements were also dealt with in the same way, and Mr. Grayson suggested that an organisation working in similar fashion in Liverpool would achieve beneficial results.—An interesting discussion took place, during which speeches were made by Mr. Rathbone, Professor Reilly, Mr. H. B. Bare, Mr. P. C. Thicknesse, Mr. Hall Neale (President of the Liverpool Academy), Mr. Abraham, and others. The following resolution was adopted:—"Having regard to the commercial importance and prosperity of the city of Liverpool, this members' meeting of the Liverpool Architectural Society considers the appearance of the city should be worthy of such commercial greatness, and

should express its own dignity. This meeting realises that this is only to be done by the combined efforts of all our worthy citizens. It therefore suggests to the Council of this city the advisability of having a committee to deliberate as to the best means of obtaining that end." It was also resolved:—"That the best thanks of this meeting be tendered to the various railway and other companies who have kindly sent copies of their posters in illustration of the advances made in well-designed poster production in England."

ENGINEERING SOCIETIES.

THE JUNIOR INSTITUTION OF ENGINEERS.—During the past few years this Institution has in various ways exercised itself in promoting a closer relationship between the professions of engineering and architecture. A movement in this direction took the form of a very fully illustrated lecture on "Architectural Design and Expression," which was delivered before the Institution at the Westminster Palace Hotel on Friday last week by Mr. H. Heathcote Statham, Mr. Lewis H. Rugg, A.M. Inst. C.E., presiding. The lecturer first pointed out the distinction between architecture and engineering, and dealt with the questions of the probable origin of the column and its wide influence on architecture. He then compared Egyptian columnar architecture with Greek, and showed the difference between imitative architecture and the quality of style. Architecture was not an imitation of nature. He cited the Parthenon as an example of intellectual refinement. The gradual transmutation of the column into the buttress was treated, and considerations in regard to mouldings, scale, and ornament were touched upon. Illustrations from some of the cathedrals were depicted, and the lecturer passed on to the architectural element in engineering works. Some interesting observations followed with respect to railway-stations, bridges—often a fit meeting-ground of architecture and engineering—and suggested principles of treating masonry bridges were introduced, comments on some existing examples and conclusions derived from them being given. He held that judgment in regard to architecture rested on acquired perception rather than on theory. A vote of thanks was accorded the lecturer, and the speakers in the discussion were Messrs. J. H. Pearson, J. Rennie, W. J. Tennant, J. Horsfield, S. Bylander, J. W. Nisbet, G. T. Bullock, G. Peyrecave, and Mr. Rugg.

THE INSTITUTION OF CIVIL ENGINEERS.—At the ordinary meeting on Tuesday, the 20th inst., Sir Alexander Binnie, President, in the chair, the papers read were:—"A Plea for Better Country Roads," by Mr. G. R. Jelby, M. Inst. C.E.; and "Country Roads for Modern Traffic," by Mr. J. E. Blackwall, Assoc. M. Inst. C.E. The author of the first paper, after pointing out that the proper maintenance of the country highways is a matter in which the whole community is interested, that the traffic on them is probably greater now than it ever has been, that many of them are hadly maintained at extravagant cost, and that a new kind of traffic, viz., the motor-car traffic, has sprung up during the past few years, urges that the present is a specially fitting time for engineers to consider:—

(1) Whether they are adopting the best methods of maintaining the roads;

(2) What improvements are necessary to fit the roads for the new and increasing traffic.

With regard to (1) the author specially advocates that the roads should be better drained, and kept dry and free from mud; and he enumerates some of the advantages which the public would enjoy if this were done. Among these advantages is the fact that the dust nuisance, which has become a very serious question, would be practically abolished. He considers that the extra cost of labour would be more than counterbalanced by less outlay on future repairs. With regard to (2) the author considers it impossible to lay down any general rules that would be applicable to all roads in all districts; he recommends that the roads should be classified, and that they should be strengthened and improved on scientific principles according to special circumstances. More care should be taken in the selection of

stone for macadam, and he deprecates using local stone because it is the cheapest. He invites discussion, and hopes engineers to county councils and others will state the result of their experience in the maintenance of roads, and especially as to the use of "Tarmac" or other dust-preventing material. He thinks that money would be better expended in improving the existing roads than in making new ones. The author also strongly recommends that all country roads should be repairable by the county councils, and points out generally, and also by reference to a special case, some of the serious disadvantages of the present system, under which the main roads only are repairable by the county councils, all other roads being repairable by district and borough councils.

If the author's suggestion as to keeping the roads free from mud were adopted throughout the country, a large number of additional labourers would be permanently needed, and he believes their work would be remunerative. If the roads were generally improved, a further large number of men would be wanted for several years to come, and the author thinks that no better or more useful work could be found for some of the able-bodied men who now swell the ranks of the unemployed, and that the work would be free from the serious objections which have been raised to many of the schemes which have been suggested for the benefit of that class.

The author of the second paper points out that it is now universally acknowledged that a radical improvement is required in the main roads of England, so that heavy traffic, consisting of traction engines, motor-lorries, and heavy carts, shall not cut up the surface and render it inconvenient for light, fast traffic, including motor-cars, light carriages, and cycles, and that foot passengers shall be protected from being run down or choked with dust by motor-cars. He suggests the gradual alteration, as funds allow, of existing main roads into twin roads, one for heavy traffic and the other for light, separated by a fence and a footpath. From what little data at present exist on the subject of the cost of maintenance of roads required for heavy traffic only, or for light traffic only, it appears probable that a saving of expense would be in the long run result; and there would be, beyond doubt, advantages to the users of the road by separating the traffic. Whether the advantages would be worth the initial cost of alteration is a matter of opinion.

The details of construction would vary considerably according to local circumstances, the amount and weight of traffic, the value and nature of adjoining land, the cost of material delivered, etc. The minimum width of the two roads and footpath together should be at least 46 ft. between fences, 21 ft. for each road and 4 feet for the footpath. The surface water would be conducted into a pipe-drain under the footpath by pipes laid near the surface under the light road, and by cross-gutters over the heavy road, both roads sloping down towards the outer sides and towards the footpath. The two roads would converge into one at the entrance of a village or any confined space. All crossings of roads would be notified by sign-posts, and speed of traffic reduced to a safe maximum. At gateways into fields on the side of the light road a space would be left in the wire fence, closed by a rail pivoted to a post near one end, and opening upwards, assisted by a counterpoise at the other end.

For purposes of considering the probable cost of conversion of a road into a twin road the items which would occur on a typical road are set out below with suggested prices. It is assumed that the road, originally 30 ft. wide, is widened to 46 ft. between fences, and that the extra land required for this widening is given by the adjoining owner for the good of the public.

	Per lineal yard.
Moving fence	2 s. 4.
Removing sod and earth	0 1 0
Foundation stone delivered	0 0 2
Reed mats (3 in. gauge), delivered	0 4 0
Labour, packing, spreading, and rolling	0 3 4
Labour, making up footpath	0 2 0
Making up light road	0 1 0
Fencing	0 9 6
	0 7
	21 1 7

This would be practically 1,900l. per mile.

* See our issue for Feb. 3.

COMPETITION.

NATIONAL CONGRESS HALL, BRAZIL.—The Commercial Intelligence Branch of the Board of Trade have received from H.M. Consul-General at Rio de Janeiro an extract from the *Brazilian Review* giving particulars of a competition for the presentation of plans for the construction of a building for the National Congress of Brazil. Projects destined to compete will be received in the Secretariat Department of the Federal Senate up to 4 p.m. on May 31 next. Three prizes, of 15,000, 10,000, and 5,000 milreis, respectively, will be awarded to the authors of the best projects presented, and a further sum of 5,000 milreis is to be spent in acquiring projects which, although not awarded prizes, are in the opinion of the judging commission deserving of being acquired for the National Congress. The text of the programme, in accordance with which projects must be drawn up, may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 75, Basinghall street, London, E.C.

BOOKS RECEIVED.

IMPRESSIONS OF JAPANESE ARCHITECTURE. By Ralph Adams Cram. (John Lane, 10s. 6d.)

MODERN BUILDINGS: THEIR PLANNING, CONSTRUCTION, AND EQUIPMENT. By G. A. T. Middleton, A.R.I.B.A. (The Caxton Publishing Company, 10s. 6d.)

BRIDGE AND STRUCTURAL DESIGN. By W. Chase Thomson, M.Can.Soc.C.E. (Engineering News Publishing Company, New York, 8s.)

TRADE CATALOGUES.

We have received from the Leeds Fireclay Company three catalogues containing illustrations and prices of various sanitary goods manufactured by Messrs. Joseph Cliff & Sons, one of the associated firms in the Company. The catalogues are very well produced on good paper, all the illustrations being coloured, and full information is given as to qualities and prices. One catalogue deals with porcelain-enamelled fireclay baths and lavatories, the trade name for the ware being "Imperial Porcelain." The baths are made in various sizes, either taper or parallel, and with either plain rims or glazed rolls; the outside may be plain, white-glazed, or stone-enamelled in a selected tint. Special baths, such as sitz, foot, and sponge, are also shown, together with a number of taps, and other accessories. The lavatories are of a substantial character suitable for schools and factories as well as for houses and hotels; the new overflow for the "Carlton" basin is a great improvement on the older type. A second catalogue contains illustrations of fireclay closets and urinals. All the pedestal closets are of the usual wash-down type, but trough-closets are also shown. The urinals are of the stall type in salt-glazed ware or porcelain-enamelled fireclay, and are of different patterns suitable for the angles of rooms, for straight walls, and for independent groups. Various plans of urinal ranges are given, and there is a sheet of illustrations of flushing-cisterns, sprays, etc. The third catalogue deals with sinks of various kinds from the inexpensive cottage sink in brown-glazed stoneware to the special sinks for hospitals, etc. The combined sink and slop-sink in one piece of fireclay with separate trap to the slop-sink will prove useful, and the "open-overflow" sink, with drainer and skirting in one piece, is also a good fitting. Illustrations of slop-sinks, wash-tubs, bed-pan sinks, post-mortem and mortuary tables, sink fittings, etc., are also given.

From Messrs. G. Shrewsbury & Co. we have received a catalogue of their "Calda" water-heaters and other appliances. The "Calda" heaters have been extensively used for a generation for heating the water required for baths and other purposes, and many of the varieties serve the purpose admirably. It is, we think, a serious error of judgment to say that ventilating flues are "unnecessary," even though the statement is qualified by adding "if the bathroom is fairly large and the gas is slight." It is true that such flues are not absolutely necessary in the case of geysers in which the products

of gas-combustion are condensed by the water in its passage through the fitting, but such geysers do not yield *pure* hot water. The claim is made on page 2 that all "Caldas" yield "pure hot water . . . suitable for drinking and culinary purposes," but, unless we are mistaken, the "Unique" and "Favourite" Caldas shown on page 9 are of the condensing type. The catalogue contains illustrations of oil-heated Caldas, baths, gas-heated conservatory boilers and pipes, washing-coppers, etc.

The Down-draught Fireplace Co. have sent us a catalogue of Regester's patent down-draught fireplaces for burning anthracite or any other fuel. The special feature is the pair of openings (one at each side of the fire) level with the bottom of the grate, from which concealed smoke-pipes are carried up to the main smoke-flue above the fire. The illustrations do not show any method of regulating the draught in the upper and lower flues. Some of the grates are made with hot-air chambers, and ducts can be formed to convey the heated air into a room above.

The David Maydole Hammer Co., of Norwich, U.S.A., send us their catalogue of hammers as used by bricklayers, masons, tile-setters, joiners, engineers, machinists, boiler-makers, blacksmiths, and others. The heads of all hammers made by this firm are forged from crucible cast steel, and the standard manufactures of the firm include some 343 styles, sizes, and finishes. The fact that a large establishment is kept fully employed in the manufacture of hammers alone serves as a practical proof of the reputation for high quality enjoyed by the Maydole hammers, and illustrates the system of industrial specialisation practised in the United States.

Correspondence.

R.I.B.A.—ELECTION OF FELLOWS.

SIR.—In compliance with requisitions in writing duly signed according to the provisions of By-law 9, the election of the twenty-eight candidates for Fellowship, nominated by the Council for election at the business meeting on the 5th March, will be taken by voting papers.

The Council are aware that these requisitions proceed from a widespread feeling that the Institute should avail itself of the permission granted by clause 3 of the Charter to declare that every person desiring to be admitted a Fellow shall be required to have passed such examination or examinations as may be directed by the Royal Institute.

Sympathising with this feeling, the Council adopted it as their policy in 1904, and at a special general meeting, held on February 29, 1904, a resolution was passed to the effect that after December 31, 1906, no person shall be admitted a Fellow unless he is either an Associate or has passed the examination or examinations qualifying him as an Associate.

On the same evening, however, the general body passed the following resolution of the Royal Institute:—

"That during the intervening period (i.e., till December 31, 1906) every architect eligible under the Charter for election who desires to join the Institute as a Fellow be encouraged to do so."

In consequence of these resolutions becoming generally known in the profession a large number of eligible candidates have come forward during the last two years. The Council are convinced that it is to the interests of the Institute that thoroughly qualified architects in various parts of the country whose age and busy practice preclude from entering for examinations should become Fellows before the door is for ever closed against them.

At the same time the Council has subjected the qualifications of candidates during the last two years to the same careful scrutiny and inquiry as has been their practice during the whole existence of the Institute.

To avoid any possible misapprehension the Council declare that the last election of Fellows under the existing system will be on December 3, 1906.

In view of the requisitions for a poll the Council think it right that members should be reminded of the above facts, and, as one

adverse vote in four excludes, they desire to direct the attention of members to the gravity of their responsibility when they fill up their voting papers.

ALEXANDER GRAHAM, Hon. Secretary.

W. J. LOCKE, Secretary.
Institute of Architects, 9, Conduit-street,
February 21.

FELLOWSHIP OF THE R.I.B.A.

SIR.—Will you permit us to return to this subject, in the hope of making clearer the points raised.

If only we could have the actual position and purpose of the Fellowship definitely explained, we should all know better where we stand. Surely it may be assumed that the original idea was to make the Fellowship a sign of eminence, more or less; otherwise why have a second class of the subscription being higher? And does not the much discussed resolution of the Institute to shortly elect this class only from the ranks of the Associates prove it? If the contention that every competent architect has a right to election as a Fellow is correct, it seems to us that to force him after this year to go through an examination will be not only a distinct hardship, but an inconsistency. We cannot see what purpose of a worthy kind the Fellowship fulfils, unless it is to recognise a select or eminent class of men.

Our views (which we have reason to know are very widely shared) seem to be much misunderstood in London. We are working solely for fair play, and for the dignity of the R.I.B.A. So far are we from holding that the Associate's examination is the main essential, that we would willingly see the entrance to our class widened, and a man's practical work accepted in substitution for some or even all of the examination work; so long as it was definitely ascertained that the conception and details were entirely his own.

But, knowing the educational value of preparation for the examination, and remembering the constant emphasis hitherto placed upon it by the leaders of the R.I.B.A. and the Provincial Societies, we are bound to insist that it is (1) unfair to such examined men, (2) derogatory to the dignity and consistency of the Institute, and (3) unworthy of the candidates, as architects and gentlemen, to bring about this unseemly scramble for easy entrance to the Institute.

We are informed that "the By-laws allow this." We admit it; but the By-laws also allow the means of protest—the demand for a poll of the Institute. In demanding this, and for the whole of the candidates, we have acted on principle only; and we earnestly hope our action will not cause any injustice to the Associates in the nomination list.

We are further told that "the close time will expire in a year from now; cannot things be allowed to take their course"? This we would gladly have done; but our information shows that due care is not exercised by the Council in their nominations. We must protest, and have already effectively protested, against the official nomination of men who hope by the Fellowship to obtain that entrance to the Institute which they have signally failed to obtain as Associates, or of men whose practice is chiefly connected with Estate Agency and kindred work.

One other remark in conclusion. Of the present members of the R.I.B.A. Council, we find that more than 75 per cent. have at some time qualified as Associates. No further argument is needed; the Council has itself fully justified our contention.

Signed on behalf of the meeting of Leeds Associates,
W. G. SMITHSON, Chairman,
FREDK. MUSTO, Secretary.

Leeds, Feb. 21.

SIR.—I must beg leave to say a few words on behalf of the London men, in reply to Mr. Musto's letter.

I number among my friends a good many Associates who are by no means indifferent to the course of events during the last year or so, and I think I shall do no injustice to the majority of the London Associates when I say that it is an excess of discretion, rather than a lack of valour or conviction, that prevents their openly joining their provincial comrades and presenting a united front.

It is undoubtedly the opinion of a great many of us that the present policy of the Council is a mistaken one, inimical to the best interests of the Institute and derogatory to the dignity of the Fellowship; but few have or can have the opportunity of taking part in an ordinary election, and fewer still, it is to be feared, can afford, here in London, to be publicly identified with the whole-hearted action of the provinces, with its attendant risk of forfeiting the goodwill of their elders.

Nevertheless, a very strong current of opinion undoubtedly exists even in London; and as the question seems now likely to be brought to a definite issue, the opinion of the majority will doubtless be ascertained, and the future policy of the Council ordered accordingly.

PERCIVAL W. HAWKINS.

THE SOANE MEDAL PRIZE DESIGN.
 Sir,—It may interest your readers if you can add the following particulars as to the author of this scholarly, beautiful, and masterly design for Lord Bacon's Ideal Palace.

Mr. W. S. George is the son of an architect practising at Ashton-under-Lyne. After training in his father's office, he obtained a Lancashire County Council Scholarship in art, and was awarded a Royal Exhibitionship by the Board of Education. He entered the Royal College of Art in 1901 and obtained the travelling studentship in architecture of the College in 1903.

The interest and charm of Mr. George's draughtsmanship can be estimated from the plates that you published last week, *Beznorsford Priory*, Royal College of Art, Feb. 21.

ROYAL SANITARY INSTITUTE.

Sir,—Many of your readers will, I think, be interested in having particulars of the Saxon Snell Prize.

This Prize was founded to encourage Improvements in the Construction of Adaptation of Sanitary Appliances, and is to be awarded by the Council of The Royal Sanitary Institute at intervals of three years, the funds being provided by a legacy bequeathed to the Institute for this purpose by the late Henry Saxon Snell, F.R.I.B.A.

The Prize consists of 50l. and a medal of the Institute, and is offered in 1906 for an Essay on "Suggestions for Improvements in Sanitary Appliances for use in Workmen's Dwellings and Labourers' Cottages under the varying conditions of Water Supply and Drainage usually obtaining in Towns and Villages."

E. WHITE WALLIS,
 Secretary.

THE PURPLE PATCH.

Sir,—In the course of your very kind notice of the *Purple Patch* in your last issue you refer to a "delightful mock-medieval" headpiece. This illustration was made from a very careful tracing of Mr. Elliot Hodgkin's reproduction of the original woodcut, which is perfectly genuine; the text also is a careful transcript, except in the matter of "long S's," which are unfortunately lacking in our font of type. I think this slight correction is due to Mr. Hodgkin (whose name was quoted in the article), as he is one of the leading English authorities on early typography.

C. F. BEACHBURNE DANIEL,
 One of the Editors, *Purple Patch*.
 . Evidently we overlooked the prefatory remarks above the drawing, which we took to be head-piece of the article. It was, as Mr. Pleydell said of *Domine Sampson*, "a curiosity worth preserving."—Ed.

WEST WALTON CHURCH, NORFOLK.

Sir,—I should be obliged if you would allow me to ask through your columns if any of your correspondents can inform me whether the ground plan of West Walton Church, Norfolk, has been published in any book, and, if so, where it is to be found.

BERNARD J. McADAM.

COURT OF COMMON COUNCIL.

A MEETING of the Court of Common Council was held at the Guildhall on Thursday, last week, the Lord Mayor presiding.

Street Improvements.—On the recommendation of the Improvements and Finance Committee, it was agreed to serve notices to acquire so much of the premises of 117 and 120, Fleet-street, and 33, Throgmorton-street, as is required for the improvement of those thoroughfares, and that 2,800l. should be offered for the last-named premises. The same committee also submitted arrangements, which the Court adopted, with St. Bartholomew's Hospital for acquiring their freehold interest in the ground needed for the improvement of Giltspur-street for the sum of 2,221l., and with Messrs. Blessey for the freehold of the land required to widen the public way in front of 2 and 3, Warwick-lane, for 2,000l.

Heating of the Library.—The Library Committee were authorised to carry out an improvement of the heating apparatus in the library at a cost not exceeding 100l.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—VII.
 SHORT CUTS TO DIVISION.

THE process of division can be much simplified by various devices, generally similar to those explained in the two preceding articles.

Contracted Method.

In cases where the numbers to be dealt with contain several decimals, the process of division can be considerably abbreviated without

affecting the substantial accuracy of the result, as the quotient can be obtained correctly to a reasonable number of decimal places.

Rule.—The contracted method consists in cutting off a figure at the right-hand of the divisor after each new figure has been obtained in the quotient; but carrying any figures furnished by mental multiplication of the figures rejected from the divisor, and adding 1 to the figure carried if the next figure of the mental product has the value of 5 or more.

In the following examples the numbers are the same as those used in Examples (1) to (3) in Article V., p. 147.

Example (1): Divide 512.2122945 by 58.645 so that the quotient shall be correct to four places of decimals.

Contracted Method.		Ordinary Method.	
58645	5122122945	58645	5122122945
469160	= 8.7341	469160	= 8.7341
43052		43052	
41052		410515	
3000		300079	
1759		175935	
241		241444	
235		234580	
6		68645	
6		68645	
6		10000	

As the result is not required to contain more than four decimals, we reject the figures 2, 9, 4, 5 in the dividend, and proceed as follows:—

Line (1).—Multiply the divisor by 8 to obtain the product 469160, which is subtracted from 512212, leaving the remainder 43052.

Line (2).—Reject the right-hand 5 in the divisor and divide into 43052. Multiplying 5864 by 7 take the canceled 5 into account mentally, thus 5 x 7 = 35; then as 5 is to be taken as 10, carry 4 instead of 3 to the product of 4 x 7, making that individual product 4 x (4 x 7) = 32. Consequently the 5 is set down and the 3 carried to the next multiplication in the same line. The process is continued in the usual way until 41052 is obtained, this being subtracted from 43052, leaving 200 as remainder.

Line (3).—Reject the figure 4 in the divisor, multiply 586 by 3, carry 1 from the mental multiplication of the two rejected figures, and proceed as in Line (2) to obtain 1759, which taken from 2000 leaves 241.

Line (4).—Reject 6 in the divisor, multiply 58 by 4, carrying over 3 from the mental multiplication of the figures rejected from the divisor. Proceed as before, obtaining the remainder 6.

Line (5).—Cancel 8 in the divisor, multiply by 1 carrying over 1, the value of the rejected figures.

The last figure in the quotient is 1, the required answer, after insertion of the decimal, being 8.7341. The preceding example it is demonstrated that the contracted method is quite as suitable for practical purposes as the ordinary process, while the saving of time and space is too obvious to require comment.

As in the converse process of multiplication we can adopt the contracted system for the treatment of large whole numbers in cases where minute accuracy in the units, tens, hundreds, or thousands places is not of importance.

The Italian Method.

This method of abbreviation has the effect of shortening the process of division, while still permitting exact results to be obtained. Instead of writing down the various products, and the difference between these products and the lines immediately above these, it is only necessary to record the difference between the separate figures of each product and the figures over them.

It is certain that familiarity with the Italian method enables the operator to diminish the mental exertion required for the performance of a given division sum by a very large proportion, because the complete calculation of the separate products of the divisor by each digit in the quotient is not necessary.

Example (4): Divide 6843580648 by 7324.

The following are the workings by the Italian method and the ordinary method:—

Italian Method.		Ordinary Method.	
7324	6843580648	7324	6843580648
52198		65916	
32260		25198	
29646		21972	
35048		32260	
5752		29296	
		35048	
		29296	
		5752	

The process is conducted as follows:—

Line (1).—Under the dividend draw a line to indicate the digits necessary to express a number greater than the divisor. In this example the line extends below the figures 68435. By inspection the first figure in the quotient is evidently 9 representing 900,000. Then, as 4 x 9 = 36, we have to deduct 36 from 5, but as this cannot be done we borrow 4 (representing 40) and get

45 - 36 = 9, which is the first figure to be written. The figure 4 has to be carried to the next product 2 x 9 = 18 and 18 + 4 = 22, which taken from the sum of 3 and 20 borrowed leaves 23 - 22 = 1, this again being the figure to be recorded, while the 2 borrowed is carried forward. Next we have 2 + (3 x 9) = 29, which deducted from 4 + 30 = 34 gives 5 as the difference to be written and 3 to be carried. Finally, 3 + (7 x 9) = 66, and taking this from 68 we are left with 2, the last figure of the difference 2519. Repetition of the same process for the other figures of the dividend gives the quotient 934,404 with 5752 as remainder.

A more facile mode of dealing with the figures is to avoid instead of subtracting the figures in ascertaining the differences.

Thus:—

(4 x 9) + 9 = 45	(carry 4)
4 + (2 x 9) + 1 = 23	(carry 2)
2 + (3 x 9) + 5 = 34	(carry 3)
3 + (7 x 9) + 2 = 68	

The figures printed in italics represent the first figure of the quotient and those in thick-faced type constitute the first line of differences.

The other figures in the quotient and the lines of differences are ascertained in a similar manner, giving the quotient 934,404 +, as before.

Comparison of the working with that under the ordinary system will be sufficient to indicate how great a saving of time can be effected by using the Italian method.

Simplified Method by Reduction of the Terms.

If the divisor and the dividend can be reduced materially by the use of the greatest common divisor (termed the *Greatest Common Measure*, or *G. C. M.*) of the two numbers, considerable simplification of division can frequently be effected.

Even if the determination of the *G. C. M.* would not repay the trouble involved, time can often be saved by using a smaller common measure which can be ascertained by inspection.

Thus we have available two variations of the same principle, which is illustrated in the following examples:—

Example (1): Divide 3072 by 108.

If the *G. C. M.* = 12, and the process of reduction and division is:—

12108	3072
9	256
	2844
	9
	1285
	35
	1285
	7
	1287
	3671

Hence we have

Example (2): Divide 1285 by 35.

Here both numbers are evidently divisible by 5.

Hence we have

535	1285
7	257
	3671

Division by Certain Numbers.

To divide any three-figure whole number by 11.

Rule.—In any three-figure whole number in which the second digit is equal to the sum of the first and third digits, the first and third digits represent the quotient of the number after dividing by 11.

Example (1):—

792	+ 11 = 72
242	+ 11 = 22
341	+ 11 = 31
110	+ 11 = 10

Note.—The same principle can be applied conveniently to the division of some three-figure and four-figure numbers by multiples of 11, as demonstrated by the following examples:—

484	+ 22 = 22
748	+ 22 = 34
1386	+ 22 = 63
693	+ 33 = 31
1059	+ 33 = 33
2079	+ 33 = 63

A little practice will enable the user to deal with suitable numbers in this way, even when figures have been carried from one place to another.

To divide any whole number by 11.25, 112.5, 1125, and so on.

Rule.—From the number subtract one-ninth of that number, and by a decimal point mark off from the right-hand end of the result one, two, or more figures, according as the integral part of the divisor represents tens, hundreds, and so on.

Example (2): Divide 72543 by 11.25.

912543	
806033	
6448266	= 6448266

To divide any whole number by 12.5, 125, 1250, and so on.

Rule.—Multiply the number by 8, and mark off by a decimal point as many figures from the right-hand end of the number so obtained as there are figures in the integral part of the divisor.

Example (3): Divide 72543 by 12.5.

72543	
580344	= 580344

To divide any whole number by 13.3, 133.3, 1333.3, and so on.

Rule.—From the number subtract one-fourth of that number, and by a decimal point mark off from the right-hand end of the result, one, two, or more figures according as the integral part of the divisor represents tens, hundreds, and so on.

Example (4): Divide 72543 by 13·3.

$$\begin{array}{r} 472543 \\ 1313575 \\ \hline 5440725 = 5440725 \end{array}$$

To divide any whole number by 14·2857, 142·857, 1428·57, and so on.

Rule.—Multiply the number by 7, and mark off by a decimal point as many figures from the right-hand end of the number so obtained as there are figures in the integral part of the divisor.

Example (5): Divide 72543 by 14·2857.

$$\begin{array}{r} 72543 \\ 7 \\ \hline 507801 = 507801 \end{array}$$

To divide any whole number by 15, 150, 1500, and so on.

Rule.—From the number subtract one-third of that number, and by a decimal point mark off from the right-hand end of the result, one, two, or more figures according as the divisor represents tens, hundreds, and so on.

Example (6): Divide 72543 by 15.

$$\begin{array}{r} 72543 \\ 372543 \\ \hline 24181 \\ 48502 = 48302 \end{array}$$

To divide any whole number by 16·6, 166·6, 1666·6, and so on.

Rule.—Multiply the number by 6, and by a decimal point mark off from the right-hand end of the result one, two, or more figures according as the integral part of the divisor represents tens, hundreds, and so on.

Example (7): Divide 72543 by 16·6.

$$\begin{array}{r} 72543 \\ 6 \\ \hline 435258 = 435258 \end{array}$$

To divide any whole number by 25.

Rule.—Multiply the number by 4, and mark off by a decimal point the two right-hand figures of the number so obtained.

Example (8): Divide 72543 by 25.

$$\begin{array}{r} 72543 \\ 4 \\ \hline 290172 = 290172 \end{array}$$

GENERAL BUILDING NEWS.

CHURCH, TOTTENHAM.—The Lord Mayor laid the foundation-stone of the permanent Church of St. Philip the Apostle, South Tottenham, the building being intended to supersede an iron mission church in Philip-lane, connected with Holy Trinity, Tottenham. Accommodation for a congregation of 750 will be afforded by the new church, which will be built in brick and stone by Dove Brothers, from Mr. J. K. Cutts's designs.

ROMAN CATHOLIC CHURCH, READING.—The new Church of St. William, in Upper Redlands-road, Reading, was opened recently. The church will, when completed, be 90 ft. long and 50 ft. wide, with seating capacity for 450 persons, but until sufficient money is raised the erection of the sanctuary will remain in abeyance, and a building 63 ft. long by 24 ft. wide, capable of holding 200 persons, has been erected. The architects are the Rev. Canon A. J. C. Scoles and Mr. G. Rayment, of Basingstoke. The church is built of red brick with stone facings. The builder is Mr. W. Hawkins, Reading.

PROPOSED CHURCH, BURNLEY.—The new Church of St. Cuthbert is to be built in Townley-street, Burnley-lane. The plan is the usual one of nave with north and south aisles, chancel, south chapel, and vestries, the organ being in the north chancel aisle. The west wall of the nave is segmental in form so as to provide a baptistery, and at the south-west corner a bell turret rises. Two porches on the south side give access to the church, and there is an emergency exit on the north. Six arches on each side divide the nave and chancel from the aisles and chapel, and carry the clearest walls, which are pierced with lancet-headed windows. The nave and aisles accommodate 450, the chapel 42, and the chancel 40. The walls are to be faced inside and out with Accrington red plastic bricks, having external dressings of Cullingworth stone and internal dressings of white Hollington stone. All the roofs are to be of wrought pitch-pine, open timbered, country slates, and covered with north country slates. The floors in the nave and aisles are to be of joists and boards under the seats, and polished flags in the passages, the chancel and chapel of vitreous mosaic and wood blocks respectively. The designs are by Mr. R. B. Preston, architect, Manchester.

CHURCH RESTORATION, HUNTINGFIELD.—The restoration of Huntingfield Church, which was commenced some ten years ago, has now been completed. The work has been executed by the contractor, Mr. Robert Etheridge, of Fressingfield, and the masonry by Mr. Perfit, of Harleston, from plans and designs and under the supervision of Mr. C. H. Lohr, architect, of London and Leicester.

SCHOOL, HANWELL.—A new school has just been opened at Oaklands-road, Hanwell. The Oaklands-road School affords accommodation for 1,143 scholars—viz., senior mixed department, 388; junior mixed department, 388; infants department, 367. The school is arranged in a two-story building for mixed classes, and a separate building for infants. Each department has a central hall and classrooms. There are also lavatories, teachers'-rooms, store-rooms, etc., on the mezzanine floors. The buildings are heated by hot water and open fireplaces. The floors are fireproof, being constructed with concrete on steel girders. Each department has two entrances, and the senior mixed department has two staircases. Two cloakrooms are provided for each department. The external walls are built with stock bricks, and the roofs are covered with slates. The playgrounds are large, and will be paved with asphaltic tar, and have two covered shelters. A caretaker's house is provided. The contract price is 18,250*l.* Mr. W. Pywell is the architect.

SCHOOL, CARTER KNOWLE, SHEFFIELD.—A new school has been erected at the junction of Carter Knowle-road and Bannardale-road off Sheffield Education Committee. The school will accommodate 900 infants, and 400 older boys and girls. It is arranged on the central hall principle. The hall measures 84 ft. by 30 ft., and is divided by sliding screens. Around it are twelve classrooms, varying in size from 25 ft. by 24 ft. to 25 ft. by 22 ft. The whole of the buildings are heated with a low-pressure hot water apparatus. The site, being a West Calder, has a large area of open ground, and is provided on the low level, each department affording accommodation for upwards of forty pupils. All the classrooms are at least 14 ft. high, and an area of 10 superficial feet is allowed for each child. The total outlay on the school has been 15,220*l.* The site covers two acres (one of which is devoted to playgrounds), and there is space for the erection of another department in case of need. The building has been erected from the designs of Messrs. Holmes & Watson, architects, Sheffield.

SCHOOL, WEST CALDER, GLASGOW.—Gavieside School, which has been reconstructed and enlarged by the West Calder School Board, was opened on the 12th inst. The boys' and girls' entrances and five class-rooms, giving accommodation for about 280 scholars, are grouped round three sides of a central hall, and each apartment opens directly off it. Two teachers' rooms and the boys' and girls' cloak-rooms and lavatories form the remaining side of the hall, and look towards the West Calder. The cost of the new work is about 1,750*l.*, and the architect is Mr. William Baillie, Glasgow.

RAILWAY MISSION HALL, SALISBURY.—The foundation-stones of a new mission hall have just been laid in Devizes-road, Salisbury. The work is being carried out from designs prepared by Mr. A. C. Bohame, architect.

HOSPITAL EXTENSION, MANSFIELD.—The memorial-stones were recently laid of the extensions which are being made to the Mansfield Hospital. The scheme provides for a ward capable of containing twenty-six additional beds, as well as extra kitchen accommodation and rooms for the augmented staff. Mr. R. F. Vallance is the architect of the work, the estimated cost of which is 6,600*l.*

COUNTY MUSEUM, LINCOLN.—The conversion of the building known as the Grey Friary, at Lincoln, into a county museum has just been completed. The Grey Friary is a building of two stories, and forms a small portion of what was once a complete monastic establishment, erected in the first half of the XIIIth century. The architects who have been responsible for the conversion of the building (Messrs. Watkins & Son), in their report to the Corporation, state that the original roof still remains intact over the eastern end of the main building. It consists of trussed rafters, with semi-circular trusses to each pair. The rooms are well lighted and heated, and the structure well arranged for its purpose, while its ancient character has been preserved.

NEWPORT LUNATIC ASYLUM, CAERLEON, MON.—The new asylum for the county borough of Newport, situate at Caerleon, has just been opened. The buildings, with their equipment and furniture, will cost 116,000*l.*, and roads and bridges represent about 6,000*l.* The laying-out of the grounds and fencing, architect's commission, clerk of the works' salary, legal costs, and miscellaneous expenditure not yet completed are estimated at 17,000*l.*, bringing the total estimated expenditure to 139,000*l.* The accommodation provided is for 328 patients, with administration offices sufficient for 500 patients, thus enabling two further blocks of buildings for patients to be erected without requiring any addition to the

administrative block. The architect for the buildings was Mr. A. J. Wood, of London, the contractors Messrs. John Linton & Co. (Limited), of Newport, and the clerk of works Mr. W. B. Partington. The Borough Engineer (Mr. R. H. Haynes) carried out the diversion of road and the construction of a new bridge over the Great Western Railway. The blocks for patients are two stories in height, those nearest the centre being allotted to sick and infirm cases, and consisting of a ward for 30 patients on each floor. The next block is designed for 35 epileptic and 35 quiet chronic cases, the epileptics being accommodated in a ward on the ground floor and the quiet chronics in a similar ward on the first floor. Next this is the recent and acute block, comprising a ward for 27 patients on either floor. The future extensions will consist of a block beyond the recent and acute on each side for working patients, that on the female side being contiguous to the laundry, and that on the male side adjacent to the workshops. The asylum is so designed that these additional blocks may be added without in any way disturbing the patients or interfering with the working of the institution. The official block is placed centrally to the south of the administrative offices. The great fall in the ground from back to front would not admit of this block being placed to the north, the position recommended by the Commissioners in Lunacy. It is a two-story building, containing on the ground floor committee room, receiving room, photographic studio, etc. The upper floor is allotted to the assistant medical officer and the matron, their quarters being quite separate and reached by different staircases. On the male side, in close proximity to the site for the future block for working patients, are the workshops. They comprise shops for shoemakers, tailors, upholsterers, carpenters, plumbers, painters and glaziers, bricklayers' shed, foreman's office, etc. The boiler-house block is placed to the east of the workshops, and contains, in addition to the boiler-house, coal stores, electric plant room, battery-room, pump-room, engineers' shop, office, etc. The blocks for attendants and nurses are placed in the usual position east and west of the administrative offices. They include the necessary mess and recreation rooms on the ground floor, the upper floor being allotted to the night nurses and domestics on the female side and to night attendants on the male side. The buildings are lighted throughout by electricity, the current being generated in the institution. Electric fire-alarms, tell-tales, bells, and telephones are installed throughout the buildings. Fire-alarms are provided in each ward and section of the building. In addition to the two means of exit provided from each ward ample precautions have been taken in case of fire, both the interior and exterior of the building being commanded by hydrants of the latest type. The following detached buildings are provided in addition to the main asylum:—Chapel, mortuary, farm buildings, six cottages for staff, two entrance lodges, cottage for bailiff, and garden buildings.

WORKMEN'S INSTITUTE, YNYSHIR.—The new workmen's hall and institute at Ynyshir was opened on the 3rd inst. The building is of native stone and, in addition to the hall, contains a library, billiard-rooms (two tables), a committee-room, providing seating accommodation for 200 people, games rooms for boys, a gymnasium, and a large reading-room. The institute will be provided with its own electricity and gas. The electric plant was supplied by Messrs. Clay Bros., Cardiff; the suction gas plant by Messrs. William Grice & Co.; and the heating apparatus by Messrs. Stoll & Co., of Oldham. The contractor was Mr. David Richards, Ynyshir, and the architect Mr. E. Williams, Cardiff. The cost was 7,900*l.*

FREE LIBRARY, CHELMSFORD.—The Chelmsford Free Library and Reading Room, Museum, and School of Art were opened recently by Lady Rayleigh. The building consists of a central block, with two wings. On the ground floor are the entrance-hall, librarian's and curator's offices, the library and reading-room, and the museum and museum library. The school of art occupies the whole of the first floor, and above are a store-room and caretaker's apartments. The cost of the work, including the site, was about 8,000*l.* Mr. Cuthbert Brown is the Borough Surveyor.

PROPOSED HOSPITAL EXTENSION, MIDDLESBROUGH.—At a meeting of the council of the North Ormsby Hospital, Middlesbrough, on the 9th inst., Mr. J. M. Boitcomley, architect, reported that the proposed addition, to be known as the Elizabeth Brown wing, would cost 6,000*l.*, and the alterations to existing buildings he estimated would cost 1,375*l.* After some discussion it was decided to carry out the improvements, omitting the staircase and lift, with approaches, estimated at 500*l.*, the amount to be expended thus being 6,875*l.*

LIBRARY, CARLETON.—A new free library was opened at Carleton on the 10th inst. The building contains a newspaper and magazine room, lending and reference departments, recreation-room, and librarian's room. There is also lavatory accommodation. The exterior of the building is of red brick with Hollington stone dressings. The

internal fittings are of polished oak with pitch-pine wood blocks. The contractors have been as follows:—Bricklayers and joiners, G. T. Taylor, Carlton; masons, Ward & Adams, Nottingham; slater, A. Wright, Nottingham; plumber, J. Straw, Carlton; painter, J. Bryan, Carlton; plastering and mosaic paving, Midland Plastering Company. The total cost of the building has been £1,800. Mr. J. C. Haller, from whose plans the library has been built, has superintended the erection.

APPOINTMENT.

LLANDEFF DIOCESAN ARCHITECT.—The Bishop of Llandaff presided over a meeting of the Llandaff Diocesan Society at Cardiff on Friday last week, and the appointment of an architect in succession to the late Mr. John P. Seidson was considered. Mr. F. R. Kempson, of Cardiff, was appointed.

SANITARY AND ENGINEERING NEWS.

SEWERAGE WORKS, ABBOTS LANGLEY.—These works have been carried out by Mr. H. Brown, contractor (Watford), from the designs of Mr. E. Lailey, Surveyor to the Watford Rural District Council. The sewage from Hunton Bridge, Upper Highway, and Abbots-road gravitates to a large receiving tank at Hunton Bridge, holding some 120,000 gallons. From this the sewage is lifted by pumps to the new disposal works near Abbots Langley, 12 acres in extent, where it is first treated in a large septic tank, holding 60,000 gallons, and then passed through continuous filters composed of beds of washed clinkers, broken to various sizes by means of automatic sprinklers supplied by Messrs. Hann, Baker, & Company. The effluent from these filters is then taken on to the land, which is of a porous nature, and well adapted for further filtration. The cost of the work was 20,000.

MISCELLANEOUS.

PROFESSIONAL FUND BUSINESS ANNOUNCEMENTS.—The partnership between Mr. W. Clifford Parnell and Mr. J. F. Fogarty, architects, has been dissolved, and Mr. Fogarty has taken into partnership Mr. George Brunell, A.R.I.B.A. The practice will be carried on as heretofore, at Belfast House, Gervis-place, Bournemouth, under the names of Fogarty & Brunell.—The *Sanitary Journal* has removed its offices to 13, Victoria-street, S.W.—Messrs. Johnson, Clapham, & Morris, of Manchester, manufacturers of steel concrete wire lattice, have opened London offices at Queen Anne's Chambers, Broad-street, Westminster, S.W.

IMPORTS AND EXPORTS OF CEMENT.—According to the Board of Trade's return of accounts relating to trade and navigation of the United Kingdom, the imports of cement for building and engineering purposes in the year ended December 31 last amounted to 234,588 tons, valued at 300,324*s.*, as compared with 272,945 tons, value 393,143*s.*, in the year 1904, and 261,077 tons, value 410,027*s.*, in 1903. The exports of British cement for the last three years have been as follows:—

	1903.	1904.	1905.
	Tons.	Tons.	Tons.
To Netherlands	2,471	5,311	12,292
U.S. of America	21,235	5,073	11,590

PILGRIMAGE OF THE ROMAN WALL.—The Newcastle Society of Antiquaries have resolved, in conjunction with the Cumberland and Westmorland Antiquarian and Archaeological Society, to repeat the decennial pilgrimage of the Roman Wall. The event is proposed to be held during the last week in June, and the entire length of the works, from Wallsend-on-Tyne to Bowness, will be examined on consecutive days. The annual report of the Council of the Newcastle Society of Antiquaries (established ninety-three years ago) contains the following reference to the matter:—The Council received a communication from the Cumberland and Westmorland Antiquarian and Archaeological Society as to the desirability of repeating the decennial "pilgrimage" of the Roman Wall, and they unanimously resolved to

act in conjunction with the Cumbrian Society in making necessary arrangements for the purpose. It was proposed to negotiate with a view to holding the pilgrimage during the last week in June next, and to examine the entire length of the works from Wallsend-on-Tyne to Bowness-on-Solway on consecutive days. This would count as the fourth of similar undertakings due to the initiative of the late Dr. Bruce. The first of these began on June 26th, 1849. After a lapse of thirty-seven years the project was revived, and a second expedition was organised, beginning on June 26th, 1886. Of this undertaking Dr. Bruce was announced as "chief pilgrim and expounder-general." After his death, in 1892, it was proposed to hold another pilgrimage at an interval of a decade, having it specially in view to commemorate thereby the distinguished services of Dr. Bruce as historian and elucidator of the wall. In this way the third of the series was begun on June 22nd, 1896. Another decade has now elapsed during which, as the results of further investigation, many new and important facts relative to the Roman occupation of these parts had yielded themselves to examination. The tenth anniversary of the pilgrimage of 1896, occurring in the present year might therefore be commemorated appropriately by a repetition of the journey, directed by the united Societies, who were the more specially and intimately concerned, inasmuch as the Roman Wall was within their province. Its investigation and elucidation is so remarkable a degree in the XVIIIth century by John Horsley, was notably continued in the XIXth century by two former secretaries of their own Society, John Hodgson and John Collingwood Bruce. By the last this had been done so conspicuously that he had identified himself with any reference to the Society and its popular association, Dr. Bruce would continue to be regarded as its "chief pilgrim and expounder." The commemoration of his great services would thus add a further interest to the projected pilgrimage of 1906.

THE CONDITION OF PUBLIC MONUMENTS IN EDINBURGH.—A meeting of the sub-committee of the Lord Provost's Committee of Edinburgh Town Council had under discussion on the 8th inst. Councillor Fraser's motion as to what should be done to restore and preserve the public monuments of the city. A report on the condition of the various monuments in the city, which was submitted, stated with reference to the Scott Monument that though the monument might be considered in fairly good order there were parts which required attention. The stonework would have to be carefully gone over, and any parts that required it judiciously painted. Owing to exposure the marble figure of Scott had not a granular surface, which would have to be removed by careful scraping or fling, after which the figure would have to be repolished. The same treatment would have to be given to the marble figure of Allan Ramsay, which, owing to its more exposed situation in Princes-street-gardens was black and discoloured in parts.

In connexion with the Burns Monument on Calton Hill, the report stated that the stone showed signs of increasing waste. Some years ago portions of the more delicate parts were found to be obliterated, and they were renewed with cement work. Now, however, it would be advisable to effect any renewals of this description by stone insertions. The Burns Monument, the Adam Black, Wilson, and Simpson memorials in Princes-street-gardens, it was further stated, would require to be thoroughly washed and polished; and the bronze figure and the granite stonework of the Prince Albert Memorial in Charlotte-square, the Chalmers, Pitt, and George IV. monuments in George-street, would have to be similarly treated. The Dugald Stewart Monument on Calton Hill was in need of attention, particularly the panel, and the inscription required recutting. A considerable amount of pointing required to be done on Nelson's Monument, but though some portions of the rock below it were found to be wasting, it was not necessary to deal with it at the present time. The Committee agreed to recommend in terms of the report, with the further recommendation that expert advice be taken as to the manner in which the marble figures of Scott and Ramsay should be treated.

MEMORIAL TO THE LATE MARQUIS OF WINCHESTER.—A memorial to the late Marquis of Winchester, erected by all ranks of the Coldstream Guards, was unveiled by General Sir F. Stephenson a short time ago at Ampert St. Mary church, near Andover. The memorial, which was designed and executed by Mr. Goscombe John, A.R.A., consists of a mural tablet in alabaster, with medallion portrait of the late Marquis, and into the design are worked angels with trumpets, the badge and motto of the regiment, and the arms and motto of the Paulet family. There is a suitable inscription in gold lettering, and the whole is surmounted with a bronze figure of a Crusader.

EDUCATIONAL POST-CARDS.—The publishers of the *Country Press* send us specimens of the first issue of their Educational Post-Cards, which form the commencement of a National History Series. The specimens sent give photographs of various

types of British ferns, several on each card, with number references and names in the margin.

HAMPSTEAD HEATH PROTECTION SOCIETY.—The Report of this Society for 1905 shows that it is keeping up its vigilance to prevent any injury to the character of the Heath. The Report was presented at the eighth annual general meeting on the 17th inst., at Stanfield House, Lord Mansfield presiding. Among other points, the Committee had suggested to the Loudon County Council that a greater vigilance on the part of the custodians would prevent much wanton damage to trees, shrubs, and flowers, and had called the attention of the Council to the deposition of clay and rubbish on the piece of ground adjoining the stream above the Hampstead Bathing Pond, and suggested that if that rubbish depository were retained in use it should be screened from sight by an irregular planting of gorse and hawthorn bushes. The Committee wrote to the Coal Smoke Abatement Society with reference to the daily emission of black smoke from a chimney-stack belonging to the generating-station of the Metropolitan Railway at Neasden, which was a detriment of the landscape seen from the crest of the Heath, and from Golders' Hill. The Coal Smoke Abatement Society had been some time watching this case, and, as soon as possible, took prompt action thereon, with the result that the railway company was fined. The Committee in October last considered the subject of the proposed erection of shelter seats on the Heath; that there is little or no demand or necessity for such structures, and that they would be objectionable on sanitary grounds, and be liable to misuse, and all of which were in agreement with them. The result was that the proposed donor of these shelter seats finally withdrew his offer, at the same time expressing his desire to serve the interests of the inhabitants of Hampstead, and the general visitors to Hampstead Heath.

INCORPORATED CHURCH BUILDING SOCIETY.—This Society held its usual monthly meeting on Thursday, the 15th inst., at 7, Dean's-yard, the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects:—Building new churches at Brentford, S. Faith, Middlesex, 225*s.*, and Hilderthorpe, Emswold, near Bridlington, 120*s.* in lieu of a former grant of 80*s.* towards rebuilding the church of S. George, Kendal, Westmoreland, 100*s.*; and towards enlarging or otherwise improving the accommodation in the churches at Huicknell Huthwaite, All Saints, near Sutton-in-Ashfield, Notts, 40*s.*, making in all 80*s.*; Streatham Hill, S. Margaret, Surrey, 150*s.*, in lieu of a former grant of 100*s.*; and towards enlarging the church of S. George, Kendal, Westmoreland, 60*s.* A grant was also made from the Special Mission Buildings Fund towards building a mission church at Cynllwyn-du, S. David, near Tylorstown, Glam., 50*s.* The following grants were also paid for works completed:—Manselton, S. Michael, near Bridlington, 150*s.*; S. Andrew, Usworth, Holy Trinity, Co. Durham, 35*s.*; Breton, S. Oswald, near Sandbach, Cheshire, 25*s.* In addition to this, the sum of 120*s.* was paid towards the repairs of eleven churches from Trust Funds held by the Society. The Annual General Court of the Society will be held at the Church of St. Dunstons, Westminster, on Thursday, May 17th, at 3 p.m., when the chair will be taken by His Grace the Lord Archbishop of Canterbury, President of the Society.

ROYAL SANITARY INSTITUTE.—The following is the list of Fellow, Members, and Associates elected during February, &c., *Fellow*—S. E. Burgess, M.Inst.C.E. (Borough Engineer, South Shields). *Members*—G. S. E. Andrews, M.Inst.C.E. (Town Engineer, Johannesburg); T. C. Aveling, A.M.Inst.C.E. (Birmingham); H. Chesson, D.P.H.Lond., M.R.C.S., L.R.C.P. (Clapham Park, S.W.); J. H. Frogley, A.M.Inst.C.E. (Bradshaw, Bolton, Lancs.); Miss E. Halsey (Sally, Birmingham); Miss A. E. Moss (Small Heath, Birmingham); Miss A. E. (Dartford, Kent); G. Pettit (North Kensington, W.); G. H. Reynolds (Ekestone); T. F. Roddick, M.D., LL.D.Edin. (Montreal, Canada). *Associates*—A. J. Abbott (Totnes); T. W. Andrews (Feignmouth); R. Basford (Plymouth); Miss A. M. Budge (Stone, Devonport); H. Brooks, (Gosport); T. W. Clarke (Horbury, near Wakefield); S. S. Dillingham (Luton); J. T. Durkin (West Hartlepool); W. Ellis (Wakefield); C. E. Hagley (Claremont, Cape Town); W. Hardy (Bradford); H. T. Hay (Grimsby); J. Herrin (London, S.W.); Miss A. A. Hogarth (Preston); W. H. Hughes (Stone, Devonport); Miss M. S. Jarvis (Moss Side Manchester); W. Johnson (Wallsend-on-Tyne); R. W. Kitchen (Manningham, Bradford); J. Lamond (Wallsend); I. C. Morrison (St. Albans); R. E. Price (Mold, Flint); A. Rance (Claremont, Cape Colony); Miss E. Reinherz (Bradford); E. G. Southon (Cranbrook); W. J. Slonewick (Boyle, Liverpool); L. Tat (Tilbrook Common, Northumberland); T. T. Tibbott (Plymouth); B. P. Tarrt (Kingsbridge, Devon); J. Turner (Waterfoot, near Manchester—W. W.

Walker (Fulwood, Sheffield).—At the twenty-third annual Congress, to be held at Bristol from Saturday to 14th, Sir Edward Fry, F.R.S., has consented to act as President. The Duchess of Beaufort will preside over the Ladies' Conference, and the following will act as Presidents of Sections:—*Section I.*—"Sanitary Science and Preventive Medicine," Sir William J. Collins, M.D.; *Section II.*—"Engineering and Architecture," Mr. Edwin T. Hall, V.P.R.I.B.A.; *Section III.*—"Physics, Chemistry, and Biology," Mr. W. N. Shaw, F.R.S.

PATENT OFFICE.—An open competitive examination for not fewer than twelve situations as assistant examiner in the Patent Office will be held by the Civil Service Commissioners in April next. The examination will commence on the 1st of the month, and forms of application for admission to it are now ready for issue and may be obtained on request addressed by letter to the Secretary, Civil Service Commission, Burlington-gardens, London, W.

BUILDERS' EXCHANGE, BIRMINGHAM.—The second of the series of the lectures at the Builders' Exchange, Birmingham, was delivered on the 15th inst. by Mr. B. Whitehouse (President of the Birmingham Master Builders' Association) presided, Mr. F. G. Whittall (President of the Midland Centre of the National Federation of Building Trade Employers) lectured on "The Housing Problem." He emphasised the necessity for the abolition of slums and for proper supervision of all property in which the very poorest are compelled to live. By the aid of modern slides he showed the condition of houses, exteriors and interiors, before and after repairs. He contrasted property in which landlords take an interest with that which landlords neglect; stating that if the landlords take no interest, neither will the tenants. The lecturer compared the conditions which obtain in Birmingham with those which obtain in German cities. In Germany, since the necessity for walled cities had disappeared, building operations had extended outside the city walls. The authorities retained the power to develop the land on definite plans, which embraced good wide roads as main thoroughfares, with narrower roads for inter-communications. They curved the line of the roads, as affording rest for the eye, and provided open spaces, the selection of which was governed by the prevailing direction of the wind, to secure an abundant supply of fresh air.

APPOINTMENT OF SANITARY OFFICERS.—The Local Government Board has sanctioned the appointment of Mr. J. W. Hall as sanitary inspector in the metropolitan borough of Hackney; and of Mr. J. H. Pearson as sanitary inspector in the metropolitan borough of Shoreditch. The Board has also sanctioned increases in the salaries of sanitary inspectors in the metropolitan borough of Deptford as follows:—Mr. J. H. Danson, Mr. J. V. Snowden, and Mr. J. Owen.

DISPLACEMENT OF PERSONS OF THE WORKING CLASS.—The Working Classes Committee of the Local Government Council brought up the following report at the meeting last Tuesday:—"In continuation of previous reports on the subject of the displacement of persons of the working classes in connexion with the development of private property, we desire to draw attention to clearances effected in the metropolitan boroughs of Finsbury, Islington, Edmonton, Lambeth, and Southwark. In Finsbury 43 houses containing 154 rooms forming a block between Ironmonger-row, Dingley-road, Lever-street, and Hull-street have been demolished, and it is estimated that about 265 persons of the working class have been displaced. As regards Holborn, we are informed that 9 shops with tenements over situated in Great St. Andrew-street and Great White Lion-street, Seven Dials, are about to be sold by public auction. The buildings contain 67 rooms, which were occupied by persons of the working class, of whom about 120 have been displaced, 10 others being under notice to quit. In Islington 15 houses have been demolished and 11 others are about to be demolished in Norfolk-street. The buildings contained 146 rooms, inhabited by about 216 persons of the working class, and it is proposed to erect upon the site working-class dwellings, containing accommodation for a number equal to that displaced. In Lambeth 9 houses containing 45 rooms in Chester-street have been demolished and about 70 persons of the working class have been displaced. On the site dwellings are being erected which will provide nearly double the accommodation contained in the old buildings. As regards Southwark, an important scheme for the reconstruction of working-class dwellings in Walworth-road is in progress. In all 100 houses containing 623 rooms in Hillingdon-street, Heiron-street, Jerome-place, and Kettle-place will be demolished, and about 617 persons of the working class will be affected. On the site it is proposed to erect 85 houses containing 170 four-roomed tenements, or 157 rooms more than were contained in the old houses."

BOURNEMOUTH AND DISTRICT MASTER BUILDERS' ASSOCIATION.—The eighth annual dinner in connexion with the Bournemouth and

District Master Builders' and Decorators' Association was held at the Princes Hall of the Grand Hotel on the 15th inst. The President (Mr. George Martin) occupied the chair. The loyal toasts having been submitted and duly honoured, Mr. C. W. Keep proposed "The Trades and Gouernment of the Borough," to which Mr. William Honre responded. The next toast—"The Mayor, Corporation, and Borough Officials" was entrusted to Mr. Fogerty, the Mayor and Councillor Doulsan responding. Mr. G. Shears gave the toast of "Kindred Associations," which was replied to by Messrs. Hasleley and Haydon. In submitting the toast of the evening, "The Master Builders' and Decorators' Association," Dr. Hosker said that he was sure that as an association they were desirous of protecting not only their own interests but of protecting the building trade as between employer and employed in the town. He felt certain that whatever might be their grievances they must feel that they had the respect of the Town Council, but he could never understand how it was that builders and architects were kept off the Building Committee, for they might just as well keep medical men off the Sanitary Committee. Surely the Town Council ought to make up their Committees of gentlemen who thoroughly understood the business before them. He believed that it had been very largely due to the enterprise of the builders of the town that Bournemouth occupied the very high position which it did at the present day. The Chairman, in responding, said that the Association was formed nearly nine years ago, during a time of stress and trouble, through carpenters having made a claim for an advance of wages. They all agreed with Trades Unionism, but they wished that Trades Unions would keep to their legitimate objects. They had no objection to paying a man what he was worth, but they did object to paying a higher rate of wage simply because that man belonged to a Trades Union. Speaking on behalf of the members of the Association, he believed, notwithstanding the bad repute in which builders stood in the minds of some people, that they endeavoured to carry out their undertakings in a legitimate and proper manner and according to the interpretation of the plans and specifications; and the good feeling which existed between the great bulk of architects and builders in the town was evidence of the fact that their efforts in that direction were to a very great extent successful.

OZONE GENERATORS.—Mr. J. Richardson Craig, of Glasgow, has sent us a pamphlet containing descriptions and illustrations of his patent ozone generators. Air is drawn or forced through the generator by means of a fan and ozone "is obtained by the silent discharge of a high-tension electric current." The test by Dr. John Clark, City Analyst, of Glasgow, shows that an appreciable quantity of ozone is generated by the apparatus, and it is said that Dr. John Glaister has expressed his approval of the system. Whether the generator will purify the air of buildings to the degree anticipated by the inventor is a point which can be settled only by a long series of experiments under normal conditions, and these experiments will doubtless be carried out in due course.

CITY POLYTECHNIC.—A scheme framed by the Charity Commissioners provides for the abolition of the City Polytechnic, which consists of the Birkbeck Institute, the City of London College, and the Northampton Institute, Clerkenwell. The last-named will constitute a separate charity, and will be administered as heretofore pending the settlement of a further scheme by the Commissioners; the two other institutions will be constituted as separate foundations, likewise, pending the issue of further schemes by the Board of Education. Meanwhile the whole of the endowments is to be applied to educational purposes only, and the Birkbeck Institute will change its name to that of Birkbeck College.

PATENTS TO INVENTORS.—Messrs. Percival Marshall & Co. send us a 3d. pamphlet on this subject, written by Mr. A. H. Stanley (Fellow of the Chartered Institute of Patent Agents), which contains short practical directions to those who wish to patent an invention, which, coming from a member of the representative body of Patent Agents, may no doubt be regarded as reliable. It is a pamphlet which intending patentees would do well to get.

CAPITAL AND LABOUR.

STATE OF THE BUILDING TRADES.—Employment in the building trades remained dull in January, and showed little change as compared with a month and a year ago. Returns received through the Trade Correspondent from 53 London employers showed that in the last week of January they paid wages to 9,961 workpeople of all classes, compared with 9,745 in December and 11,127 in January, 1905. Employment generally in London was rather worse than a month ago, and much worse than a year ago. Returns were received from Employers' Associations in 63 districts outside London. In three-fourths of these employment was reported the same as a month ago, and in one-sixth, including Halifax,

Birmingham, Swansea, and Aberdeen, it was worse than a month ago. Compared with a year ago, employment was reported worse in 25 towns, and about the same in 30; in 7 it was better.—*Labour Gazette.*

Legal.

SOUTHWARK PARTY WALL DISPUTE.—In the Chancery Division, on the 21st inst., the hearing of the case of Frederick Betts, Ltd., v. Piekfords, Ltd., was concluded before Mr. Justice Kekewich.

In this case the plaintiffs claimed an injunction to restrain the defendants, their servants and agents, from committing any trespass upon the walls of the plaintiffs' warehouse situated in Long-lane, Southwark, erected on land demised by the defendants to the plaintiffs by a lease dated October 28, 1903, and from converting any part of the walls of the warehouse into a party wall, and from doing any act or thing whereby the plaintiffs might be prevented from having the use of the walls of the warehouse as external walls. The plaintiffs further claimed a mandatory injunction restraining the defendants from permitting the walls on the defendants' land at the back of the plaintiffs' warehouse to remain connected with the plaintiffs' warehouse, and in particular from permitting the defendants' walls to remain so erected in such a way as to cause the wall at the back of the plaintiffs' warehouse, or any part thereof, to be a party wall, or to be other than an external wall, and directing or requiring the defendants to disconnect the walls on their land at the back of the plaintiffs' warehouse from the walls of the plaintiffs' warehouse where they had been connected by the defendants, and directing and requiring the defendants to restore the wall of the plaintiffs' warehouse to the state it was in before any such connexion was made. Plaintiffs also asked for an injunction restraining defendants from doing any act which might prevent or hinder the plaintiffs from enjoying their warehouse and the lights and windows at the back thereof according to the rights of the plaintiffs under the demise in the lease according to the terms and intention of the lease. There was also a claim for damages.

Mr. P. Ogden Lawrence, K.C., and Mr. R. J. Parker appeared for the plaintiffs; and Mr. Stewart Smith, K.C., and Mr. Leveson for the defendants. The facts of the case sufficiently appear from the following judgment.

His lordship, in giving judgment, said that the case arose in these circumstances. The plaintiffs were lessees of the defendants under a deed of October 28, 1903, which was a lease of land which at that time had some buildings upon it. The lease contained a covenant by the lessees to erect buildings of a certain description according to approved plans, those plans being in existence, and there being no doubt what they were. These plans showed a certain number of windows. They knew from the evidence that the plaintiffs stipulated for these windows, and that they stipulated for them for a certain purpose, and that the defendants knew why that stipulation was made. But he put that aside because it was sufficient for him to know that as a matter of fact the parties between the two parties was that the plaintiffs should erect buildings containing certain windows, the windows being an essential part of the approved plans. Therefore he thought that the special purpose for which the windows were required became immaterial. Then it was said that the defendants had acted in derogation of the grant and especially as regarded the grant of the windows, the right to open those windows, and the privilege of having light coming through them by what they had done. What the defendants were said to have done was this: The plaintiffs said that defendants by their acts had converted what ought to have been an external wall into a party wall within the meaning of sect. 5, sub-sect. 16, of the London Building Act, 1894, and the result of that was that the local authority was competent to demand, and it had demanded, these windows should be shut up. It was unnecessary to go into the question as to what was the foundation of the local authority's demand except that they said that if the wall was used as a party wall the windows could not be allowed to remain. It was said that that was a derogation from the defendants' grant. Assuming that what the defendants had done had made a party wall where it ought not to be, then they had led directly to the local authority's demand, which must be complied with, and so in that they seemed to his lordship to have acted in derogation of their own grant. He had said there was evidence to show that a special business was in contemplation, and that the windows were required by the plaintiffs for that business to the knowledge of the defendants. But he did not go on that. The defence was that you must regard any alleged derogation of grant with reference to all the circumstances under which the grant was made. What the defendants said was that the plaintiffs accepted the lease

with the obligation of building according to the plans, knowing that they were bound to build a wall separating the demised premises from the adjoining premises retained by the lessors, and that they must be taken to have known that there would be necessarily this external wall which must become a party wall. Defendants said that the plaintiffs knew there were to be buildings on the other side, and must have known that when the buildings were erected the dividing wall, at any rate, in all probability would become a party wall. Therefore, said the defendants, they must be taken to have made the grant or entered into the implied obligation derived from the lease with the knowledge that there would probably be set up a party wall, and that if there was a party wall the consequence would follow that the windows they had guaranteed could not be made. In the first place, he was not sure whether the plaintiffs ought to be treated as contemplating the existence of a party wall. He would take it that plaintiffs contemplated defendants would erect buildings, but he saw no reason for concluding that plaintiffs knew that defendants would use their wall so as to make it a party wall. The next thing the defendants said was that they had taken the ground by virtue of a contemporaneous agreement with the lessor, and when they came to do that they found overhanging the demised ground some beams which belonged to the remaining building which to some extent had to be pulled down in order to clear the ground. Defendants said they did not take them away without the consent of the plaintiffs' architect they were allowed to be built into their wall. The same was true of the stanchions and purlins left on the ground on the plaintiffs' side of the wall. Defendants said they were willing that they should be built into the wall, and that they did not want to remove them. They said they had done nothing by which they could be treated as trespassers. To his lordship's mind defendants were using the property they had demised to the plaintiffs and occupied it for their stanchions and purlins, and in respect of which the plaintiffs were entitled to relief. They were using the plaintiffs' property for unauthorised purposes which seemed to be a trespass the court could remedy. Then, defendants said that if they did it they did it with authority. All that could be said to support that was that plaintiffs' architect and defendants' architect agreed between them that the purlins and stanchions should be built into the wall. But plaintiffs' architect did not communicate that to his clients, and allowing that to be done was clearly outside the scope of his authority. He had no authority to allow the slightest deviation from the plans. There was only one other important question. Down below the ground on the other side of the wall in question were stables used by the defendants, and they used the wall between their stables and the plaintiffs' premises, the wall being on the plaintiffs' ground. That might or might not make it a party wall, but he did not decide that. He would assume that using it in that way was using it as a party wall. If the defendants desired to use the adjoining premises for stables or any other purpose they could make their own retaining wall. They had no business to use the plaintiffs' wall. As soon as the plaintiffs knew of it they protested and said it must not be used in that way. There was a question raised about a breach of the covenant for quiet enjoyment in the lease, but his lordship did not think there had been any breach. He need not say anything more about that, because he gave the plaintiffs what he thought was right on the other ground. In the result, his lordship granted an injunction in the terms of claim 1 of the statement of claim, viz., restraining the defendants from injuring or committing any trespass upon the walls of the plaintiffs' warehouse, and from converting any part of the walls of the warehouse into a party wall, and from doing any act or thing whereby the plaintiffs might be prevented from having the use of the walls of the warehouse as external walls. He also granted the plaintiffs an inquiry as to damages and gave them the costs of the action.

ACTION AGAINST AN ARCHITECT AND SURVEYOR.

The case of Southorn v. Wakerley came before Mr. Justice Farwell in the Chancery Division on the 13th and 14th insts., an action by the plaintiff, Mr. Henry H. Southorn, of Leicester, against Mr. Arthur Wakerley, an architect and surveyor, of the same town, to set aside an agreement of sale by the defendant to the plaintiff of a piece of building land.

Mr. C. E. Jenkins, K.C., and Mr. T. K. Crossfield appeared for the plaintiff; and Mr. W. H. Upjohn, K.C., and Mr. Wurtzburg for the defendant.

It appeared from the statement of Mr. Jenkins that the plaintiff claimed to set aside the sale to him by the defendant of a piece of building land forming part of a building estate known as the Evington-road estate at Leicester on the ground that it was subject to a right of way across it of

which the plaintiff had no knowledge and which was not communicated to him by the defendant. The defendant had acquired this building estate and got out plans and particulars showing the road or roads made or proposed to be made, and the plots into which it was divided, and he advertised it as a building estate and represented to the plaintiff that it was suitable for building purposes. The purchase executed by the plaintiff and the conveyance executed by the defendant were entered into a building agreement with a Mr. Skillington to erect a private dwelling-house, with stabling and other buildings, upon the building plot. The house and buildings were commenced and the building operations were continued until April 7 last, when the walls had been raised to the height of several feet. On April 7 several men acting on behalf of the owner of an estate adjoining the Evington-road estate entered the building plot, pulled down part of the dwelling-house and buildings in course of erection, and drove a horse and cart over a portion of the building plot, including the site of the dwelling-house and buildings, and back again, alleging and claiming that this gentleman, as owner of the adjoining estate, had a right of way over a portion of the building plot, including the site of the dwelling-house. It appeared that the right of way claimed had existed for many years, and by reason of that right of way the plaintiffs' building plot was not capable of being built upon as proposed under the building agreement had to be discontinued. The plaintiff accordingly brought the present action, claiming repayment by the defendant of the money paid by him with interest and a declaration that he was entitled to a lien on the building plot for the said moneys and interest.

After hearing the evidence of the defendant and other witnesses, his lordship held that the plaintiff had not proved his case, and dismissed the action with costs.

CLAIM THROUGH DEFECTIVE SCAFFOLDING.

The case of Tozeland v. The West Ham Union came before a Divisional Court of King's Bench, composed of the Lord Chief Justice and Justices Ridley and Darling, on the 14th inst., on the appeal of the plaintiff from a decision of the judge of the Shoreditch County Court.

The short facts of the case were as follows:—Tozeland, a box-maker by trade, was a pauper inmate of the defendants' workhouse, and upon the electrical engineer asking for an assistant to do some work was assigned to do it by the labour master. In order to execute his work plaintiff had to go upon a scaffold, which was held by the said County Court judge to have been negligently constructed, and in consequence plaintiff sustained a fall, and was so injured that one of his legs had to be amputated. The plaintiff claimed 100l. damages, which the County Court judge held to be proper damages, but although holding in the plaintiffs' favour on every other point the learned judge came to the conclusion that he could not recover because he was in a common employment with the person responsible for the erection of the defective scaffolding.

Mr. Wallace, K.C., and Mr. Abinger, appeared for the appellant; and Mr. Avory, K.C., and Mr. S. Lynch, for the respondents.

In the result, the Lord Chief Justice, in giving judgment, said it appeared to him that the County Court judge overlooked the broad consideration which was at the root of the common employment doctrine, viz., that the servant had an option of entering into the contract or refusing employment. The plaintiff if he did not do this work was subject to punishment. He thought the appeal should be allowed and judgment entered for the plaintiff for 100l.

Justices Ridley and Darling concurred, and the appeal was accordingly allowed with costs.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

2,495 of 1905.—C. E. LONG: *Latch or Latch Lock for Doors, Hinged Panels, Sliding Partitions, and such like.*

This relates to a pivoted or swinging bar latch, provided with a key operated mechanism for locking it in its fastened position, and consists in arranging the said key operated mechanism as a part of the stationary pivot or mounting for the swinging bar, and providing the said bar so that it can be engaged by the bolt of the said mechanism when in its fastening position, the said bar thereby not having as part of it any of the key operated mechanism.

5,248 of 1905.—D. M. NESBIT and ASHWELL & NESBIT, LTD.: *Radiators.*

This relates to a radiator for heating buildings and like purposes, and consists in having a baffle plate placed longitudinally between the radiator

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

columns so that the air to be heated is spread over the surface of the radiator columns and thereby thoroughly heated.

5,428 of 1905.—W. H. TURNER: *An Appliance to Regulate the Supply of Water to Water Waste Preventing or other Cisterns or the like.*

This relates to an appliance to regulate the supply of water to water-closets, preventing or other cisterns or the like, and consists of a ball made in two parts, one being connected to and above the other part by means of a pin at one end, and provided with a regulating screw passing through a slot in the upper part into a hole tapped to receive it in the lower part, the end being enlarged to allow for hole in same. The two parts when adjusted form one lever.

5,513 of 1905.—R. ZELLENSKA: *A Cementing Material and the Manufacture of the same.*

This relates to the manufacture of cementing materials such as have hitherto been composed of sulphur melted to a thin liquid, sand, reduced iron, and colouring matter, and consists in the use of ferrous sand foundries or sand from iron or steel fettling or the like operations, in lieu of ordinary sand and reduced iron.

7,372 of 1905.—W. A. McCORMICK: *Siphon Flushing Cisterns.*

This relates to a flushing device having an oscillatory plunger, and consists in the combination of a wide sunk portion to the chamber forming the lower portion of a cistern, and a siphon communicating with that sunk portion of the chamber and opening into same, so that water can only pass into the siphon one way.

7,502 of 1905.—F. GRIFFITHS: *Flushing Cisterns for Water-closets, Urinals, and like purposes.*

This relates to a siphon-flushing apparatus, and consists in the combination with a main cistern filled from the supply valve, and a supplementary cistern filled by the water overflowing into it from the other, of a non-return valve in the bottom of the supplementary cistern arranged to enable water to be emptied from it into the other when the siphoning action is started, and to prevent it running back, and a secondary overflow in the wall of the main cistern slightly above the level of the overflow, and a siphon, the under side of whose bend that leads into the outlet pipe or discharge being slightly above the secondary overflow but below the top of the cistern.

8,356 of 1905.—DORRATOR CO., LTD., W. W. MORRISON, and J. BAIRD: *Fire Grates.*

This relates to a fire grate, and consists in the combination therewith of side standards with frontal stops and oblique slots, each slot having two pockets, a firebreast with side pins and frontal spurs united to a bottom grate, the grate and breast being adapted for simultaneous oscillation within the firebraces, an ash pit frame with ledges and bottom closed by a damper, a front plate having a fresh-air damper opening, and a hopper containing trivet seats and a trivet with pendant prongs.

11,719 of 1905.—J. ALTY: *Water Waste Preventing Valveless Siphon Cistern for the Flushing of Water-closets and the like.*

This relates to a water waste preventing valveless siphon cistern for the flushing of water-closets and the like, and consists in the introduction of an upper dome top cylinder, and the method of connecting the discharge outlet of the cylinder to the centre of the same, by which means or arrangement a better water way is given to the siphon and which arrangement also reduces the friction in the flow of the water.

13,644 of 1905.—W. J. BEASLEY: *An Iron Drain Pipe Stopper.*

This relates to an iron drain pipe stopper, and consists of a stopper or plug of a thickness and diameter made to fit the standard sizes of earthenware and iron drain and other pocketed pipes, and which is cast in one piece of a specially tapered form, the thicker end being surmounted by an inverted groove of a section suitable to the size of the plug. The upper or outer surface of the plug is provided with a square stud, which may be either cast on with the plug or otherwise screwed in position as may be most convenient, to which is attached by a suitable bolt and washers a spring lever.

14,416 of 1905.—N. BURGER: *Pneumatic Door Closing Apparatus.*

This relates to a pneumatic door closing apparatus and is characterised by the use of two pistons in two separate cylinders mounted on one base, the main piston being coupled by means of a lever and a toothed segment, provided on one end of the said lever, and the side piston formed as a track and acted upon by a spiral spring, which can be regulated by a screw. When the door is opened the lever connected by a rod with the door is swung round, whereby the main piston draws forward, and presses back by means of the toothed segment, the side piston at the same time compressing the spiral spring while the automatic screw in position as may be most convenient, to which is attached by a suitable bolt and washers a spring lever. When the door is closed the door is swung round, whereby the main piston draws forward, and presses back by means of the toothed segment, the side piston at the same time compressing the spiral spring while the automatic screw in position as may be most convenient, to which is attached by a suitable bolt and washers a spring lever. When the door is closed the door is swung round, whereby the main piston draws forward, and presses back by means of the toothed segment, the side piston at the same time compressing the spiral spring while the automatic screw in position as may be most convenient, to which is attached by a suitable bolt and washers a spring lever.

lever by turning the toothed segment and thereby pushes back the air piston to its former position.

18,162 of 1905.—A. BELL: Fireplaces having Circulating Hot-water Boilers.

This relates to a fireplace having a circulating hot-water boiler, and consists in the combination with such boiler of a setting adapted to receive the grating, and having a chamber formed therein with inclined back and removable door.

18,572 of 1905.—J. DELPORTE: Roof Framings.

This relates to a roof framing of the Raikien type wherein the two sides or slopes of the Raikien type supported upon a triangular beam composed of three stays connected together by bracing.

19,929 of 1905.—A. BELL: Kitchen Range Fittings and their Attachments.

This relates to kitchen range fittings and their attachments, and consists in making the hinges and latches or other similar parts as plain in shape as convenient, and forming at the rear side of said parts one or more bosses or projections, which shall pass through holes formed in that part of the door or grate to which they are to be attached. In these said bosses holes are drilled and tapped so that upon the inner side a pin and washer may be employed to secure the said fittings firmly thereto.

22,920 of 1905.—A. H. MARTEL: Travelling Greenhouses.

This relates to a travelling greenhouse, and consists of concrete walls formed of spaced blocks of concrete having grooved sides to receive the ends of a connecting valve of concrete, and of means for keeping out the draught, the said means consisting of a plate of metal placed between the castings carrying the wheels on which the greenhouse travels.

1,554 of 1905.—R. F. HUNTER: Methods of Construction as Applied to Roofing and other Structural Purposes.

This relates to the construction of roofs, walls, and the like structural work and consists in the combination with principals or main rafters consisting of rolled girders, of sheathing with scroll-sheathed dependent extensions adapted to be threaded thereon and panels or tiles interlocked therewith, by means of returned edges.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office in any part of the United Kingdom at the rate of 10s. per annum (62 numbers) PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, etc., 20s. per annum.

Includes the £53 provisional for extras.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications, and the Editor cannot be responsible for any loss of articles, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is strictly subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a copy of an article in type does not necessarily imply his acceptance. The Editor cannot undertake to read and consider articles offered for acceptance unless they are type-written.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach not later than 10 a.m. on Thursdays. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100l., unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

Report of the London Traffic Commission.—III.

WO further volumes, which were published on Monday, complete the Report of the "Royal Commission on London Traffic," with the exception of Vol.

IV. still to be issued, and to contain evidence and documents furnished to the Commission by engineers and public authorities in the United States and on the Continent. In large measure the new volumes—Nos. V. and VI.—serve the purpose of illustrating the publications which have been discussed in our previous articles.* But they go considerably beyond the scope of the material already made public, being particularly intended to present, in a convenient form, for the use of the proposed Traffic Board, the chief facts and suggestions placed before the Commission relative to London traffic.

The volumes consist almost entirely of plans, diagrams, drawings, and views to the number of more than one hundred, selected from several hundreds of the same kind, either prepared by the Commission or furnished by witnesses, other than American and Continental witnesses. Each volume is provided with an exhaustive index, which facilitates the reference of plates to the evidence printed in Volumes II. and III. of the Report, a

* Nos. I. and II. appeared on July 22 and 29, 1905.

feature which should be appreciated by all who may have occasion to study the subjects therein considered.

From this introduction it will be clear that while no new recommendations are contained in the volumes now made public, it would be a mistake to consider them simply as illustrations to the previously issued portions of the Report. Those who, like most of our readers, are accustomed to the interpretation of plans and diagrams, will find in Volumes V. and VI. a wonderful amount of valuable information, expressed in graphic manner, and far more easy of assimilation than if it were in letterpress.

Among the most important of the plans are those bearing upon the relation of passenger traffic to the form, area, amount, and density of population of various districts. Plate A illustrates the radial expansion of the metropolis, and includes the boundaries of the City, the Administrative County, the Metropolitan Boroughs, and parishes within a radius of 20 miles from Charing Cross. All railway and tramway routes, areas, and populations within the 20-mile radius are clearly indicated, and in the fact that the area in question includes a total population of more than seven million inhabitants, there is ample proof of the necessity for efficient and centralised supervision over all matters connected with the traffic problem. But the mere statement that some seven million persons are congregated in a circular area of 1,600 square miles is not sufficient to make clear the difficulties which have to be dealt with. The density of population in

different localities is a far more potent factor, and this is represented very clearly in Plate VII., prepared from the census returns by Mr. Edgar Harper. Examination of the data here given shows that while the average density in the outskirts of Greater London is only about five persons per acre, the rate increases up to 200 persons per acre in districts such as Southwark, Finsbury, Shoreditch, Bethnal Green, and Stepney. It would not do, however, to stop here, for even in the central districts of London there are many open spaces, represented by public streets, squares, railways, canals, churchyards, and recreation grounds, and there are also other areas, small individually but large in the aggregate, which are more or less unpopulated. In Paris and some other cities accurate measurement is taken of all such areas so that the real density of urban population can be determined. To fill the gap in our own statistical records, Plate CVI. was prepared by Mr. Harper at the request of the Commission, showing in different colours the various classes of property and open spaces in Central London. The relevancy of this plan may be gathered by a comparison of the population density given by the census returns and those calculated upon the basis of "residential" and "commercial and residential" property as represented in the plan. Thus, while the census returns give the density of the population in the City, Finsbury, St. Pancras, and Holborn, at 40, 172, 87, and 147 persons per acre, respectively, the densities in the net areas of the same districts, as shown by Plate

CVI., are respectively 1,140, 530, 523, and 484 persons per acre. These are eight populations in each case, and if the day population of the City be taken on the net area the density is found to be no less than 848 persons per acre.

From the standpoint of hygiene it is satisfactory to find in the foregoing figures practical testimony to the collective magnitude of the more or less open spaces in thickly-populated parts of London. Considered in connexion with the housing problem the corrected densities are of some importance, but they do not seem to affect the question of traffic facilities very much, except perhaps in one or two districts where the open spaces are proportionately large. Of course, the dense population of the central districts gives rise to a large demand for means of locomotion other than walking, despite the fact that the bread-winners are in the minority, and the presumption that residence in such districts is dictated by the necessity of avoiding journeys to and from work.

Mere statistics of population, however, do not assist the traffic reformer very much unless considered in connexion with records such as those given in Plate VI., which shows the development of internal passenger traffic in Greater London from 1867 to 1902. In the former year, when the population was 3,605,510, the number of journeys was about 23 per head, and in the latter year, when the population was 6,702,063, the number of journeys had increased to nearly 140 per head. No doubt a large proportion of the increase is due to the growth of residential suburbs and the remainder to the temptations offered by improved means of local transport. This diagram indicates clearly that railways have not been responsible to a preponderating extent for the growth of travelling, inasmuch as local railway journeys in 1867 were at the rate of about 12 per head, and in 1902 not more than 41 per head. On the other hand, omnibus and tramway journeys have risen from 10 per head in 1867 to more than 93 per head in 1902. In fact, the omnibus services carry as many passengers as all the local railway lines, and the tramway services carry 50 per cent. more. When we remember that the railways, tramways, and omnibuses of London carry in one year a number of passengers equal to three-quarters the population of the entire world, it must be recognised that transportation on so huge a scale is not a matter that should be left entirely to private enterprise, and the absolute necessity for a central board of traffic is clearly brought home.

From the figures quoted above it is manifest that, up to 1902 at least, railway companies have failed to take their due share in providing means of transport for the growing needs of the metropolis. As we all know, their efforts have been chiefly directed towards opening up fresh districts in the outskirts to the dismay of old inhabitants and the general good of the community. We do not blame the promoters of railway lines for the lack of new routes within the more thickly-populated areas of London. That there has been a widespread desire to construct railways in the district is proved by Plates B. C., LXXVIIA., and LXXVII B. The last two plans, prepared by Sir Henry

Oakley, show all the railway proposals submitted to Parliament between 1855 and 1885, and between 1885 and 1903 respectively. Although these projected lines were not laid out in accordance with any scheme of co-ordination, some of them demonstrate in a remarkable manner the partiality of early promoters for routes still much in need of railway facilities, and the plans are most valuable because they give in ready form information much in request during Parliamentary inquiries, and of which no other public records are available.

The circumstance that railway routes have not developed at the same rate as omnibus and tramway services may be accounted for by three reasons:—(1) The difficulty of getting Parliament to do or sanction anything; (2) the persistent and sometimes combined opposition of existing railways to any prospective rival; and (3) the heavy cost of construction in a city where the price of land is almost prohibitive.

Tramway undertakings have also been handicapped, but not to the same extent, and the entrance of the London County Council into the ranks of tramway promoters has given a great impetus to the expansion of this class of traffic facilities. Omnibus proprietors, of course, are in an exceptionally favourable position. They require no Act of Parliament, no opposition can be raised to their projects, and the public streets provide a gratuitous and ready-made permanent way. So the omnibuses of London have flourished until they have become at once a great boon and a great nuisance, carrying annually a number of passengers equal to more than seven times the population of the United Kingdom.

The approaching completion of some valuable tube railways will do something to adjust the balance between railway and street traffic, but it does not seem likely that many new railway projects for central London will be sanctioned until Parliament has dealt in some way with the Report of the Traffic Commission.

In the meantime, there is ample scope in the outlying regions for the display of energy by existing railway companies. The great service rendered by suburban lines is shown by a series of four most instructive plans included in Plate LXXX., specially prepared for the Commission by Mr. R. W. Perks from old maps and other materials in the British Museum. These plans illustrate in four separate stages the railway route mileage, the population, and the area of land built upon in 1845, 1860, 1880, and 1900. They indicate in an unmistakable way the connexion between building development and the growth of railway facilities. From 29.75 miles in 1845 the route mileage rose to 248.5 miles in 1900—an increase of over 700 per cent. in fifty-five years. At first appearing like a small island in the middle of the present Administrative County of London, the built-up area in 1900 resembles a huge blot covering almost all the county, with large splashes outside something like an advertisement of writing-ink. To those familiar with the environs of London for a distance of 12 miles round the four plans constitute a very interesting study. Among other things they make clear the comparatively slow progress of building in semi-rural

parts where railway services are notoriously bad, and the correspondingly rapid development in parts which are served by railway companies who have kept abreast with the times. They also serve to indicate districts where little or no building has taken place, thus suggesting to land owners and railway companies directions in which judicious enterprise might be undertaken for personal advantage with the ultimate effect of relieving congestion in the centre of the metropolis.

Plate F., prepared by the Commission, evidently as the result of laborious research, throws vivid light on the interconnected problems of housing and transport for the working classes. This plan, in three large sheets, shows the principal factories in and around the metropolis, together with the number of hands employed. It indicates in a striking manner the grouping of certain trades in different districts, and the attractive force of the Thames and other waterways, although this manifestation is by no means so marked as one would expect. The most remarkable feature of the plan is that the bulk of the factories are clustered between Westminster and Poplar in an area measuring about 4 miles from east to west, and some 3 miles from north to south. Beyond these limits, which include the heart of London, clusters give place to scattered groups and isolated dots.

The plan brings home anew the truth that, in spite of vast mercantile and residential districts, Central London is still a large manufacturing town. So long as factories remain in the inner region so long will thousands of working men continue to live near their work, whatever may be done in the way of providing cheap and rapid means of locomotion to tempt them away to more pleasant and more healthful neighbourhoods.

Workmen's trains and trams already convey enormous numbers of working men to and from the central and outlying factories. The number of passengers is on the increase, but not at such a rate as to reduce materially the density of population in such districts as Bethnal Green, Stepney, Southwark, and Bermondsey. Some day, perhaps, large factories will be eliminated from parts of the metropolis where land is most valuable. In the meantime manufacturers cling to the old sites, and, so far as one can judge by Plate F., the proximity of railway goods depôts possesses far greater attraction than the riverside and the low-priced open lands of Essex and Kent. This plan may be usefully examined in connexion with Plate E., showing the position of the various goods depôts in London.

The growth of mercantile London, the distribution of cheap electric power in the Home Counties, and extended railway facilities for goods traffic, may in time combine to push and pull many of the existing factories out of the central districts. But their place will be taken by other industries and businesses requiring manual and other labour, and we shall always be faced with the problem of conveying many thousands of men and women to and from a crowded city. The work of filling and emptying a great hive of industry every day is in itself a

sufficiently serious undertaking, and when we add to it the necessity of increasing means of transport so as to entice many thousands more to live at a distance from their work, the task becomes more serious still.

Very little consideration is needed to prove that radial roads are required to assist the daily migration between every point of the compass and the business centre. However inadequate they may be at the present time, the main highways and railroads of London run generally in the right directions for the conduct of the daily centripetal and centrifugal traffic, and it is a fortunate thing that the early morning immigration takes place before the local traffic of the centre has fully awakened. The evening exodus, again, is facilitated by the different hours at which work ceases in different classes of industry and business. Notwithstanding the preponderance of the great wave which floods and leaves bare the centre of London at the beginning and end of every day, there is a constant inward and outward flow of business people whose daily course of duty is not guided by the rising and setting of the sun, and of visitors to town bent on business or pleasure, and, in addition, there are constant streams of local and through traffic from north to south and east to west. Again, armies of commercial travellers, workmen, and others start out for various districts very soon after arriving at their first destinations, and those who remain in the business centres begin to move ceaselessly from point to point. All these movements taken together provide ample supplies of passengers for long streams of omnibuses and trams, which continue to monopolise the streets throughout the day. Hence, while radial roads and railways may provide admirably for traffic connected with the social aspects of the problem, they are less useful for local traffic in the central districts, and particularly for what may be termed cross-country communications.

Nothing is more easy than the formulation of a scheme on paper to improve the highways of the metropolis. Several witnesses examined by the Commission brought forward schemes for the construction of new highways on an extensive scale. Most of these proposals are centuries too late, for they could only be realised at fabulous cost under existing conditions. As heroic projects of the kind are practically out of the question, the most that can be expected is the gradual improvement of streets on the lines adopted in the past by the City Corporation, the Metropolitan Board of Works, and the London County Council. The advantages derived from the work accomplished by these bodies within the last half-century are too well-known to need recapitulation. Still, Plate IV., showing the chief street improvements effected at a cost of more than 16 millions in London during the past fifty years, is worthy of examination. Plate XC. indicates the admirable improvements carried out by the City Corporation since 1825, at a cost of 5 millions, and demonstrates in a striking manner how much can be accomplished by a definite and consistent policy, without serious disturbance of property.

Various plans and statistical diagrams

relative to traffic are presented in the new volume of the Report. One of the most instructive is Plate VIII., showing the routes of all metropolitan omnibuses and the frequency of the services. The plan makes very clear the immense convenience offered by the omnibus companies, and at the same time the enormous amount of street area occupied by their vehicles. For instance, a passenger in Oxford-street has a choice of twenty-nine routes to different parts of London; in the Strand twenty-three, in Whitehall twenty-two, and in Piccadilly eighteen routes are open. Probably no other city in the world has more convenient facilities for local traffic than these. Unfortunately, the omnibuses take up far more room than can be spared. This is shown at a glance by the plan. At busy times 642 omnibuses pass the Bank an hour, through Oxford-street and Piccadilly the number is 400 an hour, and along other important thoroughfares 200 an hour is a fair average. The omnibus cannot be abolished, although it may be improved, and the problem of providing adequate space for this class of vehicle in addition to other traffic is one that presents serious difficulty.

From details contained in Plates XXXIII. A-1, it appears that the volume of vehicular traffic is fairly constant, or at any rate far more constant than that of foot passengers. The number of vehicles traversing any given thoroughfare does not by itself convey any definite meaning, and, to enable data for computations as to the density of traffic, Sir Alexander Bruce has prepared Plate XXV., giving the actual and relative widths of fifty-one important streets and roads in London. Only thirteen of these reach the width of 50 ft., seven of them being under 60 ft., and six over 60 ft. wide. To these must now be added Kingsway, with a width of 60 ft. The points where congestion is most painfully evident are already pretty well known to Londoners, but for the purpose of recording the facts, Plate XXIII., prepared by Mr. Riley, architect to the London County Council, indicates more than thirty points of maximum congestion. Four other plates set forth the pressing needs of Westminster, Stepney, Shoreditch, and Southwark in the direction of street area. The relief works suggested in the last five plans would fill a sufficiently long programme, and some of the more urgent might well be undertaken as a prelude to anything of ambitious character.

One point that cannot be overlooked is that at present the public are entitled to use the streets for trade as well as for locomotion. The unrestricted employment of busy thoroughfares for the loading and unloading of goods at all hours of the day is a practice that demands regulation without delay. Some photographs in Plates XLV.—XLVIII. show how various streets in the City are blocked all day long by vans. In certain streets fully 50 per cent. of the width is occupied in this way, and in others unhorsed vans of market produce are allowed to occupy half the roadway—a most economical method of securing a substitute for yard and warehouse accommodation. Other photographs published, indicate the obstruction caused by the drivers of

heavy vehicles by the erection of lamp and tramway columns along the middle of the road, by the establishment of tramway termini in crowded streets, and by the breaking up of road surfaces for attention to pipes and ducts. These are all matters which the Commission recommended should form the subject of immediate attention.

With regard to pipe subways London is undoubtedly much behind foreign cities, for, as indicated by Plates XVII. and XCV.—XCVIII., only fifteen streets in the whole of the metropolis have provision of the kind. The drawings in Plate XCVIII. of the Arthur-street East subway, built in 1887, represent an excellent design, and Plate C., prepared by Mr. H. E. Jones, embodies a useful method of connecting house service pipes with a minimum amount of public inconvenience.

Among the remaining plans contained in the volumes a few more relate to schemes and proposals advocated by witnesses as likely to reduce congestion of traffic in particular localities. The most useful idea of the kind is one submitted by Sir Henry Knight on behalf of the City Corporation for relieving the streets of much heavy traffic to and from metropolitan goods depôts and factories by the construction of a railway connecting all the goods depôts of existing railways. To some extent the purpose here mentioned may be fulfilled by the Outer Circle Railway, if the Bill now before Parliament should become law.

Consideration of the plans and diagrams relating to London highways and highway traffic leads inevitably to the conclusion that existing radial thoroughfares have almost reached the limits of their capacity in the older suburbs, and have quite done so in the busy centre. The substitution of motor-driven for horse-drawn omnibuses will give increased carrying capacity, and the continued extension of tramways will have a similar effect. Still, these developments cannot make the present main routes capable of rendering sufficient aid to schemes for housing the masses in the semi-rural outskirts. Nor will they do all that is wanted to facilitate transit across and in the central regions of London.

Therefore, the most pressing need is for measures calculated to add to the carrying capacity of existing main and auxiliary streets and roads, and to encourage the development of new neighbourhoods.

The chief proposals made to the Commission for tramway extension will be found in Plate XLIV., indicating the manner in which Mr. Stephen Sellon suggests that the tramways in the central area should be linked up to form a connected system. It will be remembered that some of Mr. Sellon's proposals were endorsed by the Advisory Board of Engineers and by the Commission, with the proviso that certain lines should be constructed beneath the surface. The Westminster Corporation also advocate shallow subways for tramway lines, and our readers will find in Plate XXXV. a series of valuable drawings representing a subway beneath the Strand with accommodation for two tramway tracks, to which access would be gained at almost every street corner through shops, so

as to obviate obstruction to pedestrian traffic. The subway also provides for the accommodation of pipes and ducts. Duplication of the Strand, Fleet-street, Ludgate-hill, and Cheapside in this way would be a great boon, and deserves consideration. The difficulties, however, would not be small, as demonstrated by Plates XXXIV. and XXXV., prepared by the Westminster Corporation, and Plates XCI.—XCV., prepared by the City Corporation, these plans showing the astonishing network of pipes, drains, sewers, and cables beneath the streets between Charing Cross and the Bank. To deal with these means much outlay, and the cost of the undertaking would be increased by compensation to property-owners whose vaults and cellars in some places absorb the greater part of the area below the streets.

Low-level tube railways already completed, under construction, and projected are shown in plans included in the new volumes. Although this method of transit is not universally popular, plenty of passengers will always be ready to avail themselves of it, and there is reason to believe that the tube boom will be revived as soon as Parliament has decided upon a definite course of action with regard to the Report of the Traffic Commission. The most interesting drawings in connexion with railways of the kind are to be found in Plate LXXIV., wherein Mr. Francis Fox takes various lines across London, and from the results of trial borings traces the depth of blue clay below the surface, the average on the selected lines apparently being about 30 ft.

That the creation of new tube railways is not likely to make a permanent reduction of omnibus traffic seems to be shown by diagrams relative to the Central London Railway, furnished by Sir Henry Oakley. Along the route of that line the omnibuses attract short distance passengers and the railways attract those who have longer distances to travel. New tubes will certainly be appreciated by people wishing to get across London more rapidly than at present. The effect will be to relieve surface vehicles of some passengers and to make room in the same vehicles for others who are now obliged to walk.

Many suggestions for new railways were put before the Commission, among these being a carefully-prepared scheme in Plate LXXXV. for a connected system of urban and suburban tube railways. This and other proposals should be of use for the guidance of railway promoters and the authority by whom new projects will have to be sanctioned.

As we have shown, the matter in Volumes V. and VI. of the Report illustrate almost every phase of the traffic problem, and by the concentrated manner in which the information is presented they serve to emphasise the necessity for the creation of a competent tribunal to whom all matters connected with metropolitan traffic should be referred, and upon whom ample powers should be conferred, so that projects calculated to benefit the people of the greatest centre of population in the world may be approved, if found good, without the disastrous delay, obstruction, and cost attending the process of obtaining Parliamentary sanction in existing circumstances.

NOTES.

NO ONE has a greater admiration than we have for the architectural learning and power of delineation shown in the paintings of Sir L. Alma-Tadema, who, if he has not exactly taught us any facts about Greek and Roman architecture, has certainly added to our comprehension of its effects. We cannot but feel, however, that it was not the turn of a painter this year, and that the Council have shown rather a strange forgetfulness of the claims of one group of professional architects. The medal is stated in the Calendar to be conferred "on some distinguished architect or man of Science or Letters, who has designed or executed a building of high merit, or produced a work tending to promote or facilitate the knowledge of Architecture or the various branches of science connected therewith." It is of course under the latter definition that an eminent painter must come, and it may very well be argued that to have painted architecture well is as good as to have written about it well. But practising architects have the first claim, and it has been usual to give the medal to a practising architect for at least two years in succession, before breaking away again from the professional list. It was given to an English architect in 1902, to an American in 1903; to a distinguished writer on architecture (M. Choisy, who is not an architect) in 1904; to a distinguished English architect last year. It should now be the turn of a distinguished foreign architect; but we should have made no comment on the subject but for the singular ignorance or forgetfulness which the Council seem to be under in regard to the claims of French architects. It seems scarcely credible, and is certainly not creditable, that it is twenty years since the Gold Medal was offered to a French practising architect, in the person of Charles Garnier. Those who know what work is being done in modern French architecture may certainly be inclined to ask the Institute Council whether they know nothing of M. Nénot and the New Sorbonne, or of M. Girault and the Petit Palais—the latter perhaps the most original and most generally admired building of recent years in Europe. We quite approve of presenting the medal to a painter who has been an eminent illustrator of ancient architecture, at the proper time; but we say—architects first, and we consider that the claims to recognition of more than one eminent French architect have been most unduly overlooked.

The Proposed
Exhibition
of Sculpture.

WE sincerely hope that the endeavour of the Society of British Sculptors to get up a special sculpture exhibition will be successful, and that they will receive the support of the London County Council so far at all events as the grant of a site goes. The complaints of the unsatisfactory and crowded manner in which sculpture is shown at the Royal Academy exhibitions are certainly called for; and what Mr. Brock seems to have said to the representative of a daily paper, that "the word 'art' to the general public has come to mean simply the

painting of a picture," is only too true. In fact, to the majority of visitors to the Academy the exhibition is really a popular picture show, the contents of which are looked at for the interest of their subjects and not for their artistic quality. In sculpture the subject generally is much more abstract and ideal than in painting, and therefore makes less impression as a subject or story; to make anything out of sculpture the mind must first have had some artistic training; whereas a picture, even to those who know nothing of art, often represents some incident which interests them for its own sake. Sculpture has none of these adventitious attractions (at least, when it has, it is bad sculpture); it is therefore the more necessary that it should be exhibited in a manner worthy of its importance as an art, and not made a mere appendage to a picture exhibition. The remarkable advance made by British sculpture during the last fifteen or twenty years is an additional reason for seeking an opportunity to make an adequate representation of the recent work of English sculptors. At present sculpture is the leading art in this country, though the public do not know it.

Coast
Erosion.

GENERAL satisfaction must be felt at the announcement by Mr. Lloyd-George that the Government proposed to appoint a Royal Commission at an early date to inquire into the question of coast defence, and two or three kindred subjects, such as waste lands and afforestation. We are rather afraid that the inclusion of these other subjects in the reference will lead to delay, which is particularly to be deprecated in connexion with the problem of coast protection. If the only remedial measures were to be looked for in the form of an Act authorising Parliament to undertake an ambitious scheme for safeguarding all threatened lands at the cost of the nation, there would clearly be every reason for anticipating considerable delay. But it would neither be wise nor fair to relieve local landowners of responsibility, and a more judicious alternative is to be found in the granting of loans for longer periods than the term of twenty-five years at present forming the limit for repayment. The Government could do other things calculated to improve matters. In the first place they could determine at once that the removal of beach material should no longer be practised by various State Departments, and could exercise their powers more fully to prevent other people from offending in the same way. Then, it would not be difficult to arrange for the abandonment of Crown claims upon all lands reclaimed from the sea. That such claims should be enforced is particularly unfair, and nothing is more certain to take the heart out of private enterprise. If lands wrested from the sea became the property of those who have paid for them in money and work—as is the case in some Continental countries—there would be a healthy revival of interest in schemes for the reclamation of land. Recognising the sympathetic attitude of the new Government towards this great question, we hope they will take early action in the directions here indicated.

Ecclesiastical Dilapidations. THE Upper House of Convocation has decided to bring forward a Bill on the subject of ecclesiastical dilapidations. The two main points of the proposed measure will be to establish a survey of the premises at stated intervals, and the payment by incumbents of an annual sum on account of dilapidations to an appointed body. These facts embody what has more than once been insisted on in these columns, that the question of dilapidations should not be left to be decided to the time when the benefice becomes vacant. The surprising thing is that some practical measure has not long ago been passed, and it says little either for the energy or the business capacity of the dignitaries of the Established Church that the question of ecclesiastical dilapidations should have been allowed to remain in its present unsatisfactory state. It will, no doubt, be regarded by some incumbents as a hardship that the already small ecclesiastical incomes should be yearly diminished by an annual payment in respect of dilapidations. But we assume that, if at, say, the five-yearly survey it is found that no expenditure on a benefice is necessary, any sums paid in respect of dilapidations during this period will be repaid to the incumbent. The main points are that houses and buildings should not be allowed to get out of repair, and that there should be a sum in hand to pay for necessary repairs.

Trade Unions' Returns. THE Parliamentary Paper just issued contains some interesting figures relating to the period up to 1904. At the end of 1904 the Trade Unions known to the Labour Department of the Board of Trade numbered 1,148, the total membership being 1,866,755. The year 1901 marked the highest recorded number of members, 1,940,874, so the decline to the end of 1904 is a falling off of 74,119 members, or 3·8 per cent. The Report states that periods of trade depression always cause a decline in the number of members, and it is significant that the Trade Unions of builders and general labourers for the above period lost members to the extent of 19·4 per cent. The membership of the Trade Unions shows a large increase when compared with years previous to 1899. The years 1902-04 brought a large increase of employees of public authorities, 23·6 per cent. gain, and of shop assistants, 60 per cent. Women represent about 6·7 per cent. of the total number of Trade Unionists. Interesting tables covering a period of ten years are given in connexion with the 100 principal Trade Unions, which represent 60 per cent. of the total membership, and their income shows a steady increase, as also does their expenditure, and the funds accumulated also steadily increase. For the year 1904 the figures are:—Income, 2,097,476*l.*; expenditure, 2,042,165*l.*; accumulated funds, 4,616,230*l.* In 1895 these accumulated funds amounted to 1,711,733*l.*, in 1904 they stood at the figures 4,616,230*l.*, having more than doubled in this period.

Trespass on Walls. THE case of Betts, Ltd., v. Pickford, Ltd., reported in our columns last week, is worthy of attention. The plaintiffs had

taken certain land from the defendants on a building lease. The intention of the plaintiffs was well known to the defendants; they proposed erecting warehouses and a show-room on the land thus leased, and the plaintiffs had submitted plans to the defendants which disclosed the fact that there would be windows in the south wall. The defendants had had to clear the site for the plaintiffs, but a shed remained standing, which projected slightly over the plaintiffs' land, and in the course of the erection of the plaintiffs' premises the architect had permitted these projections to be built into the plaintiffs' wall. The projection, which was that of some roof timbers and certain iron stanchions, was very small, only some 4 in., but the local authority served a notice on the plaintiffs under the London Building Act, 1894, treating the south wall as a party wall and requiring them to brick up the windows. This summons stood over until the determination of the action in which the plaintiffs applied for an injunction against the defendants to restrain them from trespassing on their premises, and from using the wall as a party wall. The Court held that the defendants had derogated from their grant and were trespassers. It is to be observed that the defendants to some extent relied upon the action of the plaintiffs' architect in consenting to the projection standing and building it in, but the Court held this to be outside the scope of the architect's authority. The defendants were also, it was discovered, after the commencement of the action, using the east wall as a party wall for some stables, but there is nothing in the case to show that the decision would not have been the same in regard to the trespass on the south wall alone, and its result was certainly serious, as without windows the show-room would have been useless to the plaintiffs.

Liabilities Attaching to Traction Engines. THE case of Dewar v. Tasker & Sons should be noted by those employing traction engines. The defendants were the owners of a traction engine, which they hired out for some months to another company. The defendants supplied a driver with the engine, whose wages they paid and they repaired the engine when necessary, and supplied the oil for it. The hirers had the right to give their orders to the driver, and directed where the engine was to go and what it should carry, etc. The plaintiff was suing the defendants for personal injuries he had sustained through the negligence of the driver. In these circumstances the Court held that the defendants were not liable, they had divested themselves of control over the driver, and the hirers were exercising the complete control.

Sewage Disposal. IN the recent case of Hobart v. Corporation of Southend-on-Sea, in which the plaintiff was suing the Corporation in respect of pollution to his oyster beds, and which occupied the Court some nine days, an interesting question as to the disposal of sewage was decided. The Corporation claimed a right to discharge the sewage into the river both by common law and by statute. The Court held that there was no common law right to

create a nuisance to the plaintiff such as was found as a fact to exist in this case, and that the defendants were bound to keep their noxious matter from trespassing on their neighbour's land. As regards the statutory right, the defendants relied upon sect. 49 of the Public Health Act, 1848, but the Court held that this had been repealed by the Public Health Act, 1875, sect. 23 of which Act omits the provision relied upon as to draining into the sea, and the judgment laid down that the defendants, far from having any statutory rights, were expressly prohibited by the Sea Fisheries Acts and the by-laws made thereunder from creating such a nuisance in this locality. No prescriptive right on the part of the inhabitants as predecessors of the Corporation was set up in this case, and the Court granted an injunction and damages. The case must not, however, be read as prohibitive of the discharge into the sea of any sewage at all; its teaching is that if sewage be discharged into the sea, due precautions must be taken that its discharge shall not be the cause of nuisance to other's rights.

The Design of Dry Docks. IN an eminently practical paper read before the North-East Coast Institute of Engineers and Shipbuilders, Mr. J. Mitchell Moncrieff, M.Inst.C.E., discusses the main points for consideration by those who undertake the construction of dry docks for commercial purposes. Next to the general dimensions, the selection of a site, whenever selection is possible, is the most important matter. Instances of dock companies who have been saddled with excessively heavy capital expenditure owing to lack of care in this respect justify the author in the caution addressed with regard to the most searching preliminary investigation as to the real character of sites under consideration. He shows that the nature of the subsoil has very great influence on the design and cost of the proposed works, and to illustrate this point gives drawings of four docks built under his superintendence in the Newcastle district all exhibiting distinctive features and necessitating essentially different methods of construction. A part of the paper of significance to our readers is that relating to materials of construction, and particularly to concrete. The author says that the cheapness of concrete, its execution by unskilled labour, the facilities it affords for carrying on work in a loose manner, and the presumed monolithic result obtained by the mere deposition of one batch upon another, instead of being virtues are really vices so far as regards works exposed to salt water. We quite agree with the caution as to the necessity for adopting proportions that will absolutely prevent the admission of salt water to the interior of concrete so employed, for if percolation should be established nothing can prevent its ultimate disintegration. Mr. Moncrieff is equally correct in emphasising the importance of making all beds quite level and flat, and of making connexion between the successive beds by a layer of mortar. This is good advice, for neglect of the procedure recommended will result in percolation along the seams and consequent trouble of serious character.

New Traffic
Facilities
for London.

AS THE first installation in this country of a tramway on the shallow subway principle the line which was opened to the public on Saturday last is of distinct interest. Although the underground route only extends from Southampton-row to Aldwych, a direct service is now available from Islington to the Strand, and at some future date the line will serve as the first link between the northern and southern tramway systems. The usefulness of tramway cars able to dive beneath the surface in places where traffic is much congested has been amply demonstrated in Boston, and it may be wished that ere long London may be possessed of many similar lines. A means of inter-communication to which thousands of passengers are looking forward is the Waterloo and Baker-street tube railway, now finished from St. George's-circus to Baker-street, and only awaiting the Board of Trade inspection before being placed at the disposal of the public. It is gratifying to learn that every possible endeavour has been made to eliminate fire risks and to provide for the safety and comfort of passengers. When this line is extended to the Elephant and Castle at one end and to Paddington at the other it will indeed be a most valuable line for those who do not object to subterranean travel. Among its most meritorious features are the connexions provided with the City and South London railway at the Elephant and Castle, the South-Western, the South-Eastern and Chatham, and the City and Waterloo railways at Waterloo, the South-Eastern and Chatham, and the District railways at the Embankment, the proposed Great Northern, Piccadilly, and Brompton railway at Piccadilly, the Central London railway at Oxford-circus, the Great Central and Metropolitan railways at Baker-street, and the Great Western railway at Paddington. A few more schemes like the two mentioned above would do a great deal for the internal passenger traffic of London.

A SOMEWHAT unusual gathering was held on Saturday night last at the offices of the new daily paper, *The Tribune*, as the opening of a kind of club-room or rendezvous for members of the Liberal party and readers of and subscribers to the paper. We are of course of no politics in these pages; but the idea of bringing readers of a journal in closer touch with it by providing a meeting-room and reading and writing-room for them on the premises of the journal, is a new and happy one; and the thing was splendidly done; the only disappointment being the absence of the Lord Chancellor, who was to have been the chief orator, and who was kept away by public business. Bouverie-street was brilliant with electric lighting on the exterior of the offices; there was a large and distinguished company in response to the invitation of Mr. and Mrs. Thomasson, and some very clever speeches were made by Lord E. Fitzmaurice, the Lord Advocate of Scotland, and Mr. T. Gibson Bowles—speeches the humour of which could be enjoyed even by those who might differ from the opinions expressed. The meeting-rooms, and even the stairs to the

printing-rooms (where the visitors were invited to inspect the printing of the report of the meeting), were lined with wire trellis entirely woven over with flowers—an American decorative idea, if we mistake not; and refreshments were on the most liberal scale in respect both of quantity and quality. The whole function was a great success.

ROYAL ACADEMY LECTURES.

THE lectures to the students of the Royal Academy on sculpture commenced on Monday last week by a lecture from Mr. Colton on "Enthusiasm in Sculpture," which was to a considerable extent a repetition of the argument of a lecture delivered by him a year or two back. He wished to offer his advice, as one who was still a student, on some of the difficulties which looked like mountains ahead of them, but would be found to disappear more or less when fairly faced. Though he would not tell them to despise culture, with the examples of Reynolds and Leighton before them, he would say, be content to snatch general knowledge how they could, but let their thoughts be intent, day and night, on their actual work, and not be easily satisfied with it. Those who were satisfied were blind. He had known a gold medal gained stop a man's whole career. Failure should stimulate them; if a work they had spent six months over was a failure, spend two years over the next effort. They must be content to sacrifice comfort and even health in the strife to improve. English sculpture, it was generally admitted, had advanced immensely of late years; it must be their business to push that advance still further. It was said that there was no patronage for ideal sculpture in this country, but surely that was to some extent the fault of the sculptors; if more ideal work were produced, a demand for it would arise. One class of work for which there was now a good deal of demand—decorative sculpture with which jewellery was combined, was one form of ideal sculpture, and might lead up to something more important. But the time and labour which the art demanded was so great that only a great enthusiasm could carry them through it; without that quality a sculptor's life must be intolerable. The classical standards of sculpture were now outworn; their day was passed, and they had already been responsible for the production of many soul-less busts and statues. Realism and Idealism were but words, after all; let them observe the beauty of nature, get as near to that as possible, for in that path realism became also idealism. A little thought beautifully expressed was worth more than a great thought badly expressed. It was perhaps fortunate that there was no system of modelling at the Royal Academy, for, as they knew, one "Visitor" in sculpture was quite prepared to throw aside what the last had said, and thus they were under no temptation to make an idol of a system and to mistake the means for the end. The whole earth was filled with beauty to which unhappily many people seemed astonishingly blind; but it was their part to assimilate all they could of that beauty, and give some of it out again in their works. And in this connexion it might be said that clearness of vision was even more valuable than imagination. On the Royal Academy catalogue for 1902 there had been placed as a motto the words of Théophile Gautier—"Rien n'est usé pour le génie." To succeed in sculpture they must be prepared to make self-sacrifice; and they must take their art seriously. Anyone who made the mistake of approaching sculpture lightly would surely fail. The art was so absolute in its character that nothing sketchy could be admitted into it; and though they might have seen examples of sketchy work of a clever kind, they might feel assured that such work would not last long. A fine idea finely executed was what was required in sculpture. Let them look at the finished beauty of even fragments of Greek sculpture, and make that kind of work their test. He would especially say, be careful with the hands and feet of their figures; details which were often much neglected at present.

Bones were rather a bugbear of English

sculpture at present. The study and knowledge of the skeleton structure was necessary, of course; but bones were not hard and rigid like rocks, or to be shown so, even where they came near the surface. The skeleton should be mastered and then—put on one side. Let them show what Nature showed, and not try to show more. Flesh was of equal importance with bone; it was what we actually saw in the figure; one might apply the well-known proverb, "Beauty is but skin-deep" quite truly in this sense; and flesh modelling must not be neglected, as he feared it was at present, for it alone represented life.

He would advise them to absorb all the criticism they could, and not be too sensitive if it was unfavourable. It would be better if frank criticism were more the fashion. In default of that let them go to nature. He was not attempting to give them anything of the history of the art; he left that to able hands; and after all, if they wanted facts of history, they could find them all in the library. He was rather concerned with their practical attitude towards their art. A sculptor had to copy form as it actually existed, not, like a painter, to show its appearance only from one point of view. And they must bear in mind that truth to nature was concerned not only with form but with texture. Flesh was not of the smoothness of wax; and where a figure had to be made more than life size, the irregularities of surface forming texture had to be magnified in the same proportion. Sculpture was nothing if not vital; in copying life let them take care not to end in death. It had been said by a modern critic that sculpture had no limitations. They would hardly go far in the practice of the art without discovering that it had a good many; limitations in respect of size, shape, balance between subject and execution, etc. They could not model the Lord Mayor's Show; they could not model a landscape; and if the nature and suitability of subject had been considered they would not have seen such a subject as the representation of a public-house in a recent Paris Salon, with the innkeeper and a drunken customer at the door. The finest sculpture should represent a kind of dream, but a dream carried out with infinite patience in detail. Let them not be penny-wise and pound-foolish, in doing easily things of little merit, which might save labour now, but would bring them no ultimate return. Those who would be great in sculpture must labour hard.

At his second lecture on Thursday the 22nd Mr. Colton said that in advocating reference to nature he did not mean to imply that a sculptor might not be dissatisfied with his model and try to find a better one; but as a sculptor was to express himself in the most emphatic manner, and the most emphatic manner was the direct reproduction of nature. No doubt what he had said in the last lecture, that sculpture should be "a fine idea finely expressed," was open to all kinds of questioning; one might begin by asking, "What is a fine idea?" but they must avoid entering into abstract questions of that kind on this occasion. But he would say that the general ideal of what constituted good sculpture had been the same for the Greek, the Roman, the Renaissance, and the greatest of the modern French sculptors. But recently there was a new ideal set up of what might be called brutal execution. A giant rough-hewn out of a rock might be impressive on a great scale, no doubt; but was a reduction of that ideal to ordinary lifelike to take the place of the refined modelling which the highest sculpture demanded? This kind of thing was a part of the general hurry of modern life. Let an artist work to obtain technical skill, at the cost of labour and self-sacrifice, lest he awake and find that sculpture requires definite form which he is not in a position to supply. If he were able to set up what he would regard as an ideal art school for sculpture, he would make students begin with the living model; he would hide away all the antiques; then he would set them to making finished studies for some years, and then they might be let loose among the antiques, and would be in a position to understand them rightly. As it was, he could rather sympathise with the student who looked on the antique as a dull,

convention. Yet we loved the stone idols of the past when we saw them, not in rows in museums, but under the light of a southern or a tropical sun. Transplant them to the East and its vegetation, and they found their souls again. Even in Hindu temples the simple masses of white marble in strong sunlight were beautiful; and the caves of Elephanta contained some of the most wonderful sculpture in the world, carved out of the solid rock. It was a great descent from this to the work of the modern native sculptor in India, who was in fact a craftsman rather than an artist. Yet they must not overlook craftsmanship; a sculptor must be sure of his craft if he wished adequately to express his ideas.

Sculpture had become more or less popular lately, but unfortunately it seemed only to become popular when it had lost the freshness of its first ideals. The wonderfully fine French sculpture of fifteen years ago had given place to eccentricities which were out of the true field of the art; for sculpture must never be theatrical. The praise which was shouted from the house-tops generally went to what was false in the art. There was a modern form of what might be called "arts and crafts" sculpture, which attracted by a gaudy show of sparkling materials and colour; it was not the best, but it might have done some good by popularising the art. But sculpture could express attributes of human character; not by exaggeration of special features or form, which was not originality—it was no more "original" to copy the eccentricities of the "rough-hewn" school than it was to copy the severity of Greek art—but by waiting and watching till they could find and seize the central expression which represented the real and essential character. And in trying to represent soul, let them not forget that the adequate representation of the body came before that. Let them attend carefully to the modelling of hands and feet, often too much neglected at present. They must be sure of their strength in dealing with outward form before attempting to represent great moral qualities; and let them beware of exaggeration; the healthy was the sane in art. Thin ascetic forms were not, as seemed to be supposed, spiritual; the skeleton was not life but death. There was an absurd craze now for exhibiting figures with legs and arms lopped off (perhaps under the idea that it left more scope for the imagination); busts were shown with no crown to the head, or one side of a face without the other. In one exhibition he could mention a large proportion of the works in sculpture were initiated in one way or another; one did not know whether to take this as a sign of effort or as mere hypocrisy. Sculpture, again, should not represent the frivolous or absurd, and it should be as far as possible divorced from matter of fact. Sculpture, for instance, went very well with fountains, which were objects of a poetic association, and with gardens; and one was glad to find that the old cement and lead garden statues and garden ornaments were better appreciated now than formerly, and were being rescued from the gardens and bowling-alleys of country inns.

In regard to the intention or idea in sculpture, a man who was a mere craftsman would want ideas, but on the other hand the artist who had ideas could not adequately express them unless he had the skill of the craftsman; if he had not that he was lost. It was better to be in the position of a skilled worker than to be a dreamer without adequate power of expression.

On Monday afternoon Mr. Goscombe John lectured on "Modern Sculpture." After referring to the influence of Greek art, which continued long after the fall of Greece, which created Roman art and even largely influenced Renaissance sculpture, he referred to the work of Goujon and its highly decorative character, which resembled a good deal the style of the figures on Greek vases, yet with a character of its own. Germain Pilon was a sculptor with a wider range, and his work to some extent recalled Donatello. But the real father of modern sculpture was Bernini, who was a better artist than he was sometimes called, and who at all events infused into sculpture the element of vitality and the disregard of tradition. The Baroque archi-

ture of the period was restless in effect—was always doing something, and the sculpture of Bernini was in the same spirit. Pierre Puget was contemporary with the later career of Bernini; he showed more restraint in design than Bernini, but with both of them the style of modelling suggested clay or terra-cotta rather than marble. During the XVIIth and part of the XVIIIth century the whole of Europe was under the influence of Bernini. In Spain they had Alonso Cano, a sculptor whose work was very emotional in character and showed often very excellent execution. In the XVIIIth century they had Canova and Houdon, two sculptors entirely opposed in principle. Houdon's work retained its value; Canova's was gone, inasmuch as he merely aimed at copying the antique, and acquiring a high finish which made his statues look almost like wax-work. Houdon had a great sense of style and an insight into character, and he never made a mannerism of imitating the antique. Puget, Coysevox, and Coustou might be said to have prepared the way for Houdon. They produced especially a remarkable series of portrait busts, which were as fine as the ancient Roman work of the same type. The revival of the Classic spirit at the end of the XVIIIth century led to nature being set aside, and the production of doubtful "antiques," in which many men of very moderate ability made a temporary success. The Elgin marbles produced little sensation at the time of their arrival; the Apollo Belvidere and the Venus de Medici were the standard at that time. The Elgin marbles were believed by some to be of the date of Hadrian; even Flaxman only said of them that they were "executed with great effect." Reynolds died twenty years before the appearance of the Elgin marbles; had he lived to see them, some passages in his lectures in regard to antique sculpture would undoubtedly have been altered. Canova, however, predicted that they would reverse our ideas as to Classical sculpture.

Roubiliac carried on in England the tradition of Bernini. He was a sculptor of independent genius and great power of expressing emotion, but lacked the feeling of quietude; even the shoes and the buttons on his clothed figures seemed uneasy; yet he was a man whose work it was refreshing to meet with in an age of artistic commonplace and mediocrity. During the Classic revival in England the two most prominent men were Bacon and Flaxman, the former of whom won the first gold medal given by the Academy for sculpture. It was singular that Flaxman apparently knew nothing of the works of Bacon, who was an able sculptor, interesting for his picturesque detail; his statue of Chatham in Westminster Abbey, and his Dr. Johnson in St. Paul's Cathedral, were especially worth mention; he was a sturdy lover of nature, and based his style on that and not on the imitation of antique statues. He invented the pointing machine now so widely used for transferring the model to marble. Banks, of about the same period, was a sculptor of no great charm, but he had a certain power, and it was curious to note that his figure of the fallen Titan was rather like an anticipation of the style of M. Rodin. Flaxman was one of our greatest artists, but his outline designs and small sketches in sculpture were better than his large figures, which were not always very well executed, and the influence of Canova was too perceptible in them. Thorwaldsen, who was a pupil of Canova, and Gibson, who was in turn a pupil of Thorwaldsen, both carried on the "antique" formula of Canova; their works represented the essence of academical art reduced to a formula. Gibson was supposed in his day to be an intellectual sculptor, but he forgot emotion, without which art was mere pedantry. The work of this period had, however, the merit of being simple and sculptural in character; there was no pretentiousness about it; but it was dull. In all good epochs of the art sculptors had been inspired by Nature; sculpture must be a living art and must represent its own age; the Greek sculptors worked for the Greece of their own day. The study of ancient work only meant the production of lifeless forms.

France had always been producing great sculptors; there was no break in her artistic

history in this respect; and French sculpture was always vigorous with its own life and not depending on any outside influence. Her sculptors had written the nation's epic in marble and bronze. The art was never more nobly employed than during the last 150 years in Paris. The modern period was heralded by Rude, who died in 1855, and whose astonishing "Chant de Départ" which decorated the Arc de l'Étoile might be taken as the typical representation in sculpture of the revolutionary spirit. Rude furnished the link between the older and the modern French school, and his pupil Carpeaux was the first of a distinguished band among whom might be especially named Barye, Falguère, Dalou, and (among living artists) MM. Mercié, Frémiet, and Rodin. Barye brought into animal sculpture an entirely new life; before his day animal figures were mostly mere decoration of a very ordinary type; Barye created a school of animal sculpture, which in realistic vigour reminded one of the lion-hunting scenes of the Assyrian marbles. It was curious to note that the study of animal nature had so dominated his style that when he introduced human figures into his groups there was something animal in their character and expression. Falguère was essentially a modeller; his works had created an enthusiasm and had led up to the wonderful proficiency in modelling in the French sculpture of the present day. Dalou's works carried a suggestion of the open air, of inspiration from work-a-day nature; he was a product of the Republic, of the modern democratic France; he had however spent a good many years in England, and his "Triumph of the Republic" was actually designed at South Kensington. Barrias and Dubois represented sound tradition, perfectly scholarly work, but they had exercised very little influence. M. Frémiet and M. Mercié, the former a pupil of Rude, the latter of Falguère, had on the other hand exercised a very wide influence. M. Mercié's work, the "Gloria Victis" especially (of which an illustration was shown), was in the highest degree noble. M. Rodin's career was a fight and a protest; the polemical attitude taken up in regard to him was to be regretted, and did no good; he was an artist to be reckoned with in any case, and the future would judge his work dispassionately. For the students, let them go to nature, and they would not be in danger of being led away by eccentricity. He could not quit the subject of France without a reference to her great modern school of medallists, of whom M. Chaplain and M. Roty were the most conspicuous. Italy all this time was behind; her ancient glory had departed, and the chief merit of her modern sculptors lay in being very skilful carvers. There had been no German sculptor of wide reputation since Rauch, a sculptor of the Classic school, but with much picturesque force in his classicism; among the men of the present day Herr Begas was the most talented. Mr. John also referred with appreciation to the work of the Russian sculptor M. Troubetskoï, and to Mr. St. Gaudens as the first American sculptor of the day. The work of the late Constantin Meunier was mainly pictorial in its idea, though sculptural in treatment; there was no grace in his work, but it showed truth of character and sentiment. His modelling depended on structure, not on detail.

Since the days of Flaxman, England had Chantrey's admirable work; and he would also mention the statue of Wilherforce by Joseph, which was a very fine portrait statue, and in force of character might compare with Houdon's celebrated "Voltaire." Macdowell's "Nymph" in the Diploma Gallery was a beautiful work. Foley was a sculptor who was educated under the old order of things; yet his work, especially his equestrian statue of Sir James Outram, pointed to the coming change. Stevens was a splendid anachronism, whose work resembled nothing else in English and of his period; he was a Renaissance artist born into modern England. English sculpture had been very much alive during the last twenty-five years; Carpeaux and Dalou had exercised a great influence upon it, and Leighton perhaps most of all, who had assisted this art by every means in his power. After some cordial words of appreciation of Harry Bates and Onslow Ford, whose death had been such a loss to

English art, the lecture was concluded by the exhibition of an illustration of M. Mercie's splendid group representing "The Genius of Art," the last of a set of most interesting illustrations which accompanied the lecture.

LUTON SECONDARY SCHOOLS COMPETITION.

FOR this competition, conducted by the Bedfordshire Education Committee, ten architects were selected to compete, and Mr. H. Percy Adams was appointed assessor. We do not know, and from results it is difficult to judge, upon what grounds the ten were chosen in the first instance. At any rate the standard, with one notable exception, falls very far short of what we had looked for in a limited competition of this nature. More than half the competitors have utterly failed to justify their selection. Neither the assessor's report nor the report submitted by Messrs. Spalding & Spalding with their winning designs were on view at the Shire Hall, Luton, on Monday. All the other reports were, however, displayed. We do not like to suggest that these reports were designedly suppressed by the authorities at Bedford. Indeed, telephonic communication brought the assurance that the reports would be sent through in the afternoon. They did not arrive. We cannot, therefore, review the designs and the award on the same footing. But we cannot understand the award, and we cannot agree with it. The winning scheme may be the *cheapest* submitted, but a high price is paid for this cheapness. The plan violates not a few of the cardinal axioms in school planning, and it will be interesting, indeed, to learn how it fares at the hands of the education authorities in Whitehall. In the conditions certain requirements were set forth to the end that a Secondary School and Technical Institute for 300 children (150 boys and 150 girls) might be obtained at a cost of 6,000*l.* Competitors were, however, "at liberty to submit their own estimates of the cost, provided that they show clearly how much of the whole scheme can be carried out for 6,000*l.*, and yet be complete in itself and meet the requirements of the Board of Education." The site is irregular, with a frontage to Park-square of 108 ft. between adjoining buildings. There is a depth of about 350 ft., and on the left flank, some 180 ft. from the frontage line, there is a further space about 100 ft. by 70 ft., with a narrow frontage out to Church-street. To keep well up to the Park-square front, thus leaving a maximum area for playgrounds in rear, was apparently the problem. In Messrs. Spalding's design this is done, even to following the irregular existing frontage line; while in Messrs. Russell & Cooper's scheme the frontage is squared up by setting back a few feet, with much gain in dignity of elevation. We hold no brief for Messrs. Russell & Cooper, but their scheme stands out so far superior to all the others submitted that we are altogether at a loss to understand the assessor's award. It is a model of compact, convenient, and resourceful planning and design, adapted to the site in every way most cleverly, and it is withheld from expression by architectural fitness and dignity of expression. We can only suppose that the question of cost has weighed with the assessor to the exclusion of almost every other consideration. In Messrs. Spalding's design the six classrooms on the ground floor open directly out of the assembly-hall (64 ft. by 37 ft. 6 in.), three on either side. There is a very narrow gallery to the two sides and across the ends of the hall, with classrooms similarly disposed—three for twenty-five to the playground side, one for twenty-five and two for thirty to the fronts, and on the second floor there are three rooms corresponding to these latter, allocated to chemistry, physics, and cookery, except that a passage, 4 ft. wide and about 100 ft. long, badly lighted and planned as to stairs, is taken off the back of them. Two art-rooms, separated by the length of this passage, occur at the top of either staircase over the masters' common room and office respectively on the first floor, below which, again, on the ground floor, are the headmaster's room and the mistresses' common room. These latter are lighted into small and objectionable areas, and both have water-closets opening directly out of them, regard-

less of the fact that the "Head's" room would be used for interviews with parents and others. A passage against either flank wall of the site gives, past the changing and cloak rooms, access through to the playgrounds in rear, the boys on the left, the girls on the right. The cloak-room divisions form stalls 4 ft. wide, which would be the scene of much confusion and congestion. The entrances from the street are narrow, and have bicycle-rooms next them, into and out of which it would be almost impossible to negotiate a machine. The planning of the stairs is very bad, and their start from the ground floor could scarcely be worse. They are next the street, instead of next the playgrounds, and above they open out as "wells" some 14 ft. square. The assembly-hall has an open queen-post roof, and the lighting would be quite inadequate. The worktops are placed against the Church-street frontage, thus blocking any access there, besides being at some considerable distance from the school building.

In Messrs. Russell & Cooper's design few, if any, of the defects above noted are evident. The general disposition of the hall and classrooms is much the same, but there is a central entrance giving access to the headmaster's room, and office adjacent. The latrines and workshops are admirably planned into the irregular boundaries of site, and the playgrounds are made the most of. The arrangement of the second floor is incomparably superior to the winning one, and we should have thought that, even after getting both these schemes down to the same basis of cost, there would have been no question whatever as to the superior merits of Messrs. Russell & Cooper's scheme. Space does not admit our commenting further on the various designs, but it was observed that one competitor who had gone to the trouble of sending in two schemes—fifteen sheets in all—had apparently torn his name and address off them for some reason best known to himself, and which we will not endeavour to fathom.

THE ARCHITECTURAL ASSOCIATION: SPECIAL GENERAL MEETING.

A SPECIAL general meeting of the Architectural Association was held on Friday last week at No. 18, Tafton-street, S.W., Mr. E. Guy Dawber, President, in the chair, to consider the council's proposal to add the words "editor of the A.A. Journal" after the word "librarian" in by-laws 21 and 30, and substituting nine ordinary members in by-law 21 in place of ten.

The Chairman said that this slight amendment was proposed by the council as it felt that the post of editor of the A.A. Journal should be balloted for annually, as in the case of other officers, and, as it was not desirable to increase the number of ordinary members of the council, it was proposed that the editor should be an ex-officio member of the council. This will still bring the total of the council to seventeen members, as before. The council also feel that it is eminently desirable that the editor should always be a member of the council, in order to be *au fait* with the work and policy of the Association.

The Chairman accordingly moved to that effect, and the motion was agreed to *nem. con.*

The ordinary general meeting was then held, the minutes and nominations being read.

The following gentlemen were elected as members—i.e., Messrs. A. D. Leroy, J. A. Metham, D. Kibbler, E. S. Caldwell, H. C. Chatfield Clarke, J. E. Lee, F. G. Geary, C. W. Ferrier, and G. E. G. Leith.

New Premises Fund.

Mr. C. L. Fleming-Williams having been reinstated, the following further donations to the Building Fund were announced:—Messrs. E. B. P'Anson (second donation), 10*l.* 10*s.*; Ernest Newton (second donation), 3*l.* 5*s.*; P. H. Adams, 1*l.* 1*s.*; H. J. Rippon, 10*s.* 6*d.*

Porches and Approaches.

Mr. F. T. Baggally then read the following paper on "Porches and Approaches":—"In making the customary apology for the imperfections of this paper, I may say (and you will readily believe it) that my chief embarrassment has been the enormous number

and variety of examples that might be quoted, and the consequent impossibility of covering the ground at all adequately. I have failed to find satisfactory drawings or photographs of a few examples it would have been interesting to illustrate; but, again, the chief difficulty was to reduce the list to one that would not weary you. I am greatly indebted to Mr. Alan Potter, hon. secretary of the Architectural Association Lantern Slide Committee, for help in selecting slides, for getting some made, and, in two or three cases, for the original photographs.

Introduction.

In this room no apology can be needed for calling attention to the fact that, in many cases, nearly as many opportunities for architectural treatment are to be found in the surroundings, the accessories, and especially the approaches, of a building as in the building itself. It is true that in the middle of crowded towns land is too scarce and dear for devotion to such amenities; unless the building be a public one or a palace. But in the open country and the villages, and even in small towns and suburbs, the meanest cottage or villa has at least, or ought to have, its proper forecourt. And many a commonplace building, great and small, has been redeemed from insignificance, many a beautiful one has been raised to the first rank, merely by the treatment of the approaches, or even by the addition of a well-designed porch to attract the eye and concentrate the attention of the passer-by.

In this country, at any rate from the time of the Druids until the last few years, there has never been any attempt to form those grandiose and impressive approaches which most other nations, ancient and modern, have deemed appropriate in the case of especially important or sacred edifices. And we have no porches which will compare, for instance, with those of some of the French cathedrals on which the masons lavished so great a wealth of art and religious fervour. Our mediæval forefathers spent, however, art and money on porches and gateways with enough liberality to show that they regarded such features as of more than ordinary importance. And from the Tudor period down to the beginning of the last century, the art of contriving decent and dignified approaches to private houses was well understood both in England and Scotland, and almost universally cultivated. If people did not rise, and could not often be expected to rise, to the magnificence of Bacon's three princely courts, with their walls and turrets, terraces, and colonnades, architects (as is proved by existing plans), and the owners of a few great houses, strove to get within measurable distance of that ideal. And even the smaller houses, whether in town or country, were generally approached through at least some sort of enclosed forecourt of a formal and architectural character, with an outer gate on which a decent amount of art and money were spent.

The ideas and circumstances of the XIXth century led, however, to a deplorable change. Formal approaches almost disappeared with formal gardens in a vain and childish attempt to imitate the beauties of natural landscape. The stately gateway, the straight avenue, and the spacious forecourt gave way to a sort of glorified field-gate and a serpentine-road which seems to turn aside every few yards to avoid a laurel or a nettle, reveals, by carefully-arranged accidents, occasional glimpses of the surrounding scenery, and at last lands one, sideways and unexpectedly, at the door of a mansion, which, if the art were entirely successful, would seem to be situated in the midst of a wilderness. The bard utilitarian spirit of land and building speculation has dealt even more hardly with the forecourts of small suburban and roadside houses, which, except for a cheap gate and a bit of cast-iron railing, are left to be dealt with by tenants who have but a few years' interest at most in the property.

But as the love of beauty and appreciation of art grow and spread in the nation (as we all hope they are doing) we, as architects, are beginning to be called upon again to consider and to contrive those decent accessories and approaches without which a building, with even the smallest architectural pretension, is but a kernel without a shell, and, one with the greatest, a jewel without a

setting. From the point of view of this paper it is especially worthy of note that the most striking sign of the better spirit has been the scheming of a grand processional approach road to London's Royal palace. It is true that an untimely, and considering the occasion unlooked for, parsimony on the part of the public has shorn the work, for the present at any rate, of most of its architectural adornments. But the mere fact of its inception and execution is an encouragement to consider the question of architectural approaches generally.

Egypt.

Without attempting a strictly historical treatment of the subject, I may reasonably first call attention to the approaches to the great Egyptian temples as among the most notable examples of the grand manner.

In their case the spacious open courts which have a prominent place in almost every great architectural scheme, ancient or modern, were in the strictest sense forecourts, and are supposed to have been a development of the walled spaces or outer defences in front of the mouths of caves, which were naturally used by the original inhabitants of the Upper Nile valley for dwellings, tombs, and temples.

When the great temples of Thebes were built the original purpose of the forecourts may have been forgotten, but their varied usefulness as well as tradition secured their survival. They secured privacy for the temple proper, and space for ceremonies and processions, attended probably by large crowds of worshippers; and the porticos which flanked their walls internally were, in that climate, no doubt, a sufficient dwelling for the many servants and hangers-on of the establishment. In any case, a second, or even a third, forecourt was in several cases added by the pride or care of successive generations.

But the most striking feature of the approach to an Egyptian temple, a unique one in the history of architecture, was the pair of great towers which flanked and dwarfed the outer gate, and formed the front wall of the forecourt. We call them "Pylons," after Herodotus, and the proper Egyptian term seems to have been "Sebchet," which had much the same meaning—merely "door."

They were rather exaggerated walls than towers. Of little depth, but so high that they always overtopped the temple proper, sometimes by 100 per cent., and so wide that they usually well overlapped the side walls of the court. Their faces were smooth and slightly battered, and the main purpose of their peculiar form was evidently to provide a spacious and suitable field for the illuminated texts of the sacred scribes. Almost as certainly, I think, they represent the face of the cliff surrounding the narrow entrance to the original cave temple, which must have been used for the same purpose.

In front of the pylons were obelisks and colossal statues, usually seated. And, in some cases, it is said, the gate was approached through an avenue of sphinxes.

At the opposite or inner end of the nearly-square forecourt, between the court and sanctuary in the original arrangement, was either a deep open portico or an enclosed hall of close set columns, the most important feature, architecturally, of the whole group. In most cases, when a second court was added the arrangement of pylon, court, and hall (or portico) was repeated, and the famous hypostyle hall at Karnac was the hall of such an addition; behind it is the pylon of the original court. The whole of the approaches, therefore, to the Egyptian temple, when fully developed, were an avenue of sphinxes, a pair of pylons, a forecourt, a hypostyle hall, perhaps a second pair of pylons, a second court, and a deep portico or second hall of columns.

Chaldea and Assyria.

In Chaldea the temples were mere shrines elevated on steep terraced mounds, and approached by flights of steps or winding inclines. But, according to more recent discoveries, these were approached like the Egyptian sanctuaries, through one or two forecourts with more or less striking gateways. Several such gates are represented in the bas-reliefs in the British Museum, and usually consist of a square-headed opening

flanked by square crenellated towers as if for defence. In Assyria the Royal palaces were the principal buildings; but of the approaches to them we only know that, since they stood on mounds, they must have been reached by flights of steps, with inclines, probably, for the chariots. The main gateways seem to have had semicircular arches faced with glazed tile or faience, judging from the city gate discovered by M. Place. The responds of the arch were huge sculptured bulls with human heads, some of which have been removed to modern museums. There are two very fine ones in the British Museum.

These gates were sometimes pierced through towers, and sometimes flanked by smaller ones. The sumptuous style of the staircases leading up to them may probably be fairly estimated from the ruins of those to the Palace of Xerxes at Persepolis, a building of much later date, but the general style of which was largely based on the Assyrian palaces. Perhaps I may be excused for showing at this point a view of a Japanese temple which I found in a French journal, and which seems to me to exhibit the effectiveness of stairs and terrace approaches even when combined with grotesque architecture and an incomplete symmetry.

Greece.

Returning to the prehistoric styles further west, the approaches of the Mycenaean palaces differed again entirely from all those hitherto noticed. They were more like the approaches to a Norman castle. Indeed, the resemblance is striking if you forget the drawbridge and overlook questions of style. There may be nine-and-sixty ways of constructing tribal lays, but perhaps there is only one of constructing the approach to a tribal chief's fortress. The palace was built on a hill-top, and was only to be reached by a narrow road ascending the flank of the hill and exposing the right or unprotected side of assailants to the kind attentions of the defenders on the walls. There were several narrow gates to be passed, and they were carefully situated in internal angles of the wall exposed to a cross-fire of stones and darts. Utilitarianism of the sternest kind was alone considered until the main gate leading to the forecourt of the palace was reached. This, judging by remains, was more sumptuously treated, with internal and external porticos supported on columns (probably wooden columns).

These porticos may have served both as shelter for the guards on duty and as the court of justice of the king or chief, in accordance with the practice of semi-barbarous chieftains in the East in all ages. Greece is not, perhaps, strictly Oriental. But the Huns, at a later date, brought the practice with them, much further west, and all we know of the Mycenaean civilisation, including the plans and decorations of the palaces, suggest an Eastern origin.

The gateway on the Acropolis at Athens, the admiration of the ancient world, and called by them emphatically "the Propylea" (it is said the term was never used until modern times for any other gate) was undoubtedly merely a rebuilding, on a glorified and extended scale, of the gateway to the old palace of the kings of the Mycenaean period. The approach to the gates (the plural form of Propylea is said to have reference to the two gates, or two leaves of the gate, and not to the porticos) curiously enough, as it seems to us, remained the old narrow steep pathway winding round the bastion from the south. Whether, if war had not intervened to stop the work, the road would have been improved, too, it is impossible to say; but somehow it was hardly the kind of feat that one suspects would have appealed to the Athenians even if it had been safe. The genius of Greek art, however refined, seems to have been narrow. There is no clear evidence that it ever extended from the consideration of a single structure to a group. A little superstition or priestly jealousy was allowed, even at Athens, to cripple or to crowd the finest works; and each had to stand alone, neither leading up to anything else, or itself the crown of a comprehensive scheme. It is true that in many, perhaps in most, cases there was a wall and portico enclosing the court or "temenos" in which the temple, or several temples with subur-

dinate buildings, stood. But, in all cases with which we are fully acquainted, the form of the court, the position of the gate, and the situation and orientation of the various buildings seem to have been entirely fortuitous, or decided in each case separately, without reference to the rest.

In considering Greek approaches, unless we accept partial and inconclusive evidence, we can only admire the fine judgment and unweary industry of the artists in refining the proportions and the details of porticos such as those of the Parthenon and Theseum; wondering whether it was really worth while; feeling that at any rate such an effort is beyond us in the present day, and might even be rather absurd.

Rome.

Of the ambitious spirit of the Imperial Roman architects in designing and carrying out the most splendid schemes of approach, there is, on the other hand, ample evidence in history and in the ruins of some of them. Marble porticos, surrounding and leading up to spacious courts: and decorative arches, triumphal, memorial, or merely emphatic of an entrance or a particular point, were the chief materials with which they produced their effects. But they did not disdain on occasion a fine flight of steps; and, as their native temples were mostly raised on a high podium, that feature was common.

The completeness with which Roman work has, in almost all cases, been destroyed unfortunately leaves little for illustration except a few ruined arches, rows of columns, and some plans.

Triumphal arches were more often than not erected as entrance-gates; in many cases in the provinces as the main entrance to the city. Among the well-known examples, the arch at Rimini was the south-east gate of the town, on the Flaminian way. That at Berneventum was the eastern gate on the Apennian way. That at Orange, in France, was the northern gate of the town. Those at the naval station of Pola, in Istria, at Treves, on the Moselle, at Autun, and at Verona, were all city gates. The late "Arch of Hadrian," at Athens, was the gate of one of the quarters or suburbs of the town which he rebuilt. The fine arch of Trajan, at Ancona—so much finer in its erect simplicity than most of the over-enriched work of that emperor—was the entrance to the quays which he built. The arches at St. Chamas were the entrances to a bridge; and so on.

In Asia and North-Africa most, if not all, the Roman city gates were of a similar, though plain, architectural character.

In Asia the city gate was often but the end feature of a street lined on both sides with either marble colonnades or covered porticos, leading right through the town or up to its main feature. In Palmyra such a street seems to have existed before the great temple of the Sun, or before the latter became the great feature and main glory of the city. And, as the street did not run directly towards the temple, there was a bend to disguise when it was desired to make the one lead up to the other. This difficulty was overcome by the arch seen in the view, which is built on the wedge-shaped plan familiar in doors on a small scale to all practical planners, but never, I fancy, seen elsewhere on such a scale. Such streets are said to have existed from very early days—170 a.c., at any rate—in Asia; but we do not hear of them on any great scale in Europe, except in the case of Constantinople, where one led from the forum to the palace.

The triumphal and memorial arches erected in Rome itself seem to have been generally isolated monuments; but the arch of Trajan was the entrance to his forum, and the forum was the forecourt to the Ulpian basilica. The arch had a single opening, but was decorated with sculpture in the rich and heavy style which, it is suggested, was due to Trajan's Spanish taste. Some of the carving is now to be seen on the arch of Constantine.

The forum was nearly a square of 400 ft., and on two sides had a double portico and an immense semicircular recess or hemicycle. The basilica occupied the whole of a third side, and was what we should call "double-aisled," with a large apse to accommodate a magistrate's tribunal at each end. On the

further side of the basilica (from the forum) was the great column, which could be viewed from the galleries surrounding the small court in which it stood; and beyond that again the temple of Trajan.

The whole group of the arch, forum, and basilica, and the small court may reasonably be looked on, from the architectural standpoint, as the approaches to the temple of Trajan, the crowning feature of the most magnificent of Roman works; or the one, at least, which most forcibly struck the imagination of those who, in later times, saw it when partly ruined.

Another finely-conceived approach was created in Rome by that great building emperor, Trajan's successor, Hadrian. It led to his mausoleum, now called the Castle of St. Angelo, and took the form of a bridge over the Tiber leading from the stone quay on the city side right up to the gate of the mausoleum (the quay on the mausoleum side now hurries several arches of the bridge). There were, of course, as in the case of other ancient bridges, arched gateways at the ends, which, like the decorative parts of the mausoleum have disappeared; and if it were not for Bernini's angels the whole affair would now be very tame and uninteresting. The temptation to dwell on Roman approaches of the Classic period is great. They were so well conceived; but they are difficult to illustrate, and I will only mention one other example, that at Baalbec. I do so on account of its many curious and interesting peculiarities.

A flight of over fifty steps, 150 ft. wide, leads up to a front close on 240 ft. long, and consisting of an open portico of the Corinthian order, stopped at the ends by what are supposed to have been towers (towers open at the sides to the portico). Behind this broad porch is a hexagonal court, surrounded by a peristyle, and outside the peristyle deep recesses (an arrangement like an aisle with chapels outside it). Beyond this was the great forecourt of the temple, about 400 ft. square, also with its peristyle and recesses. The temple itself was raised on a podium reached by another flight of steps. The most singular feature is the hexagon court, and if you look at the plan of this with the long portico and two towers in front of it I think you must be struck by its resemblance to the plans of such buildings as the Minerva Medica, at Rome, and San Vitale, at Ravenna, both of which are, however, on a much smaller scale. The long portico with its towers, which was built by Antoninus Pius about 160 A.D., would probably be found to be neither singular nor original if we knew more about Syrian buildings. Herod's temple, erected nearly 180 years earlier, and several others, seem to have had similar porches. Another curious feature at Baalbec, one which is found in other more or less contemporary buildings in the east of the empire, but did not reach Italy until later, is the breaking-up of the entablature into an arch over the middle intercolumniation of the portico, the space being made especially wide for the purpose.

Persia.

Of the buildings of Rome's great rival, Persia, we know but little. Of courts and gates I have found one solitary plan. But the entrance to the palace itself under the Sassanian dynasty was too remarkable to be passed over. It consisted of a large and lofty hall, end-on to the front of the building, but recessed into it and vaulted with an elliptical barrel-vault, the major axis of the ellipse being vertical. There was no outer wall whatever at the front end, so that the appearance was something like that of a huge cave nearly as high as the wall. This entrance hall at Ctisophon was 163 ft. deep by 86 ft. wide and 105 ft. high. At Firouzbabad it was 90 ft. deep and 45 ft. wide, and two apartments not very much smaller opened into it on each side in the same cave-like way.

There is a curious superficial resemblance between the elevations of the front of the palace at Ctisophon and the front of Lincoln Cathedral. It is only superficial, for the great arch at Lincoln is quite shallow, and one can hardly suppose the resemblance anything but accidental.

* Dimensions from Mr. Spiers' paper in R.I.B.A. Transactions, 1891.

Early Christian.

In the first few centuries after the great revolution, when Christianity became the State religion of the Roman Empire, and the capital was removed to Byzantium, architecture, in both the east and the west of the empire, was almost wholly occupied with the building and rebuilding of churches. The last remnant of pagan worshippers were eventually scattered by a destruction of the temples as deliberate and as sweeping as was, say, the destruction of images by the reformers in this country. But before that happened the followers of the new religion were already divided on points of doctrine, and during several centuries, as the balance of authority or popularity swayed from one opinion to another, every church in turn was subject to attack, and was sometimes destroyed. In such circumstances it is not surprising that the churches assumed on the outside something of the forbidding aspect of a fortress. Among other things the entrance to every church was guarded by a broad narthex, or porch, and a spacious forecourt—sometimes, in this style, called an atrium. The latter was surrounded by a high wall with a portico or cloister on the inside, the main object being, without doubt, to provide a refuge for defence in times of need for those members of the congregation for whom there was no room in the church. If the particular doctrine professed by that congregation triumphed, the court was promptly filled again with penitents seeking admission or readmission. All the earlier examples of these courts have either disappeared or been rebuilt, and I can only show you the well-known one in front of the church of St. Ambrose, at Milan, which, though it used to be attributed to the IXth century, can hardly be earlier in its present form than the XIIth. It is not so square in plan as seems to have been usual; indeed, it is a double square. And it has cross-vaults and clustered piers.

The proper place for penitents in times of peace was the porch—or, as we call it when it extends across the whole width of the building, the narthex. Since religious revolutions were frequent, and the penitents on every occasion numerous, and since they were sometimes kept a year or two before being readmitted, one can readily understand the necessity for so much space. The narthex of "St. Laurence without the walls" at Rome is unquestionably made up mostly of materials of very early date. The church was built about 330, with a narthex at the other end. But the orientation was reversed in 578, when a new nave was built and the old narthex apparently built up and converted into a sacristy. It is not unlikely that four of the columns which are spirally fluted, and all the ionic caps and entablatures came from the old narthex. But they all seem too good even for the IVth century, and were probably, in any case, stolen originally from some classic building. The same is no doubt true of the materials, or the most part of them, making up the narthex of Civita Castellana Cathedral. The central arch is an effort beyond the architectural skill, and out of keeping with architectural style, of 1210 A.D., when the building was erected (as is recorded in two places upon it).

Medieval Italy.

But before the end of the XIIth century the spacious portico of the ancient world, which stretched across the whole width of a building, and was part of it, often the chief part, architecturally, was disappearing in Italy. Having given to the architecture of that country such approaches as the porticoes of the Pantheon, St. Vitale, S. Ambrogio, and last, but not least, St. Mark's, it had to give way, in deference to the almost universal poverty of the times, to the porch; a feature proportioned to the door and not to the building. I think it is in Street's "Brick and Marble Architecture in Italy" that attention is called to the fact that the porch is a feature confined to the north side of the Alps. And, though that is not strictly true, the porch has never flourished in Italy. There are plenty of those deeply-recessed doorways, of which it is always hard to say whether they should not properly be called porches. But the porch proper is rare, and, with two or three

exceptions, is only found in the form of a shallow arched hood tied with an iron rod and resting on two columns: which columns often stand on the backs of lions or griffons. This form lasted from the XIIth to the XVIIth century, with changes only in ornamental details. On examination a good many of those attributed in guide-books to the XIIth or even later. The two at Bergamo are of the XIVth. That on the south side of the church bears, according to Street, the date 1360, and the name of the mason. But some, such as the porches of Modena Cathedral, S. Zeno, at Verona, and others, may very well be work of the latter part of the XIIth century. The south porch at Ancona is possibly of that date, but the west one is almost certainly XIIIth century work. If you look closely at the photograph, too, you will see clear indications, at the springings of the arch, and in some wall shafts outside the porches, that it was once a triple porch, with three doors into the church. I think the irrational idea of putting the columns on lion backs must, though some critics will not have it, be borrowed from the East, where the fashion is ancient and persistent. The beast, whether lion or griffin, has often another beast or man in his paws, and they are said to represent supporters of the church, or of orthodoxy triumphing over saracens or heretics—a piece of symbolism which would not have seemed so childish to the ignorant and barbarous folk of the XIIth and XIIIth centuries as it does to us.

The most remarkable of Italian church porches is the gigantic one attached to the church of S. Antonio Piacenza, and called "Il Paradiso." The pinnacles and wheel-window are quaint and, I think, pretty. The size and the form of the structure are unique; but how it could acquire the name of "the paradise" is a puzzle. One can only suppose it was different when first built. The buttresses look as if they were additional. Not impossibly it was stuccoed and enriched with paintings. The only other Italian church porch that I know, and that is worth a passing reference, is at the west entrance to Ferrara Cathedral. Like the last, it is unique; but it is its beauty that makes it so. And it must owe its beauty almost certainly to some French mason who, at a later time, added to the regular XIIth or XIIIth century Italian porch an upper story which, as Street said, looks at first sight as if it had been transported from Northern Europe.

Medieval France.

However restricted one may find the subject of porches when dealing with Italy, the same cannot be said of medieval England and France; where churches and cathedrals afford an endless and varied series of examples, on which, it is the merest platitude to say, the artists concentrated their best work. This section of my subject is, however, so familiar to most of you that I do not propose to go into it at much length.

France claims attention first, on account of its superiority in the richness and number of first-rate examples: and also, I think, on account of its having been rather earlier in the field. The magnificent series of the great cathedral porches allied to those at Chartres and Amiens cannot be equalled or approached by any series of existing works of any age or country; either for richness, for beauty, or for a deliberate and spirited effort to lift the mind of the entering worshipper to higher things. It seems to me that their merit is enhanced by the fact that in outward appearance many of them fail to show as porches. Built between salient buttresses, and surrounded by galleries, parapets, and pinnacles, they are artfully confounded with, and form an integral part of, the front. Instead of projections we seem to see deeply-recessed doorways. This series, with its alternating shafts and statues in the jambs, and its sculptured tympanum and central shaft, probably owes its origin to the XIth or XIIth century portals, of which two famous ones in Southern France, at St. Gilles, and at Arles have survived as samples. In its later developments the coping of the gable parapet came down and joined the good mould at the bottom, and curving upwards ran up into a great finial. And the

space within and around it was filled with light flowing tracery or sculpture. Eventually, as at Tours and St. Riquier, this aspiring moulding was snubbed off, as it were, a little above the top member of the arch, leaving a curiously-shaped panel; and the flamboyant detail melted, almost imperceptibly, into the more classic forms of the François I. style without losing either its richness or its apparent complication.

These triple porches are the typical French Gothic portals, and the telling porch of the little church of St. Maclou, at Rouen, which everyone knows, and which, I think, everyone must admire, may perhaps be considered only a clever variation in plan on much the same theme. There are, of course, other

types; and if among the members of the cycle and camera clubs there are any students of Gothic left: or if they get tired of touring their own country, I can strongly recommend them to the village churches of France. They would find a tour there enrich their minds at no great loss to their pockets. At present, as I want to get on to English work, I will only mention one other French porch—an early one at the ruined church of St. Pierre, near Vezelay. It is a low building, three aisled, of the full width of the church, and almost as much projection. It is groined from slight piers internally, and its form reminds one of the Galilee, at Durham. I shall be glad if anyone can explain its purpose to me.

English Ecclesiastical Gothic.

Among English Gothic porches, none, of course, can touch the great western portico of Peterborough Cathedral. Indeed, notwithstanding its comparative plainness and simplicity, it is at least as much greater artistically as it is physically than the porches of Chartres. The architecture of the Middle Ages cannot show its equal in Europe, and one must always regret that the genius who conceived it is robbed of a just fame by our ignorance of his identity. Unfortunately, if we looked for other English Gothic porches that anyone could think of comparing with the French ones, we should be driven to rely on the Galilees of Ely and Lincoln. We could justly claim that they owe their beauty;

The Haarlem Gate, Amsterdam. (See page 223.)

not to the profusion and the intricacy of ornament on which the French examples largely depend; but to the more solid architectural qualities of restraint in design and an almost Greek refinement of details, especially of the mouldings (the French masons never touched the English in their mouldings). The difference is typical of that between French and English Gothic as a whole; perhaps of that between the characters of the two nations. We should have to confess, on the contrary, that the chief beauties of these two porches are almost lost to the casual observer by being hidden in somewhat dark interiors. That is possibly due to our climate suggesting more strongly an enclosed porch. But it seems typical, too, of our national tendency to seize on a slight practical advantage as an excuse for avoiding display. We call it common sense; but when it is not parsimony it is generally merely the nervousness of a touchy pride which fears criticism. Of our other cathedral porches the most worthy seem to me to be the triple porch at Salisbury, the south transept porch at York, and the south porch at Gloucester.

We can show no English examples richer in sculpture than the south porches of Canterbury and Gloucester cathedrals. And in those cases it is all modern restoration. But supposing it to have been originally equal to, or better than, the best French work; and admitting that at Gloucester it is placed and arranged with admirable taste and judgment: it can never have made these box-like structures worthy entrances to great cathedrals. At Canterbury the architectural lines and proportions are quite uninteresting, if not actually bad. And although at Gloucester the reverse is the case, and the work may justly claim our admiration as a very fine and typically English example, it does not rise much above the level of innumerable parish church porches all over the country. The grand three-story south porch of Burford Church, Oxfordshire, the south porch of Beccles Church, Suffolk, and the well-known south porch of St. Nicholas, King's Lynn, which all belong to much the same period (called in the guide-books the Perpendicular), must have been very nearly as rich and beautiful before their images were destroyed. The north porch of Thaxted Church, Essex, though less sumptuously ornamented, is better proportioned and more satisfying to one's architectural instincts than either.

The south porch of the same church is also interesting on account of its great projection which allows of entrance arches as well as windows in the sides. The south porch of Boxford Church, near Sudbury, is another very fine example of the same period, though only one story high. If one were seeking to classify late English porches, all these, except the Beccles example, might be distinguished by the cornice and parapet forming a low-pitched gable. Whether that means a rather earlier date or only another type does not, perhaps, much matter. But, in the eastern counties, with which I am best acquainted, most of the numerous porches that date from the latter half of the XVth century are finished at the top by horizontal lines. The south porch of Southwold Church is typical, and perhaps the finest example of a class which is very common all over the coast country of Norfolk and the north of Suffolk, and far inland on the borders of the two counties. These porches would be effective in any case on account of the fine proportions of the whole, and of every part. But they owe their richness to the peculiar form of decoration employed, which is produced by letting very thin flakes of black flint into the surface of flat stonework. All the panelling, the tracery, the letters and monograms are formed in this way. The flint flakes are chipped away from the back to form a knife-like edge, which can then be trimmed to shape, and the hollows in which they are set are so shallow as to be scarcely perceptible where the flakes have fallen out. But, owing to the contrast of colour, the effect, so long as they remain, is nearly equal to that of pierced work. The same decoration is applied to other parts of the buildings, particularly to plinths and parapets, and the spaces between clearstory windows; but that is another matter. Very beautiful two-story church porches of a somewhat earlier date are to be found at

Northleach, Gloucestershire, Leverington, Norfolk, and St. Margaret's, Leicester, among other places. The porches without an upper story are usually less effective. But there is a very fine one of the middle period at St. Mary's, Beverley, which is illustrated in Rickman, and some of the early XIIIth century ones, now ruined, such as those at West Walton, Norfolk, and Higham Ferris, Northampton, must have been exceedingly rich internally. The porch of the Temple Church in London is unique, to the best of my knowledge, and forms a class by itself. The typical late English church porch of the larger sort must be referred back for its type and origin to such Norman examples as the north porch of Southwell Minster.

But there is also among village churches a common class of wooden porch of late date which seems to have arisen from the addition of what one may call screen-work to the timber construction of the village carpenter—with the addition of a moulding or two on the arrises of the timbers. Such porches are usually so ruined that the existing in fair condition of a wooden porch of obviously earlier date is rather surprising. If I had not seen the north porch at Boxford myself, I should have been tempted to put it down to some restorer; the more, since it is such an imitation of a stone porch with vaulting and window tracery complete as one does not readily put to the credit (or discredit) of our forefathers. It is probably unique: it must be badly decayed; and it is to be hoped that some young man, with time for such things, will make a careful measured drawing of it at once before it is either pulled down or "restored."

There is one more English church porch that must be mentioned before leaving that branch of my subject, though it is not Gothic. It is the familiar porch of St. Mary's, Oxford. In the present condition of architectural taste I am tempted to characterize it as the most beautiful of all.

The precincts of all great ecclesiastical and conventual establishments were, of course, walled in; and the approaches guarded by gates or gatehouses, having more or less architectural character. A very large number of these remain, especially in our cathedral cities. But the diversity of their forms and characters rather bewilders anyone who tries to describe them, and entirely precludes classification. Between the grand, but heavy and forbidding, XIVth century gatehouse on the hill at Ely, which I suppose most of us know, and the light and gracious late structure at Worcester, with its pelling and its gallery of windows, there is almost every conceivable form, and every degree of ornamentation. Both these have level parapets, but gables are more common, and seem most appropriate when turned to the front. Occasionally they face the sides, and occasionally both front and sides. A large number have but one opening; or had but one originally (a second has sometimes been made in modern times). A few only had two openings, a larger one for wheeled traffic and a smaller for foot passengers (like the holes for the cat and the kitten which legend says Sir Isaac Newton made in his door). The Worcester gate is the only one I can remember with three. As seems natural and proper, the outside is usually plainer or sterner-looking than the other, though where there is a lodging over the gate, as there more often is than not, there is generally a window on the outside for a lookout. I have chosen the Workshop Abbey gate for illustration, partly as being more or less typical, but mainly on account of its gables, which make a good architectural group, and for the incidental interest of some remains of an old cross just outside the gate. Norwich possesses two gates which are of exceptional interest on account of their unusually rich and symmetrical design. The earlier is the Ethelbert gate, built about the last quarter of the XIIIth century, a really fine piece of work, but much spoiled by an incongruous and absurdly ugly modern parapet of flint inlay. The other, the Erpingham gate, built by Sir Thomas Erpingham, who figures in Shakspeare's "Henry V.," if less vigorous in design is almost as elaborately decorative and is not spoiled by any modern addition.

Medieval Cities and Castles.

Of an altogether different class, and

much more formidable, were the gates that guarded the approaches to the castles and cities of mediæval Europe. And of these, again, a much larger number remain even in this country than it is possible to refer to in a single paper. The earliest form of such gates in England is to be seen in the ruins of some of the Norman castles, which were built before any of the fortifications of towns; at any rate, before any that are now left. It consisted of a narrow gateway in a lofty tower, the front being occupied chiefly by two enormous turrets, circular on plan, flanking and appearing to crowd and threaten the gate; as, indeed, they were meant to do. The tower was, of course, crowned with machicolations and parapets. The base was battered to facilitate the attentions which the owner desired to pay to unwelcome visitors. And the gateway was further protected by an iron portcullis, and, except in very inaccessible situations, by a moat and drawbridge. This form of gate persisted in essential particulars in most city and castle gates; and later, in mansion gateways in England up to the reign of Elizabeth, and is to be found even in the XVIIth century.

As time went on the turrets became less important. They were made smaller, or placed further apart, and the circular form was less insisted on. In the Micklegate bar at York, built about 1300, the turrets are quite small, and the lower part is square. At Caernarvon Castle they are polygonal; at Alnwick Castle they are square; at Harstmonceux, the youngest of the English castles (1446), the turrets are fanciful; octagonal below and circular above, with smaller circular turrets standing up within the parapets.

There are few things more picturesque to be seen by the tourist in some of the unspoiled towns of the Continent than the old city gates. I do not envy the man with a brush, a pencil, or even a camera, who could see the Haarlem Gate at Amsterdam (see page 227) and leave it alone, however often he may have seen illustrations of it before. It may be that there is not really much in it in the way of architectural detail, but it groups splendidly; there is the most delicately-graduated light and shade, and there is colour, to say nothing of a bridge and water in the foreground. What more can a man want?

The bridge and the water *do* make a difference. I doubt if people would think so much of the gatehouse at the bridge-end at Prague, which we often see sketches of, if there were no bridge. Many of the old French and German towns, and especially the towns of Holland and Belgium, can boast gates which, in other respects, are as picturesque, but we rarely see drawings of them. Germany is especially rich in city gates, and has even some early Renaissance examples, which are, however, more or less heavy, coarse, and ugly. Our own charming little "Temple Bar" is possibly unknown to some of the younger men; it is worth a journey to Waltham to see.

[The remainder of Mr. Baggallay's paper and some notes of the discussion which followed, will be given next week.]

THE ARCHITECTURAL ASSOCIATION SPRING VISITS:

III.—THE RITZ HOTEL, PICCADILLY, W.

The growing desire for hotel life has in recent years found marked expression in many of the large buildings in the West-end of London. The latest, and in some respects the most important, example is the Ritz Hotel, now nearing completion, of which an inspection was made by a numerous body of members of the Architectural Association on Saturday afternoon, February 24, the occasion of the third spring visit. The party was conducted through the building by Mr. Bishop, who has supervised the entire erection and collaborated with the architects for the work, Messrs. Mewes & Davis.

The most interesting aspect of the building lies in the planning. The main frontage, of some 232 ft., suggests a proportionate depth of site, but when it is seen that the Green Park front is only 87 ft. and that the corresponding return in Arlington-street but 102 ft., the problem of scheming a hotel to conform to the London Building Act and at the same time to show financial justification is one of considerable difficulty.

Accommodation is made for 160 to 180 guests and their servants, in addition to a large hotel staff, and the whole is distributed over nine stories. The entrance to the hotel is placed on the Arlington street side, where the left revolving door will be erected. To the left is the main staircase, while immediately in front is a long corridor or lounge extending to a large restaurant at the other end of the site facing the park; windows and floors are arranged so that a view of the trees in the park may be obtained upon entering. About halfway in the length of this corridor on the left, a top-lighted winter garden is planned opposite to the Piccadilly entrance on the right. This latter entrance is intended to serve the banqueting-hall and private dining-room in the basement, and the restaurant and ladies' dining-room on the ground floor, and thus keeps the hotel and the outside business distinct.

A mezzanine or lower ground floor is wholly a service floor, containing kitchen, sculleries, pantries, and stores, while the remaining parts of the basement not used by diners are set apart for boiler-house, ventilating appliances, ice-making plant, water-pumping house, and staff dining-rooms.

In addition to the departments already named, the ground floor has provision for office, etc., passenger lifts, and six shops in the eastern half of the Piccadilly front.

The upper floors from the first to the sixth contain bed, sitting, and bath rooms and rooms for visiting servants. The principal rooms are arranged in suites extending throughout the north and west façades, so that the whole floor can be let as a single suite, without communication with the main corridor. These servants' rooms, although enjoying the sunny aspect and overlooking the inner court, are placed on the south side of the main corridor in juxtaposition to their respective suites of rooms. Small internal areas provide light and air to the bathrooms and passages. The seventh floor is occupied as staff bedrooms.

Our readers will be familiar with the buildings which formerly stood upon the site, notably Walsingham House and the Bath House Hotel. The new building has a considerably deeper basement, the foundations in certain cases reaching to 36 ft. below street level. Difficulties in drainage arose, so that it became necessary to carry an independent sewer from Arlington street into St. James's street, and the public sewer was entered near Park-lane.

Some interesting methods of construction were utilised to overcome difficulties. For instance, the south wall, adjoining Wimborne House, is carried upon girders cantilevered from an iron grillage foundation some 6 ft. inside the boundary line. This was done to avoid interference with the bases of the walls of Wimborne House. The construction is that of a steel-framed building faced with Portland stone, roofed with asphalt and Westmorland slates; the ground story is built in Norwegian granite. Generally speaking, no wall is more than one story in height, each being carried on a steel girder, so that a wall may at any time be removed for an alteration without affecting the structure above or below.

The introduction of an arcade upon the pavement of a great London street is a matter of importance and arose in quite a natural way. The promoters of the enterprise were desired by the London County Council to set back the new frontage line as part of the general widening of Piccadilly, but the loss of space ruined the financial aspect of the undertaking. The alternatives therefore resolved themselves into the Council acquiring the whole site or giving permission to build over the public footway. The latter was accepted, and the arcade became necessary. The simplicity and strength given to the treatment of the feature are suitable elements in the design. The flatness of the main façade is perhaps devoid of interest, but the strong and massive handling of the stonework is good. The character of the design throughout the building is modern French Renaissance, the desire for which, and, indeed, much other work involving matters of taste, is very prevalent. The interior has the walls of its main stairs, halls, and corridors finished with the popular "stucco" a stone-like rendering, on which artificial jointing is made. There is perhaps an idea of monotony in the effects,

which future gilding may relieve. The ground floor restaurant has interesting marbles upon the walls, but the lower dining-halls, although finished with ornamental plastering, require some colour. The spectator is bored by the perpetual use of the semi-elliptical arch, which is not the most constructive form, although providing easy escape from certain difficulties of internal proportions.

THE SURVEYORS' INSTITUTION.

An ordinary general meeting of the Surveyors' Institution was held on Monday at No. 12, Great George-street, Westminster, S.W., Mr. C. Bidwell, President, in the chair.

The Assimilation of the Practice of Quantity Surveyors.

After the usual preliminary business, a paper was read by Mr. H. J. Leaning, prepared by the late John Leaning, on "The Assimilation of the Practice of Quantity Surveyors." The Chairman, in calling on Mr. Leaning, expressed his own regret and the regret of the meeting that death had prevented the author from reading the paper himself.

The author stated that the importance of the work of the quantity surveyor, the multitude of new inventions connected with building, the specialisation of various branches of the building trade, the preternatural sharpening of the wits of the builder's estimating clerk, and the general rise in the public expectation of what an architect should know, all combined to accentuate the distinction between the architect and the quantity surveyor. There were a number of powerful reasons why the architect should not supply quantities for his own works, perhaps the strongest being that it tended to subvert that impartial treatment of the building owner and the contractor which should be the architect's leading principle, and which (as experience showed) was often seriously impaired by his assuming the position of quantity surveyor. A logical corollary to this proposition was that the quantity surveyor should not practise as an architect. The desire for uniformity in the practice of quantity surveyors throughout the Kingdom was not new, but the movement had hitherto made little progress. The movers in the direction of uniformity had hitherto been occupied mainly in the consideration of the legal relations of the quantity surveyor with the employer, the architect, and the builder; these relations had been pretty clearly settled by legal decisions, and might very well be left to the operation of the common law, but, whether this was so or not, any desirable change in these relations could be best effected by a consensus of opinion and united action by all the quantity surveyors of the Kingdom. The advocates of what had been called uniformity of practice appeared to adopt various views as to the degree and nature of the changes which might be desirable. The Report of the Committee on the Employment of Surveyors (Royal Institute of British Architects, 1872) dealt with the questions of uniformity of measurement, the making the quantities a part of the contract, the appointment of the surveyor, and the supply by the architect of quantities for his own works.

The respected Past-President of the Institution (Mr. Thomas Rickman), in a paper read (1890) before the Sheffield Society of Architects and Surveyors. "On the Present State of Questions Relating to Quantities," had also dealt with questions affecting the quantity surveyor, and Mr. Henry Blackburn and Mr. Henry Northcroft had, in Volume X. of the *Professional Notes*, advocated a combined effort for uniformity, and suggested the form it should take. There were four leading systems in England and Scotland (quantities in Ireland were, he believed, for the most part supplied by English surveyors)—viz., London, Manchester, Edinburgh, and Glasgow. London and the southern counties had no published code of practice. The Manchester Society of Architects published a "general statement of the methods recommended by the society to be used in taking quantities and measuring up works." Edinburgh, as the result of the united deliberations of their "ordained surveyors" and master builders, had published rules and regulations for the measurement

of excavation, masonry, brickwork, carpentry, joinery. In Glasgow, the representatives of the "measures" and the master builders had agreed upon regulations for the measurement of the following trades: Excavation, masonry, brickwork, carpentry ("wrightwork"), joinery ("wrightwork"), glazing, slating, tiling, plumbing, plastering, painting. The Masters' Association of Glasgow and its neighbourhood had also drawn up certain regulations as to the time which should be allowed for the completion of measurements. The architects and builders of Aberdeen had also published a set of suggestions for the measurement and billing of excavation, masonry, brickwork, carpentry, and joinery. Among the causes of diversity of practice were:—(1) The different systems of contracting, (2) the different modes of measurement, and (3) the different arrangement of the bills.

The Different Systems of Contracting.

In London and the southern counties the system of a single contractor for a building was the prevalent one. Quantities were almost always supplied, and might be a part of the contract or not. In the country, although the system of one contractor was the rule, he often contracted with other tradesmen, such as plasterer, slater, mason, plumber, etc., who did a part of the work, although as a rule the architect would not deal with the sub-contractor, and usually knew nothing of him. In Manchester the system of employing one contractor, or a contractor for each trade, or a contractor for several trades (not the whole) was in use. Quantities were nearly always supplied, and might be a part of the contract or not. In Edinburgh the system was similar to that of Manchester—either the groups of trades, as excavator, mason and bricklayer, carpenter and joiner, smith and founder, or in single trades. In Glasgow the system was similar to that in Edinburgh, but the quantities were practically a part of the contract, as the whole was first measured and priced and, after completion, re-measured and priced again at the rates of the original schedules.

Differing Modes of Measurement.

He had prepared a tabulated comparison of the different methods of measurement in London, Manchester, Edinburgh, and Glasgow, which showed the leading differences in the various localities; there were others, but these were sufficient to indicate the task of the reformer. In a paper it was only possible to allude to these in a general way. A few of these, as distinguished from London practice, were as follows:—The practice of making material pay for labour was common, as when the surveyor made no deduction for voids of less than an agreed superficial area. This custom was to be deprecated, net finished quantities of labour and material should be presented in the bill, and everything which had a value should be measured and stated in the bill. The various points of interest were:—

"The general use of the superficial yard instead of the superficial foot or the square of 100 ft.

The measurement of labour to openings and plumbings of angles and jambs.

The measurement of brickwork by the yard instead of the rod reduced.

The separation of various thicknesses of walling and the treatment of deductions.

The more elaborate measurement of stone walling, the reduction to a standard thickness, and the greater number of distinctions therein.

The measurement of stone and labour together by the lineal foot, with sketches.

The numbering of pieces of stone of various shapes, with sketches, instead of measuring the stone per foot cube or superficial, and the labour by the foot superficial or the foot run.

In Edinburgh and Glasgow the distinctions between sizes of stone, and the measurement of every hewn stone, first as rubble, and making no deduction.

The measurement of timbers by the superficial yard, stating their size and distance apart, instead of per foot cube.

Measuring timber and labour separately or per foot run, stating size and labour.

The separation of deals and battens used for carcassing from the timber sawn out of log.

Tiling by the superficial yard instead of the square, failure to deduct certain voids, measurement of cuttings as extra value instead of adding a quantity to the net superficial measurement.

Slatting by the yard, and different allowances for cutting.

The inclusion of grounds with lineal items of joinery.

The general measurement of joinery.

The specific description of various items of scaffolding.

The failure to deduct certain voids in the plastering, and measuring labour to hollows.

The treatment of structural metal work.
Measuring and billing lead per foot superficial and per foot run.
Measuring lead in sinks and cisterns per foot superficial, to include soldered angles.
Lead pipes, including branch joints, etc."

No doubt much of this practice was the result of local custom. In London units of measurement were mainly referable to the way the merchant charged for the material or the way the mechanic was paid for labour only. The components of concrete, sand, gravel, and lime were bought by the cubic yard; stone and terra-cotta by the cubic foot; timber by the load, from which the price per cubic foot was readily derived; deals and battens by the St. Petersburg standard, from which the price per superficial foot was easily calculated; flooring and rough boarding by the square of 100 ft.; lead by the hundredweight. Plasterers' and painters' labour was paid by the yard. Asphalt brick, and tile paving was laid by the yard, etc. On these ground the presentation of the items in their ordinary form was logical enough. Uniformity could only be obtained by taking broad views, ignoring unessential differences, and by the adoption of the principle of describing items in such a way as to be most readily priced by the majority. The author then suggested a few of the compromises which appeared to him to be reasonable, and which might be adopted as being as easy to price as the present. These were not intrinsically better, but they would be evidence that surveyors did not wish to impose their London system intact.

The measurement of the net quantity of labour and materials in every case, the deduction of all labour and materials at voids, and, consequently, the discontinuance of all allowances of superficial quantity of labour and materials to cover the cost of extra labour.

The avoidance by the quantity surveyor of responsibility which was not properly his, as, for instance, stating the nature of the soil.

The concentration in the preliminary bill of all general items when there was one contractor for the whole work.

The adoption of the yard as a superficial unit instead of the foot or the square.

The adoption of the lineal foot for all lineal measures.

Escalator.—Discontinuance of the allowance for slopes or batter, measuring instead strutting and planking, with the proviso "if required."

Bricklayer.—The uniform adoption of the superficial yard as the unit for all brickwork; all, except one-brick walls fair on both sides and half-brick partitions, to be reduced to one-and-a-half-brick thickness.

The measurement of all salient angles per foot run for plumbing.

The measurement of all salient angles of reveals of openings per foot run.

Mason.—The Scottish masons were a class of capable men, and their conclusions about the measurement of stonework were to be respected; a number of their distinctions as to size of stones were, he believed, the result of quarry regulations, but, in a building with much stone in its construction, the small stones would probably tend to balance the extra value of the larger ones.

He did not think the London practice in the measurement of masonry—*i.e.*, the stone per foot cube and the labours superficial and lineal—could be improved upon. By that system the surveyor had done what had to be done afterwards by the estimator when an item was presented in the bill with a sketch. Making the price of masonry include plain beds and joints and preliminary faces would, he thought, be a step in the right direction.

Rubble-walling.—The Scottish practice as to rubble-walling appeared to be reasonable, except in the measurement of all the worked stone, first as rubble and making no deduction for it. He inclined to the opinion that the London practice was simpler and just as easy to price, and, in respect of measuring, the net cubic quantity was superior to an imaginary one.

Tiler and Slater.—Instead of allowing superficial quantity for cutting, the items might be uniformly run and described by the lineal yard, such as "extra on ordinary tiling for hip and valley tiles, including all cutting and waste."

"Raking, cutting, and waste to hip and valley, one side measured, etc."

Carpenry.—Our measurement of carpentry was, he thought, susceptible of improvement.

The uniform adoption of finished sizes, clearer distinction as to fir framed in various ways, the distinction of fir sawn out of log from deals and battens, and the counting of all trimmings (often ignored) would be advantageous. He did not think the billing of timber could be made clearer by any other method than the cubic foot, nor by departing from the principle of categories, nor by distinguishing framing to hips and valleys and similar items, especially in consideration of the fact that a carpenter would readily make a sub-contract for the labour to the carcassing of a whole building at a uniform price per foot cube.

In some parts of the country timber was billed by the cubic foot followed by the description of the scantlings comprised by the total, as, for instance, "800 ft. cube fir framed in plates, floor joists, and bearers (in deal scantlings 4½ in. by 3 in., 6 in. by 2 in., 7 in. by 2 in., 5½ in. by 3 in., 7 in. by 2½ in.)."

Joinery and Ironmongery.—As in carpentry, he advocated the adoption of finished sizes and the substitution of the yard for the square: in other respects he did not think the London method of measuring joinery could be improved.

Plastering.—There was not much to reconcile between the systems. In Edinburgh and Glasgow, apparently, the lathing for plasterer was separated from the plaster float and set, and billed with the carpentry.

Founder and Smith.—The London practice of concentrating the structural metal work into a few totals appeared preferable to the billing joists by the foot run, and took far less time to price, and our general custom of reducing the metal articles to weight was a logical result of merchants' quotations.

Plumbing.—The distinctions of lead work in a well-prepared London bill and its method generally would not, he thought, be improved by the adoption of any of the provincial arrangements.

Glazier.—This appeared to be treated in a similar manner throughout the kingdom.

Painting.—This appeared to be similarly treated everywhere; the provincial method of measuring iron balustrades and sashes and frames over all was not, he thought, to be commended.

Billing.—Before comparing the various forms of bills of quantities, one naturally asked what were the characteristic merits of an ideal bill of quantities. They were, he thought, the following:—

1. Precision of description, which goes far to prevent extras, assists the pricing of items of variation, and preserves the building owner from legal difficulties.
2. Brevity, so far as consistent with clearness of description, because it saves the time of the estimator, who probably prices a large number of bills of quantities in the course of the year, and whose time is usually valuable.
3. Presentation of the items in the form easiest to price, and consequently saving the estimator the trouble of analysis.
4. A settled order of the items for facility of reference.

The degree of detail which the surveyor should adopt required judgment; the measurement of insignificant, almost valueless items—over-refinement in fact—was the temptation which beset the surveyor of exact mind. The difficulty of deciding when to stop was increased by the extraordinary claims made by some surveyors' and builders' clerks, who alleged imperfect descriptions. The expert estimator rejected many refinements as frivolous, and did not price them, but, if surveyors omitted them, was ready enough to make claims for their value. The only safety for the surveyor was a thorough knowledge of prices.

In London practice three documents were the rule—the drawings, the specification, and the bill of quantities, and as a rule the quantity of one kind of material and labour, as "1½-in. four-square-panel door," for instance, appeared in one item, irrespective of its position in the building; the specification settled that.

The preamble to each trade comprised sufficient information as to the materials and workmanship.

In other parts of the country the quantities and specification were often combined in one document. The work in each trade in one

part of the building was kept separate from that in another, under distinguishing headings, as basement, ground floor, first floor, etc., and the specification items relating to each trade were written in the preamble to that trade; the position of the work was fixed by the headings of the separate sections of the bills. The estimator was thus subjected to the trouble of pricing an item of the same kind in a number of different places, and if his tender was unsuccessful he had been involved in the reading of conditions which concerned him by little. In Scottish bills of quantities one saw such arrangements as the following:—Separate sections for the timbers and boarding of each roof or flat, the joinery of particular apartments, an oriel window in all trades except plumber, glazier, painter, etc. The result of these arrangements was to make the bill inordinately long. The majority of the items of a bill of quantities were of the same value, whether in one part of a building or another, and if one rejected the principle of combining quantities and specification the indication of position might as a rule be abandoned.

The practice of getting a separate tender for the work in each trade also contributed greatly to lengthen the bill of quantities, as a number of items must be inserted in the bill of each trade, which in the case of a tender by a single contractor were once for all included in the preliminary bill. In many of the bills the principle—pretty generally adopted in some bills—of ignoring anything under 6 in. in a total, and calling 6 in. or over in a total another foot, was unknown; we saw such items as 5 ft. 9 in., 6 ft. 6 in., 4 ft. 3 in., 3 ft. 2 in., etc.

In addition to these well-known leading systems there were architects all over the country adopting modifications or combinations of them all. A comparison of the relative advantages of a contract with one contractor for all trades and a separate contract for each trade was perhaps irrelevant; but one might say in passing that the London architect preferred the former, because the responsibility for the work was that of one man instead of a number of men, the conflict of interests of the various trades was avoided, the business of giving certificates and the supervision were less troublesome, and the sole contractor was usually a more substantial and responsible man than such as tendered for one trade. Moreover, the large firm commonly did better work than the small man, and was much more likely, once he had begun, to finish it.

Uniformity.

As to uniformity, he thought they would agree with him that settled and uniform practice was a great element of strength to any profession. The divided counsels of London, Manchester, Edinburgh, and Glasgow were sources of weakness to the quantity surveyors as a body. Unity of purpose and action would ensure a degree of influence and consideration far beyond anything to which their order had yet attained, and withal an extension of that good fellowship which was so essential to their efforts. The establishment of unvarying and uniform custom would, beside other advantages, furnish very strong arguments in defence of points of practice which might be questioned. The quantity surveyor had already done much to settle the mechanism of contracting and to smooth and improve the relations of the various parties to a contract. He would deserve well of posterity if he succeeded in reconciling the differences such as they were now considering. Some of the differences between methods of measurement were considerable, some were insignificant. Some of the methods of the London surveyor might probably be readily adopted by the provincial societies, and the London surveyor could certainly use some of theirs with advantage, such as the measurement of brickwork and other work by the yard, measuring labour to openings and reveals and angles and the like. There was a disposition to vaunt the superiority of the London quantities to a degree which was not warranted. The codes of measurement of Manchester, Edinburgh, and Glasgow were, in his opinion, very creditable performances.

The task of the reformer, its successful conduct and completion, would be tedious

and difficult. It would involve the investigation, reconciliation, and adjustment of the various modes of measurement, and the settlement of two forms of bill, one adapted to a contract with separate trades, the other to a contract with a sole contractor. Probably the customary local bill, if well done, was best understood by the local man, but there were few parts of the country where a London bill would be misunderstood, and in many cases it was welcomed. Radical alterations in billing would probably be resisted by builders accustomed to pricing items billed in a particular way—indeed, many of them would find it difficult to price an item presented in a new fashion. It should be remembered that in any attempt which might be made they had to conciliate not only the surveyors and architects concerned in the four competing systems, but also the builders of their districts, and, in the case of Edinburgh, the board of examiners of the Edinburgh, the board of examiners of the ordained surveyors would have to be convinced of the necessity of changes. It should also be remembered that the architect usually appointed the quantity surveyor, and that the concurrence of the architects would be not only valuable, but necessary.

Mr. H. T. Steward, in proposing a vote of thanks, associated himself with the President's remarks, and said that the subject of the paper was one of great interest to those members who practised that part of the profession. There was a difference, and always had been a difference, between bills of quantities for the engineers' and contractors' business and the architects' and builders' business. He had been largely connected with both, and he had found no difficulty in making the necessary differences, and he had not had any complaint of want of uniformity. He thought the same remarks would apply to what might be called the London system and the Midland and North Country system—that was for architects' and contractors' works. If there had been any strong desire on the part of the builders of England for a uniform system they would have heard of it—from the Master Builders' Association or from some other body—and if such a desire existed he would be one to attempt to meet such views. As surveyors, it was not for them to take the initiative. Mr. Leaning seemed to have suffered somewhat from what he called the preternatural sharpening of the wits of builders' estimating clerks and the extraordinary claims made by builders' clerks, who alleged imperfect descriptions. In his experience there were good and bad amongst such a large body as the builders' estimating clerks, and he had known, and did know, some estimating clerks for whom he had the greatest respect, and whom he should be more inclined to call surveyors than estimating clerks, and whom he would be glad to see members of the Institution if there were any means of admitting them. At the same time there were many others of the class at whose hands Mr. Leaning had no doubt suffered; but in his experience the ways and manners of these gentlemen were very much the same now as they were fifty years ago. No doubt accuracy and comprehensiveness of description in bills of quantities were the best means of preventing such claims. It was impossible to deal with all the different points made by Mr. Leaning, but he would refer to a few. As to the practice of making material pay for labour, he did not think that any of them would argue that that was a right principle, and as to the question of measuring by the superficial yard or superficial foot, he did not think it was of very much moment. It could not make much appreciable difference, but if the builders wished them to adopt the superficial yard or any other means, he should be glad to do so. As to the measurement of labour to openings, etc., the only argument in favour of not doing so was that it was not customary. He did not think it would be an unreasonable thing to do. Mr. Steward referred to other points in the paper, and in the course of his remarks he said it was not for a surveyor, in taking out quantities, to take any responsibility upon himself more than that which he was obliged to do in order to translate the drawings and specification into bills of quantities for the builder. If there was any liability, the extent of which was unknown, it was for the surveyor to express it

in words, and if the builder liked to speculate in the matter he was entitled to do so. The same remarks would apply to taking. As to making the price for masonry to include plain beds and joints and preliminary facing, he had set his face against it all his life, and he could give good reasons for doing so. He had devoted a good deal of time in studying Mr. Leaning's comparative statement showing the variations in the methods of measurement, and anyone taking interest in the matter could not do better than do the same. It could be seen at the Institution premises.

Mr. Howard Chatfield Clarke, in seconding the vote of thanks, said that the paper had helped them in many ways. It was not an architect's business to interfere in the matter of quantities, and he did not do it himself, and it was not a quantity surveyor's province to become an architect; there was room for both. He never made quantities part of the contract, but he made the drawings and specification connected with the contract. As to extras, on the minutest detail there were often claims for extras, and on some jobs quantities were taken floor by floor, and that was a good system both to builders and employers. He was glad that the paper had been read, as there was an idea about that the Institution had not done as much for quantity surveyors as it could; but he did not admit that.

Mr. E. J. Burr said that more progress had been made in the matter of uniformity of contract than some people realised. He knew north-country contractors who told him that the sets of quantities they liked were sets of London quantities. It was not necessary to level down to the north-country practice, which was not so good as the London practice, and if they adhered to the London practice they would convert the whole country to it. But it was a doubtful advantage to have a very close uniformity of practice; a little individuality was wanted. They did not want to be measuring machines, and they wanted to use their brains for the good of the profession. They wanted uniformity in essentials, and not in unessentials.

Mr. A. J. Gate said that the paper they had listened to was an excellent one, and in common with everyone else he was sorry the author had passed away. The paper was carefully thought out, and was by a man who knew what he was writing about, and he (the speaker) agreed with all of it. In the *Builder* for April 22, 1905, appeared a report of a meeting of the Quantity Surveyors' Association, at which Mr. A. G. Cross read a paper relating to matters affecting quantity surveyors, and at that meeting he (the speaker) made some remarks which might very well be read in connexion with Mr. Leaning's paper. Mr. Gate then read our report of his remarks on the occasion referred to. Proceeding, he said that what he said then he said now. Mr. Leaning's paper began at the wrong end; assimilation must be led up to by a reform of our London system. As an illustration of how the London system varied, he could refer to what Mr. Steward said was his practice in London after fifty years' experience. Mr. Steward said it was not the duty of the surveyor to save the builder from risk—that the builder must take all risks, but he (the speaker) with about forty years' experience, did not believe in that at all. He found out what a risky piece of work would cost, and he put in a money provision for the amount. In London there was no recognised and followed system of measurement, and that was a disgraceful fact. Forty years ago there was, and it was a good and thorough system, and it was followed by the best men of the profession. London surveyors generally were then brought up in that system, the money premium to learn which was from 200 to 300 guineas, and unless a young man had been fairly well educated no surveyor would take him into his office at all; but once in the office they were taught the system thoroughly. He need not tell them how and where, nowadays, most quantity surveyors came from and how they got into the profession. They did not learn their profession; they picked it up from textbooks, some of which had better never have been written. Who was to blame, and how was that state of affairs to be remedied? If they were going to assimilate they must level upwards. For thirty-five years that Institution had been the examining body in

England for surveyors, and during that time it had passed into its ranks hundreds, he might say thousands, of surveyors, some by examination, some not, and until the last two years there had been no other body for quantity surveyors at all. Two years ago the Quantity Surveyors' Association was established, and since that time quantities had received more attention in the Institution.

The Chairman said he must ask Mr. Gate to keep to the subject of the paper. They would not discuss the education of the quantity surveyor.

Mr. Gate said he could not properly discuss the subject without doing that. The Institution being the examining body, they must be held responsible, to some extent, for the present state of affairs. If they were to have a London system of quantities, where were they to look for it if not to the members of the Institution, and if their mode of doing work was not the London system, where was it to be found? Mr. Gate then gave instances of the system of some London quantity surveyors, and said he was not prepared to follow that way, and until these abuses were remedied they must not talk to the provinces about assimilation; they must work for an assimilation at home. The Institution was faced by four alternatives:—(1) Either the surveyors of the present day had not found the examinations good enough to prove them competent, and a large number of the members were not competent when they passed the examination, (2) or they had been passed into the Institution without examination although incompetent, and could not have passed a proper examination, (3) or, not having passed a proper examination, and having passed a proper examination, they were yet scamping their work by underselling the profession, and taking work at prices which made it impossible for them to do it properly at the price. The fourth alternative was even worse, and it was that there were men with F.S.I. after their names—which letters induced the innocent public to think those men were thoroughly competent—using those letters to obtain work which they did not do themselves but farmed out to incompetent men—a disgraceful system of sweating. Therefore, assimilation must begin by putting the London practice in order, and when the Institution moved in the matter they would find a useful ally in the Quantity Surveyors' Association.

Mr. C. J. Mann said it was desirable, if possible, to get uniformity, but it would be difficult to get it, and it would lead to a great deal of trouble in those cases where it would be necessary to lay alterations in their system before the builders. He thought the London methods were far more precise and suitable and satisfactory than the provincial methods; therefore, he should say that it would be for the provinces to assimilate their method to the London one rather than that the London system should be assimilated to the provincial one. He should be pleased to join with others in discussing some alteration in that direction. They should look forward to the gradual survival of the fittest in the matter.

Mr. G. Corderoy said he thought that textbooks had their uses, though it was a mistake to depend entirely upon them. As to the abused examination, he should like to say a word for it. It could not be regarded as a substitute for office training, but a stimulus, and a valuable stimulus to students properly framed. They could not keep out the man who was crammed, and that was the difficulty of all professional examinations. It was not likely that in a large profession like theirs all would be of equal ability and standing, but the great thing the Institution had to do was to look after character, and it was character which was the great safeguard for good and honest work. He did not think uniformity was of much importance, and they should suit themselves as far as possible to the locality where the bill of quantities was to be used. If they could adopt the metric system in connexion with quantities he thought it would be a great advantage, and the Institution would confer a blessing upon them if it could get the metric system adopted. The varieties of work were so great that to attempt a uniform standardisation, or to write a standard bill of quantities, was beyond the powers of one man or a body of

men; the document would require skilled interpretation, and would lead to many arbitrations. He differed altogether as to one part of the paper—i.e., the suggestion that the method of measurement should follow the practice of the merchants. Surveyors' methods of measurements had no reference to that at all, and all they were concerned with was the material after it left the merchant's hands and had got into the hands of the contractor.

The vote of thanks was then put to the meeting and heartily agreed to.

Mr Leaning, in reply, said he would deal with the points raised in the discussion in a written communication.

It was announced that the next meeting will be held on March 12, when Mr. W. Woodward will read a paper on "The Means of Locomotion and Transport in London"—a paper on the Report of the Royal Commission on London Traffic.

The meeting then terminated.

The following is Mr. Leaning's written reply as communicated to the Secretary of the Institution:—

"I gladly accept the opportunity offered by the President of replying to the points raised in the discussion on my father's paper, and need hardly say in doing so how much I appreciated the kind things that were said about him.

With all deference to those older members of the profession who spoke, I cannot help expressing my great surprise at their attitude on this question. Although this subject has been mooted for so long, there has never before been a discussion in this Institution on the subject. Now that we have had one it is clear that no progress is likely to be made towards the objects for which my father contended in his paper until the need for the reform is more generally felt.

The principal objections made are as follows:—

1. That if it were necessary, the builders would have long ago agitated for it.

2. That it would result in a sacrifice of individuality on the part of members of the profession.

3. That it is impossible to produce a standard code of measurement.

In reply to the first objection the London builders would be hardly likely to concern themselves in the matter so long as there was reasonable uniformity in the London method. The chief difficulties which arise through the want of uniformity occur when London bills are circulated in the provinces and *vice-versa*. I know an authentic case where a bill of stonework according to the London system was returned by the Yorkshire masons as being quite incomprehensible to them, and the whole of the work had to be done again according to the local custom.

Want of co-operation between the master builders seems hardly a sufficient reason for persistence in the chaotic methods now prevailing. After all, the builders themselves, not being surveyors, cannot dictate to us, and as they probably profit quite as much as they are inconvenienced by it, they are quite content to look on and wonder what it all means. The men who would be most likely to agitate are the builders' surveyors, whom Mr. Steward so justly commended, but who, as he stated, have little or no voice in the affairs of surveyors as a body. The fact that four provincial societies should have found it necessary to make the attempt is a strong argument in favour of such a course, and I think it is only because London is so heterogeneous that nothing has been done there.

The second objection is a very English one, and reminds one of the case of the farmers, among whom for this same reason co-operation of any kind has entirely failed. However pleasurable the exercise of one's individuality may be, this seems hardly the place for it, and it is surely a more praiseworthy thing to sacrifice one's peculiarities, when they can be shown to be such, for the sake of the general good.

If the replies to these two objections are valid the third objection should not stand in the way, for it seems to me merely a question of determination and work. When one sees what has been done in this direction in France, as in the *Série-des-Prix* of the various municipalities, I think it is mere confession of weakness to say that it is impossible to standardise our work. I

entirely agree with Mr. Gate that the differences in practice in the London system must be settled before anything can be done. A few of these were presented by Mr. Alfred Roods in Volume IX. of the "Notes," page 156, and they might be very usefully extended to the other trades, when I am sure the necessity for a London code would be evident to everybody, and I feel that if such a code is not taken in hand by our Standing Committee at an early date it will be done by some other body, and that, I think, will be a slur upon this Institution.

Until we ourselves agree it seems futile to expect to agree with our provincial fellows, but with such a code as is now suggested London surveyors would be fully prepared for a conference with the provincial societies.

The Institution has recently expressed itself anxious to advance the interests of quantity surveyors, and I venture to suggest that some report on this question might be issued by the Committee at an early date, as I feel convinced that the feeling in favour of such a movement is much more general than the discussion might lead one to suppose."

THE APPOINTMENT OF DISTRICT SURVEYORS.

On this subject the council of the Institute of Architects have addressed the following letter to the London County Council:—

"9, Conduit-street,
February 23, 1906.

TO THE CHAIRMAN AND MEMBERS OF THE LONDON COUNTY COUNCIL.

MY LORDS AND GENTLEMEN,—

The attention of the council of this Institute has been directed to the question of certain changes which are in contemplation by the London County Council with regard to the terms of appointment of district surveyors under the London Building Act.

From the report of the proceedings of the London County Council published in the public press it appears that the original proposal of the Building Act Committee involved, *inter alia*, a reduction in the number of surveyors and the substitution of fixed salaries in lieu of fees.

This proposal, it would appear, did not meet with general approval, and the matter was accordingly referred back.

As the subject is one of considerable importance not only to the architectural profession, but also to London generally as a city and community, the council of this Institute, having given the matter their careful attention, desire me to place before the members of your honourable Council certain views which appear to them worthy of consideration.

As you are probably aware, the Legislature, in dealing with the building laws of the metropolis, has by a long series of enactments extending from the time of Charles II. deliberately and uniformly provided that the administration of those laws should be in the hands of trained and experienced professional men, who in the pursuit of their craft as architects have acquired practical knowledge of the various changing problems which arise in designing and adapting buildings to the manifold conditions which have to be met in a city of such vast size and importance as London, especially in the more central and congested districts devoted to mercantile purposes, upon which its prosperity so largely depends.

Under such supervision was London rebuilt after the Great Fire; under such supervision has London grown and developed; and under such supervision is a large proportion of the building work of the metropolis carried out at the present time.

The council need hardly dwell on the importance which this Institute attaches to the preservation of this system, and the advantages which accrue to members of the profession in having the advice and co-operation of a colleague trained in his art and with a full knowledge of the statutes relating to it.

Such co-operation has worked well in the past, and in the opinion of this Institute to the advantage of the owners and occupiers of every class of buildings in London.

It is therefore with a full sense of responsibility that the council of this

Institute would urge upon the London County Council the desirability of preserving in its integrity a system which has obtained and endured through many reigns with the full sanction and authority of Parliament.

To this end they would suggest that the disability which has been imposed in the case of some of the later appointments should no longer be enforced, and that in future all surveyors acting under the provisions of the London Building Act should be practising architects.

I have the honour to be,
My Lords and Gentlemen,
Your most obedient servant,
W. J. Locke, Secretary."

Illustrations.

THE QUEEN VICTORIA MEMORIAL, LIVERPOOL.

THE Queen Victoria Memorial in Liverpool, which we illustrate to-day, stands at the junction of Lord-street, Castle-street, and James-street in that city.

Its general plan, as will be seen, is circular, with four semi-circular bays and four flights of steps. These steps lead to a circular platform, around which are four groups representing Education, Commerce, Agriculture, and Manufacture; and in the centre is a dome supported by sixteen Ionic columns. On the dome itself stands the figure of Fame. Round the base of this dome are four figures representing Justice, Peace, Charity, and Wisdom. Beneath the dome stands the statue of the late Queen, under a flat-domed ceiling of plain gold mosaic.

The whole of the masonry has been carried out in Portland stone by Messrs. W. Thornton & Sons under the direction of the architects, Professor Simpson and Messrs. Willink & Thicknesse. The sculpture, which is in bronze, is by Mr. C. J. Allen. The figures on the dome have been cast by Mr. A. B. Burton, of Thames Ditton; the central statue and the remaining groups by Messrs. J. W. Singer & Co., of Frome, and the lead vases, measuring 2 ft. 8 in. in diameter, have been made by Messrs. Thomas Easley.

The outer diameter of the circle is 113 ft., including pavement, and the height to the top of the wings of Fame 64 ft. The statue of the Queen is 14 ft. 6 in. high.

DESIGN FOR A SKEW BRIDGE.

THIS is the design which gained for its author, Mr. George Nott, of Leicester, the Grissell Medal of the Institute of Architects this year.

The Grissell prize consists of a gold medal and ten guineas, and we believe we are correct in saying that it was founded specially to promote the study of construction, though we observe that the Institute Calendar contains no statement on this point; mention is made of the objects of several other prizes, but not of the object of this one. It would be better if a word or two were inserted on this point in future issues of the Calendar.

Mr. Nott's design was unquestionably the best of those submitted, especially in regard to the fact that it combines good architectural design with constructional study.

The author sends us the following notes in reference to his design:—

"The conditions of this competition leaving me an almost entirely free hand, my aim was to produce a scheme which should be quite simple and yet monumental in character.

The approaches seemed to demand almost as much consideration as the appearance from the river, and by placing the pavilions at right angles to the axis of road the chief architectural difficulty was overcome, the inequality of distance between the pavilions and pylons on either side being more or less unnoticeable both from the river and the approaches.

No great difficulty presented itself constructionally, with the exception of the determination of the external loading. The latest available information regarding the weight of a crowd was taken as the data for the first test, and that of modern haulage traffic for the second, the latter being a severe one.

It may be noted that, following the practice of some of our best bridge engineers, nothing was added to the actual dead weights of the above loads as an allowance for

CALCULATIONS FOR STABILITY OF ARCH AND ABUTMENTS

GENERAL NOTES
 ONE FOOT OF THE WIDTH OF ARCH AND ABUTMENT (3.7) HAS BEEN TAKEN AS UNIT FOR CALCULATION. IN NUMBER OF VERTICAL LINES FROM POINT TO POINT THROUGH ARCH AND ABUTMENT OF CALCULATION ONLY.

TEST NO. 1.

DATA & TABLE OF LOADS IN CWT'S ETC. TOTAL LOAD 2861 cwt.

NUMBER	A	B	C	D	E	F	G
WEIGHT OF CROWN	120	120	120	120	120	120	120
WEIGHT OF SPAN	24	48	72	96	120	144	168
WEIGHT OF ARCH	24	48	72	96	120	144	168
WEIGHT OF VERTICALS	20	40	60	80	100	120	140
TOTAL TO 14. VERTICALS	172	344	516	688	860	1032	1204

THE LINE OF RESISTANCE DUE TO THE ABOVE LOADS LIES ENTIRELY WITHIN THE ARCHES. THE ARCH IS THEREFORE STABLE AGAINST FAILURE BY ROTATION. FOR CALCULATING AND RECORDING RESULTS TO TEST NO. 2.

TEST NO. 2.

DATA
 THE FACTORIAL LOAD IN THE TEST IS THAT OF A CROWN UNDER A 30° TILTED LOAD. CONSIDERING THE ARCH AS A LEVER, THE POINT OF LEVER IS AT THE POINT OF LEVER. THE ARCH IS THEREFORE STABLE AGAINST FAILURE BY ROTATION. FOR CALCULATING AND RECORDING RESULTS TO TEST NO. 2.

TABLE OF LOADS IN CWT'S ETC. TOTAL LOAD 582 CWT.

NUMBER	A	B	C	D	E	F	G
WEIGHT OF ARCH	24	48	72	96	120	144	168
WEIGHT OF SPAN	24	48	72	96	120	144	168
WEIGHT OF VERTICALS	20	40	60	80	100	120	140
TOTAL TO 14. VERTICALS	172	344	516	688	860	1032	1204

THE LINE OF RESISTANCE DUE TO THE ABOVE LOADS LIES ENTIRELY WITHIN THE ARCHES. THE ARCH IS THEREFORE STABLE AGAINST FAILURE BY ROTATION.

STABILITY AGAINST FAILURE BY CREEPING:
 FROM TESTS MADE IN TEST NO. 2 THE TRUST BY ABUTMENT IS FOUND TO BE 25 TONS ACTING AT LOWER EXTREMS OF THE ARCHES. THE ARCHES ARE THEREFORE STABLE AGAINST FAILURE BY CREEPING.

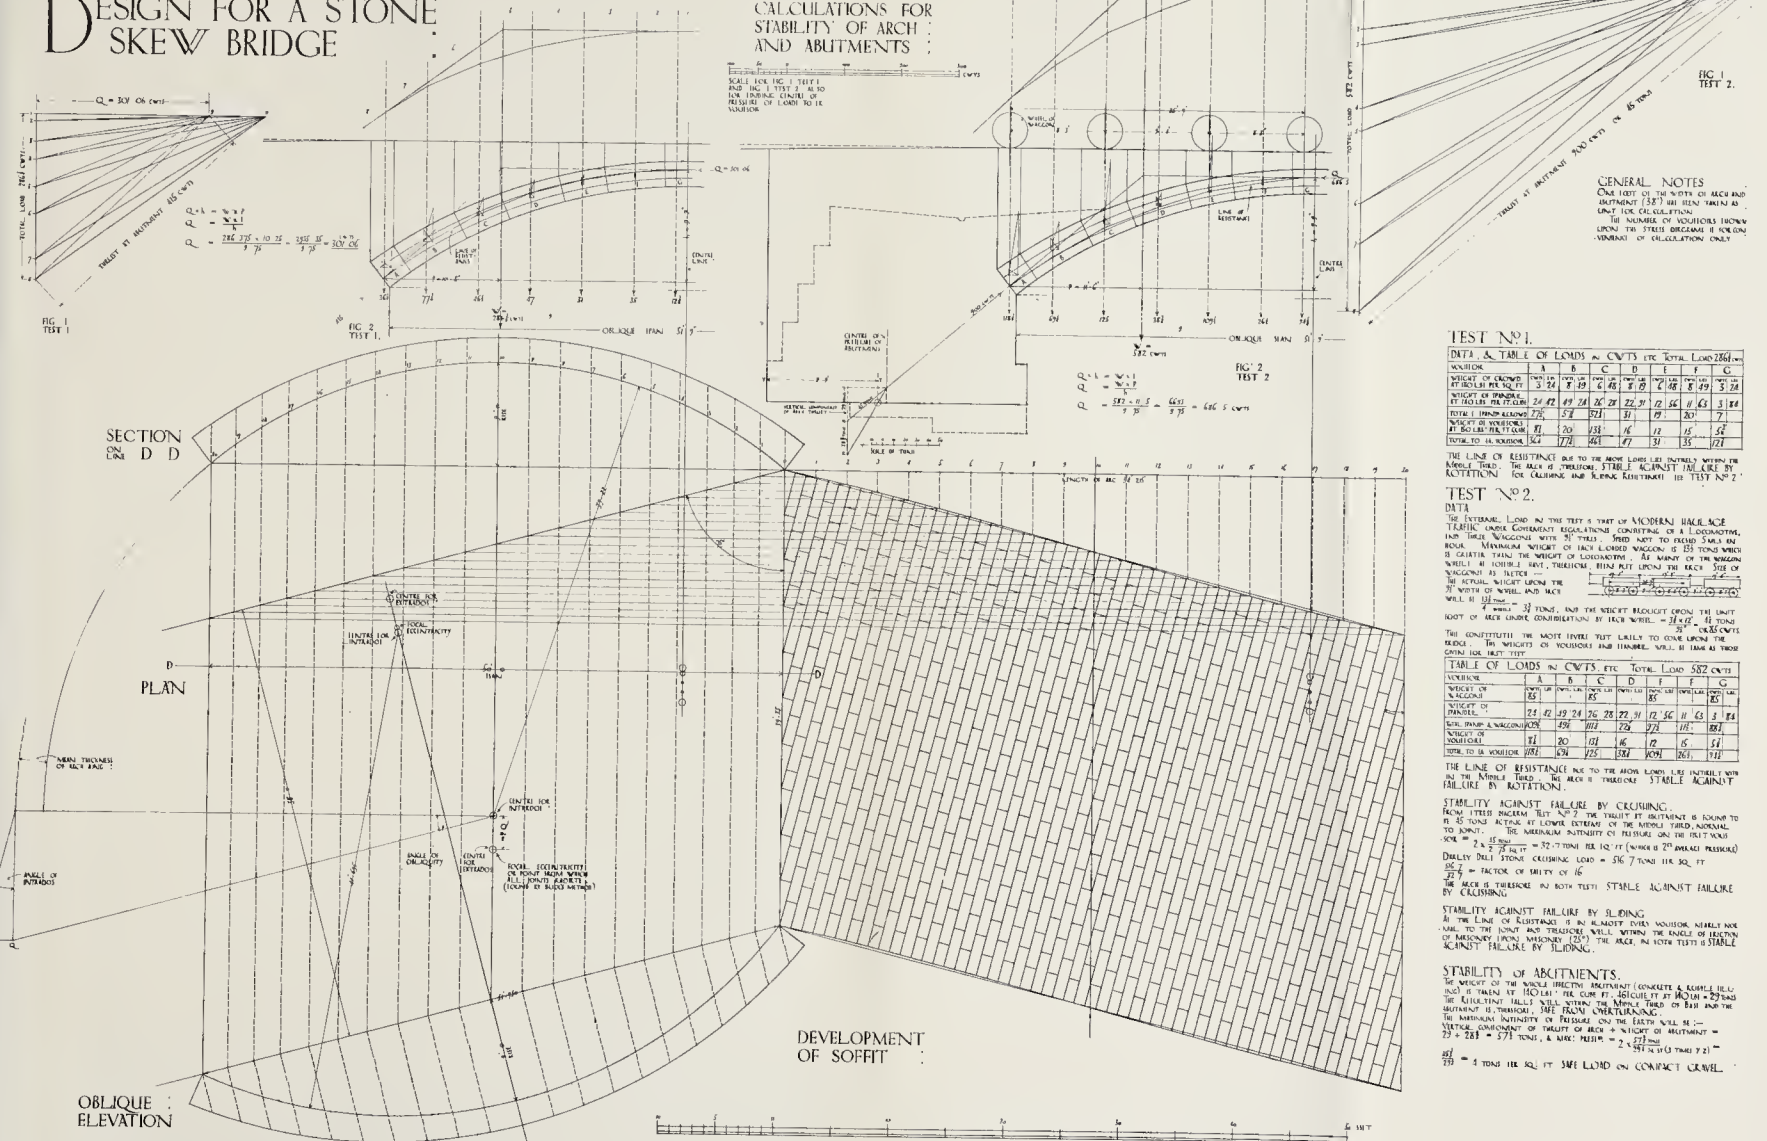

STABILITY AGAINST FAILURE BY SLIDING:
 AT THE LINE OF RESISTANCE IS IN A POINT OVER VERTICAL LINE OF ARCHES. THE ARCHES ARE THEREFORE STABLE AGAINST FAILURE BY SLIDING.

STABILITY OF ABUTMENTS:
 THE WEIGHT OF THE WHOLE BRIDGE ARCHES (CONCRETE & STONE) IS 2861 TONS. THE WEIGHT OF THE WHOLE BRIDGE ARCHES (CONCRETE & STONE) IS 2861 TONS. THE ARCHES ARE THEREFORE STABLE AGAINST FAILURE BY ROTATION.

ibration, as was at one time customary in assigning road bridges. The whole of the calculations involved are given as concisely as possible upon the drawings."

SOUND-PROOF PARTITIONS.

The construction of a partition which shall be both sound-proof and fire-proof and at the same time thin and inexpensive is a problem which many inventors have attempted to solve, but not always successfully. A report of tests made by Professor L. Norton, of the Massachusetts Institute of Technology, has recently reached us, and will be of interest to British architects, as one of the five partitions tested in America do not differ materially from certain kinds used in this country. The relative efficiency regards non-conductivity of sound is shown by a scale ranging from 50 to 100. The lowest place is given to the 2-in. solid partition of metal lath and plaster. The partitions of 1-in. "Keystone" plaster blocks and of 2-in. "National" terra-cotta blocks, both of which were plastered on both sides, are bracketed together, the index of efficiency being 40. Two-inch and 4-in. "National" partitions follow at 45 and 50, and the latter figure is also given to the 3-in. "Keystone." A double partition of 2-in. "Keystone" blocks with a 2-in. air-space between them had an efficiency of 60. The remaining tests showed the advantage obtained by the use of paper, felt, and "quilt." Two double partitions constructed of 2-in. steel studs (staggered in plan), and covered with metal lath and plaster on both sides, one partition having a sheathing of water-proof paper between the studs and the other a sheathing of felt and paper, had an efficiency of 75. Partitions made with steel channels and covered on both sides with felt, 4-in. "Sackett" plaster boards, and a thin coat of plaster ranged from 80 to 85; partitions made with steel studs (staggered on plan) and covered on both sides with Cabot's sheathing quilt, metal lath, and plaster had an efficiency of 85; and a similar partition with an additional layer of quilt placed between the studs attained the full number of marks, 100. Professor Norton says that "the insulating property of some of the partitions was so good that not even the blare of a cornet . . . could be heard through the partition except by careful listening within a few inches of the wall." If greater resistance to fire is required, the quilt can be used between double plaster blocks, as in the Conservatory of Music at Boston, Mass.

EFFLORESCENCE ON BRICKWORK.

MR. S. SMITH, the clerk of works of the Technical College, Glasgow, sends us the following communication relative to an examination of samples of efflorescence recently made at that college:—
Although generally attributed to the action of the mortar that has been used, the main cause of the efflorescence on brickwork is the presence of alkalies (soda and potash) in the clay from which the brick was made. In the higher grade clays, such as fire-clays, the felspar, which was the original form of the clay, has been so completely weathered that there is very little, if any, trace of alkalies. It is in the brick earths, from which the terra-cotta bricks are made, and the lower grade clays, in which the felspar has not been so completely weathered, that the alkalies are found.
At the New Technical College, Glasgow, the efflorescence was scraped from off two different brick walls and examined.
The first sample was taken from a dado wall in one of the staircases, which was faced with terra-cotta brickwork. When tested chemically, with the help of the spectroscope, it was found to consist of carbonate of sodium, with traces of carbonate of potassium and sulphate of calcium.
The second sample was taken from a wall in the basement, built with bricks made from composition of shale and clay. There was only one patch of efflorescence on this brickwork. The brick at this place showed signs of having been soaked with the water which had drained from the concrete of which the filling was composed. A chemical examination of the substance proved it to be largely composed of sulphate of calcium, with a

trace of carbonate present, probably as sodium carbonate, the spectroscope showing the presence of sodium.

The efflorescence on the terra-cotta brickwork would be caused by the carbon dioxide of the atmosphere acting upon the alkalies in the bricks, converting them into the carbonates of sodium or potassium, and the calcium sulphate present would be the product of a combination between the sulphur dioxide in the atmosphere with subsequent oxidation, and any deposit of lime that might have been left on the face of the brickwork by the moisture which had evaporated or drained from the mortar.

The efflorescence on the composition bricks can also be accounted for by the latter cause; the sulphur dioxide acting, as before, upon the deposit of lime left by the water from the concrete, had converted it into sulphate of calcium.

Where the brickwork is exposed to the rainfall, the efflorescence is washed off, and it will gradually get less as the alkalies present in the bricks are progressively removed. Where the brickwork, however, is in the interior of a building there is no rainfall to wash away the efflorescence, and to keep it from becoming unsightly it has to be washed with a plentiful supply of water.

As it is not always convenient to do this, the brickwork should be washed with a diluted solution of hydrochloric acid to clean off any dirt or lime which may have been left on, and which would help to form the sulphate of calcium. Wash again with clean water, then when dry give the brickwork a coat of raw linseed oil. The coat of oil will effectually prevent further action between the carbon dioxide and the alkalies, and thereby put a stop to the efflorescence."

CARPENTERS' HALL LECTURES: GREEK TEMPLES AND RUINS.

The second of the present series of spring lectures on matters connected with building, arranged for by the Worshipful Company of Carpenters, was delivered on Thursday last week in Carpenters' Hall, London Wall, by Mr. A. Evan Bernays, M.A., whose subject was "Greek Temples and Ruins." The Right Hon. Lord Addington presided.

The lecture consisted of a passing reference to a number of temples and ruins, some fine lantern slides of which were shown upon the screen. The first views shown were of Delphi and the Sacred Way leading up to the temple. The stones of the Sacred Way—some 2,000 years old—had grooves cut in them, said the lecturer, to prevent the feet from slipping, for Delphi is situated high among the rifted hills. In three special ways the religion of the Greeks showed itself at Delphi—i.e. (1) by mottoes carved on the temple was taught the lesson of self-control: "nothing in excess"; "know thyself"; (2) by predictions of the future; (3) by stories of the miraculous power of the gods. Little was left of the temple, but we could see something of the impressiveness of the site. When the ancient Greek went up to the temple he went for amusement as well as for worship, as the remains of the theatre showed. Whether there was a raised stage or not was a question on which thousands of pages had been written, but he did not intend to deal with that now. The theatre was open to the sky. Many popular books stated that the theatres were so skilfully built that every word spoken on the stage could be heard in the back rows, and this was certainly true, though the purity of the air had much to do with that. While at Delphi he made some experiments, and he found that every word spoken in the back rows of the theatre could be heard on the stage.

At Athens, the principal building was the Parthenon, and a question that might be asked was, how is it that the building lasted unharmed from the 6th century B.C. to the XVIIIth A.D.? It was the chief temple in the chief city of Greece, and Christianity marked its triumph over paganism by turning the building into a church, and it remained a Christian church until 1460, when it became a mosque. In the whole of the Parthenon there was scarcely a straight line, and it was "optical corrections" like that of the curvature of the stylobate which helped to make the beauty of the building what it is. The same tireless devotion to detail

which the mediæval mason gave to the elaboration of a cathedral was given by the masons of ancient Greece to their temples. The aim of the Athenians was perfect symmetry and perfect harmony—complete subordination of part to whole. Another building in Athens to which the lecturer drew special attention was the Theseum and the triglyph projections, which showed that the Greek temple was indebted for its design to the wooden temples made by the carpenters of a previous time.

Among other places visited by the lecturer were Ephesus, Pergamon, Halicarnassus, Rhodes, and Cos. Pergamon was situated high above the plain, about twenty miles inland from the coast of Asia Minor. The great altar of Zeus, on which 100 oxen could be sacrificed at once, was perhaps the largest altar in the ancient world. Another interesting ruin was the enormous theatre.

A little south of Miletus there stood a temple of Apollo, which Pausanias mentioned as ranking among the finest of all the temples in Ionia after the great temple of Artemis at Ephesus. It was called the oracle of the Branchidae, and the lecturer showed views of some of the remains.

In referring to some red and blue colouring which was still to be seen on a column, he said that it was curious that, while we were apt to imagine a typical Greek temple or Gothic cathedral as showing surfaces of plain stone or marble, the men who made them in each case used bright colour to bring out and emphasise the architectural features.

Some very interesting views of the volcanic island of Thera were shown, the island rising sheer out of the sea and being crowned with white stone and marble houses. There were some of the oldest traces of human habitation in the Ægean, and some stone beams where the construction was quite primitive, and clearly showed but a recent evolution from wood beams.

A hearty vote of thanks to the lecturer and the chairman brought the proceedings to a close.

THE BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION: ANNUAL DINNER.

The annual dinner of the Provident Institution of Builders' Foremen and Clerks of Works was held on Saturday last week at the King's Hall, Holborn Restaurant, Mr. Henry Holloway, J.P. (Messrs. Holloway Brothers), presiding. There were also present:—Messrs. C. Ansell, J. Carmichael, Scott Balfour, J. Bolding, C. Bussell, T. Costigan, F. L. Dove, F. Higgs, J. S. Gibson, T. Holloway, Spencer Green, J. Marsland, C. H. Mabey, D. W. McInnes, G. M. Nicholson, W. Phillips, W. Reason, J. P. (Mayor of Finsbury), Alex. Ritchie, E. H. Selby, H. B. Sanders, J. Beer, J. R. Cochran, F. Hann, J. Stapleton, and a large party of members and friends, the company numbering 644.

The loyal toasts having been honoured, The Chairman proposed the toast of "The Provident Institution of Builders' Foremen and Clerks of Works." He said that the fact of there being a record attendance that evening showed that the Institution, though an old one, was not by any means losing its popularity; in fact, he did not know of any other institution connected with the trade which seemed to be so popular as the Institution, and he hoped it would continue to be prosperous. It was a charity which must appeal to many of them very strongly, and when he remembered its objects he felt it ought to appeal, in the first place, to master builders. By its very title the Institution showed that it was possible to have harmonious union between clerks of works and general foremen, and master builders were delighted that it was so, and that it was possible to have these relations not only in the Institution, but also on the works. Another object the Institution had was to maintain the respectability of its members, and he supposed that was necessary in these degenerate days, though he believed, speaking generally, that the builders' foremen and clerks of works were as good a set of men as any to be found. The Institution also had an old age pension fund, and he was delighted to know that it was doing such

splendid work for members who had reached an age when they were no longer able to follow their calling in life, and who were then assisted in a substantial way. The Institution rendered assistance to the aged and infirm, made provision for widows and orphans, and gave temporary relief under special circumstances when assistance was needed. The pensions granted to members amounted to 17s. 6d. per week to a member who had passed the age for following his employment; of 7s. per week for a widow, with an allowance for orphans. These were the maximum allowances, and if the funds fell short the weekly payments had to be reduced; but at the present time, he was happy to say, the maximum amount was being paid to all pensioners on the funds. The amounts were not excessive, and yet the members of the Institution depended on outside help to continue them, for their own contributions were insufficient for the purpose. This was the only appeal they made, and on behalf of those members of the Institution who had passed work, he appealed to all those who could assist to give, and thus make happy the last days of those who had served them.

Mr. John Beer, secretary, whose name was coupled with the toast, responded, and in doing so he ably supported the chairman's appeal. When he became secretary the pensioners were paid 12s. 6d. per week, which amount was subsequently increased to 15s., and later on to 17s. 6d.; but he was anxious to make it 11. per week, and 10s. per week for widows.

Mr. F. Higgs, in proposing the toast of "The Architects and Surveyors," said that architects were the aristocrats of the craft, but there were many different kinds of architects. At one time he wished he had been an architect, but he had got to feel differently now, for if there was anything wrong with a building the architect was generally blamed. Shakespeare must have been thinking of architects when he wrote:—"The evil that men do lives after them."

Mr. J. S. Gibson, who responded for the architects, said he was rather amused to hear Mr. Higgs refer to architects as the aristocrats of the building world. It was rather amusing for an architect who usually had to put up with the little eccentricities of his client, and to act as a sort of buffer between the demands of a client, which were often onerous and difficult to fulfil, and the desires of a builder, which were always, of course, just and equitable. Speaking of what he called the different portions of the building world, i.e., the architect, the builder, the clerk of works, the builder's foreman, and the workmen, he said that they were all really part of one organisation. Each had to do his little, and the whole was fitted together, dovetailed, like some puzzle, and the result should be what was wanted. It was a matter of little moment whether they differentiated—whether one or the other did the greater or the lesser part; but it was the object of all to do their work well, to do it in such a manner that it would be a pride to them and a pleasure to those who came after them. Such gatherings as that tended to make them better comrades.

Mr. G. M. Nicholson, who replied for the surveyors, referred to the advantages of societies like that Institution. The best way to meet distress or misfortune in life was by co-operation. There was a certain percentage of people who every year met with misfortune, and by means of an institution like the Builders' Foremen's Institution the fortunate or helped to pay for the unfortunate, and it was the duty of everyone connected with the building trade to encourage a society of this kind in every way.

Mr. D. W. McInnes suitably proposed the toast of "The Builders and Contractors," and said that, so long as the Institution had the support of men like their chairman and others, the members of the society need have no fear that they would not be well looked after.

Mr. J. Carmichael responded, and said that as builders they ought to do all in their power to foster that spirit of comradeship between builders and their foremen and clerks of works, which was shown in the reception of the toast. A quality which was necessary nowadays was "gumption" and there was plenty of opportunity for showing

it on a large building work. In addition, if they had ability or capability and amiability, they would be pre-eminent in their work, and the result would be satisfactory to all parties concerned.

Mr. F. Hann, financial secretary, having appropriately proposed "The Governors, Trustees, Donors, Subscribers, and Visitors," and Mr. W. Reason, J.P., having replied,

Mr. T. Costigan, secretary of the Master Builders' Association, proposed the toast of "The Chairman," remarking that Mr. Holloway had filled every post of honour that his brother builders could confer upon him, and he and his partners were constantly giving assistance to deserving causes.

The toast was received with musical honours, and the Chairman briefly replied.

During the evening Mr. Hann read a long list of subscriptions and donations received or promised on behalf of the Institution, the total of which amounted to 502l., included in which was 25l. from Messrs. Holloway Brothers.

THE LONDON MASTER BUILDERS' ASSOCIATION.

The thirty-fourth annual general meeting of this Association was held on the 22nd ult. at Nos. 31 and 32, Bedford-street, Strand, when the annual report was presented. The following paragraphs occur in the report:—

"The membership is steadily increasing, but there are a number of firms who have not joined the Association. To remedy this, steps have been taken to make known to the whole of the building trade of London the objects and work of the organisation, and individual members are urged to take a personal interest in seconding the Council's effort in this direction. In consequence of the large and important element of organised labour incorporated in the General Election, it becomes more imperative than ever that employers should stand together for mutual protection.

No disputes of any moment have occurred during the last year, all differences between employers and workmen having been satisfactorily adjusted by the conciliation boards, whose operations your Council takes this opportunity of referring to in terms of the highest praise. Both employers and workmen have loyally abided by the boards' decisions, thus avoiding much possible trouble, and, at the same time, bringing about a better state of mutual sympathy and understanding.

Acting on instructions given at the last annual general meeting, your Council sent formal notices terminating the old rules to the various societies with whom the London Master Builders' Association had entered into agreements. The primary reason for this action was the necessity of making fresh and more satisfactory arrangements as to the winter working hours. Advantage, however, was taken of the opportunity offered by the conference to make the rules with all the trades as uniform as possible, and in this, your Council ventures to say, it has been distinctly successful. New rules were agreed with the bricklayers, carpenters and joiners, stonemasons, plumbers, and general smiths and fitters, but your Council failed to come to an agreement with the mill sawyers, and declined to enter into agreements with the labourers, painters, and crane drivers. Your Council urges upon all members of the London Master Builders' Association to carry out strictly the letter and intent of the new rules, and to regard them as serious contracts, the careful observance of which cannot fail to be advantageous to all concerned. The notice to the plasterers does not expire until March 3 next. A conference was held with their representatives in October last, with a view to a working arrangement as to winter hours pending subsequent consideration of the whole subject. This came to nothing, your Council considered that in the present depressed condition of trade there was no longer any justification for the preferential position which the plasterers obtained in 1900, and that they should accordingly be required to fall into line with the other trades in the matter of wages. A conference was held on January 1, 1906, with the representatives of the N.A.O.P., at which all the new rules were accepted except that relating to wages. Arbitration was offered as a solution of the difficulty, and the conference was adjourned to ascertain the wishes of the whole of the workmen on the point. The result of this was unfavourable to arbitration, but, at the request of the A.O.P., a further conference was held on February 9, when the alternative was placed before the workmen's representatives of accepting the proposed new rule or having no rules at all. They then agreed to again consult their members, and the final result is still awaited. Before dealing with the plasterers, your Council was careful to discuss the financial support of the members of the London Master Builders' Association, and to meet in conference the leading master plasterers of the metropolis with a view to an entire agreement with the course your Council was adopting.

Your Council has given its attention to all Bills affecting the building trade in Parliament. Together with the Institute of Builders, it opposed the London County Council London Building Acts (Amendment) Bill, 1905. Petitions were lodged in the Houses of Parliament, counsel and solicitors were engaged, and Mr. William Shepherd gave evidence. This proceeding entailed a heavy outlay, and it is hoped that, should it be necessary to do so in the future, some arrangement for joint representation may be come to with kindred societies to avoid the present excessive cost of Parliamentary opposition. The trade generally is under great obligations to Mr. Wm. Shepherd for his valuable services, and your Council desires to place on record its high appreciation of the able manner in which

that gentleman discharged his voluntary and onerous duties.

The financial position of the Association continues to improve year by year, though the marked depression in trade last year affected the income to a considerable extent. In addition, the resources were taxed by the heavy expenditure incurred in opposing the London County Council London Building Acts (Amendment) Bill, 1905, and by other necessary legal expenses. Further stock was purchased for the benefit of the reserve fund.

Your Council deeply regrets the loss by death of three esteemed and honoured past presidents in the persons of Mr. Benjamin Hamen, Col. Stanley G. Bird, C.B., and Mr. George James Lough.

In consequence of the lack of accommodation in the present offices, your Council has decided, in the interests of the Association, to acquire more suitable premises. The Institute of Builders and the Builders' Beneficial Institution will occupy the new offices conjointly with the Association.

The report was adopted, and the audited accounts and balance sheet were received.

The following gentlemen were then elected:—

As President, Mr. J. W. Jordan (Messrs. W. H. Jordan & Sons),
Senior President, Mr. F. L. Dove (Messrs. Dove Bros., Ltd.),
Junior Vice President, Mr. W. Lawrence (Messrs. E. Lawrence & Sons),
Treasurer, Mr. G. Rice (Messrs. Rice & Son),
Hon. Auditor, Mr. A. B. H. Colls (Messrs. Colls & Sons, Ltd.)

The following were elected members of the Executive Council—Mr. G. Appleton (Messrs. Tuttle & Appleton), Mr. F. Bywaters (Messrs. Bywaters & Sons, Ltd.), Mr. G. Milner, Mr. F. D. Riley (Messrs. Rider & Son), Mr. H. Shelburne (Messrs. J. Shelburne & Co.), Mr. Howell J. Williams, D.C.C. (Messrs. Howell J. Williams, Ltd.), Mr. W. Mitchell (Messrs. Mitchell, Ltd.), Mr. Leonard Horner (Messrs. Ashby & Horner).

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Sir E. Cornwall, M.P., Chairman, presiding.

Payment of District Surveyors by Salary.—The adjourned report of the Building Act Committee on the subject of the payment of district surveyors by salary was discussed at some length. The Committee, as we stated last week, had again submitted proposals similar to those discussed on January 30, and dealt with in our issues for December 16 and February 3. The Committee now recommended:—

(a) That as from and including April 1, 1906, all district surveyors be paid a fixed salary, by way of remuneration instead of fees; that the amount of salary to be paid to each of the present district surveyors be equal to the amount of the average of the fees received in his districts during the seven years ended December 31, 1905, as provided in sect. 139 of the London Building Act, 1894; and that the Building Act Committee do submit the necessary recommendations to give effect to this decision.

(b) That with regard to the existing and all future vacancies, the Building Act Committee do submit to the Council such recommendations, giving full particulars of their proposals in every case, as will be in general accord with the "model" scheme described in the report of the Building Act Committee, dated February 12, 1906.

Capt. Heuphill, in moving the adoption of the report, said that a mysterious document had been received by members on the subject, and that the solicitors, to whom it had been submitted, said that the statements contained in it were altogether inaccurate. As to the general question, in the surrounding districts surveyors were paid by salary, and not by fees, and if district surveyors were paid by salary their status would not be altered.

Mr. A. Smith said that no serious complaints had arisen in regard to the present system, and he was opposed to the proposed change. There was great risk that, instead of effecting an economy, a serious loss would result.

Mr. Phillimore said that the report of the Finance Committee was exaggerated in its fears. The upward tendency of fees was almost certain to continue, and if the proposals of the Committee were carried, there would be an additional margin in the future. There had been grievous defects in the past under this system, and, for the sake of proper control, he asked for a straight vote. He hoped they would not be misled by vested interests, and he was convinced that it was only by carrying the Committee's proposals that they could hope in the future to secure good work.

Col. Rotton said that the proposals had been very recently defeated by a large majority, and not one of the arguments then used had been met. He hoped the Council had before it the same proposals with a few trimmings to pass them off. He hoped the Council would not waste time in discussing the

matter, but would proceed to reaffirm its recent decision.

Mr. Howell J. Williams referred to the present commitments of the Council, and said he thought the Committee's recommendations, if carried, would result in a heavy cost to the Council. He had made inquiries, and he found that district surveyors were very ready to make abatements in their fees in special cases, and they were free to do so, but under the proposed arrangement he did not see how that could be done by the Council. He believed that, as a consequential step to the appointment of district surveyors, payment by salary was logically right, but the time was not ripe for that. Fresh legislation must be obtained before it could be done. The Building Act Committee was overwhelmed with work at the present time, and these proposals would lead to another department and staff—the District Surveyors' department—with highly-paid officials to supervise the district surveyors. All this was necessary only if they had no confidence in the men they appointed, but there was a keen sense of honour and integrity amongst architects and surveyors of London.

A member: And builders?
Mr. Williams: There might be a small class of jerry-builders in London, but they were in a small minority compared with the builders who had practically rebuilt London during the last thirty years. It was essential that the Council should maintain a class of district surveyors who would be in a practically independent, or quasi-independent, position. The public would not tolerate being harassed in the administration of the Act; the Act should be carried out in a spirit of sweet reasonableness, whereas the present proposals would lead to the Act being administered in a cast-iron way.

Sir Melville Beacheroff said he could not help feeling regret that the Chairman had again brought up this matter. He had heard no good reasons for the proposed changes. He understood that 52,000*l.* a year was collected under the present system, and he greatly doubted whether that sum would be collected under the proposed system; that amount might be regarded as the high-water mark, and London being much more built over than it was, it was probable that the fees would go down rather than up. They were far more likely to get experienced men under the present system than under that proposed. They could not ignore the views in the matter of such an important body as the Royal Institute of British Architects, whose circular letter on the subject they had received.*

Mr. Goodman said it was impossible to carry out the scheme as proposed. By clause 158 of the Act the Council was empowered to pay by salaries if they so decided, but, according to the terms of that clause, the Council would, if they agreed to put that into effect, have to pay more in the way of salaries than they contemplated. He believed that there would be no saving as was promised, but a loss of 25,000*l.* per annum. Again, if this scheme were carried, one part of the income of the surveyor would be by fees which the Council could not help paying, and another part by salary. It was quite time that the Act was altered. He thought they should have a report showing how much it had cost the Building Act cases during the last three years.

Lord Welby, chairman of the Finance Committee, said that the Finance Committee did not view the proposals of the Building Act Committee with favour. He thought that the amount surveyors would be entitled to according to clause 158 was more than the committee thought, and he believed that the proposals would cost the ratepayers a good deal. He moved that the recommendation be referred back for further consideration.

Mr. Torrance seconded.
Mr. Radford opposed the scheme, and also referred to the effect of clause 158, and to the prospect of the scheme costing a good deal more than the committee supposed. He thought that the proposals should go back, and that any future proposals should come up in the form of recommendations to go before Parliament.

Capt. Hemphill said that the point as to clause 158 had been submitted to the solicitor

for consideration, and he said there was nothing in the point. He thought that fees would go up rather than down. As to the circular letter from the Royal Institute of British Architects, the Council decided, in 1890, that it was undesirable that district surveyors should have private practice; there were great evils in such a system. The proposal of the Committee, if carried, would tend to efficiency of administration. Payment by fees was an obsolete system, and there would be no serious difficulties in carrying out what he proposed.

The Council then voted, with the following result:—For the amendment, fifty-nine; against, forty. The proposals were therefore referred back to the Committee.

Vauxhall Bridge.—Mr. Straus, chairman of the Bridges Committee, announced that the new Vauxhall Bridge would be opened for traffic in April.

Reconstruction of Tramways in Battersea.—The following recommendation of the Highways Committee was agreed to:—

"That the estimate of expenditure on capital account 19,600*l.*, submitted by the Finance Committee, representing the consideration upon which the Battersea Metropolitan Borough Council will be prepared to release the Council from its obligations as the successor of the South London Tramways Company to pave more than the usual tramway area governed by the provisions of the Tramways Act, 1870, in connection with the reconstruction of the borough of Battersea to be reconstructed for electrical traction, be approved."

Bridge Carrying Kingsland-road over the North London Railway.—The Bridges Committee recommended, and it was agreed, that an agreement be entered into with the North London Railway Company, providing for the reconstruction by the Council of the bridge carrying Kingsland-road over the Docks branch of the North London Railway in connection with the reconstruction for electrical traction of the first section of the electrical traction.

Railway Bridges.—They also reported that the bridge which carries the South-Eastern and Chatham Railway over Blackfriars-road is about to be reconstructed. The present headway of this bridge is 18 ft. 9 in., and it is proposed to reduce this to 18 ft. 3 in. The company does not intend in any other important respects to modify their present design of the bridge. The Committee were of opinion that, subject to the work being executed in such a manner as will not interfere in any way with the work of the Council's tramways, no objection need be raised to the company's proposals. The company had also submitted a plan showing the proposed reconstruction of the bridge carrying the company's lines over Alphen-street. The proposals were agreed to.

General Lines of Buildings in Fulham-road and Fulham Park-road.—The Building Act Committee reported as follows:—

"On May 3, 1904, we reported that a successful appeal had been made to the Tribunal of Appeal against the certificate of the architect of the Council, acting in the capacity of superintending architect of metropolitan buildings, defining the general line of buildings on the south side of Fulham-road, westward of Munster-road. We have now to report that on December 22, 1905, the superintending architect defined the general line of buildings on the western side of Fulham Park-road between Fulham-road and Langridge-road, and that an appeal was made against his certificate, and that on January 25, 1906, the Tribunal of Appeal reversed the certificate, and decided that there was no general line of buildings on the western side of the street leading from Fulham-road to the junction of Fulham Park-road and Fulham Park-road. The result of this decision is that, except in so far as the provisions of sect. 33 of the London Building Act, 1894, as to the prescribed distance may apply, there is nothing to prevent the erection of houses on the site in question close up to the public way. In order that the effect of these decisions of the Tribunal of Appeal, which enable the applicants to build very considerably in advance of the lines defined by the superintending architect, may be clearly understood, we have given instructions for a cartoon to be prepared and hung in the Council chamber."

The consideration of the matter was postponed.
London-street Site, Ratcliff-Bekebourne-buildings (second section).—The Housing of the Working Classes Committee recommended, and it was agreed, that expenditure on capital account not exceeding 500*l.* be sanctioned for the preparation of working drawings, specifications, and bills of quantities, and for the preliminary work in connexion with the erection of the second section of Bekebourne-buildings, in London-street, Ratcliff.

The Council adjourned shortly before eight o'clock.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

THE London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Wandsworth.—A parish hall on the northern side of Waynflete-street, Earlsfield, and a house on the western side of Trammere-road, to abut upon Waynflete-street (Mr. F. E. Halford for the Rev. D. Tudor Craig).—Consent.

Hackney, Central.—Projecting shops in front of Nos. 210, 212, 214, and 216, Mare-street, Hackney (Messrs. Hodson & Whitehead for Messrs. H. & H. W. Rowlands).—Consent.

Kensington, North.—An iron and glass shelter in front of No. 11, Penbridge-square, Kensington (Messrs. S. Dowling & Sons, Limited).—Consent.

Brixton.—The retention of a wood, glass, and zinc roof at the side of No. 144, Coldharbour-lane, Brixton, abutting upon Eastlake-road (Mr. F. Karno).—Consent.

Fulham.—Buildings on the south side of Broughton-road, Fulham (Messrs. Badenoch & Bruce for the directors of Messrs. Loud & Western, Limited).—Consent.

Hammersmith.—A porch in front of the Baptist Chapel on the west side of the Bloemfontein-road, Hammersmith (Mr. R. N. Hewitt for the building committee of the chapel).—Consent.

Islington, South.—An addition (jointing chamber) in front of the Barnsbury Telephone Exchange, Barnsbury-grove, Islington (Mr. C. Elliott for the National Telephone Co., Limited).—Consent.

Paddington, North.—Re-erection of Nos. 95 to 103, Maida-vale, Paddington, with projecting porches and bay windows (Messrs. Bochmer & Gibbs for Mr. F. Britton).—Consent.

Strand.—A projecting clock in front of Nos. 127-130, Long-acre, Strand (Mr. E. R. Burch for Messrs. Morgan & Co., Limited).—Consent.

Westminster.—A projecting perch in front of No. 121, Victoria-street, Westminster (Messrs. Farebrother, Ellis, & Co. for Mr. V. S. Galsworthy and Mr. F. T. Galsworthy).—Consent.

Woolwich.—That the application of Mr. J. M. Peate, for an extension of the period within which the erection of a Welsh Congregational Chapel on the northern side of Willenhall-road, Woolwich, was required to be commenced, be granted.—Consent.

Wandsworth.—Buildings on the northern side of Mitcham-road, Tooting, to abut upon Ensham-street (Mr. H. J. Marten for the Council of the Metropolitan Borough of Wandsworth).—Consent.

Kensington, North.—Bay windows and porches to twenty-six houses on the south side of Oxford-gardens, Kensington (Messrs. Trant Brown & Humphreys for Messrs. Daley & Franklin).—Consent.

Woolwich.—That the application of Mr. O. Fleming on behalf of the Fire Brigade Committee of the Council for an extension of the periods within which the erection of a projecting pent roof to the fire brigade station on a site on the north-east side of Eltham-road, Lee, and western side of Meadow-complee-road, was required to be commenced and completed, be granted.—Consent.

St. George, Hanover-square.—A projecting sign in front of No. 45, New Bond-street, St. George, Hanover-square (Messrs. G. & F. Kent for Mr. E. Charvet).—Consent.

Strand.—The retention of an illuminated sign in front of No. 14, Hanover-court, Long-acre (Mr. J. P. Choate for Mr. F. H. Berry).—Consent.

Woolwich.—The re-erection of No. 4, George street, Woolwich (Mr. J. O. Cook for Messrs. J. Franking & Son).—Refused.

Islington, North.—A porch in front of St. Paul's Church, Kingsdown-road, Islington (Mr. A. B. Cook).—Refused.

Kennington.—An iron and glass covered way in front of St. Mark's Vicarage, Kennington-oval (Mr. W. Fitch for the Rev. J. Darlington).—Refused.

Marylebone, East.—An iron illuminated sign at the Queen's Hotel, No. 104, Oxford-street (Mr. T. Holland).—Refused.

St. George, Hanover-square.—The retention of a wood and glass showcase in front of No. 8, Grafton-street, St. George, Hanover-square (Messrs. F. Sage & Co. (1905), Limited).—Refused.

Hackney, South.—Additions to No. 17, Sutton-place, Hackney, to abut upon Urswick-road (Mr. W. Gibbons for Mr. A. Escott).—Refused.

Width of Way and Lines of Frontage.

Battersea.—The retention of a one-story building at the rear of No. 54, Winstead-street, Battersea, abutting upon Surrey-lane (Messrs. Greenfield & Cracknell for Mr. F. C. Greenfield).—Consent.

Camberwell, North.—Houses for persons of the working class on the north side of Beckett-street, the east side of Toulon-street, and the east and west sides of Baily-street, Wyncham-road, Camberwell (Mr. Oxtoby for the Council

* The letter is printed on another page.

of the Metropolitan Borough of Camberwell).—Consent.

Chelsea.—A deviation from the plan approved for the erection of artisans' dwellings on the north-eastern side of Pond-place, Chelsea, so far as relates to an alteration in the position of the forecourt fence at the corner of Pond-place and the roadway leading to Onslow-dwellings (Messrs. Joseph & Smithen for the Council of the Metropolitan Borough of Chelsea).—Refused.

Width of Way and Uniting Buildings.

Southwark, West.—An open shed on the north side of Summer-street, Southwark (Mr. F. Bailey for the City of London Electric Lighting Co., Limited).—Consent.

Lines of Frontage and Space at Rear.

Lewisham.—Four houses on the southern side of Tressillian-road, Brockley (Mr. H. J. Clanville).—Consent.

Formation of Streets.

Norwood.—That an order be issued to Mr. C. J. Bentley, sanctioning the formation or laying out of a new street for carriage traffic to lead from Eastmead-road to Chatsworth-road, West Dulwich, Lambeth (for Mr. L. S. Rogers and Messrs. A. & E. Rowberry).—Consent.

Lewisham.—That an order be issued to Mr. W. H. Collier sanctioning the formation or laying out of new streets for carriage traffic upon the Hilly-fields-park estate, Vicar's-hill, Lewisham (for the trustees of the Jerrard estate).—Consent.

Woolwich.—A deviation from the plan approved for the formation or laying out of a new street for carriage traffic to lead from Fernhill-street to Auber-street, North Woolwich, so far as relates to an alteration in the levels of the proposed street (Messrs. Tapp Jones & Son).—Consent.

Wandsworth.—That an order be issued to Messrs. Bryant & Son, sanctioning the formation or laying out of new streets for carriage traffic out of Waverley-road and Nuthurst-avenue, Brixton (for Mrs. A. A. Coffee and the Westminster Investment Society, Limited).—Consent.

Fulham.—A deviation from the plan approved for the formation or laying out of a new street for carriage traffic, to lead from Fulham Palace-road to Colehill-lane, Fulham, and in connexion therewith, the erection of buildings so far as relates to the substitution for the two blocks of residential flats, marked Nos. 1 and 2 on the approved plan, of four shops (Mr. A. Blackford).—Consent.

Lewisham.—A building at the rear of No. 363, High-street, Lewisham (The Magneto Motor Cycle and Electrical Engineering Company).—Consent.

Alteration of Buildings.

Kensington, South.—Removal of a fence at the rear of No. 2, Kelson-place, Kensington, and also to the closing of openings in the rear wall of such building (Mr. G. E. Bucknill).—Consent.

Strand.—An infringement of the provisions of section 77 of the Act, so far as relates to the uniting of No. 43, Focadilly, with a building on the eastern side of Albany-court-yard (Mr. G. D. Martin).—Refused.

The recommendations marked † are contrary to the views of the local authorities.

ARCHITECTURAL SOCIETIES.

GLASGOW INSTITUTE OF ARCHITECTS.—The usual quarterly meeting of the Glasgow Institute of Architects was held on the 21st ult. Mr. William B. White, Glasgow, was elected a member of the Institute. It was intimated that, in addition to the prize of 2l. 2s. given by the Institute, gained by Mr. William Ralston, a second prize of 1l. 1s. had been awarded to Mr. Thomas A. McAdam in the competition for the Institute's prize in the Technical College. Messrs. Crawford and Lindsay were appointed adjudicators for the School of Art prizes. A draft letter regarding the subject of the number of apprentices employed in architectural offices was submitted, and it was agreed that the letter should be issued to the members of the Institute.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—At the rooms of this Society on Thursday, the 22nd ult., Mr. A. W. Waddington delivered a lecture on "Domestic Architecture: Some First Principles"; Mr. R. A. Smithson in the chair. The lecturer commenced by indicating his impression of the exact position of the various claimants to the title of domestic architecture. The first is the work of the average building draughtsman, whose idea of a home is that of a convenient hoddly resting-place and shelter, and nothing more. A more exclusive, or, rather, inclusive, claimant is the work of a true architect. The third claimant is an intermediate one, falling between two stools, inasmuch as it is not in healthy contact with building materials and not in reach of artistic touchstones. It is because the vast

hulk of modern houses show this unsatisfactory stage of development that a discussion of first principles is necessary. The ideal architect is the philosopher among the builders, and a philosopher is one who is genuinely in love with ideas—i.e., vital first principles. Amongst the main first principles of this sort are those of "the one and the many," from which principles of harmony and variation, subordination and individuality are evolved. The dangers of exaggerated unity are monotony and slavishness; those of exaggerated diversity are restlessness and licence. The special problem of to-day is how to obtain unity without monotony. The lecturer's excuse for an insistence upon the obvious in theory was that it was obviously forgotten in practice. Turning to illustrations of this main first principle of the interplay of subordination and freedom in architecture, the two great types are found in Greek and Gothic. Modern work reaches neither the obedience to perfect law shown in the one, nor yet the perfect liberty of the other. A house is a group of units—rectangles necessitated by rooms and other divisions. In the relation of these units natural inequality suggests the needful diversity; true scale and proportion, and, above all, simplicity of main lines, tends to unity. In detail the roof is the first consideration, as giving dominant boundaries, vertically and horizontally; the windows, as the eyes of the building, are the next consideration, as giving brightness and interest. To attain unity the main rectangle of the block should never be confused by subordinate parts; equality between natural divisions is usually bad; proportions should be subtle, and not too obvious in value. The unit of subdivision (as in window-panes) should be carefully selected, and not changed without reason; hips or gables are not interchangeable on equal terms. Changes of method were changes of key, varieties of materials, and of colours also, and should be kept to a minimum. On the other hand, a variation of minor features gives interest, and symmetry, as in gables, gains by contrast with unsymmetry elsewhere. But counsels of perfection, if of use at all, are useful as items of good taste, and good taste is a trained capacity to grasp first principles—first in feeling, then in thought. In attaining good taste sympathy with the individual artistic value of materials is requisite, and co-operation between mind and matter, sufficient not only to make a physical arrangement, but a mental creation of beautiful form.

NOTTINGHAM ARCHITECTURAL SOCIETY.—The annual dinner of the Nottingham Architectural Society was held at the George Hotel on the 23rd ult., the President (Mr. A. W. Brewill) presiding, being supported by the Mayor of Nottingham (Councillor A. Cleaver), Alderman Sir John Turney (chairman of the Works and Ways Committee), Dr. Boobyer (Medical Officer of Health), Messrs. W. D. Pratt (Vice-President), A. N. Bromley, E. R. Sutton, A. Marshall, R. Evans, jun., A. E. Heazell, F. Booker, W. B. Starr, H. W. Lockton (Newark), A. W. Bradshaw, and W. B. Savidge (hon. secretary). Mr. E. R. Sutton, in proposing the toast of "The Mayor and Corporation of the City of Nottingham," said architects, however, had a grievance—first, that the Corporation did not recognise them as a Society, and it would be an advantage if they would confer with them on such questions as the positions of the different statues and with regard to the Castle gateway, its rebuilding or restoration. They as architects came in closer contact with the Works and Ways Committee than any other committee, and he was voicing the feelings of the architects when he said that, from the chairman to the lowest official, they were always ready to give them any assistance and help in the many difficult problems which from time to time were placed before them.—The Mayor replied.—Sir John Turney proposed "The Architectural Society," saying he realised that the men who followed the profession of architecture had great responsibilities; how great they did not all realise. The welfare of a city, its sanitary conditions and arrangements, depended very much upon how the architects advised their clients and insisted upon the work being carried out. After thirty years' experience he came to the conclusion that the architects and builders of

Nottingham did their work a little better than it was done in most towns. It was important that there should be a very strong desire that everything an architect touched should be beautiful, should be useful, and should be good. Without those three elements they could understand that a city might be built up in a short or a long time, and when it was done not be a thing to please or to command the admiration of the people who visited the city. He hoped that the gentlemen connected with the Architectural Society would do all they possibly could to assist the officials of the Corporation in making the town better to live in and more beautiful to look at.—The President responded, remarking with regret that architectural work in Nottingham had been very quiet, and he was very sorry to say that in the present year he did not see very much prospect of there being any improvement. But, at any rate, he could assure the Mayor that the education of architects during the last few years had very much improved. The last two years had been important years for the Royal Institute of British Architects, and a sub-committee had been appointed, of which he was a member, to draw up a Bill to be laid before Parliament for the registration of architects. They felt that all gentlemen who desired to become members of the architectural profession should do so only by being qualified by examination. As was the case in the movement for the proper qualification of doctors, the opposition had come from the leading men in their profession, while the great body of the younger men were in favour of it. The question had not been before them at the last election of the council as the great issue, and he appealed to architects at the next election not to vote for the men who were well known, but were against registration, but for those anxious to secure the registration. In conclusion, Mr. Brewill acknowledged the kindness and courtesy Sir John Turney had always extended to the architects in the city, and suggested that the Corporation should throw open important works that were to be carried out to competition among Nottingham architects, for the city would gain, getting a very carefully thought-out building at a very much less cost. Another grievance was the tendency to take the valuation of buildings and land out of the hands of the architects and place it in the hands of the estate agents. He contended that the architect and estate agent should act conjointly.—The Vice-President proposed the "Master Builders' Association," and, in replying, Mr. F. H. Fish said the relations between the builders and the men were in a perfectly satisfactory state now, the difficulties had been settled, and they only regretted that there was not more work.

ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—A meeting was held on Wednesday, February 21, when the Hon. Treasurer (Mr. R. H. Forster) occupied the chair. Mr. Andrew Oliver gave an interesting address dealing with the memories and associations connected with the old buildings of the Strand and Whitehall. Of the old Royal palaces and stately mansions of the nobility which once lined the river bank there are but few traces now remaining, the Banqueting House at Whitehall, the water-gate of Buckingham House, the Chapel of the Savoy, and the water-gate of Essex House, at the end of Essex-street, still exist, and, with the names of the streets which cover the sites of the demolished buildings, serve to recall the historic associations of this ancient thoroughfare of the Strand. The lecture was well illustrated by fine photographic reproductions of old maps, prints, and engravings from Mr. Oliver's extensive collection of old London views, which were exhibited by lantern light. Many of these old prints are very rare. Mr. Emmanuel Green, Mr. S. W. Kershaw, Rev. W. S. Sach-Szyrma, Mr. Compton, and others took part in the discussion which followed.

SOCIETY OF PAINTER-ETCHERS.—The twenty-fourth annual exhibition of this Society, opened this week at the gallery of the Society of Painters in Water-Colours, is one of the best they have ever held. We defer detailed notice of it till next week, in order to do better justice to its contents, our space being unusually crowded this week.

ENGINEERING SOCIETIES.

THE JUNIOR INSTITUTION OF ENGINEERS.—Through the courtesy of Mr. A. P. Trotter, the electrical adviser to the Board of Trade, who was, however, unfortunately prevented through indisposition from receiving them as intended, the members were enabled to pay an evening visit to the Electrical Standards Laboratory, Whitehall, on February 19. The standard ampere balance and standard 100-volt voltmeter were shown, the former measuring to sixty-five parts in a million and the latter to eighty-four parts in a million. By means of other balances and shunts currents up to 10,000 amperes can be measured, and there are other voltmeters which register up to 12,000 volts. Smaller currents and pressures are measured by potentiometers. In a very small room, which is kept at a constant temperature by an automatic device, the standard ohm and other important resistance coils were seen, and the process shown for the comparison of ohms to the exactitude of one part in a million. The testing of meters was explained in the verification-room, and a number of different types of meters were on view undergoing the exhaustive test for official approval of "construction and pattern." Outside in the area is a battery-room, a rheostat for controlling 10,000 amperes, and a dynamo and booster-room. Other small dynamos were seen in the repair shops, as also a rotary converter for one, two, or three-phase transformers. Before the members dispersed, their thanks to Mr. C. W. S. Crawley and Mr. J. Rennie, who had kindly shown them round, were cordially expressed. Mr. Trotter is giving a paper on "Acceleration and Accelerometers" before the Institution on March 2, and on March 10 the Institution's annual conversation takes place at the Westminster Palace Hotel, when one of the special features of the evening will be an exhibition of engineering and scientific models, specimens, etc.

BOOKS RECEIVED.

ELECTRICITY METERS. By Henry J. Solomon. (Chas. Griffin & Co. 16s.)
THE RESTORATION OF THE GILD SYSTEM. By Arthur J. Pentz. (Swan Sonnenschein & Co. 3s. 6d.)

TRADE CATALOGUES.

The Weber Steel-Concrete Chimney Company send us a little pamphlet containing a brief description of the Weber chimney, and several photographic views of such chimneys under construction and completed in the United States. The method of construction is illustrated by a view on the first page showing the vertical bars of the reinforcement and two rings of moulds in position for deposition of the concrete, which, being composed entirely of Portland cement and sand, would be more correctly termed cement mortar. The valuable properties of reinforced cement and concrete in respect of resistance to atmospheric action, heat, and the products of combustion are well known, and, owing to its capacity for resisting tension, the material lends itself to the design of chimneys on much smaller areas than would be required for brick or brick-lined steel chimneys of the same height and diameter. As the weight of these chimneys is relatively light, they are particularly suitable for places where the soil has low bearing power, and even on more stable ground the cost of foundations is reduced by the smaller pressures involved. The monolithic character of the work, the smoothness and airtightness of the flue, and the rapidity with which construction can be conducted are other points worthy of note. We quite agree with the suggestion in the pamphlet that elegant and graceful outlines may be obtained by the employment of reinforced cement, but it can scarcely be admitted that the light grey colour of cement adds to the artistic effect of any structure.

Messrs. R. Waygood & Co. send us a new 8 pp. catalogue they have issued on the subject of lifts and cranes. This publication contains typical illustrations of the hydraulic, electric, and hand lifts manufactured by the firm, and appears to be one of those auxiliary circulars intended to awaken the desire on the part of recipients to obtain the complete general catalogue, in which more

complete particulars are given of lifting and hoisting machinery. The views here presented are certainly calculated to arouse the interest of intending purchasers.

Messrs. M'Tear & Co. (Belfast) have sent us an account of their asphalt roofing felts, etc., with illustrations of light bow-string and other roofs, and a detailed price-list. We have received from Messrs. Adamsez (Scotswood-on-Tyne) illustrations of Adams's patent lavatory and "Kratör" sink and bowl. The lavatory, which would have been all the better without the ornamentation, is hinged at one end to a plate attached to the wall, and can be swung out as required; it is designed for fixing over a bath or water-closet, and the waste water is discharged into the fitting below. The "Kratör" sink is a shallow, rectangular sink with a circular bowl at one end fitted with a plug and chain, and will probably prove useful in small houses.

An illustrated sheet has been sent to us by the Falcon Brass Works, containing sections and elevation of Fratwell's patent adjustable junction and tee-pieces for lead and iron waste and soil pipes. The junction is cleverly designed so that the branch may enter at various angles, and at the same time the joint allows for expansion and contraction. Screwed sockets and special holder-bats are also shown for use with screwed wrought-iron tubing.

Messrs. E. Busby & Co. have sent us particulars of their valve fittings for public baths. These are of the combination type, and can be operated inside or outside the bathroom. They are specially made to facilitate repairs to the seatings, and it is a distinct advantage that the parts are interchangeable. The valves are also made with a connexion for a shower fitting.

Messrs. Alfred Walker & Sons (Leeds) have sent us a twenty-four-page catalogue containing a long list of buildings and premises in which their concrete pavings and floors and artificial stone have been used. Four pages only are devoted to illustrations and descriptions, and at least one of the illustrations might with advantage have been omitted, as the iron joists shown in it are of an obsolete type. The pavings are made with an aggregate of either crushed granite or slag.

A small catalogue from Messrs. G. Tucker & Son (Loughborough) contains coloured illustrations of the moulded and ornamental bricks, ridge-tiles, chimney-pots, etc., manufactured by the firm. There is a good selection of moulded bricks in 3-in. and 4½-in. sizes.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—VIII.

SIMPLE METHODS OF PROVING CALCULATIONS.

AMONG the various methods of testing the accuracy of calculations involving addition, multiplication, and division, the following are the most expeditious, although it should be recognised that they do not serve to detect errors of working which are mutually counteractive.

To Prove Addition.

Rule.—Add together the individual figures of each addend, and add together the individual figures of each sum. Then, adding together the last obtained sums and also the individual figures of their sum, the result is an *index number*, which is also the sum of the individual figures in the sum of the addends.

Example (1): Prove the accuracy of the sum $(867,213 + 123,841 + 32,642 + 843,845 + 65,738 + 47,314 + 1,237,492) = 3,318,083$.

Adding the individual figures of each addend and of the sum of each addend, we get

$(8 + 6 + 7 + 2 + 1 + 3) = 27$, and $(2 + 7) = 9$
 $(1 + 2 + 9 + 8 + 4 + 1) = 19$, and $(1 + 9) = 10$
 $(3 + 2 + 6 + 4 + 2) = 17$, and $(1 + 7) = 8$
 $(9 + 4 + 3 + 8 + 4 + 5) = 33$, and $(3 + 3) = 6$
 $(6 + 5 + 7 + 3 + 6) = 27$, and $(2 + 7) = 9$
 $(4 + 7 + 3 + 1 + 4) = 19$, and $(1 + 9) = 10$
 $(1 + 2 + 3 + 7 + 4 + 9 + 2) = 28$, and $(2 + 8) = 10$

Adding together the last obtained sums, we have $(9 + 10 + 8 + 6 + 9 + 10 + 10) = 62$, and $(6 + 2) = 8$, which is the *index number*.

Adding the individual figures in the sum of the addends we have

$(3 + 3 + 1 + 8 + 0 + 8 + 3) = 26$, and $(2 + 6) = 8$.

As this result agrees with the index number found before, we may presume the addition has been correctly performed.

Example (2): Prove the accuracy of the sum $(345 + 136 + 427 + 286) = 1,194$.

Proceeding as before, we have
 $(3 + 4 + 5) = 12$, and $(1 + 2) = 3$
 $(4 + 3 + 6) = 13$, and $(1 + 6) = 7$
 $(4 + 2 + 7) = 13$, and $(1 + 3) = 4$
 $(2 + 8 + 6) = 16$, and $(1 + 6) = 7$

The sum of $(3 + 1 + 4 + 7) = 15$, and $(1 + 5) = 6$, which is the *index number*.
 As the individual figures of the sum of the addends $(1 + 1 + 9 + 4) = 15$, and $(1 + 5) = 6$, we have evidence that the addition is correct.

Example (3): Prove the accuracy of the sum $(227,443 + 45,864 + 22,621 + 9,574) = 304,738$.

Here we have
 $(2 + 2 + 6 + 4 + 4 + 3) = 21$, and $(2 + 1) = 3$
 $(4 + 5 + 8 + 6) = 23$, and $(2 + 3) = 5$
 $(2 + 2 + 6 + 2 + 1) = 13$, and $(1 + 3) = 4$
 $(6 + 8 + 7 + 4) = 25$, and $(2 + 5) = 7$

Then, as $(3 + 5 + 4 + 10) = 22$, the *index number* is 4.

Similarly $(3 + 0 + 4 + 7 + 0 + 8) = 31$, and $(3 + 1) = 4$.

To Prove Multiplication.

Rule (1).—The sum of the individual figures in the product of any number multiplied by 9, or by any multiple of 9, will give the *index number 9* when the individual figures of the sum are added together.

Example (1): Prove the accuracy of the product $(786,957 \times 9) = 7,082,613$.

Here $(7 + 0 + 8 + 2 + 6 + 1 + 3) = 27$, and $(2 + 7) = 9$, the *index number*.

Example (2): Prove the accuracy of the product $(643,323 \times 63) = 40,655,664$. (In this example the multiplier = 9×7 .)

Here $(4 + 0 + 6 + 5 + 5 + 6 + 6 + 4) = 39$, and $(3 + 6) = 9$, the *index number*.

Example (3): Prove the accuracy of the product $(327,865 \times 43,927) = 15,057,855,835$. (In this example the multiplier = $9 \times 5,103$.)

Here $(1 + 5 + 0 + 5 + 4 + 7 + 8 + 5 + 5 + 8 + 5 + 5) = 54$, and $(5 + 4) = 9$, the *index number*.

Rule (2).—The sum of the individual figures of any multiple of any number which is a multiple of 9, or the sum of whose individual figures is 9 or a multiple of 9, gives the *index number 9* when the individual figures of the sum are added together.

Example (4): Prove the accuracy of the product $(452,516 \times 5,234) = 2,311,522,688$. (In this example the multiplicand = $9 \times 132,544$; the sum of its individual figures being $(1 + 3 + 7 + 2 + 8 + 9 + 6) = 36$, and $(3 + 6) = 9$.)

Here the sum of the figures in the multiple is $(7 + 2 + 1 + 1 + 8 + 2 + 2 + 6 + 8 + 8) = 45$, and $(4 + 5) = 9$, the *index number*.

Example (5): Prove the accuracy of the product $(45,927 \times 522) = 23,972,894$. (In this example the multiplicand = $9 \times 5,103$; the sum of its individual figures being $(4 + 5 + 9 + 2 + 7) = 27$, and $(2 + 7) = 9$.)

Here the sum of the figures in the product or multiple is

$(2 + 3 + 9 + 7 + 3 + 8 + 9 + 4) = 45$, and $(4 + 5) = 9$, the *index number*.

Rule (3).—Divide by 9 the multiplicand and the multiplier, and divide by 9 the product of the remainders so obtained; then the final remainder should be the same as that obtained by dividing by 9 the product of the multiplicand and the multiplier.

Example (6): Prove the accuracy of the product $(84,362 \times 7,538) = 635,920,756$.

Here the multiplicand 84,362 divided by 9 gives 5 as remainder, and the multiplier 7,538 divided by 9 gives 5 as remainder.

Then the product of the remainders (5×5) divided by 9 gives 7 as the final remainder.

Next, dividing by 9 the product of the multiplicand and multiplier $(635,920,756 \div 9)$, we get 7 as remainder. As the remainders are equal it is assumed the multiplication has been correctly performed.

Example (7): Prove the accuracy of the product $(303 \times 54) = 16,362$.

Here the multiplicand 303 divided by 9 = 3675 + 9, gives 3 as remainder, and the multiplier 54 divided by 9 = 545 + 9, gives 5 as remainder.

Then the product of the remainders (3×5) divided by 9 gives 6 as the final remainder.

Next, dividing by 9 the product of the multiplicand and multiplier and expressing the fraction decimally, $292,875 \div 9$ gives 6 as the remainder.

Hence the product may be taken as correct.

As mentioned above, certain errors in multiplication are not invariably detected by means of the foregoing rules. For instance, two of the digits in the product may be in wrong order, or an equal amount may have been added to one digit and subtracted from another digit, or a cipher may have been inserted or omitted in error.

In example (6), if the first two figures of the product were incorrectly written to give 365,920,756, or if the individual products were incorrectly added to produce 635,820,766, or if an additional cipher were carelessly included, making the product read 6,359,200,756, the division by 9 would still

give 7 as remainder. But with ordinary care no errors are to be anticipated such as would leave the two remainders in agreement, and it would almost invariably be the case in practice that accidental errors of the kind would lead to an evident discrepancy between the remainders, and so point to the inaccuracy of the calculated product.

Rule (4).—Multiplication may also be proved by employing 11 as a test divisor in the same way that 9 is employed under rule (3).

The convenience of this test depends upon the principle that the remainder obtained after dividing any given number by 11 is the same as the difference between the sum of the individual figures in the odd places and of those in the even places of the product, commencing in each case at the right hand (a); or if the difference is more than 11, is the same as the remainder given after division of the difference by 11 (b). If the sum of the figures in the even places of the number should be greater than the sum of the figures in the odd places, then the latter must be increased by 11, or some multiple of 11, in order that the remainder shall be positive (c).

This explanation will be more readily understood by the following illustrations which are lettered to agree with the reference letters in the text above:—

- (a) $165,678 \div 11$ gives 4 as remainder, and $(8 + 6 + 6) - (7 + 5 + 4) = 4$,
 (b) $463,709 \div 11$ gives 4 as remainder, and $(9 + 7 + 4) - (0 + 3 + 4) = 11 = 4$,
 (c) $435,061 \div 11$ gives 9 as remainder, and $(1 + 0 + 3) + 22 - (8 + 5 + 4) = 9$.

Example (8): Taking the same figures as in example (6) prove the accuracy of the product $84,362 \times 7,538 = 635,297,556$.

Here the multiplicand 84,362 divided by 11 gives 3 as remainder, and the multiplier 7,538 divided by 11 gives 3 as remainder.

Then the product of the remainders $(3 \times 3) = 9$, which is the final remainder.

The difference between the sum of the figures in the odd and even places of the product commencing at the right hand is $(7 + 7 + 2 + 3 + 6) - (5 + 0 + 9 + 3) = (26 - 17) = 9$, which agrees with the final remainder ascertained.

Example (9): Taking the same figures as in example (7) prove the accuracy of the product $364 \times 544 = 198,256$.

Using decimal fractions, the multiplicand 3675 divided by 11 gives 1 as remainder, and the multiplier 544 divided by 11 gives 6 as remainder.

Then the product of the remainders $(1 \times 6) = 6$, which is the final remainder.

Next, taking the difference between the sum of the figures in the odd and even places of the product (-0.275) , we have $(5 + 8 + 0 - 2) - (7 + 2 + 0) = 15 - 9 = 6$, which agrees with the final remainder ascertained.

As in the case of rules (1), (2), and (3), test division by 11 will not reveal mutually counteractive errors.

Note.—A rough check upon the substantial accuracy of multiplication that may be sometimes applied with advantage in practical work is to multiply together numbers that are approximately equal in value to the actual numbers.

An approximate proof of the product $(1,087 \times 713) = 1,416,731$ is given by taking $2 \times 7 = 14$, and adding the five ciphers required to give 1,400,000, the test result.

Again, to test the product $(4\frac{1}{2} \times 2\frac{1}{2} \times 1\frac{1}{2}) = 19,444$, the approximation $(5 \times 2 \times 2) = 20$ shows that the original working cannot be far wrong.

Tests of this kind are useful to busy men in checking the practical accuracy of calculations made by assistants or pupils, who are apt to repose too much faith in the infallibility of their calculated results, and therefore do not think it possible that they may have placed a decimal point in the wrong position, or inadvertently misplaced some line of figures, so as to lead to serious error. Those with more extended experience know that accidental slips will occur occasionally, and so upset the accuracy of calculations that in other respects are most carefully and correctly worked.

To Prove Division.
Rule (1).—Divide by 9 the quotient and the divisor, and divide by 9 the product of the remainders so obtained; then the final remainder should be the same as that obtained after division of the dividend by 9.

Example (1): Prove the accuracy of the quotient $(64,875 \div 375) = 173$.

Here the quotient 173 divided by 9 gives 2 as remainder, and the divisor 375 divided by 9 gives 6 as remainder.

Then the product of the remainders (2×6) divided by 9 gives 3 as the final remainder.

Next, dividing the dividend $(64,875)$ by 9 we get 3 as remainder. Hence the quotient can be taken as correct.

Rule (2).—In cases where division leaves a remainder, divide by 9 the integer of the quotient and the divisor, and to the product of the remainders so obtained add the remainder left after division of the original remainder by 9; divide the sum of these quantities by 9, and the final remainder should be equal to that obtained from the division of the dividend by 9.

Example (2): Prove the accuracy of the quotient $(843,657 \div 4,235) = 199,537$.

Here the integer of the quotient 199 divided by 9 gives 1 as remainder, the divisor 4,235 divided by 9 gives 5 as remainder, and the original remainder 892 divided by 9 gives 1 as remainder.

Then the product of the remainders (5×1) plus 1 = 6.

Next, dividing the dividend 843,657 by 9, we get 6 as remainder. As the two results agree the quotient 199,537 is taken as correct.

Rule (3).—Division may also be proved by employing 11 as a test divisor in the same way that 9 is employed under rules (1) and (2).

Example (3): Taking the same figures as in example (1) prove the accuracy of the quotient $(64,875 \div 375) = 173$.

Here the quotient 173 divided by 11 gives 8 as remainder, and the divisor 375 divided by 11 gives 1 as remainder.

Then the product of the remainders $(8 \times 1) = 8$, which is the final remainder.

Next, the difference between the sum of the figures in the odd and even places of the dividend is $(5 + 8 + 6) - (7 + 4) = 19 - 11 = 8$ as before, showing the correctness of the quotient.

Example (4): Taking the figures in example (2) prove the accuracy of the quotient: $843,657 \div 4,235 = 199,537$.

Here the integer of the quotient 199 divided by 11 gives 1 as remainder, the divisor 4,235 divided by 11 gives 0 as remainder, and the dividend 892 divided by 11 gives 1 as remainder.

Then the product of the remainders (0×1) plus 1 = 1. Taking the difference between the sum of the figures in the odd and even places of the dividend, we get $(7 + 6 + 4) - (5 + 3 + 8) = 1$.

So the quotient 199,537 may be taken as correct.

Example (5): As the product of the remainders in the preceding examples are so small as to obviate the necessity for division by 11, we take in this example some larger figures.

Prove the accuracy of the quotient $(6,467,280 \div 4,230) = 1,536$.

Here the quotient 1,536 divided by 11 gives 7 as remainder, and the divisor 4,230 divided by 11 gives 6 as remainder.

Then the product of the remainders $(7 \times 6) + 11$ gives 9 as the final remainder.

Next, the difference between the sum of the figures in the odd and even places of the dividend, with the addition of 11 to the odd figures to give a positive result is $(0 + 2 + 9 + 6 + 1) - (8 + 7 + 4) = 9$.

Hence, the quotient may be taken as correct.

The inaccuracies that cannot be detected by this method are similar to those previously mentioned in connexion with rules (1) to (4) for proving multiplication.

WESTMINSTER CITY COUNCIL.

The usual fortnightly meeting of this Council was held on Thursday last week at the City Hall, Charing Cross-road, W.C.

District Railway Sub-Station, Compensation for Use of Subsoil.—The Works Committee reported having considered a letter from Messrs. Baxter & Co., on behalf of the Metropolitan District Railway, with reference to the compensation to be paid for the use of the sub-soil of Villiers-street for the construction of the Charing-Cross sub-station, stating that at the time the negotiations were opened with the City Council the company believed that the City Council were the owners of the subsoil, but that it now appeared that the subsoil was vested in the Metropolitan Council, who had insisted upon the whole of the £7,000 awarded by the arbitrator. In order to end the matter the company were prepared, without prejudice, to make a payment to the City Council of 2000, for any rights they might have in the sub-station site, the Council to accept in part payment the sum of 1000 deposited with them. In commenting on this letter the Committee stated that it was not the practice of Parliament when giving power to use the subsoil of a street for a station to allow compensation to the local authority, and although the subsoil of a public street was vested in the local authority for certain purposes, the Metropolitan Council in the present case had certain rights in the land. On the recommendation of the Committee it was agreed to accept the offer, the company to insert in their Bill before Parliament a clause authorising the arrangement.

Projecting Clock in the Strand.—The Council consented to the erection of a projecting clock at 125, Strand, the offices of the *Observer*.

Piccadilly Widening.—The Improvements Committee submitted a report dealing with this matter, in the course of which they dealt with a letter received from the London County Council enclosing a plan showing the extent of the widening and the sites of the pillars of the new arcade under

the Ritz Hotel. It appeared that certain of the pillars stood on land acquired by the London County Council from the Building and Vendor Company, Ltd., and that other pillars were on the site of the old roadway or pavement. The company desired that the City Council should undertake, by signing the plan, not to interfere with any of the pillars there shown. On the recommendation of the Committee the City Engineer was authorised to sign the plan.

OBITUARY.

M. DUTERT.—We regret to have to record the death, a few days ago, at the age of sixty, of M. Charles Louis Ferdinand Dutert, "Architecte Honoraire des Bâtiments Civils" under the French Government, and Honorary Inspector of Instruction in Drawing. M. Dutert was a pupil of Hippolyte Lebas and of M. Guinon, and obtained the Grand Prix de Rome in 1869. His name came prominently before the public in connexion with the immense Galerie des Machines for the 1889 Paris Exhibition, built from his design in co-operation with M. Contamin, a manufacturing engineer. M. Dutert was also the designer of the new galleries of the Natural History Museum, one of the most remarkable assemblages of buildings erected during recent years in Paris.

MR. KING.—The death, on February 24, at Borecandle, Prior-road, Harrow, is announced of Mr. Zephaniah King, aged 71 years. Mr. King was senior partner of the firm of Messrs. Zephaniah King & Son, of No. 171, Victoria-street, Westminster. He was elected an Associate in 1881, and in 1887 a Fellow, of the Royal Institute of British Architects; he served as an honorary auditor of the Institute for the session 1899-1900. Mr. King was elected a member of the Architectural Association in 1864; in March, 1902, he was elected a member of the Council of the Architects' Benevolent Society, and retired by rotation in March of the next following year.

MR. GODMAN.—Mr. Ernest Godman died on February 15, at Sunnyside, Banstead, Surrey. Mr. Godman was Architect and Secretary of the Committee for the Survey of the Memorials of Greater London. He was the author of a work upon Norman and Medieval architecture in Essex, and wrote additions to the Hon. Walter C. Poyss's illustrated account of the church of St. Dunstan, Stepney, which was brought out by the Essex House Press some fifteen months ago.

GENERAL BUILDING NEWS.

BATH ABBEY RESTORATION.—At the Bath Guildhall recently a decision was come to as to the completion of the restoration of Bath Abbey. The executive committee reported upon the experiments which Mr. T. G. Jackson, R.C., had conducted with a view to enabling them to advise upon the question whether there should be pinnacles on the tower. They supported Mr. Jackson's opinion that the tower was intended to have spires, and recommended that four pinnacles be erected on the tower with two to correspond at the east end. Colonel Clutterbuck (treasurer) reported that the four tower pinnacles would cost £3981, the two at the east end 5561, and in addition there was general repair work necessary to the amount of 1900. On the motion of the Right Hon. Bath and Wells, it was resolved that Mr. Jackson's proposed pinnacles, with the addition of metal flags, should be adopted for the tower, and also as the model for proportionately smaller pinnacles for the east end.

CHURCH RESTORATION, DAUNTSBY, WILTS.—The work of restoration which has been proceeding at the ancient Parish Church at Dauntsby has just been completed. The nave and two aisle roofs, and also the roof of the Danby Chapel, have been renewed, and the floors repaved with York stone. The walls and porch have been renovated and a new pulpit erected in the same style as the old oak pews, which have been retained and restored. The cost had amounted to 8000, and Mr. H. Brakspear, architect, had charge of the work.

CATHOLIC CHURCH, PORTOBELLO, N.B.—The new Catholic church in Brighton-place, Portobello, was a sanctuary and nave with apsidal end, measuring 112 ft. long, including the aisle, with chapels on each side. The design is by Mr. J. T. Walford, architect. At the west end, fronting Brighton-place, is a baptistry with groined roof. In the north aisle is a sacristy and four confessionals. The exterior is of Auchenheath stone with facings of rubble Winchester stone, and the interior treated with decoration of angels. Cathedral glass is used throughout, and there is a scheme of electric light. The tower reaches 112 ft. high—its cross raised 152 ft. from the street.

PAMPILL CHURCH, DORSET.—The foundation-

one of this church has just been laid. The architect is Mr. C. E. Ponting, F.S.A., the diocesan architect, of Marlborough, and the work of construction has been placed in the hands of Messrs. Lockings Bros., of Newbury, Berks. The church will be cruciform, and built in the late Decorated style. It will be 93 ft. long by 26 ft. wide, and consist of a nave, chancel, north and south aisles, and a western tower 40 ft. high. The space under the tower will be occupied by the family pew, to which there will be a private entrance on the north side of the tower. The north transept will be used by the school children, who will have a separate entrance, whilst the south transept will form the vestry with organ loft over it. The main entrance to the building will be by a porch on the south side, which faces St. Andrew's Green. Seating accommodation will be provided for 193 persons. The roof will be of open timber work covered with dark tiles, the timber being oak, and the flooring will be of wood blocks. The seats will be also of open oak work, and it is expected the chancel will be paved with marble. The eight large tracery windows of the nave and transepts, filled with leaded glass, will be supplemented by a six-light window at the back of the family pew in the tower wall, whilst the window at the east end of the chancel will be a five-light one and extend nearly the whole width.

CHURCH IMPROVEMENT, GALLANDER, N.B.—A meeting of the congregation of the United Free Church was recently held to hear the report of the special committee upon the proposals of the leacons' court for the improvement of the church buildings. The report stated that the committee were unanimously agreed in recommending in its main features the plans and proposals prepared by Messrs. Glegg, and Watson, architects, Glasgow. The alterations which it was decided to carry out include the transferring of the organ from the north to the south side of the chancel, the enlargement of the chancel eastwards to the extent of 3 ft., and the altering of the position of the new vestry.

VESTRY AND ORGAN, DOWLAIS CHURCH.—Since the enlargement, some years ago, of St. John's Parish Church, Dowlais, it had been felt that the old organ was inadequate to the needs of the present congregation of worshippers. A contract was, therefore, entered into with Messrs. Norman & Beard to erect a three-manual instrument to specifications prepared by Mr. Harry Evans, Dowlais, and Mr. W. J. Watkins. It became necessary to enlarge the old organ-chamber, the work being entrusted to Mr. Enoch Williams, builder, Dowlais. A new vestry has been added on the north side of the chancel, the architect of the whole of the alterations being Mr. E. M. Bruce-Young, Cardiff.

SHEFFIELD.—Alderman Glegg, the Chairman of the Sheffield Education Committee, presided on the 12th ult. at the opening of the new school at Newhall for defective children. The new building has been specially designed by the architect, Mr. A. F. Watson (Messrs. Holmes & Watson), to embrace a department for the instruction of boys, and comprises on the ground floor three class-rooms, each accommodating twenty children, a hall, in which exercises or marching will be taught, and private rooms for the teachers. An area of ten superficial feet is allowed for each child. The upper floor will be utilised as a cookery and manual training centre, and a department being for upwards of forty scholars. The manual department is fitted up with wood and other stores, as well as with cupboards for the pupils' work, while the cookery classroom has pantry and scullery accommodation.

SCHOOL, WARRINGTON.—The foundation-stone of the new "Beaumont" Council school in Orford-avenue, Warrington, was laid on the 9th ult. The school buildings are situated on a site of about 2½ acres, and have been arranged in five blocks. There will be a two-story building, which will give accommodation for 360 girls on the ground floor and 360 boys on the first floor. In another building accommodation will be provided for 360 infants, and there will also be a cookery and manual instruction block. Large covered play-sheds have been arranged in each yard, and running along the entire length of one side of the site a garden for nature study has been provided. The building will be heated with hot water on the low-pressure principle, with radiators. The work is being carried out from the designs and instructions of Mr. S. J. Sibley, architect, Warrington. The builder is Mr. C. W. Davenport, of Stockton Heath, and Mr. Henry Hallward is superintending the work. The cost of the building will amount to nearly 16,000.

HOSPITAL FOR SICK CHILDREN, GREAT OXFORD-STREET.—The top floor of the south wing of this hospital, erected in 1890, has recently been converted into an isolation department for infectious cases. The old timber roof has been removed, and a new steel roof, with an asphalt flat laid thereon, has been added. This new roof is formed of two layers of "Mack" slabs—having an air space between—over a steel work, and the asphalt is laid directly on the slabs. The flat is enclosed on three sides with a wrought-iron railing, 6 ft. high, and on the north side by a brick

wall. The flat is to be used for the open air treatment of consumptive patients. The accommodation provided consists of four single bed wards, one ward for two beds, two nurses' rooms, kitchen, and sanitary annexe. The partitions have been formed with "Mack" slabs, the asphaltting has been executed by the Val de Travers Asphalt Company, the doors by the Gilmour Door Company, Ltd., and the porter and Engineering Company. The additions, including the joinery—which is constructed throughout in teak—have been executed by the Works Department of the Hospital, under the management of Mr. James McKay. The architect is Mr. Charles E. Barry.

RECEPTION HOUSE, PARKICK, N.B.—The reception house at Knightswood Hospital was opened on the 13th ult. The building is of one story, and is designed in such a manner that from a central administrative department three radiates four different houses, which can be occupied by four different families. Each house has a living-room, two bedrooms, and a bathroom, having an independent entrance door and "flag" ground. One of the houses, instead of having two bedrooms has one dormitory, and this house can be utilised, if required, for the accommodation of men only. The administrative department is placed in the centre of the building and from the central kitchen an entrance is provided to each house with a sliding shutter for the service of food to the inmates. The administrative department consists of a large kitchen, with sculleries and all necessary store-rooms, while at the back three apartments are provided for the accommodation of nurses and servants. A special entrance is provided from the main road to this department. Heating is partly by hot-water pipes and radiators. Electric light is fitted throughout. The whole cost of the work will be about 2,500. The buildings were designed by Messrs. H. & D. Barclay, Glasgow, and the work carried out under the superintendence of Mr. John Bryce, master of works.

PROPOSED WATT MEMORIAL, GREENOCK.—A meeting of the committee in charge of the Watt Memorial Fund at Greenock met on the 8th ult., and resolved to proceed with the erection of a building upon the site of James Watt's birthplace, at the corner of William-street and Dalrymple-street. Mr. Colin MacCulloch, acting secretary, submitted the report of the sub-committee, which embraced proceedings since the beginning of the movement. It was stated that the Greenock Corporation had unanimously agreed to place the site of Watt's birthplace at the disposal of the committee, the members of which called in Mr. David Barclay, of Messrs. H. & D. Barclay, Glasgow, the architect of Greenock Municipal Buildings, who prepared four sets of plans. Provost Denholm, in explanation of these plans, stated that the committee had unanimously agreed to recommend plan No. 3, which showed a building in the old Scots style of architecture, at an estimated cost of 6,500. On the motion of ex-Bailie Macrae, seconded by Mr. John Rankin, the report was adopted, and it was remitted with full power to the committee to carry out.

PROPOSED EXTENSION OF THE INFECTIOUS DISEASES HOSPITAL, LINCOLN.—Mr. J. Spencer Low, M.B., Local Government Board Inspector, held an inquiry recently at the Guildhall, Lincoln, into the application of the City Council for sanction to borrow the sum of 2,200, for the extension of the Infectious Diseases Hospital. Mr. W. T. Page, jun., the Deputy-Town Clerk, stated that it was proposed to build two public wards, for the accommodation of eight beds each, and two private wards of one bed each. At the request of the Inspector, the Surveyor produced the plans, and explained the nature of the proposed extension, stating that the new block would be practically on the same lines as the present one. The buildings would be of brick and York stone.

NEW HALL, BALGONIE, N.B.—The new hall which has been presented to the inhabitants of Coaltown of Balgonie and district by Mr. C. E. Balfour of Balgonie, M.P., was opened on the 14th ult. The structure, which stands in the village of Coaltown, is designed after the English Renaissance style, and is constructed of terraced cotta brick, with green slates and projecting roofs, having large boards at the gables. The heating is done on the low-pressure steam system by means of radiators, the boiler being in a sunk fireproof chamber. The cost has been about 3,000. Messrs. Gillespie & Scott, St. Andrews, were the architects of the hall, and the following were the contractors:—Mason and brick work, Messrs. Wilkie & Gibb, Leven; joiner work, Mr. John Mitchell, Coaltown of Balgonie; slater work, Mr. Thomas Black, St. Andrews; plumber work, Mr. William Spittal, Markinch; plaster work, Mr. Thomas Davidson, Markinch; painter work, Mrs. Allan, Markinch; heating, Messrs. A. L. Peacock & Co., Dundee; gates and railings, Mr. David Houston, Cupar; laying out of the grounds, Mr. Archibald Douglas, Cupar; furnishings, Mr. David Grievie and Mr. M'Nab, Markinch.

GIRLS' SECONDARY SCHOOL, FOLKESTONE.—Pelliam House, Bouverie-road East, Folkestone, has just been opened as a secondary school for girls. The necessary alterations and repairs were carried out by Mr. S. Binfield, according to the plans, and under the direction, of Mr. W. H. Robinson, Architect to the Kent Education Committee. In all there are six classrooms, providing accommodation for 150 students.

HOSPITAL, EXPRESSION, BIRMINGHAM.—The Queen's Hospital at Birmingham is to be enlarged at a cost of 30,000. Plans have been prepared by Messrs. Even Harper & Bro. for a three-story structure, which will afford accommodation for sixty beds. The plan shows buildings running north and south from Bath-row, with projections to the south at either end. On the ground floor will be a physician's room near the entrance, and now to the rear residential quarters for the superintendent of the hospital, which at present the institution does not possess; a students' day-room, cloak-room for lady students, and a new chapel, 36 ft. by 16 ft. On the first floor is shown a male ward 120 ft. by 24 ft., with room for thirty beds, but this will be divided into two wards. Associated with them will be three bathrooms, a clinical room, two small wards for special cases, a ward kitchen, and store. At the front, over the entrance, will be an open balcony. On the second floor the front portion is appropriated to a children's ward, with six beds, and a women's ward, with twenty-four. A covered glass corridor running behind the out-patient departments will form the means of communication between the older portion of the hospital and the new. The consulting-rooms on either side of the out-patient hall are deficient in space, and to remedy this it is proposed to add upon each side a lean-to structure, providing an additional dressing or examination-room to each consulting-room. The nurses' home is also to be enlarged by the provision of fourteen additional bedrooms, a nurses' recreation-room, and a sitting-room for the lady superintendent.

WORKHOUSE LAUNDRY, TRANMERE.—The laundry erected at the Tranmere Workhouse by the Birkenhead Guardians was opened a short time ago. The plant consists of boiler-house, engine-room, wash-house, and ironing room, separated from one another by drying closets (common to which are receiving, delivery, or dispatch rooms), and adjoining a small wash-house for special purposes. There is a chimney 120 ft. high on the roof of the boiler, and for the sake of security the foundations were carried down to the solid rock 18 ft. below the surface. The buildings are of common brick with red brick dressings, but inside the laundry is lined with white glazed bricks of second quality. The floors are granolithic and of wood. Light and ventilation have been carefully attended to, the windows containing opening casements top and bottom, and exhaust ventilating fans being placed in the roofs and driven at a high speed by steam power. Mr. Edmund Kirby was the architect of the work.

PROPOSED MISSION HALL, PORTOBELLO, EDINBURGH.—A new mission hall is to be erected in connexion with St. Mark's Church, Portobello, Mr. Edward C. H. Maidman, architect, of Edinburgh, has prepared the plans for the proposed work.

STAINED GLASS AND DECORATION.
BUCKRELL CHURCH, HONITON.—A memorial tablet has recently been placed in this church to the memory of the late vicar. The plate is of brass richly decorated and enamelled, surmounted with repoussé silver figures representing angels, supporting a gold chalice, while at each corner of the brass are massive solid silver and enamelled studs. The whole is set in a moulded black marble frame and supported by carved Devonshire marble corbels, each bearing a sacred monogram. The design is by Mr. John Medland, architect, and the work was executed by Messrs. Keith & Co.

CHRIST CHURCH, SOUTHGATE.—The new side chapel, at Christ Church, Southgate, has been entirely redecorated by Messrs. Percy Bacon & Brothers; the roof in colours and emblems; the walls diapered; and five pictures in oils painted by Mr. Percy Bacon himself. The subjects of these pictures are "The Annunciation," "Nativity," "Epiphany," "Presentation," and the "Doctors in the Temple."

WINDOW, CATHOLIC CHURCH, SHEPHERD'S BUSH.—The east window of the Catholic Church of the Holy Ghost and St. Stephen, Shepherd's Bush, has just been filled with stained glass. The window is formed of four large quatrefoils with spandrels. In the upper portions are angels bearing a scroll. In the lower portions are ten figures of saints with their respective emblems. The glass is rich and deep in colour—to suit the unusually strong light. The window was designed and executed by Mr. E. Stanley Watkins, of Ealing.

SANITARY AND ENGINEERING NEWS.
WATERWORKS, EAST COWES.—The newly-constructed waterworks at East Cowes were opened on the 22nd ult. The water-tower is

brick built, starting with walls 2 ft. thick, and tied together at every floor with circular arches and steel girders. The tank, which rests on a floor of steel girders 12 in. deep, is 21 ft. square and 11 ft. deep. The cost, including plant, and building, is 6,000l. Mr. W. Brown was the District Council's consulting engineer.

NEWCASTLE QUAY-WALL EXTENSION.—The Newcastle Corporation have decided that the City Engineer shall carry out the extensions of the quay wall, and not let the work on contract.

VENTILATION OF THE SIMPSON TUNNEL.—So far as can be judged the ventilation of the Simpson tunnel, which is now practically complete, ought to be satisfactory as regards hygienic conditions and the comfort of passengers. When the ventilating apparatus has been installed in full it will consist of a pair of stout canvas curtains at each entrance, the material secured to iron frames mounted on rollers and operated by electric motors, and powerful fans at each end of the tunnel driven by turbines. The curtains will have to be raised each time a train enters or leaves the tunnel, and their object is to prevent any interference with the positive action of the air-propelling machinery. The fans at the north entrance will force in about 2,430 cubic feet of fresh air per second, and those at the south entrance with a similar capacity will act as exhaust fans, thus materially aiding the movement of air along the underground route. As there will be no disturbing causes such as those which make the ventilation of London tube railways so difficult, it is probable that the results will come up to the expectations of the engineers and that the temperature will not exceed reasonable limits.

FOREIGN.

FRANCE.—It is announced that Mr. Hayes, a rich American living in Paris, has offered to the city a statue of Benjamin Franklin, which is to be set up in April.—Fourteen fine Gobelin tapestries are shortly to be exhibited at Versailles; they are works executed in the reign of Louis XIV. from the designs of Lebrun and Van der Meulen. Among the subjects are, the Duke of Anjou proclaimed King of Spain, the departure of Turenne for the war, the siege of Douai, etc.

—The Municipality of Bordeaux has under consideration a large scheme for an increase to the water supply of the city, at an estimated cost of 4½ million francs.—The ancient theatre of Orange, well known as one of the finest remains of Roman architecture in France, is threatened with a complete "restoration," which would probably be as deplorable in its results as all the works of this kind that have been undertaken in France for some years past. It is proposed to lay out half a million francs on this work.

The jury in the competition opened by the Municipality of Marseilles for the reconstruction of the insanitary neighbourhood in the rear of the Bourse, has awarded the first premium to MM. Hélarard and Ramasso, architects who hold scholarships in Marseilles at the Ecole des Beaux-Arts at Paris, and the second to M. Tony Garnier, a Government architect and former Prix de Rome.—There is again talk of rebuilding the Mairie of the Eighth Arrondissement on its present site in the Rue d'Anjou. The work will be entrusted to M. Nénot. The cost is estimated at 2 million francs.—The death is announced, at the age of sixty, of M. Ernest Paugny, architect, of Marseilles, and a member of the Société Centrale.—The death is announced, at Avignon, at the age of eighty-two, of an able artist, Pierre Grivolos, Director of the Art-schools of that town. He was known as a painter of flowers, rural scenes, and of the landscape of Provence. He had presented to the Museum at Avignon a considerable number of his pictures.—The death is announced of M. Auguste Fleury, the oldest architect of Rouen, at the age of eighty-two.—When the budget for Fine Arts comes under discussion in Parliament, the question is to be considered of building four popular theatres in Paris, one in the centre and the others in three of the outlying arrondissements, such as Montmartre, La Villette, Les Gobelins, or Grenelle. The cost of the whole scheme is estimated at nearly 4,000,000 francs.

—Mme. Bartholdi, the widow of the late sculptor, has founded a prize to be awarded annually, at the Old Salon, to an artist who has executed any work remarkable for qualities of invention and imagination, in any walk of art. The prize will be awarded this year for the first time.—It is probable that the monument to Carpeaux will be erected in the square of the Louvre, behind the Gambetta monument.—Work is shortly to be commenced for the enlargement of the Mairie of the IInd arrondissement of Paris, in the Rue de la Banque.—A new district hospital is to be built at Raincy.—The Curator of the Palace of Fontainebleau has restored several of the ancient apartments, among them that formerly occupied by Pope Pius II., and those of the Princesse Hortense and of the sisters of Napoleon.—An international exhibition of Women's Art ("Arts de la Femme") is to be held at Marseilles in the course of the

present year.—M. Gervais, architect, of Bordeaux, has been appointed architect to the Department of the Gironde.—The Municipality of Nancy has voted a sum of nearly 2,000,000 francs for various works of street improvement and building, including the erection of a district school of art.—The Municipal Council of Agen have opened a competition for the building of a new theatre on the site of the existing theatre, which is to be demolished.—M. Durel, an architect, originally of Lyons, was murdered in a railway carriage a few days ago. He had designed the Kursaal and various hotels at Geneva, and the monument erected there to the French inhabitants who fell in the war of 1870. The death is announced of M. Henri Hamel, art critic, and editor of the *Journal des Artistes*. He devoted himself in the first instance to painting and lithography, and was a pupil of Gérôme and of Maillart; he subsequently devoted himself to literature and started successively the *Monde Moderne*, the *Revue des Beaux-Arts*, and the *Revue Parisienne*. He was the author of two books—"Art et Critique" and "Causerie sur l'Art et les Artistes."

SOUTH AFRICA.—Messrs. Willis & Hutchison, Solicitors, have secured the contract for building the Odzani power station and other buildings in connexion therewith.—The Transvaal Public Works Department has accepted Mr. J. J. Kirkness's tender for the erection of additional stories to the new Government buildings in Pretoria at a cost of 2,429l.

MISCELLANEOUS.

THE INSTITUTE OF ARCHITECTS.—The Registration Sub-Committee, consisting of the President, Sir Aston Webb, R.A., Mr. Edwin T. Hall, Mr. T. E. Colcutt, Mr. John Slater, Mr. J. S. Gibson, Mr. A. W. S. Cross, Mr. W. H. Seth-Smith, and Mr. George Hubbard, and appointed by the Registration Committee "to take evidence for and against the principle of Registration, and to suggest the course of procedure to be adopted at the general meeting when the present scheme of registration comes up for discussion," desire to state for the information of members that they have held twelve meetings and taken the *visa* *vice* evidence of twenty-one architects practising in and against the principle of Registration, and in London and the provinces, a verbatim report of which has been preserved, and they hope soon to be in a position to report to the Registration Committee.

CHURCH OF ST. PAUL, BALL'S POND, ISLINGTON.—In terms of the Act 29-30 Vict. c. 111 the Ecclesiastical Commissioners have agreed to appropriate out of their common fund a grant of 850l. in supplement of a benefaction of the same amount which has been paid to them in favour of St. Paul's Church. The total sum of 1,300l. is to be applied to the provision of a parsonage or house of residence for the vicarage, according to plans and a specification to be approved by the Commissioners. The church, which stands at the junction of Essex and Ball's Pond roads, was built of brick with stone dressings and window tracery in 1826-7 after Sir Charles Barry's designs in the late Gothic style then in vogue.

WESLEYAN CHAPEL COMMITTEE'S REPORT.—The fifty-first annual report of the Committee which was recently issued, setting out the progress during the period under review 483 new or enlarged buildings were completed at an aggregate cost of 692,533l., the list including 133 new churches having a total capacity for 43,000 persons, 34 ministers' houses, 55 school-rooms, 203 improvements and extensions, and 58 organs. The building is in progress of 27 out of the 60 new churches for 16,700 sittings, sanctioned during the twelve months by the Committee. Mission halls have been erected at Hull, Bootle, and Plumstead, together with the Garrett Memorial hall, the headquarters of the Wesleyan mission in Liverpool; new central halls will shortly be built in Sheffield, Wigan, Paisley, Manchester, Sydenham, Stepping, and Great Queen-street, London. During the past fifty years the value of the chapel property belonging to the Connexion has increased by 10,000,000l., and an amount of 2,863,509l. has been paid off as debt upon Wesleyan trust property.

GALLERY OF BRITISH ART, MILLBANK.—Hogarth's "A Family Group" has become the property of the Gallery in terms of the late Mrs. Anne Sealy's will, and will be removed from the collection in Trafalgar-square. Recent additions to the Gallery at Millbank consist of a series of fifty drawings and sketches by Alfred Stevens, purchased by the trustees, G. F. Watts's "Echo," presented by Mrs. Watts; the late H. H. Attwood's bas-relief, "Hero and Leander," bequeathed by the artist; and Mr. Sargent's "Portrait of Miss Ellen Terry as Lady Macbeth," presented to the Gallery by Mr. J. J. Duxey.

THE MUNICIPAL YEAR BOOK.—The Municipal Year Book of the United Kingdom for 1905 has just been issued by Edward Lloyd (Salisbury-square). The work, which is edited by Mr. Robert Donald, is crowded with useful and, so far as we have been able to test it, reliable information

relating to the cities and towns of the country, all of which is clearly arranged and printed. A brief general review is given of the work of each local authority in alphabetical order, under the name of the city, town, or district, and the chief sections into which the book is divided are as follows:—(1) London Municipal Government (County Council, City Corporation, Borough Councils, Water Board, Asylums Board, etc., etc.); (2) Municipal Government in England and Wales (general summaries of the work of the Municipal Corporations, Urban District Councils, and Rural District Councils); (3) Municipal Government in Scotland (general summaries of the work of the principal Scotch cities and towns); (4) Local Government in Ireland (general summaries of the work of the principal Irish cities and towns); (5) Water supply; (6) Gas supply; (7) Tramways; (8) Electricity supply; (9) Housing of the working classes; (10) Markets and slaughter-houses; (11) Telephones; (12) Baths and wash-houses; (13) Education; (14) Libraries; (15) Amusements; (16) Refuse and sewage disposal; (17) Local taxation, and the Municipal Corporation trading. There is also a directory of the principal societies and organisations connected with the various branches of local government. We have pleasure in drawing attention to a most useful guide to municipal work.

STREETS IMPROVEMENT, NEWCASTLE.—A special meeting of the Town and Streets Committee of the Newcastle Corporation, held on the 19th ult., at the Town Hall, Newcastle, to consider a scheme proposed by the City Engineer (Mr. C. R. S. Kirkpatrick) for making a further extension of Market-street to Trafalgar-square. The City Engineer said that the scheme as sanctioned by Parliament could be improved upon in many respects. The levels of the main street would be very irregular, and the gradient of the cross streets would in some cases be very steep. The façades of the new street would never have more than the appearance of a succession of street ends. To cope with these difficulties he (the City Engineer) had prepared a scheme which, although it would cause further delay and expenditure, would in the end give satisfaction in the matter of gradients, frontages, and land available for sale. Market-street extension by this scheme would have one uniform gradient of 1 in 79 from Elgin-street to Trafalgar-street. The difficulties with cross streets would be avoided, and instead of a succession of street-ends there would be excellent frontages with a good depth of site that would make the land marketable. After going into details of the widths and gradients of the proposed new streets, with the length of the building-frontages of each, the report stated that the extra land required to be purchased represented an area of 12,400 sq. yds., which, together with that already purchased, made an area of 21,550 sq. yds. From this area, 7,100 sq. yds. would be required for streets, leaving a balance of 14,450 sq. yds., to which must be added 3,600 sq. yds. absorbed from streets which would be abolished, making a total of 18,050 yds. for re-sale. The land already purchased had cost about 183,000l., and it was estimated that the land required would cost about 248,000l., and that the sale of the land would realise 601,820l., which, after deducting 22,000l. for street formation, and 25,000l. for other expenses, would leave a profit of 183,820l. After consideration it was agreed to make a survey of the lands in question on March 5.

STREETS COMPTON ST. GERMAN'S.—The St. Germans Rural District Council have appointed Mr. H. A. Hoslings their surveyor. There were ninety-nine applicants for the post.

SLATE TRADE.—There is an improvement in the Carnarvonshire district. It was found that prices in the January list for 24 by 12 and 24 by 11 were too low, so an advance has been made in those sizes. The wet weather has caused falls of rock in some of the deeper quarries; these, with the increasing cost of working, are turning the attention of quarry owners to the slate properties on the south side of the valley, which have long been thought of by the workmen. The men have accepted the reduction in wages, and work is being carried on smoothly in all the quarries.

THE COCKBURN ASSOCIATION AND THE AMENITY OF EDINBURGH.—The annual report by the Council of the Cockburn Association alludes to the proposal to convert the Royal High School into a National Gallery and Art School, and expresses the view that it will be a source of satisfaction to many that the proposal has been dropped. In the matter of the raising of the parapet of the Dean Bridge, the Association made a representation on the subject to the Town Council. The proposal was dropped, and the Council hope that the raising of the parapet of the Dean Bridge in the shape of a project to run tramways over the bridge. Apart from the question of overhead posts and wires, which would have disqualified the bridge, the chief objection to the proposal to convert the Royal High School into a National Gallery and Art School was the widening of the bridge, and it is felt that that could not be done without detracting

to present graceful lines upon which the bridge is constructed, and thereby destroying one of the city's greatest works. It was with regret that the Council recorded the demolition of a part of the historic Flodden wall in connexion with the building of a new school in Drummond-street. The amount destroyed is not of very great extent, and the best portion of the wall, it is stated, still remains untouched. The attention of the School Board having been drawn to the matter, a brass tablet recording the history of the wall has been fixed upon the remaining portion of the wall at the entrance to the school. The Council drew attention to the tablets displayed by Messrs. W. & R. Chambers when adding to their premises in Byres Close. The new building has been designed as far as possible to be in harmony with its surroundings. Otherwise the view of the Old Town from Princess-street would have been seriously damaged. The new headquarters of the Queen's Rifle Volunteer Brigade in Forrest-road is quoted as a successful example of an effort to harmonise the architecture of a new building with the general character of its surroundings. The North British and Mercantile Insurance Company buildings in Princess-street and the new branch of the British Iron Bank in George-street are also referred to as interesting considerations to the dignity of their respective surroundings.

BRISTOL MASTER BUILDERS' ASSOCIATION.—The annual dinner of Bristol Master Builders' Association took place on the 20th ult. at the Royal Hotel, the President (Mr. E. I. Neale) being in the chair. The Royal toast was responded to by the Chairman, Mr. A. N. Jones (President Bristol Chained Timber Importers' Association) submitted "Our Civic Rulers," and Alderman Parsons, in replying, said Bristol was a city with great traditions, and he claimed that the civic rulers desired to do their duty earnestly and faithfully in accordance with those traditions. He pointed out the expenditure on Avondale Dock, large sums of money had been spent in providing adequate facilities for the old city docks.—Councillor E. M. Dyer said he felt surprised that the masters builders were so passive, for he thought that the citizens were called upon to pay too much for work which the Corporation could do out, and which, to his way of thinking, should be put up to public competition. The timber trade was developing at Portishead, and he hoped that it would prove a great success.—Mr. Frank N. Cowlin submitted "The Trade and Commerce of Bristol." He coupled with the toast the name of the President of the Bristol Chamber of Commerce. The President of the Chamber of Commerce (Mr. S. Humphries) said that in Bristol they had to compete against rival ports, and if dues were reasonably lowered, there was no reason why Bristol should not supply the whole of the great district of the Midlands. The railway rates from Bristol were better than those which existed at Liverpool, and the slight decrease was not to dominate the district he had alluded to.—The Mayor of Bath (Mr. C. Bryan Oliver) proposed "The National and South-Western Federations of Master Builders of Great Britain." He remarked that the Federations had done an enormous amount of good, but the object was to double the preventing strikes. They had been established not for coercive, but for protective, purposes.—Mr. E. W. Wooster (Bath), President of the South-Western Federation, responded, and alluded to the position which the organisation held. He claimed that it had raised the standard of their industry to a degree more commensurate with the importance of the work done. The influence of these bodies had been felt, he agreed with the proposer of the toast, in dealing with trade disputes with the workpeople, in arriving at amicable understandings, and so preventing strikes.—Mr. A. Dowling (ex-President), who followed, claimed that the West of England Federation did not exist to tyrannise. It enabled them to make their voices heard in regard to conditions of tendering and contracting in a way that would be impossible for a single member or even the association of a single town. They were also united to the National Federation, and participated in, as well as assisted in, accumulating funds for the good of their object was to act equitably.—Mr. R. F. Wilkins gave "Architects, Engineers, and Surveyors," and Mr. Frank W. Wills, Mr. A. P. I. Cotterell, and Mr. Peter Addie (City Surveyor and Valuer) responded.—Mr. George Humphries (Treasurer), proposed the toast of "Kindred Associations." Mr. G. H. Perrin (Architect) responded.

The Visitors were duly honoured, on the proposition of Mr. E. Walters, and acknowledged by Mr. W. Webb (President, Bath Association). Mr. W. H. Brown proposed "The Bristol Master Builders' Association."—The President said he desired to thank the members of the Bristol Association for the very hearty manner in which they had supported him during his two years of office as President. It was very gratifying to know that their Association was increasing in numbers, although his friend the Treasurer (Mr. George Humphries) reminded him that their

expenses were increasing. He was sorry that during his term of office the building trade had been in a depressed state, but he thought that there were indications of better prospects. He was pleased to say that the membership between the builders and their workmen was most satisfactory, and the Association had decided not to ask for a reduction of wages, believing that better and more prosperous times were ahead.—Mr. R. F. Ridd was inducted as the new President, and the chain and badge of office placed upon his shoulders.

GLASGOW ARCHITECTURAL CRAFTSMEN'S SOCIETY.—A meeting of this Society was held last week in the Technical College, the President (Mr. Colin Sinclair) in the chair, when Professor Charles Gourlay delivered a lecture on Salonica, illustrated by lantern slides, also by drawings and photographs, some of which were taken by the lecturer. Professor Gourlay said that the modern town of Salonica was first known in history as Therna, but Cassander changed its name to Thessalonica after the name of and in honour of his wife. After touching upon the many historical associations, both sacred and classical, connected with the city and describing its beautiful situation, the lecturer referred to its ancient walls, white tower, and sculptured Roman arch. Then in considerable detail he described in the following order the Early Christian and Byzantine churches, now mosques, which still remain in a remarkably well preserved state in this modern Turkish town. The Church of St. George, with its circular nave and beautiful mosaic decoration of the interior of its dome, which is the greatest and best work in Byzantine mosaic now in existence; the Mosque of Eski Djouma (formerly a three-aisled basilican church); the Church of St. Demetrius, one of the best preserved and most finely proportioned of five-aisled basilicas of the Early Christian period; the Church of St. Sophia, with its interesting plan and dome at the crossing, which is decorated internally with a very beautiful mosaic, the subject being the Ascension; lastly, the later examples: St. Elias, with its triapsal plan; St. Bardias, having the typical Greek cross plan; the Holy Apostles, with its one central and four smaller domes, showing thus in its pristine form that which became a universal feature of the Russian churches; and St. Pantelimon, a small but interesting church now restored.

PROPOSED ART SCHOOL FOR EDINBURGH.—The Lord Provost's Committee of Edinburgh Town Council discussed on the 21st ult. the proposal to found an art school in the city. It is understood that the Government are willing to contribute a certain sum towards this object on the understanding or undertaking that a considerable contribution is made by the city. It was stated that the Government were prepared, in the event of Edinburgh not doing something, to hand the sum over to Glasgow. Ultimately it was agreed to remit the matter to a sub-committee to consider as to the attitude to be taken up by the city.—*Glasgow Herald.*

PHOTOGRAPHIC SURVEY AND RECORD OF STREETS.—The annual meeting will be held in the lecture Hall, Public Library, Kingston-upon-Thames, at 3.30 p.m., on Saturday, March 10. The President, Viscount Midleton, will give an address, and the report of the Council and the accounts of the year ended December 31, 1905, will be submitted. The meeting is open, not only to members and contributors to the Survey, but to all interested in its work and aims. Arrangements have been made for an exhibition consisting of a representative selection from the 2,000 prints already in the Survey collection, in the Art Gallery, Public Library, Kingston-upon-Thames. This will be open on the day of meeting until 9 p.m., and again during the following fortnight until dusk. A short lecture, illustrated by lantern slides, will be given on each Saturday evening at 8 p.m.

BRITISH FIRE PREVENTION COMMITTEE.—The Committee completed a further series of important fire tests last week, their investigations terminating late on Saturday. Two concrete floors were under test for the purpose of classification as affording "Full Protection" (Class B) against fire, this necessitating a fire test of four hours at temperatures reaching between 1,800 and 2,000 deg. F., followed by the application of water from a steam fire engine for five minutes (two branches), the floors being loaded with 2½ cwt. per ft. super. The one floor was of brick concrete reinforced with expanded metal lathing, supported by encaased ordinary girders. The other floor was of clinker concrete reinforced with small joists, supported by encaased broad flange girders. In both, "Ferrocrete" cement was used and the period allowed for the setting and drying was almost the same. Both floors obtained classification as affording "Full Protection." By the last-named floor test the Fire Prevention Committee again prove, among other matters, the superiority of clinker concrete versus Thames ballast concrete as a fire resistant, a floor of almost identical design of Thames ballast concrete having failed last autumn. Two fire tests with roller shutters (Kinneer type) were also completed by the Fire Prevention Committee, one with double shutters for a four-hour test, and one with

a single shutter for a two and a half hour test, followed by the application of water. Both attained classification as "Fully Protective" (Class B and Class A respectively); both were of thin steel plate under ½ in. thick, and both had, prior to the final application of water, been subjected to streams of water fifty minutes before the conclusion of the tests—i.e., they had this additional test applied beyond what was necessary for classification.

Legal.

WEST-END ANCIENT-LIGHT CASE.

In the Chancery Division, on the 1st inst., Mr. Justice Joyce concluded the hearing of the case of Fryzer v. Windus and Others—an action by the plaintiff, Mr. Alfred Fryzer, against the defendants, Mr. James Windus, Mr. W. S. Hoare, and Messrs. E. Lawrence & Sons, builders, for an injunction to restrain the defendants, their servants and agents, from erecting or continuing the erection of new buildings so as to cause a nuisance to the plaintiff or his premises, and from injuring darkening or obstructing the access of light to and through a skylight and certain windows in the plaintiff's premises as the same were formerly enjoyed, and an order to pull down so much of the buildings as were higher than the old buildings which formerly stood on the site. There was also a claim for damages. The statement of claim alleged that the height of the defendants' old buildings was 48 ft. from the ground level and 23 ft. from the party wall, and that defendants had erected on the site a new building consisting of shops, warehouses, and tenements, the rear walls of which were about 60 ft. in height, and only about 10 ft. from the party wall. Plaintiff alleged that the effect on this was to cause a substantial decrease of light coming to the lights and windows in question, and was such as to render his house uncomfortable according to the ordinary notions of mankind. There was also a claim for trespass in connexion with the party wall.

The defendants did not admit that any of the plaintiff's lights were ancient. They also said that the walls of the old buildings they had demolished were dark and unsightly, and no light could be reflected from them, whereas the walls complained of of the new buildings were faced with white glazed bricks, which afforded a considerable amount of light to plaintiff's premises. They further denied that their new buildings had or would cause any nuisance to the plaintiff as alleged, and that they would in any appreciable extent affect the plaintiff's light or interfere with the comfortable enjoyment by the plaintiff or his tenants of the premises.

Mr. Hughes, K.C., and Mr. Crossfield appeared for the plaintiff, and Mr. Younger, K.C., and Mr. E. Ford for the defendants.

Mr. Hughes, in opening the case, said it raised two points, the important one being the question of ancient lights, and the other a minor question about a party wall. The plaintiff was the lessee of a building named Cavendish-chambers, which was in a street recently called Duke-street, but was now called Hallam-street. It was a large building, and the plaintiff was the leaseholder, his term being seven years from Christmas, 1904. The rental of the plaintiff's building was 300l. a year, and it was let out by him as residential chambers. The windows affected were nine in number. The defendants, Windus and Hoare, had an agreement for a lease of certain buildings in Great Portland-street, being at the back of the plaintiff's premises. Defendants had pulled the premises down and had rebuilt them. Both the defendants' buildings were erected under one contract.

Mr. Younger said that so far as he could see the building complained of was that of Mr. Hoare and not that of Mr. Windus.

Mr. Hughes said that for all practical purposes defendants were partners in the matter.

Mr. Younger said he appeared for all the defendants, but he did not admit that statement of his learned friend. He had got to make his case against each defendant.

Mr. Hughes: Oh, yes. So far as regards an injunction no difficulty arises, but on the question of damages there might be some difficulty about severance of damages.

Continuing, the learned counsel said that the writ was issued in May last, when the defendants' buildings had not gone very far. On June 20, 1905, a motion was made for an *interim* injunction, but by consent no order was made on the motion, although it was agreed that plaintiff was not to be prejudiced by the building having gone on since the date of the motion. It was said by the defendants that the plaintiff's lights were not ancient, but he could prove they were. The windows in question were by no means too well lighted before the defendants' buildings were put up, and the result of what had been taken away was to render the rooms gloomy and uncomfortable. He should call evidence to show that the effect of what had been done was to substantially diminish the letting value of the

plaintiff's property. The other point with regard to the party wall arose in this way. The building owners, wanting to interfere with the party wall between the two properties, gave the usual notice, and a Mr. James Naylor acted for the plaintiff, and a Mr. White for the defendants, and an award was made as to the alteration that might be made in the party wall. In point of fact, the party wall was raised higher than the award allowed.

His lordship: What do defendants say about that?

Mr. Hughes said that they declined to pull it down, and set up the contention that they were entitled to another award. When the plaintiff's architect complained, he defendants' architect said he should go to a third surveyor to see if he was entitled to keep the wall as it was.

Mr. Younger said the plaintiff pleaded that the party wall was a trespass and an interference with the light. The defendants said there was no ground for saying that the wall interfered with the light, and so far as trespass was concerned the case was in the hands of a third surveyor. He thought that so far as trespass was concerned it was very trivial.

Mr. James Naylor, A.R.I.B.A., examined by Mr. Hughes, said he practised at No. 19, Hanover-square, and was Assistant District Surveyor for Marylebone. He was called in to advise on this matter on February 21, 1905. He had carefully examined and measured the buildings, and had prepared the drawings counsel had made use of. He had inspected the interior of the plaintiff's building on the question of light. The windows "A" and "B" lighted the rear room on the first floor, which was unoccupied at present. "C" lighted the staircase, "D" a water-closet and bathroom, "E" a sitting-room, "F" a water-closet on the ground floor, "K" a bedroom on the ground floor, "M" the studio, and "N" a sitting-room. There was a room just behind the studio which got its side light from the skylight in the studio. He went into all the rooms before the defendants' buildings were completed, and had been into the several rooms since the defendants' buildings were completed. The room lighted by the two windows "A" and "B" was now uncomfortably dark; so much so that a gentleman could not see to shave in it except on a bright summer day. Before the defendants' buildings were put up the light was none too good, but now it was very much worse. The staircase light was important. Since the defendants' building had been put up it had made the hall distinctly gloomy and the staircase badly lighted.

The witness was then examined as to the other windows and lights said to have been affected by the defendants' buildings, and gave evidence to the effect that the light was now substantially less than it was before. He considered that owing to the defendants' buildings the depreciation in the letting value of the plaintiff's building would be about 35 per cent. As to the party wall, the piece put on not sanctioned by the award was shown on the model.

His lordship said here that some arrangement ought to be come to on that part of the case.

Mr. Younger said that his clients would pull that part of the wall down.

His lordship: Therefore it is not necessary to go into that part of the case. I should have thought that for a small sum the plaintiff might allow it to remain up.

The witness, in cross-examination by Mr. Younger, said that his view was that the light to all the windows in question had been damaged by what the defendants had done. An artist was still in occupation of the studio. The glass in the roof was slightly obscured by a coating of dust. It was a well-lighted room before the defendants' buildings were erected. It was now an extremely gloomy room, perfectly useless as a studio and practically useless for residential purposes. He thought the result of the defendants' operations had been to depreciate the letting value of the plaintiff's rooms by 35 per cent. He thought the rental value of the studio was reduced by 50 per cent.

The rent of the studio is 100l. a year?—Yes. Therefore, according to you the present value of it is 50l. a year?—Yes; it can never again be used as a studio.

Mr. E. A. Cruning, F.R.I.B.A., examined by Mr. Hughes, said he had not known either the plaintiff's or the defendants' buildings before. He had examined the plans and models and, had visited the buildings on May 29, 1905, and February 9 last. Both were fine days. When he went in May last defendants' buildings were not completed. In his opinion the defendants' buildings had very materially affected the light coming to plaintiff's windows on the ground and first floors.

In their present condition are the living rooms comfortable according to the ordinary notions of mankind in respect of light?—No, I do not think they are.

Are they in such a condition of light that a man could carry on his ordinary occupation there as beneficially as before?—Certainly not.

Examination continued.

One-third of the light falling on the floor of the

ante-room at the back of the studio had been taken away now.

In answer to his lordship, witness said he understood that the studio had been a good one, and had been used for the purpose of painting portraits.

Cross-examined by Mr. Younger. He had no knowledge of the premises prior to his first visit in May last year.

Evidence was also given on behalf of the plaintiff by Mr. John Slater, F.R.I.B.A., Mr. G. R. Crickmay, F.R.I.B.A., and Mr. C. H. Giddy, of Messrs. Ciddy & Giddy.

At the close of the plaintiff's case Professor Boreford Pite, F.R.I.B.A., was the first witness called for the defence. He said he had visited the premises in question first in May of last year and afterwards in February of this. The opinion he formed was that the defendants' buildings had not caused a serious or material obstruction of light to the plaintiff's windows, and sufficient light was left for the quiet, comfortable use and occupation of the premises. He was confirmed in his opinion by his subsequent examinations of the premises. At the present time the unobstructed light to the windows "A" and "B" was 49½ degrees. In his opinion the studio was a well-lighted room. Defendants' premises had not in his opinion appreciably affected the light of the studio. With regard to the other rooms they were all sufficiently lighted, many of them being exceedingly well-lighted for bedrooms. He had made the usual tests in the rooms, and found that he could read small print in all parts of the rooms.

Cross-examination.

He held the opinion that a bedroom could be too well-lighted.

The following experts also gave evidence in support of the defendants' case—Mr. Matthews, F.R.I.B.A., Mr. Howard Chatfield Clarke, F.R.I.B.A., and Mr. W. H. White, F.R.I.B.A.

At the conclusion of the addresses of counsel his lordship reserved judgment.

ACTION BY CIVIL ENGINEER FOR FEES.

On the 22nd ult. the hearing was concluded of the case of Walton v. Garland and others before Mr. Justice A. T. Lawrence and others before Mr. Justice A. T. Lawrence and a special jury, an action brought by Mr. J. B. Walton, a civil engineer, of Hythe, Kent, against Mr. J. F. H. Garland (since deceased) and then represented by his executors and Mr. Joseph Rowlands, of Birmingham, to recover a sum of money for services rendered to the defendants and for money paid at their request.

The defendants denied that they employed the plaintiff, and they further said that they had paid him all that was due. Third parties were represented in the case, viz., the Great Western Railway Company and a Mr. L. R. Walker.

Mr. Hugo Young, K.C., and Mr. W. H. Waleley appeared for the plaintiff; Mr. Montague Lush, K.C., and Mr. Horace Rowlands for the defendants; Mr. J. A. Simon for the Great Western Railway Company; and Mr. Coles Preedy for Mr. Walker.

Mr. Young, in opening the case, said that the claim was made by the plaintiff, an engineer, for services rendered in connexion with the making of a new line in Wales called the North Pembroke-shire and Fishguard Railway, and which constituted a through route to Ireland. The line was now under the control of the Great Western Railway Company and would be very soon opened. There was, apparently, no question as to the plaintiff being entitled to be paid; the point was, who was to pay him? The amount he was entitled to could not be determined by the jury; that would have to be got elsewhere. The jury would have to say whether the plaintiff was not right in trying to fix the responsibility on the gentlemen with whom he contracted, leaving them to be indemnified by anybody upon whose shoulders liability ought ultimately to fall. The learned counsel then narrated in detail the various steps taken to complete certain lines in the locality, and said that in 1902 the company entered into a contract with a Mr. O'Kell to make a line from Roseshub to Fishguard, the consideration being that he should receive the whole of the shares of the company, the latter undertaking to invite public subscription for the same. This contract was assigned by Mr. O'Kell to Mr. Rowlands and Mr. Garland. In 1902 the idea entered the heads of Messrs. Rowlands and Garland of extending the local railway to Fishguard, to have a pier and harbour at Fishguard, making the through route to Ireland. The details of the various schemes which were subsequently presented to Parliament were explained, and it was stated that in October, 1905, the plaintiff was employed by the defendants to do certain work. Plaintiff was paid an amount of money under that contract, but the present claim was in respect of extra work for which he was entitled to be remunerated, as the whole original idea of the scheme was altered, and he had so much additional work to do.

After a great deal of evidence had been given, the whole matter was referred to the official referee, Mr. Edward Pollock.

ACTION BY DECORATIVE ARTIST AGAINST BUILDERS.

The case of De Jong v. James Johnson & Sons, Ltd., came before Mr. Justice Lawrence in the King's Bench Division on the 24th ult., an action by Mr. Felix De Jong, a decorative artist, to recover from the defendants, and to deconstructive work done in connexion with the erection of the Alhambra Theatre of Varieties, Cateshead. The total bill was 1,277l., but 500l. had been received.

Mr. E. F. Lever, who appeared for the plaintiff, said the question for his lordship was, whether in suing the defendants plaintiff was suing the proper persons. There were three people concerned in the erection of the theatre. There was the theatre company, the building owners, Mr. James Johnson, the original builder, who undertook to do the whole of the work, and James Johnson & Sons, Ltd., which was a company formed for the purpose of carrying on his business. The defendants said that the plaintiff should have sued the theatre company, who were the building owners, but he contended that it was the present defendants who were liable. In May, 1904, when the theatre was to be erected, his client got into communication with Mr. Stewart Mould, who was the architect, and who, it was plaintiff's contention, was acting for Mr. Johnson with reference to the sub-contract for work which was done by the plaintiff. He believed that the sub-contractor always looked to the builder for payment, and therefore, as in this case, the builder was liable. Mr. Mould had given a certificate for 500l., representing a part of the work done, and this was sent to Mr. Johnson with a request for payment, and James Johnson & Sons, Ltd., sent the cheque.

The plaintiff gave evidence that Mr. Mould told him that the amount to be paid him for his work was a provisional sum to be included in the builders' contract.

Mr. Garland, who represented the defendants, said his contention was that right through Mr. Mould was acting on behalf of the theatre company and not for the defendants, and he did not think Mr. Mould had any authority to give any undertaking.

In the result, his lordship, in giving judgment, said the conclusion he had arrived at was that Mr. Johnson, sen., was greatly interested in the theatre company, and he was the person who had the money and was financing that company. The present defendants had not made themselves liable, and therefore he gave judgment for the defendants with costs.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

3,268 of 1905.—J. N. RUSSELL: *Method of and means for Heating Buildings by the Circulation of Steam or Vapour.*

This relates to an installation for heating a building by the circulation of steam or vapour, and consists in the combination of a vacuum-creating device to which the outlets of the several heating units are connected, with devices provided upon the inlets to the respective heating units adapted to be manually adjusted without dismantling the valve so as to permit of the maximum opening of said inlets being instantly varied.

6,529 of 1905.—A. ROBERTSON: *Sliding Sashes for Windows.*

This relates to a sliding sash for windows sliding in an outer frame and operated by racks and pinions, and consists in the provision of channels in said sash with ratchet-teeth at the bottoms of said channels, and of loose bars located in said channels and provided on the underside with corresponding ratchet-teeth to those in the channels, so that when the loose bars are moved the ratchet-teeth over-ride and press the rail against the water-tight packing on the outer frame.

9,079 of 1905.—THE PREFECTOR WINDOW COMPANY, LTD., and T. F. CAUNT: *Casement Windows.*

This relates to a casement window in which the casement revolves on vertical axes, and which has a U-shaped moulding at the top and bottom, and L-shaped mouldings at the sides.

10,458 of 1905.—F. D. ROBINSON: *Louvre Ventilator for Top, Bottom, or side of Window Sash or Casement.*

This relates to a detachable window or like ventilator, and is characterised by a frame provided with a series of louvre bars formed in one with the frame or attached thereto either rigidly or pivotally, a gauze or perforated zinc backing to said bars and frame, means such as grooves for the reception of the sash cords when used as a top ventilator, and means such as bevelled top and bottom edges to fit the window sill and under edge of bottom rail or sash when used as a bottom ventilator.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

28 of 1905.—G. G. BRODIE and A. B. COLEMAN: Kitchen or Cooking Ranges.

This relates to a kitchen or cooking-range, consisting of the combination with a fixed upper socket made in one piece with the rising falling hinged bottom of the fire-box of a then or cooking-range, of a pivoted catching two arms or projections, one of which is attached to the fixed tubular socket, and is introduced upon by the lifting bar which is introduced into the socket, while the other arm or projection normally engages with one of the teeth fixed rack on the front of the range.

182 of 1905.—G. GLOSSOP, T. EARNshaw, and J. CLOUGH: Fixings of Cement Blocks or Bricks.

This relates to a compound cement block or brick, having an exterior metal plate which is secured to the block by means of wires or rods on to which the cement is poured or otherwise formed.

348 of 1905.—S. WARREN and C. ELOCK: Window Stays and Fasteners.

This relates to a fastener for window sashes, consisting of a slotted plate attached to the upper sash of the window, a frame slotted to be attached to the sash and a bar, having at one end a tightening screw to run in the slot of a plate attached to the sill or other part of the frame, and having its opposite end pivoted at an angle plate, one limb of which is furnished with a tightening screw to run in the slot of the plate attached to the sash.

621 of 1905.—C. A. LOWE: Means for Arresting Dust and Other Floating Particles.

This relates to means for arresting or intercepting dust and other floating particles, and comprises a series of fabric frames so disposed as to arrest dust or floating particles drawn or blown into contact therewith, said frames being slid into position in the casing whereby they are capable of being readily removed to be cleansed.

363 of 1905.—H. LORD: Fasteners for Window Sashes.

This relates to a fastener for window sashes, and consists of a plate attached to the lower bar of the upper sash of the window. This plate can be secured to the bar of the window by screws any other convenient means. To this plate is hinged another plate which is so arranged as to be capable when both sashes are in their closed positions of swivelling over on top of the upper sash to the lower sash. This swivelling plate is provided with a slot. Then there is attached a screw or otherwise to the top bar of the lower sash a plate which is provided with an upwardly-projecting rotatable pin. This pin has a flat end, which can be passed through the slot in the swivelling-plate, and then given a quarter turn, which locks the swivelling-plate to the plate of the lower sash, and thus holds both sashes in their closed positions.

317 of 1905.—O. A. OSMOND: Apparatus for Calculating the Dimensions of Framework, and the Like.

This relates to an apparatus for calculating the dimensions of framework and the like, and consists of a measuring tool, a pair of pivotally-connected arms, each including a bottom and top member spaced apart, said top members being provided with longitudinal slots in combination with longitudinally slotted third member adjustable in the spaces between the bottom and the top members of the pivoted arms, and means for securing said arms and third member in adjusted position.

409 of 1905.—V. F. FEENY: Farm Gates, Road Gates, and the Like.

This relates to farm gates, road gates, and the like, and consists in the combination of an oscillating lever provided with a slotted link perpendicular thereto, a single faced cam plate bearing which a roller fitted hinge pin bears, and adjustable connections on each side of the plate from each end of the lever to opposite sides of spring held rotatable drums.

8,952 of 1905.—W. H. COULTER and J. B. COULTER: Machines for Dressing and Performing Similar Operations upon Stone, Marble, Granite, and the Like.

This relates to a machine for dressing and performing similar operations upon stone, marble, granite, and the like, and consists of means for moving the belt forks for bringing about the operation of the movement of the table, said means comprising adjustable dog brackets provided with loose collars or anti-friction bows adapted to actuate through the intervention of an adjustable stud, and system of levers connected to the aid shaft.

1,444 of 1905.—F. KAEBERLE: An Electro-magnetically Operated Heat Supply Valve for Heating and Ventilation.

This relates to an electro-magnetically operated heat supply valve, and consists in the construction employed wherein the electro-magnet adapted to operate the valve is situated outside the chamber containing the valve and the armature connected to the latter, the arrangement being such that

the lines of force due to said electro-magnet act directly on said armature through the wall or partition by which the electro-magnet is separated from the valve chamber.

22,845 of 1905.—J. SOSS: Window Sash Balances. This relates to a sash balancing device, and consists of a rack plate adapted to be secured to the side of a sash, a plate adapted to be secured to a window frame, adjacent to the side of the sash, said plate being provided near its upper end with an outwardly directed bracket and at its lower end with an outwardly directed bearing provided on its upper end with ratchet-teeth, a clutch-head mounted on said bearing and provided with ratchet-teeth which correspond with those on the bearing, said clutch-head being also provided with an upwardly directed spindle and with radially arranged holes, a tube passing through said bracket, and on the lower end of which fits the spindle of the clutch-head, said tube being provided with a worm gear which operates in connexion with the rack on the sash, means for forcing the tube in the direction of the sash, and a spiral spring plate in said tube, one end of which is secured to the upper end of said tube and the other end to the spindle of the clutch-head.

10,604 of 1905.—E. E. MAWLE: Pipe Attachment for Improving Connections of Branch Pipes to Main Pipes in Water and Other Pipes. This relates to a pipe attachment for improving the flow of water or other liquids to and from main to branch pipes, and consists in the arrangement and construction of an internal deflecting lip which is cast solid on to a saddle which can be screwed over branch pipe and bolted on to an existing main pipe.

15,164 of 1905.—P. HABAY: Railway Sleepers Composed of Cement Concrete in Conjunction with Metal.

This relates to the construction of railway sleepers composed of cement concrete, in conjunction with metal, and consists in providing the metallic framework and cement concrete with means for securing the chairs to support the rails thereon and to prevent the movement of the sleeper on the road.

SOME RECENT SALES OF PROPERTY:

Table listing real estate sales with columns for location, date, and price. Includes entries like 'February 10.—By LEOPOLD FARMER & SONS, Clapton—102, 104, 108, and 110, Millsfields-rd., (s.), l., yr. 130, ... £1,726' and 'By GARBETT, WHITE, & POLAND, Regent-street—40, Conduit-st., (s.), area 2,675 ft., Corporation base, gr. St. 158, yr. 450, ... 14,500'.

Table listing various properties and their values. Includes entries like 'By PROTHEROE & MORRIS (at Leytonstone), Walthamstow—Higham Hill-rd., two freehold building sites ... £100' and 'February 22.—By H. J. BURS & SONS, Highgate—Salisbury-rd., l.g. rents 18s., reversion in 44 yrs. ... 400'.

MEETINGS.

FRIDAY, MARCH 2. Royal Institution.—Dr. R. Caton, F.R.C.P., on "Hippocrates and the Newly-Discovered Health Temple at Cos," 9 p.m. Junior Institution of Engineers (Westminster Palace Hall).—(1) Paper on "Acceleration and Accelerometers" by Mr. A. P. Trotter, B.A., Electrical Adviser to the Board of Trade. (2) Paper on "Gas Engine Indicators" by Mr. L. F. de Poyre, C.E., Stud. Inst. C.E. 8 p.m. SATURDAY, MARCH 3. Royal Institution.—Professor J. J. Thomson, M.A., on "The Corpuscular Theory of Matter," I. 3 p.m. MONDAY, MARCH 5. Royal Institute of British Architects.—(1) A special general meeting to elect the Royal Gold Medalist for the current year. The Chairman to move:—"That, subject to His Majesty's sanction, the Royal Gold Medal for the promotion of Architecture be presented this year to Sir Lawrence Alma-Tadema, R.A., F.R.S.A." (2) The ninth general meeting (business) to receive the report o

the scrutineers on the election of twenty-eight candidates for Fellowship, and to proceed with the election of candidates for Associateship. (3) Mr. A. Saxon Snell will call attention to the terms of the Henry Saxon Snell Bequest, and ask what steps have been taken by the Council to formulate a scheme for the proposed scholarship or prize, and he will move a resolution. 8 p.m. Society of Engineers.—Mr. R. G. Allanson-Winn, B.A., on "Submerged Chain Cable Groynes." 7.30 p.m. Liverpool Architectural Society.—Mr. C. Spooner on "Church Filigings." Illustrated by lantern slides. 8 p.m.

TUESDAY, MARCH 8.

Institute of Sanitary Engineers (Students' Lecture).—Professor Adams on "Supervision of Works in Progress." 7 p.m. Institution of Civil Engineers.—(1) Papers to be further discussed—"A Plan for Better Country Roads," by Mr. G. R. Jebb, and "Country Roads for Modern Traffic," by Mr. J. E. Blackwell, B.A. (2, time permitting), "The Widnes and Runcorn Transporter Bridge," by Mr. J. J. Webster. 8 p.m.

WEDNESDAY, MARCH 9.

Royal Archaeological Institute.—Mr. Ambrose P. Boyson on "Low Set Openings in Danish and other Scandinavian Churches," with lantern illustrations. 4 p.m. Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members. 8 p.m. Northern Architectural Association.—Annual meeting. 7.30 p.m. Society of Arts.—Mr. J. C. Dollman, A.R.W.S., on "Art in Painting and Photography." Mr. David Murray, R.A., will preside. 8 p.m. Edinburgh Architectural Association.—Mr. R. S. Lorimer on "Scottish Gardens and Garden Architecture." 8 p.m.

THURSDAY, MARCH 9.

Carpenters' Company, London Walk (Free Lectures on Matters Connected with Building).—Mr. O. Gerald Stone, B.E., on "Stair Turbines—Land and Marine." 8 p.m. Institution of Electrical Engineers.—Mr. A. Ryan on "A New Single-Phase Commutator Motor." 8 p.m.

FRIDAY, MARCH 9.

Architectural Association.—Mr. Gilbert H. Lovegrove on "The A.A. Camera and Ceiling Club Excursions," illustrated by lantern views. 7.30 p.m. Institution of Civil Engineers (Students' Meeting).—Mr. R. Freeman on "The Design of a Two-Hinged Spandrel-Braced Steel Arch." 8 p.m.

SATURDAY, MARCH 10.

Architectural Association.—Spring visit to the Royal London Friendly Society's Building and Tollard Royal Hotel, Southampton row, W.C. 2 p.m. Junior Institution of Engineers.—Conversations. Mr. C. Alfred Smith, B.Sc., on "The Evolution of the Man-of-War," illustrated by lantern slides. 8 p.m. Royal Institution.—Professor J. Thomson, M.A., on "The Corpuscular Theory of Matter." II. 3 p.m. Edinburgh Architectural Association.—Visits to Edinburgh Castle and addition to City Chambers.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is applied DIRECT from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum (2 numbers) PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., see per annum. Remittances (payable to J. MORGAN) should be addressed to The Publisher "THE BUILDER," Cabot-street, W.C. SUBSCRIBERS IN LONDON and the SUBURBS, by prepaying at the Publishing Office 12s. per annum (2 numbers) or 4s. 9d. per quarter (13 numbers), can ensure receiving "The Builder" by Friday Morning's Post.

PRICES CURRENT OF MATERIALS.

* * * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity usually affect prices—a fact which should be remembered by those who make use of this information.

Table with columns for material names and prices. Includes sections for BRICKS, &c., GLAZED BRICKS, and HARD STOCKS.

BRICKS, &c. (continued).

Table listing various types of bricks and their prices per yard or per ton.

STONE.

Table listing different types of stone and their prices per cubic foot or per ton.

Table listing various types of wood and their prices per cubic foot or per ton.

SLATES.

Table listing different grades of slates and their prices per 1000 or per square.

TILES.

Table listing various types of roof tiles and their prices per 1000 or per square.

WOOD.

Table listing different types of wood and their prices per standard unit.

WOOD (continued).

Table listing various types of building wood and their prices per load or per standard unit.

Table listing different types of wood and their prices per standard unit.

Table listing various types of wood and their prices per standard unit.

Table listing different types of wood and their prices per standard unit.

Table listing various types of metal and their prices per ton.

Table listing different types of metal and their prices per ton.

Table with columns: LEAD, &c. Per ton, in London. Includes items like Sheet, English, 3lb. and up, 12 s. 0. d., Pipe in coils, 19 0 0, etc.

Table with columns: ENGLISH SHEET GLASS IN CHATES. Includes items like 2d. per ft. delivered, 3d., 4d., etc.

Table with columns: OILS, &c. Per gallon. Includes items like Linseed Oil in pipes, 0 1 10, etc.

Table with columns: VARNISHES, &c. Per gallon. Includes items like Pale Oak Varnish, 0 8 0, etc.

TO CORRESPONDENTS. J. S. C. (drawings received).—H. & P. (received). We cannot undertake to return rejected communications...

TENDERS. Communications for insertion under this heading should be addressed to 'The Editor,' and must reach us not later than 10 a.m. on Thursday, F.N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner...

AYLESBURY.—For the erection of a pair of villas, Ting-road Aylesbury, for Messrs. Jones & Coeks. Mr. Fred Taylor, architect, Aylesbury.—G. & F. Cannon ... £1,150; Webster & Cannon ... £1,098; Mayne & Son ... 1,100

AYLESBURY.—For the erection and completion of grammar school, master's house, playing sheds, and fences, etc., in Walton-road, Aylesbury, for the Governors. Mr. Fred Taylor, architect, Aylesbury, London.—Messrs. W. T. Farthing & Son, 49, Strand, London:—J. Mead ... £9,130; G. Darlington ... £8,010; Dennis & Co. ... 8,931; A. Faulks ... 7,950; Myrpe & Son ... 8,640; Wallis & Son ... 7,867; H. Cleaver ... 8,750; Lawrence & Son ... 7,844; F. Gough ... 8,394; Hunt & Son ... 7,822; Jackman & Son ... 8,185; G. T. Cannon ... 7,765; W. J. Bloxham ... 8,150; Webster & Cannon ... 7,498; T. Stinson ... 8,069; G. H. Gibson ... 7,463; Henson & Son ... 8,050; Hacksley Bros., Wellingtonborough? ... 7,228; Honour & Son ... 8,044

BARNOLDSWICK.—For street works, part of long-field lane, for the Urban District Council. Mr. W. Bennett, Surveyor, Town Hall, Barnoldswick. Quantities by Surveyor.—W. Armstrong £210 16 8; E. S. Smith, Barnolds? ... 196 4 11; wick? ... £155 0 0; W. Sagar ... 186 13 9; W. J. Mc Donald ... 184 11 2

BECKENHAM (Kent).—For the erection of a private residence at Hayes-lane, Beckenham. Mr. G. St. Pierre Harris, architect and surveyor, 8, Ironmonger-lane, E.C., and Orpington, Kent.—T. Graham ... £4,668; J. E. Arnaud & Son £4,284; Perry Bros. ... 4,494; J. Dethick ... 4,197; T. Crosley & Son ... 4,388; Somerford & Son ... 4,190; Hudson Bros. ... 4,330; T. W. Grady ... 4,155

BEXLEY HEATH (Kent).—For the erection of a small villa. Mr. G. St. Pierre Harris, architect and surveyor, 8, Ironmonger-lane, E.C., and Orpington, Kent.—A. Peakes? ... £415 7

BRADFORD.—For erecting chapel and schools, Shearbridge-road, for the trustees of the late Mr. Charles chapel. Mr. R. H. Parkinson, architect and surveyor, Queensgate-chambers, Bradford.—Mason and Joiners: J. Moulson & Son, Ltd., Bradford? ... £5,556 14 5; Plasterers: A. Marsden & Son, Bradford? ... 12 0; Tiler: T. Thornton, Shipley? ... 12 0; Painter: J. O. Calvert, Bradford? ... 12 0

BUCKINGHAM.—For additions to the National Schools, Lillingstone Lovell, for the Managers. Mr. Fred Taylor, architect, Aylesbury.—J. T. Marshall ... £292 0 0

CANWELL (Staffs).—For further alterations and additions to the Hall, for Mr. Philip S. Foster. Mr. C. M. C. Armstrong, architect, 5, High-street, Warwick.—G. Hodges ... £2,619; W. J. Whittall & Son, W. & J. Webb ... 2,521; Birmingham? ... £2,371

CASTLEREA (Co. Roscommon).—For constructing houses, water pipes, and water course (Ballagherreen Electric Lighting Works), for the Rural District Council. Mr. Christopher Mulvaney, engineer, Athlone.—McKea & Mc Nally ... £1,063 3 4; B. Alldredge, Co. Sligo ... £1,130 0 0; J. Regan? ... 894 0 0

CHELLENHAM.—For erecting new school buildings to accommodate 1,100 children, for the Naunton Park district, for the Education Committee. Messrs. Chatters & Smithson, architects, 17, Regent-street, Cheltenham.—Months: W. T. Bloxham ... £15,797; Pethick Bros. ... 15,744; Wilkins & Son ... 15,238; J. Gutteridge ... 15,200; Lane & Son ... 14,900; Long & Son ... 14,633; H. Smith ... 14,440; E. Walters & Sons ... 14,500; R. Skemp ... 14,475; Estcourt & Sons ... 14,250; Channon & Son ... 14,157; Billings & Son ... 14,157; W. Jones ... 13,998; L. Jones ... 13,985; Bowes & Co. ... 13,969; Parnell & Son ... 13,725; Dallow & Sons ... 13,477; Collins & Godfrey ... 13,150; T. Culbert ... 13,088; Eastwood ... 12,855; C. Wright ... 12,777; W. Crane, Nottingham? ... 12,687

CHISLEHURST (Kent).—For the erection of a motor garage at private residence. Mr. G. St. Pierre Harris, architect and surveyor, 8, Ironmonger-lane, E.C., and Orpington.—T. Rider & Son ... £515; R. Lowe ... £536; T. Knight ... 575; T. D. Grady? ... 519

The Church of Southwold.

THE story of the church of Southwold and of the present noble building can be briefly told. There was a small church here, probably occupying part of the

same site, long before the great fabric of the XVth century was begun. The abbot and convent of Bury St. Edmunds were lords of the manor; but the prior and monks of the Cluniac house of Thetford, in right of their cell of Wangford in the adjoining parish, held the advowson of Reydon parish church, of which Southwold (then a small place of little importance) was merely a hamlet. A great contest arose between these two religious houses about the erection of a chapel here, to serve for the fisher folk; but at last, about 1202, an agreement was come to whereby the priory of Thetford, in conjunction with their cell at Wangford, undertook to build a chapel at Southwold, on ground given by the Abbey of St. Edmunds, for daily service by a resident chaplain, who was to be subordinate to the church of St. Margaret, Reydon. This original church or chapel of Southwold was destroyed by fire about 1430. During certain works in the year 1758, the foundations of the old building were laid bare, and were found to measure 72 ft. from east to west.

Just about the time when the old chapel was burnt out, the mouth of the

Blythe was becoming of greater importance as supplying quays and a port for the wool trade. The once important town and harbour of Dunwich, a few miles to the south, was being rapidly absorbed by sea encroachments, and other small ports along this coast line were being silted up. Southwold, on the north side of the Blythe, and Walberswick on the south, were gradually growing into places of repute. Although Southwold did not obtain its first charter of incorporation until 1490, traders and merchants began to settle there far earlier in the century, and the harbour dues and fisheries brought in a small local revenue.

Here then was a great opportunity for the traders and inhabitants spending no inconsiderable share of their growing wealth in the erection of a stately house of worship, and one of the four great churches of this immediate neighbourhood (the others being Covehithe, Blythburgh, and Walberswick) was begun and finished through the generous gifts of the people. It is improbable that either the monks of Thetford or of St. Edmunds played any important part in the matter.

The date or dates of the new erection of the XVth century are not a matter of guesswork. A deed dated 1458, whereby the prior of Wangford gave land for the enlargement of the churchyard of "the new chapel lately erected," shows that the inhabitants did not lose much time in setting about the reconstruction of their old place of worship on the present grand scale. Various bequests for the making of seats, the candle-beam, and other furniture, in 1461 and years immediately

following, show that the body of the church was by that time completed. Other bequests, about 1470, for the bells, point to the finishing of the tower ere that date. The fine porch seems to have been the crowning of the work, for there were bequests towards its erection or completion in 1488 and 1489.

The new church, which was dedicated to St. Edmund, consisted then as now of chancel with side chapels, clearstoried nave of seven bays, north and south aisles, south porch, and western tower.

There has been a good deal of diversity in the measurements of this large church, as usually cited. The following have been recently taken for this article:—Chancel, 44 ft. 10 in. by 19 ft. 2 in.; nave, 79 ft. by 19 ft. 9 in.; south aisle, with chapel, 98 ft. 4 in. by 15 ft. 7 in.; north aisle, with chapel, 104 ft. 3 in. by 16 ft.; tower, 16 ft. 1 in. east and west, by 14 ft. north and south; and porch, 12 ft. 11 in. north and south, by 11 ft. 7 in. east and west. The width of the walling of the tower arch is 3 ft. 6 in., thus giving a total interior length of 143 ft. 5 in.; the total width is 56 ft. 2 in. The space between the arches of the nave arcades is the same on each side, namely, 10 ft. 8 in.; this is the case with all the arches saving the two adjoining the tower, which have a width of 11 ft. 9 in.

It will be noticed from these measurements that this church is not on an entirely regular plan, although at first sight both sides seem uniform. Though not separated by any long interval of time, the construction of the aisles was not carried on simultaneously. It may

be fairly concluded that the north side of the church came after the south, for the parapet of the north aisle was left in an unfinished state until the restoration of 1867-8. On the north side the walling of the aisle is divided by the buttresses into eight bays; its extension eastwards comes to within 18 ft. (outside) of the east wall of the chancel. On the south side there are seven bays to the aisle, there being 24 ft. beyond it of chancel walling. The difference in length on the north side is accounted for by provision being made for a two-staged sacristry, the upper part of which is now used for the organ. All the side windows of the church are of three lights with good tracery, but east and west windows are of four lights. The great east window is now also of four lights. The original window was blown in during the great storm of 1696, when 200 coasting vessels, with most of their crews, were wrecked on the east coast. It was repaired with wooden mullions. The present mullions and tracery date from 1867-8; and so also do two or three of the south aisle windows, which had been repaired with wood or partly blocked up with brick.

The south porch (see lithograph) is a really noble example of the later flush-work of East Anglia; the scheme of the free-stone and flint panelling being richly carried out, particularly in the battlements and buttresses. There is a handsome canopied niche between the two two-light south windows of the parvise. There is a stone vaulted roof to the parvise.

The continuous stretch of clearstory windows, eighteen on each side, with the flat-topped pinnacles rising between, give a peculiar grace to the building. In the centre of the long line of the lead-covered high-pitched roof rises a sanctus-bell turret of some little size, and of no particular beauty. In fact, it has rather a clumsy appearance, and it would be much improved if it had greater height and was of a more fleche-like character. Much of the line of clearstory, with its parapets, was renewed in 1867-8, and this sanctus-bell turret was reconstructed. In a fine volume of drawings of Suffolk churches, made by Mr. Isaac Johnson, of Woodbridge (now in private hands), an exterior of Southwold, taken about 1800, shows a turret of a more ornamental and crocketed description.

The massive west tower, which rises to over 100 ft. in height, has a particularly fine appearance on the west side. The west doorway is of good design, with griffins in the spandrels, and lions as the terminals of the squared hoodmould. The hollows of the mouldings in the jambs and soffit of the arch are ornamented with a variety of figures. On each side of the west window there is a canopied image niche. Over the window is a bold inscription in crowned capital letters, formed in freestone and flint, which runs as follows: *St. Edmund ora p. nobis*. The large double bell-chamber windows are of unwonted construction, and would seem overweighted were it not for the particularly substantial general character of the tower; they are divided down the centre by narrow buttresses, which reach from the coping to the first string course, and there terminate. There is a

quatrefoil band round the top of the tower, but no regular parapet. The summit of the tower, as well as the parapet of the north aisle up to 1866-7, seems to have been left in an unfinished state.

The interior of the church is of fine proportions, but must have been much more impressive when the great even stretch from tower to east window was broken up by the left and great Rood on the top of the rood screen. The single hammer-beam roof extends unbrokenly from end to end. It is on the old lines, but only contains a few of the original timbers. Mr. Phipson, who restored the church in 1866-7, took off the whole of the roof and reframed it; only two of the entire series of carved spandrels below the hammer-beams are old.

It was a common practice, in old days, in many parts of England, of which there are several examples in Suffolk, to more highly ornament the bay of the church roof immediately over the Rood. Southwold afforded a singularly beautiful instance of this custom, extending over twenty panels. These panels had blue grounds spangled with gilded stars, and in each is a gold-crowned angel clad in a pink robe; the wings of the angels were alternately green above and red below, and *vice versa*. The angels all hold either symbols of the Passion or inscribed scrolls with words from the *Benedictus*. Those on the north side bore:—(1) The pillar of scourging and Judas' lantern; (2) scroll, *Benedict's domin's*; (3) scroll, *Deus israel*; (4) spear and reed with hyssop; (5) palm branch; (6) scroll, *Quia visitavit*; (7) scroll, *Fecit redemptioe*; (8) hammer and three nails; (9) Latin cross; and (10) scroll un-inscribed. On the south side the angels bore:—(1) Pincer; (2) scroll, *Et ceteris*; (3) scroll, *Cornu salutis*; (4) reed sceptre; (5) crown of thorns; (6) scroll, *Nobis in*; (7) scroll, *Domo david*; (8) rod and scourge; (9) Peter's sword, with Malchus' ear on edge; and (10) scroll, *Pueri sui*. Beneath these southern angels are the words *Te D'um c'fitemur*, and beneath those on the north *Te D'um laudam*. This description is taken from a careful survey of the roof before 1866-7. Mr. Phipson found the painted panels so decayed that it was decided to remove them all, and to supply new wood and painting in facsimile, as far as possible, of the old. The work has been done well, and most visitors seem to think that they are looking up to XVth century painting. Had the work been undertaken a quarter of a century later, it would have probably been found possible to retain much, if not most, of the original.

The rood screen, with its extensions across the aisles, is on the whole the most interesting and valuable in Suffolk, and indeed in East Anglia at large, with the possible exception of Ranworth, Norfolk. The tracery and woodwork are good of their kind, particularly in the centre portion. But the chief merit and value of this screen lies in its painting and decoration. There is remarkable delicacy and finish in the gesso-work painting and gilding of the upper portion of the screen work, though the art displayed in the figure painting of the solid lower panels makes the greatest impression. It was at one time confidently stated, when the question of chestnut

versus oak was much discussed, that the panels were of chestnut wood, but it is now generally admitted that it is close-grained oak.

The twelve panels of the central portion of the screen are occupied by twelve Apostles, though St. Paul displaces one of the original twelve (in this case St. Matthew), as is sometimes the case. They occur in the following order, beginning at the north end:—(1) St. Philip, with basket of bread; (2) St. Matthias, leaning on a sword, with letter M on hilt, to distinguish him from St. Paul; (3) St. James the Less, with fuller's bat; (4) St. Andrew, with saltire cross; (5) St. Thomas, with spear; (6) St. Peter, with the two keys (Doorway); (7) St. Paul, with uplifted sword; (8) St. John, with chalice and serpent; (9) St. James the Great, with pilgrim's staff, wallet and scallop shell; (10) St. Bartholomew, with knife; (11) St. Simon, with an oar; and (12) St. Jude, with a boat. It may be noted that the Apostles are so arranged as to give St. Peter and St. Paul the posts of honour or of most observation, namely, one on each side of the entrance.

On the panels of the screen at the end of the south aisle, beyond which was the Lady Chapel, are representations of Old Testament prophets, three of which are recognisable, namely, Baruch, with knotted staff and wallet; David, with harp; and Moses. The names of others of the prophets can be deciphered, whilst the enriched backgrounds and diapered dresses are in some instances in fair preservation. The full list of prophets was Baruch, Hosea, Nahum, Jeremiah, Elijah, Moses, Daniel, Amos, Isaiah, Joubah, Ezekiel, and Samson.

The twelve panels of the screen that shut off the chapel of the Holy Trinity from the north aisle, beginning from the north end, bear:—(1) An angel, holding the triangular Trinity shield; (2) St. Gabriel, with sceptre and shield bearing the monogram of the Blessed Virgin; (3) an angel, bearing a shield of the Blessed Sacrament (three chalices and wafers); (4) Virtues, figure with crown in right hand and censer in left; (5) Powers, figure holding the Devil by a chain, scourging and trampling on him; (6) Principalities, figure with sceptre standing in a citadel; (7) Dominions, figure holding chalice and host in right hand, orb and cross in left, with a church below the feet; (8) Thrones, figure holding a tower; (9) Seraphim, golden figure standing on a wheel, holding a scroll bearing Sc's (sanctus) thrice repeated; (10) Cherubim, figure standing on a wheel, hands folded on breast; (11) Archangels, figure with sword and scales (St. Michael); and (12) Angels, crowned figure in golden alb and green stole, holding small nude figures representing souls in a white cloth. It will thus be seen that the whole conception was to figure the nine orders of the Heavenly Hierarchy, and the emblems of the Holy Trinity, the Blessed Virgin, and the Blessed Sacrament were added to bring the number up to twelve. Similar figures are to be found, though treated somewhat differently, on the richly-painted screen of Barton Turf, Norfolk. It is clear that this screen was the special gift of some merchant of the town. The *orate* of a memorial inscription of a donor or donors can still be read. In Martin's

church notes of the year 1750, the inscription on this screen is given as *orate pro animabus Johis Gudman et atarinc uxoris ejus*. This must be the same inscription described in "Gardner's history" (1754) as being "on the east of the pulpit by the north isle," but the name is there spelt "Gueman." In 1848, the words *Ora pro anima Johis Gudman* could be read on one of these panels, so that it would appear there were several others. There can now be seen below each of these panels a monogram or merchant's mark, which seems to be formed by the letters A. A. T.

There is no one who has made so close a study of the East Anglian screens as Mr. G. E. Fox, F.S.A., and it may be well here to quote some of the words he used when describing this Southwold painting to the members of the Royal Archeological Institute, when visiting his church in 1899. After noting how much the figures on the northern and southern screens had suffered from time and evil treatment, he added:—"The less interesting figures of the chancel screen are more perfect, but have lost in genuineness from the restoration of the heads (circa 1850) by the late Mr. George Richmond, R.A., the well-known portrait painter, father of the present Sir W. Richmond, who formerly resided in the neighbourhood. Yet, in spite of time and willful destruction and restoration, a great deal of the beauty of the original work remains. Notice the delicate gesso-work with which the architectural mouldings and the backgrounds of the figures of the Apostles are covered. In the panels, the figures being first drawn, the gesso or plaster was thickly applied to the ground and worked up to the outline of the figure. Then the plaster, whose setting had been retarded by mixture with certain well-known ingredients, such as honey, received the impressions of the different diapers by means of wooden stamps. On the flat face mullions of the chancel screen are seen, here and there, little flat-backed niches impressed in the gesso, with delicately outlined and shaded figures in black upon the gold which covers everything. The little figures had originally a tiny piece of glass over them, the arrangement being meant to imitate enamel."

It is usual to assign all beautiful painting and decoration of this character in East Anglia to the Flemings, who are supposed to have been beckoned across the water to ply their crafts wherever England's church lovers required the execution of specially skilful work. Quite recently an otherwise able writer on East Anglia has asserted that the Southwold painting is "indubitably of Flemish origin." The actual craftsmen who did the painting and exquisite decoration of this screen have not so far been identified, but Mr. Fox and others have supplied us with strings of obviously English names of men of Norwich and other parts of this district, from the days of Edward III. to Henry VIII., who were "payntours," "pictours," or "staignors," employed in church work. Thus Thomas of Yarmouth and Edmund of Bradwell were the craftsmen employed at high wages to do the tabernacle work and painting at the collegiate church of Mettingham, Suffolk, at the beginning of the XVth century.

To this we can add an instance yet nearer to Southwold, not hitherto cited. In 1498, William Rede and William Sharft (purely English names) received large sums for painting the rood screen and the roof of the once noble church of Walberswick, only a mile from Southwold.

The pulpit on the north side of the nave is a fine piece of wood carving, coeval with the fabric of the church. It is in good preservation, and the rich colouring has been reproduced with much taste.

The richly-carved stall work, immediately within the screen, is original, and only slightly repaired. There are four stalls, with misericords, and three returned stalls facing east on each side.

On the south side of the altar is a stone sedilia bench, 7 ft. 6 in. long, the seat 1 ft. 7½ in. high and 1 ft. 3 in. deep. It is covered by a handsome projecting groined canopy, without any divisions, at a height of 7 ft. This is an effective but most unusual arrangement.

The octagonal font, at the west end, is a fine one; it stands 54 in. high, and the bowl has a diameter of 36 in. It was originally a "Seven Sacraments" font,

but the carvings were broken off during the previous iconoclastic visitation of 1643. Dowsing, the notorious Puritan visitor, enters in his diary, under Southwold, April 8:—"We brake down one hundred and thirty superstitious pictures (glass), and four crosses on the four corners of the vestry; and gave orders to take down thirteen cherubims, and to take down twenty angels, and to take down the cover of the font."

In the vestry is a fine chest 5 ft. long, with two knights tilting on the front panel. It is somewhat older than the church, being of the time of Henry V. (1413-22). There is another massive chest, much decayed, with coved top, in the parvise.

The rood loft staircase is in the wall of the north aisle. In the upper doorway now stands a wooden figure of a "Jack of the Clock," which used to be over a small gallery within the tower. It was worked by the clock machinery to strike the hours within the building. The style of armour shows its date to be circa 1500.

A remarkable feature of the church is the absence of old monuments. Doubtless various brasses have disappeared.

"Jack of the Clock," in Southwold Church.

The interesting brass plate to James Petre, the royalist minister of Southwold, described in "Gardner's History" (1754), was subsequently purloined. It turned up in a neighbouring iron foundry in 1850, and was replaced within the chancel. He died in 1700, aged eighty-one. About the same time a XVth century brass plate was found on the top of a vestry cupboard, inscribed:—*Orate pro animabus Johannis Bischoep et Helene uxoris sue et omnium fidelium defunctorum*. By an error of judgment this plate was affixed to the screen of the south aisle, where it still remains. Its presence there makes visitors believe that John and Helen Bishop were the donors of the screen.

Out the south side of the large churchyard a group of three graves, each with its headstone, often attracts attention. They are to the memory of Thomas Gardner, an antiquary of some note, who published a valuable and now very rare history of Dunwich, Blythburgh, and Southwold in 1754, and his two wives. He long outlived his two partners, the one dying in 1729, and the other in 1759. The middle stone bears the following inscription, said to have been written by the antiquary shortly before his death:—

"IN MEMORY OF
THOMAS GARDNER, Salt Officer,
Who died March 30th, 1769, aged 79.
Between Honour and Virtue here doth lie
The remains of old antiquary."

THE PUBLIC, THE LONDON COUNTY COUNCIL AND THE DISTRICT SURVEYORS.

FOR a second time the Building Act Committee of the London County Council has brought up a recommendation that from April 1 next all district surveyors should be paid a salary by way of remuneration instead of fees, and for a second time the recommendation has been referred back. On January 13 last, in criticising the Committee's Report, we propounded this question, "Is there not rather a strong probability that the ratepayer will find himself called upon to share with the building-owner a burden which hitherto the building-owner alone has had to bear?" and, at the meeting of the Council on February 27 Lord Welby is reported to have said that the Finance Committee did not look with very great favour on the scheme of the Building Act Committee, fearing that its adoption might involve a charge on the rates. The amendment to refer the recommendation back was last week again carried, apparently on financial grounds, and by the increased majority of 59 votes to 40.

If we may judge from the correspondence which has appeared not only in our own columns but in the press at large, there appears still to exist a good deal of misapprehension as to the 50,000*l.* per annum which, in round figures, is the sum involved in the present discussion. The Building Act Committee, in their search for paper "profits," appear to have lighted upon a disused section in a ten-year-old Act of Parliament which they have thought good enough to enable them to divert an annual income of 50,000*l.*, earned by professional men, into the devouring, but decidedly unprofes-

sional, coffers of the London County Council. The persons who at present receive this 50,000*l.* per annum are the district surveyors, while the persons who pay this 50,000*l.* per annum are the building-owners (not the ratepayers) of London. The distinction between "building-owner" and "ratepayer" is an important one, which, though frequently lost sight of in the course of the present controversy, cannot be too much insisted on. It must not be supposed that every owner of a building in London is a "building-owner"; not at all; in the technical sense the phrase means any person, be he freeholder, leaseholder, or tenant on agreement, who sets out to make structural alterations to a house or premises, or to erect a new building within the boundaries of the County of London. The building-owner's relations with the district surveyor may perhaps best be realised by a simple illustration:—

I want to make an addition to my house in London; my architect prepares plans and obtains an estimate from a builder; a building contract is completed; I notify my neighbours on each side; I then become a "building-owner"; my builder before commencing the work gives notice to the district surveyor, who is an independent person acting by the authority of an Act of Parliament. The surveyor's duty is to see that the building operations are carried out in accordance with the London Building Acts; and, for this purpose, he visits and inspects the works from time to time. That he should be an independent and incorruptible man is as much to my interest as it is to the public advantage; and therefore, when the works are finished and my builder sends in his account, the last item that I quarrel with in that account is the amount of the fee, regulated by statute, which is paid to the district surveyor. Now, unless I have wanted to do something unusual—such as, for example, to project a bay window beyond the main front of my neighbours in the street, neither I myself nor my architect nor my builder will have had any communication whatsoever with the London County Council, nor will any official from Spring-gardens have crossed my threshold.

It will be evident from this illustration that the service performed for the building-owner by the district surveyor is not to be compared with the police service or the fire-brigade service, but is in the nature of a professional service rendered by a professionally trained man to a personal building-owner, and is paid for by that owner. The fire-brigade service, on the other hand, is one maintained at the expense of the ratepayers (with the assistance of the fire insurance offices) for the benefit of the community at large. Under the scheme recommended by the Building Act Committee it was proposed that an unwieldy and complicated service should be set up and maintained at the ratepayers' risk, whereby the Council hoped to make a profit—a ratepayers' speculation—out of fees taken from building-owners engaged in enterprises from which the ratepayer was not to get any benefit, whilst the building-owner would probably be making large profits. For example, on the occasion of a Royal procession the Council would have, at the ratepayers' cost, to pay for the services of the addi-

tional assistance required by the district surveyors in inspecting the construction of the large stands which on these occasions are erected along the line of route, to the great profit and advantage of the owners of the same stands. Hitherto the owner has paid the fees for this service to the district surveyor, who has had not only to inspect the stands but himself pay for any necessary assistance. We are not speaking of the licences granted by the Borough Councils for the erection of the stands, but of the work of supervision, for the cost of which the ratepayer is not now responsible; and we fail to see why the ratepayer should be called upon to put his hand in his pocket for the benefit of a building-owner engaged in a profitable undertaking, who is perfectly willing to pay for the work of supervision.

As we have said, it is these financial objections to the scheme which appear to have carried the majority of the Council in their decision to refer the recommendation back. The letter which the Royal Institute of British Architects has caused to be sent to the Chairman and members of the London County Council was printed in our issue of last week, and approaches the question from an even higher standpoint, and is, moreover, in accordance with the views we have consistently advocated in these columns. We note with approval that in the last paragraph of that letter the suggestion is made, "that the disability which has been imposed in the case of some of the later appointments should no longer be enforced, and that in future all surveyors acting under the provisions of the London Building Act should be practising architects."

That this was the intention of the Legislature is clear, as a reference to sect. 144 of the Act of 1894 will show; that section provides that, "If any building or structure be executed, or any work done to, in, or upon any building or structure by or under the superintendence of any district surveyor acting professionally, or on his own private account, that surveyor shall not survey such building or structure for the purpose of this Act, or act as district surveyor in respect thereof or in any matter connected therewith, but it shall be his duty to give notice to the Council, who shall then appoint some other district surveyor to act in respect of the matter." In face of this section it would appear difficult to justify the compulsory subscription by candidates for the office of district surveyor of the following declaration amongst others:—"That he will not during his continuance in office (except in the discharge of the duties thereof) carry on business as an architect, surveyor, or builder, or directly or indirectly, as a partner or otherwise, be interested in such business." The result is that whereas Parliament has said that a district surveyor shall not carry on private practice within the area of his own district, the London County Council has made it impossible for a district surveyor, appointed under these conditions, to carry on private practice anywhere; and there are not a few who will be disposed to agree with the learned counsel who recently expressed a strong opinion as to the legality of this restriction, "as well might the Council require the district

urveyors to go about wearing white hats."

At first sight it might seem as if the question was one primarily for candidates for the office of district surveyor, but this is not so. To bear the responsibility of approving "the construction of every public building, including the walls, roofs, floors, galleries, and staircases," to issue certificates as to safety of cutting away chimney-breasts, to supervise the details of steel construction, to settle means of access to roof in case of fire, to survey and report as to dangerous structures and to certify as to safety of sky-signs, there is required a man who has had something more than the experience of a clerk in a surveyor's office, whose outlook is somewhat wider than is to be obtained from a desk at Spring-gardens, and whose technical education has been founded on something broader than the reading of a couple of Acts of Parliament together with the text-books required to pass the statutory examination under the London Building Acts.

It is really no answer to point to the undoubted fact that no exception can be taken to the persons who have recently been appointed under the disabling conditions; in the struggle for existence you will find here and there a man who has received a liberal professional education, who has commenced practice as an architect fired with a high ambition and a noble ideal, and who ultimately finds himself occupying, not without a struggle, the seat at an official table and having to deal with the intricacies and details of statutory forms and notices; but supply quickly lowers itself to the standard of demand. Say to the young architects:—"We do not want for this work of supervision men who may become Presidents of the Institute and Royal Gold Medallists, what we require is a man who, armed with his cloth-bound copy of the Statute, will search out 'irregularities' and have them rectified, who will take a text-book with him to test the strength of a structure alleged to be dangerous, and who, having learned his business on a stool in a district office, knows all the 'forms and notices' by heart and will regulate his steps *pari passu* with the machine at Spring-gardens." Say this persistently for a little longer, and in a few years you will get plenty of candidates for the office, and they will be men admirably fitted for police building-inspectors' duties, but eminently unqualified to act in any professional capacity where self-reliance, strength, and judgment are required. Already there is a noticeable tendency for men to come up for the statutory examination and to neglect the wider reading and study which are required in the examinations for membership of the Royal Institute of British Architects. *And it is the building-public who will suffer by this lowering of the standard of qualification for the public service.*

But, it may be asked, is not the building-public to pay less for this inferior service than under the conditions contemplated by Parliament? The answer to this question is that the building-public are to pay neither more nor less than the fees laid down by Parliament for a service which is not to be of the standard hitherto obtaining, but of such a standard

as shall satisfy the requirements of the London County Council, a standard which is sufficiently indicated in the aforementioned "Conditions of Appointment."

We should hope, therefore, that the majority of the Council will see the wisdom of adopting the suggestions of the Royal Institute of British Architects, and of reverting to the high traditions of a service which has proved itself efficient in the past, and to which no exception has been taken either by professional or public opinion.

NOTES.

TWO PAPERS read by Mr. Allanson-Winn—one before the Civil and Mechanical Engineers' Society and the other before the Society of Engineers—have served the purpose of eliciting useful discussion as to the advisability of supplementing ordinary groyning by some form of submerged groyne carried considerably beyond low-water mark. The author has devoted himself with much persistence during recent years to the advocacy of his "deep sea erosion" theory, and although the two recent papers are not identical as to subject matter and treatment, they both emphasise the contention that the continual waste of material below low-water level is one of the chief causes of the landward advance of the sea towards many coast lines. Various sections of the East Coast were exhibited at the meetings in support of this view, and it certainly is a reasonable argument that the friable material frequently extending from the visible shore into deep water should be regarded as invisible shore, and as such ought to be protected just as much as the exposed portion. Submerged groynes in themselves are no novelty, having been applied to some extent at various places for the purpose of collecting material to fill up swills beyond low-water mark. But Mr. Allanson-Winn would like to see such works carried into the sea to distances of from 100 ft. to 300 ft. or more, according to local conditions. The task of building concrete groynes or of constructing pile groynes in deep water would evidently be most costly, and the author's proposal is that a groyne, consisting of a chain cable with an attachment of bushes, or other suitable material, would form a flexible obstruction useful for arresting and collecting travelling material. Groynes made in this way have been tried at Bray, near Dublin, under extremely unfavourable circumstances, and so far the results of the experiment are inconclusive as to the efficiency of the construction, and as the groynes were not carried for a sufficient distance seawards, they have not thrown any light upon the accuracy of the theory that beneficial effects would follow the attempt to build up beach material upon the permanently submerged portion of a shore where movement of material takes place below the surface of the water.

British Canals and Waterways.

NOW THAT the paper read by Mr. J. A. Sauer "On Waterways in Great Britain," together with an abstract of the discussion and correspondence, has been issued

in pamphlet form by the Institution of Civil Engineers, quite a useful collection of opinion is available on the subject, and it seems a pity that this should not be obtainable by members of the outside public who are interested in the important question involved. However, there will be no lack of data relative to our canals and inland waterways when the new Royal Commission once gets to work. The terms of the reference to that body give ample scope for the most searching inquiry, the expression of views as to the benefits to be derived from an efficient canal system, and the expediency of placing such a system under properly organised public control. The Government must be congratulated upon having taken action, and also upon the *personnel* of the Commission which represents all interests involved, and ought to result in recommendations calculated to assist Parliament in removing the obstacles now standing in the way of inland navigation—a means of transport which contributes so largely to the prosperity of various Continental countries.

Winchester Cathedral.

IT IS reassuring to learn that the alarmist rumours which arose last week after the fall of a stone from the choir vaulting of Winchester Cathedral were based (as usual) upon gross exaggeration of the facts. The actual incident was in itself trifling, and was the result of the underpinning works now in progress. Still, it is the fact that the more closely the condition of the walls and foundations is examined, the more serious appears to be the task before the cathedral authorities. It was once hoped that the insecure portions of the fabric were only those in the south wall of the presbytery and the east wall of the south transept. Unfortunately, the whole of the north wall is now found to require attention. This means that a further sum of 10,000*l.* will have to be provided for underpinning and other works, but does not involve any new problem or constructional difficulty, and as the instability of the north wall actually exists it is rather fortunate than otherwise that it has been unmistakably demonstrated at the present juncture.

Sale of Real Property.

WE have recently commented on two cases on the sale of real property, when the vendors, after it was discovered there had been a misdescription of the property, endeavoured to rescind the contract under the conditions of sale, but in one of which the Court held this could only be done on payment of certain costs and expenses incurred by the purchaser; and in the other in which the purchaser was unwilling to rescind except on the payment of damages, when the Court held the purchaser to be entitled to compensation. The latest case on this subject is *Quinion v. Horne*, where certain freeholds had been sold by auction. The conditions of sale were in an ordinary form, and contained a clause that if the purchaser should make any objection or requisition either as to the title, the form of conveyance, or other assurance, or any matter appearing in the particulars, conditions, or abstract, "which the vendor shall be unable or unwilling to

comply with," the vendor should be at liberty to annul the sale. The abstract disclosed the fact that the property had been vested in a certain lady for life with ultimate trusts depending upon her having children or not. The purchasers required to know the date and place of birth of any of the children, but the vendors refused to comply, and claimed to rescind the contract. There was no difficulty in giving the desired information, and the Court held that the requisition was reasonable, and decreed specific performance of the contract. Intending purchasers must often have been struck with the arbitrary nature of the above condition of sale, and it is satisfactory to find that the Courts will only give effect to it when it is not exercised in an arbitrary and unreasonable manner.

Automatic Railway Couplings.

IN a letter to the *Times* Mr. Richard Bell makes one of his periodical and not unreasonable criticisms upon the inaction of railway companies with regard to the adoption of automatic couplings. Judging by the terms of a resolution adopted at the International Railway Congress of Washington, British railway companies appear to think that the system used in Great Britain and Ireland is at present satisfactory as regards rapidity of handling and the safety of employees. This hopeful view is not supported by the subsequent recommendations of the Railway Clearing House as the mouthpiece of the railway companies, the Association of Private Owners of Railway Rolling Stock, and the Mining Association of Great Britain. The expense urged by the companies for the non-adoption of a uniform system of automatic couplings is that trials have been and are still being made, but that the satisfactory coupling has not yet been found. It is quite correct that the Board of Trade are not prepared to recommend any particular form of coupling apparatus, but equally correct that the Department have not made any perceptible effort to exercise the powers conferred by the Act of 1900 to "hold such inquiries and make such experiments as they think expedient" with the object of finding a safe and reliable coupling. If this important department could be persuaded to take action there is little doubt that the annual sacrifice of life and limb exacted by the existing shunting system could be reduced very materially, with concurrent advantages to the railway companies in the conduct of traffic.

Scientific Sewage Disposal.

THE scientific disposal of waste products really dates from the Report of the Royal Commission of 1844 which led to the development of the theory that disease was bred by heaps of decomposing organic matter. Although we now know that this theory was not correct, yet it did good by laying emphasis on the function of such material as a carrier of disease, and by stimulating the great reforms in this country upon which other nations have modelled their own sanitary systems. In the December number of the *Technology Quarterly* Mr. C. E. A. Winslow, a well-known American chemist, discusses the historical development and present status of the problem of the scientific disposal of city sewage, comparing disposal by

dilution, on land, by intermittent filtration, the septic tank, the contact bed, and the sprinkling filter. All these systems originated in Great Britain, and of the last Mr. Winslow says that it will treat sewage at much higher rates than other processes, giving a very satisfactory effluent, and that the body of the beds is cheaper to construct. The only difficulties to be encountered in America are the distribution of the sewage and the possible bad effect on the beds of severe winter weather. Experiments are now being conducted at Boston (U.S.A.) with this form of filter, and Mr. Winslow considers that if the difficulties mentioned can be got over the sprinkling filter will furnish the best treatment of sewage known.

Concrete-Steel Floors.

In a paper read before the American Society of Civil Engineers, Mr. John S. Sewell briefly reviews the various formulae evolved during the past few years for the design of concrete-steel structures, and adds one more to previously existing equations of this kind. Mr. Sewell's new formula for the moment of resistance (M) of a beam is $M = h d A T$ where A = total sectional area of steel, d = depth of the centre of gravity of the steel below the upper surface of the beam, H = a constant, T = unit stress in the steel. This is a very simple equation, and in the present state of knowledge probably quite as reliable as the more complicated expressions put forward by some engineers. Among the general deductions stated in this paper are:—(1) That all floor beams and slabs should have, in addition to horizontal reinforcement, web members securely attached thereto, and arranged in accordance with the distribution of shearing stress; (2) that the bond of that portion of each web member passing through the concrete in compression should be sufficient to permit the strength of the member in question to be fully developed, and that the attachment of the member to the horizontal reinforcement should be equally strong; (3) that clips should be employed to hold the horizontal bars at the proper distance above the centring, and that these bars should be of circular or rounded section, so that the concrete may readily flow beneath them; and (4) that as the reinforced concrete beams and joists of a floor system act as continuous girders, whether intended or not, reinforcement ought to be used at the points of contrary flexure to avoid the risk of unsightly and sometimes dangerous cracks. These suggestions are all good, even if not particularly novel.

The International Exhibition.

THE sculpture remains the same at the New Gallery; the paintings have disappeared to make way for a heterogeneous collection of studies and sketches. Those who wish to realise what the ultra-modern or "progressive" class of artists are bringing art to may find it instructive to turn into the South Room, where the numbers commence, and study the kind of things they find there, and ask themselves what art is coming to. As far as the contents of this room are concerned it would appear that the object of art is to represent, in the coarsest

and most brutal spirit, whatever is most base, ugly, and vulgar in human life and society, and we can conscientiously say that we have never been in any exhibition room the contents of which seemed so repulsive. In the other two rooms much clever work is scattered about, though here too beauty or artistic finish seem to be the last qualities sought for. And we must say that we are tired of hearing Menzel called a great artist. He was a supremely clever artist; nothing could be cleverer than the succession of small portraits shown here, with the heads only coloured; but cleverness is different from greatness. We have never seen anything of Menzel's which showed either beauty of composition or beauty of sentiment; and without those qualities in art there is no true greatness.

The Carfax Gallery.

THE Carfax Gallery seems to be the chosen home of sketchiness in art; a character which is certainly kept up in the present exhibition of bronzes by Mr. C. Ricketts and drawings by Mr. Ludwig von Hofmann. In regard to figures it would appear from one or two examples that Mr. Hofmann can draw figures when he takes the trouble to do so; but some of the figure-subjects exhibited, as in "The Grooms of Diomed," are careless in drawing to a degree, in fact not modelled at all, and the absurd "Tarantella" is a kind of scrawl that any one might produce without having studied figure-drawing. The best of the figure subjects is "The Narrow Way," a line of nude boys following each other down a plank to bathe; a good picture might be worked out of this, which as a mere sketch (for it is nothing more) is interesting and original. On the other hand, some of the landscape studies, though they also are little more than sketches, are very powerful and original; we may notice especially "Out of Bounds," a hill scene; "The Troubled Water," a pool among dark rocks with the surf of the sea seen outside, and "The Sullen Rock," a composition which tells powerfully from the other side of the room, though it will not bear looking into. Mr. Ricketts's sculpture sketches we should regard with interest as terra-cotta or plaster models, suggestions for sculpture groups; one or two of them—"The Tragic Man" for instance, and the "Medea," are fine and pathetic in feeling, though the "Medea" is rather exaggerated for sculpture, which should preserve a certain repose even in tragic subjects. But they are not things which justify their being put into such a material as bronze; they are too rough in line and too unfinished for that. Bronze demands severe work; it is not a material that will tolerate sketchiness.

The Modern Gallery.

THE collection of water-colours by Miss Edith and Miss Gertrude Martineau, at the Modern Gallery, if it does not reach the highest type of excellence, contains at all events a great deal of interesting and conscientious work. Neither of these artists is content to slur over anything or to depend upon roughly indicated effects. In Miss E. Martineau's "His Dinnerhour" and "A Crop of Flowers" (35, 39) the figure and the landscape are treated with equal care. Miss E.

artean is perhaps stronger in figures than in landscape; two portraits (77 and 78)—the latter especially—are admirable, as so the characteristic study "An English school-girl" (81) and that of the child "Empty!" (177). "Sandhills at Littlehampton," next to this, is one of the best landscapes in the collection. Among Miss G. Martineau's landscapes may be mentioned particularly "A May Sketch of Glen Ennisk" (26); "Highland cottages near Aviemore" (43); "Birch trees, Loch-an-Eilan" (60); "Autumn evening near Aviemore" (109); and "Late Afternoon near Loch-an-Eilan" (144), a subject entirely trees and tre-trems, making a remarkable little picture. Among Miss E. Martineau's drawings are some excellent flower-studies.

At the Goupil Gallery there is a collection of M. Le Sidaner's pictures under the title "Venise du Crépuscule à la Nuit," a convenient and suitable title for a painter who only paints things as if seen through a mist. There are seven finished pictures; the remainder are small studies in oil and pencil, mostly for these pictures. The best of the pictures is "Le Petit Canal," an effect in twilight in a small cul-de-sac canal, with a bit of crimson light in a window at the further end. The effect of the ruffled water in the uncertain light is very well given, and

there is a unity of effect about the whole thing. "Le Palais Ducal" is seen at night in a large picture, with the flare of two large outside lights reflected in the water; it is effective but rather stogy. "L'Horloge, Place St. Marc," is a good composition showing part of the square, with the clock face, as seen from one of the porches of the Dnomo: the manner in which the texture and colour of the dark marble column in the foreground are got by repeated touches of all kinds of mingled colours forms a curious study in manipulation. "Le Palais Gris," relieved by one little bit of warm-tinted evening sky in the background, is a capital study of effect. The picture of the "Bridge of Sighs" is not good; far too woolly in texture, and the architectural details are made havoc of. M. Le Sidaner has invented an effect and a handling of his own, but so far he is a mannerist and can only do one thing. If he could get out of that groove he might show whether there is more in him than a painter of scenic effects. We suspect there is, but we have not had it yet.

Messrs. JEFFREY & Co. have been making a little exhibition at their West-end

Rooms in Mortimer-street of some of the new designs for wall-papers either prepared in their house or made for them by Mr. Lewis Day and other decorative

artists. In this instance the two best designs we saw were those to which no well-known artist's name was attached, two called "The Portland Decoration" and "Rose and Smilax"; the latter is a floral design, naturalistic in the smaller detail but strictly conventional and geometric in general arrangement, and is very successful. There are others, such as "Laburnum," which are far too naturalistic to come under the head of decorative design in the true sense of the word; one that we object to still more is a trellis with flowers apparently woven in and out of it; but we have no doubt there are plenty of people who will think this is a "sweet" idea for decorating the walls of their rooms. We give an illustration of the "Portland" design, which is produced in a good many different colours and looks well in all. The "Bethune" frieze and "Jura" filling is also a good and effective design, the main wall space treated with alternating broad and narrow vertical strips of foliage design, well contrasted by a frieze in which vesica-shaped panels containing a bold flower ornament are connected by undulating bands with a simple decoration.

LETTER FROM PARIS.

The monument to Alfred de Musset presented to Paris by M. Osiris, and of which we published an illustration in our issue of October 29, 1904, has just been inaugurated. It is the work, as will be remembered, of M. Mercié, and has been set up at the angle of the Rue de Richelieu and the Place du Théâtre Français, where it is not, however, seen to the best advantage. It has no architectural setting, and seems rather to have got by accident into this busy corner; it wants the grass and foliage of a park or garden to set it off properly, instead of a crowded street, where the figure of Musset in the everyday dress of 1840 seems rather an anachronism.

The discussion of the budget for art gives rise, every year, to sharp discussions in the Chamber of Deputies, and numerous proposals and Ministerial promises, which never come to anything. This year the subject of the School of Decorative Art has again come up for discussion, and the Government has undertaken, with the co-operation of the Municipality, to build a large school of decorative art on the site of the former Hôtel Dieu. Probably a similar promise will be made again next year, without any commencement being made of the work. The eternal question of the Louvre has also been again discussed, without the Government being able to say when the Colonial Offices will be removed from a position in which this occupation of the buildings is a constant source of risk of fire to the national art collection. It has constantly been proposed to transfer the Colonial Department to the Rue Oudinot, but the force of inertia seems always to prevail. It is the same with the question of the Conservatoire of Music, which it has long been proposed to rebuild on the site of the Caserne de la Nouvelle France. This will also probably turn up again in next year's budget, with other important schemes which the Government is obliged to defer for want of money being voted for them. The only chance seems to be that, since the separation of Church and State, the funds which used to go to keeping up the Diocesan buildings may be turned to account in the cause of art.

The Académie des Beaux-Arts has just profited by the liberality of the nephew of the late M. Henner, who, in memory of the eminent painter's former residence in Rome, has presented to the Institut de France a "rente" of 9,000 francs, which is to found three scholarships for painter students at the Villa Medici. This generous gift of M. Jules Henner is a worthy complement to the presentation of his uncle's pictures which he has already made to the Municipality of

The "Portland" Decoration: New Wall-paper by Messrs. Jeffrey & Co.

Paris. These are now hung at the Petit Palais, and the new Salle Henner will shortly be opened to the public. In its coming session the Council intend to vote a considerable sum to enable M. Girault to finally complete his beautiful building. The intended scheme includes, besides modifications and improvements in the plan, a considerable amount of decorative work. The exterior façade and the garden of the interior court are to be decorated with statues, and the large gallery parallel with the Avenue Nicolas II. is to be decorated with paintings, the cupola especially, on the paintings for which M. Pénard is now at work.

The Municipality have awarded the Lheureux Prize for this year to M. Formigé. This prize, founded in 1900 by the widow of the late M. Lheureux, the architect, was to go alternately to a sculptor and an architect, and has already been awarded to MM. Dalou, Mercié, Barrias, Girault, and Pascal. It is the entire life's work of M. Formigé, rather than his recent Paris Crematorium, which the Conseil d'Architecture of the Municipality has wisely chosen to recognise.

M. Nénot has just completed, in the Place du Panthéon, the architectural pedestal for M. Rodin's figure, "Le Penseur" which will be shortly inaugurated. The monument to the memory of Fulgère, at Pere Lachaise, was inaugurated on Sunday last. The main feature in this monument is a figure carved in stone, by M. Marqueste, symbolising "Inspiration." A subscription has been set on foot to raise a monument to Gambetta on the place named after him.

The Hôtel de Lauzun, which the Municipality have given up to Baron Pichou, grandson of the former proprietor, at the price of 300,000 francs, has been classed among the "Monuments Historiques." By this arrangement the considerable works of repair and restoration which the building requires will be carried out under the control of the Government. M. Juste Lisch, Inspector-General of Monuments Historiques, will be the architect in charge, and the restoration of the paintings has been confided to the competent hands of M. Chas. Lameire. The house is connected with the history of the "Grande Mademoiselle," daughter of the Duc d'Orléans and cousin of Louis XIV.

The death is announced, at the age of sixty-three, of the painter Adrien Moreau, who had considerable celebrity at one time for his genre painting and his scenes of the time of Louis XV., in which he exhibited a great deal of learning in representing the costumes and manners of the day. He was educated in the atelier of Pils. Among his principal works "Le Kermesse au Moine Age" (1876); "Le Mémot" (1878); "The Rehearsal of the Tragedy of 'Mitrane' before Cardinal Richelieu" (1879); "La Duchesse de Longueville à Dieppe" (1885); "La Mascarade au XVIIème Siècle" (1887); "Tabarin" (1889). From 1890 to 1900 he worked on a series of pictures of the history of Josephine and Napoleon. He worked in water colour also, and was one of the founders of the Société des Aquarellistes, whose exhibition is just now open at the Georges Petit Gallery.

The death is also announced, at the age of seventy-seven, of the sculptor Charles Auguste de Bourg, a former pupil of Rodin. Among his principal works are "Danaë"; "Saint Jacques"; "Enfant jouant avec une Sauterelle"; "Le Travail"; "Dante"; and portrait busts of Lady Wallace and of Emile de Girardin. Sir Richard Wallace commissioned de Bourg to design the small public drinking-fountains which he presented to the city of Paris.

ROYAL ACADEMY LECTURES.—Sir W. Richmond commenced, on Thursday last week, a series of three lectures on "The Development of Sculpture," but as they cannot all be reported in this week's issue (the concluding one having been given on Thursday last), we prefer to give the report of the three together in our next issue, instead of separating them.

WESLEYAN SCHOOL, GRAVESEND.—The school portion of the new Wesleyan premises in Milton-road, Gravesend, was opened recently. The new suite of rooms consists of a schoolroom with three classrooms. The roof is of pitch-pine. The electric-lighting scheme was carried out by Mr. Warner, the builder being Mr. Tong, and the architect Messrs. J. Morley & Son.

THE SOCIETY OF PAINTER-ETCHERS.

The exhibition of the Society of Painter-Etchers is one of the best we remember, not merely because the work is nearly all good—it usually is that—but because by far the larger part of it is genuine etching showing the quality and manner of work peculiar to that art, and which nothing else can imitate or replace; there are very few either of what we call the smudge type of etchings, or of those laboriously finished and shaded-up productions which want all the characteristic freedom of etching, and are really only engravings under another name. The real object of etching is to produce line drawing under more free conditions for the hand, and with a better and more subtle tone, than can be attained in any other form of line drawing.

Hence one of the great objects is to know how to make the most of your line; to bring out the essential points in the composition with it, and to know how to leave out and where to leave off. Some of the most successful etchings ever made, and some of the best in this exhibition, are remarkable for the large amount of blank paper they show; not indeed the raw blank which would be left in a pen-drawing on the same lines, but with the tone which the method of printing and the surface of the copper gives. A fine example is Sir C. Holroyd's "Fondamenta della Zattera" (71), where the stonework jointing of the paved quay in the foreground is all boldly lined out with no other surface work, and the water beyond left a blank space; by which treatment the contrast between solid masonry and light-reflecting water is conspicuously indicated in exactly the manner suitable to the conditions of etching. All these Venetian subjects by Sir C. Holroyd, which hang together at one of the angles of the room, are in fact excellent, and are well worth the consideration of the visitor; Nos. 73 and 75 especially, besides the one already mentioned. Mr. W. L. Wyllie, in "Torpedo Boats Manoeuvring" (31), has ventured to work up the sea surface completely in close lining giving the modelling of the waves, and it is very ably and conscientiously done, as one might expect, but the result is not very satisfactory; one feels that it is an attempt at something which cannot really be well done with line. In Miss Ethel Stewart's fine etching, "Evening Tide at Bridgewater" (14), we have another good example of the faculty of leaving out; the river bank on the right was probably really dark, rather than light in the actual scene, but it suited the composition, and the method employed, to leave it white, and the picture would have lost freedom and effect by any attempt to work it up into realism. Etching, as far as landscape goes at least, is not an imitation so much as a translation of Nature, and it is in that very fact that much of its interest lies. Where some otherwise good works in the exhibition rather fail through want of letting alone sufficiently, is in the sky. Why scrawl lines across the sky, as in Miss Constance Pott's otherwise excellent work, "Mill, Flanders" (39), and some others? This kind of treatment does not at all convey the idea of sky, and adds nothing to the picture in any other sense. Rembrandt's very materialistic rain-marks in the "Three Trees" have given excuse and precedent for a good deal of sky-scrawling which were better omitted.

Mr. Malcom Osborne shows picturesque composition and an effective management of light and dark in his two Wiltshire scenes "Norton Bavant" and "Rye Hill Farm" (9 and 11). Of Mr. Percy Robertson's contributions the best, "The Admiralty Pier, Dover" (25), seems to show French influence, reminding one of M. Bèjot's manner of working, though on a different and more ambitious class of subject. Mr. Oliver Hall is admirable in all his contributions, except that etching does not lend itself very well to such a subject as "Storm Clearing on Sinah Warren" (25), another illustration of the difficulty of dealing with sky effects in etching; "Pine Trees on the Edge of the Moor" (24) and "The Fallen Tree" (23), with its suggestion of a ship-building yard in the background, are among the best things in the exhibition. M. Bèjot's "Pont St. Louis, Paris" (53) shows this etcher of Paris scenes at his best; in spite of its general freedom of style, the middle distance houses are very carefully lined in so that one can follow out the make-up of the streets. His "Pont

Neuf" (58), on the other hand, fails a little in effect through want of any making out of the masonry construction of the bridge, which is close to the foreground, and should appear as something more than a mass of shadow. Mr. Haig shows more freedom and force than usual in his "Cloisters of St. Jeronymos, Bedel" (88), which we prefer to the Santiago Cathedral drawing (98), because it is less laboriously finished; in other words, more of an etching and less of engraving. However, Mr. Haig's preference is for this highly finished architectural work, and it evidently has its demand, and is excellent in its way; but it is not what etching is essentially meant for. Mr. Arthur Evershed shows his usual delicacy of treatment of picturesque little subjects, of which "Barn by the Road-side" (103) is perfect in its way. Then we come to quite another use of the etching needle in M. Hellen's portrait of "Miss K." (108); this is a full-face portrait, and one of the best of his well-known works of this class, in which he has made the most of the fine curving lines of the large hat on which much of the pictorial effect of the work depends. Miss Kemp-Welch's "Barges Unloading on the Deben, Suffolk" (114) is an excellent piece of real etching, in which every line tells. A still better example of the power of leaving out is shown in Mr. E. W. Charlton's small etching, "Regatta Day" (127), where nearly all the work is concentrated on the low line of coast buildings which goes straight across the middle of the picture, leaving sky and water nearly untouched; the small black hull of a steamer in the middle distance just serves, as it were, to suggest the water in an unmistakable manner. This is an excellent example of a kind of subject dear to many etchers and specially suited to the conditions of their craft—subjects in which there are concentrated darks opposed to large spaces of light. One is reminded by it how often and admirably Mr. Frank Short, one of our finest and characteristic etchers, has chosen subjects that can be treated in this way, and we regret not to see his name in the catalogue of the present exhibition. "The Painted Lady" (126), showing the prow and figure-head of a ship in dock, is another good work by Mr. Charlton. A ship scene of another kind gives the opportunity to Mr. Frank Brangwyn for one of the most powerful works in the exhibition, "Breaking up the *Hannibal*" (134); the great old round tub-like ship, heeled partly over on the ground, fills nearly the whole picture, her massive framing, bolts, cat-head and stem being drawn with an evident delight in their picturesque suggestiveness. The same artist's "A Butcher's Shop" (179) is, however, an exaggeration of what is called "force," and is altogether too violent in effect.

Figures are not among the best class of subjects for etching, except merely as portraits of the head only; but Mrs. Merritt has made a pleasing composition of her two angels on each side of "The Narrow Way" (186). Mr. W. Monk is a large contributor; "The Last of St. James's Hall" (197) has historic as well as artistic interest; "The Little Shop with the Dial" and "The Well House (193, 195) are very good; in regard to "The Penny Steamer" (185), if that is meant for Waterloo Bridge in the background, it is wrong in the proportion of the arches, which are too narrow for their height, or too high for their width, whichever way one likes to put it. Mr. C. O. Murray has made an interesting and successful attempt, in "Misty Morning, Venice" (198), at using etching to represent an effect of fog, and showing the Scuola church as little more than a silhouette in the mist; he contributes also an interesting view of the temples at Paestum. Miss Adeline S. Illingworth claims recognition for her effective treatment of architectural subjects; her "Tour du Choeur, Chartres" (211) is a piece of work in which freedom of style is combined with architectural truth, and she also exhibits good illustrations of Barton-street and Smith-square (208, 209). In connexion with these we may mention a good work of the same class by Mr. Sydney Lee, "The Cathedral Precincts" (220), illustrating what may be called the poetry of a back street. Mr. Alfred East shows two characteristic Italian effects in black and white, in "Villa d'Este" (219) and "The Aviano" (222), the latter an aquatint; the element is the same

Entrance Gate, Alnwick Castle.

in both—masses of dark trees against a faint sky light; his "Longpré" (228) is however the finest thing he exhibits here. Among architectural subjects Mr. Walter Burgess exhibits "Bishop Edyndon's Chantry, Winchester" (260), and "Bishop Langton's Chantry" (273) in the same cathedral; but these, though very carefully and conscientiously finished, hardly rise artistically above the level of what may be termed "architectural drawings," good as such, but not of artistic interest in the higher sense.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At a special general meeting of the Royal Institute of British Architects, held on Monday at No. 9, Conduit-street, Regent-street. Mr. Henry T. Hare, Vice-President, in the chair, the Chairman, having announced that the meeting was convened pursuant to by-law for the purpose of electing the Royal Gold Medallist for the current year, moved, in accordance with notice, that Sir Lawrence Alma-Tadema, R.A., be elected for the honour. Whereupon it was resolved, *nem. con.*, that, subject to His Majesty's gracious sanction, the Royal Gold Medal for the promotion of architecture be awarded this year to Sir Lawrence Alma-Tadema, R.A., Hon. Fellow.

This concluded the business of the special meeting.

The ninth general meeting (business) of the session then followed, and the minutes were taken as read.

The hon. secretary, Mr. Graham, announced the decease of Zephaniah King, elected Associate 1881, Fellow 1887, and a vote of sympathy and condolence was passed to his widow and family.

On the motion of the hon. secretary, a vote of thanks was passed to the givers of various donations to the library, especial mention being made of Mr. Sydney Snirkle, from whom had been received his seventeenth annual donation of 5*l.* to the Library Fund.

The secretary announced that the ballot for the election of candidates to Fellowship had resulted in the election of the following:—

- | | |
|-----------------|----------------|
| Matthew Garbutt | H. A. Satchell |
| F. W. Marshall | H. Sirt |
| G. Ransome | A. Sykes |
- The following were elected by show of hands under by-law 9 as Associates:—
- | | |
|-------------------------------------|------------------------------------|
| A. W. Addison (Cambridge) | W. P. Marr (Kingsbridge, S. Devon) |
| A. D. Aitken (Airdrie, N.B.) | D. Mitchell |
| J. H. De Caynoth Balfour | H. A. Mason |
| J. Boyle (Bolton) | G. Morland |
| J. R. Brithwaite (Leeds) | H. Stanley Morran (Auckland, N.Z.) |
| S. Bridges | A. R. Myers (Edinburgh) |
| A. E. Bullock | A. C. Nolley |
| M. Bunney | D. Mary O'Connor, B.A., B.E. |
| J. Cocker (Ayrincham, Reading) | A. J. Pesto |
| E. J. Dixon | S. C. Ransey |
| B. Drummond | W. H. Riley (Leicester) |
| P. Dyer (Manchester) | H. Ryle |
| T. Speirs Fraser (Dumfries-shire) | D. A. Shaw |
| W. Curtis Green | J. H. Shearor |
| R. L. Hampshire | P. M. Stratton |
| G. Hanson (Hullfav) | J. R. Sykes |
| C. H. Holden | P. Turner (Bradford) |
| A. Hunter (Colwyn Bay) | M. O. Type, F.S.I., Birmingham |
| A. Hay Lamont (Edinburgh) | R. F. Wheatly, B.A. |
| L. W. Crandall Lorden (Hythe, Kent) | E. C. M. Willmet |
| W. K. McDermott | L. S. Wood, B.Sc. |
| | H. E. Woodsend (Nottingham) |

OLD WHITEHALL.—In the course of the demolition of some of the old houses in Craig's-court, Whitehall, a subterranean passage has been discovered. It extends nearly 30 ft., and runs north to south to within a short distance of the Army Pay office in Craig's-court. There was no entrance to the passage from the houses lately demolished, and at some period both had been bricked up. Tradition says that a subterranean passage existed from No. 2, Craig's-court to the Royal Palace at Whitehall, and that Nell Gwynne at one time resided at 2, Craig's-court. The housebreakers have also discovered a carved water-tank. When reaching the ground floors the workmen cut into three stages of flooring, resting on three sets of rafters.

THE ARCHITECTURAL ASSOCIATION: PORCHES AND APPROACHES.

The following is the conclusion of the paper on "Porches and Approaches" read by Mr. F. T. Baggallay at the meeting of the Architectural Association on the 23rd ult., the first part of which appeared last week:—

English Domestic Gothic.

In the last twenty years of the XVth century, when the feudal castle gave way in England to what is not inappropriately called the castellated mansion, the general form of the great gate-tower was still retained; but it was pierced with large windows, and the turrets and machicolations and battlements became attenuated and merely ornamental. A type was thus developed which persisted for more than a century. The turrets, two at first, soon became four for the sake of symmetry. They were almost always octagonal in plan, and straight from top to bottom, except for a slight oversail at first where the machicolations used to be. And as time went on they became thinner and thinner, and the space between them wider and wider. Such gate-towers are always striking features; but the earlier examples, before the turrets had become too attenuated, and especially several in the eastern counties which are built of red brick and terra-cotta and have the added advantage of colour, seem to me the most handsome. The Oxburgh Hall gateway seems to be the earliest of these. The date is generally given as 1422, but, according to the present owner, it was not finished until 1489. The moat and bridge and its height (80 ft.) give it an advantage over all rivals, unless the more ornamental character of some of the detail in the Layer Marney gateway (built in 1500) be held to equalise matters. In point of date the "Deanery tower" at Hadleigh is between the two (1495). In appearance it suffers from too much neatness and hardness of line, and must, I think, have been trimmed up, rubbed down, and

pointed in modern times. It is certainly not so picturesque as the ruin of the Nether Hall gate, now standing neglected in a farmyard. The familiar gatehouse at Hampton Court, also of brick, is a little later in date (1515-1520).

Most of the stone gatehouses of this type, where they belonged to private mansions, seem to have been either pulled down or greatly altered subsequently. There is an example, though rather a poor one, perhaps never completed, at Montacute Abbey, and a very fine one at Knole, near Sevenoaks; where, however, the turrets are square in plan. The best, and by far the richest, examples remaining are some of the great gatehouses to the courts of the Cambridge colleges. The great gate at Trinity, begun in 1555, and the outer gates of Christ's and St. John's colleges, began soon after 1505 and 1510 respectively, are the best. The last two are notable for the fine decorative use made of the arms of Lady Margaret Beaufort Countess of Richmond, who founded them. The three gates to the great quadrangle at Trinity are all said to owe their present form to Ralph Symmons, who had been one of the architects or designers of the second court of St. John's, and was employed, in 1604, by Dr. Nevile, an energetic master of Trinity, to improve his college buildings. But it is unlikely that Symmons much altered the great gate; and King Edward's gate, at the end of the chapel, is said to be an old one which he merely took down and rebuilt on another site. So that the third, or Queen's gate, alone can be properly dated so late as the beginning of the XVIIth century. There is, however, another example of the type in the brick gatehouse of Abbot's Hospital, at Guildford, built in 1619.

The Oxford colleges did not accept the type, but continued to build plain, square, or rectangular entrance-towers with only one stair turret; in general outline more like contemporary church towers, but distinguished by great oriel windows over the arch (instead of belfry windows at the summit). The best of these is the Founder's Tower, at Magdalen. The only Oxford example I can call to mind of a gatehouse with more than one turret is the sumptuous Tom Tower, at Christchurch, as it was originally built by Cardinal Wolsey.

The cases in which a porch was added to a domestic building of the late Gothic period, either in addition to, or instead of, a gatehouse, are rare. And I do not know of any, except the oft-drawn porch at Compton-Wyngate, that is worth notice.

English Renaissance.

The freedom of thought and action, which the reign of Queen Elizabeth brought to the nation, led, among so many other great changes, to a revolt against the prison-like gloom of the old mansion, the small windows and the enclosed courtyards. People called for light and air and an extended view. They built enormous windows, and in the end they left out the buildings on the entrance side of the courtyard, or reduced them to a screen or even a balustrade; and if any gatehouse was erected at all it was an isolated structure. But before that step was taken the porch seems to have anticipated its coming importance, and even in the earliest Elizabethan mansions was strongly emphasised. The well-known porch at Kirby, attributed to Thorpe on what seem fairly good grounds, is an example. It has been greatly admired and severely criticised. To eyes that are educated in the niceties of architectural detail and propriety it is an unfortunate bit of honest English building, tricked out in a coarse parody of Italian details, put on in the wrong way, and in the wrong places. One is apt to find in it a parallel to the finely-made savage monarch, who, according to report, gets hold of a suit of slip-shod European clothes, puts his legs into the arms of the coat, and his arms into the legs of the trousers, wears the hat round one ankle, and puts a saucapan on his head. Perhaps architects, like men of every trade and profession, are liable to take rather a narrow view, and allow the technicalities of their trade to become too much the masters of their judgment. Yet, as architects, we cannot help feeling that the few porches of this date in which Italian detail is absent (of which that of Montacute House is an

instance) are distinctly pleasanter than either the Kirby example or the porches, say, at Audley End, where the Classic orders are used with a good deal more knowledge and discretion.

The many porches, too, built at the end of the XVIIth century and beginning of the XVIIIth—such as those of Ragdale Old Hall, St. Catherine's, Bath, and the Corsham Almshouses—in which a little classic detail is applied as a sort of spice in the lower part round the door—are quite charming. So are many of the half-timber porches of this and the end of the Gothic periods—such as those at Park Hall and Moreton Old Hall, and the porch of the Old Guildhall, at Lavenham. English porches of a later date, though the detail may be unimpeachably correct, are apt to be formal, unimaginative, and uninteresting. The Westwood porch is a not unfavourable example. The same criticism may, with some show of justice, be applied to the great porticos which may be found in every town, and which are built in imitation of the porticos of Roman temples. But the lofty and serene majesty of such a composition, when it is proportioned and detailed with care and knowledge, makes it peculiarly suited to the approach of a great public building, and one would be sorry to lose it in such situations.

When the enclosed courtyard of the late mediæval mansion was opened out by the omission of the buildings on the side of the gate-tower, and the place of the latter was supplied by a gatehouse, either entirely isolated or forming part of a low screen or connecting corridor, the gatehouse assumed a greater variety of form. The Tixall, Burton Agnes, and Charlecote gatehouses still have angle turrets; but at Charlecote the proportions have already become broader and lower; and at Old Todington and in a variety of other instances the turrets were omitted, and the gatehouse was but one story high with a tendency to dissolve into a gateway flanked by small lodges. This is actually the form of the curious and rather ugly example at Westwood, Gloucestershire. The gatehouse was replaced in some cases by an arched gateway of ornamental character, such as that at Cold Aston Manor, or the curious, elaborate, rather pleasing gateway at Caius College, Cambridge, called the Gate of Honour. Later examples of such gates are to be seen in the old Somerset House gateway now in the Embankment Gardens, London, and the gate to Queen's College, Oxford. Sometimes there was a gatehouse and screen to the main courtyard as well as an architectural gate-arch or gate-piers to an outer court, as at Rushton. Gate-piers became in the end far more general than the arch, and are usually joined by more or less elaborate, and often very beautiful, wrought-iron gates and grillwork, rising at the top into a light gable of scrolls and foliage, among which the arms or monogram of the owner are generally introduced. The arms are also frequently to be seen on the outer face of the piers, the finials of which are generally the crest, a vase, or a ball. The balls are said by some people to be properly the gruesome emblem of a lord of a manor; since they represent the heads formerly exhibited at their gates by those who had the power of life and death. Some of the best of the innumerable examples of both piers and ironwork are to be seen at Cambridge, at the entrances to the colleges from the Backs. There are many good examples, too, even in the heart of London. The gateway to Staple-inn from Chancery-lane and several of the piers on the west side of Lincoln's-inn-fields are examples which occur to me.

I have already spoken twice of the great charm of an approach over a bridge. This, too, is to be seen to perfection in the back approaches to the Cambridge Colleges, particularly at Clare and St. John's, where you advance, between handsome balustrades, in the one case towards a vista of courtyards seen through arched gateways, and in the other to the stately gate-piers and iron gate at the bridge-end. I have attributed the charm of bridges in part to the water; but the confinement of the approach between the parapets or balustrades of the bridge has perhaps as much, or more, to do with the matter. Many an old house is approached by a bridge over a moat which is now dry—

Speke Hall is an example—and the absence of the water does not entirely do away with the charm; indeed, it seems to leave the greater part. In connection with bridge approaches generally I cannot resist showing a view of a little Japanese shrine at Osaka erected in the water and reached by a characteristic wooden bridge.

Italian Renaissance.

Bridges, however, can only be made part of an architect's scheme by such fortunate accidents of situation as are rare. We want other suggestions. And we may find them, as abundantly as anywhere, in the works of the Italian Renaissance architects. They favoured small projecting porches as little as their predecessors, and were not very successful with them. That of the Miracoli Church at Brescia is the most favourable example I know, but it owes a good deal of its charm to the fact that its lines are of the simplest; and the delicate carving, with which the lower part is covered, is in such low relief that it is almost lost in the bright Italian sunlight. The porch of the hospital at Venice, a Renaissance version of the old semi-circular hood on two legs, is florid and tasteless. By instinct and tradition the Italians seem to have preferred something that did not break the front of the building, and, if not content with a mere doorway, generally either recessed the porch within the front or built a portico that covered it. The little portico of the Pazzi Chapel at Florence, which is chiefly celebrated in guide-books for its barrel-vault of Della Robbia ware, illustrates these ideas, and also the delicate beauty of cinquecento detail. The upper story, with its imitation of wooden panelling, may be open to technical criticism both on that ground and because it looks too heavy for the columns. But one would gladly commit graver errors to produce so good a result. The arch rising in the middle above the entablature deserves a note. It reminds one of some of the late Roman porticos in Syria and the narthex at Civita Vecchia, and may be borrowed direct or by tradition from late classical work. One wonders whether it was possibly the germ from which the great arched recess in the portico of St. Andrea at Mantua grew, or whether Alberti borrowed the idea of the latter from the Mahomedan mosques, or possessed some tradition of such entrances as that to the palace at Ctesiphon. There seem to me to be great possibilities and suggestiveness in these great arches rising almost to the height of a building and deeply recessed into it. Broad, deeply-recessed porches are the rule in the Venetian palaces, where they are necessary to form a landing-stage, since the water comes up to the front wall of the building. But the similar porch in the garden front of the Villa Medici at Rome was a matter of choice. Here there is again the arch rising above the entablature over the middle opening; and further suggestiveness in the arrangement of the steps and balustrades; which rise from either side to a landing bowed out in front to hold a small fountain.

The broad and deep "loggia" which forms the porch to some Italian villas is a feature common to all countries where shade from the sun is necessary, and modern "piazas" and verandahs probably owe little or nothing to Italy, where it is commonly better designed than elsewhere. The one at Arezzo is a characteristic example, especially in the great projection of the eaves, the generally light and open treatment, and the freedom of the architectural detail. There is sometimes an upper story, still lighter and more open.

The Italians have never given up the enclosed courtyard plan (unless they have done so recently); partly no doubt because peace and security were so long strangers to the country; partly because the difference between their climate and ours, if not very great, is sufficient to make an enclosure, which on most days seems cold and gloomy here, for more than half the year in Italy a cool and shady retreat from glare and heat. As a consequence, the entry to an Italian palace, or even a house of any pretension, is most frequently through a vaulted corridor to the courtyard in the first place. Plenty of such entrances, of course, are still to be

seen in this country. We even built a very pretentious one to Somerset House not much more than a century ago. But here they more often repel the passer-by, by their suggestion of darkness and dirt, than invite him by their shade. In Italy the reverse is the case, and there are few more pleasing features of the great Italian palaces than the dark entrance which frames a picture of a brilliantly-lit courtyard. The entrance to the Farnese Palace at Rome, of which Mr. Potter has obtained such an excellent photograph, is a good instance of this. The view of the entrance to the Doge's Palace at Venice (which is also from one of Mr. Potter's photographs) is perhaps less striking in one way owing to the light coming in from the side. But the view of the giant's staircase beyond more than balances the loss of the dark shadow.

Outside Staircases.

The giant's staircase is, as you know, the main entrance to the palace, and is strictly in accordance with Italian tradition. From a very early date, what we should call the ground floor was, in Italian palaces and public buildings, a basement devoted to cellars and offices; and the state entrance to the building was by a grand flight of stairs, in rare instances direct from the street, more often from the courtyard. There are XIVth century examples of the former arrangement at Perugia and Todi in the entrance to the town hall in each case. There is also a stairway entrance, probably of rather later date, direct from the street to the principal floor of a small house at Viterbo, which is a favourite subject for a sketch. That and the rather similar stair entrance from the courtyard in the Bargello at Florence are guarded by gates halfway up the stairs, a feature that suggests exciting moments in the history of the building. External stair entrances in the courtyards are common in the older palaces; but, though generally picturesque, are not often architecturally important or especially well planned. But in the later Renaissance palaces the stair approaches are generally laid out with great care and ingenuity and with an obvious and successful intention to make the most of them. Mr. Lewis has lent me two illustrations from the *British Architect*, which are reproductions from Piranesi's

great work, and show what he thought might be made of stair approaches. The works actually executed naturally fall a good deal short of such ideals, but they are well worth the most careful study.

I believe the only examples we have in England of external staircases to upper-floor entrances—such as those at Wanstead House and Kedleston Hall—were built in the XVIIIth century in imitation of the Italian palaces. German castles and public buildings of the Renaissance Period were however generally entered like the Italian ones at the first-floor level. Unfortunately the men who designed the means of access wanted the finesse of the Italians. The planning is crude, and the architectural detail is coarse, and sometimes grotesque. But the unrestrained freedom of ignorance, combined with an abundance of native wit and wild fancy, produced results which are frequently pleasing and suggestive of possibilities to the architect in search of ideas. The rathouses at Halberstadt, Lemgo, Lübeck, Heilbronn, Molsheim, and Görlitz, and the castles at Trausnitz and Hartenfels all have external stair approaches that are worth studying.

Steps and Balustrades.

Such external staircases, I think, must be distinguished in our minds from the flights of steps which lead up to first-floor entrances in some few modern public buildings, such as University College. Such flights are probably borrowed direct from the Roman temples. And they must be distinguished, too, from the short flights and long terraces with their balustrades which form such an important feature of the approaches to the palaces and great houses of the later Renaissance in all European countries. The tendency of the latter is to breadth, of the others to concentration. The value of such terraces is recognised by everyone when they are used on a great scale, and no doubt is due to the long horizontal lines of regular ornament afforded by the balustrades broken at regular intervals by piers, perhaps with vases on them, and at longer but still regular intervals by the steps. But I do not think it is fully recognised how great an effect may be produced by a single flight of such

steps and a little bit of balustrade when treated in a broad way. I have put on the wall a photograph of a very commonplace house, Draycott Manor, which seems to me to have been redeemed from ugliness by such simple means.

Courts and Screens.

But a great public building, a great church, or even a great house, calls for a more spacious approach with a more imposing architectural setting than a terrace and a balustrade. A courtyard of liberal dimensions and an architectural screen are, in fact, essential in such a case. The screen should be high enough and close enough to give the sense, as well as the reality, of enclosure, without either dwarfing the main building or shutting out light and air. The most satisfactory approach on the whole to any building in the world is the great square before St. Peter's at Rome, with its double screens sweeping round in two great semi-circles at the sides. The only reproach it is possible to level at it is that it is too vast for the eye to take in as a whole. I rather suspect that Vanbrugh must have had those semi-circular screens in his mind when he contrived the front of Blenheim with its two quadrants; and the plan of the courtyard at Seaton Delaval Hall, enclosed on three sides by screens which terminate in little pavilions and leave the front open, has also some suggestion in it of the same origin. The architecture of the Seaton Delaval screen is heavy, like all Vanbrugh's work, and not well suited to such a feature. The best screen enclosing a courtyard that we have in London is the one in front of the Admiralty in Whitehall. It was even better before it was altered. The plan of using the screen to close the fourth side of the courtyard, the other three sides of which are formed by the building, is typically English, derived of course from the late Elizabethan house plan.

Conclusion.

I should like to have commented on a number of other branches of the subject and particular instances. I have neglected altogether the vast and prolific field of Mahomedan architecture; to say nothing of the Native Indian, Russian, and Chinese, from which some apt and curious illustrations

Entrance Gate Charlecote, Stratford-on-Avon.

might be drawn; and I have dealt very superficially even with French and German work. I meant to have noticed some approaches which are beautiful, as it seems, by accident, and others that are curious or eccentric. I should like to have called attention to some successful modern work. But the paper is already far too long, and all that must, for the present at least, be left unwritten."

Mr. Walter Millard, in moving a vote of thanks, said he felt as though he had been taken headlong through the whole history of architecture. In an hour and a half they had gone through some 4,000 years, at any rate; and still, as Mr. Baggally said, there was much left unnoticed. As to the objects of these inclosed approaches, shown in the earliest examples, it was a commonplace to say that they were based on utility to start with; whatever architecture resulted was got out of the feature after the requirements of utility had been satisfied. What we called the architecture was what the useful man did out of his head after he had schemed what was really wanted. Regarding the "Paradise" example referred to by Mr. Baggally, he thought that this was a medieval term for a special enclosure. And, as to the porches at Chartres, he preferred the north porch to the other; the north porch did not have its gables separated by pinnacles running up between them. It was pleasing to have a review of porches in our own country, not only of church porches, but of domestic examples also. There was a tendency to think that nearly all our medieval work was church work. We read in books that Gothic architecture was church architecture, and so on, but, he supposed, there was nearly as much secular work done in proportion to church work—then as now, and there was no essential distinction between the two.

Mr. A. Needham Wilson, in seconding the vote of thanks, said they had had a most interesting and instructive evening, and Mr. Baggally must have taken an enormous amount of pains in the preparation of his paper. If anything, he had covered too large a field for consideration in one evening, but he had given a great deal of matter for thought. He did not altogether agree with Mr. Millard that the origin of these approaches was a utilitarian one. In many instances they arose, he thought, from the fact that there existed a wish to add dignity to buildings. There was one instance of this in our own country which had perhaps been overlooked, and that was in the extraordinary "pagan temple" at Avebury, in Wiltshire, which consisted of nothing more than huge lumps of stone set upright in the ground, much anterior in date to Stonehenge. The temple formerly had miles of approach to it, flanked by such stones set up in the ground, which could have served no other purpose than to lend processional dignity to the approach to the temple. Another instance occurred in Norfolk, in the Fen district, where there was a very striking church tower standing bare almost, above the flat land, and where the road going in the direction of the village appeared to have been purposely diverted in order to give a vista of this church tower at the end of it. There was no reason apparently why the road should not have gone straight, except in order to give a good view of the tower. He was interested to see the arch at Khorasah, for they were taught in the old days that the Romans invented the arch. Could Mr. Baggally tell them whether the arch was constructed with voussiors? Mr. Baggally dwelt in a most interesting way on the advantage given to approaches by bridges. He (the speaker) might mention the extremely interesting and clever manner in which Mr. Lutyens had dealt with that in his most interesting house at Sonning. He had no water, but he obtained it by providing a circular pool, over which he put a bridge, approached by steps, for no other reason than to give dignity to his entrance. Architects now appreciated the necessity of dignity in the approaches to their buildings, though in a 1,000-ft. house the problem was generally a difficult one, but even then they were glad to win the client from a love of the serpentine walks, which Mr. Baggally condemned, to an appreciation of the quiet

dignity of the straight flagged path and nicely-kept green lawns on either side.

Mr. Francis Hooper said he hoped that Mr. Baggally would treat the subject as illustrated by Indian architecture at some future date, for he had given that evening a most interesting and suggestive discourse. Mr. Baggally had not, he thought, used the word "mystery," or referred to that element of mystery which a screened approach secured. An archway afforded a limited view of the prospect beyond, and provided the necessity for coming suddenly upon a building or a view which had been framed or concealed, and so enhanced one's appreciation of what lay beyond. One saw that in the case of the south-west gateway at Canterbury, for if one approached the cathedral that way one saw it suddenly and almost with surprise. The framing of the view at Canterbury was enchanting, and this element of mystery was provided by such screened gateways as were found at York, Chester, and elsewhere.

Mr. H. Gregory Collins, in supporting the vote of thanks, referred to the papers read before the Association this session, and congratulated the Committee on providing such excellent papers as those read by Mr. Gotch, Dr. West, and Mr. Baggally. After hearing Mr. Baggally's paper, one felt quite travelled, especially as they had seen such a fine collection of illustrations. As to the approach to Buckingham Palace, he did not think it would be a success architecturally. The memorial to Queen Victoria would soon rise in the centre bed opposite the palace, which looked so pleasant in summer, and the palace would be quite appreciated. Besides, he did not quite appreciate the idea of the planning; a procession would not be able to go straight up to the palace, but would have to bend and turn. The porch of the Guildhall at Exeter was not mentioned by Mr. Baggally: it is in the High-street, on columns, with superstructure of half-timber work. Exeter had another interesting gateway—i.e., at the entrance to the old Rougemont Castle, built in red sandstone. There were many instances in London of porches which one might see. As a recessed porch he thought the one at New Scotland Yard might be followed, though it might look a little cramped by the steps taking up almost the entire room in the porch itself; it might have looked better with more landing space at the bottom and at the top. Another example was the porch of St. Michael's Church, at Chiswick, which was a good example of modern work. In the matter of screens and porches, there was a great deal to learn. He always admired the little lodges at Hyde Park, and especially the lodge from the inner ring to Regent's Park.

The Chairman then put the vote of thanks to Mr. Baggally for his scholarly and charming paper, adding his personal thanks for a most enjoyable evening.

The vote of thanks having been very heartily agreed to,

Mr. Baggally, in reply, said it seemed to be a reproach that he had travelled too far that evening, whereas he expected to be criticised for leaving out this and that. And it really was as he anticipated, for those who had spoken had referred to examples which he had omitted. He agreed with Mr. Millard that it all started in utility—was not that what all their work started in? The making it into architecture came afterwards. Mr. Wilson took him rather out of his depth when he spoke about Avebury, for he did not know that it was determined that there had been even a temple there. Probably Mr. Wilson was right, but he was not aware that anyone professed to know exactly what those stones, etc., were. After all, if the long lines of stones were approaches for ceremonial purposes, did not they start in use? The ceremony was the thing; not the approach. As to whether the arch illustrated in the book by M. Place was built in voussiors, there seemed to be no question that it was arranged in voussior fashion, and he thought he recollected seeing in books illustrations of similar arches built in the voussior plan in the Assyrian period. He appreciated Mr. Hooper's remarks about screened approaches; he had overlooked the point. He did not quite agree with Mr. Collins, who seemed to object to the possible breaking of a procession

round the statue in the processional road leading to Buckingham Palace. He (the speaker) rather thought it was an improvement not to have an unbroken line. But to have it going round something. If the road were long and straight it would be less interesting than if it were broken in the middle. That was one of the great objections he had to the way in which our streets were managed in London. Everything was given up to a straight line for the traffic and one never got a nice break in a cross road where one might put up a statue.

The Chairman announced that at the next meeting on March 9 the paper would be by Mr. Gilbert H. Lovegrove on "The A.A. Camera and Cycling Club Excursions," illustrated with lantern views, Mr. A. Vye-Parminter being unable to contribute his promised paper.

THE MEASUREMENT AND FLOW OF WATER.

On the 20th ult. a meeting of the Institute of Sanitary Engineers was held at the City and Guilds of London Institute, Finsbury, E.C., when the Presidential address, by Professor E. G. Coker, M.A., D.Sc., was read. The title of the address was "The Measurement and Flow of Water," and in the course of his remarks the President said that the manner in which water flows and the circumstances which influence its movement were only fully investigated by Osborne Reynolds in 1885, although forty years before Sir G. Stokes discussed the matter and pointed out the general causes which make water change the character of its motion from direct or stream line to eddying or sinuous flow. The unrestricted flow of water from a small circular orifice in a tank was essentially direct, each drop of water moved at the same velocity as any other in its neighbourhood, and a colour band when introduced remained in general unbroken. If, however, the water was caused to move through a pipe the motion was essentially changed; the principal part of the flow occurred about the centre of the pipe, and died down to nothing at the sides. That liquids do not slide over solid surfaces in contact with them was abundantly clear from the experiments of Whetham, who had shown that even with tubes of capillary bore there was no slipping at the boundary of the tube, and other examples might be given of similar results in the case of the hull of a ship moving through the water. In practical cases the motion of water was rarely direct, and consequently the eddies which arise make the resistance to flow much greater than if these eddies were absent. Observations of the mean velocity of the water and of the head lost in friction showed that while the motion remained direct the head lost was proportional to the velocity simply, but with eddy motion the resistance increased very much more. The effect of temperature on the resistance to flow was an appreciable one, and was much more marked for direct motion than for sinuous motion. The increased resistance due to bends had lately been the subject of much research by Williams and Alexander, and their results brought out very interesting facts that the bend of least resistance was one having a mean radius of about two and a half times the diameter of the pipe, and that the resistance of the bend was about three and a half times that of a straight pipe of the same length. The need for the automatic measurement of small quantities of water had led to the invention of a large variety of meters of varying degrees of excellence. For very large flows weir measurements were usually adopted. In some cases the weir method was not convenient, especially when it was required to measure the discharge of a pipe without the loss of the pressure head, and in such cases a form of meter, invented by Herschel, had been used with very great success. The name of "Venturi" had been given to it, in honour of the Italian philosopher who first investigated the flow through cones, rather more than a hundred years ago. The meter was extremely simple in construction, consisting of a short cone inserted in the pipe line at a convenient point, with its narrow end pointing down stream, and merging into a short parallel neck connected to a long cone, which swells uniformly until it reaches

the diameter of the main again. The arrangement therefore involved a sharp constriction of the pipe, causing a comparatively high velocity through the neck, which gradually falls back to the normal velocity in the down-stream cone. The high velocity of the liquid through the neck was accompanied by a considerable fall of pressure, in some cases below that of the atmosphere. Experiment shows that the flow through the meter per second was very accurately expressed by $\frac{1}{2}$ the formula $a = \sqrt{h}$, where the head h was taken as the difference between the water columns attached to the meter, at the point where the water enters, and at the throat respectively, while the constant c was calculated from the dimensions of the meter and the gravitation constant. The accuracy of the formula for large flows had been tested by the inventor for discharges through a 1-ft. pipe, and also a 9-ft. pipe, and it was found to agree remarkably well with independent measurements of the discharge. Experiments on small flows in a pipe of about $\frac{1}{4}$ in. diameter showed similar results. Usually the meter was used in conjunction with a recorder in which there was a meter for sewage connected by pipes to two water columns containing floats. Besides its application to the measurement of the discharge of water main pipe lines, the Venturi meter had been used for many other purposes. One interesting application was for the measurement of sewage, and at the present time meters for this work are in use in several countries.

THE SANITARY INSPECTORS' ASSOCIATION:

RURAL HOUSING AND BUILDING BY-LAWS.

On Saturday, March 3, at Carpenters' Hall, London Wall, E.C., Mr. T. C. Barralet, Surveyor to the Rural District Council of Godstone, addressed the members of the South-Eastern Centre of the Sanitary Inspectors' Association on the subject of "Rural Housing and Building By-laws." He said that since Mr. Justice Grantham's famous case with the Chislehurst District Council the subject had assumed a magnitude in the eyes of the public only second to the great political questions of the day. Sanitary inspectors, from the very nature of their occupation, were the best qualified to express an intelligent opinion upon the subject, and, as an old inspector, he wished to treat the question mainly in regard to those aspects in which it affected the daily work and duties of inspectors, rather than from the sentimental, financial, or aesthetic standpoint. There was no doubt that we had been faced for some time with a peculiar phenomenon in our rural districts. Side by side with a steady diminution of population we had the anomaly that there were not enough houses for the people to live in. On the other hand, the last census returns indicated that the number of persons per house was less than ten years before—proving that conditions were not getting worse, but, taking the country as a whole, were rather better. Nevertheless, it could not be denied that in many rural districts overcrowding to an outrageous extent existed, insanitary cottages were the rule rather than the exception, and local authorities persistently neglected their statutory duties in enforcing the provisions of the Public Health Acts. It was equally patent that the ordinary laws of supply and demand would not stimulate building in purely agricultural districts, for the sufficient reason that a wage of 14s. or 15s. a week did not allow an adequate margin to pay a reasonable return on the outlay of capital involved in building the cheapest cottage. Low wages meant low rent, which, in turn, meant low interest. When they heard of country cottages being let at 1s. 6d. or 2s. a week, that sum frequently represented a return of perhaps 2 or 3 per cent. on the cost of the cottage. The rent, in fact, represented the amount of discount the labourer was able to afford from his wages, and had no relation to the cost or size of the dwelling he inhabited. That was especially so in the case of cottages attached to farms. Such dwellings were, to all intents, an appanage of a farm as much as the stables and cow-sheds. The occupants were not "tenants" in the sense of town-dwellers. Tied cottages were really a grant in aid of wages, and they were

really the bane of most rural sanitary inspectors. As a rule no claim could be made on the owner as the cottages were included in the tenant's lease. A vast improvement would be effected in this class of rural dwellings if landowners could be induced to retain cottages in their own hands instead of farming them out. From a financial point of view there were few inducements to a builder or owner to erect dwellings in rural districts; the rustic labourer's requirements were simpler, but his dwelling probably cost a good deal more to build than that of his town brother. He was not content with a two or three roomed tenement, and wanted a good garden, an outdoor wash-house, and an interior accommodation, which in towns would command a rental of 7s. or 8s. a week, for less than half that sum. True, the price of land and labour was cheaper, but the extra cost of materials and carting more than counterbalanced those advantages. Clearly, then, little help could be expected from private enterprise to make good the acknowledged shortage, except it be in the form of philanthropy. It would be generally admitted that it was to the best interests of the State that a large proportion of its citizens should be born and reared to rural pursuits, and that everything which tended to discourage the provision of healthy homes was to be deplored. Political economists of one school told them that to nationalise the land would stimulate rural life. Others recommended small holdings and peasant proprietorship, while others, again, advocated municipal action. Of late years there had been a pretty unanimous chorus from landowners and architects that the building by-laws adopted by rural district councils were the great stumbling-block to the provision of proper cottage accommodation, and it was to the examination of this plea in relation to the work of sanitary inspectors that he invited attention. Rural England received its sanitary charter in 1875, but no powers were conferred then to make building by-laws in any rural district. But by sect. 157 of that Act the Local Government Board might give such powers, and for the guidance of the local authorities a model series of by-laws was issued by the Local Government Board in 1877. Having passed in review these by-laws, Mr. Barralet remarked that it would generally be conceded that those by-laws were sound and reasonable from a health officer's point of view, and were calculated to secure the erection of healthy dwellings. The work of the sanitary inspector was, without doubt, materially assisted in places where they had been enforced. They did not prevent any "jerry-building," but confined it to narrow limits, and, although they contained many anomalies, they had done much for the improvement of all classes of buildings in the country. Up to a few years ago little complaint was heard of the hardships inflicted by the building regulations in rural districts, but, since they had become more universal, a vigorous agitation had arisen, having for its object their total abolition, or whittling them down to such an extent that they would have no control over structure above foundation, and would merely enforce what were called sanitary regulations. It must be confessed that many rural districts had taken advantage of their position to enforce requirements which were quite out of place in a rural, and of questionable utility in an urban, district, such as rooms 9 ft. in height, and party-walls being carried above the roofs. The Local Government Board were much quicker to yield to pressure than was usually supposed, and in 1901 they issued their Rural Model By-laws, with a recommendation to rural councils to adopt them for those parts of their district to which they appeared suitable. This latter model had much to recommend it. It insured at least a solid foundation, a damp course, and efficient drainage. The walls and roofs might be of any material, no concrete was required over site, the windows might be of any size and fixed, brick floors might be laid upon bare earth on a damp site, and the walls built of the most porous materials. For a detached house with plenty of land such by-laws might be sufficient. It would, of course, be possible to build a very damp and insanitary house complying with those regulations, but there was at least the satisfaction that it had a foundation, and a damp course and drains. From a sanitary inspector's point of view his work was likely

to be largely increased if the rural model were adopted generally in place of the urban model. Dealing with the opponents of by-laws, Mr. Barralet said that imagination failed to picture the evils of "jerry-building," and slum creation which would occur in some districts termed "rural" if Lord Hylton's measure of last session had become law. The policy of the Local Government Board was, without doubt, in the direction of weakening rather than strengthening the hands of local authorities in dealing with buildings, and almost every objector who appealed to them received a sympathetic hearing. The Board had clearly been convinced that the building by-laws acted as a deterrent upon cottage building in country districts, but his own experience did not confirm that assumption. Over a large part of the country there were no regulations of any kind, and yet the house famine was just as pronounced in those parts as in the others, so that the absence of any check did not stimulate building. The district which he represented comprised fourteen parishes in the south-east of Surrey. Up to a year ago the urban model was in force in eight of those parishes, and the remainder were without by-laws. Yet nine-tenths of the building took place in the parishes with the regulations. He was of opinion that building by-laws were necessary all over the country, and that they should be essentially the same for urban and rural districts. Mr. Barralet then proceeded to deal with the administration of the by-laws in detail, and at the conclusion of his paper there was some discussion.

CARPENTERS' HALL LECTURES:

THE RELATION OF ARCHITECTURE TO HISTORY.

The third of the present series of lectures on matters connected with building was delivered on the 1st inst. at Carpenters' Hall, London-wall, by the Right Hon. James Bryce, M.P., F.R.S., on "The Relation of Architecture to History," the chair being occupied by the Right Hon. Lord Tweedmouth, P.C.

The lecturer said that architecture was one of the very oldest of the arts, and also one of the most necessary. It had a scientific side and a practical side; it was needed for the purposes of our life; it could be carried out by the methods of science, and yet it had also got a side which belonged to imagination and taste. It existed not merely for practice, it existed for beauty, delight, and it had, perhaps more than any other art, the interest of combining the two elements of beauty and utility in everything it did and in every step of its advance. Architecture, as embodied in the works it produced, became a part of the life of every nation—a part of its practical life, a part of its intellectual and æsthetic life. The architect studied it for a practical end, in order that he might erect buildings which were needed for some immediate practical purpose; but he would understand better the principles upon which he worked if he had a general view of the relation which his science and art bore to life—that was to say, if he understood how the practical element and the æsthetic element were both to be blended to give satisfaction to practical needs and to the demands of taste and feeling; and he would better understand the styles of art—the lines which the development of a building ought to follow, the harmony of its parts, the appropriateness of every part to a general end—if, in studying the models which the past had bequeathed to us, he understood what were the causes which formed and moulded the invention and the taste of those who had gone before us. No architect could understand even the buildings and styles of our own time, much less those of the past, unless he understood the causes at work in the past, which gave to every building its particular style.

The causes which had affected the development of architectural styles had been of many kinds. A good deal was due to materials; where wood, for instance, was the common material, that gave a certain character to the architecture. Different kinds of stone, or the absence of stone and the use of brick, had also made great differences in the styles of architecture, as also did climate and light. But with those particular causes of the development of different styles in building he was not then concerned; he was, however,

intending to deal with other causes which influenced architecture—i.e., the needs of each particular people at each particular time; their taste, and the circumstances which existed at any given epoch. These were the fancies which determined the form which buildings took: the needs, the tastes, the resources of each successive age and people were expressed in their buildings. They were the permanent evidence of what a people were. No evidence was so good as that of a building. Tradition might err, records might be falsified, but a building told its own story; it was incontestable evidence of what existed at the time it was produced. It had been the practice in recent years to restore buildings, which constantly meant the destruction of the original character of the building and the substitution of something which the modern restorer thought was better than what the ancient architect did. We did not desire that buildings should fall into ruin—that was the very end one sought to avoid—but we desired to preserve the truth of a building.

The subject of the relation of history to architecture had two aspects. They might look at it from the side of the light that history threw on buildings, and from the way in which buildings illustrated history. Mr. Bryce then proceeded to give a few instances in which history explained the features of a building—that was to say, where they would be puzzled by the features which a building presented if they did not know the history of the times when it was produced. Mr. Bryce then dealt with the uniformity of the style of the Greek temples from the very earliest temples down to the Greek or Roman temples of the IIIrd or IVth centuries, and said that after eight or nine centuries it was remarkable that there should be the same type of temple prevailing over the whole Greek—afterwards the Greco-Roman—world. What a contrast that was to the changing styles of mediæval Europe from the Xth to the XVIIth centuries. The explanation of this contrast was easily obtained from history. The Greek temples were all beautiful externally and plain and uninteresting inside, and that pointed to worship, such as there was, outside; and that kind of worship was continuous and uniform from the time when we first get our light on Greek architecture down to the Greco-Roman period. The early style became sacred, and it never occurred to any architect to deviate from it. That was one reason, but there was another: the Greeks were pre-eminent for their taste and creative power amongst the nations of antiquity: they were immeasurably superior to any of the people, except the Egyptians, with whom they came in contact, and with the fall of Egypt at the time of the Persian conquest the Greeks stood alone. That being so, there was no influence to come to them from outside, as the other nations had not a creative power or artistic taste. The Greeks remained pre-eminent, preserving all their ancient forms, because they did not receive any impulse from others. On the other hand, there was much in mediæval Europe to bring about change and differences.

Again, as anyone who travelled in the Eastern world could see, dull uniformity was the characteristic of the buildings of worship of the orthodox Eastern Church; but in the Western world there was a great diversity in the forms of the churches. What was the explanation of that? It was, he believed, due to the fact that the orthodox church of the East became petrified, so to speak, at a comparatively early period; there was a stagnation of its intellectual and æsthetic powers, which prevented its growth in the way in which the Western world was developing during the same centuries. As the literature and art, thought and theology, were petrified, so also was its architecture, and there were not those creative minds working in the Eastern world that there were in the West. The historian of Eastern architecture would not be able to explain this dull uniformity if he did not know the history of the Eastern church. Even outside the orthodox Eastern church—in the churches of Armenia, for instance—people build to-day in the way they did in the IIIrd century. Constantinople was the centre, and it set the type, invention and development being checked and ultimately paralysed.

Another illustration Mr. Bryce gave was the castle architecture of our own country. Whoever studied the castle architecture of our own country must have been struck with the difference between the buildings of defence in the different parts of the United Kingdom. In England we had large and splendid examples, often with a great deal of architectural beauty, and their erection cost a great deal of time and money—such castles, for instance, as Conway and Carnarvon, Rutland and Peubroke, Bodiam in Sussex, and the castles of Northumberland, although they were a little ruder. Across the border, the castles of Scotland, though fine, were ruder and simpler than the English ones, and in the western parts they were bare, rough towers. In Ireland this was more evidenced; as a rule they were still ruder—except those built as the result of the Anglo-Norman invasion—and this was true also of the castles on the western coast of Scotland. An architectural traveller who knew nothing of the history of Great Britain and Ireland might be puzzled by this contrast, but as soon as he understood the history of the country he would realise the cause. There was plenty of money in mediæval England, and the great lords found it worth while to build fine castles for themselves and their retainers. The same was true, to some extent, in eastern Scotland, where the great lords built in a comparatively beautiful and sumptuous style; but in western Scotland and Ireland the chiefs were poor, or lords of small clans, and with no means of building castles that would do more than supply the absolutely irreducible minimum of comfort and convenience to themselves and their vassals. When one understood the social and economic conditions prevailing from the XIIIth to the XVIth centuries, one understood why there should be these differences in the castles of the country.

Then as to how architecture illustrates—i.e., where the historian, who knew the history of the country, was able to learn and confirm his views and illustrate his conclusions from the facts which architecture supplied. One of the great values of the study of architecture was that it went back to the ages from which we had little or nothing in the way of records. The art of building considerably ante-dated written records. Written history was comparatively modern, though, of course, architecture was modern relatively to the progress of the human race. Even in Egypt, the country in which were the oldest architectural remains, it was evident that they had civilised history before the great buildings we admire were produced.

Architectural products of primeval, pre-historic times were the most valuable evidence of the social and economical state of the nation. Take Egypt; anyone looking at the gigantic piles erected there—the great Temple of Karnac, the Pyramids—would see that the country which produced such works must have been a wealthy country in which there was a settled order and government, and where there was a large command of slave labour. Again, take Mexico. When the Spaniards conquered Mexico they arrested its civilisation, and it was a great misfortune that they did, for it would have been curious to see how that civilisation developed independently of the influences of the world. The Mexicans were just beginning architecture in the proper sense of the word. The Mexicans had come some way with decoration, but very little in the way of creating proper stone buildings of a well-marked architectural style, but there were evidences that they had gone some way towards becoming an artistic people—i.e., in the great taste they showed in the figures they carved. Primitive man could not produce a fine temple or a distinct architectural style, but he could produce decoration, and could advance to a considerable degree of skill and taste in the production of such work. Architecture showed that the artistic faculty in man proceeded on the same path as the literary faculty. In Crete, for instance, that held true; there was a great deal of skill, grace, and beauty in the decorations before there was architecture in the grand style. The architecture of a country was the best evidence of its state of society—whether it was rich or poor, or peaceful or troubled; if troubled, its build-

ings would be chiefly of defence. The diffusion of different types and styles over different local areas was an exceedingly interesting branch of the subject, because it was the branch in which history was best illustrated in architecture. The map of modern Europe was different from the map of mediæval Europe, but the political divisions of four to ten centuries ago are written unmistakably in the buildings of the different local areas over Western Europe, and those buildings also show what was the influence that one nation exercised on another during the mediæval period.

Mr. Bryce proceeded to give one or two illustrations, and in speaking of Indian architecture he said that anyone who went to India and saw the extraordinary diversity of styles in that country would be unable to explain that, unless he had the lamp of history to light his path, and it was a melancholy reflection that Englishmen were not leaving India much architecture of permanent value. If by some catastrophe we were to quit India and leave her to her own devices for 500 years, what traces would remain of English occupation? He thought the embankments, the railway cuttings, and the tunnels would be the chief remains. In speaking of mediæval Europe, he said there was great similarity in the different types of building of the same age, but all with distinctive features, and that was exactly what history told us; there was one religious head or faith, one great ecclesiastical power, but there were different influences co-existing and ennobling the nations to acquire different characteristics. There was a diversity in unity and a unity in diversity; there were political divisions, which we do not notice now, which were written in the buildings of Europe. In France, for instance, there were four or five different types of architecture with great similarity, but all with distinctive features, and the same remark applied to Italy. In England there was not so marked a difference between the styles in different parts of the country as was to be seen in France, and the broad, salient feature about England was how largely she was influenced by France in her architecture.

As to the way buildings illustrated the needs of any age, the great fact in the Middle Ages in Europe was the ecclesiastical power, which dominated everything else, and religion occupied a larger part in men's thought than it does to-day. Therefore the great buildings which had come down to us from the Middle Ages were mostly ecclesiastical buildings, and we saw recorded in them—in their size, splendour, and beauty—the immense passion which the people threw into their religion and the money they spent to produce noble structures. A curious little instance belonged to our own time. The XIXth century had been the great age since the end of the XVth century of church building and restoration. That was due to two concurrent influences; one was the extraordinary development of wealth and population, which made more churches necessary, and the other was the influence of the romantic movement—the same influence that we saw in Ruskin and Walter Scott—which took people back to the Middle Ages and gave them an interest in architecture and art, and made them willing to spend money on building churches and in making them sumptuous and beautiful. When the New Zealander came ten centuries hence to reconstruct the history of England from its ruins, he would be struck by the number of churches belonging to the XIXth century, and if all other records were gone, he would find the evidence of buildings valuable for the purpose. Besides churches, there were many places in which we found fine town halls, and such great municipal buildings were a witness of the truth of the force and volume of the municipal life of the time.

Architectural history embodied, as hardly anything else did, the life of the people. It gave a new interest to travel, and made it far more profitable and suggestive. Nothing set one thinking more than to study the architecture of a city and what the life of it must have been as revealed by the buildings that remained. It set one thinking, and there was a reason for everything in the world if one could but find it, and the essence of all profitable travel was to make one ask the reason for what one saw, and nothing did that more than the study of

architectural history. Architecture was one of these branches of art which suggested to us the immense influence and power of emotion, as well as intellect in the development of mankind. It was emotion which was the motive power of man; it was religious emotion which had produced most of the great art of the world, and it was religious emotion that drove man on in the path of artistic creation.

A vote of thanks to the lecturer and the Chairman brought the proceedings to a close.

THE LONDON COUNTY COUNCIL.

The ordinary weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Sir E. Cornwall, M.P., Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Battersea Borough Council 9,088*l.* for various purposes; Camberwell Borough Council 1,163*l.* and 2,500*l.* for housing purposes; Hammersmith Guardians 12,400*l.* for poor law purposes; and Lewisham Borough Council 4,737*l.* for street works, etc.

Improvement, King's-road, Chelsea.—The estimate of expenditure on capital account of 4,814*l.*, submitted by the Finance Committee, in respect of the King's-road, Chelsea, near Church-street, improvement was approved.

Streatham High-road.—It was agreed that the amount of the Council's contribution towards the cost of widening Streatham High-road, between Mount Ephraim-road and the Tate Library, executed by the Wandsworth Metropolitan Borough Council, be 4,070*l.* 15*s.* 1*d.*

Northern Low-level Sewer—Diversion at East London Railway.—It was agreed—

(a) That the estimate of expenditure on capital account of 10,390*l.* submitted by the Finance Committee in respect of the reconstruction of the northern low-level sewer where it crosses the East London Railway at Shadwell be approved. (b) That the estimate of expenditure on maintenance account of 2,000*l.*, submitted by the Finance Committee, in respect of the diversion of the northern low-level sewer at the East London Railway, Shadwell, be approved. (c) That the offer, amounting to 11,235*l.* 15*s.*, of W. Kennedy, Ltd., be accepted for the reconstruction of that portion of the northern low-level sewer where it crosses the East London Railway at Shadwell.

Indication of Houses of Historical Interest.—The Local Government, Records, and Museums Committee reported as follows:—

"On October 25, 1904, we informed the Council that the Duke of Bedford, the Duke of Bedford had affixed memorial tablets at his own expense to certain houses on his estate. We have since been informed that His Grace has affixed tablets to the undermentioned additional houses:—Nos. 10 & 102, Great Russell-street (Topham Beauclerk and Lady Diana Beauclerk); No. 54 Gower-street (Sir Samuel Romilly); No. 31, Bloomsbury-square (Sir Anthony Panizzi); and No. 67, Euston-square (Lord Leighton). The tablet in memory of Sir Anthony Panizzi was affixed as a result of a suggestion made by Mr. J. T. Taylor, a member of the Council. We propose that a list of the tablets affixed by the Duke of Bedford shall be included in the volume, 'Indication of Houses of Historical Interest.' We have made inquiries with a view to the commemoration of the residence in London of Sir Edwin Landseer, but we regret that we are unable to recommend the Council to take any action in the matter, as it appears that the only two houses in London in which Landseer resided have been demolished."

Main Drainage Extension—Appointment of Arbitrator.—The following recommendation of the Main Drainage Committee was agreed to:—

"That the seal of the Council be affixed to the appointment (in duplicate) of Mr. Edward Augustus Grining as sole arbitrator in the matter of the claim of Mr. W. J. Lough in respect of alleged damage to Nos 167 to 173 (odd numbers), Eastfield-street, Bow, by reason of the construction of section No. 1 of the northern low-level sewer No. 2."

Tooting Common—Formation of a Bathing Lake.—Permission was given to Wandsworth Metropolitan Borough Council to form at its own expense a bathing lake with an area of not less than 30,000 sq. ft. on a site on Tooting Common immediately adjoining the western side of the London, Brighton, and South Coast Railway between Tooting Bec-road and Bedford Hill-road, subject to all work being executed to the satisfaction of the Council.

Displacement of Population, 1905.—The Parliamentary Committee reported that they had before them a return, prepared by the statistical officer, showing the probable dis-

placement of population in London to the extent of 6,809 persons through the proposed acquisition of 1,727 houses in connexion with the various Bills deposited in the present session of Parliament. The Housing of the Working Classes Act, 1903, requires rehousing accommodation to be provided where as many as thirty persons of the labouring class are displaced under any Bill in the Administrative County of London. Prior to that Act the limit below which rehousing was not required was twenty houses in any metropolitan borough.

The Council adjourned soon after seven o'clock.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Clapham.—Buildings between Nos. 65 and 69, South-side, Clapham Common, Clapham (Messrs. Homer & Lucas).—Consent.

Hackney, Central.—Projecting pilasters to Nos. 231, 233, 235, and 237, Mare-street, Hackney (Mr. C. G. Smith for Mr. W. Frith).—Consent.

Hammersmith.—Buildings on the northern side of Uxbridge-road, westward of Providence-place (Mr. J. E. Richardson for the Home Counties Land Company, Limited).—Consent.

Lewisham.—The retention of a one-story shop in front of No. 5, Brownhill-road, Catford (Messrs. Norfolk & Prior for Mr. J. Alder).—Consent.

Lewisham.—That the application of Messrs. W. D. Church & Son for an extension of the period within which the erection of a porch in front of the proposed church on the south-eastern side of Torrion-road, Lewisham, was required to be completed, be granted.—Consent.

Marylebone, West.—Bath-room additions and a covered way on the south-west side of Grove-road, St. Marylebone, eastward of the Regent's Canal (Mr. J. P. Waddington for the St. Marylebone Metropolitan Borough Council).—Consent.

Newington, West.—Houses on the north-western side of De Laune-street, Kennington (Messrs. Briant & Son).—Consent.

Paddington, South.—A projecting sign in front of No. 1, Burwood-news, Burwood-place, Edgware-road, Paddington (Messrs. Allen & Mannoch, Limited, for the London and Parisian Motor Company, Limited).—Consent.

St. George, Hanover-square.—Bringing forward of the frontages of No. 1, Hamilton-place, abutting upon Piccadilly (Messrs. W. H. Romaine-Walker & Besant).—Consent.

Strand.—A deviation from the plans approved for the erection of two iron-and-glass shelters to the Royal Institute of Painters in Water Colours and Princes Restaurant on the south side of Piccadilly, so far as relates to the affixing of the name of the premises to both sides of the shelter in front of Princes Restaurant (Mr. W. Emden).—Consent.

Wandsworth.—Five blocks of cottages and shops (section "B"). Franciscan-road, Tottenham (Mr. R. Robertson for the Housing of the Working Classes Committee of the Council).—Consent.

Wandsworth.—The retention of a porch in front of Spencer House, No. 27, Wimbledon Park-road, Wandsworth (Messrs. Boyton, Sons, & Trevor).—Consent.

Wandsworth.—A building on the western side of Beaumont-road, Wandsworth (Mr. A. J. Hardwick).—Consent.

Hampstead.—A building at the rear of No. 9, Fawley-road, Hampstead, to abut upon Honeybourne-road (Mr. C. G. Durrant for Dr. G. Elam).—Refused.

Marylebone, West.—Raising projecting one-story shops in front of Nos. 168 and 170, Edgware-road, St. Marylebone (Mr. J. W. Stevens for Mr. E. S. Burns).—Refused.

Width of Way.

Islington, South.—Retention of a building at the rear of No. 35, Thornhill-road, Islington, with a forecourt boundary at less than the prescribed distance from the centre of the roadway of the southern arm of Barnsbury-square (Messrs. F. J. Bedle & Meyers for Mr. T. Heath).—Consent.

Width of Way and Lines of Frontage.

Kensington, South.—Retention of an iron-and-glass covered way at the entrance to No. 3, Douro-place, Victoria-road, Kensington (Miss F. A. Lee).—Consent.

Strand.—A projecting chimney-stack at No. 13, Golden-square, to abut upon Lower James-street (Mr. W. Woodward for Messrs. Rye & Eyre).—Consent.

Hammersmith.—A building at the rear of No. 243, Uxbridge-road, Hammersmith, at less than

the prescribed distance from the centre of the roadway of a news leading out of the east side of Askew-crescent (Messrs. Prickett & Ellis for Miss S. Axton).—Consent.

Woolwich.—Buildings abutting upon the western side of Godfrey-street, the southern side of Godfrey-hill, and the eastern side of Lower Wood-street, Woolwich (Messrs. G. A. Wilkinson & Son).—Consent.

Strand.—A wood-and-glass showcase at No. 224, Regent-street, to abut upon Argyle-place. (Messrs. F. Sage & Co. (1905), Limited, for Messrs. T. & J. Perry).—Refused.

Paddington, South.—A one-story addition in front of No. 4, Hyde Park Gardens-news, Paddington (Messrs. G. Trollope & Sons and Colls & Sons, Limited, for Mr. J. G. Griffiths).—Refused.

Formation of Streets.

Lewisham.—That an order be issued to Messrs. Norfolk & Prior, sanctioning the formation or laying out of a new street for carriage traffic out of the east side of Ravensbourne-park, Catford (for Mr. A. E. Rudd).—Consent.

Norwood.—That the Council do not accede to the request of Messrs. R. Ellis & Son, on behalf of Mr. R. A. Sanders, for permission to build over the land marked "reserved" on plan approved for the formation or laying out of five new streets for carriage traffic on the Sanders estate, on the south-east side of Coldebour-lane, Brixton).—Refused.

Space at Rear.

Peckham.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to a building erected on the north-east side of Hall-road, Peckham, abutting upon Hichisson-road (Mr. C. Farley).—Consent.

Space at Rear and Alteration of Buildings.

Bow and Bromley.—A two-story factory building over a part of the space at the rear of Nos. 47 and 49, Norman-road, Bow (Mr. A. P. Stokes for Messrs. C. J. Russell).—Consent.

Southwark, West.—Buildings on a part of the space at the rear of No. 6, Nelson-square, Blackfriars-road, Southwark (Mr. R. C. Murray for Messrs. Sidney Straker & Squire).—Consent.

Height of Buildings.

Lincolns.—A building on the site of Nos. 13, 15, and 17, Dod-street, Lincolns (Messrs. H. Herman, Limited).—Consent.

The recommendations marked † are contrary to the views of the local authorities.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The ninth meeting of the session was held at No. 18, Tufton-street, S.W., on Wednesday, February 23rd, Mr. E. W. M. Wonnacott being in the chair, when Mr. E. C. M. Willmott read a paper on "The Architecture of Shop-fronts."

In the course of his paper, Mr. Willmott said: "A shop-front as we see it in the streets to-day makes no pretence at art or the expression of art. It has been accepted by even the best among us as a purely utilitarian necessity engendered of a present-day commercialism—a commercialism which I hope to show presently is only binding itself to its own advancement.

Of course, we are always ready to depreciate the fact that it is unseemly and unarchitectural for a stone building of massive proportions apparently to be supported upon a brass and mahogany slip of an inch or two diameter, but what are we to do? We lament the state of affairs, and promptly blame the clients who will insist upon large expanses of glass as a commercial necessity.

Surely our art has become stagnant and purposeless when we find it not equal to the task of adapting itself to modern conditions and requirements. The difficulties are, no doubt, very great, but they are not insurmountable, and I rejoice to find that a small move is now being made in the right direction. I will endeavour to prove that there are great possibilities of artistic treatment even in a shop-front. Conditions of life and commerce have so changed as to render useless and ineffective such charming old Georgian or Early Victorian fronts as we sometimes see in Soho and other quarters of London.

The shopkeeper, in those times, was limited both in his ideas and ambitions, so making it possible for the designer to do full and complete justice to those proportions which are so essential between the shop-front itself and the building overhead. Gradually the shopkeeper found it necessary to make his shop-front the medium whereby he could advertise and display the special goods which

be sold and attract the public. And this power to attract is the keynote which the designer must study to satisfy his clients' commercial instincts.

I propose to deal, firstly, with the single shop-front as being the most common problem. There should be perfect harmony between the shell and its contents, and a front that would be suitable for a jeweller is flagrantly out of place when setting forth the charms of a new costume. With the art of window-dressing improved and improving, we architects must fall into line and provide a shop-front which shall be not only artistic and suitable, but educationally instructive to the window-dresser.

A notable and praiseworthy tendency in many of our later fronts is to set back the actual line of the framework 2, 3, 4, or even 5 ft. from the frontage line. This has many advantages. It creates a standing-place where an intending customer can admire the goods without being jostled by passers-by. Again, if set back deeply enough it does away with any need for sun-blinds. The idea has many possibilities; the sides of the lobby, or loggia, can be occupied by show-cases, and in one or two examples I have seen an additional showcase in the centre.

Considering this setting back in relation to the building above, we now get a building over a void, and not, as it seemed before, on a framework of wood and glass. I should deprecate the use of the sham arch, and think that the only natural treatment for a shop-front opening is a square treatment of beam and posts, even showing the girder supporting the wall over boldly and frankly. Galvanise or otherwise protect it, and then do as one ingenious architect did, use it instead of the sham fascia, and let the name of the shopowner be bolted on in metal letters.

Now treat the stanchions in the same way, dress the bareness of girder and stanchions with a little decorative metal work, and I think the effect will not lack artistic qualities.

In contradistinction to the ideas I have just outlined we will imagine the most difficult case—a draper's shop where the glass is required to be taken down close to the floor, and the frontage is of considerable width. Let the line of building frontage be set back a few feet, and, instead of using the usual girders and columns for the superstructure, let it be carried upon a series of arches of such sizes and proportions as are suitable architecturally and structurally. Now, let your shell be practically a showcase hung up as a light accessory and projecting from the building face such number of feet as that may have been set back.

The frame itself could be of metal, giving a clear, unobstructed view, and made as much like a large hanging showcase as possible in order to do away with any impression that the building is supported upon glass or wood.

There is an increasingly popular tendency, especially in furniture shops, to take the front up two stories. This is certainly a gain to shopkeepers, as people are attracted from the tops of passing omnibuses.

Architecturally, I consider it also a gain if suitably treated, making the task of proportional reconciliation between the two portions of the building much easier to deal with. As the height to which the observer can see in comfort is never more than 8 ft. or 9 ft., all space above this is really useless unless for effective display, and, with the average ground floor anything from 15 ft. to 20 ft. high, the scope of the designer is enlarged and his difficulty lessened.

I would also plead that more attention be paid to the window back and general fittings.

With regard to a series of shop-fronts, we can do as in the Rue de Rivoli—that is, bring our buildings out over the pavement, making a series of arches upon which the superstructure is carried. The shop-front is set well back, and forms no part of the façade as seen from the street. Or we might have a small lower pier at each end of the front, and a large entrance block in the centre; on either side between the entrance block and side piers, both of which would project 5 ft. or 6 ft., come the shop-fronts proper. These could be appended to the building in the same way as we would attach a conservatory to a dwelling-house, and with, I think, the same architectural effect.

The lecturer concluded by drawing attention to the possibility of using the idea of the old Rows at Chester, where a continuity of thoroughfare was possible.

Mr. F. Lishman, in opening the discussion, considered the use of stall-board lights preferable to pavement lights. He suggested that sun-blinds might be made to run out horizontally, and so avoid the unsightly and awkward irons at sides. Arcades, he considered, were usually unprofitable undertakings. The double-story front, now somewhat frequently used in modern work, he also disliked, and advised a competition in reticence instead of showiness.

Mr. Pearson referred to the way certain well-known firms, such as Slater's and Kodak Co., had become associated in people's minds with certain and definite styles of fronts, so gaining cleverly an advertisement.

One or two speakers referred to the draper's requirements being the most difficult to deal with, the saying that the "eternal feminine is the root of all evil" evidently applying specially to shop-front architecture.

Mr. Max Clarke singled out certain excellent modern fronts, an early work in Oxford-street by Mr. Shaw being one specially noticed. He also, from recent experience, commended the recessed shop-front, it being almost a necessity for grocers' purposes.

Mr. C. R. Ashbee, who acted as Special Visitor, made a special point of reliance on colour and the use of bright metal. An early example of the XVth century, was to be found at Beauvais, where tiles, in a wood setting, made a fine front. After referring to the use of curved glass at Slater's shops as a plucky attempt on legitimate lines, he turned to good lettering, on some of the old traditional models, as being a thoroughly good decoration. In fact, he advocated generally the preference for traditional forms over those of the "New Art."

Mr. Willmott, in replying, again emphasised the importance of avoiding any feeling that the shop-front was responsible for the support of the building above.

Fifty Years Ago.

FROM THE *Builder* OF MARCH 8, 1856.

NEWGATE JAIL.

At a meeting of the Court of Aldermen of the City of London last week, Alderman Cubitt brought up the report of the committee on the state of Newgate Jail, and its improvement or removal. The report, after some preliminary remarks, in which it was stated that, till some important alteration was made in the physical structure of the interior of the building, Newgate must continue to be a standing reproach to the City of London, proceeded to intimate that a plan was under consideration which would give 120 separate cells at a cost estimated by the City architect at 10,000; that they had in view another plan of a comprehensive nature for the entire demolition of the courts and of the jail, and the reconstruction of the courts and such a portion of the jail as might suffice for the custody of prisoners while trials were going on, the objects of this plan being to dispense with Newgate as a prison, except only as above stated. A plan had also been submitted to the committee for such additions to the prison at Holloway as would enable it to receive the prisoners now kept at Newgate. The cost of the combined operations—that is, the reconstruction of the Criminal Courts and a portion of Newgate—was estimated by the City architect at 87,000, less the value of a piece of land at the Old Bailey set free, and estimated at 9,000. In working out these plans, the City architect had so arranged as to permit the smaller one to form an integral part of the larger. The report, after some discussion, was received, and referred back to the committee to act therein as they should think fit.

SECONDARY SCHOOL, BLACKPOOL.—The new secondary school, in Raikes-parade, Blackpool, was opened recently. The scheme of the building is one of three floors—the rooms for trades instruction in the basement, those for ordinary class work on the ground floor, and those for art and science teaching on the first floor. The building contract has been carried out by Messrs. Parkinson & Sons, of Blackpool; and the architects are Messrs. Potts, Son, & Hennings, of Blackpool, Manchester, and Bolton.

Illustrations.

PART OF ELEVATION, HAMPTON COURT.

HIS is one of the drawings which gained for its author, Mr. John H. Markham, the Ashpittel Prize at the Institute of Architects this year.

It appeared to us to be the best of the set; and, though Hampton Court is so familiar, so good a detail drawing as this is worth having, and will probably interest our readers.

The Ashpittel Prize was founded in 1872 as a memorial to the late Mr. Arthur Ashpittel, and is awarded annually to the student who distinguishes himself most highly in any one of the final examinations held during the year, and whom the Board of Examiners recommend as deserving of such honour.

In regard to the present drawing, Mr. Markham writes:—

"This building is probably too well known to need much description. The part illustrated is from the east, or garden, front of the State apartment erected by Sir C. Wren for William III. and Mary on the site of Henry VIII.'s old Cloister Green Court, which was pulled down to make way for it.

The materials employed in this front are Portland stone and brick, the brickwork to the ground floor being of a dark colour, and above that rubbed red bricks five courses to the foot.

The carved frieze between the Corinthian caps is probably by Grinding Gibbons, and the tympanum sculpture by Gabriel Cibbes represents Hercules triumphing over Envy, and is supposed to contain some complimentary allusion to His Majesty. The wrought-iron gates, probably by Fijou, are very fine.

To the south, or river, front the materials are similar, but a good deal of an Oxfordshire oolite has been used owing to the difficulty in conveying Portland stone up the Channel during the troubles with France. This stone has weathered to a warmer hue than the Portland, and can be distinguished from it. The date of the work is about 1690-1700.

The drawing was made from measurements taken in July, 1904, and was used as a testimony of study for the final examination R.I.B.A."

ILLUSTRATIONS OF SOUTHWOLD CHURCH.

THESE illustrations, from photographs by Mr. F. Jenkins, of Southwold, are given in connexion with the leading article in the present issue, to which the reader is referred.

METROPOLITAN ASYLUMS BOARD.

THE usual fortnightly meeting of the managers of the Metropolitan Asylums District was held on Saturday last week, at the offices, Victoria-embankment, E.C.

New Central Stores.—Revised plans of the new central stores, submitted by the Contract Committee after conferring with the Works Committee, were approved and ordered to be forwarded to the Local Government Board. Messrs. Northcroft, Neighbour, & Nicholson were appointed to take out the quantities in connexion with this work.

Balmont Asylum.—On the recommendation of the Works Committee Messrs. Jowler & Hugman were appointed to take out the quantities of the proposed stables and other buildings at this asylum.

High Wood School and Leavesden Asylum.—The same Committee reported that the cost on completion of this school and the female attendants' home at the asylum—had been respectively 105,507*l.* and 6,206*l.* Reports dealing with both institutions were ordered to be sent to the Local Government Board.

South Western Hospital, Isolation Accommodation.—Messrs. T. W. Aldwinckle & Son were appointed architects in connexion with the provision of additional isolation accommodation at the South Western Hospital.

Joyce-green Hospital.—Messrs. Treadwell & Martin were appointed architects for the new staff cottages and other buildings at this institution.

SCHOOLS, DROYLSDEN.—There were twenty-three tenders for these schools. The District Committee have recommended the acceptance of the tender of Mr. John Tihline, Parker-street Saw Mills, Bury, and, subject to the approval of the County Authority, the contract will be let to him.

ARCHITECTURAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Before the members of the Birmingham Architectural Association, Professor Berford Pitt lectured on the 2nd inst., on "Architectural Effects in Cities." Architecture, he pointed out, was the expression of noble thought. It united the practical elements of life with the experience of, and reverence for, past art. So far as Great Britain was concerned, Edinburgh, he said, took the palm for beauty in architectural effect. They did not grudge it its civic glory. There was similarity in architectural effect in Birmingham, Manchester, and Leeds. Each had fine buildings, but the grouping was not really effective. As a matter of effect the civic monuments in architecture in this country were too often lost; they were being lost in the crowd. They were disconnected and scattered, because they were dealt with from time to time, separated by long intervals. Cardiff, however, was a more hopeful illustration of what intelligent foresight could achieve. The acquisition of Butts Park had enabled a site to be laid out for town hall, law courts, museum, and university all adjoining the picturesque castle. As far as practicable there should be characterisation of different districts. There was grandeur in the Thames Embankment, and in this connexion he insisted that public buildings and national monuments could be placed with better effect on the banks of a broad river than on any other class of site. Pictorial illustrations were given of English and foreign architecture in order that the many students present might note the contrasts in style and expression.

NORTHERN ARCHITECTURAL SOCIETY.—At the meeting of the Northern Architectural Society in Newcastle, on the 28th ult., the award of the assessor in connexion with the R.I.B.A. Intermediate examination testimonials of study was read. The first prize was awarded to Mr. Wilfrid Turpin Sunderland, and the second to Mr. J. H. English, of Corbridge. During the evening the Glover Bronze Medal was presented to Mr. Bryan Watson. A paper was read by Mr. J. B. Mitchell-Withers, of Sheffield, on "Early XVIIIth Century Architecture," in which he referred to Greenwich Hospital as the building where the work of Inigo Jones and Sir Christopher Wren could be seen to advantage, but of which portions were built by various architects in the XVIIIth century, of whom Sir John Vanbrugh and Hawksmoor were the most celebrated. He showed lantern slides of portions of this work, and of some of the buildings erected in London during the XVIIIth century. The architects of the period did not confine the tradition of Sir Christopher Wren, but adopted a heavier style, making the details of their buildings much more massive. In the smaller buildings the same feeling was introduced, and the interiors were carefully thought out even in smaller houses, there being evidence of great skill and refinement throughout. Mr. Mitchell-Withers afterwards referred to the buildings erected at Oxford and Cambridge, such as the Fellows' Buildings and the Senate House at Cambridge, and the Radcliff library and buildings to the High-street at Queen's, in Oxford. Domestic and street architecture of the period were illustrated by a number of views of buildings at Bath and Stamford, concluding with views of Belheim Palace and Castle Howard, both of which were built by Sir John Vanbrugh.

CARDIFF, SOUTH WALES, AND MONMOUTHSHIRE ARCHITECTS' SOCIETY.—A meeting of the Cardiff, South Wales, and Monmouthshire Architects' Society was held in Cardiff on the 22nd ult., the chair being taken by the President, Mr. J. H. Phillips. A paper was read by Mr. J. Ward, the Director of the Welsh Museum, Cardiff, entitled "Some Observations on the Planning of Romano-British Houses." The lecturer first described the typical Pompeian house, and then proceeded to give the salient features of the Romano-British house. By means of a series of block plans he indicated the development of a typical house of the latter kind from the simplest form to one of considerable complexity surrounding a courtyard, and showed that the planning of the Romano-British was fundamentally different from that of the Pompeian. He then illustrated this point by a series of plans of

actual houses, beginning with several Silchester examples. *En passant*, he paid a high tribute to the explorers of Silchester and Caerwent, remarking that they digged for "plans," not for "plans." Silchester, he said, had revolutionised our views of the Romano-British houses, and he referred with high praise to the illuminating remarks upon their character by Mr. George E. Fox (one of the directors of the former exploration). Mr. Ward pointed out that in its simplest form the Romano-British house consisted of a row of rooms bordered on one side with a corridor, which provided a means of access to these rooms. He considered that the corridor was an external adjunct, carried as high or but little higher than the first floor of the main block. This block, he showed, constituted the nucleus in the more complex houses. While he regarded the nucleus as of two stories, he was inclined to think that the various outshoots were of a single story on the whole. He strongly advocated the use of models of the remains of Roman buildings in museums, and pointed out the excellent work in that direction in the Reading Museum. More could be learned from the model of a house than from an assemblage of broken pottery and fragments of metal found on its site. What, he asked, would anyone learn of a Tudor house from a Tudor candlestick taken from it?

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday, the 5th inst., Mr. Maurice Wilson, President, in the chair, a paper was read on "Submerged Chain Cable Groynes," by Mr. R. G. Allanson-Winn, of which the following is an abstract:—In his opening remarks the author stated that this paper had been prepared with the view of describing the chain cable groyne and its uses, and he dealt with the difficulties often experienced in securing examples to put sufficient life and force into a theory to secure its comprehension and acceptance. The author then urged on all young members of the profession the importance of not only learning all they can from books recording the experiences of others, but of using their best endeavours to make their knowledge their "very own," by efforts to gain what he termed unaided solutions to troublesome problems. By that means they might avoid the danger of sliding into ready-made grooves, and quenching their own originality. The following are the main features of the author's chain cable groyne:—To a heavy chain cable are attached bushes or other suitable obstructions, until the chain is converted into a veritable flexible hedge. When used on the visible shore the chain is strongly pinned down to the shore by iron bars of piles, and is laid in deeper water from low-water mark by paying out from barges or lighters. When the flexible hedge or groyne has been placed in position, seaweed and other travelling material collects in and around the hedge, and the obstruction begins to cause a slowing down of currents and to encourage the deposit of all kinds of detritus. Dealing with the practical question of the areas which may come under the influence of groynes, the author took for example an average shore, on which the horizontal distance between high and low water marks was 600 ft., and the distance from low-water mark to the five-fathom line was one mile. Here it was easy to realise what a large area of the invisible shore was being influenced by currents and waves, compared with the visible area exposed to the sea's action with every tide. Taking 100 ft. of frontage, he said, we saw 60,000 sq. ft. of exposed shore acted on by visible agencies, but when it came to the same width of the invisible sea bottom, constantly exposed to the unseen movements beneath the surface, we had an area of 528,000 sq. ft. over which we knew changes were taking place and material travelling possibly in vast quantities. Reference was here made to the condition of the Dunbar foreshore, and to the troublesome situation at Bray, a description of the groynes at the latter place being given. The reality of deep-sea erosion as the main factor to be reckoned with on the East Coast and elsewhere was enlarged upon by the author, who held that almost any form of low groyne securely held in position between, say, mean sea level and

a point in the deeper water in the offing—to be decided upon by the particular circumstances of the case—would arrest and bring about the retention of large masses of travelling material and the covering up of exposed surfaces. Quotations were given from various recent articles and letters referring to the origin and utility of low groynes, and the conclusion of the paper was devoted to a description of various sections of the East Coast sea bed, taken over certain lines from charts dating back to 1824, and in one case even to 1806, the comparison of the older sections with those of the present day fully bearing out the author's contention as to the deep-sea erosion, and consequent advance of deep water landwards.

COMPETITION.

HACKNEY CENTRAL LIBRARY.—The awards of the assessor (Mr. J. W. Simpson, F.R.I.B.A.) in the Hackney Central Library competition was made known on Monday; 152 designs were submitted. First place was given to No. 26 "for its excellent and economical planning and generally satisfactory design." The assessor continued:—"I have checked the author's calculations of cost, and am of opinion that the design can be executed for the sum stipulated in the conditions. The second place I award to No. 23 for a very good plan and picturesque elevation. I place third No. 140, who submits a design which is in many ways admirable. The following designs may be mentioned as meritorious:—Nos. 6, 22, 32, 45, 49, 53, 55, 58, 67, 71, 86, 100, 128, 134." The Libraries Committee, in its report upon the competition, says:—"The assessor regards the competition on the whole as a successful one, many of the designs being of considerable excellence. Every drawing submitted was examined by the assessor personally, and every report read. Full consideration was given to all, however inadequately presented, and their merits carefully marked as far as possible. The designs are to be exhibited in the swimming baths for members of the Borough Council only this week. From the 12th to the 17th inst. they will be on view for competitors and the public generally. The sealed envelopes containing the names of the competitors are not to be opened until the Council has definitely decided the appointment."

Books.

Lockwood's Builders', Architects', Contractors', and Engineers' Price Book for 1906. Edited by FRANCIS T. W. MILLER. (London: Crosby Lockwood & Son. 1906.)
Laxton's Builders' Price Book for 1906. Originally compiled by WILLIAM LAXTON. Eighty-ninth Edition. (London: Kelly's Directories, Ltd. 1906.)

THESE two works, which can now be considered the standard books of reference on the subject of builders' prices, keep abreast of each other in completeness and the excellence of their contents, and form a good example of the beneficial effects of healthy competition. The position that both have taken in the building world for some years past is due largely to the greater attention to the rise and fall of the markets given in the later issues than was the case some years ago, when the editors of both seemed satisfied to republish the same prices and information (often misleading) year after year, until the suggestion of referring to a price book provoked a smile. Happily, these days have passed, and, so far as it is possible for any price book to be of value in practice, these works meet the demand.

The position of the building trade for the past twelve months has remained practically stationary, and, as everyone interested trusts, at its lowest point, consequently the work of revision has been light. Strangely, "Lockwood," which in the preface notes a slight upward tendency, apparently considers it so "slight" as not to warrant a rise in pricing, while "Laxton," which does not mention this "upward tendency," shows a slight increase—a very slight one—but sufficient to show that the editor has not been idle. While everyone wishing to build is anxious for low prices, the fact remains that the state of the building trade is a fair indication of the

prosperity or otherwise of the country; it is therefore to be hoped that before the next editions are published the editors will find plenty to do in a general revision.

Both works give a reprint of the London Building Act, reports of law cases, conditions of contract, and other miscellaneous information; while "Lockwood" is brought up to date with the Amendment Act of 1905.

Valuations and Compensations for the Use of Architects, Surveyors, etc. By Professor BANISTER FLETCHER, F.R.I.B.A., etc. Third Edition. Revised and Rewritten by BANISTER F. FLETCHER and H. PHILLIPS FLETCHER. (London: B. T. Batsford, 1905.)

The revision and rewriting of this work is obvious to anyone who has studied the earlier editions, while the call for a third edition is a commentary upon the varied practice of an architect—or ought it more properly be that of a surveyor, the practice of architecture as an art being far removed from such prosaic subjects as valuations and compensations? In addition to two of the editors being F.S.I.'s (and one of them a barrister-at-law in addition), the preface refers to three more who have had a hand in the work, which for its size is one of the most complete reference books on these subjects.

The authors have strengthened their advice and information by giving references to former decisions in numerous cases. Especially useful is Chapter III., dealing generally with points to remember in making out a claim, as also is Chapter VII., on procedure—that bugbear to so many professional men, however well qualified they may be to deal with the question of valuing. This chapter deals with almost every prospective difficulty, and, moreover, treats of the question of "latent value" and that much-vexed question of "betterment." In the appendix are given many useful tables, and we have no hesitation in commending the work to anyone who may be called upon to formulate a claim for compensation, or who may have to value property for any other purpose.

The Cathedrals of England and Wales. Second Series. By T. FRANCIS BUMPUS. (London: T. Werner Laurie, 1906.)

THERE have been in recent years so many books and details published of our cathedrals that it may be questioned whether a further book on the subject was needed. The subject will, however, always be a fascinating one for both writer and reader, and the author has brought together from actual observation and former writers a number of facts and details relating to the cathedrals which are included in this, the second volume of the series. Eight cathedrals are described—Canterbury, York, St. Paul's, Winchester, Norwich, Peterborough, Exeter, and Wells. The illustrations are reproduced entirely from photographs, many of them excellent. A view of the interior of the choir of St. Paul's before the mosaics were inserted is interesting as a record, and there is a good view of the interior of the nave at Norwich. The distant view of the Wells from the south-east is one of the most effective points from which this building can be seen, but within a volume of this size it is not possible to attempt anything like an adequate account or illustration of so large a subject. A considerable list of authorities quoted is given at the end of the book, which is capably printed throughout, and will doubtless be a popular publication.

The Year's Art: 1906. Compiled by A. C. R. CARTER. (London: Hutchinson & Co., 1906.)

This useful publication fully keeps up its standard of information as to the artistic events of the past year, and is supplemented by a short critical article by the Editor which contains more of judicious criticism, especially in regard to the recent idolatry of Whistler and Manet, than we generally find in current writing about art. The illustrations to this year's issue consist of a good reproduction of the "Venus" of Velasquez; portraits of Mr. Thomas Brock, Sir Aston Webb, and the late Robert Brough; and a sketch of a little girl under the title "Tired," which was exhibited by the Royal Drawing Society last year, and was a drawing from

life by Beatrice Hirschfield, a child of eight years old. As such it is most remarkable, and was well worth introducing, as an encouraging example of what can be done by young children drawing with the object before their eyes.

For those who do not know "The Year's Art" it may be mentioned that its permanent contents include lists of the chief pictures in our permanent art galleries; information as to art institutions in London; records of the main artistic events in Great Britain and the colonies; lists of the art sales of the year and the engravings published; a directory of artists and art workers; a list of private art schools; and other useful information and records.

The Champagne Standard. By Mrs. JOHN LANE. London: John Lane, 1906.

THE meaning of the title of Mrs. Lane's pleasant and attractive book is that it is a protest, in the first instance, against the evil of show and extravagance in daily life—keeping dinner-parties (and everything else) up to "the Champagne standard," whether one can reasonably afford it or not. This is the subject of the first chapter, and gives its title to the book, which in a general way would hardly come within our province; but Mrs. Lane, who we gather is an American by birth, has some trenchant and amusing criticisms to make on house architecture and arrangements in England, which she finds very inadequate and primitive in some points, compared with American houses.

There is, in the average house, no dinner-lift; there are no speaking-tubes to save servants running up and down stairs; the plumbing is "clumsy and inadequate"—"in America it would be pretty and nickel-plated, resisting the action of the air, and easily kept clean." There is a want of contrivance of cupboards and other recesses, for which she blames the English architect, and suggests, in a chapter on "Women as Architects," that women would plan houses much more conveniently than men. There is some truth in all this, though we should be inclined to think that the author has been a little unfortunate in her architect; she might certainly have found some who would not have overlooked the things she mentions. In illustration of "the remarkable progress in America in all the applied and domestic arts within the last ten years," it is mentioned that when they desired to put away the funeral chimney pieces from a Victorian house, they could get no wooden mantel-pieces but what were expensive and clumsy, and had to go to New York to get those which were artistic and cheap. Of the average wooden chimney piece sold in England this would be true enough; but it is possible nevertheless to get the right thing in England, if you know where to go for it. However, Mrs. Lane's criticisms are both piquant and good-natured, and are worth attention.

MODERN MILLING MACHINES. By Joseph G. Horner, A.M.I.Mech.E. (Crosby Lockwood & Son.)

A MANUAL OF COSTUME AS ILLUSTRATED BY MONUMENTAL BRASSES. By Herbert Druitt. (The de la More Press, 10s. 6d.)

PAPERS OF THE BRITISH SCHOOL AT ROME. Vol. III. (Macmillan & Co., 50s.)

BUILDING CONSTRUCTION. By Professor Henry Adams, M.Inst.C.E. (Cassell & Co.)

TRADE CATALOGUES.

We have received from the Leeds Fireclay Company a large and well-bound catalogue of nearly 600 pages, containing more than a thousand illustrations (chiefly half-tone) of the most important manufactures of the associated firms, together with prices and other particulars. The catalogue is divided into twelve separately pagged sections, namely—I, Glazed bricks, tiles, partitions, etc.; II, Burmantofts terra-cotta and faience, including illustrations of some important works carried out from the designs of well-known architects; III, "Imperial" porcelain baths with the necessary fittings; IV, Cliff's "Imperial" porcelain lavatory

basins and Oates & Green's lavatory basins and drinking fountains; V, sinks for domestic use, sloop-sinks, etc.; VI, wash-tubs; VII, urinals; VIII, water-closets, both single and multiple, wash down and siphonic; IX, Oates & Green's waste-water-closets; X, hospital and laboratory fittings, including surgeons' lavatories, bracket closets, sloop-sinks, post-mortem tables, laboratory sinks, etc.; XI, stable and farm fittings with glazed-ware mangers, hay-racks, cattle troughs, etc.; and XII, drainage specialties, including pipes, traps, gullies, channels, inspection-eyes etc. The catalogue is a very comprehensive one, and in nearly all cases the sections on sanitary fittings are divided into two parts, one giving illustrations and prices of the unfitted goods and the other of the same goods fitted complete. Separate illustrations and prices are given of the various accessories. Architects and builders will certainly find the catalogue extremely useful.

Messrs. A. & P. Stevens send us their catalogue of electric, hydraulic, and other lifts in the form of a tastefully-produced quarto volume, consisting for the greater part of full-page illustrations and brief descriptive notes. As modern lifts have usually to be specially adapted to prevailing conditions, comparatively little value attaches to a price-list of such apparatus, and in the case of this firm the object of a catalogue is evidently to place before interested readers a general idea of the machinery and fittings supplied, with the view of eliciting correspondence leading up to the preparation of exact specifications and estimates suited to stated requirements. Four distinct types of electric lifts are illustrated, namely—Passenger-lifts of the under-driven drum type with car switch control, the overhead geared drum type with rope control, and push-button controlled lifts, and goods lifts with friction-drive and rope-control. Hydraulic lifts are still more fully illustrated, the examples selected covering practically every type of passenger and goods lift in ordinary use, while belt-driven and hand-power lifts are briefly described. The remaining pages of the book are devoted mainly to the illustration of steam and belt-driven pumps, hydraulic pumps, accumulators, intensifiers, control valves, wrought-iron lift cars and enclosures; and they also include a drawing of a useful hydraulic crane with hydraulic lifting and slewing gear.

Messrs. Wilmer & Sons have sent us a copy of their general catalogue, containing illustrations and prices of fire-grates (including Bond's patent stove without front bars), fire-chimneys, mantles, baths, water-closets, lavatories, manhole covers, stable fittings, rain-water pipes, soil-pipes, builders' hardware, etc. It is somewhat surprising that a catalogue of eighty-eight pages, containing illustrations of such a varied assortment of goods, has been sent out without either index table of contents. From the same firm we have also received a priced catalogue of slate and marble slabs, slate cisterns, drain-pipes and channels, paving bricks, copings, roof and floor tiles, finials, etc. The table of contents is useful.

The Simplex Couduit Co. send us illustrations and description of their electric shade tilter a contrivance for tilting the lamp and shade of a hanging electric light in the direction in which the light is specially required. The action, so far as we can judge from the drawings, is very simple and is contrived so that the shade will maintain its position at any angle at which it has been placed. A flexible wire with extra length for adjustment to different positions is required.

Correspondence.

THE SURVEYORS' INSTITUTION.

SIR,—I am much obliged to you for inscribing my remarks on the discussion following my father's paper last week, but should like to point out that these do not represent my official reply, which will be printed later in the "Professional Notes" of the Institution. H. J. LEANING.

PORCHES AND APPROACHES.

SIR,—The illustration of the very interesting city gateway given on page 237 is wrongly described. It should be "the Amsterdam Gate,

Haarlem." I saw it only in 1884 and, if I remember right, it is the last one of the Haarlem gateways that has not been destroyed.

JOHN NEWNHAM, A.R.L.B.A.

* * * We had an impression at the time that it did not look like anything at Amsterdam, but in our friend Mr. Bagallay's paper it was clearly stated "The Haarlem Gate at Amsterdam" (see page 228), and we therefore assumed that he was correct. It was evidently a slip of the pen.—Ed.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—IX.

APPROXIMATIONS.

WHEN dealing with contracted methods of multiplication and division we called attention, on p. 147, to the relatively small value of the figures in the tens, and hundreds places in large numbers. Of course, in many cases the actual value of the right-hand figures of a number may be of much importance. This is more particularly so in commercial than in technical calculations of practical character, and the consideration to be paid to the figures representing units, tens, and hundreds must depend largely upon the magnitude and value of the units represented by any number in question. For example, it might not be wise to accept approximations if sovereigns or 5s. notes were treated as units, although approximate methods might be permissible in the case if the units were farthings or pence.

Nevertheless, for the purposes of an estimate for works to be executed involving hundreds or thousands of pounds, a few pounds are obviously of little importance, because so many unforeseen contingencies are invariably involved as to preclude any reliable prophecy as to the actual cost of the works.

An architect or an engineer who has to give his client an idea of the amount likely to be required for the execution of a given project never dreams of measuring the cost to a nicety.

Similarly, if contracting firms really calculate every item in minute detail, they usually add a purely empirical margin for contingencies. Tenders submitted are very often brought out to shillings and pence, not as the result of calculation, but for the purpose of effect. Sometimes a little is deducted from and sometimes a little is added to the calculated amount.

If the estimated total were 3,005*l.*, for example, the contractor would very probably make his tender, say, 2,999*l.* 15*s.* 6*d.*, so as to bring the amount below 3,000*l.*, and in the hope of being a few pounds below other competitors. Or if the total came out at, say, 2,975*l.*, a few pounds might be added for luck and a few shillings and pence for decorative purposes, thus giving such a sum as, say, 2,985*l.* 16*s.* 9*d.*

The fact that harmless little devices of the kind exist is sufficient to show that approximations within judicious limits are quite suitable for contractors, as well as for architects, in some monetary calculations.

When we come to statistical computations, the value of approximate methods is even more evident.

For instance, in dealing with population and water supply it would be perfectly futile to take into account units, tens, or hundreds of persons in a large town, or thousands of persons in a large country, or to deal with tens or hundreds of gallons of water. The reason, of course, is that the available statistics of population are never correct except for the particular date on which they were compiled, and that the available supplies of water cannot be precisely guaranteed under all circumstances.

In practical work, measurements forming the bases of computations are rarely correct to more than three decimal places, and even when quantities have been measured with the greatest possible accuracy they are seldom correct to more than six decimal places. In other words this means that an ordinary measurement is sufficiently accurate if its magnitude is determined to within one-thousandth part, and that in scientific work it is generally sufficient to denote quantities within one-millionth part. Of

course, it will be understood that we do not here refer to the very delicate measurements that are now employed in some modern developments of physical science.

Recognising the fact that absolute accuracy in practical work is impossible and unnecessary, a good deal of time may be saved if judicious employment be made of approximate methods of calculation.

The permissible degree of approximation, as already stated, is a matter for discrimination, and may be roughly measured by the number of significant figures known to be accurate in any given quantity.

Examination of published records shows that the coefficient of elasticity of mild steel may be, say, 29,165,000 lb. per square inch under bending tests, 30,866,000 lb. per square inch under tension tests, and 37,050,000 lb. per square inch under compression tests. Yet no useful purpose could be served by taking into account the last six figures in any of these results in calculations relative to the probable resistance of a steel column or beam. In fact, only the first figure is of any practical value, and, as a general rule, the value of the coefficient of elasticity may be put at 30,000,000 lb. per square inch without the least risk.

Similarly if guidance be desired as to the effects of expansion and contraction upon steel or concrete structures, minute accuracy is of no real use. The coefficient of expansion is variously stated at values between 0.000056 and 0.0000665 for steel, and between 0.0000634 and 0.0000656 for concrete. In either case the value denoted by the last significant figure is very small, and for ordinary calculations an approximate coefficient will serve all practical purposes.

For the same reason approximations are generally accepted for various data employed in calculations relating to the strength of structures, and the practice is further justified by the fact that most determinations of the kind include purely hypothetical data, some of which are known to be more or less inaccurate.

When mathematical processes are conducted by students for the sake of acquiring facility in their use it may be advantageous to work out results with great nicety. But in practical work no benefit is derived from carrying results to several places of decimals, especially if, as often happens, the essential data are only correct to within 20 or 30 per cent.

In dealing with money it is very convenient to express shillings and pence in decimal fractions of a pound.

The following is a simple rule facilitating the conversion of all sums under 1*l.* into decimal parts of a pound:—

Rule.—After the decimal point write down the number of florins contained in the sum to be converted; next write down 0.025 for every sixpence in the remainder, and add 0.001 for every farthing in the final remainder. If the number of farthings is more than twelve add 0.001 more.

Example (1): Convert 17*s.* 8*d.* into a decimal part of a pound.

Here there are 8 florins = 8 × 2 = 16*s.*, 3 sixpences = 3 × 6 = 18*d.*, and 8 farthings = 2*d.*

So the decimal fraction is

0.000 = 16*s.* 0*d.*
0.075 = 18*d.* 0*d.*
0.008 = 0*s.* 2*d.*

Example (2): Convert 12*s.* 9*d.* into a decimal part of a pound.

Proceeding as before, we have

0.6 = 12*s.* 0*d.*
0.025 = 0*s.* 6*d.*
0.001 = 0*s.* 3*d.*

The foregoing rule gives results that are correct to the nearest farthing, which is quite accurate enough for practical purposes. If exact results were required it would be necessary to take into account the difference of value between a farthing, 0.0010415 + or 0.001 of a pound, and 0.001, or 1/1000 of a pound.

In practice a penny is the lowest amount that need be considered. Consequently the conversion of shillings and pence into decimals of a pound can be simplified by taking the next penny above or below the stated amount, and accepting 0.004 as the approximate value of each penny.

Then in example (1) we should have

17*s.* 8*d.* = 0.875
0.008

£0.885

and in example (2) either

12*s.* 9*d.* = 0.625 or 0.625
0.012 0.016
0.637 0.641

It should be remembered, however, that if a sum of money be multiplied by a large number the result may not be correct as to pence if fractions of a pound are only expressed to three decimal places.

The multiplication and division of other quantities can be simplified by the adoption of decimal fractions, instead of conventional subdivisions of various units of weight and measurement, in spite of the difficulties presented by the heterogeneous character of British weights and measures.

Among the most convenient decimal equivalents are those given in Table III. Table III.—Decimal Equivalents of Some Weights and Measures.

Avoirdupois Weight.	
1 lb.	= 0.000447 ton (roughly 0.00045).
28 lb.	= 0.0125 " "
56 lb.	= 0.025 " "
112 lb.	= 0.05 " "
Lineal Measure.	
1 inch	= 0.0833 foot.
1 foot	= 0.0001894 mile (roughly 0.00019).
1 yard	= 0.000568 mile (roughly 0.00057).
1 pole	= 0.025 furlong.
1 furlong	= 0.125 mile.
Surveyor's Lineal Measure.	
1 link	= 0.066 foot.
1 link	= 0.001 chain.
1 link	= 0.000125 mile.
1 chain	= 0.0125 mile.
Square Measure.	
1 sq. foot	= 0.111 sq. yard.
1 sq. foot	= 0.000023 acre.
1 sq. yard	= 0.0002962 acre (roughly 0.0003).
1 sq. yard	= 0.00000283 sq. mile (roughly 0.000003).
1 perch	= 0.00625 acre.
1 rod	= 0.25 acre.
10 sq. chains	= 10 acre.
1 acre	= 0.0015625 sq. mile.
Cubic Measure.	
1 cubic ft.	= 0.03704 cubic yd. (roughly 0.037).
Miscellaneous.	
1 gallon	= 0.16046 cu. ft. (roughly 0.16)—
1 lb. of water	= 0.1 gallon.
1 super foot of planking	= 0.01 square.
1 cubic foot of timber	= 0.02 load
1 sack of Portland cement	= 0.1 ton.
1 cask of Portland cement	= 0.16 ton.

Complete lists of decimal equivalents for all weights and measures are of great use to those frequently engaged in calculations, and so also are tables giving decimal equivalents for various fractions of yards, feet, and inches, of tons, hundredweights, quarters, and pounds, and of links reduced to decimals of a foot.

The following examples sufficiently indicate the application of approximation to the ordinary requirements of architects and contractors.

Example (1): Find the cost of 12 tons 3 cwt. 2 qr. 20 lb. of steel bars at 7*l.* 10*s.* 8*d.* per ton.

By the use of Table III, the weight is readily reduced to 12.184 tons, and by the rule for metric conversion of shillings and pence the rate per ton is reduced to 7.527.

Then 12.184 × 7.527 by the contracted method of multiplication (see Article V.) gives

12.184
257
85288
6092
244

91624 = 91.624

Inspection at once shows that this is equivalent to 91*l.* 12*s.* 6*d.*, an amount quite near enough for all practical purposes.

If worked by practice the process would be far more complicated and tedious, as follows:—

4 s. d.
7 10 5 = value of 1 ton.
12

90 5 0 = value of 12 tons.
2 cwt. = 1/10 of 1 ton ... 15 0 5 = value of 2 cwt.
1 qr. = 1/4 of 1 cwt. ... 7 8 2 = value of 1 qr.
2 qr. = 1/2 of 1 cwt. ... 3 9 1 = value of 2 qr.
14 lb. = 1/4 of 2 qr. ... 11 2 = value of 14 lb.
6 lb. = 1/4 of 14 lb. ... 4 8 = value of 6 lb.

£91 12 7 8

The extra trouble here involved is certainly not repaid by the discovery that the value of the material is 1*s.* 6*d.* more than that calculated by the approximate method.

Example (2): Find the value of 2 roods 6 perch. 54 sq. yds. 42 sq. ft. of land at 67*l.* per acre.

By the use of Table III, the area is readily reduced to 0.5387576 acre. Then by the contracted method of multiplication we have

53876
676

362344
37712

360956 = 360.956

This result is at once shown by inspection to be

360l. 15s. 1d. If worked by practice the process would be as follows:—

	c	s.	d.	=	Value of			
670	0	0		=	1 acre.			
2 roads	=	$\frac{1}{4}$ of 1 acre	...	335	0	0	=	2 roads.
5 perches	=	$\frac{1}{16}$ of 2 roads	...	20	18	9	=	5 perches.
1 perch	=	$\frac{1}{16}$ of 5 perches	...	4	3	9	=	1 perch.
21 sq. yds.	=	$\frac{1}{16}$ of 1 perch	...	7	7	3	=	21 sq. yds.
21 sq. yds.	=	$\frac{1}{16}$ of 1 perch	...	7	7	3	=	21 sq. yds.
41 sq. ft.	=	$\frac{1}{16}$ of 21 sq. yds.	...	1	4	4	=	41 sq. ft.

£360 19 1

Example (3). Find the cost of 546 sacks (each containing 2 cwt.) of Portland cement at 2s. 2s. 7d. 6s. 7d. per ton.
By Table III, the weight of the cement is 546 tons, and the rate is 2s. 2s. 7d. Then by the contracted method of multiplication we have

2125
10625
6375
1275
11603=116 03

This result is at once shown by inspection to be 116l. 0s. 0d. If worked by practice the process would be as follows:—

First we should have $546 \times 2 = 1092$ cwt. Then the rate 2s. 2s. 7d. = 2s. 14d. per cwt.

	c	s.	d.	=	cost at 1l. per cwt.
1,092	0	0		=	cost at 2s. per cwt.
2184	0	0		=	cost at 1½d. per cwt.
£116 0 6					

In connexion with all approximate calculations it is important to remember that the number of correct figures in the product of two approximately correct factors is not always so great as the number of correct figures in either of the factors. The degree of accuracy depends upon the relative number of figures in the multiplicand and the multiplier, and upon the value of the figures themselves.

For example, $106 \cdot 3245 \times 2 \cdot 5167 = 267 \cdot 56686915$.

(a) Then by taking three figures in the multiplicand and two figures in the multiplier we get the result correct to two places only; for

$$106 \times 2 \cdot 5 = 265 \cdot 0$$

Similarly, four figures in the multiplicand and three figures in the multiplier only give the result correct to two places; for

$$106 \cdot 3 \times 2 \cdot 51 = 266 \cdot 84$$

(b) By taking four figures in each factor we get the result correct to three places; thus

$$106 \cdot 3 \times 2 \cdot 516 = 267 \cdot 44$$

(c) Again, five figures in the multiplicand and four figures in the multiplier give the result correct to four places; for

$$106 \cdot 32 \times 2 \cdot 516 = 267 \cdot 54$$

If only four places in the product need be correct it is useless to use more figures in the factors than above, as the following results show:—

$$106 \cdot 324 \times 2 \cdot 516 = 267 \cdot 5114$$

$$106 \cdot 3245 \times 2 \cdot 516 = 267 \cdot 5124$$

$$106 \cdot 32 \times 2 \cdot 5167 = 267 \cdot 5754$$

(d) By taking six figures in the multiplicand and five figures in the multiplier we get the results correct to five places; thus

$$106 \cdot 324 \times 2 \cdot 5167 = 267 \cdot 584$$

These workings show that the number of correct places in the product is sometimes the same as and sometimes less than the number of correct places in the multiplier. Hence to obtain results correct to one decimal place it may be necessary to employ five decimal places in the two factors.

THE BUILDERS' EXCHANGE, BIRMINGHAM.

At the Builders' Exchange, Birmingham, on the 1st inst., Mr. J. Miller Carr delivered a lecture on "Architectural Ceramics." Mr. John G. Dunn was in the chair. In the course of his lecture, which was illustrated by a number of cartoons and specimens of artistic pottery for building purposes, Mr. Carr said there were in Birmingham a number of important examples of the use of the ordinary colours of terra-cotta in buildings. He complained, however, that during the last five years, and especially during the last three years, Birmingham had not, in the matter of decorative architecture, acted up to its motto of "Forward." There had been such feverish anxiety in all the more important buildings to make the work cheap that they had omitted to make it nice, and had not attained to that desirable quality expressed by the French word *distingué*. As far as architectural ceramics were concerned Birmingham had only touched the hem of the garment. Dealing with new uses to which terra-cotta might be turned, Mr. Carr said that some years ago he was asked if he could not

apply the methods of manufacture of slab mosaic to the purpose of putting a representation of Warwick Castle on to an old wall about 30 ft. by 15 ft. He at once replied that it could be done with striking effect, and, in order to carry out the idea, he put a tracing over a steel engraving of the castle, subdued all the worrying details, and expressed the subject by just a few broad fields of colour separated by broad outlines. The lecturer gave instances of other directions in which this principle might be applied. By the use of simple means coupled with artistic designs it was possible to express in a permanent and architectural way on the exterior of a building the purpose of any kind of manufacture or business that might be carried on within. Had they not got nearly tired of the vulgar attempt to shout each other down on the part of shopkeepers by each striving to put larger letters across his front than his neighbour could? After all, the shopkeeper only proclaimed his name, but it would be much better if he could make his building itself to declare his craft. The walls of many of the principal hospitals in the country had within the last few years been enriched and rendered almost vocal by illustrations of various nursery rhymes painted on the tiles. The primary object in such cases was to tell the story effectively, but still to do it in such a way that the panel should be manifestly a part of the wall. Concluding, the lecturer did not deny that Birmingham had progressed architecturally. He remembered the Birmingham rickshaws which existed twenty-five years ago when Corporation street now stood, and Birmingham was, indeed, a fine city, but it was only a body—well laid out and compact. If it could attain to the dignity of a soul, what possibilities there were! The city might be the Venice of to-day. There was no need to go to Italy for marble or to Venice for glass. Birmingham has far richer colours at its command, and in wares that would stand the local climatic conditions better than anything brought from abroad.—On the motion of Councillor Tonks, seconded by Mr. J. C. Nicol, a very cordial vote of thanks was passed to Mr. Carr.

NOTTINGHAM MASTER BUILDERS' ASSOCIATION.

SOME sixty members and friends of the Nottingham Master Builders' Association dined at the George Hotel, Nottingham, on the 2nd inst., on the occasion of the annual dinner. The President for the year, Mr. F. H. Fish, occupied the chair at the dinner, and was supported by the Mayor of Nottingham (Councillor Arthur Cleaver), Sir John Turney, Mr. W. D. Pratt, Mr. E. R. Sutton, Mr. A. S. Smith, of Birmingham (hon. secretary of the Midland Centre of the National Federation), and Mr. R. Weston (President of the Derby Association), and others. The loyal toast was honoured, Mr. H. Vickers proposed "The Mayor, Magistrates, and Corporation," and the Mayor briefly replied.

Mr. Jas. Wright submitted "The Architects and Surveyors." The Royal Institute of Architects, the Builders' Institute, and their own federation had, he said, produced a recognised form of contract, which was believed to be a reasonable, businesslike, and equitable document, and it was very desirous that this should be generally adopted. The questions of prime costs and of specialists outside the builders' jurisdiction wanted careful handling. It had become a very general practice for specialists to be appointed by architects to carry out such works as the construction of steel floors, concrete and wood-block floors, and other works; these specialists came on to the work without notice to the builders, and treated the latter as interlopers, when, after all, it was the builders who were responsible for the contracts. They accepted the position of introducing the specialists, but he thought that notice should be given to the builders and that the specialists should be treated as sub-contractors. That was provided for by the form of contract which he had mentioned, and he hoped to see it adopted.

Mr. W. D. Pratt, in reply, said that education was the question of the hour, and he was glad to know that everyone connected with the architectural profession was using every endeavour to make himself conversant with all that was necessary for the profession. He hoped, too, that builders and workmen would take their share of would urge their apprentices, and pupils, and the men under their care, to take advantage of the great opportunities that were now offered by the University College and School of Art in acquiring technical knowledge that they did not acquire in the workshop. They would all benefit if the workmen would take pride in their work, Mr. J. W. J. Barnes and Mr. E. R. Sutton also responded.

Ald. Sir John Turney proposed "Success to the Builders' Federation." For the past thirty years, as chairman of the Works and Ways Committee, he had met not only architects, but builders, and he always fancied that there were no differences between them. He supposed that

the building industry, with the allied trades, was perhaps the second industry in the country. There were over half a million people engaged in the work, they paid more than 74,000,000 a year in wages, and invested in their undertakings was a sum of upwards of 150,000,000. Many people could scarcely realise the magnitude of such an undertaking. They were engaged in building up big cities and towns, and though he admitted that the men who found the money had a good deal to do with it, the builders and architects were, after all, practically responsible for the work, for the appearance of the town, and the character of the work in it. Every consideration, therefore, should be given to the men who undertook such work, and they in their turn should strive to do their duty. He was afraid that some of the builders never knew when the price was low enough. He had had some rather peculiar tenders before him, and he was sure some people seemed to think it was a great honour to work for a Corporation, but the Corporations did not want things at less than cost price. They were prepared to give money for value, but expected value for the money they gave.

A. S. Smith said that employers were beginning to think themselves overpaid for labour in the recent elections protracted? For some years past they had considered that they stood in a favourable position towards trade unionism, because of the common-sense judgment of the late Lord Chancellor in the Taff Vale case. They might have said "Now is our time to go for unionists, but if the Government had not gone further and established in many parts of the country—they hoped to see them established in all parts shortly—Conciliation Boards, with the object of preventing strikes and lock-outs, and settling all disputes. They had, indeed, tried in every way to conciliate rather than irritate the workers. But if the spirit of amity was to be shown, and employers were to be made the target and butt because they were capitalists, he was afraid that those who had money invested in business would be compelled to withdraw it. The Trades Disputes Bill, which sought to place trade unions above the common law of the land, was class legislation of perhaps the worst possible kind, and would bring evil instead of good. Mr. R. Weston also replied. Mr. T. Barlow toasted "The Visitors," for whom Mr. J. Sander and Mr. F. W. Amphlet responded.

THE REGISTRATION AND TRAINING OF PLUMBERS.

A CONFERENCE of representatives of municipal, educational, and labour interests, convened by the Plumbers' Company, was held on Wednesday last week, at the Guildhall to consider the question of the registration and training of plumbers and other skilled workers. Lord Selby presided. The Chairman said that they had met to discuss matters connected primarily with the efficiency of that trade, but also to consider how to improve the efficiency of the workers in other trades. The methods by which it was sought to obtain that result were principally the registration and technical education of the workmen. The Bill for the registration had passed the second reading, but it had never got so far as the third reading stage. With regard to the apprenticeship question, it might be that a period of seven years was too long in view of the superior education that a lad received in these days. Apprenticeship should be coupled with a continuation of education in technical schools during some part of the day or in the evening.

Mr. W. D. Caröe, Master of the Plumbers' Company, said that the Plumbers' Company, in doing what they could for the plumbing trade, had no "axe to grind." They were prepared to lend their influence and to spend their money for the purpose of improving the craft, just as other City Companies devoted their time and money to establish and maintain technical institutions of various kinds. The three things which they had in view were the education, the examination, and the registration of plumbers, and in all they had done they had had the hearty support of the men themselves. The central office, as it were, of the movement was the office of the Plumbers' Company, but they had district councils in all parts of the country affiliated to them, who held examinations of their own, and whose successful candidates were accepted for registration by the Company. The examinations were practical as well as theoretical. It had been borne in upon him, as an architect, that the only real system of training for craftsmen was that of apprenticeship. The work which was done in the past had been done in a very haphazard manner, and was seldom equalled. It was surprising to see, as he often had seen, work done thirty or forty years ago in

restoring old buildings falling into decay, whereas the work of 600 years ago was perfectly sound. It was marvellous to observe the way in which in the XVth and XVth centuries, particularly in Spain, the small technicalities of dealing with masonry were carried out without the slightest effort apparently, and yet always right. Architects nowadays had to give workmen a drawing for all those things. It was important that the working man should be educated to use his brains, and not be merely a machine to carry out drawings. The only sound work which could be accomplished was work to which some definite tradition was attached, and he believed that tradition could be acquired and passed on from one to another only through the responsible training which the apprenticeship system made possible.

Dr. Macnanaara, M.P., proposed a resolution expressing the opinion that the time had come when a more systematic training than had hitherto prevailed among the industrial workers of this country was imperatively required, in order that our skilled trades might maintain and increase their efficiency, and so hold and improve their position in face of the prevailing conditions of modern commercial and industrial competition. Referring to the 200,000 boys in England and Wales who in the fourteen years of age which they left school every year and were obliged to start work at once at a small wage owing to the poverty of their parents, he said that after a few years they were thrown on the labour market without any skilled capacity, and helped to swell the ranks of the unemployed. He advocated the provision of maintenance scholarships for these boys, equal to their actual wages, with a view to their being trained to follow a trade.

Mr. Bostell seconded the resolution, and after considerable discussion, in which Mr. Jowett, M.P., Mr. Priestley, M.P., Mr. Hooper, M.P., Dr. Crawford, and others took part, the resolution was carried.

The committee was appointed to consider the conclusions arrived at by the conference and to report to an adjourned meeting.

COURT OF COMMON COUNCIL.

THE Lord Mayor presided at a meeting of the Corporation held at the Guildhall on Thursday last week.

Bishopgate-street Improvement.—In reply to a question, Deputy Sir George Woodman said that an effort was being made to persuade the London County Council to reconsider their decision in connexion with the proposed widening of this street, and to induce them to contribute to the cost, on condition that the improvement was carried out.

Sir Christopher Wren's House.—Mr. Deputy Sayer moved that the consideration of the desirability of purchasing the stone steps belonging to the school-house which project into Love-lane, Eastcheap, and also the projecting front of No. 14, Love-lane, for the purpose of widening this thoroughfare, should be referred to the Improvement Finance Committee, which was agreed to.

The Lord Mayor laid before the court a letter which he had received from the President of the Local Government Board enclosing a letter from Mrs. S. Arthur Strong on this subject. The building, the letter stated, was an excellent example of XVth century architecture, containing some finely-carved chimney-pieces and handsome panelings and ceilings. These decorations had been removed preparatory to the house being demolished. Mrs. Strong appealed to the President of the Local Government Board to use his endeavours to secure the house to the nation as a public museum or for some similar purpose. In the discussion that followed, Mr. Rome expressed the hope that immediate steps would be taken to preserve the building, while Mr. Lile advised caution, reminding the court of the "historic" building in Fleet-street recently restored by the London County Council. The communication was referred to the Library Committee.

Paving Works.—The following recommendations of the Streets Committee for paving works required during the year were agreed to—

"That the carriageway of Aldermanbury-avenue be laid with asphalt at an estimated cost of 1907.

"That the footways of the undermentioned streets be laid with asphalt at an estimated cost of 9000, viz.—
Finsbury-pavement west side (Short-street to Popemaker-street).

Shilt-street (half east side).

Farrington-street (both sides from Ludgate-circus, half way to Plumtree-court).

Ludgate-circus, north-east and south-east pavements.

That the footways of the undermentioned streets be relaid partly with new and partly with the existing York stone at an estimated cost of 1,0300, viz.—
West side, Smithfield, west side (Giltspur-street to Long-lane).

London wall (Moorgate-street to Blomfield-street), relaid with existing York stone, the deficiency being made good with the best of the old York from the streets where asphalt is to be substituted, at an estimated cost of 1,0300.

Farrington-street (both sides from the end of the asphalt to Plumtree-court).

Biliter-street (half east side).

That the carriageways of the undermentioned streets be relaid with asphalt at an estimated cost of 10,6000, viz.—

London-wall.

Chapsald.

Finsbury-pavement.

Moorgate-street (London-wall to Telegraph-street).

That the carriageways of the undermentioned streets be repaved with cressed wood blocks at an estimated cost of 1,3900, viz.—

Old Bailey.

Plumtree-court.

For altering the line of footway pavement in London-wall, between Moorgate-street and Blomfield-street; and that the necessary works be carried out at an estimated cost (exclusive of the repaving) of 7500, for diverting pipes, etc.

That the contract with the Val de Travers Asphalt Company, for maintaining the carriageway pavement of Mansell-street, be extended for a further period of one year at 1s. 6d. per yard super per annum, being the same price as the existing contract.

Underground Conveniences.—The same committee were authorised to expend 1,6000, on the provision of additional lavatory basins and for accommodation for women at the conveniences in Aldgate High-street and Bishopgate-street Without.

Milan Exhibition.—The Library Committee were empowered to make arrangements for an exhibit from the Corporation to the International Exhibition at Milan, with instructions to confer with those committees controlling suitable objects for exhibition.

Ventilation.—The General Purposes were authorised to spend 2000, in improving the ventilation of the Egyptian Hall at the Mansion House.

OBITUARY.

MR. J. PRICE.—Mr. John Price, City Surveyor of Birmingham, died on the 6th inst. at Burnham, Somersetshire, where he had gone for a short rest. Mr. Price, who was in his fifty-first year, was educated at Sandbach School, Manchester Grammar School, and the Victoria University. In 1871 he entered the office of Mr. Hartley Watson, a civil engineer, of Manchester, and was engaged in a number of important engineering works. In 1884 he became engineer and surveyor to the Toxteth Park Local Board, but upon that district becoming absorbed in the city of Liverpool he was appointed assistant city engineer. In 1896 he went to Birmingham as City Surveyor and deputy engineer to the Tame and Rea Drainage Board. Since his appointment Mr. Price had carried out a number of important works in the city. He was a member of the Council and of the Board of Examiners of the Incorporated Association of Municipal Engineers, a member of the Institution of Civil Engineers, and a Fellow of the Surveyors' Institution. He had served as President of the Birmingham Association of Engineer Students, and he was a vice-president of the Municipal Officers' Association. Mr. Price leaves a widow, one son, and two daughters. Sympathetic reference to the death of Mr. Price was made at the meeting of the Birmingham City Council. The Lord Mayor said that every member would be sorry to hear of the death of the City Surveyor after a short acute illness, and he would move "That the Council express its deep regret at the sudden death of Mr. John Price, the City Surveyor; it records its appreciation of the ability and energy displayed by him in the duties of his office; and it respectfully tenders to Mrs. Price and her family its sincere and heartfelt sympathy in their great bereavement." Mr. Price, he reminded the Council, was appointed City Surveyor in 1896, and all who were brought in contact with him must have been struck by his unbounded energy and devotion to the interests of the Corporation. Alderman Cook seconded the resolution, which was carried in silence, the members standing.

GENERAL BUILDING NEWS.

BAPTIST CHURCH, HULL.—The new Baptist church on the Beverley-road was opened on the 22nd ult. The church occupies a site at the corner of Trafalgar-street, and the buildings are "in a late period of Gothic freely treated." A gable, flanked on one side by a turret and on the other by a tower, terminating in a cupola and spirelet, gives prominence to the block. A lych gate forms a feature in the front. Internally the church is divided up into nave and aisles by a tracied timber arcade. The seating, which is of fumed oak, and has curved seats and backs, and tracied and carved pew ends, is semi-circular on plan. The pulpit and platform furniture are of fumed oak, and tracied and carved, the whole having been designed by the architects, Messrs. George Baines & Son, London. Pastor's and deacons' vestries are provided, together with two choir and baptising vestries, the latter having an approach direct from the baptistry (which is placed under the pulpit). Cloak rooms are provided near the main entrance. There is a church parlour, 36 ft. by 20 ft., having ladies' cloak-room in connexion; also a retiring-room of suitable size is given. The contract amount of the building scheme is 5,5000, but the total cost, inclusive of the organ, will be about 9,0000.

NEW CHURCH, HANDSWORTH.—The foundation-stone of the new church in Grove-lane in connexion with St. James's Church, Handsworth, was recently laid. The church will consist of a nave with north and south aisles, widening into double transepts on either side towards the east end. There will be a chancel arch between the nave and chancel, with another similar arch dividing the chancel from the sanctuary. The east end will be apsidal. The walls will be chiefly composed of Black Country brown bricks and the roof will be covered with rough Bangor slates. Inside the brickwork will be relieved with stone and a certain amount of buff brick. The seating accommodation is to be for 700 persons. The estimated cost of the new structure is between 4,0000, and 5,0000. The architects are Messrs. Chatwin & Son, of Birmingham.

CHURCH RESTORATION, LANTEGLOS-BY-FOWEY.—The restoration of the church at Lanteglos-by-Fowey has just been completed. The work involved considerable care, for the north arcade was leaning towards the aisle about 12 in., and it was held in that position by several iron tie-rods; the north wall also being affected by the outward thrust of the roof. All the XIVth and XVth century roofs were found in their original position. They have been repaired *in situ*, and the arcade has been partially straightened. The whole of the floor had to be dealt with. Oak block flooring has been laid on the spaces occupied by the mediæval benches. The chancels have been paved with Devonshire and Sicilian marbles, and the old altar of the south chapel has been restored. The original west entrance under the tower, which had for many years been blocked, is now opened out. It is proposed to reland the bells, and the tower has been strengthened for the purpose. The pinnacles, which were found in the churchyard, have been restored to their original position. The cost of work already executed is over 2,1000. The architect is Mr. Edmund Sedding, of Plymouth.

WESLEYAN METHODIST CHURCH, CHORLEY.—The New Wesleyan Methodist Church, Gave-lane, Chorley, was opened recently. The auxiliary rooms comprise minister's vestry and classroom accommodation. Externally the building is faced with red plastic bricks and stone dressings, with ornamental relief carving over the large window above the front entrance. The heating is by hot water at low pressure. The church will seat 320 adults, or a mixed congregation of 400 persons. Mr. W. Huggill Dinsley, Chorley, is the architect, and Mr. Leonard Fairclough, Adlington, the contractor.

RESTORATION OF FOHBING CHURCH, ESSEX.—Works of restoration have been carried out at the old church of St. Michael, Fobbing, under the direction of Mr. Hodgson Fowler. The restoration has consisted of practically a new roof and extensive repairs to the tower; while in the interior the centre pillars have been removed and new ones erected. The Norman portion of the church was found to be of chalk, so soft that it crumbled to the touch, and there were no foundations to the outer wall. A carved and coloured stone image of the Virgin and Child, of XIVth century date, was found during the operations.

RESTORATION OF GLOUCESTER CATHEDRAL.—The Lord-Lieutenant of Gloucestershire is starting, as a matter of urgency, a movement for carrying out immediate works of repair to the Cathedral of Gloucester Cathedral. The resident architect (Mr. F. W. Waller) has made to the Dean and Chapter, as described by Lord Ducie, "a disquieting report." The tower is urgently in need of most careful reparative work. Not only are the more ornamental features rapidly disappearing, but the fabric of the tower is being seriously damaged, owing to the perishing of the projecting mouldings of the stonework in many places. Wet has penetrated through the large joints, and is gradually loosening the stonework, and even showing on the inside of the building. A recent fall of some of the stonework connected with the groining of the choir roof close by the tower has been of a very alarming nature. In addition the lead roofs of the nave and south aisle are in urgent need of reparation and renewal. They are all much worn, and the damp is penetrating and seriously injuring the timbers of the roofs. These roofs must be largely renewed. Three of the pinnacles, two on the west front and the other on the south transept, were in danger of falling. One has been repaired, and the other two must be taken in hand without delay. Other less important works are also urgently needed. If these various matters are seriously taken in hand at once the architect is of opinion that grave and threatening damage of the great fabric will be averted in time. His general estimate of the cost of these essential works amounts to 8,1500.

CHURCH RESTORATION, YARMOUTH.—As a parochial memorial to the late Earl of Chichester, the north transept of St. Nicholas Church, which for some years has stood in need of repair, has been restored under the direction of Messrs. Olley & Hayward, ecclesiastical architects. The walls have been recentred, the roof painted white, with vermilion stars, an Early English window on the western side, and the double niche on the

eastern wall restored, and the floor space rearranged. In addition to the restoration, a new scheme of lighting has been adopted in the restored transept.

GORDON BROOK-STREET COUNTY COUNCIL SCHOOL, BROCKLEY.—This school, which has recently been publicly opened, has been designed by Mr. Thomas J. Bailey, the Council's architect (Education), and consists of three principal blocks, each of one story, and planned for elementary teaching in three complete departments with power of future extension, a large central hall being included in each case. The internal finish of the buildings is in plaster with salt-glazed dados and flat ceilings to the classrooms with open timbered roof, top lighted, to each of the three halls. Externally the buildings are finished with picked stock facings enriched by red brick dressings, the angles quoined, the eaves and gabled ends having a moulded and enriched red brick cornice, and the roofs being covered with Broseley tiles. Spacious playgrounds are also provided. The accommodation is as follows:—Boys, 328; girls, 328; and infants, 340; each department being accommodated in seven classrooms and provided with ample cloak, lavatory, and toilet accommodation, together with rooms for the head and assistant teachers respectively. A cookery and laundry centre has been provided in a separate building at the north-east corner of the site. Also a schoolkeeper's house facing Gordonbrook-street. The amount of the contract was 22,836s., and the contractor is Mr. William Downs, of Hampton-street, Walworth.

COUNCIL SCHOOLS, CALTON-ROAD, GLOUCESTER.

—These buildings consist of three blocks and comprise mixed school, infants' school, and cookery and laundry centre, with separate playgrounds for boys, girls, and infants, each department having its own shelter sheds and lavatory. The mixed school provides accommodation for 500 pupils in 10 classrooms arranged round a central hall, 61 ft. by 32 ft., with separate entrances, cloak-rooms, and lavatories for boys and girls, and rooms for head and assistant teachers and school store on each side. The infants' school gives places for 310 children in 6 classrooms, also grouped round a central hall, 56 ft. by 25 ft., with cloak-room and lavatories and head and assistant teachers' rooms, stores, etc. The cookery and laundry is provided with distinct accommodation for each department, both containing general school-room, cloak-room, and lavatory. The schools are built of bricks from Mr. Whitfield's yards on Robinswood Hill, with Bath stone dressings, and the roofs are covered with Staffordshire tiles. The buildings are warmed throughout by hot water from a central apparatus room placed under the cookery school, and the system of pipes and radiators has been installed by Messrs. Beaven & Sons (Gloucester and London), under the direction of Mr. E. J. Cullis (Gloucester). The schools are lighted throughout by electricity put in by Messrs. Woodward & Co. (Gloucester). The whole of the classrooms are fitted with oak dual desks, supplied by Mr. James D. Bennett (Glasgow), and the other furniture throughout the buildings is provided from the architect's designs by the Educational Supply Association of London, and is executed in orham wood. The fixed blackboards are from the Bennet School Furnishing Company (Glasgow). The window blinds have been fitted by The C. P. Price (Gloucester). The whole of the builders' work has been carried out by Messrs. J. Byard & Sons (Gloucester), and Mr. W. H. Bush has acted as clerk of works. The whole of the work has been carried out from the designs and under the immediate superintendence of Mr. Walter B. Wood, architect, of Gloucester. The entire cost of the building, with furniture and fittings, and all attendant expenses, will probably amount to about 14,000l.

SCHOOL, BARNSELY.—The newly-erected mixed elementary school, in Doncaster-road, Barnsley, has just been opened. The accommodation is for 420 mixed and 360 infants. The building, erected from designs by Mr. E. W. Dyson, C.E., is near the St. Peter's Church, with a frontage to Doncaster-road, and has four entrances. The classroom arrangement has been adopted, the infants being on the ground floor, where six classrooms, with central hall, teachers' rooms, cloak-rooms, and lavatories are provided. The boys and girls are on the upper floor, the entrance being provided by a staircase on either side of the building. A marching corridor of fire-proof construction connects the staircases, giving access to seven classrooms, with cloak and teachers' rooms. Two of the main classrooms are divided by glazed sliding partitions, enabling the formation of a central hall. There are drill and play sheds and playgrounds. The building is heated on the low-pressure system, and the lighting by electric light. The contractors are Messrs. R. Ruffles, mason and bricklayer; A. Ovrain, plasterer; Dawber & Townsley, slaters; C. Dryden, joiner; D. Dransfield, plumber and glazier; Snowden & Son, painters; A. Chappell, carving; Saunders & Taylor, Manchester, heating; Laurance & Son, ventilators; J. Taylor, electric lighting; C. Downing, wrought ironwork.

PROPOSED CENTRAL LIBRARY FOR EAST HAM.—At a recent meeting of the East Ham Town Council the Libraries Committee reported that they had directed the Engineer to prepare and submit to them plans and estimates for a central library to be erected adjacent to the Town Hall.

WORKMEN'S INSTITUTE, MARDY.—A workmen's institute has been opened at Mardy. The cost of the building alone amounted to 6,000l., whilst the fittings, gymnasium, and library, etc., made up the amount to nearly 9,000l. The institute is situated at the corner of Ceridwen and Church streets, and is built of native stone, with Forest of Dean stone dressings. In the basement at the entrance to Church-street are a large billiard-room, gymnasium, lecture-room, and games-room. The ground floor entrance is from Ceridwen-street, and contains a vestibule, ladies' room, refreshment-room, magazine-room, and a reading-room. On the first floor is the hall, which, with the gallery, is capable of providing seating accommodation for 1,200 people. The building is lighted by both gas and electricity, the electrical fittings being supplied by Messrs. Clay Brothers, Cardiff, whilst the heating apparatus, which extends throughout, was installed by Messrs. Stott & Co., Oldham. The building was erected by Mr. J. B. Mundy, contractor, Mardy, from plans by Mr. E. Williams, architect, Cardiff.

FREE LIBRARY, STAPLEFORD.—The foundation-stones of the free library which the Stapleford Parish Council are building in Towle's-avenue, were laid a short time ago. The building is to be of red brick and stone. In addition to the library there will be a reading-room, lending library, librarian's room, and ladies' room. Mr. R. Smith, of Long Eaton, is the architect, and Mr. F. Martin, of Stapleford, is the builder.

PUBLIC LIBRARY, BARRY.—A new public library has been erected in Holton-road, Barry Dock, at a cost of 8,000l. The library forms part of a group of municipal buildings, which, when completed, will include municipal offices and town hall. At the lending library there are stacks for 30,000 volumes. The reference library is provided with accommodation for 4,500 volumes and seating for sixteen readers. The news-room is situated to the right of the hall, and contains an area of about 1,375 sq. ft. with accommodation for sixty readers, in addition to newspaper stands for twenty-five persons. On the first floor is a committee-room, which for the present is to be used as a council chamber by the urban council. A reading-room for ladies is situated in the front, at the head of the stairs. The caretaker's apartment is on the second floor. The architects were Messrs. C. E. Hutchinson and E. Harding Payne, of London. Mr. Watkin Williams, of Cardiff, was the builder, and Mr. G. Sanders clerk of works.

WESLEYAN INSTITUTE, SHEFFIELD.—On the 1st inst. the institute connected with Trinity Wesleyan Church, Highfield-place, Sheffield, was formally declared open. Mr. C. B. Flockton was the architect, and he has taken advantage of the difference in the level between the ground at the front and at the back of the building, and has obtained two floors on the ground level. The institute contains on the lower ground floor two classrooms, each 16 ft. square, accommodating twenty-six persons, and a third classroom, 33 ft. by 17 ft., capable of holding fifty-five persons. Close at hand are the store-rooms and kitchen, with two boilers. Upon the upper ground floor is the ladies' room, 33 ft. by 16 ft., and the girls' room, 33 ft. by 22 ft., together with a small classroom, about 15 ft. square, cloak-rooms, and lavatories. The young men's room is on the first floor, and is 39 ft. by 33 ft.

PROMENADE PAVILION, BRIDLINGTON.—On the new Parade extension works at Bridlington the Corporation is about to erect a pavilion and café. The Parade extension works have recently been completed at a cost of about 25,000l. The pavilion is being constructed of wood, iron, and glass, and, with furnishing, will cost 10,000l. It has three domes, and is to be capable of accommodating 3,500 people. It will have a sloping floor, and there will be a gallery extending around the building. There is to be a stage, with manager's room, band-stands, and dressing-rooms. Around the sides of the building lounges are to be provided. The building is to be heated with hot water pipes, and is to be lighted by electricity. Extending the full frontage of the building is a wide balcony and promenade, and doors lead from the gallery inside the building to this balcony. Adjoining this pavilion will be a café, 60 ft. by 60 ft. in area, with flat roof. This roof is to be laid out as tea-gardens. The architects for the pavilion and café are Messrs. Mangnall & Littlewood, architects, Manchester. The Parade extension works have been designed by the Borough Engineer, Mr. E. B. Matthews, C.E.

PROPOSED DISTRICT BATHS, WYKE.—The question of providing district baths at Wyke was again considered by the Bathing Committee at Bradford Corporation recently. The City Architect (Mr. F. E. P. Edwards) submitted three alternative plans, showing how the land could be adapted for the erection thereupon of a building

suitable for baths and a free library. One of these, providing a swimming bath 60 ft. long by 20 ft. wide, douche and slipper baths for men and women, and premises for a free library, was approved by the committee for presentation to the City Council.

SANATORIUM, BARRASFORD.—A new sanatorium for consumptive patients has been established at Barrasford on the North Tyne. The building stands in a site of sixty acres, twenty of which are pine plantation. The cost has been about 20,000l. The buildings were designed by Messrs. Nicholson & Ditchin, Newcastle. The contractors for the various works have been as follows:—Foundation, drainage, and road-making, Messrs. Middlemiss Brothers, Newcastle; superstructure, Messrs. Speirs & Co., Glasgow; plumbing, Messrs. Edwin Joicey, Ryton; heating and hot water engineering, Messrs. R. J. Ward & Co., Newcastle; electric lighting, plant and bells, Messrs. Falconar, Cross, & Co., Newcastle; boilers and boiler setting, Messrs. Arnot & Co., Coatbridge (through their agent, Mr. W. J. Richardson, Newcastle); fencing and tree planting, Messrs. Fell, Ltd., Hexham; sanitary fittings, Messrs. Healy & Wainwright, Newcastle. The arrangements for the water supply were carried out under the direction of Mr. Alfred S. Diming, Newcastle. The contract for the sinking of the well has been executed by Mr. Robert Wood, of Morpeth. The laying of the water mains and the construction of the reservoir have been carried out by Mr. H. H. Nettleton, who has directed a wind motor, with auxiliary petrol engine and pump, have been constructed and erected by Messrs. H. P. Sanderson & Co., Ltd., of Bedford, through their agent, Mr. W. J. Richardson, Newcastle.

TOWN HALL, OSSINGTON.—The foundation-stone of the new Ossington Town Hall was laid on the 27th ult. The architects are Messrs. W. Hanstock & Son, Batley, whose plans were selected in a competition in which the designs of over thirty architects were adjudicated upon by Messrs. Kirk & Son, of Huddersfield and Dewsbury. The building is being erected in the Market-place, and is estimated to cost altogether about 20,000l. It includes offices for the borough officials and a public assembly room to seat 1,300 persons. From the central entrance direct approach is obtained to all the principal municipal offices. The central entrance will be 10 ft. wide, and, in addition to serving the offices, will have a direct approach to the public hall in the rear. From this main corridor cross corridors 6 ft. wide are provided to the main offices. The accommodation on the ground floor will consist of magistrates' retiring-rooms, accountants' offices, rate offices, gas offices, surveyors' and sanitary inspectors' departments. Directly from the main corridor will be a direct staircase to the first floor level, which will also act as an approach to the gallery of the public hall. The first floor accommodation will provide council chamber, mayor's parlour, committee rooms, education room, and town clerk's department. The public hall will be to the rear of the municipal section, with the principal entrance to Dale-street, and a direct approach to the entrance cut off from the municipal section. The accommodation will consist of cloak rooms for ladies and gentlemen, large crush hall, assembly room, orchestra, chorus, and artists' rooms. The police-court section is again arranged independently and separately from the municipal and public hall, and has a direct approach from the outside. It will consist of lavatories, solicitors' rooms, witnesses' waiting-rooms, with borough court. In the basement there will be weights and measures offices, prisoners' waiting-rooms, store-rooms, gas show rooms, large shop for examination of gas fittings, cooking kitchens, heating vault, etc. The corridors are being constructed of Delph wallstones to front and sides, white glazed bricks to areas, and Oxenhop ashlar to walls throughout. The floor of corridors will be laid in concrete and mosaic, and the floors of rooms in wood. The large hall is to be finished in ornamental plaster work, with a decorated ceiling. The corridors will be lined with tiling. A clock turret is also provided.

CONVALESCENT HOME ENLARGEMENT, HORSFORD.—The work in connexion with the enlargement of the Springfield Convalescent Home is expected to be completed by the end of the year. The home at present accommodates thirty-two patients and an administrative staff of seven. When the enlargements have been completed there will be accommodation for sixty-six patients and a staff of fourteen. The present building will be adapted to the purposes of the administrative department, and the new wing will provide the patients' quarters. The administrative department will be so arranged as to isolate the staff from the patients, but there are connecting doors on the ground and first floors for the use of the matron. The estimated cost of the scheme is 3,500l. The architects are Messrs. Hobson & Co., their designs being accepted in open competition.

COURT-HOUSE, BLOFIELD.—A new court-house has been erected at Blofield. The building contains, besides the court, a room for the

magistrates to hold private consultations, a room or solicitors to consult their clients, a waiting-room for witnesses, and a public waiting-room. In the passages connecting these rooms there is a ludo of blue bricks with dark red skirting. Lavatory accommodation is also provided. Adjoining the court-house are large cells. The County Surveyor, Mr. T. H. B. Heslop, was the architect; Mr. T. Gill, of Rupert-street, Norwich, builder; Mr. W. Crotch, of Magdalen-road, Norwich, plasterer; Messrs. C. Payne & Co., Redwell-street, Norwich, fitted in the heating apparatus; Mr. E. Potter, of Chapel Field-road, was responsible for the stone work; and Messrs. Turner, Barnes, & Wright, of Norwich, were the furnicers.

PUBLIC MARKET, SCUNTHORPE.—The new public market at Scunthorpe was opened on the 2nd inst. The principal building is the hall, which measures 95 ft. by 60 ft., clear span, equipped with six butchers' shops, one refreshment-room, one general dry goods store, eight fruiterers' and florists' stands, and sixteen other stalls, as well as a ladies' lavatory and superintendent's office. The roof is matchlaid, stained, and varnished, and is carried by braced steel principals of 60-ft. span; the floor is of concrete, and the whole of the shops, etc., are painted cream, outlined with blue, and the principals with green. The walls are lined with glazed bricks to a height of 5 ft., and the building is lighted by eight pendant arc incandescent lamps (Humphrey's patent) each of 300 candle-power. The open markets are laid out in a modern style with open-fronted sheds, paved with red chequers, and covered cattle pens. The remainder of the market is paved throughout, and gives accommodation for 280 sheep, 120 beasts, and 60 pigs, besides weigh bridge, weigh house, and a public convenience. Slaughter houses are also provided. The plans for the work were prepared by Mr. A. M. Cobban, the Council's Engineer, and the contract let to Mr. W. Pallister, a local builder, for 2,437l.

STAINED GLASS AND DECORATION.

NORTON CHURCH, NEAR EYEMASH.—The stone-work of one of the windows, put in in 1840, on the south side of the nave of this church, has been removed, and a new window put in its place, copied from one of those formerly existing, a specimen of which remains. The new window, of two lights, has been filled with stained glass, showing St. Luke drawing the portrait of the blessed Virgin, and St. Cecilia at the organ, with a background of local scenery. The architect was Mr. C. Ford Whitecombe, of Broadheath, Worcester, and the artist Mr. H. A. Payne, of Birmingham.

SANITARY AND ENGINEERING NEWS.

EXTENSION OF BURNLEY WATERWORKS.—The Burnley Corporation have decided considerably to extend their present water storage, and Mr. Diggle, C.E., consulting engineer, has presented his report, in which he advises the making of a reservoir in the Thursden Valley, with an 88 ft. embankment, to hold 400 million gallons. The report is now being considered by the Water Committee.

DRAINAGE SCHEME, WEST RUNTON.—A Local Government Board inquiry was held recently at the West Runton Hotel by Mr. P. M. Crosswhite, M.Inst.C.E., with regard to the application of the Eppincham Rural District Council to borrow £1,900 for works of drainage in West Runton. The engineer of the scheme is Mr. A. F. Scott, of Norwich and Cromer.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The partnership between Messrs. Tait & Harvey, architects, of Exeter, is dissolved, and Mr. C. J. Tait is now carrying on practice in his own name at 57, High-street, Exeter. The club which was formerly entitled "The Architectural Association Old Day-Students' Club" has changed its title to "Old Architectural Association Day-Students' Club." Mr. A. G. Cross, F.R.I., has been elected Honorary Secretary of the Quantity Surveyors' Association in place of Mr. F. B. Hollis, who has resigned the position. The address of the Association still remains 17, Bedford-row, W.C.—It is announced that Mr. Arthur Pyle Smith has been elected Chairman of the Board of the St. Pancras Ironworks Co., Ltd., and Messrs. Hugh Leader and T. Percival Chubb have been elected directors of the company.

SOUTHAMPTON AND DISTRICT BUILDERS' AND DECORATORS' ASSOCIATION.—The annual dinner of this Association was held at the South Western Hotel recently. About 100 members and guests were present, including the Mayor (Mr. Henry Law), Mr. R. Andrews, J.P., Alderman J. H. Hollis, Mr. Harold Marshall (President), Mr. W. H. Dyer (Vice-President), Major G. Brinton and Mr. Harry Stevens (Past-Presidents). The loyal toasts having been submitted from the chair, and duly honoured, the toast of "The Mayor, Corporation, and Borough Officials" was proposed by Mr. T. Rashley, the Mayor and

the Sheriff responding.—Mr. H. Stevens, in proposing "The National and Kindred Associations," said it was to be hoped that members of the trade would work together, not merely from a personal point of view, but from a general desire to benefit the conditions. Mr. G. Martin (President of the Bournemouth Association), in responding, mentioned that their Association had not been affiliated with the National Association, possibly because there was some feeling that that Association might call upon Bournemouth builders to do something which they might consider detrimental to their interests. He personally had always been in favour of affiliation, and if during his year of office he possibly could he would bring about this affiliation. Mr. G. R. Chamberlain (President, Portsmouth Association) and Mr. F. B. Roscoe (Portsmouth Association) also made brief responses.

—Mr. W. F. Wallis (President, Southern Counties Federation) in proposing "The Southampton Master Builders' and Decorators' Association," emphasised the necessity of organisation amongst master builders in order that they might be enabled to meet employees on level terms. The revival of labour as seen in the recent Parliamentary elections, and the decision of the Association at their last annual meeting, to appoint Conciliation Boards in conjunction with the local workmen's unions, in order to consider points in dispute, and wherever possible to avoid strikes, were other points touched on. Mr. Harold Marshall (the President), in responding, mentioned that of late the number of apprentices had fallen off a great deal. Sir James Knollys, M.P., endeavoured to give a presentation, and to offer every inducement to young fellows contemplating entering the trade. Mr. A. T. Doggell (hon. Secretary) also responded.—The Mayor proposed "The Architectural Profession and other Guests," and traced an abridged history of the profession. The toast was responded to by Mr. G. Gutteridge and Mr. J. Blizard, on behalf of the former, and Alderman J. Hollis, on behalf of the latter.

INTERNATIONAL CONGRESS ON SCHOOL HYGIENE.—A second International Congress on School Hygiene is announced to be held in London from August 5 to 10, under the management of the Royal Sanitary Institute. Sir Leicester Brunton will preside; and the Honorary General Secretaries are Dr. James Kerr, Medical Officer in the Education Department of the London County Council, and Mr. E. White Wallis, Director of the Sanitary Institute. The circular announcing the Congress states that in order to prepare for the annual Congress the first step to be taken is the formation of a Local Committee for each particular town or district, which Committee should approach the authorities of the Education Department and the Treasury, the leaders of Educational movements in town or country, the Presidents or Chairmen of Educational Committees, teachers of experience, philanthropists who are interested in Educational movements, and medical men who have experience in treating children; engineers, and architects, and any other citizens whose assistance would be desirable. This Committee when formed should report forthwith to the London Bureau the name and address of the Chairman and Secretaries. These Local Committees will be co-ordinated from London under National Committees. Their aim should be to do all in their power to promote the success of the Congress by diffusing information, by letters, circulars, or announcements in special and technical journals, and by press notices. They should also endeavour to obtain the co-operation and support of Governments, Municipal or Educational Authorities, and Committees of Institutes and Societies, and induce them to participate by delegating representatives to the Congress or by sending representative exhibits of local interest or manufacture, or scientific appliances or inventions to the School Hygiene Exhibition which is to be arranged. Contributions are invited either from the representatives of Governments, Authorities, Societies, or Academies, or from individual members to the scientific work and proceedings of the Congress by the reading of papers, contribution of reports, or by discussion of various subjects to be brought forward in the national meetings. It is proposed that besides sectional meetings and lectures there shall be held at least three general discussions. The subjects will be announced early, so that there will be time for collective investigation and observation. The English Committee invite suggestions, as soon as possible, as to the subjects under this heading. A list of the various National Committees, the subjects of reference for general discussion, and details as to arrangements of the Congress will be issued shortly. All communications relating to the School Hygiene Exhibition, which will be arranged in conjunction with the Royal Sanitary Institute, should be directed to the Secretary of that Institute, Margaret-street, London, W.

BIRKENHEAD BUILDING TRADES EMPLOYERS' FEDERATION.—The members of the Birkenhead

and Wirral Building Trades Employers' Association held their seventh annual dinner recently at the Woodside Hotel. Mr. P. Rothwell, President of the Association, presided. The loyal toast was honoured, and "The Liverpool Master Builders' Association" was proposed by Councillor G. Snape, who said the Birkenhead Association was merely an adjunct of the Liverpool Association, and they had to go to Liverpool for counsel in matters appertaining to their trade. He coupled with the toast the name of Mr. W. Bullen, who was a most courteous President. The toast was drunk with musical honours, and Mr. Bullen, in responding, said he did not think he would be egotistical if he said that the Liverpool Master Builders' Association had justified its existence, had been a forerunner of many such associations, and was doing a great deal to help other associations. Trade was at present entering into what he might call a new sphere. They as master builders and members of Master Builders' Associations must be fully alive to their positions, or they would find the Labour representatives looking after their own interests only. Mr. James Merritt proposed the health of "Our Guests," Mr. B. B. Moss, secretary of the Liverpool Association, responding. In submitting the toast "The Birkenhead and Wirral Building Trades Employers' Association," Mr. W. Bullen said times were changing very rapidly, and they could not expect that every movement they made would please everyone. One of the old stock sayings was, "Well, they did so and so fifty years ago," but it was no good talking like that now. The years ago building trade associations were not formed. They might expect great changes, not in fifty years nor fifty months, but in the next fifty weeks. Although the associations were good, they were not by any means perfect. What had they to do? They had their associations and federations, and it might be asked: "What else had they to do?" He noticed that the membership in Birkenhead was about 80. He did not expect to see such a fine gathering, but he wanted to know if that represented all the building trade employers in Birkenhead. Well, there was their work. He wanted them to try and persuade those builders who were not in the Association to join not only for their own benefit, but for the benefit of the people at large. He thought that the builders of Liverpool and Birkenhead were too far separated, not by distance, and that they ought to combine more. Mr. P. Rothwell, in responding, said they had been thinking of combination for years, and they would try and bring it about. It would be better if the wages, hours, etc., were the same in Birkenhead as in Liverpool. The toast of the "Town and Trade of Birkenhead" was proposed by Mr. J. Sansom. Unfortunately, he said, there were a lot of legitimate genuine unemployed, but there were always a host of loafers to swell the ranks. From a report of the Labour Bureau that had been sent him he found that with regard to his particular trade—the timber merchants—there was only one man wanting employment, and he was a sawyer. If they took that as a criterion, it was a fair inference to say that the building trades generally in the town could not be in a bad state. That was indeed a matter for great congratulation, but there was one trade in Birkenhead that was not doing so well, and that was the shipbuilding. Mr. Shilton briefly replied.

ROMANESQUE ORNAMENT AND ITS ORIGINS.—Under this title Mr. F. Hamilton Jackson, R.B.A., gave a lecture before the Society of Designers on Tuesday evening, the 27th ult., in the Suffolk-street Galleries, when he sought, with the aid of some 150 lantern slides, to bring more clearly before his audience the early origins and influences at work in Southern Europe during the Early Christian and Medieval times as regards the development of ornament. The lantern views were perfect of their kind, and were almost exclusively of or from more or less well known churches and religious houses in Italy and the South of France. In his rapid review of the slides the lecturer directed the attention of his audience rather to the purely Byzantine influence at work than to the differences between that and the other more local sources and tendencies. We cannot do justice here—either critically or otherwise—to the matter contained in Mr. Hamilton Jackson's lecture, but where architectural objects are concerned, while regarding the value of historical research at its full worth, a proper and logical discrimination ought also to obtain, and admiration, in some cases, proportionately qualified. Notably in some of the doorways and other details shown by the lecturer we failed to find this attribute, while coarse sculptured figures from Lombardian fagades were termed "caryatides."

ST. WILLIAM'S COLLEGE, YORK.—St. William's College, the ancient building at the east end of York Minster, has been purchased by the Convocation and House of Laymen of the Northern Province. It is much dilapidated, but the building has passed into the hands of Convocation on the express condition that it is to be thoroughly restored. It is intended to convert it into a church house, providing accommodation for the two Houses of Convocation and for the House of

Laymen, and available for other church purposes. St. William's College was founded in 1453 as a college for priests holding chantries in the Metropolitan Church. In 1642 Charles I. set up his printing presses here. In the purchase and the complete restoration that is contemplated a sum of not less than 10,000l. will be required. Contributions will be gratefully received and duly acknowledged by the Restoration Committee. Cheques or postal orders should be made payable to the Treasurer of St. William's College Fund, Beckett's Bank, York, or to the Secretary, Rev. C. N. Gray at Liverpool, U.S.A. Visitors are admitted as the chief entrance to inspect the buildings by ticket (price 8d.), to be obtained at the first door of the College next the Minister.

Legal.

AN ARCHITECT AND HIS EMPLOYER: SEQUEL TO A CONTRACT.

In the King's Bench Division, on the 6th inst., Mr. Justice Grantham delivered judgment in the case of *Shallcross v. Bergyl*, an action tried by his lordship at the Liverpool Assizes last week. In this case the plaintiff, Mr. Thos. M. Shallcross, an architect, of Liverpool, sued the defendant, Mr. Moritz Bergyl, for fees, and had obtained judgment. The defendant set up a counterclaim for damages for the alleged breach of duty of the plaintiff, as architect, in connexion with the renovation of the Carlton Hotel and Restaurant at Liverpool, of which the defendant was proprietor. The facts sufficiently appear from the judgment.

His lordship, in giving judgment, said the case was important, even so far as the amount was concerned, but was much more important on account of the principles involved in the dispute and the claim made by the architect to act in the interests of the builder unknown to the building owner at the same time that he was acting as the architect for the building owner. In his judgment it was impossible to act honestly where the interests were antagonistic, and in that case, were it not that the plaintiff, as an architect, claimed the right to do so, and contended with great earnestness that such conduct was legitimate and was adopted by other architects, he should have said that the plaintiff had been guilty of great dishonesty, but he had no reason to doubt his word when he stated that he believed all through that the plaintiff, as an architect, had placed himself. Defendant was the owner of a large restaurant and public hall, and wished to improve it and so structurally alter it as to bring it up to modern requirements. The work might be described as divided into two heads—first, the preparation of plans to lay before the magistrates, and the consequent attendance of the magistrates for the purpose of getting their consent to the alterations; secondly, the preparation of plans for, and the superintendence of, the carrying out of the work. This work, though in one sense distinct, was in reality almost identical and overlapped, because he found that the plans prepared for the magistrates were practically the plans ultimately used for the carrying out of the work, and were mostly the plans charged for by the plaintiff in his charges for carrying out the alterations by the builder, and the whole of the negotiations for the contract, subsequently signed, were being carried on while the proceedings before the magistrates were taking place. Defendant admitted that the plaintiff was his architect during the whole of this period, and that he was liable to pay him for his services as such. Then what was the plaintiff's contention? It was that, during the earlier portion of the time, he had a right to act, and was acting, in the interests of the builder. Messrs. Norman & Stacey were trying to get the job to do the work, or, rather, get a contract to do it, as they were incapable of doing it themselves, and plaintiff alleged that in the interests of this firm he was entitled to get a contractor who would do the work for a specific sum, and then, having fixed that sum as the cost of the work, to add 20 per cent. to that sum as a commission or bonus to these nominal builders, who were a London firm of furniture dealers, who never intended to do a stroke of the work themselves, and to represent to the defendant that sum as the fair price at which that work could be done. In other words, knowing that the real contractor had to do the work for 1,625l., he was entitled to tell his other employer, the building owner, that 1,950l. was the price, and that it could not be done for less, and not only that, but was entitled to do everything for the interests of this nominal builder as against the interests of the building owner until the period of the latter finally signing

the contract with the nominal builder, who simultaneously, through the intervention of the plaintiff, got the contractor to sign a contract to do the work at 20 per cent. less. That was the case. His lordship said he might leave it there, but to do ample justice to the plaintiff he would shortly state the justification that he put forward. He said he was brought into the matter by the nominal builders, and was employed by them to suggest a scheme for the alteration of the defendant's premises, and in that way was introduced to them.

These nominal contractors were introduced to defendant by a person named Copper, who had, or said he had, an idea of taking the place when altered. They now knew that he expected to get a commission of 5 or 10 per cent. out of the nominal builders for the introduction, and they heard no more of Mr. Copper after the first interview. At the first interview with the defendant in London nothing was done, but at a second meeting a few days afterwards, when the plaintiff was present, the defendant agreed to employ the plaintiff as his architect to prepare plans and manage the matter for him before the magistrates, and to get their consent to the proposed alterations. The defendant stating that, if the magistrates passed the plans and the work could be done within his limit of price, he should certainly carry it out. Plaintiff at once set himself to work to prepare the plans and attend the magistrates and the municipal authorities, etc., because the plaintiff said that he continued to act in the interest of Norman & Stacey, the nominal builders, and was justified in getting the more favourable terms he could for them and the highest price he could out of the defendant for the work, though at the same time employed to superintend the work for the defendant. In other words, for nine months, according to his suggestion, he was acting in the interests of the masters whose interests were opposed to each other, and for the last six months, when acting only for the defendant, he was justified in withholding from the defendant all the knowledge that he possessed as to the best way of carrying on the work in the interest of the defendant, because, by so doing, he would be betraying the interest of the other employer who had previously, as it were, a joint employment of him with the defendant. It was an impossible position. There could be no doubt that from start to finish the plaintiff looked to the interest of Messrs. Norman & Stacey, who had become bankrupt long before the work was finished and never once, that he could see, when there was any conflicting interest, looked to the interest of the defendant, though the special work alleged to be done by the plaintiff for Messrs. Norman & Stacey was only of the alleged value of 311l., as against 300l. charged to the defendant. His lordship found, as a fact, that upon the first appointment of plaintiff as architect for defendant and acceptance of that appointment by him, the defendant looked on the plaintiff as his architect, and that the plaintiff neglected the defendant's interest and committed a gross breach of duty in acting at the same time in the interests of the nominal builders. He would find, if necessary, that he was guilty of negligence in the way the contract was prepared and the orders for extra work given. But he found in reality that it was not by ordinary negligence that the work was so done, but because it was to the interest of the builders to do so. Not only was the defendant prejudiced by having to pay 1,950l. as the cost of the work, but, instead of 1,625l., but also extra to the amount of about 2,600l. It had been said that even if the defendant had known Norman & Stacey were getting the work done by a sub-contractor for 1,625l., instead of 1,950l., *non constat*, that the defendant could not have done for that sum. His lordship believed he could have done so, because the plaintiff's own account of it was that by his instructions to the sub-contractor, Marshall, were to put his tender at such a price as would enable Norman & Stacey to obtain the contract against London contractors when they had added 20 per cent. to his price. But why limit it to London contractors? The property was in Liverpool, the architect was there, and the defendant had his agents there, who superintended the property. Defendant did not ask for a London contractor, and it was fair to assume that contractors of the character of Waring & Gillow would put a higher class of work into the job than a local contractor who would raise it at 20 per cent. less. Marshall was not estimating, therefore, as against any local contractor, but was taking advantage of the known higher prices of London firms. He thought the defendant could have claimed the return of almost the whole 20 per cent., but, as defendant's advisers generously said they would accept a basis of 10 per cent., he found that the defendant was damaged to the extent of 400l. by the plaintiff's conduct. As to the extra amount charged for the drawings—as the requirements—unjust and foolish requirements as they were—by the Liverpool Municipal Surveyor undoubtedly did necessitate a great deal of work that had not been anticipated, he thought it would be undgenerous,

not to say unjust, to make the plaintiff refund the money paid to the builder for the work unexpectedly required by the authorities, though, strictly speaking, the contract might be said to make the builder liable for it. It was negligently drawn to leave the matter in uncertainty. He did not give any damages to the defendant on that head. His judgment was for the defendant on the counterclaim for 400l. and costs.

Leave to appeal was refused.

SEQUEL TO THE CHARING CROSS STATION ACCIDENT.

THE cases of Scott and others v. Lennox and Lennox v. Curzon came before Mr. Justice Lawrence in the King's Bench Division on the 3rd inst.

In the first case Mr. Lush, K.C., for the plaintiff, said that the action, which was for rent, arose out of the accident which occurred at Charing Cross Station on December 5 last when the Avenue Theatre was practically destroyed. The plaintiffs were the lessees of the freeholder and the defendant was the assignee of the lease which had been granted to the Theatrical Syndicate, Ltd. Mr. Curzon was a sub-lessee, and he gave the sub-lease to Mr. Maude. The question in the case was whether defendant had excused from paying rent by one of the covenants in the lease. The rent of the theatre was 750l. a quarter, payable in advance. The covenant in question was as follows:—"If and whenever during the said term the said theatre and premises shall be closed by order of any superior authority, or be destroyed by fire, or by any other cause, the same cannot be continued to be used as a theatre, the rent shall as from the date of such closure or from the day following such fire, if any, be suspended." The only question in the case was whether the theatre had been closed by an order of any superior authority. At the time of the accident the theatre was being repaired. The accident caused the destruction of the theatre. As it could not be said that the theatre had been closed by an order of any superior authority, he contended there was no defence to the action. Mr. Roskill, for the defendant, said the lease provided that the cost of structural alterations ordered by the County Council should be borne by the lessors. The County Council had required structural alterations after the accident, and the true construction of the covenant was that, while the theatre could not be opened by reason of an order requiring structural alterations, the rent should be suspended.

In the present case there was not only an order of the magistrate, Mr. Fenwick, on December 8, but a letter from the Lord Chamberlain later, saying that the theatre must not be opened without it was passed as safe by the County Council. The theatre was badly damaged, and in consequence of the injury had been closed by superior authority. As the defendant was not liable as between himself and the plaintiff for any of the structural work ordered by the magistrate, and as the existence of the magistrate's order was one of the reasons the theatre could not be opened, the proviso as to the suspension of the rent was operative.

In the result, his lordship, in giving judgment, said it was one of the cases provided for in the lease. The theatre was still a theatre after the accident, but as it was then impossible to carry on the business of a theatre there, that was the real reason of the closing. He accordingly entered judgment for the plaintiffs for 750l. and costs.

In the second action of *Lennox v. Curzon* a similar question arose on the same covenant. Mr. Lennox, the defendant in the other case, being the plaintiff in this, his claim being against Mr. Curzon, his sub-lessee, and in the result Mr. Lennox recovered judgment for 1,210l. and costs. A stay of execution was granted in both cases on the usual terms.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

2,038 of 1905.—C. J. S. LAMBERT: A Process and Apparatus for Drying Air.

This relates to a process for the desiccation of air for all applications to ventilation and to the condensation of substances, said process consisting in effecting the operation in a system of refrigerating apparatus where the condensation of the greater part of the water vapour is obtained by bringing the air into contact with cold liquid trickling over either plain or corrugated surfaces which are not cooled below the point of congelation of water, the operation being completed by physical and not by chemical means by causing the air to pass into a second refrigerator, in which it comes into contact with any solution capable of forming with water a uncongaleable mixture, and having a vapour tension corresponding to a lower percentage of

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

water than the final percentage which it is desired to attain in the air.

2,045 of 1905.—R. J. BROOKS: Hot-Water Heating Apparatus.

This relates to a hot-water heating apparatus, wherein, at starting, the liquid of the circuit put into motion around the circuit is small in quantity in comparison with the total delivery of the circulator, and offers comparatively little resistance, and the quantity of the liquid so moved is gradually increased until normal circulation is established.

2,383 of 1905.—R. WANDERMAN: Dovetail Cutters.

This relates to an appliance for cutting dovetails, consisting of a slide, a chisel composed of several parts attached to the slide, some of the parts being movable to aid from each other, the ends of the chisel being played out and rebated or overlapped, and a mechanism for moving the parts to widen and narrow the chisel as it descends and ascends.

8,169 of 1905.—J. G. HARRISON: Ventilators for Windows.

This relates to ventilators for windows constructed from perforated sheet metal, two of which comprise a set of ventilators for one window. The first ventilator is similar to a rectangular box about half an inch thick, and of a suitable width, it is fitted closely between the top and sides of the outer window frame, and is secured by its projecting ends and top side to the back of the aforesaid window frame, and immediately in front of the sliding window sash, so as to allow the upper window sash, which presses slightly against the back of the ventilator when in its position, to slide up and down at will. The second or middle ventilator is about 1 1/2 in. wide, and is bent double to a convenient shape, and secured to the bottom part of the upper window sash at a short distance from the lower window sash, so that when the upper window sash is pulled down the perforated metal strip may almost touch the lower part of its downward travel. When required, a V-shaped piece is cut out of the strip so as to allow the strip to fit closely up to the pane and round outside part of centre frame. Screw holes are provided in various positions on the perforated metallic strips for the purpose of fixing the ventilators to the woodwork by means of screws.

8,965 of 1905.—A. TOMKINS: Traps for the Wastepipes of Sinks, Baths, and the like.

This relates to the adjustment and control of the direction of the outlet piece or leg of traps to sinks, baths, and the like by means of a joint at or near the weir of the trap, the seating of such joint to lie in a plane normal to the curved axes of the adjacent parts, and inclined at an angle of 45 deg. or thereabouts to the horizontal plane when the trap is in its usual position. When in use the parts are bolted, screwed, or otherwise fastened together as desired.

9,784 of 1905.—S. S. HELLYER: Pans of Water Closets, Bed Pans, Sinks, and the like.

This relates to pans of water closets, bed pans, sinks, and the like, and consists in applying strips of wood, vulcanite, or other protective material, or material which is a bad conductor of heat, to the rim of the same, and in providing the strips with the said pans, sinks, or the like with parts which will engage together so that the strips are secured in place without the use of bolts or analogous fastenings, and whether cement be interposed or not.

10,012 of 1905.—E. F. GOODALL: Method of Securing Slates, Tiles, and the like.

This relates to the method of securing slates, tiles, and the like by nails or spikes, and of rendering the same waterproof, and is characterised by the use of nails or spikes having on the undersides of their heads recesses or sinkings, which are filled with putty or other plastic material adapted on the nails or spikes being driven home, to fill up and seal the holes in the slates and the like.

10,354 of 1905.—J. HALL: Air Filtration and Means Thereof.

This relates to an apparatus for filtering air for supply to brewers and other factories, and consists of a suction fan inlet chamber, the walls of which are composed of removable frames containing filtering medium and arranged in sets so as to prevent a large filtering surface, whereby the air is drawn through the filtering medium evenly over the entire surface thereof.

11,265 of 1905.—J. H. CARTLAND and J. LILLY: Apparatus for Opening and Closing Swinging Windows, Ventilators, Fanlights, or Similarly Swinging Bodies.

This relates to an apparatus for opening and closing swinging windows, ventilators, fanlights, or similarly swinging bodies, and consists in the combination of a frame having eccentric pivotal connections, and an attachment bracket, said frame carrying a screw and a rotatable pulley nut, which screw is pivotally connected to bracket, and in means for rotating the nut.

21,733 of 1905.—S. GOLLIER: Building Blocks.

This relates to a building block formed from plastic material, and provided with channels in its ends, and consists of metallic binding members embedded near each longitudinal edge of the block, and provided with a hook on one end and an eye on the opposite end, and a binding member disposed centrally transversely of the block, and provided with a hook on each end in engagement with the longitudinal binding members.

23,048 of 1905.—J. DUGDALE: Fastener for Windows and the like.

This relates to a window fastener, and consists of a bracket with a spring pin or catch secured to each window sash, combined with a notched bar secured to the window-frame, and so arranged that both sashes can be locked and secured in different positions independently of one another.

24,244 of 1905.—C. BONAFIDE: Manufacture of Mastic for Flushing the Joints in Flooring and other Similar Purposes.

This relates to the manufacture of a mastic for flushing the joints in flooring, according to which twenty-five to fifteen parts of sawdust and finely ground cork are mixed with seventy-five to eighty parts of a cold starch prepared from pure rye flour and boiling water, for obtaining a mastic of greater elasticity.

3,699 of 1905.—W. TIPPER: Grabs and Means for Operating the Same.

This relates to a grab device for raising grain and other cargoes, excavating or dredging and other purposes, wherein the fall or lifting-chain for the jaws of the grab is provided at one point with an enlarged link, and in which the suspending rods by which the grab jaws are suspended when open preparatory to being lowered are provided with a crown piece or catch device through which the said fall passes, said catch device being adapted to engage the enlarged link on the fall when the jaws of the grab are fully open, and so permit the chain to lower the grab with the jaws in the open positions, but release said link when it is required to close the jaws.

4,335 of 1905.—D. E. L. DAVIES: Means for Indicating and Recording Variations in Level or Depth of Water or Other Liquids, as in Reservoirs, Sewers, and Mines.

This relates to means for indicating and recording variations in level or depth of water or other liquids, as in reservoirs, sewers, and mines, and consists in the use of a revolving drum upon which the fluctuations of the flow of water shall be indicated by means of a pointer to which a horizontal motion is imparted from a revolving shaft by means of a screw with nut working thereon.

10,579 of 1905.—C. AMES: Surface Water Gully.

This relates to a double trapped surface water gully having the one trap formed by a hopper, the lower end of which depends below the surface of the water in the gully, and the other trap formed by a diaphragm in a chamber within the gully, the said chamber being situated about midway between the bottom and top of the gully, through which chamber the water has to pass on its way from the gully to the sewer, the said chamber being divided into two compartments by the said diaphragm, so that one compartment is open to the sewer and the other compartment is open to the interior of the gully.

The New North and South Tube Railway.

MIDING itself under the too modest designation of the Baker-street and Waterloo Railway, the new line of communication between north and south London, of which a portion was opened to the public on Saturday, may justly be regarded as inaugurating a new era in metropolitan underground railway construction. Apart from the City and South London Railway, there has been no means of rapid transit between the northern and southern districts of the metropolis, and absolutely none between them in the western region. For this reason the new tube railway fulfils a great public want, and will undoubtedly be a great success. Even if its operations were confined to north and south traffic the railway would be of much service; but providing for direct junction with no fewer than six existing and sanctioned underground railways, and with four existing surface railways, its value is infinitely greater.

On the next page will be found a plan showing the route and connexions of the Baker-street and Waterloo Railway, the unopened extensions being shown in broken lines, and other railways as indicated in the table of reference. At this stage it may be convenient to explain that the Act authorising the construction of the line was passed in 1893, and that the extensions to Paddington in the north

and to the Elephant and Castle in the south were sanctioned in 1900. In 1902 the Underground Electric Railways Company entered into a contract for the completion of the works, which had been commenced in 1898. This company, having already reorganised the District Railway, are now engaged in the construction of the Great Northern, Piccadilly, and Brompton, and the Charing Cross, Euston, and Hampstead lines—the first two in direct connexion with the Baker-street and Waterloo Railway, and the last having its southern terminus close to the Trafalgar-square Station of the same line. Therefore, the group of lines projected will really provide three new north and south routes, and a new east and west route, in addition to useful connexions between existing east and west railways. The table given at the end of this article indicates the various connexions in a form permitting them to be seen at a glance. Any who examine this table and the plan will agree that the comprehensive system there represented is the greatest and most praiseworthy attempt hitherto made to deal with the passenger traffic of London.

As mentioned above, the construction of the new railway was commenced in 1898, work being started in the Thames near Hungerford Bridge by the erection of a staging on which were built workshops and offices, and an electric generating station to furnish power and light. From this staging two vertical shafts were sunk through the bed of the river to provide means for the removal of excavated earth and for the delivery of

structural materials without involving the necessity of cartage through the public streets.

So far as general construction is concerned the new railway resembles other tubular subways driven through the London clay, the up and down lines being in separate tunnels of 11 ft. 6 in. diameter, practically the same as that adopted on the Central London Railway, the station tunnels being double the tunnel diameter, as usual. The work of tunnelling was performed for the greater part by the well-known Greathead shield, which is so familiar that no description is necessary. In operating below the river bed, however, a new type of shield was employed in connexion with the method known as the "clay-pocket" system, the invention of Mr. Dalrymple-Hay, one of the engineers retained by the company. The shield in question comprises a steel cylinder, 10 ft. long, specially adapted for use in water-bearing strata under compressed air against a pressure of 30 lb. per square inch. To prevent any sudden incursion of water a steel trap, consisting of two diaphragms, is fitted near the middle of the shield, the front diaphragm filling the upper half of the space across the shield, and the back one the space across the lower half. The bottom of the front diaphragm extends below the top of the other, and any inrush of water is prevented from rising above the last-mentioned level by the air-pressure maintained. Before the shield is brought into operation a series of pockets is cut in the face of the soil, and the holes are filled with clay. In

this way an annular ring of clay is formed, about 2 ft. in advance of the shield, and extending 3 in. all round beyond its periphery. Then the shield is forced forward by hydraulic machinery for a distance corresponding with the width of a ring of the cast-iron segments employed for lining the tunnel. When advancing the cutting edge of the shield is forced into the clay ring, and when the cutting edge has advanced beyond the clay first encountered the remaining portion of the ring serves as a protection, permitting the cast-iron lining to be fixed without risk of subsidence, as would inevitably occur in water-logged gravel below the bed of a river. Of course, it will be understood that the shell of clay is held up by the pressure of air employed in this system of tunnelling.

All the stations are lined with Simpson's patent grip stoneware glazed tiles, especially manufactured to withstand the severe tests necessary in the case of underground railway work. The general colour scheme adopted throughout the line represents an innovation, each station being treated in distinctive colours. The object of this colour system is to enable passengers to identify the stations without that anxious search among advertisement placards for the official announcement which is so difficult to find on most railways. The following are the colours of the stations at present open for traffic:—

- Kennington.—Light and dark green.
- Waterloo.—Green and dark brown.
- Embankment. Green and light brown.
- Trafalgar-square.—White (down tunnel); light green and light brown (up tunnel).
- Piccadilly.—Green and celeste blue.
- Oxford-circus.—Dark brown and blue.
- Regent's-park.—Light brown and amber.
- Baker-street. Light and dark blue.

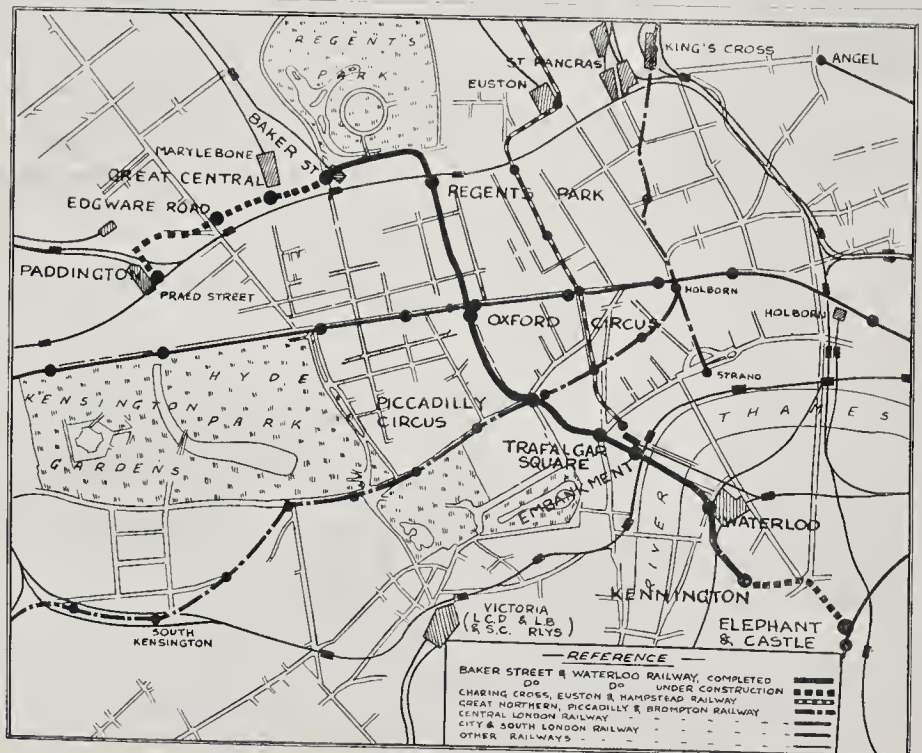

As a matter of convenience to strangers (and the colour-blind) the names of the stations are written in bold characters on the tiles, and permanently fired on. The filing of the corridors and staircase shafts is treated on the same colour scheme as that adopted in the several station tunnels, the staircase tiles being fixed with vertical joints to suit the circular form of the shafts. All the booking-halls on the line are tiled in green and cream colour, the ticket openings being of glazed faience ware. It is worthy of note that a similarly distinctive colour system will be adopted by the company for the stations of the Great Northern, Piccadilly, and Brompton, and the Charing Cross, Euston, and Hampstead tubes.

Each of the station lifts has a floor area of 150 sq. ft., and on the basis of 2 sq. ft. per passenger this gives a capacity of 75 persons per lift. The cages are built of steel with Karri floors, and the entire installation is of fire-resisting construction. Each cage is suspended by four steel ropes of $\frac{7}{8}$ in. diameter, and is counterbalanced to two-thirds of its weight. Various safety appliances have been adopted for the protection of passengers. The Otis safety apparatus has been applied, and as a further safeguard each cage is fitted with two oil buffers. In case the current should fail powerful electro-dynamic brakes come into play, and effectually prevent the cage from running away. An emergency switch is provided so that the lift attendant can cut off current from the entire installation. The lifts are operated by 35-horse-power motors, driving worm-gear winding drums about 4 ft. in

diameter. One innovation of very convenient character in connexion with the lifts is that passengers always leave the cars by the end opposite to that at which they enter. This obviates the objectionable crowding round the entrance which prevails on other tube railways. The lift gates are opened and closed by compressed air, and the general arrangements are such that passengers can be conveyed between the stations and the surface with a minimum waste of time.

Every precaution has been taken by the adoption of fire-resisting construction to eliminate fire risks. The station platforms are built of concrete and steel, the permanent way sleepers are of Jarrah wood, which is of the "slow-burning" class, if not absolutely incombustible; and the carriages are built almost entirely of steel, the comparatively small proportion of timber used having been treated so as to render it non-flammable.

From these brief particulars it will be seen that in respect of safety the new railway exhibits considerable advances on that of some of its predecessors. Outside the stations the running tunnels are whitewashed and lighted by electric lamps, spaced at intervals of 40 ft. apart, the service cables being quite independent of the cables distributing current for power purposes. Another excellent feature which deserves mention is that the cavity between the rails has been filled in with granite concrete, thus providing a secure footway from end to end of the line. Consequently, if a train should come to a standstill through any cause, passengers will be able to walk along a well-lighted footpath to the next station. As an additional provision for

the safety of the public, arrangements have been made for cutting off the current in any section where passengers may be called upon to make use of the footway.

We come next to the very important question of ventilation, which is so great a drawback to all tube railways except perhaps the Great Northern and City, which is the only line where the atmosphere is really fit for human beings to breathe. Although the Baker-street and Waterloo subway has been completed in accordance with designs prepared at a time when the ventilation problem had not assumed a state of urgency, the directors of the company have done their best under the circumstances to exhaust foul air, and to insure the admission of fresh air in adequate volumes. The unfortunate thing is that the tunnels were not designed suitably for perfect ventilation, which, in our opinion, can only be secured by the adoption of absolutely distinct tunnels and access shafts for the up and down lines. After considering various alternatives a system was devised by Mr. J. R. Chapman, Chief Engineer to the Underground Electric Railways Company, and based upon the following hypothesis: That if at every station air be taken out to the surface by means of a closed duct from a point situated on the tunnel platform at an appreciable distance from the physical opening of that platform through the passage-ways and shafts to the surface, then this distance will be partially filled by fresh air; the existing air being replaced by air coming from the surface down the shafts and through the passage openings. In addition, a portion of the tunnel length adjacent to the opening of the closed duct will be similarly affected. A constant closed circuit of air will obtain, and the nearer the duct opening is to the passage openings the more will be this actual short circuiting. If trains be run through a station so treated, horizontal columns of fresh air will be pushed into the tunnel from the station, and further pushed on by subsequent columns propelled by following trains.

After the general lines of the ventilation system had thus been laid down, the next point for discussion was whether the plenum or the exhaust method should be adopted. The decision made in favour of the latter is one we quite agree with. Under the exhaust system the air drawn from the tunnels is ejected through a closed duct above the roof of the station building, while fresh air enters at street-level and passes down the lift and stairway shafts, the movement of air down the passage-ways being likely to assist the movement imparted by trains to horizontal columns of fresh air. Another point is that the safety of the public depends in some measure upon the design of the ventilation apparatus. For example, if the plenum system had been adopted the foul air would be ejected through the passages and shafts, to the manifest discomfort of passengers. Moreover, in case of fire the only means of egress from the tunnels would be filled with smoke, and their use might thereby be impracticable. On the other hand, the exhaust system operates by removing foul air through a duct not used by passengers, and opening from the tunnel roof, to which smoke and other fumes

caused by any unforeseen cause would naturally rise. At the same time the passages will be kept clear by the inflow of fresh air from the surface, and, therefore, always available for use.

With the object of insuring adequate supplies of fresh air, six exhaust fans have been installed at intervals along the line, each capable of moving 18,500 cubic feet of air per minute from the stations and running tunnels. While these fans are in full operation some 11,000 cubic feet of foul air are removed, and a corresponding volume of fresh air is drawn in, sufficient, in fact, to renew all the air in the average length between the stations at least once every hour. The installation is virtually a scheme of station ventilation, although the tunnels will derive incidental benefit. It is certainly a better one than any hitherto attempted on a low-level railway, but it remains to be seen whether all the benefits anticipated by the company will be fully realised.

Turning now to the equipment of the railway, it should be mentioned in the first place that the total length of the authorised line is about five and a quarter miles, and that at Kennington an inclined tunnel has been made, communicating with the surface through a depot established on the site occupied for many years past by the Indigent Blind Schools on the south of St. George's Circus. Here ample accommodation has been provided for the housing and repair of rolling-stock. It has not been necessary to erect a generating-station for the supply of motive power, as electricity is furnished from the power-house of the Underground Electric Railways Company at Chelsea, being transmitted in the form of alternating current at a pressure of 11,000 volts to sub-stations at suitable intervals along the new line, where it is transformed to 600-volt direct current for distribution to the motors installed in every train. In order to guard against the possibility of breakdown, the main transmission cables are in duplicate, and the transformer plant at each sub-station is of sufficient capacity to supply the whole line in case of need.

In order to avoid the repetition of any trouble such as occurred on the Central London Railway, the lower portion of the tunnels has been filled in with concrete, in which a longitudinal drain has been formed, and into this firm foundation the sleepers of the permanent way are embedded. The running rails are laid to standard gauge, and consist of bull-headed sections, 90 lb. to the yard, their length ranging from 35 ft. to 36 ft. 5 in. The rail chairs are secured to the sleepers by means of screwed bolts in place of the ordinary spikes. The negative conductor rail, instead of being an inverted channel, as usual, is of square section, and is laid between the running rails, the positive conductor being carried on insulators of special design near the ends of the sleepers.

The rolling-stock at present in use comprises thirty-six motor carriages and seventy-two trailer carriages, all of these having been built by the American Car and Foundry Company, of Manchester, and, as stated above, they are of the most approved fire-resisting type. The electrical equipment of the cars was furnished

by the British Thomson-Houston Company, and may be thus briefly described. Each motor-carriage is fitted with two 200-horse-power electric motors, with control apparatus and air-compressors in a steel cab at the driving end of the car. The contacts and circuit breakers are hung from horizontal slate panels carried by rigid steel frame-work. This mode of installation is clearly advantageous, for, in the event of any fault taking place, it is far safer to have the apparatus enclosed in a steel compartment than beneath the car, as in the case of the District Railway.

In respect of signalling we may say that the electro-pneumatic system has been introduced, in a manner providing for both automatic and semi-automatic working of the signals and points, and including a complete scheme of interlocking. Each of the trains works the signals in the following manner:—A signal is placed inside the forward end of each block section, this signal being automatically set to "danger" as the train passes. When the train has reached the end of the block section it automatically sets the signal at the backward end of the next block to "clear," so that there is always a danger signal at a sufficient distance behind each train to permit the next train following to be pulled up by an automatic stop. This stop prevents trains from running past any danger signal, and consists of an iron arm outside the track rail, actuated by a compressed air motor acting in unison with the adjoining signal motor. When the signal goes to danger this arm is raised to a position in which it engages with the cock on the air-brake system of the train. Thus the brakes are automatically applied if the driver should disregard the danger signal. Another safeguard is that, should a driver release the handle of his controller for an instant, the current would be automatically cut off from the motor and the continuous brakes applied.

An ingenious telephone system has been provided for the use of drivers, telephone instruments being installed on every motor-car, and fitted so that connexion can be made from a train in any part of the tunnels with copper conductors running alongside the train, and thereby communication can be opened with the nearest passenger station, with any of the exchanges used in connexion with the power-house at Chelsea, or with any of the public telephone exchanges.

From the foregoing description it is evident that every possible effort has been made by the company to provide for the comfort and convenience of the travelling public, and that every available means has been applied to provide for their safety. One disadvantage, however, shared by this line with other tube railways is the gap presented, particularly at Baker-street station, between the carriage steps and the edge of the platforms. Heedless and short-sighted people run some risk of injury under the present state of things, but we understand that this is engaging the serious consideration of the company, and it is to be hoped that a satisfactory remedy may soon be found.

The present line is, of course, only

a portion of the much larger undertaking to which allusion was made in the early part of this article. Consequently, its usefulness cannot be fully developed until the further railways included in the general scheme have been brought into operation. Still, we are confident that this first instalment will confer a great boon upon the people of London, and when the entire system is opened it will constitute an admirable object lesson of what may be accomplished by judicious and well-co-ordinated schemes towards the solution of the passenger traffic problem.

TABLE SHOWING MEANS FOR THE INTERCHANGE OF PASSENGER TRAFFIC (BAKER-STREET AND WATERLOO RAILWAY).

Station.	Connected and Adjacent Railways.
Elephant and Castle	{ City and South London Railway. County Council Tramways.
Kennington	{ County Council Tramways. Waterloo and City Railway. London and South-Western Railway.
Waterloo	{ South-Eastern and Chatham Railway. County Council Tramways.
Embankment	{ District Railway. South-Eastern and Chatham Railway (short walk).
Trafalgar-square	{ Charing Cross, Euston, and Hampstead Railway (short walk).
Piccadilly-circus	{ Great Northern, Piccadilly, and Brompton. Central London Railway.
Oxford-circus	{ Central London Railway.
Begeut's-park	{ Metropolitan Railway (short walk).
Baker-street	{ Metropolitan Railway.
Lisson-grove	{ Great Central Railway.
Paddington	{ Great Western Railway.

NOTES.

At last the full Report of the Board of Consulting Engineers, together with the Report of the Secretary of War, a statement by the Chief Engineer to the Canal Commission, and a letter from the President of the United States, have been submitted to Congress. The President's letter is justly characterised by the *Engineering Record* as "most surprising and scarcely less disappointing." When appointing the Board of Consulting Engineers in September last the President said:—"I have named you because in my judgment you are especially fit to serve as advisors in planning the greatest engineering work the world has yet seen." Now that the Board have reported in favour of a sea-level canal, the President, acting in concert with the Secretary of War, has written to Congress strongly recommending the reversal of the finding, and the sanction of an 85 ft. summit level canal with six locks. It is indeed an extraordinary thing that the President should have thought it worth while to appoint a Commission of experts if his intention was to be his own consulting engineer after all, in the event of a decision adverse to his own feelings. Bearing in mind the fact that the whole subject has been submitted to the prolonged study of a body of the most experienced American and European engineers, it would be only reasonable to suppose that the recommendation contained in their Report would be adopted without question. Of course, the matter is not yet settled, for the final opinion of Congress has to be taken. The project now advocated by the President is clearly not the best, and, if once carried out, there will be no possibility of afterwards converting the lock canal into one at sea-level, as was formerly anticipated.

Hence any false step will be irrevocable. And in view of the enormous expenditure involved, the issue clearly demands most earnest and unbiassed consideration by the final Court of Appeal.

Two Bills on Trade Disputes. TWO BILLS have already been introduced in the present Parliament relating to Trade Unions and Trade Disputes. Of the first, which is presented by Mr. Hudson, nothing further need be said than that it is identical in its terms with the Bill of last year known as Mr. Whitaker's Bill. The second Bill is presented by Sir Charles Dilke, and is supported by Mr. Keir Hardie, who also supports with other members the first Bill. The Bill in the memorandum states that its object is "completely to restore Trade Unions to the legal position in which they were intended, and until recently were understood to stand," but it would appear more accurate had it stated that the intention was to place them in the position in which they wish to stand. This Bill is also only a replica of one introduced by the same members in 1904, save that the clause as to "peaceful picketing" is now the same as in Mr. Hudson's Bill. The two Bills are practically the same, except that Sir Charles Dilke's Bill, besides legalising "peaceful picketing," rendering actions against Trade Unions impossible and altering the law of conspiracy so that combined action on the part of two or more persons in furtherance of a trade dispute shall not be actionable unless similar action on the part of one person would be actionable, in Clause I, carries the matter much further, since it provides that an interference by one person, in furtherance of a trade dispute, with the exercise by another person of his right to carry on his business or with the "establishment or continuance of contracted relations between other persons," is to give no ground of action. Is any comment required on such a clause? We hardly think the labour party can seriously contemplate the introduction of such an element of discord into their trade relations; and, if they do, we feel assured that the working men themselves will resent the introduction of irresponsible interference in their relations with their employers and with the conditions of trade generally.

Making up Streets. AN interesting question was decided last week in the case *Mayor, etc., of Hornsey v. Birkbeck Freehold Building Land Company*, on appeal from the justices. The respondents, the land company, were owners of property which abutted on Birkbeck road, situated on its north side. The boundary between the Hornsey Borough and the Friern Urban District runs along the kerb on the north side of the road, the north footpath being in the Friern District, but the roadway and the footpath to the south side of it being in Hornsey. The Hornsey Borough Council, acting under sect. 150 of the Public Health Act, 1875, had made up the roadway and the south footpath, and apportioned the expense as regards the roadway between the owners of premises on both sides of the road. The sum

apportioned to the respondents was 72l., and the appellants, the Hornsey Borough Council, were suing them for this sum. The Divisional Court have decided that the Borough Council had no power to charge the owners outside their own district, and thus the action failed. The decision is of considerable importance. It is to be observed that sect. 150 of the Public Health Act, which deals with such streets not being highways repairable by the inhabitants at large, contemplates the expenses being borne by the "owners or occupiers of the premises fronting, adjoining, or abutting" upon those parts of the street which require making up. The accident that this road lay between two districts would seem to have the effect of making the whole expenses incurred in making up the roadway a charge upon the owners of houses on one side alone, and to create some hardship to them. The Friern houses did not drain into the sewer under the road as the Hornsey houses did, but their owners appear to have had all the advantages of the road, and yet to escape liability.

Speed Regulators and Motor Omnibuses. THE conviction of two motor omnibus drivers for exceeding a speed of 16 miles in London draws attention for the necessity of motor-car manufacturers applying some mechanical contrivance which automatically shall fix a maximum speed limit. In the two cases in question the defendants relied upon the fact that the omnibuses were fitted with automatic governors, which rendered it impossible to exceed 12 miles an hour, but the magistrate found that these governors were capable of being tampered with, and that the omnibus company had posted notices threatening with dismissal any driver who should tamper with them, and in face of this fact he refused to accept a statement that the governor had not been tampered with, and accepted the evidence of the police as to speed taken by stop-watches. If the motor omnibus is to supersede the horse-drawn vehicle, it is important to the companies that speed governors should be fitted which cannot be tampered with, and there would appear no difficulty in accomplishing this in the case of vehicles going a moderate pace in fixed localities.

Acceleration and Accelerometers. THIS is the title of a paper read before the Junior Institution of Engineers by Mr. A. P. Trotter, the Electrical Adviser to the Board of Trade, who deals in very plain language, not unflavoured by just a suspicion of what may be termed latent humour, with phenomena of much interest to users of railway and other public carriages. Mathematicians tell us that the force of acceleration varies in a manner indicated by a certain arrangement of algebraical and trigonometrical values, which, however, does not appeal to all minds, and certainly does not convey a clear conception of the practical effects produced by acceleration and retardation upon passengers in systems of traction, where high speeds and numerous stops occur. The employment of higher speeds on suburban railways has had the effect of bringing the subject prominently forward, for in such work acceleration is of far greater importance

than full speed running. It is important that acceleration should be taken into account in designing, and equally important that it should be accurately measured in experiments. From the standpoint of the engineer, acceleration is a force measured in pounds per ton of train, while to a passenger it is the rate of change of velocity, which may have the effect of slewing him violently forward or backward when seated, and of throwing him off his balance or throwing him upon a pile of other passengers when standing in a carriage. The various ingenious accelerometers described by Mr. Trotter are capable of indicating acceleration and retardation with much nicety, and are extremely useful for studying the results of traction in a scientific way. The practical value of scientific study is that it ought to lead to the arrangement of braking apparatus so as to reduce the violence of slewing, lurching, and jerking to a minimum, without operating against the reasonable desire of passengers to attain the end of their journeys as rapidly as possible.

At the recent Electrical Exhibition at Olympia the most striking novelty in the design of most of the dynamo and motors exhibited was the use of "interpoles," that is, small poles placed between the field poles so as to counteract the demagnetising effect of the armature currents and the consequent excessive sparking of the brushes when the machines are running under load. The use of these interpoles enables the constructor to build machines for much higher voltages, which will run without sparking at all loads, and, in some cases even, without moving the brushes. In a recent communication to the *Electrical World* of New York (February 24, 1906), Mr. F. J. Sprague, one of the pioneers of electric traction, gives extracts from patents which were taken out by him as long ago as 1884, conclusively proving that he had completely anticipated modern practice in this respect and that motors made on this principle were running in New York in 1886. It is curious that the Sprague Electric Railway and Motor Company should have laid aside this method for many years whilst making developments in other directions, and only taken to it again at the same time as their European rivals. The possibility of constructing direct current dynamo and motors economically for pressures of 1,500 volts and upwards will modify ordinary practice in connexion with the design of electric systems for heavy traction work. With these high voltages new methods of regulating the speed of direct current motors become feasible, and Mr. Sprague states that with his 1,500 volt motors the ratio of the minimum to the maximum economical speed is 1 to 8, and that the motors will run practically equally well at any speed between these limits, the controller giving almost a continuous variation of the speed. In a recent article also in the *Elekrotechnische Zeitschrift* Herr Dettmar predicts the important consequences that will follow from the cheapening of the cost of high voltage direct current machines not only in electric traction but also in power transmission.

THE Report of Dr. Reginald Farrar to the Local Government Board on the Sanitary Circumstances and Administration of the Clun Rural District, Salop. states that, while the district in respect of house property compares on the whole not unfavourably with other rural districts, defects in housing conditions are sufficiently numerous to call for vigilant and systematic inspection by an inspector of nuisances. In regard to water supply, the district being intersected throughout by high hills which form good gathering grounds and yield copious springs at their bases, the problem should present comparatively little difficulty; but it is computed that less than half the population of the district derive their water from supplies conveyed by pipes; the remainder draw water from shallow wells, from springs, sometimes converted by steining into dip-wells, or from brooks; and in many cases the supplies thus obtained are inadequate in amount or liable to serious pollution. The pollution of the river Clun by the sewage of Clun, and by privies built over it, is noted as a state of things that ought not to be allowed to continue. "It would, I think, be practicable," says the Report, "without undue expense to gather the drainage to a single outfall on each side of the river, and by means of septic tanks and filter beds to purify the effluent before discharging it into the stream. This is a measure which the Rural District Council should take seriously into consideration." The disclosures as to removal of excrement are as bad as we are accustomed to find in these cases of insanitary country districts. It was found that some of the school privies had only been cleaned out twice in fourteen years. Dr. Farrar's remark at the close, that "the Rural District Council should take a more serious view of their responsibilities, as a body charged with the care of the public health," seems certainly to be not uncalled for.

The final services were held at St. Michael, Burleigh-street, Strand, on Sunday, September 10, of last year, and the parish having been united with that of St. Paul, Covent-garden, the church will shortly be pulled down by order of the Ecclesiastical Commissioners. It was built in 1832-3, as St. Michael's Chapel-of-ease to St. Martin-in-the-Fields, after designs in the Gothic style by James Savage. The interior was re-seated and otherwise improved in 1862, and 300l. has since been expended upon repairs and decoration in memory of Queen Victoria. The east window was a gift of Lady Burdett-Coutts in honour of the Duke of Wellington; the organ, by Gray, was restored by Richardson thirty-five years ago. The communion plate, font, altar-table and some fittings will be transferred to the church of a new ecclesiastical district at Sutton-court, Chiswick. The net proceeds of the sale of the site and materials are to be applied towards the site and the building of the new church of St. Michael to the extent of 8,000l., and towards the new parsonage-house, a repair fund for the existing parsonage-house (for which the Duke of Bedford gave the ground), and the augmentation of the income of the united benefice. The freehold site, at

the corner of Exeter-street, extends over about 4,400 ft. superficial, and will be offered for sale at the Mart on March 27.

THE impending demolition of No. 15, Buckingham-street, Strand, is announced of the large house which stands at the southern end, east side, of Buckingham-street, near the York water-gate in the Embankment-gardens. The house was occupied in 1689 by the Tsar Peter the Great, who had for his opposite neighbour Samuel Pepys, who lived at No. 14 in the interval 1684-1700. No. 15, a former home of the Institution of Civil Engineers, was afterwards the residence of W. Black, the novelist, and is mentioned in his "Sunrise." Nos. 14-5 are delineated in one or two of Samuel Scott's pictures of the riverside, but No. 14, we may point out, has been rebuilt since, as will be seen from a comparison of the present state of things with the view as depicted by W. James in his painting of or about 1756, which is now, or was lately, hung in the Queen's Presence Chamber, Hampton Court Palace. No. 15, which has two ceilings finely painted by hand, overlooks York-terrace, formerly Villiers-walk, a water-side promenade of which Hugh Hewson, Smollett's school-fellow and the original of his "Strap," was keeper during many years. Hewson's death, at the age of eighty-five years, and his burial in St. Martin-in-the-Fields graveyard are mentioned in the *Dublin Pantheon*, April, 1809.

At the Fine-Art Society two exhibitions are open together. Mr. Fulleylove fills one room with a collection of "Pictures and Studies of some Architectural Monuments of London." These, as a whole, were a little disappointing to us; a good many of them seem to have lost the clearness of light and colour on the buildings through having been somewhat overworked on the surface; we refer mainly to the exteriors. There are some excellent architectural interiors, such as "The Norman Chapel in the Tower" (21). Of two views of the interior of St. Paul's we prefer the smaller one (11); No. 31, on a larger scale, is excellent in perspective, but we have never seen the interior stone-work look so brown as it is shown here. Among the exterior views which are clear and bright in effect are "Hyde Park Corner" (4); "Waterloo Bridge" (18); "Lambeth Palace" (45), and "Old Buildings, Lincoln's Inn" (63), one of the very best. The small drawing of "The Water Stairs, South Side of Waterloo Bridge" (51A) reminds one of a most effective subject, which might very well be worth treating on a larger scale. As a record of London sites and buildings the drawings make a very valuable collection; and the panoramic view of London as seen from the top of the Tower Bridge is a great success, the more so as we are spared the sight of the bridge itself. In an adjoining room is a collection of water-colours by Miss Ina Clogstoun, under the title "Italian Spring and English Summer," of which one cannot speak without enthusiasm; they are beautiful from beginning to end. Miss Clogstoun has a fine sense of colour and gets all her detail in a true water-colour method of execution. We may

mention especially "Red Roses, Villa Carlotta" (37) for composition and colour alike; "A Gay Border—Balcarres" (44), a garden scene in a flood of light; "The Cypress Avenue—Villa Mondragone" (46); "The Pool, Villa d'Este" (52); and "Val d'Arno" (31), as some of the best in a charming collection.

It was a good idea of the Burlington Burlington Fine Arts Club to honour the memory of Mr. Charles Furse by making a collection of his pictures at their rooms, and one is glad to see so many of them together; but it must be admitted that the room is too small to show them to advantage. Furse's large style of banding, in such pictures as "Cubbing with the York and Ainsty" and "Diana of the Uplands," requires large spaces, and the latter does not look nearly so well as it did in the Academy. We hope this beautiful work will be acquired for some public gallery; it ought to be in the Tate Gallery. The collection as a whole impresses one greatly with the power of this early lost painter; he would have been, had he lived, one of the greatest English artists of his day.

At the Baillie Gallery in Baker-street there is on view a large collection of flower-paintings, mostly water-colours but with some oil-paintings; it is stated on the catalogue to be the first of an intended annual series of flower-painting exhibitions. Flower-painting is beautiful practice, but a whole exhibition of this class of work rather wants interest, it is such a merely imitative form of art, and a good deal of the work is hardly the highest of its class. Among the best works are some by Mr. Francis E. James, and a large painting of anemones by Mlle. M. Lemaire, which shows great power of execution both in the flowers and the basket which forms the principal accessory. Flowers are best treated, as in this case, as portions of a still-life scheme of composition. Among the well-known artists exhibiting, but not specially known as flower-painters, are Mr. Clausen, Mr. Lorimer, Mr. Wirgman, Mr. Grosvenor Thomas, Mr. James S. Hill, Mr. MacWhirter, etc. It is odd, in such an exhibition, not to find the name of Fantin-Latour, the only artist we have known who has been able to make an exhibition entirely of flower-paintings really interesting. In the small room are some good landscapes (water-colour) by Mr. Vigoules Fisher, among which we prefer some of the smaller compositions—"Wind in the Sky" (8); "A Ray" (9); "Afternoon in February" (16); and "Amongst the Heath" (29). In the larger drawings the skies tend to be rather heavy and overloaded.

THE Junior Institution of Engineers gave their annual conversation on Saturday last at the Westminster Palace Hotel. The entertainment was of a most varied description; a lecture by the President (Mr. Dugald Clerk) on "Algeria," with a number of lantern illustrations, some of them showing some extremely interesting bits of early architectural remains (Roman and other); an illustrated lecture by Mr. C. Alfred Smith on "The Evolu-

tion of the Battleship"; Mr. W. Day's orchestra, and some good piano-playing and violin-playing from Miss Beatrice Dunn and Miss Evelyn Russell respectively, besides songs from several other performers. In the rooms upstairs visitors could inspect their bones with the Röntgen rays (one lady prepared to take off her glove for the purpose, but was told that was unnecessary—the rays could see through the glove), a working model of a paper-making machine was in operation, and various other models and drawings of engines, etc., were on view. Altogether the Institution may be congratulated on a most successful evening, in which instruction was happily combined with amusement.

HACKNEY CENTRAL LIBRARY COMPETITION.

The public library is perhaps the most popular subject for competition amongst architects, and provides an occasion for the youth of the profession to try its skill. It is therefore not surprising that the request for designs for a central library for the metropolitan borough of Hackney should meet with the very large response represented in the 152 sets of drawings on view at the Corporation Baths. Each set consists of $\frac{1}{2}$ -in. scale plans, elevations, and sections, $\frac{1}{4}$ -in. scale details and perspective view; and the sight of this enormous amount of wasted work lining the upper walls and the entire extent of the tank of a very large swimming-bath is a matter for serious reflection. The depression produced upon the spectator is somewhat lessened when it is seen that at least one-third of the schemes are absolutely without merit of any kind, and represent the extraordinary diversion of thought and ideal existing in the minds of the increasing number of followers of the art of architecture.

Ten thousand pounds is the amount of money at disposal for a building which is to occupy an irregular quadrilateral site measuring about 84 ft. to Mare-street, 128 ft. to Paragon-road, 45 ft. to Valette-road, and 118 ft. to a party boundary on the north side. The usual accommodation is required, and the 152 ways of regarding the problem are interesting and remarkable. With the award and report of the assessor, Mr. J. W. Simpson, we are in entire agreement.

The entrance is subservient to the location of the departments, and in this instance the principal street, Mare-street, has a short frontage. Very few designs provide the entrance from this thoroughfare, but the angle position is mostly attempted, and produces the best solution of the problem, while a side doorway is the one next generally adopted.

The three premiated designs have angle approaches. Mr. H. A. Crouch, No. 26, is the winner of the competition with a design which we say without hesitation is very much the best. Naturally there must be great similarity in the numerous schemes, but the adroit stroke in Mr. Crouch's scheme lies in the protrusion of the public counter of the lending library into the main hall. To the left on entering are the main stairs and the children's library; opposite the door is the lending library, while the newspaper-room is immediately on the right. On the first floor the magazine-room is on the Mare-street front and the reference library on the Paragon-road side, but both floors are arranged in such a way that official supervision is perfect. Through ventilation is contrived for the ground floor departments by lowering the stack-room of the lending library, an important point not generally provided. Areas of rooms were left to competitors, and we think the author has given an excess of space to the reference library. There is no escape for readers in the women's magazine-room other than through the men's part of that department, and the approach to the sanitary conveniences for occasional public use is not happy. It is impossible to include all the necessary points, but this plan obtains more than the other competitors show. The architecture is admirably ex-

pressive of the purpose of the building. A stone rusticated angle pavilion with a semi-circular open porch is the dominant feature. The fronts are of brick and stone, each terminated by a stone projection. There is a sense of dignity in the scheme, which is well expressed in an excellent view, and the deep brick frieze, from which windows are excluded, supplies a breadth and massiveness of considerable value. The Borough Council is to be congratulated upon the successful issue of the competition.

No. 23 is placed second, and is the work of Messrs. Trimmell & Davison. The plan is very similar to the selected design, but is not so simple or easy in working, and is, moreover, greater in cost. Only a part of the news-room receives cross-ventilation, but a mechanical system is provided, for which a turret is placed on the Paragon-road roof. The ground floor supervision is open to improvement, while the first floor lavatory, etc., is liable to become a public convenience owing to its undue prominence. The lighting of it is not happy, a point evidently shared by the authors, who omit the small side windows from the perspective drawing. A large dome emphasises the angle entrance. Some detail hereabouts is very ordinary, but the rusticated Ionic pilasters are eccentric, and the upper main windows have unpleasant proportions. Whereas the first design makes full use of corners in the angular planning of the hall, No. 23 is wasteful in getting nothing out of the corners, in spite of the possibility of the authors' intention to arrange flues.

The third premiated design, No. 140, is the work of Messrs. Crouch, Butler, & Savage, and, although it is still planned upon the preceding principles, has less merit, and scarcely deserves premiation. The whole site is built upon, which produces that excess of corridor and consistent generosity of treatment which is the weak element in the scheme. The inner and outer doming, for instance, is a method more suited to a huge building than the humble institution of a library.

Some remarks upon a selection of the remaining designs may interest our readers in regard to the aspect of variety which characterises library competitions.

No. 6 places one range of ground floor rooms parallel with the north and one with the south boundary, and into the intervening wedge-like space the hall and borrowers' counter are driven. The central door on the Mare-street front produces a third plane in the line of this façade, and it is observed that a piece of the site is given up to the public footway. The fronts are banded in brick and stone, and there is much excellent detail, but supervision is not a strong point. No. 22 is one of the most satisfying exteriors in the exhibition. A side entrance is arranged, with news-room to the left, children's-room to the right, and the lending library between them. The detail is excellent, and, although the side street is widened for this particular perspective view, the central feature would suffer loss of dignity in the side road.

A stone building and another angle entrance plan is No. 32, wherein two stair-cases are unnecessary. The fronts have interest, but the curved angle portico, with columns two stories high, is overpowering, and the arched flanking façades are poor and heavy. The supervision is well considered. A convex wall behind the portico and appearing in the parapet above is an honest way of producing this now popular combination of features.

No. 33 is a very good exterior of the angle entrance type drawn beautifully in pencil; the plans were unfortunately missing. A good example of the typical design of the fronts in this competition is seen in No. 45. Here is the customary domed angle pavilion, with brick side fronts terminating in stone-featured projections. The weak spot in the planning of No. 46 is the placing of the newspaper-room, the most frequented department, in the rear of the site, and the consequent missing of the chief traffic through the length of the building.

There is an air of rapidity about the drawing of No. 50, which also characterises the planning. The fronts are consequently too much broken up. The author has large ideas of the magazine reading public of Hackney, but we are afraid that the ladies

of the borough will not care to ascend and descend the two staircases in order to pass from one side of the building to the other.

There is magnificent force in the external qualities of No. 53, from the view of which the return front is wisely omitted. The scheme covers the whole space, and is wasteful in general respects. The quiet simplicity of No. 54, which is a stone building, is refreshing. The planning is simple, although not facile, but the design and detail are commendable.

The circular hall plus the staircase hall in No. 55 is somewhat unnecessary, but the plan is otherwise excellent and easy working. The exterior is more suited to the demands of a town hall. There is a sense of experience in the details of No. 55, which has a side entrance, but perhaps the main corridors are overdone in length. The elevations have much good detail. Although the rendering of the view of No. 62 suggests the scene of an inquest rather than the eagerness of people in search of light and leading, there are many merits in this design. The angle portico, together with a large inner hall, is not economical, while the door to the news-room is quite inadequate.

No. 67 is on the lines of the leading trio, and is an excellent design. The recessed angle treatment with projecting circular portico, above which rises a charming turret in stone, is one of the most pleasing ideas in the whole series of designs. We certainly think this scheme would have obtained a premium had the Mare-street front received more consideration. No. 71 is emulating the qualities of a town hall, and has a large, overhanging eaves to a flat gable, which is carried to the ground by the agency of three pairs of pilasters. The central pair is unhappy, and occupies a place usually assigned to the entrance doorway, and thus discloses one defect. The news-room at the rear of the site is another, but the interior would be very dignified. The drawings are charming.

We do not understand the special reasons for giving the plan of No. 72 the external expression of a plain domestic residence. Although the supervision is faulty, the scheme merits a more serious idea in front. No. 74 is a good scheme, quite on the right lines. The lending library and book store above, however, prevent the other ground floor departments getting the necessary cross-ventilation, and perhaps the reference-room, although having no windows on the outside wall, would be noisy on the Mare-street side. The view of No. 80 shows much tasteful design, but the scale drawings are miserably rendered. No. 86 is one of the best plans, and has good fronts, but the view does not adequately convey this idea. There is a magnificent lobby for borrowers in No. 91, which will be an excellent romping place for the children, whose room it also serves. Another drawback is that the librarian will see the sky, and nothing else in nature, and would not fail to tell the author of this fact. The party wall copings on the roofs are surely not serious. No. 99 is one of the many miniature town halls, and is municipal even to the balustrade of the basement areas. No. 108 is a charming design, and appears to be a most fitting building for its purpose. The entrance at the north corner of the site involves a long, top-lighted corridor to the news-room at the rear, the position of which is objectionable. Again, the irregular recessing of the side front is not satisfactory. The view admirably shows a brick and stone Georgian design, in which the roof plays a strong part. In addition to the excellent gables, the façade has stone terminal projections and a frieze of circular niches containing busts of famous literary men. The plan is directed chiefly to this front, and not to the actual site. The plan of No. 138 has merit, and the severely learned quality in the Greek Classic idea is interesting.

LABOURERS' COTTAGES.—Answering a question by Mr. John Roche as to the building of labourers' cottages with regard to which the Ballinascloe District Council state that the cost of acquiring the sites for labourers' cottages almost 100% more than it did before 1898, the Chief Secretary for Ireland states that the proposals contained in the Labourers Bill, which the Government are to introduce, will tend to diminish largely the incidental expenses connected with schemes for labourers' cottages.

ROYAL ACADEMY LECTURES.

On Thursday the 1st inst. Sir William Richmond commenced a series of three lectures on "The Development of Sculpture." Lectures, he said, on subjects of this kind could not teach much; they were a stimulus only; and the three which he was to give must be taken as representing a continuous argument; the concluding one would not be intelligible apart from the opening argument. He wished to commence with some preliminary considerations as to the origin of art. It would seem that man had always had an impulse to represent in some way either what he saw or what he imagined; whether the primary moving cause towards doing so was mere curiosity, or admiration, or fear. But the impulse must have existed long before any time of which we had historic evidence, for the oldest known representations, the ancient incised drawings on bone of the cave-men, of which they could see examples in the British Museum, could not be the first efforts of man at drawing; the people who did them were in their way accomplished artists; their drawings could not be called primitive: there must have been a great deal done before they arrived at that stage. Man could never have been without some degree of artistic aspiration; it was that which more than any other quality distinguished him from animals. The communication of ideas by some kind of pictured symbol probably preceded writing, and even was to some extent the origin of it; the symbols drawn became stereotyped emblems, and formed the foundation of alphabets. The origin of design would probably arise in the offering of weapons; weapons were a necessity in savage life, and the idea of decorating them perhaps arose partly from the desire to give them a personal value as property. The love of beauty for its own sake one could not account for, save by supposing that man had in his nature some infinitesimal portion of the Divine nature, leading him to the desire to create some ideal possibility; ideas being at first only expressed by symbols, a block of stone serving as an idol, till from this the symbol rose by degrees to the perfect art of the Greeks. But art had concerned itself also with the grosser aspects of nature; the first ideal was that of beauty, the second that of gauntness and ugliness; this double nature, that of Love and Fear, had always existed in art. Could we question the Primeval man, he could perhaps have told us whether his symbolic art was the offspring of terror or of love. Perhaps it arose from both feelings at once; like the ancient Egyptians, the primitive man might have made a mythology out of his own emotions. All art, in one sense, was symbolism; as the primitive man made the circle an emblem of the sun, a modern child would make some scribble on paper which represented to him some idea that was in his own mind. It was noticeable that children took to drawing before they took to shaping anything in the round; this symbolism in the representation of form was the germ of idol worship, as it was also the germ of portraiture. Recently the attempt had been made to divorce art from meaning; Literature was jealous of Art representing ideas, or recording facts or narrative; art was to be content with form and rhythm. But there was nothing to forbid our uniting the ethical with the aesthetic in art; the greatest men had done so. We should avoid such narrowness, as we should also avoid the mistake of regarding art as a series of different professions. Art was *one*, though a variety of emotions were expressed by different means; to limit sculpture and painting to facts was mere professionalism. Our finer perceptions were injured by a vulgar environment; we too soon got used to it; and the present tendencies in art were vulgar—the tendency to illustrate squalor and misery; it was part of the spirit of hurry of the present day, which drove us to rush at motor-car speed over the fame of our ancestors in the act of advertising ourselves. A nation that had become pessimistic was on the way to its downfall; our proper task was to arrest this decay, not to encourage it. The real difficulty was to build into the old structure wisely and securely. It was never more difficult really to know ourselves than at the present moment. Was legitimate originality impossible? Originality, it must be remembered, was a rare quality; it did

not come by leaps and bounds; it was the offspring of modesty and courage combined. Reynolds was of opinion that a knowledge of all art history was necessary before we could become original. Art had now grown, as it were, to man's estate, after passing, like man, through stages of weakness and disease. What seemed new was a growth out of the old stock; the links in the chain could be traced back to 5000 B.C.; the men of the Stone Age were our artistic ancestors; we were echoes of the past, and our own work would echo to the future. The idea of evolution applied to art as well as to science, and there was therefore a grave responsibility on us of the present day to make a worthy choice of subjects. Intelligent natures would continue to look for a motive in the arts of design, and what was said in art must be related to what was highest in our nature. Religion was the great inspirer of ancient art, its two types, the Pagan and the Christian, the figures of Jupiter and Christ, had become almost inseparable from artistic expression. Philosophy had not reasoned away the idol forms from art. But the fear that beauty was a kind of snare was far too widely spread. The nude form shocked the *bourgeois* mind, yet the Bible quoted it as the image of the Creator. He could not but say that he valued Tradition, and did not believe in a "New Art."

This preamble was necessary in order to explain the view which he took of his subject. Let them consider now what they saw in the artistic remains of the oldest known civilisation—the Pyramids of Memphis and the Sphinx, going back to about 5000 B.C.; perhaps even earlier. The Sphinx was the oldest piece of sculpture known to us; when Pliny saw it, it was coloured, as sculpture was coloured in the Greek and Medieval Periods also. It was an extraordinarily expressive work, especially in its diversities of expression. He had seen it during every hour of day and night, changing its expression with the time of day; it looked grim at noonday, in full sunlight; it took a cynical expression at sunset; it was always changing. It had seen the fall of dynasty after dynasty; Moses and Napoleon had alike contemplated it; and it still remained a masterpiece; no photograph gave any real idea of it.

The Memphian sculpture was very realistic in character. The best examples were found in the tombs, especially figures carved in sycamore or acacia, the only two trees found in the Nile Valley which were suitable for wood carving. He showed the photograph of one which was evidently the portrait of a middle-class man who held some office, with a long wand of office in his hand; the character of the figure was admirably given, and the figure resembled very much the kind of man whom one might find exercising the same kind of office in the Egypt of today. The hands and feet, however, it would be observed, were less carefully executed than the head. In other examples, too, they found the limbs clumsily executed, while the head was full of character; it was an age of portraiture in sculpture. The statue in basalt of Chephren, the builder of the Second Pyramid, showed a great deal of artistic perception in the emphasis given to the most essential details. The life of an ancient people was more vividly shown in the bas-reliefs and paintings in the Memphian tombs than any written record could have given it. The representation of birds and animals was excellent, and reminded one of Japanese work. The gods were not represented as perfect men; they were only alluded to. It was an age of realism and portraiture. But the study of its works was a good preparation for the understanding of Greek art.

In his second lecture, delivered on Monday the 5th, Sir W. Richmond said that he would now consider the art of the Theban period in Egypt, when the seat of government had been transferred from Memphis to Thebes; a period when we found much larger temples, led up to by avenues of sphinxes, and colossal statues of kings represented as gods, and the tombs were larger and more important in their architectural and decorative treatment. From the XVIIIth to the XIXth century there was an inroad of a foreign Turanian race, known as the Hyksos or Shepherd Kings, who adopted the

religion and art of Egypt. The sphinxes might have been portraits of these Hyksos kings; the type of face they showed was not Egyptian. Eventually Egypt revolted and expelled the Hyksos, and after this a new and more brilliant period arose under the new Theban empire. Art in this period became important in connexion with the ideas as to the life after death, and the dead were honoured not only in the quantity but in quality of the art bestowed on their memory. Art thus became a sacred thing, a religious necessity, and illustrated ideas which in the Memphian period were only described in writing. The occupations of the deceased were illustrated on the walls of his tomb, and the myth of Osiris, who, having been permitted to visit the earth, was slain by his brother Typhon, the power of Evil, and became the guide of the souls of the dead, because he had lived with and known men. In the colossal statues the portrait character was much less marked than in earlier art; the expression was more abstract. These colossi were mostly carved out of one block of stone. In the tombs the walls were very carefully prepared for the bas-reliefs, and the design then sketched out for the carver to work upon. They retained the ground of the design untouched, not cutting into it for any accompanying detail. Did the Greeks ever see any of these Theban tomb sculptures? He thought it was probable that they did. But on the whole it might be said that the Greeks learned sculpture in the round from Egypt, and Egyptian influence was quite obvious in early Greek sculpture; but bas-relief they probably learned from the Assyrians. Was it possible that the colossal Zeus of Pheidias resembled at all the colossi of Egypt?

In considering the influences prior to Greek art they had to reckon with five nations—Chaldea, Assyria, Babylonia, Media, and Persia. Art in Egypt had originally progressed from north to south—from Memphis to Thebes; now it took the opposite direction, from south to north. The Greeks were now to be taught by a people in Asia Minor, the Chaldeans, who again were the artistic precursors of the Assyrians. It had never been proved that Hellenic art was Hellenic in its origin.

The Assyrian reliefs might be called drawing on stone rather than sculpture in the usual sense of the term. The hunting propensities of the Assyrians gave them an interest in animals, and their treatment of these was exceedingly artistic; he might mention especially the admirably sculptural spirit in which they created the lions' manes, a much better sculptural treatment than that of the manes in Landseer's lions. Then the Chaldeans and Assyrians were great in metal-work, and it was probable that Homer's description of the shield of Achilles was inspired by Chaldean or Assyrian metal-work. We saw from the well-known gates in the British Museum that it was customary with the Assyrians to overlay sculpture or carving with gold or other metal, an art afterwards practised in Greece. The sculpture at Selinonte was quite Oriental in feeling; and primitive Greek art showed traces of Assyrian influence. And he could understand how this might be, for long before the colony of Naxos was founded, Phœnician sailors, trading along the Mediterranean, had made the arts of the East familiar on European shores. Whence came the inspiration of the lions of Mycenæ, the oldest sculpture in Europe? The heads were missing, and it had been suggested that they might have been of metal. The prototype of the lions of Mycenæ was to be found in a sculpture in Asia Minor. About the sculpture of Persia little was known; the Persians were eclectic in art, and influenced by others rather than making a style of their own; and as far as there was a native art in Persia it was textile rather than graphic.

The sea-faring Phœnicians, who occupied islands in the Ægean sea, must have almost provided an education for the uncivilised countries which they visited. The archaic age of Greece was not a long period; from about 700 to 500 B.C., and it received its earliest inspiration from Oriental sources. Much fine Egyptian art which is known to us was not known to the Greeks.

At the third and concluding lecture, on Thursday, the 8th, Sir W. Richmond dealt with Greek sculpture. He remarked that

the Greek vase-paintings bore a great deal of resemblance to Greek bas-relief in regard to general stylo and composition and the treatment of the figures. More particularly was this the case in regard to the spacing of the figures and the arrangement of the unoccupied spaces between them. The Greek artist was sensitive to the shape of every portion of his design; not only the shape of the figures but the shape of the unoccupied spaces. The vase-paintings should be studied in regard to this point in design, which was most important. The Egyptian and Assyrian relief sculptures, which were the precursors of Greek work, were always in low relief; alto-relief was a later invention. Vase-painting was commenced by the outline of the design being incised by the master artist, afterwards filled in with colour by his pupils or assistants, and probably corrected or touched upon by the master afterwards. Greek bas-relief, on the contrary, was begun as a drawing on a carefully prepared smooth surface, and the spaces occupied by the figures defined by a coating, perhaps of wax or a colour mixed with wax. Then the ground or space between was cut away till the figure composition showed as a growth out of the ground; and the interior modelling of the figures followed. Where a broad light or shadow was required the surfaces were left flat; but for obtaining strength and emphasis of effect a deep sharp sinking would be made here and there in the drapery, where it was clear of the limbs; a sinking sometimes carried even deeper than the ground, which remained as a half-tint. This device was found in the best Babylonian sculpture, but not in that of the Egyptians, who forced their design by a deep incision all round it, sometimes an inch wide, and within this there was little modelling. This was an easy way of getting effect under a very strong sun, and considering the great size and distances of the Egyptian temples there was an excuse for this forcing the design. With the smaller temples of Greece there was not this necessity for forcing the outline, and the air of Greece was so clear that the most delicate moulding would tell. The system of delicate work in low relief was kept for the friezes—which were on the cella wall, and separated from the external architecture of the temple. With the metopes the case was different; they were placed in immediate connexion with the structural portion of the building and (at the ends) were immediately beneath the rounded sculptures of the tympanum; they therefore required a stronger treatment in high relief, some of the figures being sometimes entirely separated from the ground. In the frieze sculpture it was probable that there were no preliminary models made; the first making out of the design was a matter of drawing, not of modelling. And this led him to emphasise the point that it was important that a sculptor should be a good draughtsman, especially for setting out the design of a relief. Recurring to what he had said as to the importance of spacing, he would remark that this applied equally to the sculptures in the round in the tympanum; the spaces, as a matter of composition, were as important as the figures, especially when seen from some distance, where the figures stood out as lights against a darker background; and if, in making conjectural restorations of tympanum sculpture, the arrangement was such as to produce bad and awkward shapes of the spaces between the figures, they might depend upon it that the restoration was incorrect. Badly shaped spaces were enough to ruin a work otherwise good. The same principle held good in all forms of design; in lettering or printing the spacing between the letters was as important as the shape of the letters themselves; and the study of ornament taught the same lesson. The vase-painters worked on a limited surface, and the figures were set out as an ornament within this space. Ornament in its earlier forms was simply expression produced by line, and the earliest attempts both at ornament and sculpture were symbolical. The first statues, the *xoana*, were mere shapeless blocks, which rudely expressed the mysteries of creation. By slow degrees heads and arms were shaped on them. These were rude shapes, but they were objects of popular reverence. The wood statues representing Athene or Zeus

were however richly clad at festivals. The Greeks were a conservative people, however; they did not lend themselves readily to artistic innovations, and the old wooden block still remained the idol. The ivory and gold-covered statue of Athene was the eventual outcome of this cult; was it in fact a development of the vested *xoanon*? Pheidias, in executing a sacred statue, would probably adhere to the ancient type of the idol; he would not care to experimentalise on a new type. The core of his statue was still the wooden idol, covered over with plates of gold and ivory—a *xoanon* to all intents and purposes, which gathered up in itself every ancient tradition. The complete Doric architecture was evolved from the wooden hut, the complete Greek sculpture from the wooden idol. But while Pheidias was opening up new fields of sculpture, an archaic art was being practised at the same time. The figures from the Temple at Ægina, of which fifteen were in the British Museum, ten from the western and five from the eastern pediment, were in a quite different style from the work of Pheidias, a style more suitable to bronze than marble; they had the appearance of having been designed by sculptors accustomed to work in bronze. Eyes that had been accustomed to bronze would find marble too cold in effect, hence the Greek marble statues were coloured, undoubtedly with restraint, but still they were coloured. It was likely that the colouring of Greek architecture and sculpture somewhat resembled that of Persian tiles. Until recently it had been thought that this idea of colouring sculpture was a vandalism, and there was still a prejudice against it. Not long since, however, they had seen at the Royal Academy exhibition a fine example of a modern statue by Gérôme, executed in ivory and bronze, with colour, somewhat after the idea of the Athene statue; though probably less brilliant in colour effect, yet giving some idea of the ancient practice. This was not a thing to be passed over. If a taste and a demand for coloured sculpture came in again, they would be called upon to provide it. It was worth note that Pheidias was the son of a painter; his works were decorated sculpture enriched by colour; he was not therefore a sculptor pure and simple, in the ordinary acceptance of the word; he should rather be called an artist. We could not suppose that the nude portions of the pediment statues of the Parthenon were strongly or realistically coloured, though they would not be left white marble; probably the draperies were coloured; but the interior statues were really huge idols, and it was probable that they reproduced more or less the ancient objects of reverence.

The frieze represented a procession which took place once in four years; a procession in honour of the virgin goddess. The quality of the execution in the frieze varied a good deal; the execution was the work of a large staff of artists, but the whole was drawn by Pheidias himself on the prepared wall surface, looking in that stage like vase-painting. Perhaps Pheidias finished some of the sculpture himself. The delicacy and care with which it was set out and executed were remarkable. In one place seven horses were indicated in a group, one behind another, but the whole twenty-eight legs were carefully made out, one could trace each set to the right animal. It had been remarked that the horses were small in comparison with the men, but Pheidias would take liberties with nature when the composition demanded it, and he did so in this case in order to keep the line of heads unbroken. He recommended to the students a careful study of this work, which was undoubtedly the finest and most perfect piece of relief sculpture in existence; and to produce such a work it was necessary that it should be carefully drawn first.

In studying the style of execution of the Elgin marbles he would tell them of one interesting and instructive experiment that could be made. Take any straight piece of rigid material, say a piece of iron, three or four inches long, and apply it to different portions of the surfaces of these marbles. They would find that everywhere these surfaces were flat; there were differences of planes but no absolutely curved surfaces. In Roman sculpture it was different; if they applied the same test to the Apollo Belvedere, for instance, they would find that

all the surfaces were curved. It was the same with the later Greek work of Praxiteles and his school; and this was the secret of the inferior and sensuous appearance of these works. Archaic sculpture was always building up a strong thing, even if imperfect; then a great man came and, like Pheidias, gathered up all the archaic tradition, breathed the breath of life into it, and made it noble and dignified sculpture with a noble motive and a rhythm in the leading lines and planes; the result of good craftsmanship working on tradition. Let them stick to tradition and cultivate craftsmanship; without industry and love the art could never rise to its old heights.

THE ARCHITECTURAL ASSOCIATION: CAMERA AND CYCLING CLUB EXCURSIONS.

An ordinary general meeting of this Association was held on Friday last week at No. 18, Tufton-street, Westminster, S.W., Mr. John Murray, Vice-President, in the chair.

The minutes and nominations having been read, Messrs. J. B. Scott and P. W. Pocock, jun., were elected members of the Association.

The Chairman announced the following further donations to the Building Fund, i.e.:-

Howell J. Williams, Ltd.	10	s. d.
T. Tyrwhitt	5	0 0
W. Morrison	5	0 0
J. E. Beck	3	3 0
J. E. K. Cutts	1	1 0

Mr. Tanner (Hon. Secretary) proposed a vote of thanks to Mrs. James Scott Stewart for donation of books and photographs.

The motion was agreed to, and it was announced that a meeting of the Camera and Cycling Club will be held on March 20, and a demonstration on "Lantern Slides" will be given.

Mr. Gilbert H. Lovegrove then read the following paper, prepared by very short notice in consequence of the inability of Mr. A. Vye-Parininter to read the paper arranged for, entitled "The Architectural Association Camera and Cycling Club Excursions."

"It has been impossible during the fourteen days at my disposal to prepare a connected, much less a scholarly, paper. I, therefore, propose only giving a brief description of some photographs as they are thrown on the screen to give some idea of the buildings visited by the Architectural Association Camera and Cycling Club during the past few years.

Christchurch Priory.

One of the most beautiful and interesting buildings we have visited is the Priory Church of Christchurch, hard by Bourne-mouth, containing specimens of every period of architecture from the early, possibly Saxon, crypt to the Renaissance of its chantries. The church has, as is usual with our larger churches, legends connected with its foundation and construction, but with these I will not delay you. The site is close to the junction of the rivers Stour and Avon, on the flat lands of the Saxon Tweoxreham, and the first mention of a church here is made in the time of the Confessor. This church, held by a dean and a college of secular canons, was swept away by Ranulf Flambard, the chaplain to William II., and it is suggested that before he was appointed to the bishopric of Durham in 1099 he began the present church, of which part still stands. The earliest existing remains are the nave arcades, the triforium, and the transepts, with the eastern apsidal chapel attached to the south transept. Next in date are the walls of the western aisles, and of about the beginning of the XIIIth century the clearestory of the nave, followed by the vaulting of the western aisles, the north porch, and the chapel attached to the north transept. To the XIVth century belong the rood screen and the reredos.

Early in the XVth century the Lady Chapel was completed and later the western tower and portions of the choir. From an inscription on the vaulting of the choir we know that this was completed between 1502 and 1520, while later still is the chantry at the east end of the south choir aisle, and in 1541 the famous Salisbury Chantry. The stalls and misereres are of various dates from 1200 to 1500.

Wimborne Minster.

From Christchurch we visited Wimborne

Minster, a comparatively small building containing a great many interesting details, but, owing to the journey and the church services, very little time was left for photography. At the western end of the late Norman nave several bays were inserted in the XIVth century when the church was lengthened, and the illustration shows the junction on the north side. The choir is mainly of XIIIth century date, the east window, which is impossible for photography from the exterior, being illustrated in Parker's Introduction to Gothic Architecture. This portion of the building is raised over a crypt, reached from the aisles through an archway, over which is the beautiful tomb to John Beaufort, who died in 1444. The label stops of the arches over the entrances to the crypt are of great interest. The sedilia, which are of great beauty, are, unfortunately, un-illustrated. No one visiting Wimborne should miss seeing the museum in the celebrated chained library.

Bruges.

With the present facilities for cheap travel a week-end in Belgium is of small moment, for one can leave London at 9 p.m. and be photographing in Bruges by 4 a.m. The street opposite the station takes us past the cathedral to the square, one side of which is formed by the Cloth Hall and its celebrated belfry. The Cloth Hall was built in the XIIIth and XIVth centuries, and altered in 1561, the courtyard containing some interesting Renaissance detail. The eastern wing contains one of the most remarkable collections of local relics it has ever been my good fortune to visit, and several days could be spent studying the specimens of iron hinges, door-handles, &c., apart from the other exhibits. The belfry was begun in 1222, and finished at the end of the XIVth century, the delay being due to the rebuilding of the octagonal upper portion. The statue over the entrance is of the Madonna. Continuing along the south side of the Market-square we reach the smaller square containing the Town Hall, begun in 1376, and restored in 1871, adjoining which is the old Municipal Record Office, built in 1535, and now the Law Courts. The facade is gilded over the greater portion of its surface, and so presents great difficulties to the photographer.

The interior is not generally visited by the tourist, but contains some excellent carving. Passing under the archway in the Record Office we reach the Quai de Rosaire adjoining the Fish Market, from which many interesting photographs may be taken. The building on the left of the illustration is the Town Hall, seen from the rear. Continuing along the back streets we reach the Church of Notre-Dame, opposite the Memling Museum, the most interesting portion of which is the old north porch. A walk round the canal encircling the city brings us to the various gateways, of which the Porte Marechale is illustrated.

Ypres.

From Bruges a cross-country railway journey brought our party to Ypres, a grass-grown city, surrounded by ramparts. The most interesting feature, apart from one or two houses, are grouped round the Cathedral and Cloth Hall. As it was Sunday, the Cathedral was left untouched, but the Cloth Hall, completed in 1304, provides plenty of subjects. Over the entrance through which the Cathedral-square is reached is a statue of John I. of Brabant. The interesting way in which monotony in so long and flat an elevation is avoided by the alternate use of blank windows filled by statues should be noted. Adjoining the Cloth Hall is the Town Hall, erected during the XVIth century, the ground floor being an open arcade, about 20 ft. wide, surrounding a vaulted hall. Behind and adjacent to this is the Conciergerie, perhaps the most interesting building in Ypres; passing under the arcade we see the side elevation of the conciergerie to the cathedral-square, and the cathedral tower, with the Cloth Hall in the background. The domestic buildings in Ypres are uninteresting compared with those in Bruges or Ghent, the best building being at the end of the town furthest from the station.

Peterborough.

Approaching Peterborough Cathedral from the station one passes the Guildhall, built in

1671 immediately opposite the entrance to the close, passing through which we see the west front, erected probably about 1238, the porch being a XVth-century addition to support the central piers. The denary gateway, built about 1520, is of considerable interest owing to the carvings of the arms and the rebus of the prior (Robert Kirkton), the Tudor rose and portcullis, the Prince of Wales' feathers, and the triangle of the Trinity. To the south of the cathedral are the ruins of the cloisters, whence one may see the grouping of the western towers. At the east end is the "new building," 1438-1528, from which until the XVIIth century the Lady Chapel projected.

The nave was commenced about 1117, and is of unusual length; it is uncertain whether the Norman west front was ever completed. The font, of XIIIth century date, is placed in the south-western transept.

The eastern transepts and the tower are ceiled, like the nave, with wood, the bosses in the crossing being very finely carved. The transepts are of similar date to the choir, but the eastern and western arches of the crossing are of the XIVth century.

The choir contains the earliest English example of tracery in the triforium; the marble paving and baldachino were completed in 1294. This last illustration shows the original eastern extremity of the cathedral with the tracery inserted in the clearestory in the XVth century. The aisles of the choir contain some matters of interest, such as the double piscina in the north and the ruined monument in the south. The three remaining misereres of mediæval date are fastened to a board in the south choir aisle.

The "new building" was built beyond the apse at the end of the XVth century, and is of the width of the choir and aisles together.

Stamford.

Within easy reach of Peterborough is Stamford, a fascinating town containing many interesting houses and magnificent churches, while those interested in the work of John Thorpe may study Burghley House, of which he is supposed to be the architect. Its architecture, however, did not suit the fancy of our members, and no photographs were taken.

Close to the Stamford Hotel, in St. Mary's, are several small houses of interest, as also in St. Martin's, on the road to one of the entrances to Burghley Park, but to the mediævalists All Saints' Church is the chief attraction, nearly every capital in the church providing a subject, while the roof-corbels, vaulting bosses, and almost every portion of the church are worthy of record. St. Leonard's Priory on the outskirts of the town, and now used as a barn, is of great interest.

Warrington.

A short drive from Stamford on the Oundle road is Warrington, where St. Mary's Church provides a day's work. The building, including the wooden groining of the roof, is of XIIIth century date throughout.

Thorpe.

One mile from Peterborough is Thorpe Hall, where Colonel Strong kindly gave us free access to every portion of the building. According to Blomfield, the house was commenced from Webb's designs shortly after the death of Inigo Jones, and is dated 1655; its design is directly inspired by Inigo Jones, and is uninfluenced by Wren.

Greenwich Hospital.

Greenwich Hospital has been visited twice by our members, and is always a source of interest. When Wren commenced work here there were two buildings on the site, the house facing the park designed by Inigo Jones and the unfinished palace begun by John Webb from designs by Inigo Jones for Charles II. Wren completed King Charles' block, and, making the Queen's palace of Inigo Jones the centre of the extreme south, designed two courts, with colonnades facing each other, running northwards towards the river till they joined the great court, the west side of which was already occupied by King Charles' block, opposite which he built Queen Anne's block. The junction of the colonnades with the great court was marked by the two domes surmounting the entrances to the chapel on the east side and the hall on the west. Hawkesmoor continued the building of the south-western or King William's block, which was finished by Vanbrugh.

Among the City churches we have visited Christ Church, Newgate-street, of which slides are shown of the litany desk, formerly the door of the reading-desk, whose panels now form the front of the choir-stalls. These have all been cleaned, and present an entirely different appearance from the pulpit.

The font of St. Stephen's, Walkbrook, is of great beauty, and a more successful subject to the photographer than the hody of the church, which is too small in area for photography.

The font at All Hallows, Lombard-street, may be taken by artificial light, but the church is far too dark for successful exposures.

Hereford.

Hereford forms an excellent centre for a visit, although the town itself contains little of interest except the houses formerly known as Butcher's-row.

The cathedral tower is profusely ornamented with the ball flower, but, owing to the condition of the stone, the larger part of the exterior has been refaced, and the chief points of interest are the north transept turret and the north porch. The cloisters are almost all new.

The south transept seems to have been built about 1115 and the north in 1240 by Bishop Aquablanca, whose tomb is in the aisle of the north transept, where also is the temporary resting-place of an effigy with beautifully-carved robes of Bishop Westfayling, who died in 1602. The font is of about 11th century date, and is carved with the figures of the Twelve Apostles; the lions supporting the base are of exceptional interest. The nave arcade is of great beauty, but has suffered considerably both accidentally and at the hands of Wyatt and other restorers, and practically all above the crown of the arches has been rebuilt at one time or other.

Ludlow.

The chief points of interest in Ludlow are the castle, the church, and the Feathers' Hotel, where many subjects are ready to hand, one of which, a fireplace, is illustrated. Being Sunday, we could not obtain admission to the church, which contains many points of interest, but the south-eastern windows are shown as an example of weathering. At the east of the church is the Reader's house, an early XVIth century building in half timber, of which the door-head is shown.

Ledbury.

Ledbury, of which I have but two slides, is a charming village filled with interesting buildings. The market-house is one of the easiest to photograph, and is certainly the most striking. At the top of the town is Sir Michael Biddulph's house, of great size and interest.

Kilpeck.

From Hereford we drove to Kilpeck, where the remains of the castle and the little Norman church were visited. The church, as is well-known, was rebuilt in 1848, stone by stone, but nothing was recut and no new stones were used except one in the tympanum of the south door. The extraordinary freshness of the carving is a striking contrast to the condition of the stone at Hereford and Ludlow.

The few slides I have shown will give some idea of the extreme variety of the architecture visited, and, I believe, studied by the members of the Camera and Cycling Club during the past few years. I have omitted, owing to want of time, illustrating several of our most interesting visits, such as those to Gloucester and district, Hampton Court, and Morden College, as it would have been an easy matter to have filled several evenings with an account of our excursions. The excursion to Winchester next Easter will be open, as all our excursions are, to all members of the Architectural Association, and those who will go will find that the members of the Camera and Cycling Club form a very sociable section of the Architectural Association.

The paper was illustrated by a large number of lantern slides, and the Chairman, in inviting discussion, referred to the trouble which Mr. Lovegrove must have taken in preparing the lecture at such short notice.

Mr. Matt Garbutt proposed a vote of thanks, and said that Mr. Lovegrove had

proved an interesting guide to a number of buildings which they all wanted to see.

Mr. E. W. M. Wonnacott seconded the vote of thanks. His advice to ordinary members of the Association who had not taken part in the Camera and Cycling Club excursions was summed up in two words—i.e., "Try them." Members who had been once went again, and that would particularly apply to foreign visits. At any time, with reasonable notice, the Camera Club would give the members of the Association an entertaining evening.

Mr. W. J. H. Leverton having supported the vote of thanks,

The Chairman, in putting the motion, said their thanks were due to Mr. Lovegrove for having prepared his paper and the slides at such short notice. Photography was undoubtedly a considerable aid to the study of architecture, and they had before them that evening a vast field of work. He would advise students to visit the buildings shown whenever the opportunity arose. He thought that they should have one such evening at not infrequent periods.

The vote of thanks was heartily agreed to, and Mr. Lovegrove briefly replied.

The next meeting will be held on the 23rd inst., when a paper will be read by Mr. A. W. Soames, M.P., on "The London Club-house of the Last Century."

THE ARCHITECTURAL ASSOCIATION SPRING VISITS:

IV.—ROYAL FRIENDLY SOCIETY BRANCH
OFFICES AND TOLLARD ROYAL HOTEL,
SOUTHAMPTON-ROW, W.C.

SATURDAY, March 10, was the occasion of the fourth spring visit, when the object of inspection, the Royal Friendly Society's new building, proved one of considerable value to the members of the Architectural Association, both as a study in planning and in construction.

The undertaking arises out of the great Holborn-to-Strand improvement, and the site, at the widened end of Southampton-row, was purchased by the Society from the London County Council upon an eighty years' lease. The ground has an average frontage of 60 ft. and a depth of 45 ft. The Council made certain conditions in design, the London Building Act imposed its usual unnecessary restrictions upon construction and the rights of light enjoyed by the school at the rear of the site made the problem of an adequate financial return one of intense complexity.

The general impression of the visitors was that the architects, Messrs. Bradshaw & Gass, had achieved a distinct success as the result of some arduous labours. Under the guidance of Mr. Gass, who came specially from Lancashire, the building was inspected from foundation to roof. Some printed particulars, including lithographed plans and diagrams, were supplied to each member of the party by the architects, a privilege which was greatly appreciated.

The Friendly Society has a large office with a small basement only, at the north end of the site, while the remaining accommodation is sub-let for the purposes of the Tollard Royal Hotel, the main entrance to which is at the south-west corner of the site. The hall, office, and cloak-rooms of the hotel are at the street level. In the basement there are a billiard-room, kitchen, scullery, larders, etc., and on the first floor a large dining-room, a drawing-room, and several bedrooms. The six upper floors contain bedrooms (fifty-three in all) of a small size, but suited to the particular business of the establishment, for visitors and staff.

The back part of the two lowest stories is roofed at the first-floor level, while the main building rises in the rear to the fourth floor, the level of the old buildings on the site, and is then roofed at sixty degrees to enable the school to enjoy its right of light. The whole of the back elevation is faced with white glazed bricks and the roofs covered with white glazed tiles.

The main fronts are faced with Ancaster stone, and have certain features in Portland. The warm colour of the former is interesting. The usual idea of a rusticated treatment to the two lowest floors is introduced, but the absence of columns and their accessories and the idea of leaving the pier masses to express their own purpose is quite refreshing. The

use of the gables terminating the irregular roofs, procures symmetry in the end facades, and it will be realised that a considerable amount of skill is brought to bear on the point.

The construction, however, is mainly that of an American steel-framed building in which a larger extent of cross-bracing is used than is usually the case. All the walls are carried upon steel beams cased in concrete, yet the promoters are driven to the amazing course of building the independent wall-fillings of the enormous substances required for self-supporting walls by the Building Act. One of the main reasons for this form of construction is to render the building easily adaptable to other purposes than those of an hotel. The stanchions are carried upon large steel-grillage concrete foundations, while the construction generally is of a fire-resisting nature.

Some of the London County Council requirements in this building are excellent, such as the means of escape in case of fire. The two internal staircases and the external staircase are well placed, and each of the three parts into which the interior is divided by doors of a fire-resisting design are conveniently arranged for rapid exit. Requirements of an aesthetic nature were also made, such as the cutting off of the angles and the height of the cornice of the main front made to introduce a sense of uniformity with the adjoining buildings.

Bearing in mind all the conditions governing the design, it was unanimously considered that the architects had obtained the utmost possible floor-space out of the site for their clients.

MAGAZINES AND REVIEWS.

The *Art Journal* contains an article by Lady Victoria Manners on the remarkable series of the Penrhire and Vernon tombs in the church of Tong, in Shropshire; which are well worth special illustration and description. "The Craft of Thomas Chippendale" is the subject of an illustrated article by Mr. E. Avery Kedell. The examples given vary much in merit, nor do we gather that the author of the article intends by any means to exaggerate his artistic qualities. The worst things about Chippendale are his "Gothic" and "Chinese" designs for chairs and other articles, which are, to speak plainly, about as bad in their way as anything could be, and the fact of their pretending to be Gothic makes the impression still worse. The best are those which he treated with a broad and monumental-looking arrangement of the lines of construction, with little other ornament, such as the circular-backed chair and the settee at the top of page 79. The "Chippendale Mirror," an illustration placed at the end of the article, in which the wood frame is fairly tortured into all kinds of ragged forms, is a thing so atrocious that one questions whether it ought to have figured at all in an artistic journal; it is a kind of thing better forgotten. A chromolithograph reproduction of a foreground picture by Mr. E. C. Clifford, entitled "A Sussex Garden," is a very successful piece of colour painting. In a notice of the pictures recently exhibited at the New Gallery the writer of the article, we observe, singles out as "one of the best" the hideous travesty of a picture by Manet, "Le Linge." When we see such work held up to admiration, one is inclined to ask whether painters and critics have alike gone mad.

In the *Burlington Magazine* a certain Mr. Robert Dell has revived the old contention that Pugin was the real architect of the Houses of Parliament. From his writing he seems to be totally blind to the architectural genius of Barry, to whom the real greatness of the design of the Houses of Parliament is unquestionably due, and no man who has any perception of what architecture really means can have any doubt on the matter. It is significant to find (what we did not know before) that Pugin's family, in the former campaign, had the more than doubtful assistance of the late Lord Grimthorpe, who pretended that his interest in Gothic (!) induced him to take their side. The fact is that Lord Grimthorpe was always ready to turn against and endeavour to belittle any eminent and successful architect; it was not that he desired to help the Pugins so much

as that he desired to injure Barry. The competency of Mr. Dell to speak on the subject may be estimated by the fact that he thinks the Houses of Parliament a greatly over-rated building, whoever designed it. When he says that "few of us would now agree with the extravagant praise of the Palace of Westminster that seems to have been the fashion in 1867," he only shows that he must be totally unacquainted with the current of architectural thought, not only in this country but in America also. The same number contains a review of Messrs. Agnew's "Independent Artists' Exhibition" by a prominent member of the New English Art Club, who of course discovers that the most remarkable works in the Exhibition are those of another prominent member of the same institution of eccentrics. That is what "art-criticism" seems to have come to now.

The *Magazine of Fine Arts* is going on admirably, both in illustrations and matter. It includes an article on Linné by M. Alexandre Arsène, and one on Ingres (a painter who has been too much forgotten of late) by M. Octave Uzanne, with a large number of illustrations of his works, including a page plate of the beautiful "La Source." "Old Silver Communion Plate" and "English Chairs of the XVIIIth Century" are among other subjects illustrated, and the issue also contains no less than nine separate plates in "sanguine" after drawings by Leonardo da Vinci.

The illustrations in the *Berliner Architekturwelt* are mainly devoted to the exterior and interior and details of a remarkable private house, the "Haus Erich," by Herr Otto Spalding. Externally it is a good-sized but unpretending residence of rather picturesque character, with a specially designed iron rail fence and some other decorative accessories; but the various interiors show a treatment that is full of originality without eccentricity. The walls of the staircase hall are faced with brickwork with white joints; the furniture and fittings, the stairs, the entrance gates, have all a *coquet* of their own, and appear to have been specially designed; an interesting study of the artistic treatment of a modern residence.

Concrete and Constructional Engineering, of which the first number appears this month, deserves more than passing notice as the pioneer journal in this country on the application of concrete, steel, and reinforced concrete in constructional engineering. The literature on concrete in all the chief languages of the world has become very extensive, and the English language is well to the front in this respect, especially when we take into account the United States. Nevertheless, up to the present time no British journal has been specially devoted to the subject of concrete, notwithstanding the fact that numerous publications in other countries are dealing exclusively with that important structural material. The number opens appropriately with an article entitled "The Advent of the Concrete Age," by Lieutenant-Colonel J. Winn, R.E., who deals with the early history and the steady advance of concrete, when once it became recognised by engineers that the material was worthy of a more important place in engineering construction than as a mere backing for masonry and brickwork. The more noteworthy developments that followed, and the use of concrete in combination with iron and steel are then traced, some examples of reinforced concrete construction are given, and the article concludes with a consideration of the difficulties to be overcome before concrete-steel can be introduced so fully as could be desired. We agree with the writer that the great obstacle among engineers is an attitude of distrust, and among architects the restrictions of building regulations. That the obstacle presented to the application of concrete-steel by building laws equally affects another important development of structural engineering is shown forcibly in the succeeding article on "Steel-Skeleton Construction and the London Building Act," by Mr. W. Noble Twelvetrees. The writer points out that architects, even where they appreciate the merits of skeleton building construction, find their way barred by the London Building Act, which he not unreasonably considers to be at least fifty years behind the most advanced architectural practice. Personally, we are not advocates of skeleton construction, but architects who desire to adopt it should certainly

be allowed to do so under rational regulations. At present the capability of a well-built steel skeleton for supporting loads without any help from brick walls is quite ignored, and architects are compelled to use just as much brick as if the steel possessed no greater strength than putty. To illustrate the practical hardship inflicted by this state of things, Mr. Twelvetrees calculates the floor space occupied in a ten-story building, measuring 100 ft. long by 50 ft. wide by 120 ft. high, by walls in accordance with the London Building Act, and with the proposals of the Royal Institute of British Architects. The results show that fully 7 per cent. of the gross area of the building is wasted by the unnecessarily massive walls demanded by the Act, this proportion representing an estimated loss of rental value in an office building of 720l. a year, equivalent to 5 per cent. on a capital expenditure of 14,400l. Among the shorter articles one by Mr. Charles F. Marsh deals briefly with "The Advantages of Reinforced Concrete for Foundations of Buildings"; Dr. Cecil H. Desch commences a series on "The Setting of Portland Cement," dealing in this instalment with the chemical aspects of the question. In addition to original contributions, the issue contains a well-chosen collection of miscellaneous information relating to new uses of concrete, tests, building laws and regulations, industrial notes, and a very complete index to recent articles and papers in the technical press and the transactions of engineering societies. *Concrete and Constructional Engineering* has made an admirable start, and if the present standard is maintained we are sure it will have a most useful and successful career.

Professor Ashley's article in the *National Review* on "Trade Unions and the Law" recognises that the principle set up in the Taff Vale case is not likely now to be got rid of, and that it is desirable that it should be maintained. But his remarks on picketing are really absurd. It should not, he says, be prohibited for several reasons:—

"First, because it is one of the ways in which, without any action worth seriously grumbling at, a work union may possibly become stronger; for it makes the existence of the union to the notice of people in the trade who might otherwise remain ignorant of it; and we have already accepted the apparent paradox that, in the interests of business, strong unions are preferable in the long run to weak ones. Secondly, because the attempt to prevent it cannot succeed, and creates a bitterness of feeling that adds to the friction of industrial life." Thirdly, because it is harmful to confuse together in the popular mind acts which the popular conscience, left to itself, regards very differently. To treat as reasonable what workpeople generally regard as an obvious right is to tempt them to palliate what they themselves feel to be wrong" (1).

The last argument is truly delightful. During the bad days of Sheffield rattening it was thought "an obvious right" to threaten an obnoxious employer or "black-leg" with murder; the argument might equally have been applied there. Because working-men think they have "an obvious right" to make another man's life intolerable to him (for that is what picketing comes to) unless he joins their ranks—a "right" which no other class of society pretends to, therefore we are not to legislate against it for fear of confusing their sense of right and wrong. The passage we have italicised is even more remarkable. We confess we should think that it was the act of picketing itself, not the act of restraining it, that tended to "create a bitterness of feeling" and to "add to the friction of industrial life."

The *Nineteenth Century* contains an article by Dr. Charles Davison, the well-known expert, as we may call him, on earthquakes, on the subject of "Earthquakes in Great Britain," a summary of the evidence on this subject, from which it appears that earthquakes, though nearly always very slight, are far more numerous in this country than is generally supposed. There have been 171 observed earthquakes in England and Scotland during the last seventeen years. This is, indeed, a very small number compared with the records of what may be called earthquake countries; Japan has recorded 8,351 shocks in eight years; but it will be a surprise to many readers to learn that we have had so many. They have been mostly very slight shocks, sometimes hardly noticed except by those who were possessed of

sensitive recording instruments. For the purpose of scientific observation, however, Dr. Davison thinks that these slight shocks are particularly valuable, as they can be better observed than those more serious ones which are disastrous in their effects. Dr. Davison's article contains much interesting information and theory as to the causes of earthquakes and the best system of classifying and observing them, for which we must refer the reader to his article. Mr. D. M. Morrison's short article on "The Unemployed and Trades Unions" is really an implication that the Trade Unions can no longer give any substantial assistance to the unemployed, having spent so much of their funds and influence in organising strikes which, by driving trade orders out of England, have in fact largely contributed to the present crisis, and he thinks "the country should now relieve them of a position they can no longer occupy either with dignity or with benefit to the working men on whose subscriptions they depend for existence." And he goes on to suggest whether the Trade Unions have not "unconsciously" been guilty of a serious breach of trust in utilising funds subscribed by working men in this country to assist and develop strikes abroad. The real gist of his article is the suggestion of a machinery for the regulation of labour in the interests of the labourers by means of a "Labour Tribunal" formed in every centre of manufacture, the proposed duties of which are set forth in tabular form; one of them being to collect and pay into a Government bank every week a fixed proportion of the wages of each man or woman, "the amount not to exceed what is now being paid to Trade Unions." By this the working classes as a whole will purchase the right to an allowance in sickness and a pension in old age, on the same principle now applied in the case of Indian civilians. The idea is partly suggested by the example and working of the Old Age Pensions system in Germany. This, to be sure, is no immediate panacea for the present shortness of employment, but it affords a better outlook for the future. The article is worth study.

School gives a paper on "The Warming and Ventilating of Schools," by Mr. Sydney F. Walker, which does not impress us very much, and we should advise managers of schools to pause before accepting all its dicta, and take another opinion. The paper is rather contradictory in one point, as to the open fire, which we first read has been superseded to a great extent "on account of its want of economy." But on the next page we read that "a glowing fire still offers the simplest and most pleasant method of warming, while it is doubtful if it can be beaten on the score of economy when the fireplace is one of the modern forms." We are disposed to agree with this, but it is rather contradictory of the previously quoted sentence. A large schoolroom, however, cannot be efficiently warmed by fireplaces alone; those near them will be too hot, those far away too cold; but this subject does not enter into the article now under consideration, and is to be considered in a future number of *School*. For small rooms we think (speaking from actual experience) that the best economical substitute for the fire is the Welsh gas stove, which not only gives out a surprising amount of heat for its small size and low consumption of gas, but has the merit of being a pretty and attractive-looking form of combustion, almost as pleasant to the eye as a fire. It requires careful treatment and will not stand rough usage, hence it would never do in rooms where boys were left to themselves; but schools include masters' residences, and for the ordinary sitting-rooms of private houses it is a very pleasant type of gas-fire, and very economical after the first installation. The author of the article recommends hollow walls for warmth, to which we reply that the disadvantages of hollow spaces which no one can get at—their possible disadvantages, at all events—far outweigh their supposed advantages, which we believe to be a good deal over-rated. We also absolutely disagree in the recommendation to have the door close to the fireplace, the supposed object being to prevent draughts crossing the room from the door to the fireplace. To have the hall outside the door warmed (as it always ought to be) would prevent that; and to place the door

close to the fireplace is to destroy all the comfort and repose of the fireside seat, to which everyone naturally gravitates when there is no special occasion to sit at the table.

The *Antiquary* contains two articles on very interesting subjects, neither of which, however, come exactly into our category: "Mary Queen of Scots, her connexion with Art and Letters," by Mr. Blackie Murdoch; and "Notes on the Old Church Bands and Village Choirs of the Past Century," by the Rev. F. W. Galpin, reprinted from the *Proceedings of the Dorset Natural History and Antiquarian Field Club*, with revision by the author. As may be supposed, the subject gives occasion for much curious and amusing record. Mr. Galpin thinks that the disestablishment of the old village instrumental helps to singing—the clarinet, flute, and violoncello in the gallery—to make way for the organ or harmonium, leaves something to be regretted; "the practice of these wind and stringed instruments gave occupation and recreation to the peasant folk"; but if that were all, they could still add their aid to the organ or harmonium. The present writer can just recollect one of these old country choirs with its violoncello and clarinet (there had been a bassoon, but it had been laid up for want of any hand cunning enough to handle it); but to the best of his recollection it was certainly conducive to amusement rather than devotion. The country choir and its instruments were a picturesque characteristic of the period, but we can hardly think their extinction is to be regretted from any point of view. Dr. Ball concludes in this number his interesting article on "Old Heraldic Glass in Brasted Church," with which much history is connected.

THE SURVEYORS' INSTITUTION.

An ordinary general meeting of the Surveyors' Institution was held on Monday evening, at No. 12, Great George-street, Westminster S.W., Mr. G. Langridge, Vice-President, presiding in the absence of the President, Mr. C. Bidwell.

The minutes having been read, some donations to the library and library fund were announced, and a vote of thanks was accorded to the donors.

The Means of Locomotion and Transport in London.

Mr. William Woodward then read a paper entitled "The Means of Locomotion and Transport in London," which consisted to a large extent of a review of and comments on the Report of the Royal Commission which was appointed in 1905. In the course of his remarks the author said, as to the Report of the Advisory Board of Engineers, that he was afraid that the great labour and skill bestowed on the Report had rather tended to hide its practical conclusions and to relegate to some future period works of relief which should be undertaken at once. If he differed from some of the conclusions arrived at by the Board, it was not because he did not grasp and appreciate the results of their labours, but because he thought the relief now sought for was immediate. Of one thing he might be certain, that neither the Legislature nor the London County Council would further the immediate pulling down of any large area for the purpose of forming new streets or of widening existing ones to any considerable extent; and it was, therefore, to the present plan of London we must confine our attention, much as we should, of course, like to make London streets useful as well as beautiful. The author then dealt with the present unlimited liberty of drivers and others, obsolete vehicles to be dealt with, and tramways. To his mind the most important part of the subject was the question of tramways. Should they be retained and perpetuated, or should their future use be immediately prohibited, and the present trams gradually removed from certain roadways? His own view was that the Legislature should at once, if it had the power, stop all proposed fresh expenditure by the London County Council and others on tramways and shallow subways. He included in this category both electric and horse trams. The County Council at present owns forty-eight miles out of the fifty-four now within the Administrative County of London, and

enormous extensions are proposed. He did not suggest that the electric trams in outlying districts should be at once dealt with, but he did suggest that, wherever in the inner circle of London motor buses were likely to compete with tramways, the tramways should go. Parliament should at once step in with a short Act and prevent the enormous contemplated outlay, which the London County Council had before it, from being made. It should stop all proposed contracts both as to subways and trams, and see what effect upon the traffic of London the motor omnibus would have. He felt he could not be too insistent on this grave matter, and he regretted that the Advisory Board had not, with the views they had already expressed, made it perfectly clear that pause should be given before such vast expenditure was incurred as was now determined upon by the County Council. It was true that the Board further said that the time had not, in their opinion, arrived for a definite judgment on this question of motor omnibuses, but they unfortunately go on to say that "whatever may be the eventual result of the rival systems—i.e., motor omnibus v. electric tram—the recommendations they had made as to routes and similar matters, including the widening of streets, will remain unaltered." He felt certain, however, that the views of the ratepayers of London would not remain unaltered, and he would venture to point out to the Advisory Board that if the contention that the motor bus was the mode of transit for London proved to be the correct one, the whole fabric of the contemplated enormous expenditure on tramcar routes and tramcars fell to the ground with a crash. We now know that permanent lines of undeviating rigidity were a mistake; we saw that the elasticity of route possible with a motor bus was the right thing, and he thought that the sooner the County Council also grasped that fact, the better it would be for London traffic and for London ratepayers.

In speaking of the new shallow subway along Kingsway, the author said that at the junction of Southampton-row with Kingsway, the London County Council had debouched a shallow subway for the purpose of continuing the trams coming from the Angel at Islington through Kingsway as far as Aldwych. The opening formed for this subway occupies a surface area of 172 ft. in length by 24 ft. in width, which in itself formed an obstruction to the traffic. This shallow subway is about 14 ft. high from the roadway to the roof, and has a width of about 20 ft. The trams run in the open for the greater part of the distance, and they have been constructed without any top or outside seats. This, to his mind, was a very great error. In the first place the shallow subway could easily have been made a little deeper so as to take the cars with inside and outside passengers through it; next, smoking cannot be indulged in, and the pleasant summer outside ride is lost; and thirdly, there is a great loss in the number of passengers carried by each car. He hoped that the Council would stay its hand as regards these shallow subways and the trams generally. But this was not the only struggle we might anticipate from the County Council to stick to its now antiquated guns. Our bridges and our Thames Embankment were practically doomed. Tram lines would be insisted on as certainly as they must ultimately be removed. The serpentine power of a motor omnibus was bound to kill the rigid lines of the tram, and the speed of the electric tram, even supplanted by the conduit system, would be equalled by the power of the motor to select its own route. Having referred to the Blackwall Tunnel, the camber of the roadway of which was far too great, the author referred to City impediments to traffic, such as loading and unloading wagons, etc., empty cabs, and suggested the appointment of special traffic constables. Bearing in mind the vast importance of this traffic question, he thought the Legislature would be quite justified in appointing special mounted traffic policemen, armed with full powers to deal summarily, on the spot, with all persons, who, in their judgment, impede the traffic. Of course, these special men need only be employed in the busy and congested thoroughfares of London, and they should be under

the control of the present police authorities, or of the proposed new Traffic Board. Other obstructions to traffic were the street refugees, although he did not see how they could well be removed without incurring danger in crossing wide thoroughfares. In some streets they occur too frequently, and in others they could be entirely dispensed with. In watching the effect of these refugees we could see how frequently their presence impeded, and how much injury they did to locomotion. Certain persons took up more than their share of the street areas for carts and waggons. Parcel delivery offices, and music halls and theatres at once suggest themselves as instances of this. Or take, for example, the surroundings of Covent Garden Market. Another little relief might be secured by "moving on" pedestrians at points where they obstruct the traffic. At places of public resort exit was impeded on ordinary occasions by the crawling propensities of the British public. The first to descend a staircase or to use a corridor should be hastened on, and thus a theatre or a music hall could be emptied in half the time now occupied. Then visitors to theatres and music halls were allowed to occupy the footways while waiting to get into these places of amusement. If a bookstall projected a few inches over the footway in Charing Cross-road the owner was summoned at the police-court, but theatre and music-hall proprietors might for hours occupy nearly the whole of a long length of footway for their visitors, while ordinary passengers were driven into the roadway at considerable personal risk. The traffic, both vehicular and pedestrian, was impeded, and all because the authorities, who were so keen in other matters, would not compel the proprietors referred to either to open their doors earlier or face action taken to prevent obstruction. The formation and construction of roadways must always be an important element in the traffic question. He had referred to the Blackwall Tunnel as a modern example of excessive camber, and the Advisory Board of Engineers, of course, fully understood the mischief that arose from this over-cambering. The drivers naturally keep to the centre of the roadway as much as possible, and hence the blocking which would otherwise not occur. "Uniformity of material" was another matter which had a bearing on the subject. Macadam, asphalt, granite, pitching, granite cobbles, and wood of various kinds crop up in a single mile of roadway; some of it was well laid on good foundations, some was not; some of it was always under "repair," some was repaired and "finished off" with what was euphemistically termed "hoggin," which material was converted into mud after a few days' traffic had been on it. Some of the granite pitching had become "polished granite" by effluxion of time; some of the wood was "hard," and some was not; and some surveyors knew how to construct a macadam roadway, and some did not. These various little matters necessitated more frequent repair and attention, and hence traffic was unnecessarily impeded. Again, utter want of common sense and ordinary care on the part of constituted authority permitted steep gradients in roadways in slippery times to be quite unattended, and when half a dozen poor horses had fallen of sand or gravel would be sent to the spot—where it was perfectly well known danger existed—under the charge of a perfunctory workman who took as long to spread it as their masters did to think of it.

The Board had devoted considerable attention to railways. If he were the authority wielding any powers as regards railway companies, they should not be allowed to pass a single fresh Bill until they had made their stations decent, and their carriages sufficiently lighted to enable travellers to read. The sanitary condition of many of the London railway stations was a standing disgrace to the companies, and to the sanitary authorities.

The author then dealt more closely with the Report of the Advisory Board of Engineers. One sentence in the Engineers' Report, which had reference to the widening of Euston and Marylebone roads, he heartily endorsed, and that was that, where public improvements must be carried out, proper compensation should be given for interference

with such private rights as might exist. One word as regards the proposed widths of new streets which range from 140 ft., house to house, for "main avenues," to 40 ft. or 50 ft. for "fourth-class streets," and that word was that wide streets entail correspondingly wide crossings, every foot of which increased the trouble for foot passengers; the engineers would, however, no doubt vary these widths if tramways were abolished, as, he thought, they should be. The engineers, among other suggestions, proposed a bridge across the Strand at Wellington-street, which seemed to him a feasible and not too costly scheme.

As to the report of the Commission, the Commission, on the whole, recommend the extension of tramways, and in this recommendation he thought they had made a fatal blunder.

An innocent-looking little paragraph appeared on page 47 of the Report of the Commission. It was the "Tower subway." It was for a tramway starting at Leman-street, passing under the river, and terminating at the southern approach to the Tower Bridge. If the short, shallow subway at Southampton-row cost between a quarter and half a million sterling, he should like to know what this proposed "river subway" was likely to cost.

The author touched on other matters dealt with in the Report, after which he briefly referred to the President Reports of Sir Joseph Dimsdale and Sir George Bartley, and the "note" by Sir George Gibb.

In conclusion, the author said he agreed with the proposed immediate creation of a Traffic Board. The nature and constitution of that Board required most careful consideration; but its powers should be correspondingly great; and the exercise of those powers should be of such a character as to render red tape unnecessary, and appeals to legal tribunals out of the question. It should, moreover, be thoroughly independent, and outside the control of the London County Council or of other constituted authority.

He warned the London ratepayers that he is in for a thorough and almost immediate crushing expenditure on tramways, shallow subways, street widenings consequent thereon, and some other little accessories pertinent thereto. These tramways would, in his opinion, in the majority of cases, be taken up again in less than ten years from the present time, as would those now existing.

In the discussion which followed Mr. A. R. Stenning, who gave evidence before the Commission, moved a vote of thanks to the lecturer, and said that the great point of the recommendations of the Commissioners was their advice that there should be an Advisory Board to consider questions of London traffic. In his opinion, such a body should be an absolutely independent one. As to tramways, he agreed that the rigid lines impeded traffic, and that a motor bus carried nearly as many passengers as a tram, and that the bus could turn and twist about as the tram could not; but, for all that, he thought that trams outside a certain radius were advisable. By means of trams people could be brought to certain points and then transported to their destination by railway, tubes, or motor buses. That would be a better arrangement to having tramways along the Embankment and over the bridges. Trams on the Embankment would disfigure a great London improvement, and would not result in the good that was expected. The idea of a new thoroughfare east to west was a good one, but the cost of such a work would be great. He thought that an outer circle railway, with a radius of eight miles from the centre, would be a good thing.

Mr. H. Chatfield Clarke seconded the vote of thanks, and said that if a Traffic Board were established omnibuses would not be allowed to use narrow thoroughfares when broad ones were available, and he agreed that the blocking of streets by vans and carts ought not to be permitted. "Dockyards" should be provided, where carts could be backed in. He did not agree with the lecturer as to tramways, and he agreed with the Commissioners. He could not see why trams should not be largely extended on the outskirts of London, and if there were no dead ends to tramways a good deal of trouble would be avoided.

Mr. P. E. Pilditch said he certainly did not think that the London County Council should be the Traffic Board of London, and he agreed with Mr. Clarke rather than the lecturer as to tramways. Tramways would be necessary for the long arterial thoroughfares, but they would have to go through London. But he believed that at least two-thirds of the tramways suggested by the Commissioners ought not to be undertaken until motor omnibuses had shown what they could do. He did not think the motor omnibus would solve the problem; it was not cheap enough for long distances.

Sir G. Bartley, one of the Royal Commissioners, referred to the great increase in the traffic of London, which showed that small improvements would not meet the need, though, of course, they should be carried out. The only solution of the problem was to face the question of wider roads, and especially the provision of the two great avenues north and south and east and west. Of course, the expense would be great, but think of the enormous loss to Londoners in trade and commerce by not having rapid transmission through the streets. Small alterations would cost as much in the aggregate as a real facing of the problem. As to trams, while he thought it would be mischievous to have them in all the places suggested, still he believed in the usefulness of trams when the road was wide enough; he would not allow a tram unless there was room on either side of it for two lines of traffic. The streets of London were for the trade of London, and it was no use complaining about vans and carts, for if trade were kept out of London, London would cease to exist; streets must be wide to suit the requirements of the City. A Traffic Board was the beginning of the solution of the problem, but it would be disastrous for the London County Council to be made that board. The board should be absolutely independent. We should face the problem boldly; if Sir Christopher Wren's plan had been carried out London would have been a very different place, and we must do something to prevent the growing congestion, which was retarding the progress of the City.

On the motion of Professor Robinson the debate was adjourned, and the vote of thanks to the lecturer having been agreed to, the meeting terminated.

REGISTRATION OF ARCHITECTS.

On Tuesday evening a meeting, convened by Messrs. J. S. Gibson, G. Hubbard, and A. W. S. Cross, was held at the rooms of the Royal Institute of British Architects, No. 9, Conduit-street, to consider what further steps should be taken to carry forward the movement for registration. There were about fifty present, and Mr. J. S. Gibson was voted to the chair.

The Chairman explained that the meeting had been called to consider the course of procedure to be pursued. The necessity for it arose really out of the meeting held on June 19 of the members of the Institute Registration Committee, who were in favour of the statutory qualification of architects. At that meeting there was a considerable number of representatives of the allied societies and others. It was felt by the members of the provinces that some steps should be taken by London architects to form a committee of London men to carry the movement forward, and the following resolution was carried:—"That an organisation be formed for the purpose of furthering the Bill adopted by the Registration Committee of the Royal Institute of British Architects, and that an executive be formed consisting of the Presidents and appointed representatives of each of the allied societies and an equal number of London members of the Royal Institute of British Architects who are in favour of the statutory qualification of architects, and that the London members now present are appointed and requested to call such meeting." It was common knowledge that after this meeting the election of the Council for the session took place, with the result that a number of the old members were not re-elected. The new Council then appointed a Registration Committee to still further investigate the subject, and this committee had held meetings and carried forward the

business as rapidly as they had been able. At the same time, they had this resolution to deal with, and it was felt by those who had convened the meeting that it would be well if they could ascertain from a considerable number of representative members of the Institute both in London and the provinces whether at the present juncture they would allow their names to be brought forward to represent the registration cause on the Council for the forthcoming year. They had a number of replies from gentlemen who would allow their names to be put forward. He might say without breach of confidence that the sub-committee appointed by the Council had taken a considerable amount of evidence, and hoped to be able to report within a fortnight, and therefore it was a question whether it would be desirable to bring the names forward, or whether they ought not to allow the house list to go forward, as in previous years, and take no action. Personally, he had a strong feeling that, as this sub-committee had nearly concluded its labours, and was in a position to report to the Council on a certain line of action, which he hoped would commend itself to the majority of the Institute, that it would be impolitic and would jeopardise the whole success of the movement if they as registrationists did anything to set at enmity those members of the Institute whom they all respected and liked, and who had done a great deal for the Institute. He did not think they ought to set out on any electoral campaign merely for the purpose of placing on the Council a majority of registrationists, and he thought it would be better if they merely suggested to the Council that they should place on the house list the names of several well-known advocates of registration. He thought it would simplify matters if they divided the business of the meeting into two parts. First, they should consider whether they should give effect to the resolution of June 19; and, secondly, whether they should select a list of gentlemen and suggest to the Council that they might be placed on the house list. It might be construed into a menace to the present Council if an organisation was formed at the present moment for the furthering of a certain Bill, and he must say that it had been evident right through the session that the Council had honestly tried to deal with the matter of registration to the best of its ability.

A speaker said that if the present Council was really in earnest in taking up the matter they ought not to do anything to interfere with them. If that meeting made a suggestion for names to be placed on the house list, unless it was notified in some way members would not know who were in favour of registration and who were not.

Mr. Leonard Stokes said he received a card for the meeting, and, being interested in the question of registration, he came. He now understood that it was a meeting of those in favour of registration, and, as they were going to settle procedure, he had better retire, for he did not wish it to be said that he was a wolf in sheep's clothing.

Several other members intimated that they also were interested in the question, but were not prepared to say they were in favour of registration; but

The Chairman said they welcomed the presence of all those interested.

Mr. Maurice B. Adams said he would be sorry to pledge himself to any proposals they might make, and would not like to participate in the meeting if he was compromising himself. He was glad to hear the Chairman say that the Council was dealing with the matter on honest and straightforward lines, for that was the only way in which it ought to be dealt with. He certainly thought it would be premature for anything to be done by that meeting in view of the early report of the sub-committee appointed to deal with the matter, and he personally would view any action with a certain amount of doubt. He wanted to arrive at an opinion, but first of all he wanted to hear what the Council had to say.

The Chairman said that officially the Council had no cognisance of that meeting.

Mr. Hubbard said the sub-committee appointed by the Council consisted of four in favour of registration and four against, and the four against had treated the

question in a perfectly fair and open manner. He was doubtful if they carried out the instructions of the resolution of June 19 whether they would not do their cause harm, and accordingly be moved:—"That the consideration of the resolution of June be deferred."

Mr. Cross seconded the motion, and said that they who were on the sub-committee, of course, had knowledge which they could not communicate, but they confidently hoped that a measure satisfactory to both sides would ultimately result from their deliberations.

Mr. Middleton said they ought to follow those who were behind the scenes. He could assure the meeting that, if the Royal Institute of British Architects brought forward a satisfactory Bill, the Bill being put forward by another society would be dropped.

The Chairman remarked that it would be a comfort to know that if a Bill was laid before Parliament they would have the support of the major portion of the architectural profession in the endeavour to carry it through.

Mr. B. J. Capell asked if they could not have some statement made showing the advantages and disadvantages of registration. He was pretty well posted up in the case of the registrationists, but he wanted to know what the anti-registrationists had to say. He knew with regard to registration that they would be in the same boat as the plumbers and sanitary inspectors and so on, but there must be something on the other side which he had not heard.

Mr. Bonner asked how the sub-committee had decided as to who they should get to give evidence.

The Chairman said the sub-committee took the evidence of well-known men in London and the provinces, both in the Institute and outside, and had done their best to arrive at the most comprehensive knowledge of the question of registration as to its effect on architects. He had not the slightest doubt but that the whole of that evidence would be available to the members of the Institute, and he did not think that that meeting was the proper time to go into the origin and history of the question.

The motion was then carried.

Mr. Middleton said he considered it would be unwise to enter into an electoral campaign, and he moved a resolution to the effect that a list of names be placed before the Council with the suggestion that they might make a selection of some of those who were in favour of the statutory qualification of architects to be placed on the house list.

Mr. Leonard Stokes thought that if it was merely a suggestion the Council would welcome it.

Mr. Gilbee Scott seconded the motion.

Mr. D. Blow said he took it there would be no circular sent round as to who they should vote for, which was a course he considered most derogatory.

The Chairman said he was of opinion that the selection should be left to the Council.

Mr. Cross said he honestly thought the Council would meet them liberally in the matter.

Mr. R. Stark Wilkinson deprecated any action being taken in view of the early report of the sub-committee, and proposed an amendment to the effect that the selection of names be deferred until after the sub-committee had reported.

Mr. Maurice B. Adams seconded the amendment, and pointed out that many of them placed a great deal of importance on the opinions of such men as Sir Aston Webb, and if the report of the sub-committee came forward with the benediction of the Council it would be carried without question.

The amendment was defeated and the motion agreed to.

After further discussion it was agreed to select the names of Mr. Gibson and Mr. Perkins Pick (Leicester) for submission for election as vice-presidents. The following Fellows were nominated and voted on as suggested members of Council on the Institute House List:—Messrs. Hubbard (twenty-four votes), Cross (twenty-three), W. Floekhart (twenty-one), Woodthorpe (eighteen), Gilbee Scott (sixteen), C. E. Mallows (sixteen), L. Solomon (sixteen), Max Clarke (fifteen), and W. H. Seth Smith (fourteen). The other Fellows nominated and not selected were—E. Seward

(Cardiff), H. L. Goddard (Leicester), A. W. Brewill (Nottingham), Gilliland (Belfast), T. Cooper (Birmingham), J. W. Beaumont (Manchester), and J. T. Cackett (Newcastle). Three Associates were also nominated for the House List, viz., Messrs. H. W. Willis, C. E. Hutchinson, and G. A. T. Middleton, and the first two were selected for submission. The meeting then terminated.

Fifty Years Ago.

METROPOLITAN IMPROVEMENTS.

It is rather singular, that while such a vast number of suggestions on the above subject has inundated the new Board of Works since its appointment, they have all had reference exclusively to the construction of additional thoroughfares between the eastern and western parts of the metropolis. But not a thought has been given to the wretched state of our communications between the north and south, which call loudly for a portion, at least, of the attention which the authorities have to bestow on metropolitan improvements.

The most urgent want of all, and at the same time the most easily remedied and at the smallest cost, is a good line of street from the broad part of the Strand to Holborn through Lincoln's Inn-fields. It is, in fact, already more than half made. Nothing more is required than the destruction of some worthless old houses in confined courts between the Strand and Carey-street, and the setting back of the few houses on one side of Great Turnstile, to complete the whole line as far as Holborn; and the site of this new street would be so valuable for offices and chambers, that the improved ground rents would cover the interest of the outlay three times over! For more than thirty years this very opening has been projected by the inhabitants of the neighbourhood, and the public have constantly been led to believe that it was on the point of being carried out. Yet to this day that magnificent area of Lincoln's Inn-fields—the largest open space in the heart of London—is suffered to remain a perfect *cul de sac*, except for pedestrians!

Illustrations.

SOME ITALIAN RENAISSANCE WORK.

1. PULPIT IN THE DUOMO, RAVELLO.

 THIS pulpit in the Duomo, at Ravello (a tiny town in the mountains above Naples), is one of the finest examples of mosaic work to be found in South Italy. The carving, executed in marble, is particularly clean and perfect. Over the entrance to the stairs up to the pulpit (and not seen in the photograph) is the marble bust of the wife of the donor. A cast of this bust is exhibited in South Kensington Museum, as an example of portraiture of the period.

The maker's name, inscribed upon a panel seen at the back in the photograph, is as follows:—

"Ego magister Nicolaus de Bartholomeo de Fogia marmorumus hoc opus feci."

Another inscription above this in Latin runs as follows:—

"For love of the Virgin, Nicolaus Rufulus Siciliensis lord dedicated this work for his country's honour. Of them were born Valtheus, Ursi, Jacobus too, and Maurus, Laurentius was becomen by the first named."

May this be pleasing to thee, plus Virgin, and do thou pray thy son that hereafter he may grant to them the same good heavenly gifts, when a thousand two hundred twice thirty and three six full years have elapsed from the birth of Christ."

The pulpit has been rather damaged at the back, and portions removed to form a Bishop's throne in the chancel.

2. PULPIT IN SAN GIOVANNI DEL TORO RAVELLO.

This pulpit is supposed to have been executed by Nicolaus de Bartolomeo for this church belonging to "The Nobles of Ravello," after the completion of No. 1. But the design is so different in character that one can only believe the mosaic work to be by the same hand. This pulpit, unlike No. 1, has ancient plaques let in to form centres to the mosaic work, and the carving is much more pagan in type. The mosaic work is

unfinished, and there is a legend to the effect that, when it was seen this pulpit would be finer than the one in Duomo, Nicolaus was decoyed into the mountains and blinded, and that a friend filled in with fresco the unfinished portions. I was told that documentary evidence existed in Ravello as to this, but was unable to see it, although the legend is quite in keeping with the customs of this period.

3. PULPIT IN SAN LORENZO, FLORENCE.

This is from a photograph of one of the two pulpits in this church, of which the bas-reliefs in bronze are by Donatello and his pupils, Bertoldo and Bellano. They are, indeed, wonderful pieces of work, but the angles and joints of the bronze-work need repairing. The door into the pulpit is at the end, and a movable ladder is used, although these pulpits are now seldom, if ever, made use of. Donatello is buried in this church, the foundation of which dates from 394, but it was rebuilt in 1425 from the designs of Brunelleschi, the inner wall of the façade being by Michelangelo, whose design for the outside of the façade was never executed.

4. ORGAN-CASE, VALERANO.

This organ-case, in the church of the "Madonna del Ruscello," at Valerano, has been executed in walnut and pine "painted" from designs by Vignola.

LIONEL U. GRACE.

NEW COMIC OPERA, BERLIN.

The illustrations of this building, which was recently completed, are reproduced from some of the numerous illustrations of it in a recent number of the *Berlin Architekturwelt*.

The theatre is designed to accommodate an audience of 1,230 persons, with an orchestra of sixty, a large stage, and twenty-five dressing-rooms, besides the necessary rooms for rehearsals, etc. The building contains sixteen different staircases—eight of these are for the use of the public, six for the scene-shifters, and two for the artistes.

The foundations presented some difficulties, as water to the depth of 5 metres had to be pumped out and the soft ground removed before they could be laid.

The auditorium is heated by means of openings in the roof through which the warm air is admitted under pressure; the vitiated air is allowed to escape through openings underneath each tier. It is considered that the currents of air pouring downwards would, in the case of a fire, prevent the fumes from rising; this danger is also almost entirely provided against by a large opening in the roof of the proscenium, the cover of which is held down by thin fastenings which would be easily destroyed by fire, so that the fumes would then have means of escape, and at the same time the openings in the roof of the auditorium would be automatically uncovered.

There are two fire alarms in connexion with the nearest fire-station—one for the use of the public, and the other for the artistes; besides these there are, throughout the theatre, thirteen electric buttons by means of which an alarm can be given. The necessary hydrants for the extinguishing of fire are placed at intervals in the building, so that the provision against any danger of this kind is almost as perfect as it can be.

The architects have endeavoured to construct the building in a style which will conform with the purpose for which it is intended—namely, a comic opera house.

The architect for the exterior architectural treatment is Herr Bieberfeld; the house is planned by MM. Lachmann & Zauber. Among others connected with the work were Herr Kuhn, engineer; Herr Brandt, who superintended the stage mechanism, and Dr. Marx, who organised the heating arrangements. The sculpture is by Herr Kreischnar.

NEW LAW COURTS, CAPE TOWN.

This illustration of the accepted design of the new Law Courts at Cape Town is enlarged from a small and not very good photograph of the architects' drawing, which was sent home to us; a second reproduction from a photograph of a drawing of course can never be done with an entirely satisfactory result; but we thought it better worth while to give the design by this means than not to give it at all at present, which was the only alternative.

The design is by Messrs. Hawke & McKinlay, of Cape Town. The adjudication

of the competition was entrusted to a special committee appointed by Government, consisting of Sir Henry de Villiers (Chief Justice), Sir John Graham (Secretary to the Law Department), Mr. Advocate Searle, K.C., Mr. C. H. von Tyl, and Mr. Mervyn Macartney, who attended from England as professional assessor. There were forty-two competitors.

The estimated cost of the building is about 175,000. Unfortunately no plan has reached us.

SKETCHES BY MR. GEO. DRYSDALE.

THESE are a selection from the sketches by Mr. Drysdale which gained him the Pugin Studentship this year at the Institute of Architects. The titles are on each sketch, and otherwise they speak for themselves.

We selected these particular sketches of small buildings rather than those of larger and more monumental works, with the object of giving subjects that have not been too much familiarised by illustration.

ARCHITECTS' BENEVOLENT SOCIETY.

THE annual general meeting of the subscribers and donors of the Architects' Benevolent Society was held in the rooms of the Royal Institute of British Architects on Friday last week, at No. 9, Conduit-street, W., Mr. J. Macvicar Anderson presiding, in the unavoidable absence of the President, Mr. John Belcher, A.R.A.

The report of the Council was read by Mr. Percival Currey, Hon. Secretary, and, on the motion of the Chairman, seconded by Mr. H. L. Florence, adopted. From the Report we take the following paragraphs:-

The Council, in presenting the fifty-fifth annual report of the Architects' Benevolent Society, have to express regret that, judging by the number of claims made upon the Society, the past year seems to have been one of exceptional difficulty for many of the less fortunate members of the architectural profession. Towards the middle of the year it was found that the demands made upon the Society were beginning to outweigh the funds at the disposal of the Council, and that it was necessary to consider means by which the income could be increased. The President (Mr. John Belcher) accorded his suggestion that should issue a personal letter of appeal, and this was sent out to 5,280 architects practising in the three Kingdoms. The President directed attention to the fact that, although the Society had been in existence for over fifty years, and was the only institution organised specially for the relief of architects or their widows and orphans, not a single one of the architects in the active or practising contributed to its support. As the income had suffered in recent years from the loss of many liberal contributors, the President appealed particularly for subscriptions. Connected with the support hitherto accorded the result of the appeal must be considered satisfactory, the subscriptions having increased some 20 per cent., while a considerable sum has been added to the capital. The grateful thanks of the Society are due to the President for the active interest which he has taken in this matter, and it is to be hoped that the effect of his letter is not yet exhausted.

In connexion with the appeal, the Council wish specially to call attention to an offer of a donation for subscriptions, Mr. Walter Spiers, M.P., and other contributions of an equal amount are received. Mr. Ender's offer has so far been supported by Mr. Wm. G. Scammel, Mr. H. Chatfield Clarke, and the Society of Architects.

The total amount of subscriptions received during the year was 615*l.* 19*s.* 6*d.* (last year 539*l.* 5*s.*); the donations amounted to 755*l.* 17*s.* (last year 145*l.* 1*s.*). The Society's investments were increased by the purchase of 600*l.* New Zealand Three per Cent. Inscribed Stock at a cost of 531*l.* 15*s.* To meet the claims of applicants, it was found necessary to transfer 140*l.* received in response to the President's appeal which was made especially to relieve current needs from Capital to Income Account.

The amount of 1,000*l.* was distributed in grants and pensions. The number of applicants, apart from pensioners, was eighty-six, out of which eighty were granted assistance.

Through the courtesy of Mr. John Holden, the Society's hon. local secretary at Manchester, the Council have been informed that Mr. Alexander W. Mills, of Bowdon, Cheshire, an old subscriber, has bequeathed to the Society 500*l.* Further bequests of 2*l.* from the late Mr. C. Forsler Hayward, and two other subscribers, and Company's shares from the late Mr. H. B. Collins have also been received.

It is with great regret that the Council have to record the death of these members. Mr. Collins was also member of the Council at the time of his death, as well as of Mr. Alfred Waterhouse, Mr. J. T. Wimpey, and Mr. G. Fowler Jones, all old subscribers.

The Council desire to express their appreciation of the kindness of the Committee of the Architectural Association Students' Smoking Concert in devoting part of the proceeds of the concert on February 2 to the funds of the Society, the amount received being 12*l.* 12*s.*

To meet the wishes of corporate bodies, a resolution will be submitted to the Council which bodies may be represented, subject to the fulfilment of certain conditions, on the Council and at general meetings by their Presidents for the time being, and granted the same privileges with regard to the recommendation of applicants for relief as possessed by individual members.

Owing to the absence of Mr. Graham C. Awdry from London, Mr. Edward Greenop kindly undertook the auditing of the accounts with Mr. Sydney Perks, Mr. S. D. Kilson, A.A., has consented to act as Hon. Local Secretary at Leeds.

The following gentlemen, being the five senior members, retiring by rotation from the Council, are:—Edwin T. Hall, Mr. Lewis Solomon, Mr. Wm. Woodward, Mr. H. H. Collins (deceased), and Mr. T. E. Colcutt. To fill the vacancies caused by these retirements, the Council have the pleasure to nominate Mr. Arthur Ashbridge, Mr. Walter Ender, Mr. Reginald A. Roumieu, Mr. H. Chatfield Clarke, and Mr. Alfred Saxon Snell.

The Chairman said he hoped that the offers made to give certain sums of money in aid of the Society's efforts, provided that other contributors could be induced to give the same amount, would not be forgotten. What had once been done could be done again, if members put themselves to a little personal sacrifice.

On the motion of Mr. A. Ashbridge, seconded by Mr. G. Scammel, a vote of thanks was accorded to the retiring members of Council.

Mr. A. T. Taylor then moved, and Mr. Osborn C. Hill seconded, and it was agreed, that the Council for the ensuing year of office be elected as follows:—President, the President of the Institute; Vice-President, Mr. Wm. Glover; Council, Mr. Rowland Plunbe, Mr. C. T. Hine, Mr. Ambrose M. Poynter, Mr. Wm. Grellier, Col. R. W. Edis, Mr. H. L. Florence, Mr. G. E. Bulmer, Mr. F. W. Hunt, Mr. W. L. Spiers, Mr. Arthur Ashbridge, Mr. Reginald Roumieu, Mr. Walter Ender, Mr. H. Chatfield Clarke, and Mr. Alfred Saxon Snell.

On the motion of Mr. Christoper, seconded by Mr. Rowland Plunbe, a hearty vote of thanks was accorded to Mr. W. Hilton Nash, Hon. Treasurer, and he was re-elected to fill that office again.

Mr. Nash, in response, said it was a great source of satisfaction that they had been able to give away the largest sum of money in one year that they had ever done in the history of the Society, i.e., 1,000*l.*, and, at the same time, to have increased the capital. The total capital now represents between 14,000*l.* and 15,000*l.* They ought to try and influence new members to join the Society, especially as only about 1 per cent. of the architects of the United Kingdom were subscribers, and only about 6 or 7 per cent. of the subscribers were members of the Institute. Mr. Curney was re-elected as Hon. Secretary, and a vote of thanks was accorded to him for his past services. In reply, he said that, if only 2 per cent. of the members of the profession would subscribe, the Society would have an income of nearly 1,000*l.* a year. The thanks of the Society were due to Mr. Dircks, Assistant-Secretary, for his work on behalf of the Society.

On the motion of Mr. W. Grellier, seconded by Mr. Walter Spiers, the auditors (Messrs. Sydney Perks and E. Greenop) were thanked for their services and re-elected.

The following resolution was then moved by Mr. Nash:—

That the following be inserted after By-law No. 7:—Societies and corporate bodies who are now or may become annual subscribers of not less than ten guineas, or donors in one sum of not less than fifty guineas, shall be entitled to be represented on the Council by their President or Chairman for the time being, who may also vote at all general meetings, and shall be entitled on behalf of his Society to the same privileges as those of individual donors or subscribers. And to remember consecutively the subsequent by-laws.

Mr. Walter Spiers seconded, and the motion was agreed to.

On the motion of Mr. Florence, seconded by Mr. Nash, the thanks of the Society were accorded to the Institute for the use of the rooms.

The Chairman, in reply, said that, whether the Institute remained at No. 9, Conduit-street or got new premises elsewhere, they would esteem it one of their privileges to accord the use of their rooms to the Society.

On the motion of Mr. J. D. Croce, seconded by Mr. Curney, the Chairman was thanked for presiding, and the Chairman having replied, the meeting terminated.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Sir E. Cornwall, M.P., presiding at the commencement of the proceedings.

Chairmen.—The first business was the election of new chairmen for the ensuing

year, as follows:—As Chairman, Mr. Evan Spicer; as Vice-Chairman, Mr. Henry Ward; and as Deputy-Chairman, Dr. Forman.

New Committees were also elected. The new Building Act Committee consists of the following councillors:—

W. Davies, F. Goldsmith, W. Goodman, R. W. Graville-Smith, H. J. Greenwood, G. A. Hardy, Capt. the Hon. Fitzroy Hemphill, H. Jephson, John Lewis, R. C. Phillimore, John Smith, Hon. Arthur I. Stanley, H. R. Taylor, G. J. Warren, Edward White.

The new Works Committee is as follows:—

T. H. W. Idris, Lewen Sharp, Edward Smith, A. M. Torrance, W. Davies, D. S. Waterlow, Lord Welby.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Camberwell Borough Council 3,371*l.* for housing purposes; Stepney Borough Council 10,000*l.* for electric lighting; and Stoke Newington Borough Council 9,500*l.* for street improvement.

Theatres, etc.—The Theatres and Music-halls Committee recommended as follows:—

"A building to be known as the Hammer-smith Public Baths, and to be erected on the west side of Lime-grove, Hammersmith (Mr. J. E. Franck for Hammersmith Borough Council).

The building of the Welcome Club and the construction of the "Austrian Salt Mine" at the London Exhibitions, Earl's Court (Mr. A. O. Collard).

A building to be known as the Parochial Hall, and to be erected at Allardyce-street, Brixton (Mr. C. E. Hewitt).

Reinforced granolithic steps, proposed to be provided at the Putney Hippodrome, Gardener's-lane, Putney, and proposed arrangements for ventilating and heating the premises (Mr. F. W. Hingston).

A heating chamber in the stage basement, and the provision of four radiators on the stage of the Royalty Theatre, Dean street, Soho (Messrs. Smee & Cobay).

Certain alterations proposed to be carried out in connexion with the exits from the Royal Victor Hotel (late Royal Victor Music-hall), Old Ford-road, Bethnal Green (Mr. E. Stephens).

The proposals were agreed to. The Council adjourned at 7.30 p.m.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

THE London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Norwood.—A town hall building upon a site abutting on Brixton-hill and Ace-lane, Brixton (Messrs. Warwick & Hill).—Consent.

Southwark, West.—A wall on the western side of Gravel-lane, Southwark (Messrs. Nevison & Newton for Messrs. Stevenson & Howell, Ltd.).—Consent.

Lewisham.—Projecting one-storey shops in front of Nos. 33 to 45 (odd numbers only) inclusive High-street, Lewisham (Messrs. Kennard Brothers for Messrs. Chessman Brothers).—Consent.

Strand.—A projecting sign in front of No. 32A, St. James's-street (Mr. R. H. Kerr for Messrs. Sandow, Ltd.).—Consent.

Paddington, North.—Re-erection of Nos. 8, 9, and 10, Paddington-green, Paddington (Messrs. Bourchier, Burnmaster, & Galworthy).—Consent.

Hammersmith.—That the application of Mr. L. W. Williams for an extension of the period within which the erection of a projecting lavatory addition and steps in front of "Seion" Welsh chapel, Southerton-road, Hammersmith, was required to be commenced, be granted.—Consent.

St. George, Hammer-square.—Retention of an iron and glass shelter in front of the porch of the Coburg Hotel, Carlos-place, Grosvenor-square (Mr. E. H. Watts for the Coburg Hotel, Ltd.).—Consent.

St. Pancras, South.—A bay-window, five stories in height, in front of No. 14, Fitzroy-square, St. Pancras (Mr. M. M. Smith).—Consent.

Dulwich.—A motor-car shed of a temporary character at the rear of No. 100, Alley-road, Dulwich, to abut upon South Croxted-road (Messrs. J. Harrison & Co. for Mr. Barnett).—Consent.

Marylebone, West.—Retention of a range of luncheon and store sheds at Lord's cricket ground, abutting upon St. John's Wood-road, Wellington-road, and Wellington-place, St. John's Wood (Mr. F. E. Lacey).—Consent.

Hammersmith.—A building upon a site abutting on Blythe-road and Addison-gardens, West Kensington (Col. E. Clarke for Mr. F. Smiths).—Refused.

St. George, Hanover-square.—An iron and glass porch in front of No. 6, Chesterfield-street, Mayfair (Messrs. Hindley & Wilkinson for Mr. R. G. Behrens).—Refused.

Finchley, Central.—The retention of a wall in the rear portion of the one-story shops in front of Nos. 190 to 208 (even numbers only) inclusive, Pentonville-road (Mr. C. E. Pettitt for Mr. T. Lilley and Messrs. Lilley & Skinner, Ltd.).—Refused.

Strand.—Projecting lettering in front of No. 56, Charing-cross (Liverpool, London, and Globe Insurance Company).—Refused.

Hackney, North.—The retention of a shed at the flank of No. 17, Bethune-road, Hackney, abutting upon St. Kilda's-road (Mr. H. Willmott).—Refused.

Width of Way.

City of London.—A warehouse building on the northern side of Tenter-street, Moorfields (Messrs. Gregg & Detmar for Messrs. Raphael Tuck & Sons).—Consent.

Kensington, South.—Two studio buildings on the southern side of Logan-place, Kensington (Mr. G. H. Jenkins for Professor G. Moira and Mr. F. L. Jenkins).—Refused.

Lines of Frontage and Space at Rear.

Poplar.—Two houses on the southern side of Mellish-street, Glengall-road, Poplar, and a building on the northern side of Glengall-road, to abut upon the western side of Mellish-street (Messrs. J. & W. Clarkson for Mr. A. E. Ricks).—Consent.

Width of Way and Construction.

Brizton.—A wood and iron cart-shed upon a site on the south-west side of Eastcote-street, Lambeth (Messrs. J. Harrison & Co. for Mr. Cornell).—Refused.

The recommendations marked * are contrary to the views of the local authorities.

ARCHITECTURAL SOCIETIES.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—At the rooms of this Society on Thursday, the 8th inst., Mr. H. Phillips Fletcher read a paper on "The St. Louis Exhibition," Mr. G. B. Bulmer in the chair. The lecturer said:—"It is possible that some few of us are but dimly aware of the great event which the World's Fair at St. Louis commemorated. It was the centenary of the purchase of the Louisiana territory from Napoleon by the United States Government. The first organised action for the holding of the Exposition was taken in 1836, and it was determined, in the typical American fashion, to make it the 'biggest' ever held in the history of the world; 15,000,000 dols. was the amount of capital which was proposed for the financing of the enterprise; 5,000,000 dols. of this was raised by public subscription from the citizens of St. Louis, 5,000,000 dols. by the issuing of City bonds, and the remaining 5,000,000 dols. was appropriated by the United States Government, together with the support of the latter. Later, this capital had to be considerably augmented. The site chosen for the exhibition was a good one, being situated on the western limits of St. Louis. In all there were over 1,240 acres, 250 acres of which were roofed in. The general scheme of the plan was designed by a committee of American architects, amongst whom were such men as Cass Gilbert, Carrere, Hastings, Hames, and Link, and it resembled a lady's open fan. The centre of the picture, and what may be likened to the handle of the fan, was the festival hall, situated on the top of the hill. Flanking the festival hall on either side was the colonnade of States formed in a crescent, with a restaurant pavilion at each extremity. The face of the hill in front of these was terraced, and three series of cascades discharged 90,000 gallons of water per minute into the grand basin at the foot. From the hill as the focal point three main avenues radiated like the ribs of a fan offering a vista, terminated with the highly-decorated features of the festival hall and the colonnade of States. A grand transverse avenue crossed the three main avenues, and gave the general outline to eight of the main exhibit buildings." The lecturer then described the engineering of the building. The construction of the main buildings was under the control of the Division of Works, and it was decided to erect these in timber, partly owing to the then congested state of the steel market, and partly to save expense. Internally, the buildings were intended to be finished in plaster, but this and much of the colour scheme for the exteriors had to be omitted for lack of funds. Some idea of the

enormous size of the exhibition may be gained from the fact that the average height of the cornice level to the buildings was 60 ft. from the ground. The lecturer then described in detail the festival hall, colonnade of States, restaurant pavilions, cascades and gardens, United States Government building, mines, liberal arts, education, manufactures, electricity, varied industries, machinery, transportation, agriculture, horticulture, forestry, administration, Washington State, and foreign buildings. Perhaps one of the most surprising facts of all the wonders of the World's Fair was that, with all the inventive genius at the disposal of the American race, so few original architectural efforts were made. The architects of the mines and transportation buildings alone made any attempts at conceiving original designs. The lecture was illustrated by lantern slides. The following officers were nominated for the ensuing session:—President, Mr. H. S. Chorley, M.A., A.R.I.B.A.; Vice-Presidents, Messrs. P. Robinson (F.), and S. D. Kitson, M.A.; hon. treasurer, Mr. G. F. Bowman; hon. librarian, Mr. E. Musto (A.); hon. secretary, Mr. A. E. Kirk (A.); members of Council, Messrs. W. G. Smithson (A.), E. P. Edwards (F.), C. B. Howdill (A.), H. A. Chapman (A.), A. R. Hill (A.), and G. E. Reason (Assoc. member).

NORTHERN ARCHITECTURAL ASSOCIATION.—The annual meeting of this Association was held on the premises, 6, Higham-place, Newcastle, on the 7th inst., Mr. J. T. Cackett (President) in the chair. The annual report of the council for the forty-sixth session was read by the hon. secretary, Mr. A. B. Plummer. The report expressed the pleasure of the council in again recording the increased success of the Association. During the session, and since the last report, two members, nine associates, and fourteen students were elected, as compared with nine members, ten associates, and thirteen students during the previous twelve months. The roll of members for 1906 was as follows:—Members, seventy-eight; associates, seventy-two; students, seventy—total, 220. The report of the treasurer showed a total income of 271l. 2s. 8d., the cash balance from 1904 being 79l. 2s. 7d. The total expenditure amounted to 267l. 8s. 7d., leaving a balance in hand of 3l. 14s. 1d. It was stated in the annual reports of the Students' Sketching Club and the Students' Classes Club that the memberships were twenty-two and twenty-nine respectively. The drawings submitted for the Northern Architectural Association for the degree of R.I.B.A. were exhibited during the evening. Mr. Bryan Watson was successful in securing the Glover Bronze Medal. Only one set of drawings, however, was submitted for this competition. The award of the assessors in connexion with the essays competition was read by the Chairman, who expressed his regret at noting that there had been only two competitors that year. The two entrants were placed as follows:—Mr. William Stockdale (under the motto of "York"), of North Shields, 1; Mr. Arnold Sutherland Constable ("Essayez"), of Stockfield-on-Tyne, 2. On the proposition of the Chairman, a vote of thanks was accorded to the hon. secretary, Mr. A. B. Plummer, for his services to the Association, it being also decided to record in the minutes appreciation of Mr. Plummer's work in connexion with the Association's premises. The President intimated that considerable interest was being shown in regard to his suggestions for the proposed alteration of New Bridge-street. He believed that his ideas would influence the City Council in their line of policy in reference to the alterations. With the election of Messrs. Hill and Badenoch as auditors and a vote of thanks to the Chair man the meeting ended.

EDINBURGH ARCHITECTURAL ASSOCIATION.—A meeting of the Edinburgh Architectural Association was held in the Association Rooms at 117, George-street, Edinburgh, on the 7th inst., when a paper was read by Mr. E. S. Lorimer, A.R.S.A., architect, on "Scottish Gardens and Garden Architecture." In the course of his remarks, Mr. Lorimer laid stress on the fact that there was at the present time a great interest taken in gardens. He gave a sketch of the development of garden design in Scotland, and spoke of the relation between the garden and the house. A historical account was given of some of the

principal gardens in Scotland, and these were described, and Balcasie, in Fife, was instanced as the ideal of what a Scottish country gentleman's garden ought to be. It was a fine specimen of a terrace garden. The lecture was illustrated by a series of lantern slides, which showed some of the gardens of Scotland and their sculpture and architectural setting, and another series illustrating some foreign—French and Italian—garden sculpture.

ARCHAEOLOGICAL SOCIETIES.

SUSSEX ARCHAEOLOGICAL SOCIETY.—There are at present 706 members on the roll of the Sussex Archaeological Society, the number elected during last year being thirty-three. In their annual report, which has just been issued, the Council state that the sub-committee appointed to negotiate for the purchase of a site for the new museum and library has to report that some of the difficulties attendant on the Gun Garden site have been removed by enfranchisement, and that the services of Messrs. Runtz & Ford have been acquired as architects. Since the plans and elevations prepared by them are now before the landlords for approval, it is hoped that it will not be long before the committee can begin building. The Council regret that, owing to ill-health and his removal from the county, Mr. H. Michell Whitley felt compelled to resign the office of hon. secretary. Mr. W. E. Nicholson has been appointed in his place. Mr. C. G. Turner has also resigned the office of clerk, and Mr. W. W. Davey has been appointed to succeed him. In reference to Lewes Priory, Mr. W. H. St. John Hope reports that, through the kindness of Mr. Kenward, he has been permitted to make excavations in his garden for the purpose of finding any remains of the choir and transept of the Priory Church. Strong foundations are found to exist in many places, but no definite lines of masonry, and a portion of the tiled floor of the south transept was the only important point disclosed. By the like kindness of Mr. F. G. Courthope, Mr. St. John Hope was allowed to sink a number of holes in his garden, with the result that he was able to find the rubble core of the western end of the Priory Church, and also of the circular building which enclosed the conduit and lavatory above the so-called "lantern." Mr. St. John Hope further reports that he has elsewhere lighted upon the original letters in Italian of Giovanni Portinari to Cromwell, describing the destruction of the Priory Church. They seem to throw a rather different light upon the plan of the church from that afforded by what can now be proved to be Richard Moryson's somewhat inaccurate translation. During the year the Roman pavement at Bignor has been repaired, and the tesserae fixed at the cost and under the supervision of the Society of Antiquaries, of London, and a probably unique wall-painting has been discovered in a house known as the "Old Flushing Inn," Rye. The Society has made a grant towards the copying of this wall-painting, which will be reproduced in a forthcoming volume.

COMPETITION

HACKNEY PUBLIC LIBRARY.—In the competition for the Hackney Public Library 152 designs were sent in, and from these the assessor (Mr. J. B. Simpson F.R.I.B.A.) selected three. The competitors were Mr. Crouch, Mr. Trimble, and Messrs. Crouch & Butler, and they were selected in that order. The Committee selected the designs of Mr. Crouch.

BOOKS RECEIVED.

SANITARY ENGINEERING; A PRACTICAL MANUAL. By Francis Wood, M.Inst.C.E. Second Edition. (Chas. Griffin & Co.)
PORTFOLIO OF MASTER DRAWINGS. School of Architecture, University of Liverpool. Vol. I. (University Press, Liverpool, 15s.)

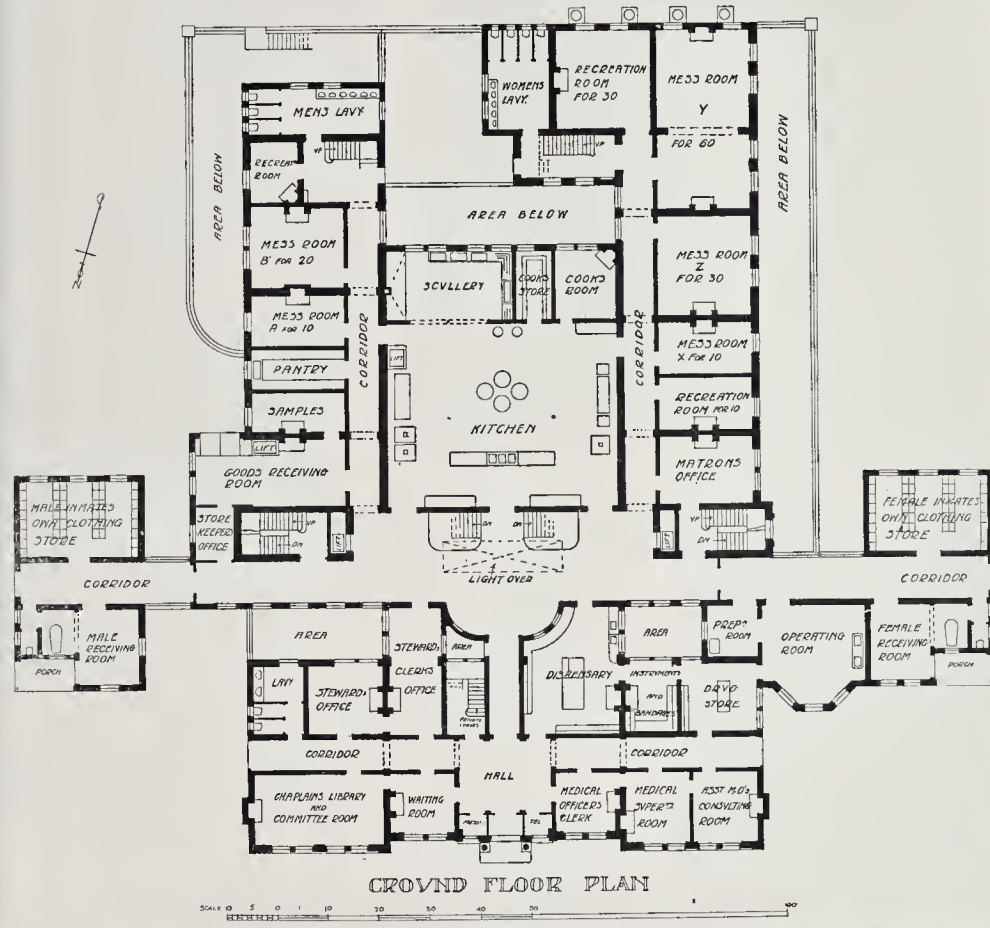

HISTORICAL MANUSCRIPTS.—In reply to a question by Sir Thomas Esmonde as to when the report on the MSS. of the Irish Franciscans will be published by the Historical Manuscripts Commission, Mr. McKenna replies in the Parliamentary papers that the report is now in type, and it is hoped to issue it in the course of next month.

HACKNEY UNION INFIRMARY NEW ADMINISTRATIVE BLOCK.

The scheme of which the present building forms an important part had its inception so long ago as 1892. If carried out in its entirety the administrative block now in course of erection would eventually become the central building of the Infirmary group, having in addition to the two present pavilions on its eastern side, which will then serve for the accommodation of male patients, two additional pavilions for women on

the vacant ground to the west. The whole would be connected by a covered way at the ground floor level, and subway beneath, running from end to end, by means of which service would be conducted from the building to the various departments on either side. The old building fronting the High-street would be cleared away and the ground left clear with the exception of a site for a porter's lodge and possibly a residence for the medical superintendent. The final design for the new building was completed by the archi-

tect, Mr. W. A. Finch, in 1903, and is intended for the administration of the existing Infirmary and also for a possible extension. It will contain accommodation for seventy-six resident male and female officers, with spare rooms, should this number be increased. Provision is also made to enable an extra story to be easily added to the east block should it at any time become necessary. The building will consist of a basement, ground, and two upper stories. The basement contains a central general store and goods distributing

room, lit from an open area on the south, in rear of which are the coal store and a chamber in which will be placed the valves controlling the heating and domestic hot water service throughout the building. This chamber is in direct communication by means of a tunnel, with the boiler and engine-house situated in the workhouse. On the east of the general store is a corridor giving access to the various rooms, stores and a dining-room and a spacious open area. On the west is a similar corridor affording access to the needle-rooms, clothing, and drapery stores, and matron's store, which also derive their light from an open area. The main axial corridor to the north is lit by three open areas, and affords communication to the existing pavilions, switch-board and battery-room, and a pipe subway under the northern portion of the building. Four lifts will be provided for conveying goods to the various floors. There are three staircases from this basement, the main one communicating with the ground floor only, the others with various floors above.

The ground floor provides in the north block for an entrance-hall, with corridors to the east and west, communicating with a waiting-room, chaplain's library and committee-room, stewards' offices, dispensary and drug and instrument stores, medical officers' consulting-rooms, and the necessary lavatory accommodation. There is here a staircase, which gives communication to the first floor only. A short passage leads from the hall to the main axial corridor, which communicates with the male and female receiving-rooms, to each of which are attached baths and lavatories, with inmates' own clothing stores in close proximity. An operating-room, with north light, and a preparation-room adjoining are also approached from the main corridor. The east block contains a good receiving room with storekeepers' office and sample room attached, a pantry, mess and recreation-rooms for male officers, also their lavatory accommodation. The west block contains the matron's offices and female mess and recreation-rooms, together with the necessary lavatory accommodation. The space between the east and west blocks is taken up by a large and lofty kitchen, top-lighted and ventilated, to which is attached a scullery, cooks' store, and cooks' room.

Five staircases give access to the first floor, which will contain the various officers' bed and sitting rooms, bath-rooms, lavatories, etc. There will also be a small kitchen and scullery for the use of the medical officers, matron, and steward. From this floor access will be gained to the second floor by three staircases. The floor will contain cubicles for ward, dormitory, kitchen, and laundry-maids and rooms for the remainder of the female staff, for whom bath and lavatory accommodation is also provided. Officers' box-rooms will be provided on each floor. Above the ground floor the building will resolve itself into three detached blocks, thus allowing for the free circulation of air, but communication will be preserved by means of external fire-escape staircases and bridges. To facilitate progress in erection, the contract was divided into two portions.

The removal of the old buildings and erection of the substructure to the ground level was executed by Messrs. Stapleton & Sons, of High-street, Stoke Newington, and the remainder of the building is being carried out by Mr. Albert Monk, of Lower Edmonton. It is of brick, with slated roofs and of fire-resisting construction throughout, but fire hydrants are to be fixed in convenient positions. The decoration throughout is of the simplest character, economy consistent with sound construction being the rule. The quantities were prepared by Mr. G. T. G. Wright, of Great Winchester-street, E.C. The clerk of the works is Mr. J. T. Hodzson.

Correspondence.

FELLOWSHIP, R.I.B.A.

SIR,—I should like to be allowed, as an Associate of some eleven years' standing, to express my surprise at the result of the recent election by ballot, and regret at the exclusion of the majority of the candidates for election to the Fellowship.

In my opinion it would be preferable, where members demand, according to the by-laws, an election by the ballot, that they should restrict such method of election to certain candidates, as to whose qualifications they may have information—information, perhaps, not in the possession of the majority of the members of the Institute.

The fact that there might occasionally be a candidate or candidates for election to the Fellowship, proposed and supported in perfect good faith by those responsible for a nomination or nominations, against whom there might be reasonable objections, cannot be controverted. But the indiscriminate rejection of candidates for the Fellowship who have not passed an examination for election as "Associate" previously would at any time be deplorable.

HENRY JAMES WISE.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—X.

SQUARE ROOT.

AS the main object of this article is to indicate contracted and other ready methods of extracting square roots, brief reference only is made to the methods more generally employed, these being introduced chiefly for comparison.

The general rule for the extraction of a square root is stated below as a matter of convenience.

Rule (1).—(a) Mark off the figures in pairs, commencing from the right-hand, by dots over alternate figures, or by commas between alternate figures. If the number includes a decimal fraction, mark off the figures of the fraction in a similar manner, commencing from the decimal point, making the number of digits even, if originally odd, by the addition of a cipher.

(b) Divide the first period of the dividend by the highest number whose square does not exceed the amount of that period. This number is the first figure in the required square root.

(c) After the remainder bring down the next period of the dividend and divide by the highest digit which, multiplied into twice the first digit of the quotient (considered as so many tens) and into itself, will give products whose sum does not exceed the number to be divided. After division bring down the remainder, and proceed in a manner similar to that before described until the exact square root or a sufficiently exact approximation has been obtained.

Example (1): Find the square root of 62809645586.

Adding one cipher at the end of the decimal fraction, marking off the periods, and proceeding as above,

We have

62,80,96,45,58,60/7925 253 +	49
149 1380	1341
582 3996	3164
15845 83245	79225
158502 402058	317004
1585045 8505460	7925265
15850503 8023500	4381509
	10471991

The working may be shortened by applying the Italian method of division, as given in Article VII, p. 206.

Thus

62,80,96,45,58,60/7925 253 +	
149 1380	
582 3996	
15845 83245	
158502 402058	
1585045 8505460	
15850503 8023500	
	10471991

A contracted method of extracting the square root is given below. In some cases the result will be the exact root, and in others a close approximation thereto.

Rule (2).—Find one more than half the number of figures in the required root by the ordinary method (see Rule 1), and determine the remaining figures of the root by ordinary division of the remainder by double the part of the root already found, the units figure of the product being rejected.

To apply this rule it is first necessary to know how to find the number of figures there are in the square root of any given whole number. The process is quite easy, for it is simply necessary to mark off the figures in pairs from the right, and then if the number of figures is even, each pair gives one figure in the square root, or if the number of figures is odd, each pair gives one figure in the square root, and the single figure remaining also gives one figure.

Example (2): Find the square root of 168558289.

Marking off the periods we find there are four pairs of figures and a single figure over. Therefore, there are five figures in the square root.

We have first to find three figures by Rule (1),

Thus

1,68,55,82,89/129
1
22 68
44
249 2455
2241
2148289

The first three figures of the square root are 129 with the remainder 2148289.

Next we have to find the two remaining figures of the square root by Rule (2), dividing the remainder 2148289 by (129 × 2) = 258 after rejection of the last figure. Here as the figure rejected is more than 5, the next figure to the left must be increased by 1 (as explained in Article V, p. 147), giving 26 as the divisor.

Then 2148289 ÷ 26 = 826, which is taken at 83.

Writing the quotient so obtained after the first three figures of the root previously determined we have 12983, which is the exact square root of 168558289.

Rule (3).—The Method of Factors.—The process of evolution can be very much facilitated in the case of numbers readily separable into prime factors, for as a perfect square, or the square of a whole number, is the product of two equal factors, it follows that when a perfect square is expressed as the product of its prime factors, each prime factor occurring must be raised to an even power.

Consequently familiarity with prime factors frequently enables the operator to arrive at the square root of a number by mere inspection.

Rules for ascertaining the prime factors of a number are given in all manuals of arithmetic, and need not be repeated here, but the following tests of divisibility are specially worthy of note.

- 2 is a factor of any number whose last figure is divisible by 2.
- 3 is a factor of any number the sum of whose figures is divisible by 3.
- 4 is a factor of any number whose last two figures are divisible by 4.
- 5 is a factor of any number whose last figure is either 0 or 5.
- 6 is a factor of any number divisible by both 2 and 3.
- 8 is a factor of any number whose last three figures are divisible by 8.
- 9 is a factor of any number the sum of whose figures is divisible by 9.
- 10 is a factor of any number whose last figure is 0.

11 is a factor of any number if the difference between the sum of the figures in the odd and even places is divisible by 11, or equals 0.

12 is a factor of any number divisible by both 3 and 4.

It should also be remembered that no whole number which is a perfect square ends with the figures 2, 3, 7, or 8.

Example (1): Find the square root of 1089.

3 1089	∴ 1089 = 3 ² × 11 ²
3388	and 1 √1089 = √3 ² × 11 ²
11 121	= 3 × 11
11	

∴ 33 is the required square root.

Example (2): Find the square root of 7056.

4 7056	∴ 7056 = 2 ⁴ × 3 ² × 7 ²
4 7164	and √7056 = √2 ⁴ × 3 ² × 7 ²
3 441	= 2 ² × 3 × 7
3 117	= 4 × 21
7 49	
7	

∴ 84 is the required square root.

To extract the square root of a vulgar fraction the following rules are available:—

Rule (4).—Reduce the fraction to its lowest terms, and take the square roots of the numerator and denominator as the terms of the required square root.

Example: Find the square root of $\frac{21}{54}$.

As neither the numerator nor the denominator in this fraction is an exact square, it is impossible to obtain an exact result without reduction of the fraction to its lowest terms.

Here

21	4
54	9

Therefore

$$\sqrt{\frac{21}{54}} = \sqrt{\frac{4}{9}} = \frac{2}{3}$$

When the numerator and denominator are not exact squares two methods are open.

Rule (5).—Multiply the terms of the fraction

by such a number as will make the denominator an exact square, and extract the square root of the fraction so obtained, or

Rule (6).—Multiply the numerator and denominator together, then use the square root of the product as the numerator of the required root and the original denominator as its denominator.

Example: Find the square root of $\frac{5}{32}$

By Rule (5)

$$\sqrt{\frac{5}{32}} = \sqrt{\frac{5 \times 2}{32 \times 2}} = \sqrt{\frac{10}{64}} = \frac{\sqrt{10}}{8}$$

The required square root being $\frac{3.16 +}{8} = 0.395 +$

Example: Find the square root of $\frac{5}{3}$

By Rule (6)

$$\sqrt{\frac{5}{3}} = \frac{\sqrt{5 \times 6}}{\sqrt{3 \times 6}} = \frac{\sqrt{30}}{6}$$

The required square root being $\frac{5.477}{6} = 0.913$.

Rule (7).—Convert the vulgar fraction to its equivalent decimal, extract the square root of this, and, if desired, re-convert to a vulgar fraction.

Example: Find the square root of $\frac{5}{6}$.

By Rule (7)

$$\sqrt{\frac{5}{6}} = \sqrt{0.833 +} = 0.913$$

The square root of a mixed number can be treated by Rules (4), (5), (6), or (7), after reduction to an improper fraction, or after reduction of the vulgar fraction to its decimal equivalent.

In dealing with expressions containing surds, or roots whose exact magnitude cannot be stated arithmetically, methods can often be adopted which simplify to a considerable extent the incidental extraction of roots and the determination of the required values.

Rule (8).—The product of the sum and the difference of two quantities is equal to the difference of the squares of the same quantities. (Illustration $(a + b)(a - b) = a^2 - b^2$).

Example (1): Find the value of $\frac{1}{\sqrt{2} - 1}$

It is always troublesome to have a surd in the denominator, and if we multiply the numerator and the denominator by $\sqrt{2} + 1$ then, in accordance with Rule (8), the denominator reduces to 1, and the surd is transferred to the numerator, where it can be dealt with more readily.

The process is as follows:—

$$\frac{1}{\sqrt{2} - 1} = \frac{1 \times (\sqrt{2} + 1)}{(\sqrt{2} - 1)(\sqrt{2} + 1)} = \frac{\sqrt{2} + 1}{2 - 1} = \frac{\sqrt{2} + 1}{1} = \sqrt{2} + 1$$

Then we have only to extract the square root of 2 approximately, and the addition of 1 gives the required value: $(1.41421 + 1) = 2.41421$.

If worked in the ordinary way we should have

$$\frac{1}{\sqrt{2} - 1} = \frac{1}{1.4142136 - 1} = \frac{1}{0.4142136} = 2.41421$$

This involves the extraction of $\sqrt{2}$ to seven places of decimals, and the division of 1 by 0.4142136, both of these operations involving tedious division sums. If $\sqrt{2}$ were only extracted to five places of decimals we should get the incorrect result 2.41423.

Example (2): Find the value of $\frac{\sqrt{3}}{\sqrt{6} + \sqrt{3}}$

Multiplying the numerator and denominator by $(\sqrt{6} + \sqrt{3})$ we get

$$\frac{\sqrt{3}}{\sqrt{6} + \sqrt{3}} = \frac{\sqrt{3}(\sqrt{6} + \sqrt{3})}{(\sqrt{6} + \sqrt{3})(\sqrt{6} + \sqrt{3})} = \frac{\sqrt{18} + 3}{6 + 3} = \frac{\sqrt{18} + 3}{9}$$

As $\sqrt{18}$ is found to be 4.2426 approximately, we have $\frac{4.2426 + 3}{9} = \frac{7.2426}{9} = 0.8047$

Rule (9).—The square of a binomial expression (that is, an expression consisting of two terms connected by the sign + or -) is equal to the square of each of its terms, and twice the product of the same terms.

Thus

$$(a + b)^2 = a^2 + b^2 + 2ab$$

$$(a - b)^2 = a^2 + b^2 - 2ab$$

This rule can be applied with considerable saving of time in finding the square roots and expressions where one term is a binomial

surd which is the square of another binomial surd.

Example: Find the square root of $21 - 8\sqrt{5}$.

Here

$$21 = 16 + 5 = 4^2 + (\sqrt{5})^2$$

and

$$8\sqrt{5} = 2 \times 4\sqrt{5}$$

It will be observed that 21 represents the sum of the squares of the terms 4 and $\sqrt{5}$ in the expression $4\sqrt{5}$, and $8\sqrt{5}$ represents twice the product of the terms in the same expression.

Hence

$$\sqrt{21 - 8\sqrt{5}} = \sqrt{(4 - \sqrt{5})^2} = \sqrt{16 + 5 - (2 \times 4\sqrt{5})} = \sqrt{21 - 8\sqrt{5}}$$

and the required square root is $(4 - \sqrt{5})$.

By finding the square root of 5, say 2.236, and subtracting, $4 - 2.236 = 1.764$, we obtain the result with very little trouble.

To get an equally accurate result by the ordinary method, the square root of 5 would first have to be extracted to at least nine places, nine times the root would then be deducted from 21, and the square root of the remainder extracted to four places.

Applications of Square Root.

Example (1): Find the length in yards in the side of a square plot of land containing 83 acres 2 roods 12 perches and 8 sq. yds.

83 acres 2 roods 12 perches 8 sq. yds. = 404,511 sq. yds. As the area of a square = (length \times breadth) = (length)². Therefore, the length of the side is $\sqrt{404511}$ sq. yds. = 636.011 yds.

Example (2): Find the length in feet of the diagonal of a square field containing 3 acres.

3 acres = 43,560 \times 3 = 130,680 sq. ft. Therefore, the length of the side is $\sqrt{130680} = 361.49$ ft.

As the diagonal of a square = $\sqrt{2} \times$ length of side, Therefore, the length of the diagonal is $\sqrt{2} \times 361.49 = 511.227$ ft.

Example (3): Find the length in yards of the diagonal of a rectangular plot of land measuring 320 yds. by 152.4 yds.

By Euclid I., 47, the area of a square described on the diagonal of a rectangle is equal to the sum of the areas of the squares described on the two other sides of either triangle formed by the diagonal and the sides of the rectangle

Therefore, the length of the diagonal is

$$\sqrt{320^2 + 152.4^2} = \sqrt{102400 + 23225.76} = \sqrt{125625.76} = 354.43$$

Example (4): Find the radius in feet of a circular enclosure covering an area of half an acre.

As the area of a circle = 3.14159, say 3.1416, times that of the square described on its radius, Therefore, the required radius

$$= \sqrt{\frac{0.5 \times 43560}{3.1416}} = \sqrt{\frac{21780}{3.1416}} = \sqrt{6932.6} = 83.26$$

Example (5): Find the circumference in feet of the circular enclosure in example (4)

As the circumference of a circle = diameter \times 3.1416, Therefore, the required circumference = 83.26 ft. \times 2 \times 3.1416 = 523.14 ft.

Example (6): Find the length in feet of a rectangular hall, the area of which is 202 1/2 sq. yds., the length being two and a half times the breadth.

Since the length = the breadth \times 2.5, the area can be divided into two squares each of whose sides is equal to the breadth of the hall, and one rectangle having one side equal to the breadth and another side equal to half the breadth of the hall.

The area of each square in square feet

$$= 202.5 \times 9 \times \frac{2}{5} = 729 \text{ sq. ft.}$$

and the side of each square

$$= \sqrt{729} = 27 \text{ ft.}$$

Therefore, the breadth of the hall is 27 ft., and the length of the hall = 27 \times 2.5 = 67.5 ft.

OBITUARY.

MR. F. WHITTINGHAM.—The sudden death is announced of Mr. Frank Whittingham, architect, of Wrexham and Cornhill Quay, which took place at his residence at Cefnybedd, near Wrexham, on Wednesday last week. The deceased gentleman, who was only twenty-eight years of age, was the only son of Mr. James Whittingham, J.P., of Fechan House, Wrexham.

Mr. F. J. Morris, of Francis J. Morris, Borough Surveyor of Grantham, died somewhat suddenly at the home of his father, at Sleaford, on the 12th inst. Mr. Morris, who was only forty years of age, was appointed by the Grantham Town Council ten years ago.

GENERAL BUILDING NEWS.

PRIMITIVE METHODIST CHURCH, ASHBY-DE-LA-ZOUCH.—The foundation-stones of the new Primitive Methodist Church, on Burton-road, Ashby, were laid a short time ago. The style of architecture is Gothic. The cost of the buildings will be about 2,200. The contractors are Messrs Orton & Son, Ashby, and the architect is Mr. Harry Smedley, of Ashby.

COUNCIL SCHOOLS, CHATHAM.—New Council schools have been erected in Glence-road, Chatham. The departments are arranged as follows: A two-story building, accommodating 304 boys on the ground floor and 304 girls on the first floor, and a separate one-story building for 308 infants. The classrooms in each block are grouped around three sides of a central hall, and each hall is directly accessible from the entrances. Duplicate entrances are provided to the departments on the ground floors and two staircases give access to the girls' department and the first floors. All classrooms have stepped galleries, and they are so arranged that all scholars obtain direct light from the left side. Two commodious cloak-rooms and lavatories are provided to each department, fitted with numbered hat and coat hooks on iron rails and standards. There are also teachers' rooms and stock rooms, those in the boys' department being placed on a mezzanine floor over the cloak-rooms. The central halls, cloak-rooms, and corridors are warmed on the low-pressure hot water system; each radiator is capable of independent control. The apparatus was installed by Messrs. Gibbs & Sons, of Liverpool. The classrooms are warmed by means of warm air ventilating grates, supplied by Messrs. Hand & Pattison, of London. All rooms and halls have separate wall inlet ventilators and extract shafts carried up in the chimney stacks. The lighting is by gas, with two-light pendant in the classrooms, and reflecting star lights in the central halls. The gas fittings were supplied by Mr. Frank Rayfield, of Chatham. The site is a sloping one, a special centre has been provided on the sub-ground floor, affording accommodation for upwards of forty pupils. The materials used in the outside work are red bricks from the Darnall brickfield, and Portland stone copings, strings, and key stones, etc. The roofs are covered with Broseley tiles, and the flats with Val de Travers asphalt. All corridors, staircases, and cloak-rooms have high dadoes of glazed bricks, the classrooms and central halls have dadoes of matched boarding, the walls above the dadoes are distempered in a dull reddish colour, and the interior woodwork is stained and varnished. The floors throughout are fire-resisting and covered with pitch-pine blocks. The offices are placed well away from the school buildings, and the sanitary fittings were supplied by Messrs. T. & W. Farmiloe, of London. The playgrounds are paved with tar paving, and covered shelters, with a drinking-fountain in each, are provided for each department. The schools have been erected from the Architect to the Education Committee, Mr. Herbert H. Dunstall, by the contractor, Mr. H. E. Phillips, of Gillingham, at the contract price of 11,637. Mr. George Carr was foreman of works, and Mr. Thomas Cramp carried out the duties of clerk of works.

SCIENCE SCHOOL, DULWICH.—On the 3rd inst. Lord Rayleigh laid the foundation-stone of the new science school which is being erected in connexion with Dulwich College. The building is to cost 18,000. It has been designed by Mr. Charles E. Barry, and is being built to the north of the present buildings in red brick and terra-cotta. On the ground floor there is to be provision for the teaching of physics, with a museum, and on the top floor there will be chemistry rooms with an optical laboratory. Both lecture theatres and teaching laboratories will be provided.

PROPOSED COTTAGE HOSPITAL, ALSTON.—Plans have been prepared by Mr. T. Taylor Scott, architect, Carlisle, for a cottage hospital which is to be erected at Alston. The plans show that the new hospital will have a frontage of over 70 ft., with the main entrance in the centre, which forms a porch leading into the vestibule hall and corridors. On the right-hand side of the hall is situated the operating-room, and beyond it, approached by the main corridor, will be a female ward with a cut off sanitary wing. The opposite end of the main corridor will give access to the male ward with an isolated sanitary wing practically the same as the female ward, and a nurse's night room adjoining it with inspection window. Bathroom and hospital stores for both wards will be approached from the main corridor. At the rear will be erected a large two-story block forming the administrative department at right angles with the body of the hospital, and consisting of kitchen, pantries, larder, scullery, matron's and nurse's bedrooms, etc.

PUBLIC LIBRARY, FENTON.—The new public library at Fenton is situated at the corner of Station-road and Baker-street. The exterior is of red Accrington brick and Hollington stone, and the roofs are covered with brimble tiles. In the entrance-hall is a decorative painting in oils of children sitting at the feet of an allegorical

figure of Knowledge. It has been painted and presented by Mr. G. M. Forsyth, of Stoke. The lending library has bookshelves of 12,000 volumes capacity. The reference library is placed in the quietest and most secluded part of the building.

The general reading-room will accommodate seventy-eight readers—eighteen at newspaper-stands and sixty at tables. In the basement there is a heating chamber with coke and coal stores. A staircase leading from the entrance-hall is constructed of Stuart's granolithic. The principal room on the first floor is a lecture-hall, to seat 120 persons, and on the same floor are a ladies' reading-room, committee-room, and filing-room. The walls in the building are painted with Harland's enamel; the woodwork is of selected varnished pitch-pine; the railings, balustrades, grates, and gas fittings are executed in wrought iron; the floors are of steel and concrete, and are fire-proof; all the rooms are laid with wood blocks, and the building is heated by means of low-pressure hot-water apparatus. The architect of the building is Mr. F. R. Lawson, of Fenton and Longton, and the contractor Mr. John Bagnall, Messrs. Minton, Hollins, & Co., of Stoke, supplied all the mosaic, faience, and wall-tiling; Messrs. Thomas Brawn & Co., of Birmingham, the wrought-iron grates and gas fittings, the remaining ironwork being supplied by Mr. W. Durose, of Tunstall; Messrs. Burgess & Co., of Liverpool, the wood-block floors; the Critical Manufacturing Company, of Braintree, Essex, the wrought-iron casements; Messrs. E. Peake & Sons, of Fenton, the heating apparatus. The sanitary ware was presented by Messrs. F. Winkle & Co.

ASYLUM, NABURN, YORK.—The new asylum which has been built by the Corporation of York at Naburn has a present accommodation for 362 patients, but the building could be extended so as to permit of 124 more being received. The new asylum faces south-west, and the extreme length of the building from north-east to south-west is about 740 ft., and the depth from north to south 430 ft. A lodge has been built at the entrance from Naburn-lane, and a wide drive leads up to the north entrance, over the doorway of which is a medallion containing the City Arms carved, and surmounting this is a turret with a domed roof. The entrance hall has a flooring of mosaic, on which is represented the City Arms. The build-ings have been arranged somewhat in the form of a fan, and there are three blocks on each side of the centre all facing south-east. Those on the north-east side are for males and those on the south-west for females, with the apartments of the assistant medical superintendent between. The requirements of the Lamscy Commissioners have been fully met, the details of the accommodation being as follows:—Female side, block A, epileptic, ground floor, 40; chronic, first floor, 40. Block B, recent and acute, ground floor, 30; recent and acute, first floor, 30. Block C, sick and infirm, ground floor, 35; sick and infirm, first floor, 35; total females, 210. North side, Block D, sick and infirm, ground floor, 25; sick and infirm, first floor, 25. Block E, recent and acute, ground floor, 20; recent and acute, first floor, 20. Block F, epileptic, ground floor, 30; chronic, first floor, 30; total males, 152. The estimated cost of the institution, fully equipped, is 133,000. The cost works out approximately at 280l. per bed, exclusive of the land. The corridor from the entrance block and that of the assistant medical officer's block have terrazzo floorings by Geary Walker, of London. The plans of the building were drawn by Mr. A. Greer, City Engineer, and his assistant, Mr. Spurr, the contract having been executed by Messrs. Longden & Son, of Sheffield. The clerk of works has been Mr. J. C. Laight, who had for his assistant Mr. W. Berkeley, who has been appointed by the Asylum Visiting Committee resident engineer. The wooden flooring of the building has been in the hands of Messrs. "Ronuk," Ltd., of Portslade, London, and Manchester, for treatment by their sanitary methods. Leading out of the main corridor are the night nurses' quarters. There are two stories with ten rooms on each. At one end of the long corridor is the female bath-room, that for the males being at the other end. The fittings are by Doulton, of Lambeth, the floors having been laid by the Challenge Flooring Company, of London. The dormitories have Dunsco coloured walls and polished floors. The fire grates are of various designs with tiled hearths. They have been supplied by Messrs. Doulton, London, Messrs. Burnmantotts, Leeds, the Selby Brick Company, Messrs. Dove, of York, and Messrs. Bushell, of York. The glazed bricks throughout the building have been supplied by Burnmantotts and the Selby Brick Co., and the latter with the Castleford Brick Company have been responsible for the bricks for the external walls. The rubber arches over the doors and windows are made of bricks supplied by Lawrence, of Bratton, Berkshire, and the fire-proof ceilings and iron roof principals come from the works of Homan & Rogers, Manchester. A water tower 100 ft. high with a clock dial 7 ft. 6 in. in diameter, by Nowey, of Petergate, York, has been provided. An isolation hospital and a mortuary have been built. The chapel, which is built on the left of the avenue leading to the

entrance from Naburn-lane, is small in dimensions, and is built of brick with an open roof of stained and varnished pitch-pine. The interior of the walls are plastered in Keen's cement and coloured. The floor is of oak blocks, and the general seats are of pitch pine, while the choir stalls are of oak. The heating is supplied direct from the main building by radiators. The house for the medical superintendent is situated on the right of the entrance gates. On the north-west corner of the site six cottages have been erected for the head attendant, head gardener, and other employees. Messrs. Dent & Co., of York, are the contractors for the rebuilding of the farm steading.

HOLBORN COUNCIL'S NEW OFFICES.—The Establishment Committee of the Borough Council reported on Monday having authorised the Town Clerk to invite preliminary plans for this building from the following architects:—Messrs. Colcott & Hamp, Edwin T. Hall, Henry T. Hare, Gerald C. Horsley, A. Brunwall Thomas, Septimus Warwick, and Herbert A. Hall.

DEPTFORD MORTUARY AND CORONER'S COURT.—Instructions have been given for the three sets of designs for the mortuary and coroner's court to be open for public inspection at the Town Hall from the 19th to the 24th insts. inclusive.

APPOINTMENT.

ROYAL BOROUGH OF KENSINGTON.—It is announced that Mr. Alfred Robert Finch has been appointed Borough Engineer and Surveyor, Kensington, in succession to Mr. William Weaver, who recently tendered his resignation after having been injured through an accident, and has been granted a pension of 500l. per annum. Mr. Weaver had served during more than forty years the former vestry and its successor, the Borough Council, firstly as a pupil and ultimately as chief in connexion with the largely increasing municipal work of the district, and is a past-President of the Incorporated Association of Municipal and County Engineers.

SANITARY AND ENGINEERING NEWS.

VENTILATION OF SEWERS.—The Highways Committee of the Greenwich Borough Council are to consider as to the advisability of convening a conference of the Camberwell, Deptford, Lewisham, and Woolwich Borough Councils to exchange opinions as to whether danger to the health of the inhabitants is likely to arise from the proposed sewer ventilators of the main sewers now in course of construction, and to ascertain whether any practical means can be devised for preventing a nuisance arising from the ventilation of sewers.

APPOINTMENT OF SANITARY OFFICERS.—The Local Government Board has sanctioned the appointment, in the place of Mr. R. W. Hindhaugh, resigned, of Mr. W. S. Matson as sanitary inspector in the Metropolitan Borough of Finsbury, as from February 19, 1906.

INSTITUTE OF SANITARY ENGINEERS.—A meeting for the formation of a Northampton District centre will be held at the Guildhall, Northampton, on Saturday, the 17th inst., at 3 p.m. The chair will be taken by the President of the centre, Mr. Alfred Eider, M.Inst.C.E., Borough Engineer and Surveyor of Northampton. After the meeting an official visit will be made to the refuse destructor, tramway power-station, etc., under the direction of the President. The Hon. Local Secretary is Mr. A. E. Abbott, Engineer and Surveyor, Wolverton, Bucks.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The partnership hitherto existing between Mr. Stephen Salter, of Oxford, and Mr. R. C. Davy, of Maidenhead, architects, has been dissolved. Mr. Henry Stock, of the firm of Stock, Page, & Stock, architects, who recently resigned the appointment of Surveyor to the Haberdashers' Company, which he had held for twenty-three years, has been succeeded in that appointment by his son, Mr. H. W. Stock. Mr. C. P. Knowles, A.M.Inst.C.E., has removed his offices from Craven-street to 39, Victoria-street, Westminster.

STATUARY AT THE CENTRAL CRIMINAL COURT.—The upper portion of the scaffolding at the new Central Criminal Court has now been removed, and the massive bronze-gilt figure of "Justice" which surmounts the building is visible. It is over 200 ft. above the street level, and was designed and executed for the casting by Mr. F. W. Pomeroy. Including the globe on which it stands, the figure is 20 ft. high, measures from 10 to 15 ft. from the extremities of the outstretched arms (uplifting the sword and scales of Justice), and weighs several tons.

PROPOSED STREET EXTENSIONS, NEWCASTLE.—A report has been issued by the City Engineer of Newcastle-on-Tyne Corporation with regard to the proposals for dealing with Market-street extensions. The first proposal is that part of New Bridge-street be widened a minimum width of 60 ft.; second, that Rose-street be continued to New Bridge-street, opposite to the foot of Higham-place, and with a width of from 40 to 50 ft.; third, that Erick-street be diverted a

little westward, and become a continuation of Princess-street; fourth, that a street of 20 ft. wide be provided from Pilgrim-street to Trafalgar-street to give better access to the block of buildings on the south side of the new Market-street. The City Engineer recommends that the improvements should be commenced as early as possible after the necessary preliminary work has been obtained.

WAR MEMORIAL, PENRITH.—A memorial to the local volunteers who were killed in the South African War has been erected in Comez-square, Penrith. It consists of a bronze figure representing the angel of peace placed on an unpolished column of Shap granite, which, in its turn, stands on a base of the same stone, formed into three steps. The angel stands with outstretched wings and arms, and holds in its hands a laurel wreath. The full height of the monument is 21 ft., and it has been designed by Mr. F. W. Doyle Jones, of West Hartlepool.

THE PEABODY FUND.—The forty-first annual report of the Peabody Fund states that 154 cottages of five rooms each are in course of erection at the Tottenham estate, and it is hoped that some of them will be ready for occupation towards the end of the present year. At the end of the year the governors had provided for the artisan and labouring poor of London 12,328 rooms, including the houses occupied by the superintendents and porters, besides bath-rooms and lavatories. These rooms comprised 5,448 separate dwellings, viz., 82 cottages of 5 rooms, 105 tenements of 4 rooms, 1,833 of 3 rooms, 2,550 of 2 rooms, and 899 of 1 room.

CHICHESTER CATHEDRAL.—The programme of restorations of the cathedral during the coming summer was discussed at a meeting of the Executive Committee of the Cathedral Restoration Fund held in the Chapter House last week. The Committee had before them the chapter clerk's report as to the result of the appeal recently made to the county at large for the purpose of completing the restoration of the bell-tower, and of replacing the lead roof of the cathedral. The result has not been so favourable as the Committee hoped would be the case, though the substantial sum of 1,055l. has been paid or promised, besides 500l. promised by the Ecclesiastical Commissioners. In the absence of the supervising architect (Mr. Somers Clarke, of Brighton), who is abroad, Messrs. Vick & Sons, of Chichester, who have had the carrying out of a considerable amount of the recent restoration work, were consulted as to the details of the nature and cost of the further work required. They gave it as their opinion that at least 2,000l. will be needed to complete the bell-tower, while the work on the cathedral roof will necessitate another 3,000l. They recommended that the roof should be left for a year or two, as it is not so urgent, and that they should be instructed to get on with the repairs to the northern half of the bell-tower, which would take them practically the whole summer, and cost about 1,000l. The Committee, after discussion, resolved to instruct Messrs. Vick to carry out the renovation of the bell-tower, but limited the expenditure for the time being to 700l. The works will be under the supervision of Mr. Somers Clarke. For the completion of all the contemplated repairs and renovations above mentioned some 3,500l. is still needed. Meanwhile, 100l., which is in hand, of the old restoration fund is to be applied to the further pointing of the cathedral.

ARTESIAN WELLS IN LONDON.—An artesian well has just been bored at Bric House, the large buildings just completed in Leadenhall-street, and a good supply of pure water obtained, which is remarkable for its softness, it being less than 6 degrees. The well was carried to a depth of 450 ft., and beds of yellow, blue, and variegated clays, also sand and pebbles, were passed through before the chalk was met with. An electric bore hole pump raises the water noiselessly to the top of the building, at the rate of 2,500 gallons per hour. Messrs. Alfred Williams & Co., of Artesian Works, Bow, were the engineers.

PROPOSED EDINBURGH EXHIBITION.—A special meeting of the Parks Committee of the Edinburgh Town Council was held on the 8th inst. to consider the application of the promoters of the Scottish National Exhibition, which it is proposed should be held in Edinburgh in 1908, for the use of Saughton Park as an exhibition site. The general feeling was that the committee could not adopt the policy of standing in the way of the success of the scheme, but members wished to be satisfied that it would be carried through, and that certain work which the exhibition authorities would have to undertake would be made of permanent value to the city.

THE SQUARE CLUB.—The club is holding its third smoking concert in the Institution, the Hall, Monico Restaurant, at 8 p.m. on Tuesday, the 20th inst. The chair will be taken by the President, Sir Aston Webb.

LONDON COUNTY BUILDING BILL.—In the House of Commons on Tuesday, on the motion for the second reading of the London County Building Bill, Colonel Legge said he rose not to oppose the Bill, but to express a doubt whether the present was the best time to incur the expense proposed in erecting municipal offices on the south side of the Thames. The debt of the

County Council had risen from 17,500,000, in 1889 to 33,000,000, in 1905, although in the latter sum was included the burden occasioned by taking over the Board Schools. It regards as another scheme of the County Council, and stated that the County was in danger of overstraining its credit. The total cost of the site and buildings now proposed was 2,000,000, but this Bill only asked for 655,000, for the site.—Sir E. Cornwall remarked that, leaving out of the question the cost of education cast upon the County Council, the debt had only increased by 8,000,000, or 2d. in the pound on the rates, in respect of public works in the last ten years. The percentage of debt to the rateable value was very much less in London than in most of the large provincial towns and cities, therefore these alarmist statements were not quite worthy of those who wished to regard London in its highest aspect. Of the staff of 1,950, the central offices housed 525, and the remaining 1,425 were accommodated in twenty-five separate buildings. The architect's department occupied seven buildings, the clerk to the Council's department occupied five, the controller's four, and the engineers' four. The proposed outlay, although he doubted whether the expenditure would be kept within the limit mentioned, The Bill was then read a second time.

TRADES DISPUTES BILL.—A deputation from the Employers' Parliamentary Committee and the Trades Union Congress, headed by Mr. Gladstone and the Attorney-General, at the House of Commons, on the subject of the Trades Disputes Bill. The Earl of Wenys introduced the deputation, who asked that in any Bill contemplated by the Government their views should be considered. Nowadays it appeared to be the opinion of many people that only the interests of labour were of importance, and that the employers should be ignored. It was strongly urged that clear instructions should be given on picketing. The Home Secretary, in reply, said the time had come for attempting some settlement of this important and difficult question. A Bill was now under the consideration of the Government—in fact, was in the last stages of consideration—and in the course of a week or two it would probably be introduced into the House of Commons. The difficult points of the Bill were the liability of funds, the question of the law of conspiracy, and the question of picketing. Whatever proposals might be brought forward he was confident that they would not depart from the principle that it was the duty of the Government to see that all reasonable protection, as far as possible by law and executive action, should be given to everybody in the execution of his lawful business. He assumed that the Government was perfectly aware that there were other interests in this country besides labour interests, and that it would view this matter from the standpoint of public policy.

CHARING-CROSS IMPROVEMENTS.—In the House of Commons on Tuesday, Mr. Bryce, in answering Mr. Hay, said all the lands and buildings necessary for the completion and opening of the new road from St. James's Park to Charing-cross had been purchased in 1883 and 1885, and that the foundations of the buildings and entrance to Charing-cross would be completed by the end of June next.

BUILDING BY-LAWS.—In Tuesday's Parliamentary papers Mr. Brodie asked whether it is the case that inquiries have recently been addressed to the district and parish councils throughout the country asking for a return as to the housing requirements in their respective districts. The President of the Local Government Board stated that he has not asked district and parish councils for a return as to the housing requirements of their areas, but he recently addressed a circular to rural councils relating to by-laws with respect to new streets and buildings, and he stated that the object of the circular was to secure that, whilst sanitary requirements should be strictly observed, all unnecessary impediments in the development of building should be avoided.

IRISH SLATE QUARRIES.—In the Parliamentary papers for last Tuesday, Mr. Edward Barry, M.P., asks the Chief Secretary for Ireland if he will ask the Department of Agriculture to send an inspector to visit the slate quarries at Benduff, Roscommon, County Cork, and report on the quality of the slate and the possibility of further development, giving special attention to the disadvantage under which the quarries at present suffer owing to the fact that they are ton miles from a railway station. Mr. Bryce replies that the Benduff slate quarry was investigated in 1904 by the Department's economic geologist in compliance with an application made to them by the managing director of the quarry, and the inspector's report was communicated to the managing director.

SHEFFIELD MASTER BUILDERS' ASSOCIATION.—The annual dinner of the Sheffield Master Builders' Association took place on the 8th inst. at the

Building Trades Exchange. Mr. T. Roper (President of the Association) was in the chair. In submitting the "Corporation, City, and Trade of Sheffield," Mr. A. J. B. Smith concentrated on the fact that all trades were better represented on the Council than the building trade. Councillor A. Neal responded. He expressed the hope that the Federation would be conducive of peace, and not of war, that it would meet the men always in a proper spirit, that it would meet the architects and make them give reasonable conditions under which to execute contracts, and that it would raise the status of the building trade in Sheffield. Councillor G. L. Wood also responded. Mr. J. D. Cook claimed in proposing "The National and Yorkshire Federation of Building Trade Employers" that, although the Federations were at first regarded as antagonistic to the Labour party, they were seen to have worked equally in the interests of the men. Neither a strike nor lock-out could now take place in Sheffield until the matter in dispute had been referred to the conciliation board of the district, and after that to the Yorkshire Federation, then to the Northern centre, and finally to the National Association. If the Federations had done nothing more than render the establishment of conciliation boards possible they had justified their existence. Mr. P. Rhodes (President of the Yorkshire Federation) said that, with the exception of agriculture, the building trade were the largest industry in the kingdom, and employed about 1,000,000 men. He waxed indignant over the proposal to be made in Parliament to sanction picketing, and expressed the opinion that if the law were amended in the way suggested the men's organisations would soon be backing out of the conciliation board. His views were expressed by Mr. A. Moulson (Bradford). The toast of "The Architects, Surveyors, and Engineers" was proposed by Mr. J. Biggin. Mr. C. F. Wike, City Surveyor, replied, and gave some figures and details as to the continued spread of the city. Last year, he said, plans for 1,982 dwellings were passed by the Council, compared with 1,950 the previous year, which meant that about 10,000 people were being added to the population of Sheffield every year. Plans were also passed last year relating to 2½ miles of streets, and this year a single plan submitted contained nearly four miles of streets. What had been one of the beauty spots of the city would therefore in all probability in a few years be a "landscape of masonry." Mr. Wike also touched on the question of the unemployed, and intimated that the list of unemployed in Sheffield had contained 2,200 names. Out of that number the city had found work for about 600. Some of the others were unsuitable owing to age and other reasons, but some undoubtedly were wastrels and did not want to work. Replies were also made by Mr. E. M. Gibbs and Mr. E. Holmes. The toast of the evening, "The Sheffield Master Builders' Association," was given by Councillor W. C. Epton, who referred at some length to the much-discussed question of direct labour. The only difference between direct labour and contract work, he thought, was that direct labour was more expensive than the other. Nevertheless, there were times when direct labour was the class he certainly should employ. He was not in favour of the attacks so often made upon builders by people anxious to obtain cheap notoriety, he urged the builders not to sit quietly down under them, but to give forcible replies. The President of the Association (Mr. T. Roper) briefly responded, declaring that the Association was not formed for fighting purposes, but to settle matters amicably. "The Visitors" were honoured at the behest of Mr. G. E. Powell, and Mr. J. Bingham and Mr. J. Sissons responded.

THE LONDON GEOLOGICAL FIELD CLASS.—This Class, conducted by Mr. H. G. Seeley, F.R.S., F.G.S., Professor of Geology in King's College, London, is one in which students are taught continuously by the same teacher in the open country and in quarries. The excursions for this year will commence on the last Saturday in April. The departure by railway is usually between two and three o'clock in the afternoon, returning to London between eight and nine o'clock. Some excursions start earlier and return later. The afternoon walk varies from two to six miles. A drive is arranged when the distance is longer. A suitable tea is taken after six o'clock at the hotel or village inn. At the conclusion of tea a connected account of the geological work done during the day is usually given by Professor Seeley. The remainder of the excursions are held during the Whitsun, Summer, and Christmas vacations. Each extends over two or three days, and is unlimited as to distance. Each excursion is planned either to compare the geological deposits of the London district with those found in other parts of the country; or to examine the outcrops of the older rocks which have been proved by engineering work to underlie the London district; or to examine rocks which are not known in the south-east of England, such as the crystalline and volcanic rocks. The excursions of this series for 1906 will be chosen from the following:—A tertiary locality in the Hampshire Basin, the cretaceous rocks of north-west Norfolk, Devizes, or Folkestone; the oolites of

Swindon or Cheltenham; and the primary rocks of Clifton, the Mendip Hills, the Welsh Border, or Leicestershire. Particulars of each excursion will be sent to all members of the Class as the details are arranged. The director will issue a report on these longer excursions at the close of the session. The fee is one guinea for all the excursions for the session, 1906.

TOWN HOUSES, OLD AND NEW.—Speaking before the Auctioneers' Institute on the 9th inst. at Hamilton House, Victoria-avenue, on the subject of "Town Houses, Old and New," Mr. W. Henry White said that the housing of the working-classes and garden cities had been so much to the fore during the past year or two that the charms of a more town house or mansion were in danger of being forgotten. So far as comfort went the modern town house was much more luxurious than was its prototype, and the improvements which had taken place, together with the conditions imposed by various Acts of Parliament, had materially increased the size and costliness of houses, apart from the question of labour and materials. They had also given the architect fresh problems in design. In the hands of educated and trained men he believed that these fresh conditions had been an incentive to design of a high standard, as evidenced in many instances on the great West-end estates, but, unfortunately, the bulk of modern work was not done by highly-trained men, and the results were disappointing. He believed, however, that there was a constantly increasing number of capable men, and he hoped that the building-public and great landlords were beginning to appreciate the better class of work, and that they would assist architects by demanding a high standard of design. Why were there so aptly now amongst the citizens as to the appearance of London streets? The average building owner thought mainly of the matter from a commercial point of view, and there was but little evidence of any large view of citizenship and of "the city beautiful" being to the fore. A high such a view was more general it would be only here and there that beautiful buildings would be erected. It was an age of speed, hurried work, and hurried schemes, and he was convinced that even from a commercial point of view the result was not satisfactory. He drew attention to Park Lane, and remarked that a study of those homes of the millionaires showed an extraordinary conglomeration of buildings. There was no stately laying-out worthy of such a position, but practically each house was different in style from its neighbour.

GREEK ARCHITECTURE.—On the 6th inst. Professor Capper lectured to the members of the Northern Art Workers' Guild, at the Grand Hotel, Manchester, on Greek architecture. His impressions from a recent visit to Greece were, he said, not those usually accepted. The general view was that ancient Greek architecture was purely abstract art, and that once the abstract proportions were mastered they had the correct Greek architecture. He did not believe that view was sound. Another point on which he differed was that once the Greeks had fairly established it, they worked at their system and were content to do nothing but continue practising it. That was an entire misconception of Greek architecture, and one of his impressions had been how greatly progressive their art was.

ORGAN, CARLISLE.—A new organ has been erected in the Warwick-road Presbyterian Church at a total cost of 743l. It was built by Messrs. Alexander Young & Son, Manchester, in accordance with designs prepared by Mr. T. Taylor Scott, of Carlisle.

WANDSWORTH PARISH CHURCHYARD.—A portion of the parish churchyard of All Saints, Wandsworth, is to be taken for a widening of South-street in connexion with the London County Council's scheme for tramways and local improvements. The remains to be disturbed will be re-interred in Streatham cemetery, Garratt-lane, at the charges of the Council, who will defray the cost, to the extent of 10l., in respect of each grave taken for the new works.

Legal.

TRIBUNAL OF APPEAL CASE.
ESTON-ROAD BUILDING LINE.

ON Friday last week the Tribunal of Appeal was engaged for over five hours at the Surveyors' Institution in hearing the appeals of the Worshipful Company of Skinners (as governors of Tonbridge School), Mr. W. F. Howard Flanders (as trustee of the Flanders Estate), and the Metropolitan Railway Company against the certificate of the Superintending Architect of Metropolitan Buildings, dated January 17, 1906, defining the general line of buildings on the south-east side of Eston-road, St. Pancras, between Liverpool-street and Duke-street. Mr. Horace Avory, K.C., and Mr. Cumming Glen, represented the Skinners Company; Mr. Macmorren, K.C., the Metropolitan Railway Company; and Mr. Avory and Mr. Jenkins, Mr. Howard Flanders, Mr. Morton

supported the appeal on behalf of the United Kingdom Temperance and Provident Institution; Mr. Payne on behalf of the Euston Theatre Company, while a number of other owners and lessees were represented. The London County Council was represented by Mr. C. Russell, K.C., and Mr. Bailhouse.

Mr. Avory, in opening the case, said the Skinners' Company were the owners of the houses numbered from 45 to 113, and Mr. Flanders from Nos. 23 to 35, and in between was the property of the Euston Theatre Company. The matter of the building line was of the greatest importance to his clients because the line, as it had been fixed by the Superintending Architect, absolutely prevented the advantageous development of the property, the lessees of the majority of which were just about to fall in. It also prevented any advantage which the public might have acquired by the widening of this important thoroughfare, for his clients could hardly be expected to give up property for the widening of the road unless they were going to get some corresponding advantage. The line as at present fixed by the Superintending Architect would prevent any buildings being erected on the gardens in front of the houses, and so would prevent the property being developed for modern purposes. On January 3 they invited the Superintending Architect to fix the line of building for their property between Belgrave-street and Mapleton-place. If there had been a general line of buildings in that portion of the Euston-road it would have been the duty of the Superintending Architect to define it, but when he came to his certificate he admitted that in that portion of the Euston-road there was no general line of buildings existing, and so in order to define one he had to extend his view along the road to Liverpool-street to the east and to Duke's-road to the west. He submitted that even if they took that limited view the line which had been laid down could not be justified, but his contention was that in order to define the line it was necessary to take a much larger survey of the road. At present near Chester-street there were one-story buildings projecting beyond the line now laid down by the architect, and going west they had at the corner of Mapleton-place buildings of two stories projecting to the pavement-line. Between Mapleton-place and Duke's-road there were a number of buildings which came in front of the line defined by the architect. He submitted that they were bound to take into account these existing buildings because they were in front of the line now laid down by the architect, and further, if they looked at the line laid down, he ventured to doubt if there had been any exercise of judgment at all. It simply looked as if a clerk in the office had drawn a red line along the fronts of the existing houses. Unless the County Council was prepared to show that these one-story houses were erected without consent of the Metropolitan Board of Works, how could it be laid that they were beyond the existing frontage? If they were to take the line from Liverpool-street to Duke's-road then the line of building should be defined to the line occupied by the buildings he had mentioned, viz., the pavement-line. He suggested, however, that they ought not to stop at Duke's-road, but should have regard to the whole of Euston-road and begin at Portland-road station. The question of the building line of Euston-road had already been before the Tribunal.

Mr. Hudson said the Tribunal did fix the building line between Tottenham Court-road and Southampton-street.

Mr. W. Campbell Jones, architect and surveyor to the Skinners' Company, gave evidence with regard to the property belonging to the company, and expressed his disagreement with the line as defined by the Superintending Architect's certificate. He thought the architect should have taken in the whole of Euston-road in fixing the line, and so bring it to the pavement-line.

In cross-examination by Mr. Russell, witness said that if they took the property in blocks, the building line as laid down by the architect would be the right line so far as the blocks were concerned. In their earlier applications the Skinners' Company offered to give up from 25 ft. to 30 ft. of the frontages for the widening of the road if they could build on the remainder of the forecourts.

Mr. Stenning, surveyor, stated that he had examined the part of Euston-road in question owned by the Skinners' Company and was of opinion that the line as laid down by the Superintending Architect was not the general line of building. He considered that the one-story and two-story buildings must be taken into account in fixing the line, and agreed that the line should be drawn from Portland-road station to King's-cross.

Cross-examined, witness said he thought some consideration ought to be paid to the north side of the road in fixing the line. On this side the buildings were brought out. It might be that the Royal Commission on London Locomotion had recommended that the forecourts in Euston-road should not be allowed to be built upon, and he agreed that it would be a good thing to make the road 100 ft. wide.

Other evidence of a similar character was submitted.

Mr. Macmorren addressed the Tribunal on behalf of the Metropolitan Railway Company. He pointed out that his clients had not asked the Superintending Architect to define the line of building, but if the line was now defined between Duke-street and Liverpool-road they would be seriously affected. The railway company had acquired property under an Act of Parliament really for the purposes of ventilation of the railway, and the building line as now laid down would absolutely go to take away a large quantity of their property. The property of the company was one-story property. When the time came to rebuild, he contended that they would be able to do so on their statutory title.

Mr. Russell, K.C., argued that the line ought to be defined in accordance with the previously existing lines for the different blocks of property in the line, and he suggested that there was a well-defined part of Euston-road which lay between Liverpool-street on the east and Euston-square to the west. The Superintending Architect had taken a well-defined part of Euston-road in which the buildings in question were situated, and had dealt with that part with regard to the more important question as to what was the general line of buildings of the street; the reason for the contention that the line should be defined from Portland-road station was obvious. When they got beyond Gover-street there was a considerable number of buildings which were brought right up to the pavement-line and further, it enabled the appellants to drag in that portion of the road between Tottenham Court-road and Southampton-street with regard to which the Tribunal had settled the line of buildings. Euston-road had a history and up to 1862 it was unlawful to bring any building nearer than 50 ft. from the street, therefore up to that date it was certain that the general line of building was the front of the existing houses, which were 50 ft. from the pavement. Then the question arose whether a new building line had come into existence since 1862. The one-story buildings had been erected on conditions and must be eliminated from the minds of the Tribunal.

The Chairman said it might save time if he intimated that it was in the minds of the Tribunal to limit their finding as to the general line of buildings as between Chesterfield-street and Mapleton-place.

Mr. Avory said if only that piece of the road was taken, then there was no building projecting beyond the line which the Superintending Architect had fixed, and he contended that they must take the other portions of the road into consideration.

The Chairman said their intimation would not prevent argument as to where the building line should be fixed.

Mr. Russell read the conditions on which the one-story buildings were erected, which were to the effect that they were not to be altered or raised without the consent of the Metropolitan Board of Works. As to the two-story buildings, he had no records of how they came to be erected, but the appellants had brought no evidence to show how they came to be there.

Mr. Avory said that if the Tribunal were going to exclude from their consideration those buildings which had been erected with conditions, he should have to ask for a case to be stated for the High Court. As to the two-story buildings, it was a rule of law that a thing was legally done until it was proved to the contrary, and the old Act of Parliament only said that no new building should be erected on a new foundation. There was no law which said that a one-story building was not to be considered in defining a building line.

Mr. Macmorren said that, of course, his clients' property did not come in if the Tribunal limited their finding as intimated.

The Chairman said the Tribunal had decided to uphold the line of building of the Superintending Architect as between Chesterfield-street and Mapleton-place.

On the question of costs, the Tribunal gave the County Council costs against the Skinners' Company and Mr. Flanders, and awarded the Metropolitan Railway Company costs against the London County Council.

CASE UNDER THE PUBLIC HEALTH ACT.

The case of the Mayor, &c., of Hornsey v. the Birkbeck Freehold Land Society, came before the Divisional Court of King's Bench composed of the Lord Chief Justice and Justices Ridley and Darling last week on a case stated by the Justices of Highgate on a complaint by the Hornsey Borough Council against the Society, whereby the Borough Council sought to recover from the Society 72s. as the apportioned share of expenses incurred by the Council in the execution of certain works in the Birkbeck-road under the Public Health Act, 1875. The road in question was a highway not repairable by the inhabitants at large, and the boundary between the Hornsey borough and urban district of Friern Barnet runs along the line of the kerb of the footpath on the north side of the road, so that the carriage-way and the footpath on the south side are in the borough of Hornsey and the footpath on the

north side is in the urban district of Friern Barnet. It appeared that the Society were the owners of premises abutting on the footpath on the north side of the road within the urban district of Friern Barnet, and these premises were wholly within the district. In July, 1903, the Hornsey Borough Council, under the provisions of the Public Health Act, 1875, caused notices to be served on the Society, calling upon them to make up the parts of the road within the borough of Hornsey, but this work was not done. The work covered by the notice comprised work to the carriage-way and to the footpath on the south side, but did not comprise sewerage or any work to the footpath on the north side. The notice was also served on all the owners of premises abutting on the south side of the road, and, as none of the owners executed the work, the Hornsey Borough Council carried it out themselves. The expenses, which amounted altogether to 949s., were attributable 739s. to the carriage-way and 210s. to the footpath on the south side of the road. The Borough Council's Surveyor apportioned the 210s. among the owners of the premises abutting on the south side, and he apportioned the 739s. among the owners of all the premises, whether on the north or south side, including the Society whose share of the 739s. was 72s., but this sum, although demanded, was not paid. About this time the Friern Barnet Urban District Council served notices under the Act with reference to the footpath on the north side, and, having executed the works, apportioned the expenses on the owners of the premises on the north side only, including the Society, who had paid the sum so apportioned. Certain sewers ran through that part of the road which is within the borough of Hornsey, and these were vested in the appellants. The houses on the south side of the road drained into these sewers. The houses on the north side drained into a sewer which ran along that part of the back-road within the Friern Barnet Urban District, and which was recently constructed by the Friern Barnet Council at the request and cost of the owners on the north side. The contention on behalf of the appellants was that the fact that the Society's premises were not within the appellants' borough was immaterial under section 150 of the Act. The case for the Society was that their premises, being outside the district of the appellants, were beyond their jurisdiction.

In the result, the Lord Chief Justice, in giving judgment, said it lay on the appellants to establish their right to charge people outside their district. It had been laid down that the authority of one district should not charge or tax the inhabitants of another, and the appellants had failed to show that they had any power to do so.

Justices Ridley and Darling concurred, and the appeal was accordingly dismissed with costs.

Mr. Macmorren, K.C., Mr. Jenkins appeared for the appellants; Mr. Alexander Glen, K.C., and Mr. Aldrett for the Society.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

4,808 of 1905.—A. DRYSDALE: Means for Hinging Windows.

This relates to means for hinging windows, and consists of a hinge plate for securing to the inside of the sash frame, the hinge plate to the window sash being moved at right angles to the fixed plate when it is desired to open a window inwards. The said hinge plate is bifurcated at the top and bottom so as to form a hinge so that the window sash can engage therewith to pivot on, the hinge plate being slung with the fixed plate when not in use. To allow the hinge plate to be secured to the window the baton is hinged with an ordinary hinge to open outwardly, the same with regard to the centre or parting baton. After the baton or headings have been turned out wardly the window is turned, on its hinge, one of the sash ropes being held by a blind check action.

5,806 of 1905.—W. LAVERY: Construction of Bricks for Building Purposes.

This relates to the construction of bricks for building purposes formed with a number of circular bottom and circular side shaped grooves on one or more of the sides or ends of the bricks. The grooves, preferably either two or three in number, may be formed on the side of the brick which is intended to form the outer surface of the wall or building or on both sides, and may be placed longitudinally. One or more grooves may be formed on the end or ends of the brick when these are to form part of the outer surface of the wall. These grooves, which will be narrow at the surface of the brick and be widened out at the bottom or back in oblong circular form, will give a strong hold or key to any coating of cement, stucco, or plaster applied thereto.

10,756 of 1905.—G. GREEN and W. GREEN & Co., Ltd.: Stoves, Ranges, and the like.

This relates to a combined sitting-room grate and cooking range, comprising a grate proper, partially projecting from the chimney wall and having a movable cover, a chamber or oven

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

above the grate enclosed by the chimney wall, and having an open front capable of being closed by a door or the like, and flues extending from beneath the grate cover for heating the chamber or oven.

12,906 of 1905.—J. WATERHOUSE: Water Waste Preventer.

This relates to a water waste preventer, which consists of an ordinary flushing cistern in which is mounted a siphon arrangement composed of a central pipe forming the long leg of the siphon, a cap on its lower end surrounding the said central pipe, two or more side passages rising from the top of the said cap and opening into a ball or chamber over the said central cap, the said cap, side passages, and ball or chamber forming the short leg of the siphon.

19,786 of 1905.—J. H. JONES: Combined Sash and Casement Windows.

This relates to a combined sash and casement window, and has for its object to construct said combined sash and casement window so that it can work in two ways, that is, up and down like a sash window, and also open inwardly and outwardly upon hinges at any height required, thus combining two windows in one without requiring any more brickwork "reveal" than is usual in ordinary windows.

3,708 of 1905.—P. KUBNE: Combination Concrete Steel Construction.

This relates to a combination concrete steel construction having two or more sections or floor fillings, separated from each other by a beam or beams and reinforced by tension-rods, which cross the line of shear, and consist in an arrangement of the tension-rods such that the tension-rods of adjacent sections or fillings overlap each other at suitable intervals apart, the tension-rods of each section or filling extending beyond the beam or beams into the adjacent section or filling.

26,553 of 1905.—A. HEMSELY: Means for and the Method of Cleaning Sink and Similar Waste Pipes.

This relates to means for cleaning sink and similar waste pipes, comprising a cylindrical vessel which is, or can be, closed at one end, and at the other end is provided with a rubber or similar washer, by which a joint can be made between the appliance and the sink or the like. The appliance is charged with chemicals capable of generating gas or steam, and when the charged appliance is placed in position over the waste pipe the gas or steam generated passes through the waste pipe and effectually removes all objectionable matter which accumulates therein.

27,231 of 1905.—R. L. HARRISON: Water Closets.

This relates to water-closets that are flushed with waste water from a sink or other source, and consists in the combination with a closet pan and a waste water cistern of a jet pump connected either to the main or to a cistern placed in such a position as to cause the water issuing from the nozzle of said jet pump to draw up waste water from the cistern, which, with the addition of the fresh water issuing from the pipe through the nozzle, will be forced through the inlet.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

Table listing recent property sales with columns for date, location, and price. Includes entries for Camberley, Bishop's Stortford, Shrewsbury, Great Shelford, Little Shelford, Whitteford, Beckenham, and Islington.

Table listing real estate listings with columns for location, agent, and price. Includes entries for Paddington, Dalston, Lambeth, Aberavenny, Stratford, Clapton, South Kensington, Dulwich, Battersea, Finchley, Dulis-ay, Notting-hill, Clapham, Southall, Walsworth, Battersea, Hackney, Bromley, Ealing, Hoxton, Palmer's Green, Mile End, Plaistow, Loweham, Crouch Hill, Hornsey, Sutton, Whitechapel, Haggerston, Clapham, Poplar, Plastow, Maudray, Old Kent, Putney, March 9, Shepherd's Bush, Tooting, and Islington.

PUBLISHER'S NOTICES

THE INDEX (with TITLE-PAGE) for VOLUME LXXXIX. (July to December, 1905) was given as an appendix with the issue of January 1906. CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each. READING CASES (Cloth), with Bindings, price 6d. each. THE EIGHTY-NINTH VOLUME of "The Builder" (bound), price Twelve Shillings and Sixpence. SUBSCRIBERS' VOLUMES, on being sent to the Office, will be found as a cost of 2s. 6d. each.

CHARGES FOR ADVERTISEMENTS. COMPETITIONS, CONTRACTS, ALL NOTICES ISSUED BY CORPORATE BODIES, COUNTY AND OTHER COUNCILS, PROSPECTUSES OF PUBLIC COMPANIES, SALES BY TENDER, LEGAL ANNOUNCEMENTS, etc., 6s. 6d. Six lines or under 1s. 3d. Each additional line (about ten words) 1s. 3d. SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, TRADE AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under 4s. 6d. Each additional line (about ten words) 1s. 6d. Terms for series of Trade advertisements, and for front page and other special positions, on application to the Publisher. SITUATIONS WANTED (Single-handed-Labour only). Four lines (about thirty words) or under 2s. 6d. Each additional line (about ten words) 1s. 6d. PREPAYMENT IS ABSOLUTELY NECESSARY. Stamps must not be sent, but all sums should be remitted by Postal Orders, payable to J. MORGAN, and addressed to the Publisher of "THE BUILDER," Catherine Street, W.C.O.

Advertisements for the current week's issue are received up to THREE o'clock p.m. on THURSDAY, but "Classification" is impossible in the case of any which may reach the Office after HALF-PAST ONE p.m. on that day. Those intended for the outside wrapper should be in by TWELVE O'CLOCK on WEDNESDAY.

ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS, to be made, must be received at the Office before TEN O'CLOCK on WEDNESDAY MORNING.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, etc., left at the Office in reply to advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

ADVERTISERS in "THE BUILDER" may have Agents addressed to the Office, Catherine Street, Covent Garden, W.C.O., first of charge. Letters will be forwarded if address envelopes are sent, together with sufficient stamps to cover the postage. Unused stamps are returned to advertisers the week after publication.

The Reply Boxes are not intended for trace lists, circulars, and the like; should these be received, they cannot (if noticed) be forwarded.

AN EDITION Printed on THIN PAPER, for FOREIGN and COLONIAL CIRCULATION, is issued every week.

READING CASES (NINEPENCE EACH) (By post (carefully packed) 1s.)

Table listing meetings and reading cases. Includes sections for MEETINGS (Saturday, Monday, Tuesday, Wednesday, Thursday, Friday) and READING CASES (NINEPENCE EACH).

discussion will be opened by Mr. C. Killick Millard, M.D., D.Sc., Medical Officer of Health, Leicester, 11 a.m. Edinburgh Architectural Association. Visits to the new offices of the North British and Mercantile Insurance Co., and new premises of the Professional and Civil Service Supply Association, Ltd.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article, or to execute or send a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. The Editor cannot undertake to read and consider articles offered for acceptance unless they are type-written.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PRICES CURRENT OF MATERIALS.

. Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table listing prices for various materials including Hard Stocks, Rough Stocks, Grizzles, Pickled Stocks, Facings, Plettons, Red Wire Cuts, Best Farham Bed, Best Bed Pressed, Kaulon Facing, Best Blue Pressed, Staffordshire, Do. Bullnose, Best Stourbridge, Fire Bricks, Glazed Bricks, Best White and Ivory Glazed, Stretchers, Headers, Quoins, Bullnose, and Flats.

Table listing prices for various types of Stone including Bath Stone, Portland Stone, and Grey Stone Lime.

STONE (continued).

Table listing prices for various types of Stone including York Stone, Scappled random blocks, 6 in. sawn two sides landings to sizes, 40 ft. super., 6 in. rubbed two sides ditto, 6 in. sawn two sides slabs, 2 in. to 2 1/2 in. sawn one side slabs, 1 1/2 in. to 2 in. ditto, and Hard York.

Table listing prices for various types of Hopton Wood (Hard Bed) in blocks, 2 to 8 per ft. cube, delivered, and sides landings.

Table listing prices for various types of Slates including In. In., 20x10 best blue Bangor, 20x12, 20x10 first quality, 20x12, 16x8, 20x10 best blue Fortmadoc, 16x8, 20x12, 20x10 best Eureka, 16x8, 20x12, 18x10, 16x8, 20x10 permanent green, 18x10, and 16x8.

Table listing prices for various types of Tiles including Best plain red roofing tiles, Hip and Valley tiles, Best Broadley tiles, Do. Ornamental tiles, Hip and Valley tiles, Best Rulon red, brown, or shire do., Do. Ornamental do., Hip tiles, Best Red or Mottled Staffordshire do., Do. Ornamental do., Hip tiles, Best 'Rosemary' brand plain tiles, Best Ornamental tiles, Hip tiles, Best 'Hartshill' brand plain tiles, Do pressed, Do Ornamental do., Hip tiles, and Valley tiles.

WOOD.

Table listing prices for various types of Building Wood including Deals, Battens, Second yellow deals, and various sizes of Deals and Battens.

WOOD.

Table listing prices for various types of Wood including Fir timber, Danzig or Mosaic (average specification), Second yellow deals, Small timber, Swedish balks, Pitch-pine timber, and Joyners' Wood.

WOOD.

Table listing prices for various types of Wood including Fir timber, Danzig or Mosaic (average specification), Second yellow deals, Small timber, Swedish balks, Pitch-pine timber, and Joyners' Wood.

WOOD (continued).

Table listing prices for various types of Joyners' Wood including White Sea and Petersburg, First white deals, Battens, Second white deals, Yellow Pine, Oddments, Seconds, regular sizes, Yellow Pine oddments, Kaur Pine, Danzig and Stettin Oak Logs, Large, per ft. cube, Wainscot Oak Logs, Dry Wainscot Oak, Mahogany-Honduras, Mahogany, per ft. super., Selected, Figury, per ft. super., Dry Walnut, American, per ft. super., Teak, per load, American, per ft. cube, Prepared Flooring, 1 in. by 7 in. yellow, 1 in. by 7 in. yellow, 1 in. by 7 in. white, 1 in. by 7 in. white, 1 in. by 7 in. white, and 1 in. by 7 in. white.

Table listing prices for various types of Joyners' Wood including Rolled Steel Joists, Compound Channels, Steel Compound Stanchions, Angles, Tees, and Channels, Flitch Plates, Cast Iron Columns and Stanchions, Iron—Common Bars, Staffordshire Crown Bars, Staffordshire 'Marked Bars', Mid Steel Bars, Hoop Iron, Sheet Iron Black, Ordinary sizes, Sheet Iron Galvanised flat, Ordinary sizes, Sheet Iron Galvanised flat, best quality, Ordinary sizes, Galvanised Corrugated Sheets, Best Soft Steel Sheets, Best Soft Steel Sheets, Cut Nails, Lead, LEAD, Sheet, Pipe in coils, Sol pipe, Compo pipe, Zinc-Sheet, Yellow Metal, Silesian, COPPER—Strong Sheet, Thin, Brass—Strong Sheet, Thin, TIN—English Ingots, SOLDER—Plumbers, Blowpipe, ENGLISH SHEET GLASS IN CRATES OF STOCK SIZES, 15 oz. thirds, 2 1/2 lb. thirds, 2 lb. thirds, 26 oz. thirds, fourths, 3 1/2 lb. thirds, 3 1/2 lb. fourths, Fluted Sheet, 15 oz.

Table listing prices for various types of Joyners' Wood including Rolled Steel Joists, Compound Channels, Steel Compound Stanchions, Angles, Tees, and Channels, Flitch Plates, Cast Iron Columns and Stanchions, Iron—Common Bars, Staffordshire Crown Bars, Staffordshire 'Marked Bars', Mid Steel Bars, Hoop Iron, Sheet Iron Black, Ordinary sizes, Sheet Iron Galvanised flat, Ordinary sizes, Sheet Iron Galvanised flat, best quality, Ordinary sizes, Galvanised Corrugated Sheets, Best Soft Steel Sheets, Best Soft Steel Sheets, Cut Nails, Lead, LEAD, Sheet, Pipe in coils, Sol pipe, Compo pipe, Zinc-Sheet, Yellow Metal, Silesian, COPPER—Strong Sheet, Thin, Brass—Strong Sheet, Thin, TIN—English Ingots, SOLDER—Plumbers, Blowpipe, ENGLISH SHEET GLASS IN CRATES OF STOCK SIZES, 15 oz. thirds, 2 1/2 lb. thirds, 2 lb. thirds, 26 oz. thirds, fourths, 3 1/2 lb. thirds, 3 1/2 lb. fourths, Fluted Sheet, 15 oz.

Table listing prices for various types of Joyners' Wood including Rolled Steel Joists, Compound Channels, Steel Compound Stanchions, Angles, Tees, and Channels, Flitch Plates, Cast Iron Columns and Stanchions, Iron—Common Bars, Staffordshire Crown Bars, Staffordshire 'Marked Bars', Mid Steel Bars, Hoop Iron, Sheet Iron Black, Ordinary sizes, Sheet Iron Galvanised flat, Ordinary sizes, Sheet Iron Galvanised flat, best quality, Ordinary sizes, Galvanised Corrugated Sheets, Best Soft Steel Sheets, Best Soft Steel Sheets, Cut Nails, Lead, LEAD, Sheet, Pipe in coils, Sol pipe, Compo pipe, Zinc-Sheet, Yellow Metal, Silesian, COPPER—Strong Sheet, Thin, Brass—Strong Sheet, Thin, TIN—English Ingots, SOLDER—Plumbers, Blowpipe, ENGLISH SHEET GLASS IN CRATES OF STOCK SIZES, 15 oz. thirds, 2 1/2 lb. thirds, 2 lb. thirds, 26 oz. thirds, fourths, 3 1/2 lb. thirds, 3 1/2 lb. fourths, Fluted Sheet, 15 oz.

Table listing prices for various types of Joyners' Wood including Rolled Steel Joists, Compound Channels, Steel Compound Stanchions, Angles, Tees, and Channels, Flitch Plates, Cast Iron Columns and Stanchions, Iron—Common Bars, Staffordshire Crown Bars, Staffordshire 'Marked Bars', Mid Steel Bars, Hoop Iron, Sheet Iron Black, Ordinary sizes, Sheet Iron Galvanised flat, Ordinary sizes, Sheet Iron Galvanised flat, best quality, Ordinary sizes, Galvanised Corrugated Sheets, Best Soft Steel Sheets, Best Soft Steel Sheets, Cut Nails, Lead, LEAD, Sheet, Pipe in coils, Sol pipe, Compo pipe, Zinc-Sheet, Yellow Metal, Silesian, COPPER—Strong Sheet, Thin, Brass—Strong Sheet, Thin, TIN—English Ingots, SOLDER—Plumbers, Blowpipe, ENGLISH SHEET GLASS IN CRATES OF STOCK SIZES, 15 oz. thirds, 2 1/2 lb. thirds, 2 lb. thirds, 26 oz. thirds, fourths, 3 1/2 lb. thirds, 3 1/2 lb. fourths, Fluted Sheet, 15 oz.

Table listing prices for various types of Joyners' Wood including Rolled Steel Joists, Compound Channels, Steel Compound Stanchions, Angles, Tees, and Channels, Flitch Plates, Cast Iron Columns and Stanchions, Iron—Common Bars, Staffordshire Crown Bars, Staffordshire 'Marked Bars', Mid Steel Bars, Hoop Iron, Sheet Iron Black, Ordinary sizes, Sheet Iron Galvanised flat, Ordinary sizes, Sheet Iron Galvanised flat, best quality, Ordinary sizes, Galvanised Corrugated Sheets, Best Soft Steel Sheets, Best Soft Steel Sheets, Cut Nails, Lead, LEAD, Sheet, Pipe in coils, Sol pipe, Compo pipe, Zinc-Sheet, Yellow Metal, Silesian, COPPER—Strong Sheet, Thin, Brass—Strong Sheet, Thin, TIN—English Ingots, SOLDER—Plumbers, Blowpipe, ENGLISH SHEET GLASS IN CRATES OF STOCK SIZES, 15 oz. thirds, 2 1/2 lb. thirds, 2 lb. thirds, 26 oz. thirds, fourths, 3 1/2 lb. thirds, 3 1/2 lb. fourths, Fluted Sheet, 15 oz.

Table listing prices for various types of Joyners' Wood including Rolled Steel Joists, Compound Channels, Steel Compound Stanchions, Angles, Tees, and Channels, Flitch Plates, Cast Iron Columns and Stanchions, Iron—Common Bars, Staffordshire Crown Bars, Staffordshire 'Marked Bars', Mid Steel Bars, Hoop Iron, Sheet Iron Black, Ordinary sizes, Sheet Iron Galvanised flat, Ordinary sizes, Sheet Iron Galvanised flat, best quality, Ordinary sizes, Galvanised Corrugated Sheets, Best Soft Steel Sheets, Best Soft Steel Sheets, Cut Nails, Lead, LEAD, Sheet, Pipe in coils, Sol pipe, Compo pipe, Zinc-Sheet, Yellow Metal, Silesian, COPPER—Strong Sheet, Thin, Brass—Strong Sheet, Thin, TIN—English Ingots, SOLDER—Plumbers, Blowpipe, ENGLISH SHEET GLASS IN CRATES OF STOCK SIZES, 15 oz. thirds, 2 1/2 lb. thirds, 2 lb. thirds, 26 oz. thirds, fourths, 3 1/2 lb. thirds, 3 1/2 lb. fourths, Fluted Sheet, 15 oz.

Table listing prices for various types of Joyners' Wood including Rolled Steel Joists, Compound Channels, Steel Compound Stanchions, Angles, Tees, and Channels, Flitch Plates, Cast Iron Columns and Stanchions, Iron—Common Bars, Staffordshire Crown Bars, Staffordshire 'Marked Bars', Mid Steel Bars, Hoop Iron, Sheet Iron Black, Ordinary sizes, Sheet Iron Galvanised flat, Ordinary sizes, Sheet Iron Galvanised flat, best quality, Ordinary sizes, Galvanised Corrugated Sheets, Best Soft Steel Sheets, Best Soft Steel Sheets, Cut Nails, Lead, LEAD, Sheet, Pipe in coils, Sol pipe, Compo pipe, Zinc-Sheet, Yellow Metal, Silesian, COPPER—Strong Sheet, Thin, Brass—Strong Sheet, Thin, TIN—English Ingots, SOLDER—Plumbers, Blowpipe, ENGLISH SHEET GLASS IN CRATES OF STOCK SIZES, 15 oz. thirds, 2 1/2 lb. thirds, 2 lb. thirds, 26 oz. thirds, fourths, 3 1/2 lb. thirds, 3 1/2 lb. fourths, Fluted Sheet, 15 oz.

ENGLISH BOLLED PLATES IN CRATES OF STOCK SIZES.

Table listing various types of bolts and plates with their respective prices per ton or per hundred.

Table listing various types of varnishes and oils with their respective prices per gallon.

TENDERS.

Communications for insertion under this heading should be addressed to 'The Editor,' and must reach us not later than 10 a.m. on the day before the opening of the tenders.

* Denotes accepted. † Denotes provisionally accepted.

ALDBOURN.—For the erection of a Primitive Methodist church at Aldbourn, Wilts. For the Aldbourn Primitive Methodist Trustees. Mr. T. Colborne, architect, Swindon.

BANGOR.—For remaking streets (Farnham-road, Somerset-avenue, etc.) for the Urban District Council. Mr. E. L. Wood, C.E., Town Surveyor, Bangor.

BUNCRANA.—For constructing outfall sewer, Bunrana main drainage, for the Inishowen Rural District Council. Mr. T. Johnston, Engineer, East Wall, Derry.

CARLISLE.—For erecting a small-pox hospital, administrative block, mortuary, etc., Bell Vue, for the Corporation. Mr. H. G. Marks, City Engineer and Surveyor, 36, Fisher-street, Carlisle.

CLAVERING (Essex).—For erecting a farmhouse, for Trustees of the Deverux Charity, Chessington. Messrs. Crawley, surveyors, Chessington.

COOLMORE.—For erecting a dwelling-house. Mr. F. G. Bennett, architect, Ballinacorney, Clonsilla, Co. Wick.

COWDEN.—For resewing and paving portion of Back Bowers-street, Waterloo, for the Urban District Council. Mr. R. Graves, Surveyor, Seaforth-street, Waterloo, Hants.

DARTFORD.—For erecting two new Council schools, for Kent Education Committee. Mr. W. Harston, architect, 3, Hythe-street, Dartford.

FRIENTON-ON-SEA.—For storm overflow from sewer opposite Second-avenue, with sea outfall, for the Urban District Council. Mr. E. M. Bate, Engineer and Surveyor, Council Offices, Frinton.

GUILDFORD.—For constructing surface water drainage, for the Town Council. Mr. C. G. Mason, Borough Engineer and Surveyor, Guildford.

GUILDFORD.—For private street works, Gardner-road, Linden-road, Chesnut-road (Sycamore-road, etc.) for the Town Council. Mr. C. G. Mason, Borough Surveyor, Tun-street, Guildford.

HINCKLEY.—For sewage disposal works, Burbage, for the Rural District Council. Mr. F. C. Cook, Surveyor, Ynnerton.

LONDON.—For the erection of children's conveniences in Southwark-park, for the London County Council.—For prior & Co., 4327 3 3; F. & G. Foster, 1234 0 0; F. Bull, 290 10 0; E. Harding, 230 0 0; Griggs & Son, 273 7 7; Son, 230 0 0; Doulton & Co., 264 0 0; W. H. Hyde, 264 0 0; Johnson Bros., 233 0 0; Junction, 206 0 0.

TENDERS.—Continued from page 303.
NETHY BRIDGE.—For water supply works, Nethy Bridge Special Water District, for the County Council of Inverness-shire, Mr. Gilbert, engineer, The Square, Grantown. Quantities by the engineer:—
 L. D. Smith, Grantown-on-Spey £800

NOTTINGHAM.—For house, Edwaton-hill, Nottinghamham, Messrs. A. R. Calvert & W. R. Gleave, architects, 18, Low-pavement, Nottingham:—
 F. W. Thompson & Son £1,372

POOLE.—For erecting a new secondary school at Seldown, for the Education Committee. Mr. G. A. Bligh Livesey, architect, Fir Vale-chambers, Old Christchurch-road, Bournemouth:—
 Sons £11,400 0 0
 George & Harding 10,847 0 0
 W. E. Jones & Son 10,798 0 0
 W. Hoare 10,729 0 0
 Jenkins & Sons 10,318 0 0

PWLLHELL.—For constructing a main sewer, sea-outfall, and other works, for the Corporation. Mr. W. T. Douglas, engineer, 15, Victoria-street, Westminster, S.W. Quantities by engineer:—
 R. H. B. Howett & Sons, Ltd. £9,109 4 9
 Neak, Ltd. 10,938 11 6
 J. H. Macdonald 8,063 0 0
 W. F. Facey 10,679 5 5
 Brebner & Co. 10,643 9 2
 W. Westwood 7,943 5 6
 P. Edwards 9,637 0 9
 J. R. Riley 9,511 11 9
 G. Bell 8,308 2 6

PLYMOUTH.—For the erection of a bridge to connect the main block with the special block at Salisbury-road school, for the Education Authority. Mr. H. J. Snull, architect, 11, The Crescent, Plymouth.—

W. E. Blake, 23, Salisbury-road, Plymouth... £200

SEAFORD.—For drainage works on the L.B. & S.C. Railway Co.'s works, for the Urban District Council, Messrs. Pollard & Tingle, engineers, 31, Old Queen-street, Westminster, S.W.—

J. Jackson £453 0 0 G. Napier & Son £210 10 0
W. Young 450 0 W. L. Walls & Co.,
R.W. B. Neal, Ltd., 300 0 Exmouth... 150 0
J. G. Porter 243 0 J. Carley 148 15
H. A. Chambers 233 5

SKEGNESS.—For sewers etc., Lifford-avenue, Marine-avenue, and Trafalgar-avenue, for the Urban District Council. Mr. R. Hudson, Surveyor, Skegness. Quantities by Surveyor:—

Parker & Son £273 14 6 J. J. Turner & Sons £167 2 6
A. E. Palmer 246 18 0 G. G. Dunkley 240 10 0
Hardy, Bates, & Co. 187 1 5 W. H. Hill, Skegness? 148 14 11
G. W. & H. Holmes 169 14 3

SOBERTON.—For building an engine-house, boiler-house, machine-shop, coal-storeroom, chimney-shafts, superintendent's house, cottages, and other works at Soberton, Hants, for the Gosport Waterworks Company. Mr. E. T. Hildred, A.M.I.C.E., Engineer.—

R. H. B. Neal, Ltd. £8,208 J. Crout £5,205
H. Jones 5,845 H. Stevens & Co., 5,350
Playfair & Toole 5,838 J. Hunt 5,345
C. M. Dash 5,805 Jenkins & Sons, 5,287
H. I. Sanders 5,577 Ltd. 5,287
J. H. Vickers 5,600 H. Sweetland 5,065
F. Orkio 5,640 F. Osmann, South- 4,989
C. J. Lear & Sons 5,682 ampbur?
J. Crockerell 5,550

SOUTHWICK.—For private street works and improvements, Gordon-road, George-street, etc., for the Urban District Council. Mr. G. W. Warr, Surveyor, Council Offices, Southwick. Quantities by Surveyor:—

J. Whitting J. Jackson £1,880 11 0
J. Parsons & Sons 2,097 0 0 C. S. East- 1,368 0 0
C. H. King 1,961 8 9 bourne? ..

TOTTENHAM.—For the erection of a school to accommodate 1,630 children, on the Belmont-road site, West Green, for the Tottenham Education Committee. Mr. C. E. T. Laurence, architect, 22, Buckingham-street, Adelphi, W.C.—

Table with 3 columns: Name, Amount, and Description. Includes entries for A. J. Bateman, H. J. Carter, Chessum & Sons, etc., totaling £212,311 3 11.

SOUTHEAST-ON-SEA.—For proposed alterations and additions to No. 1, Marine-terrace, for Mr. P. Zanich, Mr. Charles Cooke, architect and surveyor, Tower-building, High-street, Southeast-on-Sea:—

F. P. Guiver £129 F. & E. Davey, Ltd.,
A. B. Wilm 383 Southeast-on-Sea? .. £373

WALSLEND.—For erecting a mortuary and funeral, Portage-place, for the Corporation. Mr. G. Hollings, Borough Surveyor, Corporation Offices, Walslelend:—

J. T. Charlton, Elsdon-road, Gosforth, Northumberland £330 4 3

WITTON.—For alterations, repairs, colouring, painting, etc., at Witton Hall, for the Aston Guardians. Messrs. C. Whitwell & Son, Birmingham? £448 5

WORKINGTON.—For erecting new co-operative stores at Bridgfoot, for the Beehive Co-operative Society. Messrs. W. G. Scott & Co., architects and surveyors, Victoria-buildings, Workington:—

Builders: Wilkinson & Miller, Workington £216 0 0
Joiner: J. Steel, Workington 179 12 6
Slater: T. Mandle, Maryport 44 0 0
Plasterer: J. Lawson & Sons, Workington 71 0 0
Painter: W. Wildridge, Workington 20 8 6
Plumber: D. M. Walker, Workington 27 13 0

WORKINGTON.—For works at four houses in Hope-street, Messrs. W. G. Scott & Co., architects and surveyors, Victoria-buildings, Workington:—

Builder: T. Brown, Workington £280 0 0
Joiner: R. Douglas, Workington 133 0 0
Slater: E. Barrow, Workington 34 16 0
Plumber: D. M. Walker, Workington 24 10 0
Plasterer: Kaberry Bros., Workington 57 10 0
Painter: W. Wildridge, Workington 15 0 0

WORKINGTON.—For alterations and additions to the Beehive Co-operative Stores in Vulcan-lane, Messrs. W. G. Scott & Co., architects and surveyors, Victoria-buildings, Workington:—

Builders: Wilkinson & Miller, Workington £48 10 0
Slaters: J. Lythgoe & Sons, Workington 11 6 10
Plumber: W. Stewart, Workington 28 10 0
Plasterer: J. Lawson & Sons, Workington 35 0 0
Painter: K. Hodgson, Workington 16 14 0

WORKSHOP.—For erecting an operating-room at the Kilton-hill Infirmary, for the Guardians. Mr. T. Webster, architect, Market-street, Workshop:—

T. H. Harrison £167 8 0 G. G. Middleton £144 0 0
G. Wright 167 0 0 J. Doncaster 141 10 0
Bowles & Son 150 0 0 C. Hett & Sons 130 0 0
C. A. Leverton 148 12 6 Dennis, Oil, & A. Chadwick 148 0 0 J. Doncaster? 137 0 0

THE BATH STONE FIRMS, Ltd., BATH.

For all the Proved Kinds of BATH STONE. FLUATE, for Hardening, Waterproofing, and Preserving Building Materials.

HAM HILL STONE, DOULTING STONE.

The Ham Hill & Doulting Stone Co., Limited (Incorporating the Ham Hill Stone Co. and G. Trank and Son, The Doulting Stone Co.). Chief Office:—Norton, Stoke-under-Ham, Somerset. London Agent:—Mr. E. A. Williams, 16, Craven-street, Strand.

GREEK MARBLE.

White and Blue Pentelikon at Low Prices for BUILDING PURPOSES. Beautiful Colours for Interior Decoration.

MARMOR, LIMITED, 18, Finsbury-square, E.C. See Advt. p. xxiii.

Asphalte.—The Seyssel and Metallic Lava Asphaltum Company (Mr. H. Glenn), Office, 42, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. Asphalt Contractors to the Forth Bridge Co.

SPRAGUE & CO., Ltd., LITHOGRAPHERS.

Employ a large and efficient Staff especially for Bills of Quantities, &c. 4 & 5, East Harding-st., Fetter-lane, E.C.

QUANTITIES, etc., LITHOGRAPHED accurately and with despatch. METCHIM & SON QUANTITY SURVEYORS' DIARY & TABLES.

W. H. Lascelles & Co. LIMITED,

121, BUNHILL ROW, LONDON, E.C. Telephone No. 1365 London Wall.

HIGH-CLASS JOINERY, LASCELLES' CONCRETE.

Architects' Designs are carried out with the greatest care.

CONSERVATORIES, GREENHOUSES, WOODEN BUILDINGS,

Bank, Office, and Shop Fittings. CHURCH BENCHES & PULPITS.

ESTIMATES GIVEN ON APPLICATION.

PILKINGTON & CO

(ESTABLISHED 1838.) MONUMENT CHAMBERS, KING WILLIAM STREET, LONDON, E.C. Telephone No., 6319 Avenue.

Polonceau Asphalte.

PATENT ASPHALTE and FELT ROOFING. ACID-RESISTING ASPHALTE. WHITE SILICA PAVINO. PYRIMONT SEYSSSEL ASPHALTE.

Patent "OPALITE" Tiling

With Shelmerdine's Patent Granulated Backing. SANITARY, DURABLE, EFFECTIVE. The only Reliable Material for Lining Walls of SUBWAYS, LAVATORIES, AREAS, KITCHENS, BATHROOMS, &c.

Invaluable for HOSPITAL WORK, Operating Rooms, &c. WILL NOT CRACK OR CRAZE.

Over 250,000 Square Yards Fixed in LONDON Alone.

"OPALITE"

SUPPLIED AND FIXED BY WILLIAM GRIFFITHS

(London Concessionaire of Patent Rights of the National Opalite Glazed Brick and Tile Syndicate, Limited). 126, HAMILTON HOUSE, BISHOPSGATE ST. WITHOUT, E.C. Telephone Nos. 268 and 269, LONDON WALL.

ORDINARY GLAZED TILING Executed with Care and Despatch by Competent Workmen.

The Builder.

Notes in New Zealand.—II.

FROM Dunedin to Christchurch, if the weather be fair, is an easy one-night trip by the good coasting steamers which ply all round New Zealand. The harbour of Christ-

church is Port Lyttleton, a landlocked bay of considerable extent, surrounded by treeless steeply sloping hills. In a hollow of one of these is the small town of Lyttleton, its houses perched picturesquely on the steep hillside. Below, on the only level ground, are the railway yards, from which the wharves jut out into the water. The train almost immediately enters a long tunnel, and when it regains the light of day the suburbs of Christchurch commence. The contrast to Dunedin is striking. As far as the eye can reach not a single break in the level plain is visible, except occasional houses and trees, till in the far distance a faint outline of white and grey is detected. At first the stranger thinks them clouds, but on close observation they are seen to be snow-capped mountains, a spur of the fine main range of the country. Between is a great expanse of some of the richest agricultural country in the world, the celebrated Canterbury Plains. Seven or eight miles from Lyttleton, Christchurch is reached, the station being at the southern end of the city, and the first impression is one of disappointment. Commonplace

buildings surround the railway, and there is nothing to catch the eye or excite the imagination. Even the few domes and towers that exist seem lost. Hence when one gets to know the city and its surroundings their charm is all the greater.

As Dunedin was founded by Presbyterian Scotchmen, so Christchurch was settled by Established Church Englishmen, and the influence is marked even to the present day. The ecclesiastical tone permeates its fine educational buildings, University schools and museums, its Law Courts, municipal offices, and even affects many of the private dwellings of the well-to-do. But there it ends. In the business quarters modernity is paramount, though even so there is a faint recollection of some of the more up-to-date of the country towns of the midlands. The chief discordant note in the English symphony is the newly-completed Catholic Cathedral (see lithograph plate), which in size quite dwarfs its earlier Anglican brother, but of these more anon. It is a sign of the mixture of races and of the presence of the genial and irrepressible but devout Irishman.

The city proper is nearly a mile and a quarter square, surrounded on the north-east and south by wide avenues called the Town Belt, and on the west is bounded by the fine public domain of Hagley Park. The city's centre is a large open space, a Greek cross in plan, and the rest of the area is sub-divided by wide straight streets into rectangles, relieved by the pretty little winding river Avon, which

meanders through its heart from south-west to north-east, and bisected by a tram-line and main street, which traverse the city diagonally from south-east to north-west. The Avon is the chief jewel in the Crown of Christchurch, for its waters are clear and uncontaminated, and its banks are formed into charming public gardens bright with the greenest of grass and the gayest of flowers, and backed up by some of the more important public buildings. Many of the streets are also planted with trees, notably the Belts, and the northern end of Antigua-street, with its fine avenue of elms; but even more might be done in this direction with advantage.

The Anglican Cathedral (see plate) occupies, as is natural under the circumstances, the finest site in the city, viz., one half the central square, and is thus well open to view on all sides, and forms, in addition, the terminal point of the vista of the chief cross street from east and west. To English eyes it merely gives the idea of a large parish church, but if it is remembered how small was the population when it was projected, then the faith and liberality of its founders are deserving of the most sincere respect. They meant to do their best and to get the best, and so commissioned the late Sir Gilbert Scott to prepare the design, which is of the usual cruciform type, with north and south porches. From the large piers at the crossing it is evident that Scott intended a central tower, which would have had a much finer effect than the almost detached tower and spire at the north-west angle now existing. The lower part of the

Fig. 1. Canterbury College and Museum, Christchurch, N.Z.

spire is of stone, but two-thirds of the way up the colour abruptly darkens, and one learns on inquiry that the rest is in metal. Earthquakes even in the South Island of New Zealand are not infrequent, and twice has the top of the spire been shaken down—hence the present makeshift. To the same ever-present danger the abandonment of the central tower is no doubt attributable; but it is much to be regretted that, though this could not have been safely erected, yet the alternative of a timber-framed and metal-covered central lantern was not adopted. It would have suited the site far better than a detached tower out of centre with everything. It is, however, a fine church of its kind, and the interior is impressive, but it is easy to see that the somewhat ornate western narthex is by another hand, as also the transepts and the apsidal choir. The former may have been designed by Scott but detailed locally; the latter look as if they were wholly of local origin, as the scale of the windows and features is not in harmony with the rest of the building, being too coarse and bald. Internally, also, the apse is bare compared with the nave, and the aisles to the latter are disfigured by a garish-coloured glazed tile dado that is quite out of harmony with the stone walls and undecorated timber roof.

Flanking the Cathedral on the right and left are Dalgety's florid Renaissance stoue-faced office building and Warren's quieter but cement-coated hotel. Adjoining the latter is one front of the Lyttleton Times office, a vigorous modern design of free Renaissance type, with a ground story of grey stone and an upper one of white stone and red brick. The arched ground floor and pier treatment above, with an emphasised centre, are decidedly sensible and satisfactory. Another pleasing but low square one-story building is the Bank of New Zealand on the south side of

the square. It is of much older date, a quiet correct classic design, with four Corinthian attached columns and entablature marking the centre of each face, and its reticence serves as an excellent reminder that an excess of strenuousness is no more pleasing in buildings than in people. At the south-west corner of the square a large block of business premises in course of erection give promise of being effective, but they look as if built primarily for revenue. The large semi-arches of the second-story suggest the idea of a hall at that level. Except the Australian Mutual Provident Society's office, there are no other buildings in the square of any architectural merit, but when the time comes to pull them down their sites will offer very fine opportunities to the architects of the city: may they have the skill to use them right worthily. In that case Christchurch will possess a city centre that the inhabitants of many older and larger cities might envy. In the open spaces, besides ample roadways, there are at present only one fountain and basin, one statue, and some flowers and grass. What an opportunity exists to turn this fine area into an architectural and botanic triumph, if the city fathers could only be inoculated with the idea that colonnades, shelters, fountains and statues, trees, shrubs, and flowers should be co-ordinated in one complete conception worthy of the future of this prosperous town. But the trams would have to be taken severely in hand, and the traffic so arranged that it would pass around and through the square, and not turn it into the mere tram shunting-yard it bids fair to become.

In strolling around the business streets near the Cathedral-square some very fair specimens of architecture may be noted. One of the most recent is the office of the Christchurch Meat Company, a two-story building in brick and stone, with a large

cove finely carved with a ship motif and a richly-foliated frieze. The central bay gives piquancy to the otherwise flat front. The New Zealand Loan and Mercantile Agency Company's three-story stone building, in round arched Gothic à la Waterhouse, belongs to an earlier period, but is good of its kind, as are also the temporary premises of the National Bank, a Renaissance design with a Doric porch and Ionic order above. The new permanent premises for the same institution are, however, a sad contrast, the exterior showing a commonplace two-story treatment, and inside one-story the full height. Another new bank building is that for the Bank of Australasia (see plate), which is an attempt at being up-to-date, in the later English Renaissance, but is much too ornate to be wholly satisfactory. Amongst the warehouses, that of Messrs. Sargood, Son, & Eweu is noticeable for its deeply-recessed windows and generally good warehouse character, but the very wide ground floor openings make the entrance in contrast look pinched, and the centre gable is too sharply pitched to quite harmonise with the other lines of the front. Shop architecture shows very little that is out of the common, but Ballantyne & Cosgrove's may be noted as evidencing more thought than usual in connexion with the treatment of large surfaces of glass, one of the most difficult problems an architect has to solve. Not far away, in a small triangular space left at the junction of the diagonal street with one of the gridiron series, there is a small clock-tower, which at once arrests the attention of an Englishman. The upper part is of sheet and wrought iron, and very well designed in the prevalent Gothic of thirty or forty years ago. The lower part is of very ordinary design in stone, and is provided with a drinking fountain. The story goes that one of

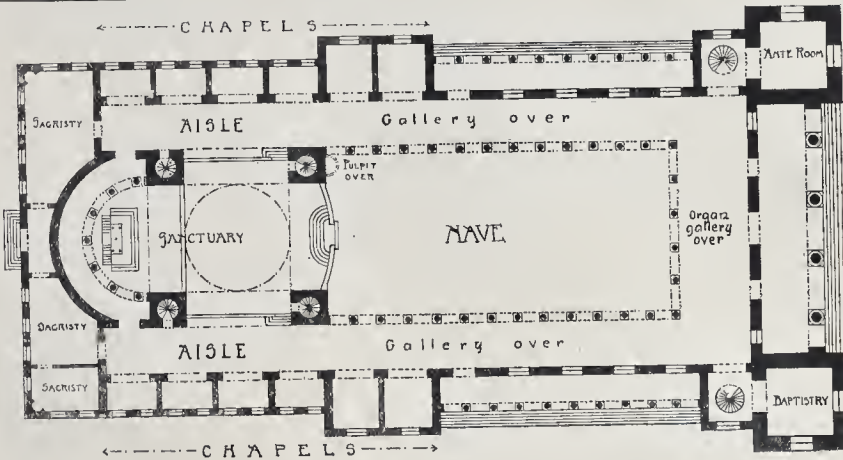

Fig. 2. Sketch Plan of Catholic Cathedral, Christchurch, N.Z.

the Premiers purchased the upper part *en bloc* second-hand, and the Borough Engineer erected the stone lower story. If not true the story is, at any rate, *ben trovato*, and one feels it ought to be true, to explain the anachronism. Going eastward from the business quarter in search of the Canterbury Hall one passes a small new hotel (the "Provincial"), in red brick and white stone, which is noticeable for its quiet, sensible, and almost plain treatment of red brick and white stone in the Free Renaissance manner—a very pleasant exception to the usually too pronounced efforts of hotel architects. The Canterbury Hall, again (see plate), is in the same materials, but shows more effort, and the twin towers, twin pedimented projections, and small central feature, to say nothing of the balconies, are somewhat disturbing. But, on the whole, it is better than many another building of the same class, and, as the result of a competition, is not to be too severely criticised, for "the man in the street," even in Christchurch, still likes a good deal of show for his money.

This failing is also the dominant note in the large new Roman Catholic Cathedral just completed, which is nevertheless the most important building in Christchurch, so far as size is concerned. Indeed, it is a wonder how so large a structure could have been erected entirely in stone for 46,000*l.*, the sum it is reported to have cost. In the description published in the local papers on the occasion of the opening it is mentioned that the design had to be cut down to reduce expense. This is patent everywhere, and the cutting down process has been so severe as to be ruthless. The conception—said to be based on the Church of St. Vincent de Paul at Paris—is a fine one, and, apart from some faulty detail, the building would have been a worthy monument of the Catholic Church if carried out with reasonable solidity. But the walls are too thin, and this alone gives the building a starved and pretentious appearance. When, however, details are examined, and we find that the staircases are of the cheapest cast-iron stock circular pattern, that visible abutments to the arches of the crossing are non-existent, and that

the ceiling of the nave and the dome and semi-dome of the sanctuary are of thin but over-ornate stamped steel sheets with nothing behind them, then the conviction is forced upon one that it would have been better to be content with a smaller and less ornate edifice built on sounder lines. The sketch plan (Fig. 2) gives a rough idea of the general arrangement. Above the narthex is a spacious organ-gallery, and over the aisles other galleries, as in some of the Early Roman Basilicas. The close spacing of the columns is also Basilican, but the colonnaded apse and whispering-gallery under the dome are features of later date. Apart from the faults just mentioned and minor ones of detail, the interior is a fine one, and is, on the whole, more satisfactory than the exterior. The difference in scale between the upper stage of the western towers and the portions below is so marked as to make one think the architect must have been coerced into a modification of his original design, and the way in which the drum of the principal dome is splayed out into the square is crude in the extreme. The transepts, again, are attached to the nave instead of supporting the dome and crossing, and thus intensify the weakness of the supports of the latter. As to materials, the walls and features are wholly of soft white Oamaru stone, with Timaru blue stone plinths; the roofs are covered with red tiles from Marseilles, on Oregon timber rafters. The domes are covered with copper, the flat roofs asphalted, and the floors are of concrete. The greatest length is 210 ft., the width, 106 ft.; the height to the top of the dome, 135 ft.; while the nave is 92 ft. 7 in. by 42 ft. 6 in. by 48 ft. in height. On leaving the edifice and passing through Cathedral-square one's final thought is that, after all, the far smaller but well-built Anglican Church quite holds its own in every way, and is indeed much to be preferred to its more pretentious rival.

The group of buildings which, however, give a special *cachet* to Christchurch have not yet been referred to. Most of them, such as Canterbury College, the Museum (Fig. 1), the Boys' High School, the Normal School, and the Law Courts, have been built a good many years, and

they are all in the domestic Gothic manner of the latter half of the last century, and in general fair specimens of the style. The Museum especially is very thorough, the whole of the interior, which is mainly of wood, being well detailed. One cannot help feeling that, however suitable such buildings may be in England amongst historic surroundings, they are somewhat out of place in a new country of wider spaces, more open outlook, and in many ways more advanced thought. The people, their institutions, and their politics are really very modern, and some form of Renaissance would, therefore, be more in harmony with their ideas. Loyalty to the ideal set up by the founders of the province has hitherto kept them faithful to the accidentals associated therewith, but now that Christchurch is more cosmopolitan than Anglican it would be well to give up what has already been abandoned in England. This has been done in the commercial quarter, but that the old idea still persists the new municipal buildings are evidence. They are well designed in brick and stone, but, while the windows are mullioned, there is a breadth and simplicity in detail that is lacking in the more archaeological older work. The Law Courts in the same locality look quite fussy in comparison, though they are undeniably picturesque in outline, and charmingly situated amidst grassy lawns near the winding Avon (see plate). The modern spirit is also in evidence in the hospital. Commenced a good many years ago, its Gothic half-timbered open corridors and some of the buildings are charmingly quaint, but it has evidently been found that they do not suit modern requirements, for in the newer wards a more modern form of Renaissance has been adopted. One great advantage, however, in a Colonial City like Christchurch is that this change of idea and change of style strikingly shows history in the making, and so gives it an interest that is unique in the Britain of the south.

The conservative instincts of the well-to-do section of the citizens are also evidenced in their domestic architecture, which is much more English in type than in any of the other cities of New Zealand.

On the western side of the town, near Hagley Park, and beyond it in the leafy lanes and roads of Fendalton and Riccarton, many charmingly-designed dwellings are to be seen, some few of which might have been transported almost bodily from the neighbourhood of an English country town. But the prevalent type leans more to single than to two or three story houses, and the roof coverings are usually of iron, while the walls are mostly of weatherboard. Here, again, local conditions have modified the type aimed at. In the first place the people generally are so prosperous that the shortage in domestic help is very pronounced, and hence a single-story cottage is much preferred to a two-story dwelling, as being more easily worked. Then the prevalence of earthquakes, usually not very serious but quite sufficient to cause alarm and sometimes damage, makes a wooden building covered with light sheets of corrugated iron preferable to bricks and tile or slate. On this point cost also is a factor, as wages are very high and the hours of labour short. But to maintain as far as may be the tone of an old country town, these suburban dwellings, especially the more recent ones, are painted a deep dull red, roofs and all. Amongst the leafy trees and abundant vegetation this looks exceedingly well, and in winter time also, when the houghs are bare, the warm colour would be equally pleasant. Of course, the majority of the older dwellings are of the usual commonplace weather-board Colonial type, and some are truly awful examples of misplaced ingenuity, with their sham rusticated quoins and other wooden imitations of stone features; but it is to be hoped these are now things of the past. There is, however, only one really vulgar dwelling in the whole of the city, and that is very large and very aggressive amongst its small cottage surroundings, and reminds one very much of a *nouveau riche* cotton-spinner's house of twenty or thirty years ago in a Lancashire manufacturing town. Most of the dwellings are small, but for absolute compactness a little week-end cottage on the sea coast is remarkable, and may even be suggestive to home readers, so a sketch plan is here given (Fig. 3). It measures over all 22 ft. by 16 ft., and may surely be regarded as the irreducible minimum. Being only intended for summer use there is no fireplace, and cooking is performed on an oil-

stove in the little kitchen, about the size of a small pantry. The beds for the husband and wife are bunks one over the other, like those in a ship's cabin, and visitors (of one sex) may be entertained, as, in the living room, the settees by day form beds at night. With this unique example one may take leave of Christchurch, a city which does not impress one at a first glance; but, like everything that possesses real charm, it grows upon one daily, so that when the time comes to leave it is with sincere regret and a firm belief that it will progress in the future as it has done in the past, and that the ideals of its founders will be realised, if not in the exact way they intended, yet on stronger, fuller, and broader lines, and permeated by the same high principles that inspired them.

NOTES.

An interesting conference in regard to the Garden City, as it is called, at Letchworth, took place last week. It was perhaps a little too academic in character, the most practical thing which was said being the statement of Canon Rawnsley that the bubble of cheap cottages had been pricked, and that those built at Letchworth for 150*l.* would really cost far more if built by an ordinary landlord. It has not redounded to the credit of those who have charge of the Garden City that they should have induced so many persons to visit the city to view these cottages, when, in fact, their cost if built under ordinary circumstances would be greater than 150*l.* We trust that the idea of the Garden City itself, factories and dwellings in close proximity in a semi-rural district, may have better results than the Cheap Cottage Exhibition. As we have more than once said, its results are likely to be beneficial in an indirect rather than a direct manner, namely, by making local authorities more careful in regard to open spaces, the planting of trees, and so forth. At present the tendency of manufacturers to place buildings at the Garden City seems but slight.

OWING to the universal employment of double-track permanent ways on all main line railways in this country, and the

rigid precautions adopted on the few single-track lines which are in existence, the latest catastrophe in the United States conveys no moral to us so far as concerns railway working. It is very evident, however, that the occurrence on the Denver and Rio Grande Railroad, in Colorado, ought to serve as a serious warning to American railway proprietors and managers. Until the proprietors adopt the most desirable precaution of providing separate tracks for up and down traffic the safety of the travelling public must depend absolutely upon the efficiency of the safeguards provided by the management to prevent trains running in opposite directions from colliding end-to-end, as happened on the Rio Grande Railway. The general manager of that line is said to attribute the collision to a "misunderstanding of orders by the engine-drivers of both trains." So far as can be judged from the reports available, it would appear as if the two trains were started on their death-dealing career under the control of drivers who had certain discretionary orders, which one or both of them failed to apply in a judicious manner. Surely American ingenuity ought to be able to devise a system of signalling by which continuous control could be exercised over trains on the road. If not, American railways should send deputations of their chief officials to study British methods of operation, and we feel sure that, if willing to learn, they would very soon find out how to obviate the constant accidents which are so common in the United States. The terrible fire which followed the Colorado disaster furnishes for us one more reminder of the absolute necessity for non-combustible rolling-stock, which indeed ought to be made compulsory by Act of Parliament.

THIS HONOUR JUDGE BRAY has had to determine an important point under the Workmen's Compensation Act as to whether timber stacked in a yard constitutes a "warehouse." The yard was 11 yds. by 24 yds., bounded on two sides by walls of neighbouring houses 25 ft. in height, and enclosed at back and front by fencing 12 ft. high. The County Court Judge held this yard, with some 80 tons of deals stacked in it, not to constitute a warehouse. Considerable difficulty has been experienced in determining what is a "warehouse" within the meaning of the Act, and two of the tests which have been applied are:—Is the store used for wholesale purposes or merely ancillary to retail business? Is the warehouse covered in? In the present case the yard fulfilled neither condition. Ninety per cent. of the sales were retail, and the yard was open to the sky. Neither of these tests is, however, satisfactory, and it is to be hoped that the promised Government measure will deal with this question. The amendment proposed by the Departmental Committee would place the matter beyond doubt. It was suggested that the Act should extend to employment "on or in or about the storage of goods for sale or safe custody by way of trade or for purposes of gain."

Claims against Tube Railways. A CLAIM was brought last week before the High Bailiff for Westminster and a special jury by a leaseholder of certain premises in Long Acre, with sixty-eight years of the lease to run, for £2,000, or 1,400% compensation for interference with the subsoil against the Great Northern, Piccadilly, and Brompton Railway Company. Counsel for the railway company asserted that this was the first claim ever brought against a tube railway company by a leaseholder, and he was prepared to argue before another Court that there was no right to claim compensation at all. The public have, however, been deprived of hearing this question argued, for the jury having heard the evidence decided that no damage had been sustained by the claimant. The railway ran 120 ft. below the surface of the roadway, beneath 78 ft. 6 in. of solid London blue clay. The tube railways are under special conditions as to compensation, since it was decided in Committee that a general clause should be inserted in their Bills dealing with the time within which such claims can be made and the character of the damage which can be made the subject of a claim. Ordinarily no claim will lie against a railway company for damages caused by its working as apart from its construction. On this question see our Note, May 17, 1902.

Radial Trucks for Tramway Cars. It is well known that when a four-wheel truck is passing round a curve considerable grinding takes place between the leading outer wheel flange and the rail. This action has been generally attributed to centrifugal force alone, but that is probably not quite the correct view, as Professor Carus-Wilson demonstrated in his recent lecture to the members of the Tramways and Light Railways Association. The natural tendency for a truck with a rigid wheel-base when passing a curve is to roll straight on in the direction of its wheel-base, thereby giving rise to an additional force which, when the speed is small, assumes large proportions as compared with the centrifugal force. The obvious remedy is to pivot the axles on the principle of the bogie. But there are objections to this form of apparatus which account for the attempt made to secure radial action with only one axle on each truck. Professor Carus-Wilson described and illustrated several types of radial trucks which are being tried in various parts of the country. At present it does not seem to be conclusively established that radial action can be secured at the low speed necessary when curves are being negotiated, although it has been stated that at Chesterfield the trucks actually radiate at car-speeds of less than three miles an hour. It should be noted in this connexion that the desideratum is an apparatus actually capable of radiating, and not merely a "flexible" truck that can be forced by the grooved rails to accommodate itself to the track. Action of the latter kind may cause as much grinding as would result from the use of a rigid wheel-base truck. Radial types of truck are now being tried upon upwards of thirty tramway systems, but so far with inconclusive results. It may be hoped, however, that the experimental working will before long

indicate the direction in which success may be finally attained.

THE growth of motor-car Motor Vehicles, traffic can be gauged by the figures issued from time to time in connexion with their licences. The figures now published by the Public Control Committee of the London County Council for January give the total number of cars registered in London as 9,049, and of cycles 5,138. These figures show an increase of 990 motor-cars and 330 motor cycles in four months, the figures up to September 30 of last year having been respectively 8,059 and 4,808. We are glad to observe that the motor cycles do not increase as quickly as motor-cars, as these cycles add to the dangers of the streets far more than any other conveyance, and provide a method of locomotion which should be discouraged in a city.

Concrete-Steel Workshop Buildings. ATTENTION is drawn in a paper read by Mr. E. N. Hunting before the American Society of Mechanical Engineers to the advantages of reinforced-concrete for the construction of modern factory buildings. After pointing out the strength, fire-resisting qualities, durability and economy of this material, the author selects for detailed description and illustration a workshop, 160 ft. by 102 ft. wide, erected in Pennsylvania. The main conditions specified for this building were:—(1) That it should be absolutely fireproof; (2) that it should be built at a minimum cost; (3) that provision should be made for heavy cranes; and (4) that the design should have some artistic value. Several useful drawings are given of the columns, beams, crane runway, and arched roof construction, and the value of these illustrations is much increased by the fact that they have figured dimensions in every case. The photographic views are not very convincing as to the artistic merits of the structure, but in other respects it seems to be quite satisfactory. The cost per cubic foot is stated at 1-625d., and as the rate of insurance was reduced to 1s. 3d. per 100%, it may be considered that the fire-resisting qualities of the building are all that could be desired.

Action of Sea Water upon Concrete. INVESTIGATIONS conducted into the causes leading to the failure of concrete in dock works have abundantly established the fact that when Portland cement concrete is sufficiently permeable to permit sea water to act continuously throughout its mass, the cement will become disintegrated and ultimately be destroyed as the result of chemical action. Mr. J. Watt Sandeman, M.Inst.C.E., is an acknowledged authority on concrete, and a pamphlet recently written by him possesses special value for the reason that it contains, in concise form, directions for making concrete capable of retaining permanent stability in docks, piers, and other structures exposed to the action of sea water. As pointed out in a recent "Note," the essential quality of concrete to be used under such conditions is impermeability. Mr. Sandeman now gives clear instructions for insuring this essential. We do not propose to quote figures here, but can sum up the points necessary for success in a few words.

First, the proportion of the cement in the mortar must be such that all voids in the sand are entirely filled; and, second, the proportion of mortar to aggregate must be sufficient to fill the voids in the aggregate and to surround all the particles. To satisfy the first point the percentage of voids in the sand must be ascertained. To satisfy the second point the percentage of voids in the aggregate must be known, and the reduced volume of mortar, as compared with the original separate volumes of cement and sand, must be ascertained. Those who wish to save themselves trouble will find the tables prepared by Mr. Sandeman of service; they contain standard proportions for qualities of concrete, with and without "displacers," for special parts of dock and pier works, for ordinary marine works and reservoir walls, and for land works where impermeability is not essential. Altogether fourteen different types of concrete are tabulated, and the pamphlet concludes with a convenient method of ascertaining the weight and cost of various mixtures.

Economies in Electric Lighting. THE paper by Mr. G. Wilkinson which was read to the Leeds local section of the Institution of Electrical Engineers is a useful and instructive one. He describes how consumers in many cases fail to obtain the full advantage of the electric power which they pay for in their meter bills, and he suggests that central station engineers should study carefully the private installations they supply, so as to ensure that their consumers get the amount of light to which they are entitled. Mr. Wilkinson's method of certifying lamps is useful, but we think the system adopted in Bradford of supplying free lamps is preferable. The cost to the supply company is only a small fraction of the receipts from meter bills, and the supply of free lamps can be used to induce consumers to pay their bills promptly. For instance, at Bradford, the cost of the 14,000 lamps distributed last year was only 3 per cent. of the total receipts, and it was stated in the discussion that the bills were paid with gratifying regularity, as the consumers felt the loss of free lamps much more keenly than losing the small discount formerly given. In America the custom is to supply new lamps whenever they are required, and the engineers are careful to supply the best on the market. Lamp-makers complain that the pressures of supply in this country are not sufficiently varied, so that those lamps—technically known as "outfalls"—which are not of the proper efficiency at the standard voltage, are unsaleable. This may explain possibly the large percentage of unsuitable lamps sometimes found in a private installation. Mr. Wilkinson stated that he recently found in a public building eighty 32-candle-power lamps, which consumed about 40 per cent. more power than the average lamp. Replacing them all by more efficient lamps effected a saving of more than 100% per annum.

The Warning of the Law Courts. WE are glad to see from a reply given by Mr. Lewis Harcourt last week to Mr. Arnold Herbert, M.P., that the Office of Works is at last going to have the corridors

of the Law Courts which adjoin the Chancery Chambers and the Admiralty Registry heated. Although space was left when the Law Courts were built for warming these portions of the building, no heating system has yet been carried out. In no other country would such extraordinary want of care be found, since the omission to heat these passages causes great inconvenience, as well as immense waste of fuel in the adjoining rooms. The tendency in America and on the Continent is to overheat public rooms, but in this country we often have run into the opposite extreme. That main corridors in public buildings should be warmed in winter by hot air or water cannot, we think, at this time of day be doubted.

The Sanitary Condition of Stafford District. DR. MAIR'S Report to the Local Government Board on the "Sanitary Circumstances and Administration of the Rural District of Sleaford" discloses an exceedingly bad state of things in regard to drainage and water supply. In a few cases houses in villages are not provided with drains at all; slops are then thrown upon the garden, or into a roadside channel or ditch. Where house drains do exist, or are believed to exist, very little indeed is known of their course and character, and it was very rare to see any provision for their ventilation. The sewers which have been provided in many of the villages are either road drains constructed of agricultural pipes, or sewers which have been constructed of glazed earthenware pipes purposely to receive sewage. With only three exceptions, the contents of these sewers are allowed to discharge direct into the nearest available ditch, stream, or beck. In some cases, the water of the stream into which sewage is so allowed to discharge is used for drinking purposes by the inhabitants of the same village; in other cases the water is so used by the inhabitants of a village or villages lower down in the course of the stream or beck. In a district where most if not all the streams are more or less polluted with sewage, and where the ground in the neighbourhood of houses is liable to soakage of excremental and other refuse matters, it is clear, says Dr. Mair, that the drinking water supply of the inhabitants should be made secure against contamination. Some of the villages are mentioned which possess excellent water supplies, obtained by means of deep bores into the Oolite; but all the others in the district are dependent for drinking water upon private surface wells or upon streams, polluted as before described. In regard to this question of water supply Dr. Mair asked the Chairman of the Rural District Council why a certain village had no water supply like the villages on either side of it; "he said he supposed that the reason was that the village had not asked for it; and on inquiring what would lead a village to ask for it, he informed me that practically it would be either scarcity of the existing supply or an outbreak of enteric fever," a reply which certainly needs no comment.

A Celebration at Ely Cathedral. THE Dean and Chapter intend to celebrate this year the 800th anniversary of the consecration, on October 17th, 1106, of Ely Cathedral. The first church appertained

to the abbey founded in 673 by Etheldreda, daughter of Anna, King of the East Angles, and wife of Egfrid, King of Northumbria, for monks and nuns, and dedicated to the Blessed Virgin Mary, of which she became the first abbess. The Danes destroyed the greater portion of the monastery two hundred years afterwards. Some monks who escaped from the massacre partially restored the buildings; in 970 King Edgar sold the Isle of Ely to Ethelwold, Bishop of Winchester, who rebuilt and endowed the abbey for an abbot and regular monks. Henry I. gave Richard, tenth and last abbot, permission to establish a see at Ely, and in 1107 Hervey, expelled by the Welsh from his see at Bangor, was appointed as first bishop of a diocese which then included the whole of the county of Cambridge, taken out of that of Lincoln. At the suppression of the monastery, re-dedicated to SS. Peter and Etheldreda, Henry VIII. converted the priory church into a cathedral dedicated to the Holy Trinity, and endowed it with the site and the revenues, in part, of the dissolved religious house. Simeon, ninth abbot, laid the foundation of the present cathedral in 1081, upon a plan which his brother Walkelin adopted, with the addition of a crypt, at Winchester. In the presbytery is the shrine of the foundress, of whom the Anglo-Saxon Chronicle relates that in the year 673 Saint Etheldreda began the minster at Ely. For particulars of the fabric we may refer our readers to Mr. D. J. Stewart's article—one of our "Cathedral" series—with plans, views, etc., of April 2-9, 1892, and the illustrations we published on July 21, 1888 (interior of one of the small western transepts), February 16, 1901 (Galilee porch), and October 18, 1890 (the prior's door).

THE Ecclesiastical Commissioners have sealed and presented to Parliament a scheme framed, in pursuance of the Union of Benefices (Metropolis) Act, 1860, for uniting the benefice of St. Peter-le-Poor, Old Broad-street, and St. Benet Fink with that of St. Michael, Cornhill. To the new rectory the Drapers' Company have nominated Canon G. C. Bell, formerly headmaster at Marlborough. The proceeds of the sale of the site and materials of the church of St. Peter-le-Poor are applied under the scheme towards the erection of two, or three, new district churches, provision being made for grants in aid of the services and fabric funds of the churches of St. Michael and All Hallows-on-the-Wall. The church of St. Peter-le-Poor was rebuilt in 1791-2 after Jesse Gibson's designs in the classic style, upon a circular plan, with an internal diameter of 56 ft.; the organ, by Green, 1792, was enlarged and improved by Castello thirty years ago. Wren's church of St. Benet Fink, or Finch, stood in Broad-street Ward, near Finch-lane, on a site between the present Bank of Australasia, Threadneedle-street, and the Royal Exchange. It was finally dismantled in December, 1845, when the monuments were removed to St. Peter-le-Poor. The stone tower, being similar in design to the brick tower of St. Benet, Paul's-wharf, was surmounted with a lead-covered swelling cupola carrying a lantern.

THE large rooms of the Institute of Painters in Water-Colours. Water-Colours are a snare to them. There is not the quantity of good work forthcoming that is necessary to fill the walls, and one has to run the gauntlet of a whole tribe of mediocrities to come at the few things really worth looking at. If the exhibition were confined to the medium-sized room of the three it would be a much better one. Worse than mediocrities are such things as the fantasias of Mr. Hal Hurst, which are clever in a way, but a very bad way. Among the things that may be picked out as of more than the average level are Mr. Hait's "A Venetian Fruit Stall" (187), the most important and most successful water-colour, by him that we have seen; Mr. Winter-Shaw's "A September Evening" (197); Mr. Bernard Evans's "A Path Through the Woods" (201); Mr. J. T. Watts's beautiful little landscape "Birmingham Moor" (79)—the merits of this kind of work do not seem to be appreciated, or this would not be hung so high; Mr. David Greu's "Lighting-up Time, Whitty" (218), a careful working out of a difficult effect; Mr. T. Pyne's "A Sunny Morning" (226), a good example of the old style of carefully finished water-colour; and all of Mr. Frank Walton's set of pictures from Sark (306, 311, 314, etc.), which are really worth looking at carefully. Mr. John White, one of the best names in the Institute, is as excellent as usual in "Shades of Evening—Dartmoor" (324); then there is Mr. Weedon, one of the few remaining adherents of the School of David Cox, whose "Autumn Day on the Moors" (330) is in his best style. Mr. Cyril Ward's "A Valley in the South Downs" (346) is a good large landscape of the realistic type—what we may call a "conscientious" landscape; Miss Alice Hobson's "The Ruins, Bradgate Park" (388), is something more than that, and is one of the best drawings in the Gallery; she has a fine sky, too, in "Exmoor" (402). Miss Vaughan Jenkins exhibits a well-drawn interior of "Christchurch Cathedral, Oxford" (384), and another lady exhibitor, Miss Alice Squire, pleased us with two or three small landscapes representing different aspects of nature in Spring and Autumn. Mr. Murrings, whose name we do not remember before, is able in the foreshortening of horses, as in "On the Common" (86), but the colour is unsatisfactory. There is a certain amount of what we call the flattery of imitation; Miss Hagarty (128) and Mr. A. MacBride (275) are obviously taken by the peculiar manner of Mr. Paterson as recently exhibited at the older Society; and elsewhere we find a member endeavouring (not very successfully) to "do Alma-Tadema," as one may say. Mr. Nisbet's "Solitude" (462) is meant to be, and is to a certain extent, poetic, but perhaps a little stagy. Among other good names of exhibitors are those of Mr. Fulleylove, Mr. John R. Reid, and Mr. Ammonier; but none of them quite at their best.

MR. NELSON DAWSON'S show-room at 111, Jernyn-street, St. James's, is at all times a place of interest. At the present time some fine specimens of forged ironwork

of elaborate and interesting workmanship are on view. The largest exhibit consists of railings for a tomb, with a large memorial cross in bronze. The sides are divided into panels decorated with rose designs; the ends are similar with the panels decorated with lilies. The work in these is very vigorous and fine, and there is a beautiful little group in the cross entitled "Charity." There is perhaps a lack of what we may call architectonic grip in the design, and a feeling of smooth roundness in detail, which prevent the whole from being as successful as it might otherwise have been. Mr. Nelson Dawson has been influenced by "L'Art Nouveau," and we hope he will return to the severer restraint in line, in form, and in detail, of the older work; a restraint which produced the extraordinarily rich and beautiful work to be seen in the galleries at the Victoria and Albert Museum. A little bronze, "The Light of the World," daintily set in marble, is very beautiful, and there are besides many useful and ornamental objects in metal-work which will stand the hardest wear and give pleasure to the eye besides.

Those who care about preserving the architectural character of a great monumental work (but a small minority, we fear, in this country) may now have the satisfaction of seeing that Waterloo Bridge has been freed from the disfigurement of the wretched commonplace lamp standards which the engineering department of the London County Council was allowed to place there, without the slightest consideration for the architectural character of the structure. These are at last removed and replaced by standards of the original fine and monumental design. The immediate moving influence with the London County Council in making this change was the strong representation made by the Architectural Vigilance Society, but we think it is only just to ourselves to record that the Society's action was due in the first instance to the Editor of this journal, who brought the matter under their notice, and but for whose initiative the shop-pattern lamps might be there still. It is gratifying to find that the Bridges Committee of the County Council seem at last to have recognised that the design of the lamp-standards has some relation to the design of a bridge, and it is to be hoped they will not again give an engineer a free hand to supply details of this kind without any reference to architectural style.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The usual fortnightly meeting of the Royal Institute of British Architects was held on Monday evening at No. 9, Conduit-street, Mr. E. T. Hall, Vice-President, presiding.

The Chairman said they would all be sorry to hear that the President continued to be very ill. He had now been in bed for three weeks, but they would all hope he would be present at their next meeting. Mr. Belcher himself was exceedingly sorry that he was unable to be present.

The Late Mr. Bartlett.

Mr. Alex. Graham, Hon. Secretary, said he regretted to announce the decease of Mr. William Giles Bartlett, who had been a Fellow for forty-eight years, having been elected an Associate in 1858 and a Fellow in

1869. His son, Mr. Sidney Francis Bartlett, he was glad to say, was now a Fellow of the Institute. On the occasion of the funeral the previous Thursday a wreath was sent on behalf of the Institute in sympathy with the relatives of their deceased colleague.

The Strand Further Improvement.

Mr. Maurice B. Adams asked why the Institute was not represented in connexion with the Strand further improvement memorial which had been sent to the London County Council that day. The Institute had taken a very prominent position with regard to the matter, and almost every society was mentioned in the memorial except the Institute.

The Chairman said the Council of the Institute did not think it wise to take part in the particular movement to which Mr. Adams referred, because they had made their own representations to the County Council, and had only quite recently been in communication with them in the direction that the Institute decided to take about a year ago.

Leadwork.

Papers were then read by Mr. F. W. Troup and Mr. Lawrence Weaver, F.S.A., on "Leadwork," the following being abstracts:—

Mr. Troup said that, as the architect had frequently to decide what metals should be used on a building, it was imperative he should know the peculiar properties of each, and why lead ought to be used in one case, cast-iron in another, and pewter or copper in a third. To bring out the most prominent qualities of lead—viz., its durability at ordinary temperatures, its ductility, its exceptional weight, and its low melting-point—the lecturer compared it with other metals in common use, showing its advantages for open-air purposes over copper, tin, zinc, iron, etc. Lead required, however, great care and judgment in its use. As regards the material as now supplied—milled lead and cast sheet—milled lead is a dull and pasty material compared with lead run out in the old way by casting the molten metal on a sand-bed to the actual thickness required for use. Cast sheet can be had in the open market at the present day at a rather higher price than milled sheet of the same weight. For a flat lead roof, often liable to be walked upon, there is not much to be gained from using cast sheets. The surface texture of the cast sheet, however, is worth making some slight sacrifice to obtain, especially if the old-fashioned open roll or flat well-roll can be used. Either of those joints is preferable to the usual modern roll with its wooden core. The wood roll has to be large, and therefore clumsy, else leaks arise from capillary attraction between the sheets. The open roll has not this defect, but cannot stand under much foot traffic. When lead is used in a spire or turret it is certainly worth while to use cast sheet. Even with a wooden core in the rolls the cast sheets do not cause suction to such an extent as milled lead. The natural surface of the lead as it is cast is the best to use as the exposed surface in a roof or elsewhere. When there is ornament of any sort to be cast with the sheet, then the under or sand surface must be exposed. This can be as rough as you like for roofs or rain-water heads, and a coarse sand may be then used for the casting bed. But for things which come close to the eye, or which may be handled, a much finer sand should be used. More care is then required in the casting to provide for the escape of the steam formed by the molten metal on the damp sand. For a "repeat" ornament or for casting letters and figures for dates a lead mould can be used. This is easily made, and lasts for a long time, but a brass or cast-iron mould is more permanent. For knobs and finials it is possible with a lead or brass mould to fill it with molten lead, and after two or three seconds empty out the interior un-solidified lead, giving a hollow casting without the trouble and expense of making a core as for a brass or iron casting.

For decorative forms the lecturer counselled restraint; lead was so easy to twist and turn. The designer should never forget his material while designing on paper; even in modelling the final material must never be lost sight of. It is quite possible to make a casting from a single pattern in several different materials, but to take full advantage of the best that can be got out of each material that original pattern ought to be varied in each case. For a plaster cast, for example, moderately high relief may be had; but it should be soft in

contour, and there is no special reason for economy in material.

In lead, however, there is reason for economy of material, and one can have finer lines, and can reckon on bending, soldering, or even to some extent bossing up the casting after it is made. There are several other ways of ornamenting lead. It is very easy to make fretwork patterns for ventilating panes in windows, or as a valance round a leaded dormer or door-hood. This is best done with chisels and gages on a block of lead. Lead can also be incised, and the incised lines filled with various coloured mastics in letters or other shapes. One of the most gorgeous possibilities for decoration in lead is to be had by tinning the metal in some design of ornamental or figure decoration and then glazing over the tin surface with transparent colours.

In the Middle Ages the chief method of working lead and using it in buildings was simply to take the plain cast sheets, and, after cutting it to the outline as near as might be, and in convenient size for handling, to dress, boss, and beat it up to the shape required. Sometimes these forms were carried on wooden cores; at other times on a framework of iron, or were simply fixed by iron hooks and brackets on the timber framing. This art is as dead as Queen Anne. It is a personal art, like sculpture—very often it was sculpture—and no amount of designing by another for the craftsman to execute will do much to restore it. The art has been so long divorced from the craftsmanship, and the teaching of tradition so long deserted, that their reunion is hardly a matter to be accomplished in a single generation. We can but live in hope.

Mr. Lawrence Weaver took for his subject the earlier lead spires. Lead, he said, had no nobler use than in the covering of spires, for spires were the greatest concession that Gothic architecture had made to constructed beauty and symbolism. The lead spire has a character all its own, and maintains its character of a spiritualised roof more intelligibly than a stone spire can do. The white, almost glistening patina which comes with age on lead, where the air is not befouled with smoke, makes the spire stand like a frosted spear against the sky, and the slight twists, which almost every timber spire has taken, give a peculiar sense of life. These were refinements which did not fit in with Mr. Goodyear's theories. Dealing with the history of lead spires, and discussing the question of origins, the lecturer quoted the classification of spires given by Mr. Francis Bond in his "Gothic Architecture," and gave his reasons for offering the following classification, based on Mr. Bond's but corrected:—

PATELESS SPIRES—

- I. *Collar-type*—e.g., Ryton.
- II. *Broach-type*—e.g., Braunton, Barnstaple, Godshaling, Ickleton, Swymbridge, Almondsbury.
- III. *Pinnacled-type*—e.g., Long Sutton, St. Nicholas, and Aberdeen.

PARAPETTED SPIRES—

- I. *Collar-type*—e.g., St. John's, Perth, the tower of which has a heavy over-sailing parapet, within which the spire stands.
- II. *Broach-type*—e.g., Hemel Hempstead.
- III. *Straight-sided type*—e.g., Harrow, Chesterfield, Minster, Great Baddow, Much Wenlock, Wickham Market.
- IV. *Spirelets*—e.g., East Harling, Wenden Ambo, Swaffham, Hitchin, Sawbridgeworth, and Ash, Kent.

A certain difficulty arises in the definition of lead spires owing to the somewhat loose use of the word "broach." What the lecturer called the "collar-type" is sometimes called "broach," but incorrectly. The essence of the broach he took to be that the filling-in between the angles of the tower and the diagonal faces of the spire shall be of pyramidal form. The influence of the stone broach on the form of the lead broach may be admitted without suggesting that the lead broach was a slavish or unoriginal copy of the stone broach. It was a question of carpentry. The construction of the collar-type is more congenial to wood than is the broach. The octagonal framing calls (but not very urgently) for strutting at the base. In the broach the main framing is strutted by single timbers running through the diagonal faces of the octagon; and this is not so satisfactory as the double strutting of the cardinal faces, which obtains in the collar-type. From the

weathering point of view the lecturer considered the stone broach to be as efficient as the collar-type, and he felt strongly that the broach was far the more attractive. Having given details and brought out the chief characteristics of examples of the different types classified, the lecturer made some remarks by way of constructive criticism. His illustrations, he said, had shown how beautiful lead spires can be and are. The lead gave the architect no trouble: he gained infinite variety of surface by different arrangements of the rolls; he outlined great cartonnages on the faces of his spires (as at Chalons-sur-Marne) and blazoned them with gold and colours: he wanted the metal-cased architecture of the poets, and he got it. His difficulty was that he could not keep it. The timber framing was always liable to destruction by fire. To-day, however, there is an alternative. Our spires can be built in steel and sheathed in lead, and will defy the flames. Here is one field where steelwork may come into its own, may come faithfully and gracefully, may be the metal bones of a metal architecture. The lecturer claimed for it that it preserved the initial idea of a spire, that it is a glorified roof; that the lead surface gives opportunities for colour treatment that a stone spire cannot give. Had the medieval architect found the material to his hand, we should be pointing to-day to his leaded steel spires as notable examples of the Gothic spirit. In conclusion the lecturer showed a design for a leaded steel tower done by Sir Charles Nicholson to illustrate his suggestion. The design, he said, was instinct with the poetry and mystery which are the characteristics of great architecture. He could only hope that some ecclesiastical Mæcenas would be found for whom Sir Charles could materialise this dream church encrowned with lead.

Lieut.-Colonel Prendergast, in proposing a vote of thanks to the readers of the papers, said the meeting had given the greatest satisfaction, as it was a little out of their usual groove. He doubted if there were many even there that night who knew much about leadwork in its artistic sense, and yet there were few great architectural works throughout Europe which were not much indebted to the leaden statues and lead works with which they were surrounded. The uninitiated, the idle, and the careless did not know the immense value of lead when used architecturally. He did not pretend to be an architect, but he had been an honorary member of that Institute for many years, and had a great love for art, and he never went to Westminster without wondering that this country, which in Westminster Hall had one of the most interesting and remarkable halls in the world, had left it standing in front of the great abbey with such a ramshackle roof, instead of replacing it with a glorious leaden roof. It was perfectly astounding to him that a great country which professed to have some love of art and of architecture should be unable to realise that a splendid building like this was absolutely ruined for want of a leaden roof. The great architect who built the Houses of Parliament never meant that the hall should show itself, but for some reason his plans were altered, and, as the nation had chosen to have the hall exposed, they ought to make it what it should be. With reference to the spire of Chesterfield Church, he had for the last fifty years been trying to find out the reason for the twisting, and the conclusion he had arrived at from all the information he could get was that the thing was deliberately done.

Mr. H. V. Lanchester seconded the motion, and said he would like a little more information with reference to the tinning or the application of other metals to lead. He would also like to know a suitable method for putting lead on construction. He did not think that Mr. Troup need plead the cause of lead to any architect, for they all liked it and realised the fine conjunction it made, particularly, with Portland stone. He did not think any two dissimilar materials like lead and Portland stone ever produced such harmony. He should like to know if they could get a thoroughly fire-proof construction, such as concrete or ferro-concrete, and attach lead in a satisfactory way. It seemed to him that it would be possible, but Mr. Troup had more experience than most of them, and they would like his views on the matter.

Sir Charles Nicholson asked what timber was used at Chesterfield. Was it oak? He had always understood that the cause of the twisting of the spire was that green timber was used, and it occurred to him that possibly a good deal of elm might have been used for some reason or other. They all knew that elm was a timber very apt to twist and curl up, and a simple explanation like that might possibly account for the twisting of the spire.

Mr. C. Harrison Townsend said that reference had been made to one who was well known as having helped very greatly to revive the interest in their own time in the craft of working in lead—he referred to Professor Lethaby; but he thought Mr. Lethaby would be the last to deny that there was an earlier worker in the field, whose interest also showed itself in working in lead, more or less elaborated, in his architectural work. He referred to Mr. Eden Nesfield. Some of them would remember his earlier works, and those who, like himself, were privileged to work alongside him would remember particularly how keenly he sought to revive the interest in lead at a time when it was simply used for plumbers' work. He remembered one work, which he believed was at Balbacombe, where Mr. Nesfield introduced lead cornices, with moulded and cast figures supporting them at intervals, and a lead parapet divided into panels, each panel being enriched with a different motif. This was done at a time when his fellow architects did not dream of using lead for anything but to cover a flat roof which they did not particularly draw attention to the work of one whose work he felt had not received the recognition that it should have received.

Mr. Maurice B. Adams said that he had occurred to him to use uralite where lead and iron came together. He did not know whether Mr. Troup had ever thought of that, or whether anyone had so used it, but he thought that the necessity of keeping lead away from iron might be met by using strips of uralite, which was extremely hard, and could be used like wood. Uralite was composed of asbestos, consequently no chemical action could take place between the iron and the lead when it was employed to insulate the two materials. He threw it out as a practical suggestion which he was intending to try himself. It was well to keep such new materials before one, and he could imagine a spire of steel or ferro-concrete where the metal would crop up towards the surface, and where it would not be wise to use lead without some intervening material. The necessity of protecting lead against the action of oak was never more demonstrated, if he remembered rightly, than in the new lantern over the crossing of Ely Cathedral, because in a short time after that was put up the structure was so disintegrated that it had to be practically re-erected.

Mr. E. W. Hudson said he had been specially interested in the remarks referring to the crocketed work and ornamental work on spires, and trusted that they would be illustrated, for they were much less known than the twisting and ordinary broach spires. He was particularly interested in that of East Harling, and in the drawing of Sir Charles Nicholson it threw a light on what had long been a problem to him. Stowe in his account of the House of the Knights Hospitallers in Clerkenwell described the tower and spire as being "a great ornament to the City, the like of which he had never seen; graven, gilded, and enamelled." It materialised him for a long time as to what the material could be, but when he saw the drawing of Sir Charles Nicholson and the inlay which Mr. Troup had made it struck him that they had the explanation now. With regard to steel covered with lead, that might be a very honest structure, but he hoped they would never see a repetition of what they saw at Rouen and at Cologne, where cast-iron was used. Mr. Lethaby's work had been mentioned, and in his book they had some views of fonts and of other things which were not supposed to be fonts—they were small lead vessels, the use of which apparently he did not remember them, and he was able to tell what they were. When the Templars' goods were seized in the Temple in 1507 by order of the King, amongst the inventory of goods were items of lead—"one lead, 40s.; one lead, 30s.;

and one lead, 10s." He had never been able to make out what they could be. They could hardly be ingots, but it struck him they might be something in the nature of cisterns or tanks, because 40s. was a considerable sum in those days, and "odd pieces" at 8d. each were noted. They were found in the brewery, and whether lead was used for such purposes in a brewery would be interesting to know. In interments also they had instances where an abbey had been buried, and lead been used not only for the ring, but also for the patten, chalice, and mitre, and these were covered with gilt and colour in a very elaborate way. This was a novel way of using lead, and the colouring and enamelling seemed noticeable as a way of cheaply honouring the dead.

The Chairman said the practical details which Mr. Troup had given them were of great value, and the beautiful enamelling he had shown was very interesting. The art had almost died, but he hoped it might revive again, because it contained in itself a permanent decoration far better than many of the enamels which they had seen, like that of the drinking fountain of Westminster. Mr. Weaver's paper was most wittily delivered, and was a very poetic paper dealing with a very poetic subject. As the paper was confined to spires, he naturally did not refer to the many other ways in which leadwork had been used for decorative treatment. He was aware that it was a moot question whether the Palace of None-Such had its decoration in leadwork or plaster. They knew that some of the beautiful lead cisterns were quite works of art, and displayed an architectural or craftsmanship knowledge on the part of the plumber which was highly commendable. With reference to the use of lead and steel, there must be some disconnecting material, or they would get galvanic corrosion, which would probably create very grave evils. Personally, he generally put felt between the materials, which was a very safe non-conductor, and he did the same when using oak. Reference had been made to Chesterfield. They had heard of eccentric architects, but he could not imagine any architect wanting to design Chesterfield spire in the way they saw it to-day. It was, of course, interesting, because it was so very absurd and because it stood without falling.

The vote of thanks having been passed, Mr. Troup said that, with regard to Mr. Lanchester's question as to tinning, he had a description from an old French book, which ran as follows—"When the plumbers wish to tin sheets of lead they have a tinning furnace full of hot charcoal, on each side of which a man stands holding up and heating sheets of lead. Leaves of tin are laid over these, and as the sheets get hot and the tin melts the tinning is accomplished by rubbing and spreading it over the surface with tow and resin." This was from a XVIIIth century book, and the process was really like tinning a saucapan. Burges also gave a description of how tinning was done when the lead was *in situ*, because it was not necessary that the work should be done in the workshop. There was another way in which it could be tinned ornamentally. This was to cover the lead with plumbers' soil and scratch out the parts they wanted to tin. It could also be done by laying brown paper cut out in a pattern over the lead. Then they applied the tin to the lead, and it adhered only to the parts not covered with the brown paper. That was the way in which some part of the roof of Hatfield House had been ornamented, so said Mr. Lethaby. There was no great difficulty in fixing lead upon other things besides woodwork. Of course, the milled lead was lighter than the old cast lead, which could be hung to pieces of iron. They frequently supported lead with iron hooks, and without the protection of felt or anything else. So long as there was no leakage so that water came in there was no great harm, because the galvanic action did not take place when the two metals were dry, and, of course, where the wet did come in felt would not be much good. When oak was used it was almost impossible to keep the acid from the lead. They could paint it and varnish it, but the acid came through almost anything, and seemed to seek for the lead. He did not think there was any way of getting over that difficulty except by washing the acid out of the oak before using it. He should think that uralite would be a very good basis for

lead, but was probably unnecessary in cast lead, because cast lead was so much stouter, and would hang on a framework instead of having to be supported all over the roof. In French cathedrals the boarding was not continuous, and this had the further advantage of allowing ventilation. With modern lead it would probably sag unless continuously supported. As regarded ironwork as a framework for roofs, the whole of the roof of Chartres Cathedral was ironwork, and the sheets simply hung between the ribs of iron. It was not lead at all, but was simply a skeleton of cast iron, and could easily be covered with lead if there was any desire to do so. As to the question of lead for tanks in breweries, he thought it would be rather dangerous to use lead, because the acids from the materials used in brewing would attack lead. The French Government had a regulation which prohibited the employment of more than one-third lead in pewter, so as to avoid the possibility of lead poisoning.

Mr. Weaver said that, as to the twisted spire at Chesterfield, he did not think that anyone could possibly desire to perpetrate such a gigantic practical joke, but, as a matter of fact, Chesterfield was not the only spire that twisted, for there was a little spire at Walsingham, in Norfolk, which also had a twist. He did not know what the timber work at Chesterfield was. As to the intermediate material between steel and lead, he thought urdite would do, and, indeed, there were plenty of materials which would do. The main thing was that the material should not burn. He quite appreciated what Mr. Townsend had said of Mr. Nesfield, but what he appreciated about Mr. Lethaby was that he was the only person who had written a book about leadwork. Mr. Lethaby in his book referred to a vessel, which he called Anglo-Saxon, which had triangular forms on two and two iron handles. He did not think this was a font, and it was probably a large salt of a monastery. There was a small vessel in Gloucester Cathedral, and he could not imagine what it could be. It was too large to be a vessel for the ablution of Mass, but it might possibly be a stoup. As to the question of interments, there were a large number of patters and chalices of lead, but he did not know of a mitre before; they were simply put in in the ordinary way of swinding the dead. They could make a patten or chalice of lead and gild it, and a long way off no one could tell it was not gold, and so they got the benefit of being generous without the cost. From the very earliest Egyptian times these votive offerings had invariably been swindles. There had been very many lead pectoral crosses found, and in the times of the Black Death, when people died rapidly, everyone had a pectoral cross, which were nearly always of lead. When they were dealing with the site of Christ's Hospital recently Mr. Hilton Price came on a gigantic find of lead crosses, none of which were in the least bit decorated. They were simply pieces of lead chopped out of a sheet. The friars doubtless died in large numbers, and the pectoral cross was simply chopped out roughly, without the faintest attempt to ornament.

The Chairman announced that the next meeting would be held on April 2, when Mr. W. Ammoner and Mr. A. W. Martyn would read papers on "Wood-carving."

BRITISH SCHOOL AT ROME.

The third open meeting of the above school was held on March 12, and was attended by a considerable number of British residents in Rome and foreign scholars. Professor Gardner opened the proceedings with a paper upon "Copies of Statues on Coins." He began by pointing out the value of the representations of works of sculpture upon coins, and noticing the conventions which are found in them, and which must be taken into account. He proceeded to illustrate his remarks by reference to two particular statues—the Artemis Laphria at Patre and the Themistocles at Magnesia. The former was mentioned by Pausanias as having been brought to Patre from Calydon by Augustus after his depopulation of the latter city, and as being the work of two Naupactians—Menechmus and Soidas. Upon a series of coins of Patre of the imperial class

reaching from Nero to Caracalla was an almost identical figure of Artemis, sometimes vouchsafed for by the inscription "Diana Laphria," but unmistakable in itself. The coin showed us a copy of the cutter's statue was in itself almost certain, and the association with it on one coin of the well-known Aphrodite of the Acropolis of Corinth, left practically no doubt on the point. It had been objected that the statue as represented on the coins was of a later period than that to which belonged the sculptors to whom Pausanias attributed it; but the objection probably rested upon a misunderstanding, and both sculptors and statue might be fairly assigned to the middle of the Vth century B.C.

The statue of Themistocles, set up soon after his death in the market-place of Magnesia, in Ionia, was represented on a coin struck in the reign of Antoninus Pius. He is seen nude, standing to the left, with a patera in his right hand and a sheathed sword in his left. Before the hero is a burning altar, in front of which lies a slain bull. It seemed probable that an actual copy of the statue might be recognised in a figure now in the Glyptothek at Munich, which was formerly in the Villa Albani, and which generally bears the name of "A Heroic King," though attempts had been made to see in it a Zeus—wrongly, in all probability, inasmuch as a Zeus with short hair (which this figure has) would be most unusual in the first half of the Vth century B.C., to which the original of this figure must be assigned. In pose and type the Munich statue and the figure on the coin correspond fairly closely; some archaeologists maintained that the sheath in the former was a modern restoration, but, even if this was so, it was difficult to see why the restorer (who could not have known or used the coin) should have introduced it unless he had some authority to go by; and in period the two were contemporaneous, which gave the identification a high degree of probability.

The second paper was read by Mr. A. J. B. Wace, Librarian of the School, on "Some Late Roman Historical Reliefs." He first considered the six late reliefs that form the frieze of the Arch of Constantine; these he divided into two sets, which were distinguished by some slight stylistic differences, and by the fact that in the first group of three the original head of the Emperor had been carefully chiselled away, so as to be replaced by another. Of the other three, two showed no Emperor at all, and in the third the Emperor's head, though badly damaged, had never been altered.

The first group he attributed to Diocletian, who was the last Emperor to celebrate a triumph (503 A.D.), and whose building activity in Rome was considerable, and the scenes on these reliefs—a triumphal procession, a *congratium*, and a speech from the Rostra—were, or could be, all connected with a triumph. Of the other three reliefs, one probably represented the defeat of Maxentius at the Pons Milvius, and another the battle of Verona—Constantine's two decisive victories in the Italian campaign of 512 A.D. The third, a conventional triumph, might have been made as a pendant to the corresponding relief of the first group. These reliefs were thus to be considered Constantinian.

He next dealt with the sculptured base of the obelisk of Theodosius at Constantinople. This base consists of two large marble blocks, the lower one cut so as to form a smaller cube resting on a larger one. This block was originally intended to carry the obelisk, as shown by the representations on two of its sides of the transport and erection of the obelisk itself; but from the Greek and Latin inscriptions on its other two sides it was plain that the obelisk, though brought to Constantinople some time before, was erected for the first time only under Theodosius. The upper cube of this block, which was decorated merely with grooved ornamentation, has had its corners cut away and replaced by blocks of granite set with mortar. From the dowel holes visible on the upper surface of the lower cube it was plain that the granite blocks and the grooved ornamentation, which had been much cut away, were covered by facing slabs of marble.

The upper block of the base carries the four bronze blocks on which the obelisk actually stands. Directly underneath one of these bronze blocks the corner has been repaired, clearly after the block was first

carved, since, though some of the representation was continued on the restoration, the rest was not. Thus it might be assumed that this upper block was not originally intended as a base for the obelisk, and was already sculptured when put into its present position, being damaged in the process. It was necessary, in order to protect the reliefs upon it, to lift it by clamps under its four bottom corners, and to allow of the removal of these when the upper block was dropped into position on the lower the four corners of the upper cube of the lower block were cut away. This assumption, that the two blocks of the base were not made for one another, was strengthened by the fact that on two sides the upper block overhung the lower. We had therefore to consider the reliefs on the upper block at least as pre-Theodosian. In the scenes which represent the Emperor and his family in the Hippodrome the figures were usually identified as Theodosius, the Empress Flaccilla, and his sons Arcadius and Honorius. But the figure called Flaccilla wore the same dress as the other three, and had no feminine characteristics. Therefore the conclusion that the block is pre-Theodosian was strengthened, and we might take the four male figures to represent Constantine and his three sons; and the style of the heads on these reliefs agreed very well indeed with the extant portraits of the Constantinian period.

THE FURTHER STRAND IMPROVEMENT SCHEME.

A MEETING of signatories to the memorial to be presented to the London County Council for a review of the planning of the Strand between St. Martin-le-Strand and St. Clement Danes was held at Burlington House on Monday, Sir Edward Poynter, President of the Royal Academy, presiding.

Mr. Mark H. Judge, hon. secretary of the Further Strand Improvement Committee, said that the County Council were about to consider a scheme for dealing with the Aldwych site, and if the recommendations of the Improvement Committee of the Council were carried it would be impossible to adopt the proposals which the signatories to the memorial advocated. It was of the greatest importance, therefore, that they should make another attempt to get the Council to revise the frontage line, and to set back the line of the Strand on the north side between the two churches, so that the roadway may have its natural course direct to and from the Courts of Justice.

The Chairman stated that the reason which had actuated the Royal Academy in taking the lead in the matter was that previous memorials to the County Council seemed to have received but scant attention. As strong representations from individual members of the Academy had been set aside, it seemed but right that the Academy should take action in its corporate capacity, and he was in a position to say that the memorial had been unanimously adopted as expressing the views of all the members. He hoped, therefore, that this expression of the Royal Academy's sympathy with the memorial might finally have some effect on the decision of the Council. He believed that if the County Council could be convinced that there was a public advantage to be gained outside the financial considerations, they would be willing to provide for a noble thoroughfare in the most conspicuous part of the metropolis. After the handsome way in which the County Council had met him in the matter of preserving the view from Richmond Hill, he could not believe that that body were oblivious to considerations of beauty or the desires of the public. This was quite as important a matter as the Richmond Hill view, and he wanted the County Council to feel that there were questions of economy that might rightly be subordinated to higher considerations.

The Earl of Plymouth moved:—
"That, in the opinion of this meeting, the memorial of the Further Strand Improvement Committee, the Royal Academy of Arts, and other corporate bodies makes a clear case against the plan adopted for the building land between Aldwych and the Strand, and that the London County Council be requested to receive a deputation charged with the duty of presenting the memorial."

He said he feared there were still people who held that aesthetic considerations were not to be taken seriously when they went beyond utilitarian interests, but they should recollect that they were now dealing with a scheme of London improvement larger than a

any which had been undertaken since the Great Fire of 1666, and that the untold millions of people of the years to come would assuredly hold the present generation responsible for any blot which might impair the dignity and architectural effect of the Strand. They were accustomed to look with shame and some contempt on the lost opportunities and shortsightedness of their predecessors; therefore, surely they would not be led into committing the grave error of failing to enter a very earnest and solemn protest in a matter of this kind before it was too late. They had been told that to adopt the prayer of the memorial would mean a loss to the ratepayers of a sum which had been put as high as 350,000*l.*, although he did not believe it, but he did believe that the ratepayers in the future would suffer no serious damage by the laying out of a great thoroughfare from Buckingham Palace to St. Paul's on lines sufficiently large, as befitted the greatest city in the world.

Mr. Harold Cox, M.P., in seconding the motion, said they had an opportunity of doing something to-day which would be the pride of Londoners for all time.

Mr. Frederick Harrison stated that he was the Chairman of the Improvements Committee of the London County Council which in 1892 brought up the original Kingsway scheme, and he knew that in those days the Council never contemplated any narrowing of the Strand, as was now proposed. If the Council adhered to their plan it would wantonly mar the grand effect of the perspective view from east to west.

Sir Aston Webb, R.A., Sir William Richmond, R.A., and Mr. Hamo Thornycroft, R.A., cordially supported the resolution, which was carried unanimously, and, on the motion of Sir Henry W. Lawrence, seconded by Sir William Chance, the President and Council of the Royal Academy were cordially thanked for the support they were giving to the movement.

The memorial has been signed by the President and Council of the Royal Academy, by the President of the Council of the Institute of Bankers, by the President and Council of the Civil and Mechanical Engineers' Society, by the President and Secretary of the Council of the Surveyors' Institution, by the Chairman and Secretary of the Arts Club, by representatives of the metropolitan borough councils of Bermondsey and Fulham, the Civil and Mechanical Engineers' Society, the Fabian Society, the Clinical Research Association, and by a long list of peers, members of Parliament, artists, men of science, and others who have joined the Further Strand Improvement Committee.

The memorialists say that they feel that the persistent and widespread condemnation of the shape which has been given to the portion of the Strand between the churches of St. Mary-le-Strand and St. Clement Danes makes it their duty to bring the subject again before the Council. They urge that the representations of the Royal Academy have hardly received the consideration they deserved, and they state that the Gladstone memorial, now erected at its allotted point, intensifies the need of the alteration for which appeal is made. This monument, it is pointed out, is so placed that it makes the eastern end of the site between Aldwych and the Strand still more awkward to eastward traffic. The memorial proceeds:—"To state concisely our objection to the plan adopted, it is that, between the two churches, the north side of the Strand, instead of being planned so as to give the roadway its natural course direct to the Courts of Justice, deviates some 60 ft. towards the south, thus forming a barrier between the portions of the Strand east and west thereof. Our reasons are that (1) we consider the plan is in itself an ugly, distorted figure; (2) when buildings are erected on the site, these will obliterate from the west the view of the Courts of Justice and the church of St. Clement Danes, and from the east that of the church of St. Mary-le-Strand; (3) being at an angle encroaching upon the church of St. Mary-le-Strand, the buildings will mar the beautiful aspect of that church from wheresoever viewed; (4) the angles of the roadway are awkward and dangerous to traffic. We submit, therefore, that the matter should be considered from the points of view not only of what is for the moment financially desirable, but also of what is

befitting the dignity of the capital of our Empire." The memorialists further contend that the alteration is essential, and, moreover, would materially enhance the value of the frontage, thus to some extent compensating for the reduction of building area. The memorial concludes:—"As pointed out in the report of the Royal Commission on London Traffic, Paris, New York, Washington, Berlin, Brussels, Vienna have streets finer than any that London can show. We ask—Is London, by want of determination to overcome minor difficulties, to refuse this opportunity of showing itself in reality an Imperial city, a worthy capital of a world-wide Empire? We are unwilling to think so, and trust you will seriously reconsider the plan as at present adopted, and grant our appeal."

MONUMENT TO THE LATE MR. LEANING.

The monument here illustrated, to the memory of the late Mr. John Leaning, has been put up in Norwood cemetery.

It is in one block of Hopton Wood stone, and has been executed by Mr. Nathaniel Hitch from the design and details by Mr. H. P. Burke Downing.

We are very glad to illustrate a memorial to a man whose memory we honour; but we may observe that the text forming part of the inscription, if intended as a citation from the authorised version of the Bible, is incorrect; the sentence runs, "do it with thy might," not "with all thy might." It means the same thing, of course; but the quaint simplicity of the authorised version is preferable.

Monument to the late Mr. John Leaning, in Norwood Cemetery.
Mr. H. P. Burke Downing, Architect.

CARPENTERS' HALL LECTURES :

THE YEOMAN'S HOUSE IN ENGLAND.

The fifth of the present series of free lectures on matters connected with building arranged by the Carpenters' Company was given on Thursday last week at Carpenters' Hall, London-wall, by Mr. E. Guy Dawber, who took for his subject "The Yeoman's House in England."

In some preliminary remarks, the lecturer said he would take the opportunity of thanking Mr. Batsford, the publisher of the series of volumes on old cottages and farmhouses, for his kindness in lending the photographs and for the use of his books for the occasion. Proceeding, he said that architecture was so interwoven with the life and history of a people in all the great changes that nations underwent that it was expressed in the buildings of their time. In the Middle Ages and down to the XVIIIth century architecture, or building, as it is better called, was always influenced by local conditions, and the character of the work was much the same all over the country. It was really a product of evolution, growing out of the inherited knowledge of the wants the builders had to satisfy and the natural material at their disposal, and the first need was shelter. The original classes into which primitive man was divided were hunters, shepherds, and agriculturalists, and the buildings which each would require were characterised by their several occupations.

The lecturer described the sort of dwellings used by these classes—i.e., caves and rocks, tents, and the hut—and he gave a brief account of the gradual evolution of the house from prehistoric times. The central room or hall was the keynote to the plans of houses, both great and small, in this country for centuries, and if we remembered this fact it was easy to trace the development of the plan throughout the Middle Ages and down to the XVIIIth century. Up to the Reformation, or dissolution of the monasteries in Henry VIII.'s reign, most of the workers on the land were accommodated in convent buildings or beneath the roofs of the great land owners, whilst the numerous hospitals or beds-houses afforded shelter for a number more, and small individual houses were practically unknown. But when the change of ownership came at the Reformation an immense impetus was given to agriculture, and the building of houses, both great and small, became a necessity. Houses were no longer built for defence, as it was from this period—about 1550—that the greater part of the timber and stone houses and cottages in England were constructed.

The architecture of the larger houses lay in a category somewhat by itself, and doubtless owed much to foreign influence and execution, so that it must be amongst the smaller and more homely buildings standing modestly by the wayside that we must look to find work conceived and carried out by native hands, and the period in which we found the most representative types would be in the years between 1580 and 1680. A yeoman as we understand it to-day was a freeholder, a man who owned and usually himself cultivated a small landed property, and thus had an interest and stake in the welfare of the country. We must recollect that in those days houses were handed on from father to son, and were often occupied for generations by the same families. Perhaps we did not sufficiently realise that it was this old architecture that had made our country so picturesque and had added so largely to the quiet beauty of our villages and hamlets, for the forms and colours of old English cottages and farmhouses were almost always pleasing in themselves, and in harmony with their surroundings. Again, the geological formations of this country not only gave a distinctive character to the districts which they compose, but also to the buildings themselves, and where we found the materials that nature provided used there, without doubt did we see the most beautiful architecture, because it was the most appropriate. The chief feature of building generally in the olden times was suitability to its purpose and the use that was invariably made of the local materials at hand.

The lecturer said he should endeavour to show how much the materials of which the houses were built influenced their construction and design. Of course, we must recollect

that the builders had none of the difficulties to contend with that are ever present to-day. Drainage and sanitation were practically unknown as we understood them; water supply and the consequent introduction of pipes inside the house, together with the complications of modern requirements, were non-existent, so that when examined in detail they were found to be simple, both in plan and arrangement. The houses were mostly placed in such positions as would shelter them from exposure to the weather and give ready access to such roads as then existed. This, however, was by no means always the case. Apparently no attention was paid to the question of aspect, or as to whether the position commanded good views. No doubt a great deal of the charm of these old houses was due to the fact that they were nearly always self-contained, for the first thing that struck us was the absolute simplicity of the plans. The bulk of the larger ones had now been converted into two or more separate dwellings, and, though many of these later alterations appeared at the first glance to have changed the original plan, it was easy to reconstruct it. As single houses they consisted of two or three rooms on the ground floor, with one—the living-room—generally larger than the others, the most usual plan being practically a continuation of the old mediæval one—an oblong living or common-room in the centre, with offices or chambers at either end or forming wings; sometimes the wing was built at one end only, but more frequently the plan was symmetrical. A beautiful, though much mutilated, example still remains in the manor-house at Patten-den, Kent, which dates from the early part of the XVIIth century, having been built for the standard-bearer of Henry VIII. Beyond the actual rooms themselves there was nothing—no store cupboards or conveniences of any kind—and everything was contained within the four outer walls. The smaller houses generally had but one outer door, but as they grew in size and importance two, and sometimes three doors were not unusual, and it was only since these houses had been converted into cottages that other doors and windows had been inserted, such as were never found in the original buildings. In the farmhouse at Bissington, in Oxfordshire, this was clearly seen.

The houses were always planned one room in thickness, so that they could be roofed in a single span, and so avoid any complications with internal lead gutters and flats. When more accommodation was needed they were at first lengthened, then made L, E, or H shaped, with a central block and projecting wings, but, however large the house, always retaining the single-span roof. The stairs generally ascended in the middle of the house directly from one or other of the living-rooms, and frequently by the fireplace, and contained in as small a space as possible. They were often circular in plan, and in some of the oldest houses were in stone, with a central post or newel similar to those in a church tower—an instance of the manner in which old traditions lingered in country places. Oak was the other material used, with a series of winders round a centre post, and generally cramped and awkward to get up and down. Sometimes these staircases were in turrets projecting from the main building, finished at the top with a conical roof.

The two great features of domestic architecture, more particularly in a climate like our own, were the roof and the fireplace. Most of the fireplaces, those in the living-rooms especially, were very large, frequently 6 ft. and upwards in width; they were not high—some 4 ft., or 5 ft.—with the head formed either of stone (as at Plas Mawr, in Conway, and Boswick Hall, in Westmorland) or spanned with a plain lintel of oak or arched in bricks. When the fireplaces were large on one or both sides seats were often arranged just wide enough for a person to sit down comfortably. Some few inches up on each side there were places hollowed out to take the elbows, or else to stand a cup or mug on. Sometimes cupboards were fitted in, and occasionally there were small windows to light the angle. The chimneys were quite one of the most important elements in the external effect of many of the houses. The liberal use of materials in their construction, the simple yet bold way in which they spring in rich, clustering shafts from the ridges or gable

ends, was always an attractive feature, and one that greatly enhanced their beauty. The variety of plan adopted was almost endless, and the utmost ingenuity seemed to have been exerted in their arrangement. They were placed generally at either end of the building, or they rise in a mass from the centre of the roof, and as if the old builders disliked too much uniformity. When the latter plan was adopted we notice various projections and setting forward, many without apparent reason, except the love of novelty and change, as at Eastbourne, near Midhurst.

In those parts of Sussex and Kent where stone was quarried many of the cottages were built of it, but here, as in other districts of England, the builders were confronted with the difficulty of carrying up the stacks above the roof line in stone. The nature of the stone was such that it did not lend itself to the customary separate shafts, such as were seen throughout the Cotswold and Northampton districts, formed of thin slabs set on edge one over the other. To build them in the ordinary stone walling would have made them too cumbersome and bulky, so before leaving the roof the stone was abandoned and brick unreservedly used as a substitute. Hence we frequently saw in this part of the country the pleasing combination of the base of the stack, which generally projected from the face of the wall, being of stone, and the shafts above being in brick, as at Eashing Park, Ford Mill, near Wrotham, Penshurst, Wickhambreux, and Bean Lodge Farm, near Petworth, and Craven Arms. Now, in the stone districts the chimneys were always placed centrally over the ridge or on the apex of the gables at either end (as at Broadway), or when the stacks were at the side of the building then one smaller roof connecting them with the main one. The base of the chimney was invariably square until it cleared the roof, then the flues were built separately, either square or diagonally, in clusters of two, three, or four, always made of slabs of stone (as at Medford House, in Gloucestershire), about 3 in. or 4 in. thick and 8 in. or 10 in. deep, standing on edge and breaking joint over each other, and tied together at the top by a moulded cap of some simple section, as at the court-house at Painswick, in Gloucestershire. The ingenious way in which these chimneys were managed, whether of stone or plain, un-moulded bricks, always excited a feeling of admiration, for, simple as they were, they possessed a breadth and sense of proportion sadly lacking in cottage chimneys of the present day. It was, however, in the arrangement of the roofs that these old builders excelled, always bold in outline, simple in plan and arrangement, and generally unbroken in their surface and treatment; they sheltered the whole house, and conveyed at once a kindly feeling of homeliness. In the tiled roofs of Kent and Surrey hips perhaps were more frequently met with than gables, and hardly a roof seemed complete without them, but directly we got into the districts where stone-walling and mullioned windows were used gables were more noticeable. If we analysed any of these roofs in order to discover what constituted their charm we found that they resolved themselves into very simple forms, but the masterly way in which in almost every instance the grouping and disposal of the gables, chimneys, and dormers was managed was worthy of our admiration. Dealing first with the stone buildings, the roofs were nearly always treated in the same way, having a slope of about 55 deg., and being hung with stone slates (the only material available) graduated in thickness and size from the eaves to the ridge, and crowned on the top with a stone cresting. In the example from Painswick we saw the effect of material upon design and construction, and how these builders realised that one was dependent on the other. The nature of the stone of which the slates were made—in the Cotswolds, at any rate—limited them to certain sizes, so that the stone roofs of flatter pitch covered with large and heavy slates found in Sussex and the north of England were quite unknown here.

If the angle of the roofs was flattened the slates would have to be larger, otherwise they would not keep the wet out, so after finding the pitch at which they had least strain on the pins and were most weather-proof, the old slaters never varied it. The valleys were formed of the same slates, in

a wide sweep with no hard line of demarcation where the roofs intersect, all laid in regular formation and ranging with the ordinary slating, as shown in Callowell Farm, near Stroud. Owing, doubtless, to the difficulty of getting lead in these country villages the builders did without it, and their houses, as mentioned before, were always roofed in a single span, and no lead gutters or flats were needed. Hips or any cutting or mitring of the slates were absolutely unknown in a genuine stone-roofed house, and we, therefore, invariably found the gables with the slates carried out over them, as at Back Edge, in Gloucestershire, or finished with a coping, as in Moor Hall, Stroud. The old craftsmen could do almost anything with their stone slates; the clever way in which the outside eaves were roofed, or over the circular outside staircases with pointed roofs, and again in the beautiful dove-cots, of which so many still remain scattered about the country, was truly remarkable. The dove-cot from near Cirencester was a very typical example. In Cheshire and Lancashire and Yorkshire, and parts of Sussex and Somersetshire, where the stone slates were very large and heavy, the pitch of the roof was flattened, for it would be impossible to cover with heavy stone slates steeply sloping slides, where all the drag and strain would be on the pegs and laths. Doubtless some of the roofs of the houses in the south-east of England which were now covered with red tiles and had such a beautiful effect were once hung with stone, as many of the buildings were of earlier date than the roofs.

Tiles were not generally used in England until the XVIIth century, owing to the scarcity of coal and the difficulty of burning them. For the same reason bricks were not employed extensively for building before Henry VIII's reign, though, of course, the art of brick-making, so commonly used by the Romans, was never lost in England. Formerly bricks were much thinner than they are at present, and there was little to distinguish them from tiles. The old red tiles we found on the roofs of these buildings were thicker and more unevenly burnt than our modern ones of to-day; they were, of course, all made by hand, and the holes for the pegs or nails were not so accurately placed, and, being hung on oak riven laths instead of sawn straight ones, the irregularity of the tiling and the texture of the surface produced a softness and delicate play of light and shade that was very pleasing. This effect could be seen on the roof of the cottage at Mayfield. Thatched roofs, which were probably a survival of the earliest form of roof covering, were frequently met with, and here the hips treatment was even more prevalent than with the tiled ones. There was no doubt that these old houses gathered a great deal of their charm and simple picturesqueness from the fact that the roofs were so unbroken in their surface and treatment and though the little use to which the space inside was devoted and the apparent wastefulness of their construction would appal the modern builder, yet it was this evident disregard of economy that made them so effective.

Quite apart from anything else a roof of high pitch gave a character and dignity to the building it covered which was distinctly pleasing. The roofs of all these old houses were so satisfactory as they seemed to grow naturally from the walls below, and whether of stone, tile, or thatch, being of the local materials made them seem part of the actual landscape.

Timber-built Houses.

As to timber-built houses, broadly speaking, as they resembled each other to a certain degree in plan and elevation, so they did in their construction, which was simple in the extreme. The author then gave the following description of these houses:—

"The plan was first set out, and a base or foundation-wall built, generally of brick or stone, high enough to keep the wood all well above the ground, as at Boughton, in Kent. Into this sill-piece heavy story-posts of timber were fixed upright about 7 ft. or 8 ft. apart, those at the angles being larger and formed of the butt of a tree placed root upwards, with the top part curving diagonally

outwards to carry the angle-posts of the upper story, as shown in the view of Stone Hill Farm, Chiddingfold, where also the typical Sussex stone slates can be seen. Upon these main posts beams were laid across the building, projecting forward some 18 in. in front of the framing below; into these beams others were connected longitudinally, and to these again the floor joists were tenoned, projecting the same distance as the main beams. The framing of the upper story then followed that of the ground floor, excepting that the plate or sill was now laid on the ends of the overhanging timbers. In the XVIIth century the ends of the joists were often covered with a richly-moulded (and carved, as at Lenham) fascia; but later this was abandoned, and the ends of the joists were merely rounded off. The projecting stories of these timber houses, which, with their quaint and decorated fronts and many gables are so beautiful, were not born of a mere freak or an artist's fancy. They were copied from the town houses, and these overhanging stories were intended for use—namely, to give shelter from the sun or rain to the stalls and books and to the goods displayed in the streets; and though there was no actual need in the country for such projections, the custom was adopted until it became almost traditional. The house in its first stage was a mere timber skeleton or "carcass," as it was then called, and until the framing was well advanced had to be staged or propped up from the outside—the slats to receive these stays are still showing in the larger timbers of many of the houses. The spaces between these main uprights were then filled with windows or timber framing, the latter generally about 8 in. or 9 in. apart, the closeness of the timbering being an indication of early work, and it was not until later that they were set further apart and curved and shaped braces introduced. Though the general character and appearance of these Kent and Sussex houses bears some resemblance to those of Shropshire and Cheshire and the West of England, the elaborate panels, filled with curved braces and cusings, so typical of the latter districts, are seldom seen in Kent, though there is a somewhat isolated example at Mayfield, in Sussex. These were contrived by using the bent and twisted pieces of wood obtained from the smaller branches and fitting them into the panels formed of the upright and cross-rails. It has been suggested that the prevalence of this kind of ornament was due to the shape the trees assumed from the force of the wind which is so frequent in the West of England, and which bent and distorted the trees, and so supplied many more crooked than straight branches. I have some typical examples from Little Moreton Hall, Cheshire. These houses were chiefly built of oak, which generally shrinks, and, as their construction depends in great measure upon the security of their mortises and tenons, when the joints shrank apart or decayed and the buildings settled they were, in order to keep out the weather, either plastered all over on the outside, hung with tiles, or covered with deal boarding—indeed, very many of the tiling houses one sees throughout Sussex are the old XVIIth century timber-framed ones in a new shell, as at Goudhurst, in Kent. The windows, as a rule, in the timber houses were small, with moulded frames and mullions, and filled with lead lattice-glazing. Sometimes they were treated as oriels, swung forwards on richly-moulded sills, supported by cut and shaped brackets. An effective arrangement was to place a bay window carried out on the first floor only, as at Chiddingstone, but more frequently taken up from the ground and under a gable which projected forward and overhung it, as at Beckley. The large boards and finials to these gables were always decoratively treated, and many still remain. At first they were merely stout boards cupped or shaped at the edges, and later ornamented with perforated tracery and carving, as at Eynsford and Cranbrook; a beautiful example is still to be seen in the High-street at Burford, in Oxfordshire."

The Stone Districts.

Turning again to the stone districts we found the walls of the houses always built of stone never less than 18 in., and often considerably more than 2 ft. in thickness; they

were built of either rubble in thin layers, or in deeper courses of dressed stone, or in larger blocks of dressed stone, the character of the walling depending in great measure upon the way in which the stone came from the quarry. In Wales and Westmorland the nature of the stone was reflected in the walling, as at Plas Mawr and Ambleside.

In the XVIIth century the employment of the stone lintel was universal, and one was struck by the almost entire absence of the arch in these buildings—externally the openings were never made wider than the stone would carry, and stout oak beams were laid across the door and window opening inside. The four-centred door head out of one stone was the commonest treatment, at first steep in outline as at Laverton, then shallower, until eventually it became the flat lintel. Occasionally the doorways were sheltered with a projecting hood, on moulded brackets as at Chalford Hill, but in the stone districts a point to be noticed was the absence of porches so common in timbered houses. The doorway, or entrance, had always been the centre of attraction, and that upon which the best workmanship was most often found, for if there were no ornament anywhere else it was generally here that some effort was made. It was always in the doorways, fireplaces, and memorial tombs in the churches that the old builders tried to exercise their ingenuity and originality, and where one would notice the influence of change of style and fashion as at the Warren Farm. The proportion of the doorway also greatly affected its character, a wide and low opening conveying a sense of welcome and comfort that was seldom obtained by a tall and narrow one.

The windows, again, were always stone mullioned, filled with lead-latticed panes and wrought-iron casements, and, whether in stone or wood, were nearly always treated in the same way, 12 in. to 16 in. wide between the mullions, and in the small houses with seldom more than one light high. The number of lights in nearly every instance diminished in each succeeding story. On the ground floor the windows had four or sometimes six lights, with a heavier central mullion, the next story would have three, and in the gable would be two. It was the invariable practice to lessen the number of lights as the windows ascend into the gables. The reason for this might have been owing to the dearth of glass in the XVIth and XVIIth centuries, which in these small houses would doubtless govern the size of the windows, those in the living-rooms being generally the largest. Indeed, the smaller the window as a rule, the older the house. Before the time of Henry VIII. glass windows were rare except in churches and important houses, and when it eventually became cheaper the fashion arose of making the windows as numerous and large as possible.

The symmetrical disposition and squareness of the plans and the way in which they were roofed enabled the windows to be easily arranged to come centrally under a gable in every case, as at Tocknell and Whittington, a treatment also met with in the timber and brick built houses.

In the stone houses the windows were always placed on the outer face of the wall, so that inside the deep recess gave that delightful sense of comfort and warmth only obtainable when thick walls were used. Bay windows were not of very frequent occurrence in these small houses, but in the towns and villages they were sometimes used with very happy effect, as at Duddington, in Northants. Where the frontage to the street was very narrow the entrance was placed in the centre with a bay window on either side terminating in gables above, as at the Swan Inn at Lechlade, in Wilts, and at Campden, in Gloucestershire, where we find an almost similar treatment, but without the bay windows. No description of the windows would be complete without speaking of the dormers, the most characteristic feature of these stone houses. Their origin arose in the following manner:—The buildings were generally roofed about 12 ft. or 15 ft. above the ground, or some 4 ft. above the bedroom floor. This did not give sufficient height for the windows to be placed under the eaves, and, as the bedrooms were always constructed partly in the roof, it was necessary to carry

up the side wall and form smaller gables with windows in them which thus become dormers, as at Santbury. The lead laticed glazing of all these houses forms quite an integral part of their construction, and the mullioned window without its accompanying small panes of glass was but a sorry sight.

In the early houses we found the panes based upon a variation of the diamond and the square, sometimes very small and intricate, but always such as the village glazier could cut and put together. Towards the close of the XVIIIth century the rectangular oblong panes became very popular and continued down to the end of the XVIIIth century with but little change. The leading of the small panes of glass enabled the texture of the masonry walls to be carried, as it were, through the windows without a break, getting a continuity of surface that was very pleasing, and which these old builders thoroughly appreciated, as at Broadway. The mistake so often made to-day was in glazing windows with a single sheet of glass, producing a cold effect inside, and breaking up the exterior with cavernous spots of black, and emphasising the openings in a manner which was never intended. In these houses the rooms were generally about 7 ft. or 8 ft. high, or even less, for so long as a man of average height could walk about without knocking his head against the ceiling everyone was satisfied.

In many of the houses one or more of the rooms had the open-beamed ceilings richly moulded and sometimes curved, but as time went on this delightful treatment died out and square beams and joists were used, to be finally superseded by the plain plaster ceilings. The main beams were often placed in the rooms without the least regard to the position of the windows and fireplaces over which they happened to come.

Mr. Dawber then briefly described one or two houses—i.e., at Aston Subedge, Gloucestershire, and the farmhouse at Willersey, and, in conclusion, he referred to the obliteration of the older cratis (which could not be sufficiently deplored), and the building by-laws (which had been responsible for the decline of much local building and tradition). In conclusion, he said—"Is it out of place to raise a plea on behalf of these eloquent though silent witnesses to the craftsmanship of our village ancestors, and to urge that those who had the care or reparation of old cottages and farmhouses should treat them with a gentle hand and more tender regard? Unfortunately, many are being swept away, and the dwellings of our forefathers, so closely interwoven with the life and history of the country, and possessing such an intensely human interest, are being rapidly destroyed, in some cases to make way for what can be regarded as but doubtful improvements. Go where we will and contemplate any old building untouched by the hand of the restorer, and it is impossible not to be impressed by its beauty and subtle charm—the mullioned windows and laticed panes, the roof a kaleidoscope of varied colours, the venerable walls covered with lichens, the absence of any ostentatious or unnecessary ornament, and the wonderful feeling of homeliness that pervades every feature—all combine to produce the essence of simple and beautiful architecture. I would not suggest that, merely for the sake of their antiquity or picturesqueness, unhealthy or insanitary houses should be retained, but I would most strongly urge that where it is possible to save them we should hesitate before breaking any of the few remaining links that bind the villages and country towns of to-day with the interests and associations of the past."

On the motion of Viscount Dillon, who presided, a hearty vote of thanks was accorded to Mr. E. Guy Dawber for his excellent lecture and series of beautiful views. A vote of thanks was also tendered to Viscount Dillon for taking the chair.

VESTIGES OF BERMONDSEY ABBEY.

The further demolition of the houses in Grange-walk includes the two which mark the site of the East Gatehouse; in one of them were fixed what are believed to be the gate-hooks—the gatehouse remained until 1760. A ground plan, published by Wilkinson in 1820, and described as being from an original drawing taken in 1679, plots the buildings as

they stood nearly 140 years after Sir Thomas Pope had pulled down the abbey church together with most of the conventual buildings. At the west end of Grange-walk is plotted the East Gatehouse, giving access into the Base Courtyard. Next, north, to the East Gate is "the Bakehouse"; between the Bakehouse and the west end of Long-walk is shown "where the Mansion House stood," with its "Gallery"—these being on the east side of the Base Courtyard, side Bermondsey-square. To the south of Grange-walk are the "Highway leading to the Grange," "the Stable-yard," with its "Pond," and "Coney-grew" (sic). Excavations made in November, 1902, for the South-Eastern Railway Company's working class dwellings disclosed what were considered to be fragments of the substructure of the chancel of the abbey church on the north side of Long-walk, and, in Abbey-street, in 1903, several skeletons, and two stone coffins containing human remains. Sir Thomas Pope, Treasurer to the Court of Augmentations, used materials of the church and other buildings for his house, whereof the gardens, orchards, pasture lands, etc., covered about 20 acres. T. H. Shepherd's water-colour drawing, made about sixty years ago (now in the Crace Collection), shows the old stones in the walling of Bermondsey House which, after Pope's death at Clerkenwell Priory in 1559, was, with its pleasure, acquired by Thomas Ratcliffe, Earl of Sussex, Lord Chamberlain, who lived there in high state. His widow, Frances, daughter of Sir William Sidney, died in 1589, and founded Sidney-Sussex College, Cambridge. Pope founded Trinity College, Oxford. The Crace Collection contains also C. I. M. Whicello's original drawing (engraved by Wilkinson, 1820), of the North, or Great, Gatehouse, at the north-west angle of Bermondsey-square, which survived until 1806, when Abbey-street and most of the square were laid out. Just beyond stood the West Gate, where is now Bermondsey New-road. Over part of Long-walk, and between Long-walk and Grange-walk, stood a palace of William I., his successor, and our earlier Plantagenet kings. The Domesday Survey cites Bermondsey, in Brixton hundred, as held by the King, and before him by Earl Harold, and as having a new and handsome church. William II. bestowed the royal manor upon the priory which Aylwin Child established there in 1082 for Benedictine monks from the Cluniac Priory De Caritate sur Loire; at Richard II.'s request Pope Boniface IX. erected, 1399, the priory into the Abbey of the Holy Saviour, which attained to great opulence and power. After Abbot Wharton's surrender in 1538 the site was granted, July 8, 1541, to Sir Robert Southwell, Master of the Rolls, who, on August 30 of that year, conveyed the property in fee to Sir Thomas Pope and his wife under a sale, afterwards confirmed by letters patent. The monks built for their tenants in Southwark a church which, at the Suppression, was converted into the parish church of St. Mary Magdalene. The church, rebuilt in 1680, was restored by George Porter in 1830, and altered and decorated by Mr. E. Crosse eight years ago; the graveyard, 1½ acres, was laid out as a public recreation ground in 1886, at a cost of 1,500l., borne by an ordinary vestry rate.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The tenth meeting of the session was held at No. 18, Dutton-street, S.W., on Wednesday, March 14, under the chairmanship of Mr. F. W. M. Womacott, when Mr. Geoffrey Lucas read a paper on "Inexpensive Cottages," of which the following is a summary:—

"Inexpensive cottages—a delightful ideal—are also a necessity. There is little doubt that a great change is coming in the placing of the population on the land, with our increased facilities of transit and communication. The factories and the workers must be moved into the country, the workers living within easy distance of their occupation, and enjoying home-life amid the countryside. The most important thing is a good living-room, with sheltered door, and fireplace containing the cooking range well away from draughts. A wide and sunny

window is essential. The external door is better if shielded by a porch. The minimum size, for a cottager with wife and three children, is about 14 ft. by 11 ft. Probably it will be better to screen the stairs off from the sitting-room, in spite of the loss of the picturesque effect in the interior. The height depends on the requirements of the local by-laws, otherwise a height of 7 ft. 3 in. to 7 ft. 9 in. is sufficient. A portable range, with boiler if a constant service is available, set in a brick chimney breast, finished with a fair face, and provided with a shelf above shoulder-height, is a good arrangement.

A chamfered wood picture-rail, set just under the ceiling line, saves much knocking about of walls, as do wood linings to the windows.

A wood floor is more comfortable than tile, and should be finished with a square wood skirting, 5 in. high. Whitewash or cream colour wash is a good wall finish, but tenants usually prefer colour-wash or paper; and, it may be added, sash-windows to casements. A simple dresser is an essential fitting. I do not think a parlour is a necessity for labourers, but may be so for artisans. It can, however, be kept quite small, a minimum size being 10 ft. by 8 ft., fitted with a fireplace and finished like the living-room. Adjoining the living-room is the scullery, say, 8 ft. by 8 ft. minimum, containing sink, at least 30 in. by 18 in., with draining-board and tap and a plate-rack. The copper may have a ventilating hood over it. Shelves for saucepans are a necessity. It is doubtful if a bath is required at all, but, if so, it can be put in the scullery, and hot water drawn from the copper. If possible, the bath should be screened off with a wooden screen, as is cleverly done in Mr. F. Troup's cottage at Letchworth. The combined fitchener and copper and the tip-up bath are both excellent fittings, but their cost is a large item in a cheap cottage. The ladder should be large, with wide shelves, and ventilated by air-bricks. The sash-frame should be fixed and partly filled with fly-wire instead of glass.

The coal-hole should hold at least a ton, and may very well be lowered a step, and open out of the scullery. An outside shed for storage is useful, almost essential. Earth-closets should be as simply fitted as possible: seat with pail under, an earth-bucket and shovel being sufficient. Water-closets are but little trouble, and the by-law requiring an outside window can often be got over. The stairs should be from 2 ft. 4 in. to 2 ft. 6 in. in clear, and may be as steep as 8 in. rise and 8½ in. tread. Three bedrooms are the minimum required by decency for a family, though it is difficult in a single living-room cottage to find space for them on the first floor. One room may be quite small, and need not have a fireplace. The landing is sufficiently lit by a fanlight over one door. Generally speaking, a southerly aspect is best, but an east and west aspect is also good. Casements cost less than sashes, and are more sympathetic for cottage work. Wood-skirtings fitted in behind, are good in practice, also tiles, but these are more costly. Matchboard partitions to bedrooms are not sound proof and patent partitions are economical only when used in large quantities. Lugged-doors are good, but liable to sag. No architraves are needed if the linings project to stop the skirting. Bricks seem to be the best and cheapest materials, at least for use in brick districts. Drainage is the most expensive, if necessary, item in a cottage. A cheap and effective system has yet to be devised. Joint drainage, if allowed, effects a great saving. The best sink-gulleys are those with a deep-set grating, the lead waste delivering vertically over this. The rain-water is best collected in rain-water butts or open iron cisterns."

After making some suggestions in regard to exterior treatment, Mr. Lucas said that in regard to the question of village street architecture, continuous lines of houses, instead of detached houses, led to dignity, and he instanced such towns as Blandford and Baldock. Economy in cost was a gain to be considered. In conclusion, he said that the design of inexpensive cottages was well worth doing by architects.

The discussion was opened by Mr. H. G. Collins, and continued by Mr. Drummond and other speakers. A good many practical points were brought out, such as the demand

still found in some districts for brick ovens for bread making, or, as in the west country, earthenware ovens. The use of breeze concrete for wall-plates was a good suggestion, and one or two speakers said that a fillet at chair height saved damage to walls.

Mr. Maurice B. Adams, in summing up the discussion, criticised the many sets of plans shown on the walls, and considered that modern work showed a very great advance in practical qualities, consideration, and value of textures. He thought that all new materials should be carefully considered, but agreed that, so far, brickwork had held its own for external walling. He then dealt with the difference of habits which led to the distinction between the labourers and artisans' homes. Mr. Clough's cottages, with their mansard-roof construction, were instanced as a typical example of economy in building, the Kentish type of high-pitched roof being the opposite extreme. Two of the newer materials were mentioned in bitumen paint for ironwork, and the roof-proof stains for external woodwork, both being commended. The use of aralite on an iron framing was noted for workshop construction.

The Chairman announced that the next meeting would be held on Wednesday, March 28, at 7.15 p.m., at the Law Society's Hall, in conjunction with the Law Students' Debating Society, when a paper would be read by Mr. Wm. Woodward, F.R.I.B.A., on "The Legal Ownership of Architects' Drawings."

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. Evan Spicer, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Lambeth Borough Council 5,000*l.* for contribution towards purchase of certain land at Denmark-hill; Poplar Guardians 61,000*l.* for poor law purposes; and St. Marylebone Borough Council 48,545*l.* for electric lighting.

Further Strand Improvement.—The petition presented by the Further Strand Improvement Committee, and referred to on another page, was sent to the Improvements Committee.

Secondary Schools.—The following recommendations of the Education Committee were agreed to:—

"That it be referred to the Education Committee to report as to the steps necessary for the acquisition of sites as follows:—

(i.) In the south-west of London, for the accommodation of the dual school now carried on by the Battersea Polytechnic; (ii.) at the north of London, for a new boys' school; (iii.) in Paddington, for the accommodation of the mixed school now carried on at the London County Council Paddington Technical Institute; (iv.) in North Islington, for a new girls' school; (v.) in the south-west of London, for a new girls' school.

That the Governors of the Adeley and Stanhope School (Deptford) be asked to submit plans for the erection of additional classrooms and an additional art room.

That, subject to the Governors of the Aske's School for Boys (Deptford) notifying the Council of their willingness to erect a new block of school buildings out of the funds of the foundation, an equipment grant of 1,000*l.* be offered to them, and that they be informed that the Council will consider the question of increasing its maintenance grant when the new block shall have been completed.

That, subject to the Governors of Aske's School for Girls (Deptford) deciding to increase the accommodation of the school, an equipment grant of 500*l.* be offered to them, provided that the work is put in hand at once and completed to the satisfaction of the Council.

That, subject to the Governors of Camden School for Girls (St. Pancras, N.) deciding to extend the school buildings, an equipment grant of 8,000*l.* be offered to them by the Council, provided that the work is put in hand at once and completed to the satisfaction of the Council.

That the Governors of the Central Foundation School for Girls (Whitechapel) be asked to submit proposals for the enlargement of the accommodation of the school out of the funds of the foundation, and that, subject to the Council providing that the work is put in hand at once and completed to the satisfaction of the Council, they be offered an equipment grant of 400*l.* in connexion with the enlargement, provided that the work is put in hand at once and carried out to the satisfaction of the Council.

That an equipment grant of 500*l.* be offered to the Governors of the Stepmay and Bow Foundation in connexion with the rebuilding of the Coopers' Company's School (Mile End), provided that the work is undertaken at once and completed to the satisfaction of the Council, and that they be informed that the Council will consider the question of increasing the maintenance grant in connexion with the rebuilding of the school.

That the Governors of the Grovecoat Hospital (Westminster) be informed that the Council will

consider the question of increasing its maintenance grants for the year 1907 on the completion of the extension of the buildings now being made.

That the Governors of James Allen's School (Dulwich) be asked to submit proposals for the extension of the school buildings in order to reduce the size of the classes, and that an equipment grant of 400*l.* be offered to the Governors in connexion with the enlargement, provided that the work is put in hand at once and completed to the satisfaction of the Council.

That the Governors of the Latimer Upper School (Hammersmith) be asked to submit, at an early date, plans for increasing the accommodation of the school at the expense of the foundation.

That the Governors of Farmer's School (Bevis Green, N.E.) be asked to submit proposals for the enlargement of the school, or for the removal of the boys' school to a more northern part of the county. That the Governors of the Owen's School (Bevis Green, N.E.) be asked to submit proposals for the enlargement of the accommodation of the school out of the funds of the foundation, and that, subject to the proposals being approved, they be offered an equipment grant of 500*l.* in connexion with the enlargement, if carried out at once to the satisfaction of the Council.

That the Governors of the Roan School (Greenwich) be offered a grant of 6,000*l.* in connexion with the erection of new buildings, provided that the work is commenced at once and completed to the satisfaction of the Council.

That the Governors of St. Mary's College (Paddington, N.) be informed that, subject to their undertaking to obtain the premises of the Kensington Park High School, and thus increase the accommodation of their school by September, 1906, the Council will consider the question of increasing its maintenance grant.

That the Governors of St. Olave's and St. Saviour's Grammar School (boys) be offered an equipment grant of 2,000*l.* towards the cost of extending the accommodation of the present building, on condition that it is taken in hand at once and completed to the satisfaction of the Council.

That the Governors of St. Olave's and St. Saviour's School (girls) (Bermondsey) be offered an equipment grant of 1,500*l.* towards the cost of extending the accommodation of the present building, on condition that the work is put in hand at once and completed to the satisfaction of the Council.

That the Governors of the Whitechapel Foundation School (Whitechapel) be asked to submit proposals for enlarging the school on the falling in of the lease of premises adjoining the school, and that an equipment grant of 500*l.* be offered to them in connexion with the enlargement, provided that the work is put in hand at once and completed to the satisfaction of the Council.

That the Governors of the William Ellis School (St. Pancras, N.) be asked to provide two additional classrooms, and new desks.

That the Governors of the Lewisham Grammar School (Lewisham) consenting to enlarge the accommodation of this school to the satisfaction of the Council, they be offered a grant of 6,000*l.*

General Lines of Buildings in Fulham-road and Fulham Park-road.—The Building Act Committee reported as follows:—

"On May 3, 1905, we reported that a successful appeal had been made to the Tribunal of Appeal against the certificate of the architect of the Council, acting in the capacity of the superintending architect of metropolitan buildings, defining the general line of buildings on the south side of Fulham-road, westward of Munster-road. We have now to report that on December 22, 1905, the superintending architect defined the general line of buildings on the western side of Fulham-park-road between Fulham-road and Landridge-road, and that an appeal was made against his certificate, and that on January 23, 1906, the Tribunal of Appeal reversed his certificate and decided that there was no general line of buildings on the western side of the street leading from Fulham-road to the junction of Fulham-park-gardens and Fulham-park-road. His decision is that, except in so far as the provisions of section 13 of the London Building Act, 1894, as to the prescribed distance may apply, there is nothing to prevent the erection of houses on the site in question close up to the public way. In order that the effect of these decisions of the Tribunal of Appeal, which enable the applicants to build very considerably in advance of the lines defined by the superintending architect, may be clearly understood, we have given instructions for a cartoon to be prepared and hung in the Council chamber.

Mr. Cobb asked why the case was allowed to go by default, and why the borough council was not informed that the Council intended to take no action.

Captain Hemphill said that the case did not go by default. There was a decision on the report of the superintending architect defining the line, and it was not usual for the Council to appear on such occasions. In nearly all cases, whether the Council was right or wrong, the Tribunal allocated the costs against the Council.

Mr. Phillips more said that the Council did not appear at a party to the appeal, and consequently the Tribunal was not able to pile up the costs against the Council.

Colonel Rotton asked if it was true that the Tribunal was habitually unfair to the Council. That seemed a very serious statement to make, and if the statement was true and the Tribunal was in the habit of piling up the costs against the Council, then it would be necessary to get another Tribunal. (Several members: That is what we want.) The state of affairs was very unsatisfactory. Captain Hemphill said there was no reason

why the borough council should not, if they had desired, have taken action in the matter. As to the Tribunal, he did not intend to say that they were habitually unjust to the Council, but their decisions had been in the great majority of cases against the interests of the public and in the interests of the people who appeared before the Tribunal against the reasonable and fair decisions of the Council.

Holborn to Strand and Southampton-row—Tramway-subway and Paving, etc., Works.—The Highways and Improvements Committees recommended, and it was agreed, that additional expenditure not exceeding 550*l.* be sanctioned in respect of the employment of a resident engineer and of clerks of works in connexion with the execution, under the direction of the Works Committee, of the paving and tramway-subway, etc., works in the Holborn to Strand and Southampton-row improvements.

Encroachment on Land, Mansell-street.—The Improvements Committee reported as follows:—

"In connexion with the Mansell-street improvement terms were agreed for the purchase of the portion of the site of the Swan public-house, abutting on the building on the opposite side of the road, and not, as arranged, 50 ft. from the front of the forecourt. The encroachment on the land purchased for the improvement was 2 ft. 3 in. while the area of the land which has been encroached upon is about 63 sq. ft. We have agreed with the owners of the property for the frontage to the Swan public-house, that when the premises are rebuilt the frontage shall be set back to the proper line without further compensation. This will result in a profit of about twice the *pro rata* cost of the land which has been unlawfully built upon, and is calculated on the basis of the total amount payable to the owners in respect of their interest in land and the disturbance to their trade. We recommend that the arrangement under which, in consequence of an encroachment upon land acquired for the widening of Mansell-street, 500*l.* has been deducted from the compensating payable to the owners of the Swan public-house, No. 94, Mansell-street, be confirmed.

After discussion, the matter was referred back to the Committee.

Site for Sub-Pire Station.—The Highways Committee reported, and it was agreed, that the estimate of expenditure on a capital account of 10,000*l.*, submitted by the Finance Committee to cover the cost of acquiring the property in Gray's Inn-road, submitted to the Highways Committee on January 25, 1906, be approved.

Holborn to Strand—"Morning Post" Premises.—The Improvements Committee recommended, and it was agreed, that the approval of the construction of vaults in Aldwych, Wellington-street, and Exeter-street at the Morning Post premises be confirmed; and that the construction of a lift in a recess on the Exeter-street side of the building and of an opening in the footway in Wellington-street as shown on the plan be sanctioned.

Goldsmiths' College.—The following recommendations of the Education Committee were agreed to:—

"That the estimate of expenditure on maintenance account of 4,000*l.*, submitted by the Finance Committee, in respect of the grant of that amount for the maintenance of day and evening classes at the Goldsmiths' College, be approved.

That, subject to suitable arrangements being made with the University of London for the conduct of the school of art at the Goldsmiths' College on sufficiently practical lines to meet the views of the Council, the Council do express its willingness to contribute for the present a grant not exceeding 1,000*l.* a year for the maintenance of the day and evening classes therein.

That the department of mechanical and electrical engineering and the classes connected with the building trades now conducted at the Goldsmiths' College be removed as soon as possible to a new institution, and that it be referred to the Education Committee to consider the advisability of the provision of such institution as near as may be to the New Cross or Lewisham Junction railway stations.

That arrangements be made by the Council for the provision of evening classes either in the new institution referred to in resolution or in a separate institution in the neighbourhood of New Cross.

That pending the provision of other suitable accommodation, the Council do make a grant to the University of London for the actual cost of conducting the evening classes in mechanical and electrical engineering and the building trades at the Goldsmiths' College, such grant not to exceed 2,000*l.* a year."

Stepney Jewish School.—The Education Committee reported that on February 21, 1905, they decided to ask the trustees of the

Stepney Jewish School (Stepney) to join with the Council in making application to the Board of Education for a scheme dealing with the management of the school trust. The trustees have now forwarded their application, which is as follows:—

(i) For permission to contribute the Rothschild fund, £3,000, towards the cost of building an assembly hall, new classrooms, and making improvements in the existing building, which would include the alterations required by the Council.
(ii) The trustees propose to add to the school site a piece of freehold land which is stated to be the property of the committee.
(iii) The trustees also propose to provide from their own funds an additional sum of 4,000*l.* towards the buildings and improvements."

The Committee recommended, and it was agreed, that, subject to the plans of the new buildings and alterations being approved by the Council, and to provision being made in the scheme as to the amount of the income of the fund (when replaced) which should be paid to the Council under sect. 13 of the Education Act, 1902, the trustees of the Stepney Jewish School (Stepney) be informed that the Council has no observations to offer on the proposed application to the Board of Education for a scheme.

The Tribunal of Appeal under the Building Act.—The Building Act Committee reported that they had had under consideration a letter from the Home Secretary forwarding, for the observations of the Council, a copy of a letter received from the members of the Tribunal of Appeal constituted under sect. 175 of the London Building Act, 1894, asking that the rate of remuneration granted to them in respect of their services may be increased. In accordance with the terms of sect. 179 of the Act, the Home Secretary in 1894 decided that the members of the Tribunal should be paid by fees, and fixed the amount of the fees at three guineas for the first hour and two guineas for each subsequent hour of each day's sitting of the Tribunal, and in 1895 it was laid down that such remuneration was limited to the sitting of the Tribunal in its judicial capacity. The amount of the fees then fixed has remained unchanged up to the present. The members of the Tribunal ask that the rate of remuneration may be increased to five guineas for the first hour and three guineas for each subsequent hour or part of an hour, and that each member should receive a minimum fee of twelve guineas in respect of each appeal when an appointment has been fixed, whether the case is argued before the Tribunal or not, and further that such fees should be paid whether the members of the Tribunal are acting judicially or not, provided they are employed in the work of the Tribunal. The Committee proceeded:—

"It is stated that the maximum amount earned by any member of the Tribunal during the ten years inclusive was 940*l.*, which was paid in respect of 103 sittings of which were settled without being heard and the average amount received in respect of the ninety-eight sittings of an average duration of 2*h.* 15*m.* was less than four hours was 9*l.* 12*s.* This amount appears to us to be sufficient even if the members are prevented from making professional appointments on the days fixed for the hearing of appeals. The increased number of appeals which may be made under the London Building Act (Amendment) Act, 1905, is advanced by the members of the Tribunal as one reason why the rate of remuneration should be increased. It is, of course, impossible at the present time to form any opinion as to what the number of appeals under the new Act may be, but we are of opinion that, should the number be large, it would probably be found advisable for the Tribunal to sit at stated intervals, and if necessary to continue the sittings from day to day until all the cases then before them had been settled. Should this be the case, and assuming that the sittings lasted six hours each day, the average remuneration for each member would be about thirteen guineas, and we are, therefore, strengthened in our opinion that the present scale of fees is adequate."

The Committee recommended accordingly, and the motion was agreed to.

White Hart Lane Estate.—Erection of Shops.—The Housing of the Working Classes Committee recommended, and it was agreed:—

"That tenders be invited from selected firms for the erection of four shops fronting Fordship Lane at the south-western corner of the White Hart Lane estate; that bills of quantities be not prepared and that the form of contract be provided that payments to the extent of 80 per cent. of the work done be made to the contractor in fortnightly instalments upon the architect's certificate, that a further 15 per cent. of the bills of quantities be paid on the completion of each shop, and that the remaining 5 per cent. be paid within one month after the completion of each shop, subject to any liability as to the maintenance of the buildings."

Portion of the Crescent Site.—The Improvements Committee reported as follows:—

"We have had before us a proposal for a lease, for ninety-nine years, at a rent of 55,000*l.* a year, of the central portion of the crescent site formed in connexion with the Holborn Strand improvement. The site has an area of about 123,350 sq. ft., and lies between Aldwych and the Strand, being bounded on the east and west by the 50 ft. approaches which it is proposed to form to connect Strand and Aldwych. It has frontages of about 636 ft. to Aldwych, about 413 ft. to the Strand, about 236 ft. to the approach on the west side of the site, and about 231 ft. to that on the east side. The proposal has been made by Mr. L. Wornser on behalf of a syndicate who have prepared a scheme for developing the site as a whole. A company is to be formed for this object with a capital of 1,000,000*l.*, and arrangements have been made for underwriting nearly the whole of this amount. From inquiries made through the Council's bankers, we are satisfied that the necessary capital will be forthcoming, and that the financial position of the underwriters justifies the Council in favourably considering the present offer."

It is proposed to erect on the central portion of the site a stone building of commanding architectural features. This building will contain large galleries for use in connexion with a permanent exhibition of arts and manufactures; it will also contain a theatre, a concert hall, and a restaurant. Beyond the central block of buildings the site will be inclosed by shops with basements ground floors, and two floors above. There will be seventy-eight shops on the ground floor and seventy-eight on the first floor, while the second floor will be let for commercial purposes. The promoters have undertaken to spend not less than 500,000*l.* in the erection of these buildings. They state that negotiations have already been commenced for letting portions of the buildings, and that they have no doubt as to the disposal of the whole to substantial tenants. There will be no large open spaces, the shops and the central building then that which is necessary to provide for the access of light and air. The plans, elevations, and specifications of all the buildings will be entirely subject to the Council's approval.

The lease will be in the Council's usual form, subject to such modifications as may be necessary for the special underwriting, and will give the Council entire control as to the uses to which the buildings will be put and also the right of re-entry, if the buildings are put to any other use than that sanctioned when the lease is taken up.

We recommend that, subject to the terms and conditions of an agreement to be prepared by the Council's solicitor, the central portion having an area of about 123,350 sq. ft. of the crescent site, formed in connexion with the Holborn Strand improvement be let for a term of ninety-nine years at a rent of 55,000*l.* a year on an agreement for a lease to Mr. L. Wornser, on behalf of a syndicate which has been formed for dealing with the site; and that the Improvements Committee be authorised to complete the matter on the basis (i) that one year's peppercorn be allowed, and that the rent for the second and third years be at the rate of 27,500*l.* a year; (ii) that one year's ground rent (55,000*l.*) be paid to the Council upon the signing of the building agreement, and that this sum be forfeited to the Council in the event of the promoters not taking up their lease; (iii) that no public drinking bars be allowed other than those proposed to be used in the theatre during the performances, and that these be subject to the usual requirements of the Local Chamberlain, and that the sale of alcoholic liquors be restricted to the central building and to the courts and verandahs forming part thereof; (iv) that the buildings be erected in accordance with plans to be approved by the Council and that a sum of not less than 500,000*l.* be spent in the erection of such buildings; (v) that no deviation from or abatement of these plans be made without the previous sanction of the Council; (vi) that the Council reserves the right to terminate the lease at any time and to enter into any possession of the site and of the buildings erected thereon if, without the previous permission of the Council, such site or buildings be put to any other use than that sanctioned by the Council when the lease is taken up; and (vii) that no part of the site or of the buildings thereon be sold without the sanction of the Council."

Mr. Hubbard, the Chairman of the Committee, said that they had had a petition presented from the Royal Academy; there had been previous petitions of the same character, and the Council had always decided to take no action. With regard to the previous scheme, that was an offer for an option of a lease without a deposit, but in the present scheme they had a definite offer for a lease, with a deposit of 55,000*l.* upon signing the agreement. The other scheme involved a licence for the whole of the central building, grounds, and terraces, but now the licence would be only for the restaurant in the central building and in the open courts, or verandahs, where food would be served, and these would be much smaller than the open spaces in the previous scheme. There would be only one theatre, instead of two, and there would be two-story shops with one floor above, and no promenades on the roofs of the shops, as was proposed in the former scheme. The area of the open courts would be restricted to a minimum compatible with the access of light and air, and, owing to the number of shops being increased from about sixty to 176, the Council would have increased security for its ground rent. Another important matter was that, whereas in the former proposal there was no fixed amount for the

expenditure on the buildings, the Committee had now secured a minimum expenditure of 500,000*l.*

Mr. Howell Williams congratulated the Committee upon having made such a good bargain.

Sir Melville Beachcroft, while joining in that congratulation, stated that there was a very strong feeling about the alignment, and an influential committee had been formed with the object of getting a better architectural view of the Law Courts. He proposed, therefore, to ask the Council to add the following words to the recommendation:—"And that the building line at the south-east end be such as the Council may determine, having regard to the alignment which the Council may fix hereafter."

Captain Swinton seconded the addendum, remarking that if this proposal were accepted it might be possible to get an adequate view of the Gladstone statue.

The Chairman ruled that Sir Melville Beachcroft's amendment was out of order, as it would increase the cost of the improvement, and must, therefore, be dealt with as a separate recommendation.

The recommendation of the Committee was then, without further discussion, adopted with only one dissentient.

Road Widening, Old Brompton-road, Kensington.—The Improvements Committee recommended, and it was agreed, that expenditure not exceeding 2,265*l.* be sanctioned in respect of the widening of Old Brompton-road near Summer-place; that consent be given under sect. 72 of the Metropolitan Management (Amendment) Act, 1862, to the widening executed by the Council of the Royal Borough of Kensington.

The Council adjourned at 7.30 p.m.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

- Lines of Frontage and Projections.**
- Norwood and Wandsworth.**—Buildings on the south side of Lancaster-road, Norwood, between Chatsworth-road and Dalmore-road (Mr. C. J. Bentley for Mr. L. S. Rogers).—Consent.
- St. Pancras, West.**—The erection of an illuminated sign at No. 292, Easton-road, St. Pancras (Mr. A. Monigetti).—Consent.
- Lewisham.**—Retention of two projecting shops at Nos. 17 and 19, Louisa-vaile, Lewisham (Messrs. Blake & Dannatt).—Consent.
- Wandsworth.**—A flight of steps in front of the Southfields Baptist Chapel, Wimbledon-park-road, Wandsworth (Mr. R. H. Weymouth).—Consent.
- Woolwich.**—Bay windows in front of Nos. 20, 26, 28, and 30, Beechhill-road, Eltham (Mr. J. J. Bassett for Mr. A. Cameron Corbett).—Consent.
- Woolwich.**—Bay windows in front of Nos. 1 and 7, Glenchiel-road, Eltham (Mr. J. J. Bassett for Mr. A. Cameron Corbett).—Consent.
- Woolwich.**—A porch to a house to be known as "Dulce Domini," on the western side of Cleantius-road, Shooter's-hill, Plumstead (Mr. A. A. Beard).—Consent.
- Deptford.**—Ten one-story shops at the junction of Horstead-road, Arica-road, and Revelon-road, Brockley (Mr. A. H. Kersey for the trustees of the late Robert Kersey).—Refused.
- Battersea.**—A porch to a proposed new church on the east side of Alreburg-gardens, Clapham-common (Messrs. Kelly & Dickie for the Rev. G. Grady).—Refused.
- Marylebone, East.**—An iron and glass shelter to the premises of Messrs. Waring, Limited, Oxford-street, St. Marylebone, on the east side of Binstead-street (Mr. R. F. Atkinson for Messrs. Waring, Limited).—Refused.
- Width of Way.**
- Dulwich.**—A building on the north side of Grace's-news, Camberwell-grove, Camberwell, with the forecourt boundary fence at less than the prescribed distance from the centre of the roadway of the street (Mr. A. W. Osborn, for Mr. J. F. Chiverall).—Consent.
- St. Pancras, East.**—A two-story building at the rear of No. 8, Rochester-square, Kentish-town, to abut upon Rochester-place at less than the prescribed distance from the centre of the roadway of that street (Mr. T. B. Westcott for Mr. W. Baskwill).—Consent.
- Stepney.**—A wood and glass roof over a portion of the yard at the rear of No. 52, Mile End-road, Stepney, at less than the prescribed distance from the centre of the roadway of Cecil-street (Mr. W. E. H. Crawley for Messrs. Franks & Simons).—Consent.

Holborn to Strand.—Letting of the Central

Camberwell, North.—Houses on a site on the east side of Elmington-road, Camberwell, with the forecourt fences at less than the prescribed distance from the centre of the roadway of that street (Mr. W. M. Proudfoot for Mr. S. F. Cope).—Refused.

Kensington, South.—The retention of an iron forecourt railing in front of No. 22, Aubrey-walk, Kensington, at less than the prescribed distance from the centre of the roadway of the street (Messrs. Selby and Kissingbury for Mr. A. Withers).—Refused.

Width of Way, Lines of Frontage and Projections.
Islington, North.—A library building with projecting porches on the east side of Holloway-road and south side of Fieldway-crescent, Islington (Mr. H. T. Hare for the Islington Metropolitan Borough Council).—Consent.

Width of Way and Space at Rear.
Bethnal-green, South-west.—A building at the corner of old Nichol-street and Clancey-street, Bethnal-green (Mr. C. R. Peters).—Consent.

Width of Way and Construction.
Woolwich.—Three temporary wood and iron sheds at the Borough Council's Callis-yard Depot, Woolwich, at less than the prescribed distance from the centre of Callis-yard (Mr. J. Rash Dixon for the Woolwich Metropolitan Borough Council).—Consent.

Lines of Frontage and Construction.
Rotherhithe.—An iron gangway to connect Hay's Wharf and Wilson's Wharf, over the public right of way leading from Battle-bridge-lane to Battle-bridge-stairs, Rotherhithe (proprietors of Hay's Wharf).—Consent.

Rotherhithe.—A wood and iron chute of a temporary character to connect Hay's Wharf with Wilson's Wharf, over the public way of Battle-bridge-lane, Rotherhithe (the proprietors of Hay's Wharf).—Consent.

Space at Rear.
Hampstead.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a building, to be known as No. 8, Froggatt-terrace, West End-lane, Hampstead, with an irregular open space at the rear (Mr. R. L. Pearce for the Middlesex Building Company, Limited).—Consent.

Deptford.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of buildings on a site at the junction of Horstead, Africa, and Revelon-roads with irregular open spaces at the rear (Mr. A. H. Kersey for the trustees of the late R. Kersey).—Refused.

Cubical Extent.
Strand.—A building on the site of Nos. 132-135, Long-acre, to exceed in extent 250,000 cub. ft., and to be used for the purposes of a motor carriage works, repair shops, and showrooms (Mr. W. Woodward for Messrs. Slatter & Son and Mr. W. H. Eastgate).—Refused.

Height of Buildings.
St. George, Hanover-Square.—That the application of Mr. C. L. Morgan, for the London, Brighton, and South Coast Railway Company, for an extension of the period within which the erection of an addition to the Grosvenor Hotel, Victoria-station, Buckingham-palace-road, Westminster, was required to be completed, be granted.—Agreed.

The recommendations marked † are contrary to the views of the local authorities.

Fifty Years Ago.

FROM THE *Builder* OF MARCH 22, 1856.

TYNDALL'S-BUILDINGS is a court containing twenty-two houses, of which the society have obtained possession of seventeen, including the two shops in Gray's Inn-lane, one on each side of the archway, and will presently have the rest. The houses are all front, few of them having even the smallest outlet, and are in the most miserable state of dilapidation. The shutters and doors are broken; from most of the windows projects a well-known apparatus for drying the day's "wash"; the pavement is broken and out of level, retaining decomposing matter to contaminate the air; while the basement story of nearly all the houses is filled with fetid refuse, of which it has been the receptacle for years. In some of the houses it would seem scarcely possible that human beings could live: the floors are in holes, the stairs broken down, and the plastering fallen; nevertheless, they are densely peopled, and as much rent is paid for the rooms as ought to obtain for the tenants decent accommodation. In one the roof has fallen in. It was driven in by a tipsy woman one night, who

sought to escape over the tiles from her husband. Listen to the conversation, if so it may be called, of those inhabiting it: you will find it in keeping with the disordered, disrupted, disreputable locality: notice the faces that press against the window-pane, or come out in to the doorways as a stranger passes round the court; you will find them altogether in accordance—as the house, so the inmates. Three or four years since, several of the cellars were inhabited, the place was ill-drained, cesspools were in the dark underparts. The police have since then interfered, and the drainage has been slightly improved. The condition, however, is still bad enough. Take, for example, one of the houses as a specimen of the rest. Entering the doorway, we were shown a narrow staircase, dark as night, broken and shaky, down which we groped with bent back and much difficulty. At the bottom a glimmering light showed a water-barrel which would hold fifty or sixty gallons at the most. It was at this time not eleven o'clock in the morning, and the water was all gone, and this was not to be wondered at, when we found that this barrel was the only supply furnished for two houses, which, at the lowest calculation, contained a population of 100 persons old and young—this to serve for all purposes of cleanliness and domestic use. In this dim underworld was also the only convenience provided for the same number of persons. The smell was abominable. The owners of such places, as we have before observed, say:—"People of this sort are naturally dirty, and it is useless to do anything with them." We would ask in reply, "How is it possible that good habits can be acquired under such circumstances?"

Illustrations.

PALAZZO AVIGNONESI, MONTE-PULCIANO.

THE Palazzo Avignonesi was built by Giacomo Barozzi, of Vignola, during the latter half of the XVIIth century. The building looks well in execution, being situated upon the angle of the main thoroughfare (a very steep hill) of Montepulciano, a small town in Central Italy, about 2,000 ft. above sea level.

The ground floor rooms are vaulted over, and, although now used as a granary, still retain very good frescoed ceilings and walls. The sections show the curious arrangement of window seat and step up so often used in Italian houses.

The upper floors have been reconstructed, and are now used as flats, although the facade remains untouched. The coat of arms over the doorway is that of Cardinal Roberto Bellarmine, being probably added after the completion of the building.

LIONEL U. GRACE.

BLEBO HOUSE, FIFESHIRE.

THESE illustrations show additions which have been made to Blebo House, Cupar, Fife.

The house, which stands on a very finely wooded site, is of a simple Classic design typical of Scotch mansion houses about the middle of the XVIIIth century, and is built of local yellow sandstone. The additions have been carried out in the same stone, and the roofs are covered with green

Blebo House, Fife. Plan.

BUILDINGS IN CHRISTCHURCH, NEW ZEALAND.

Design for Hackney Central Library. Section.

Westmorland slates, while the inside finishings are executed in fumed oak and pitch-pine.

The architect is Mr. James Findlay, of Dundee.

HACKNEY LIBRARY.

This design, which was placed first by Mr. J. W. Simpson, the assessor, in a recent open competition, provides accommodation for a central library which it is intended to erect at the corner of Mare-street and Paragon-street, Hackney.

The form of the plan is determined by the lines of the site, and an endeavour has been made to obtain complete supervision, by a small staff, not only of the reading-rooms but also of the public stairs and entrance. Efficient natural lighting and cross-ventilation have also been aimed at.

It is intended to face the building with Monks Park stone and red bricks, while the construction will be fireproof throughout.

The architect is Mr. Henry A. Crouch.

THESE illustrations, taken from photographs, are given in connexion with the first article in this issue, to which the reader is referred.

Architectural Societies.

MANCHESTER SOCIETY OF ARCHITECTS.

The eleventh meeting of this Society was held last Tuesday evening, and was presided over by Mr. Paul Ogden, F.R.I.B.A., who, after a few preliminary remarks, called upon Mr. Charles Swain to read a paper entitled "The Development of Plan." The lecturer dealt at length with the subject, and showed how in the modern planning of ecclesiastical, public, and domestic buildings there is a development from the crude design of the early and medieval times. The lecture was illustrated chiefly by plans of the XVth century. The Chairman, in his summing-up remarks, cited further instances which clearly showed a development of plan in accordance with the views of the lecturer. Mr. Ogden felt that the books dealing with this subject were in many cases mere pretences, for they only gave plans without showing their development to that stage.

Books.

A History of English Furniture. By PERCY MACQUOID, R.I. London: Lawrence & Bullen, Ltd.; New York: G. P. Putnam's Sons, 1905.

The second volume of this sumptuously-illustrated history commences with that period of activity in furniture production following upon the death of Oliver Cromwell in the middle of the XVIIth century. The period dealt with is spread over about eighty years, called by the author the "Age of

Walnut." Walnut-trees appear to have been planted in great quantities in Elizabeth's reign, and the wood was for some time only used as a decoration in conjunction with oak; it was much used for furniture on the Continent, and by the Restoration was in general use in this country as a suitable framework for upholstered furniture. When large pieces of furniture were made throughout of walnut it is probable that the wood was imported, as in the case of oak wainscot panelling in Elizabethan times. Oak still held its own for constructional purposes, walnut being venerated to its surface with applied mouldings in the same wood. It is not easy to find a more beautifully-marked wood than English walnut, the one objection to its use being its liability to decay by worm if neglected; this defect is probably the weightiest of those reasons which led our ancestors to adopt mahogany in its place. As a reassurance to the lovers of walnut furniture, we would point out that mahogany is also liable to decay by worm if not carefully cleaned at intervals with paraffin oil. Chapter I. contains matter relating to chairs and cabinets of the Restoration Period, a period remarkable for the fine combination of carving and turnery; the later chairs aim at graceful combinations of the lines of the various parts rather than richness of ornament, or where richness of ornament is aimed at it is obtained by velvet and silk covers of fine design. The third chapter deals with the early marquetry work of the last quarter of the XVIIth century. Mr. Macquoid shows by illustration that in cutting their marqueterie patterns the ground was not wasted; two chests of drawers are shown of the same design in which the dark wood cut away forms the ground in one and the pattern in the other. It is difficult to discriminate between foreign and English marquetry; there is no doubt much that is regarded as foreign work was made in this country, and Mr. Macquoid mentions several characteristics of the English examples. Chapter IV. deals with stools and settees; the latter show some of the most beautiful designs in structure and material of any class or period in the history of furniture. The damaske and velvets made for the purpose are most rich and fanciful in design and colour, the turning and carved scroll-work and the lines of the compositions bold, graceful, and delicate; here and there extravagance may spoil the effect as in the settee, Plate VI. As a general rule the pieces are wrought to the highest pitch of perfection; figures 71 and 72 are examples of this. The chapter also includes an account and many illustrations of the silver tables, mirrors, and furniture that were in vogue in Charles II.'s time; the custom of overlaying furniture with silver was fortunately knocked on the head by a tax on plate imposed by William III. in 1696, when no doubt great quantities of Charles II. silver furniture disappeared into the melting-pot. The next extravagance was that of Grinling Gibbons in the XVIIIth century. Both

in technical excellence and beauty the wood-carving of this period excels anything produced in other countries, though it lead to no advance in construction; the realism of the decoration is out of place in serviceable pieces of furniture. It is at this juncture that the beneficial influence of architects like Sir Christopher Wren began to be felt in furniture design. Chapter V. deals with chairs and the latter marquetry, and Chapter VI. with lacquers, which became a fashionable form of decoration in the XVIIIth century, practised both by professional artists and amateurs. Chapter VII. deals with bed-enormous structures, some near 20 ft. high, hung with the richest velvets. Beds were considered by far the most important furniture in the room, and were specially described in wills of the period. The remaining chapters bring us down to Queen's Anne's reign, a prolific period of production, united with saneness of taste. They show the development of the cabriole leg and the ball-and-claw foot, the illustrations of which prepares us for the third volume, which is to deal with mahogany furniture.

Cassell's Building Construction. By Professor HENRY ADAMS, M.Inst.C.E., etc. London: Cassell & Co. 1905.

TO THE various text-books on building construction this new work is a welcome addition. Originally issued in weekly parts, the treatise now appears in the form of a handsome volume of more than 550 pages, illustrated by 2,300 blocks and twelve full-page coloured plates. The first thing to strike the eye in a preliminary examination is the thoroughly business-like manner in which the author has set about his onerous task. No space is wasted by tedious preliminary observations, and from first to last everything said is to the point. Including a brief introduction there are twenty-two chapters, each divided into paragraphs with distinctive headings, which in many cases render unnecessary any reference to the index. The latter is a specially praiseworthy feature occupying sixteen pages, and containing nearly 4,000 references. The illustrations are, without exception, reproduced from line drawings and diagrams, many of them have figured dimensions, and wherever such treatment is suitable they are drawn in accordance with a uniform system enabling the reader to identify at a glance the chief materials of construction indicated. One disadvantage we must point out is that the coloured plates are not invariably bound in appropriate positions. For example, the plate illustrating the "Five Orders of Architecture" is in the chapter on "Foundations," 500 pages away from its natural place; "Window Sashes" occur among the illustrations relating to steel girders; "Open Timber Roofs" is in the middle of the chapter on "Plumbing"; and so on. The utility of the plates is further decreased by the fact that none of them bears any reference to the text, and we have not

observed any reference in the text to the plates. It rather looks as if the binders had inserted these plates on their own responsibility without waiting for proper instructions from the author through the publishers.

So much for the general characteristics of this volume, which produces a most favourable impression at first sight. More extended study of the contents certainly confirms this impression and leads to the final opinion that in his new work Professor Adams has collected an extraordinary quantity of sound and practical information dealing with materials and methods of construction and the principles underlying building practice. It may be, as the author modestly hints, that the quality of continuity is occasionally lacking in the text. But we have not observed anything of the kind that can be suggested as a defect. On the contrary, the concise and direct treatment of different points connected with each branch of work should be regarded as a recommendation. Architects and builders do not want to find practical instruction swimming in a flow of beautiful language from which it has to be fished out with persevering labour, and we feel sure they will appreciate to the full the manner in which Professor Adams has endeavoured to save their time and facilitate their studies in this encyclopaedic text-book.

Structural materials, such as timber, brick, stone, lime cement, sand, iron and steel are discussed under the chapters wherein the corresponding types of construction are considered. The materials in question are not dealt with exhaustively, the manifest object of the author being to content himself with the presentation of practical notes and hints, leaving readers who require other information to find it elsewhere. All the main branches of work comprised in building construction receive very ample treatment, in which the illustrations play no inconspicuous part. Plumbing and other branches of domestic engineering are more lightly treated, and here the reader finds just enough information to make clear the necessity for studying each of these extensive subjects by the aid of a special treatise.

Having covered the essentials of building construction in the manner generally indicated above, the author has selected some of the subjects for more theoretical consideration, as shown by the chapters on "Stress Diagrams for Roofs," the "Strength of Beams and Girders," "Struts, Stanchions, and Arched Ribs," and the "Stability of Walls," and he concludes the book by a series of illustrated notes upon "Architecture." The least satisfactory chapter is that upon "Bridges," a branch of work which scarcely belongs to what is commonly recognised as "building construction" and really requires an entire volume for anything like adequate exposition. The construction of brick and masonry arches is previously discussed in connexion with these two materials, and we are inclined to think that in future editions the chapter on bridges should either be omitted altogether or modified so as to refer only to such structures as architects and building contractors are called upon to design and build. The design of railway viaducts, large highway bridges, and suspension bridges cannot be satisfactorily expounded within the limits accorded in this text-book, and the space so occupied might be devoted advantageously to the more complete discussion of small timber and steel footbridges. The same remark applies to "Wooden Bridges for 100 ft. and 200 ft. Span," a class of structure which nobody is likely to want in the present day.

There is far too much material in this book to permit anything like detailed comment upon its contents. We have indicated its general scope and salient features, and will add that Professor Adams thoroughly deserves the thanks of architects and builders for this valuable work, and that students will find in it a most useful complement to whatever text-book on building construction may be already in use as the basis of their studies.

Proceedings of the Incorporated Association of Municipal and County Engineers. Vol. XXXI. (London: E. & F. N. Spon, Ltd. 1905.)

In the last volume of "Proceedings" issued

by this Association several of the papers appeal to architects and engineers generally. Mr. H. K. G. Bamford, F.C.S., in dealing with the manufacture and testing of Portland cement could not very well say anything of much novelty, for modern methods have been repeatedly discussed at great length within the last two or three years. His paper, however, is a useful and concise epitome of present practice. Mr. Philip H. Palmer, M.Inst.C.E., contributed a short paper on "Armoured or Reinforced Concrete," summarising some of the chief points connected with the combination of concrete and steel and giving some examples of construction. Mr. A. R. Galbraith, A.M.Inst.C.E.I., read a paper on "Reinforced Concrete Piling," which deserves special commendation for the thoroughly practical manner in which the subject was treated. In discussing the important question of "Rivers Conservancy" Mr. Herbert G. Coales, A.M.Inst.C.E., certainly rose to the occasion in a very satisfactory manner, his paper being one that puts the case for reform with conspicuous lucidity. Among other noteworthy contributions are those of Mr. Albert D. Greatorex, A.M.Inst.C.E., on "Suggested Amendments to the Model Building By-laws for New Streets and Buildings"; Mr. C. H. Cooper, M.Inst.C.E., on the "Adaptation of Highways for Modern Traffic"; and Mr. Joseph Owen, on "Tramway Permanent Way Materials and Construction." The volume contains other papers, chiefly of local interest, and is well illustrated by numerous plates of diagrams.

Industrial Efficiency: A Comparative Study of Industrial Life in England, Germany, and America. By ARTHUR SHADWELL, M.A., M.D. In two vols. London: Longmans & Co. 1906.

THE prosperity of a nation must largely depend on its industrial efficiency—in other words, on the capacity of its men and its machines for the work which they have to do. Such an examination, therefore, as that which Dr. Shadwell set himself to accomplish, and the results of which are contained in these two interesting volumes, is of the first importance. Scientific in intention, this book, when it is carefully examined, is somewhat loose both in analysis, reasoning, and conclusions, one, and the main one, of which is that England in some respects has been industrially outstripped by her rivals. But because a nation has been able to surpass an older society in some respects it gives no cause for fear, because industrial progress depends on many circumstances connected with climate and so forth. But unquestionably a perusal of this book will enable those who are interested in the subject which it treats to better understand some of the factors of international industrial competition. Some of these are personal, others political; some depend on education, and some on long-standing social conditions. The book is one to be read and to be pondered over.

FERRO-CONCRETE.

SIR,—The great interest that is now evident amongst engineers and architects in all that relates to this subject, owing principally to the enterprise of agents for several foreign systems of ferro-concrete construction, should not be allowed to obscure the work of a pioneer of the system, Mr. Hyatt, over a quarter of a century ago.

Those who are interested in the early history of the system should refer to the pages on

fire-proofing in a work on the "Fire-resisting Arrangements of Factories, Workshops, etc.," by B. H. Thwaites, C.E., published by Spon in 1882. The method of utilising concrete not only as a metallic preservative but also as an agent of compressional strength, is clearly shown, so that in simple justice to Hyatt his work should be remembered.

PULPITS AT RAVELLO.

SIR,—A correspondent kindly points out to me that the Latin inscription referring to the date of Duomo pulpit reads:—

... Lapis, Millenis, Bis Centum, Bisque Trisemis Christi Bissenis," etc.

"Thrice six" should, therefore, have been "twice six," making the date 1272.

It is also pointed out to me that authorities upon these matters are agreed that the pulpit in "San Giovanni Del Toro" is anterior to the one in Duomo, and probably dates from prior to 1154.

This may be a correct surmise, but for my own part I must say that, after carefully examining and comparing the two pulpits as to the treatment, design, and colour of the mosaic. I came to the conclusion that parts were either copied the one from the other, or were by the same hand, and since an artist of Nicolas de Bartolomeo's ability would hardly copy, I prefer to think that they are by the same man. Moreover, mosaic work at Salerno, etc., dating from 1150 (about) has quite a different appearance, upon careful examination and comparison.

LIONEL U. GRACE.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XI.
CUBE ROOT—HIGHER ROOTS.

WHILE most people are able to solve square roots with reasonable facility, there are many who cannot deal with cube roots without adventitious aid of some kind.

Architects and contractors generally have at hand in their offices mathematical tables facilitating the extraction of cube roots, but as calculations sometimes have to be performed without other appliances than a piece of paper and a pencil it is really desirable that the arithmetical process should not be entirely neglected.

The methods for extracting the cube root of a number are analagous to those for extracting the square root.

By the method of factors it is frequently possible to find the cube root of a number by mere inspection.

Thus it is easy to detect the fact that $216 = 8 \times 27$, and still more easy to recognise that $8 \times 27 = 2^3 \times 3^3 = (2 \times 3)^3$.

Consequently the cube root of 216 is seen to be $\sqrt[3]{(2 \times 3)^3} = 2 \times 3 = 6$.

Again, it is not difficult to see that 2744 is divisible by 8, giving 343 as quotient, which is divisible by 7 with 49 as quotient.

Then as $8 = 2^3$, and as $7 \times 7 = 7^2$, the cube root of 2744 = $\sqrt[3]{2^3 \times 7^2} = 14$.

Of course, the convenience of this method depends a good deal upon the readiness with which numbers can be split up into prime factors, and the extent to which analysis of the kind can be usefully applied depends a good deal upon the facility of the operator.

Example (1): Find by the method of factors the cube root of 13824.

Referring to the tests of divisibility given in Article X., p. 296, we find that 8 is a factor of 13824, as the last three figures are divisible by 8.

Therefore $13824 \div 8 = 1728$

As the last three figures of 1728 are again divisible by 8 we have

$1728 \div 8 = 216$.

We have already seen that 216 can be resolved into 8×27 .

Therefore the factors of 13824 are

$(8^3 \times 27) = (2^3 \times 3^3)$

and we get

$\sqrt[3]{13824} = \sqrt[3]{(2^3 \times 3^3)}$

$(2^3 \times 3^3) = 24$.

Example (2): Find by the method of factors the cube root of 4492125.

By the tests of division in Article X., p. 296, we find that 5 is a factor of 4492125 as the last figure is 5, and similarly is a factor of the two succeeding quotients.

Therefore

$5)4492125$

$5)898425$

$5)179685$

$5)35937$

Next adding the figures $3 + 5 + 9 + 3 + 7 = 27$, we find that 9 is a factor.

When 35937 + 9 = 3593.
As 3593 is obviously divisible by 3, we have
3593 + 3 = 1331.

As the difference between the figures in the odd and even places of 1331 = (1 + 3) - (3 + 1) = 0, we have 11 as a factor, and for the same reason as a factor of each successive quotient.

Thus

$$\begin{array}{r} 11 \overline{)1331} \\ \underline{11} \\ 11 \\ \underline{11} \\ 1 \end{array}$$

Collecting the factors ascertained above, we have

$$\begin{array}{l} 5 \times 5 \times 5 = 5^3 \\ 9 \times 3 = 3^3 \\ 11 \times 11 \times 11 = 11^3 \end{array}$$

and

$$\sqrt[3]{439:155} = \sqrt[3]{(5^3 \times 3^3 \times 11^3)} \\ = 5 \times 3 \times 11 \\ = 165$$

The general rule for the extraction of cube root by the ordinary method is as follows:—

Rule (1).—(a.) Mark off in groups of three the figures of the number whose cube root has to be found, commencing from the right hand, by dots or commas. If the number includes a decimal fraction, mark off the figures of the fraction in a similar manner commencing from the decimal point, and in cases where there are not enough decimals to complete the last period, add either one or two ciphers as necessary.

(b.) Find the highest figure whose cube does not exceed the first period of the dividend. The figure so found is the first figure of the required root or "quotient," and its square is the first "divisor." Denoting by the symbol (a) the first figure of the root, the first divisor = a².

(c.) After division of the first period append to the remainder the next period of the number or "dividend," and divide by a number consisting of the sum of the three following products:—

- (1) 300 × (quotient already found)²,
- (2) 30 × (quotient already found) × (new figure of quotient),
- (3) (new figure of quotient)³.

After division, bring down the remainder and proceed as before until the exact cube root or a sufficiently exact approximation has been obtained.

Note.—It will facilitate operations to remember that the form of successive divisors, expressed algebraically, is

$$\begin{array}{l} 300a_1^2 + 30a_1b_1 + b_1^2 \\ 300a_2^2 + 30a_2b_2 + b_2^2 \\ 300a_3^2 + 30a_3b_3 + b_3^2 \\ 300a_4^2 + 30a_4b_4 + b_4^2 \\ \text{and so on,} \end{array}$$

where the index figures against a denote the number of figures in the quotient, and the index figures against b denote the numerical order of the figure in the quotient.

Further, it will facilitate the determination of b in each divisor to employ a trial divisor consisting of 300 times the square of the quotient already found, or expressed algebraically, 300a², 300a₁², 300a₂², and so on.

Example (1): Find the cube root of 82312875 to three places of decimals.

After marking off the periods to the left of the decimal point, adding one cipher to complete the period to the right of the decimal point, and adding two complete periods of decimals, we proceed in accordance with Rule (1), as follows:—

$a_1 = \frac{81 \overline{)823,128,750,000} \text{ (93714)}}{729} = 93714$
 $300a_1^2 + 30a_1b_1 + b_1^2 = \frac{25119,94128}{7557}$
 $300a_2^2 + 30a_2b_2 + b_2^2 = \frac{2614279 \overline{)18771750}}{1826983}$
 $300a_3^2 + 30a_3b_3 + b_3^2 = \frac{263418811 \overline{)471797000}}{263418811}$
 $300a_4^2 + 30a_4b_4 + b_4 = \frac{26345816836 \overline{)10837819000}}{10538267344}$
 2994921656

The manner in which the various divisors (1) to (5) are obtained is given below.

$9^2 = 81 \quad 81$
 $300 \times 9^2 = 24300$
 $30 \times 9 \times 3 = 810$
 $3^3 = 9 \quad 9 \quad 25119$
 $300 \times 93^2 = 2584700$
 $30 \times 93 \times 7 = 19530$
 $7^3 = 49 \quad 49 \quad 2614279$
 $300 \times 937^2 = 263380700$
 $30 \times 937 \times 1 = 28110$
 $1^3 = 1 \quad 1 \quad 263418811$
 $300 \times 9371^2 = 26344692900$
 $30 \times 9371 \times 4 = 1124520$
 $4^3 = 16 \quad 16 \quad 26345816836$

Horner's method provides an expeditious alternative to the ordinary process for extracting the cube root of a number. To avoid a lengthy explanation this method is explained by the aid of an example in which we use the same number as in example (1).

Example (2): Find by Horner's method the cube root of 82312875 to three places of decimals.

After marking off the periods to the left and right of the decimal point and adding the necessary ciphers as in example (1), three columns are commenced for the convenient calculation of the successive divisors, beginning column I. with 1, column II. with 0, and column III. with 0. The number whose cube root is required forms a fourth column, but we have here placed the number and the successive processes of division first, and the columns wherein the successive divisors are calculated below the final working.

The Roman numerals in the margin above, and the small index figures against some of the numbers under columns II. and III. refer to similar numerals and figures in the subjoined explanation.

I.—A. (1) The first period to be dealt with is 823, and as the cube next below this number has the cube root 9 we place the figure 9 as the first figure of the cube root or "quotient."

B. (2) We multiply the 1 in column (I.) by the first figure of the quotient and write the product 9 in column (II.)

(3) Next we multiply the product 9 by the first figure of the quotient (9 × 9), and write in column (III.) the product 81, which is the first divisor.

(4) Then after using 81 as a divisor we subtract the product, 81 × 9 = 729, from the first period of the number or "dividend," and bring down the next period.

II.—A. (1) We multiply the 1 in column (I.) by the first figure of the quotient and write the product 9 in column (II.) below the sum 9 previously obtained.

(2) Next we multiply the sum of the figures in column (II.) by the first figure of the quotient, 18 × 9 = 162; writing this number in column (III.), and adding in the sum 81 already there, we get the sum 162 + 81 = 243.

(3) Then we multiply the 1 in column (I.) by the first figure of the quotient and add the product 9 to column (II.), giving the sum 27.

(4) At the right of the 27 last written in column (II.) place one cipher, making the amount read 270; at the right of 243 in column (III.) we add two ciphers, making the amount read 24300.

(5) The number 24300 in column (III.) is now the trial divisor for determination of the second figure in the quotient. As the divisor evidently goes only 3 times into 94128 in the dividend we write 3 as the second figure of the quotient.

B. This figure 3 is used in the same manner as was the first figure of the quotient, as briefly indicated below.

(6) The 1 in column (I.) × 3 = 3 is added to 270 in column (II.), giving 273.

(7) Then 273 × 3 = 819 is added to 24300 in column (III.), giving 25119, which is the second divisor.

(8) Then using 25119 as the divisor, we subtract the product 25119 × 3 = 75257 from 94128 in the dividend and bring down the next period.

III.—A. To obtain the trial divisor for the dividend now to be dealt with, we proceed as in II. A.

Thus:—
 (1) 1 × 3 = 3 is added to the total of column (II.), giving 276.

(2) 276 × 3 = 828 is added to the total of column (III.), giving 25947.

(3) 1 × 3 = 3 is added to column (II.), giving 279.

(4) 279 with one cipher added = 2790, and 25947 with two ciphers added = 2594700.

(5) The trial divisor is 2594700, and indicates 7 as the next figure of the quotient.

B. The actual divisor is obtained as in II. B.

(6) The 1 in column (I.) × 7 = 7, which added to 2790 in column (II.) gives 2797.

(7) Then 2797 × 7 = 19579, which added to the number in column (III.) gives 2612479 as the third divisor.

(8) Then after using the divisor, we subtract and bring down the next period.

IV.—The operations in II. and III. are repeated, giving the divisor 263418811, as shown.

V.—The operations in II. and III. are again repeated, giving the divisor 26345816836, as shown.

From the above working and explanation it may appear at first sight that the extraction of a cube root by Horner's method is a somewhat complicated process. In reality, it is quite simple, but, as everybody knows, the explanation of a most simple thing is frequently a most complex operation. The apparent complication is further increased by the number of figures and the decimal fraction in the number chosen for example (2).

In order to illustrate the facility with which Horner's method can be used, we give below an example of evolution applied to a number such as architects may have occasion to deal with when separated from their accustomed hooks of reference.

Example (3): Find by Horner's method the cube root of 175616.

Col. (I.)	Col. (II.)	Col. (III.)	
1	0	0	175,616/56
	5	25	125
	5	25	50616
	5	50	50616
	10	7500	
	5	936	
	150	8436	
	6		
	156		

Therefore the required cube root = 56. In preparing columns (II.) and (III.) it will be found better to perform the various multiplications mentally, writing down only the results of the several additions. Similarly, in the columns devoted to the final working the Italian method of writing down only the differences may be adopted with advantage.

By these modifications the above workings would then appear thus:—

Col. (I.)	Col. (II.)	Col. (III.)	
1	0	0	175,616/56
	5	25	
	10	75	50,616
	156	8436	

Applications of Cube Root.

Example (1): Find the dimensions of a cubical tank capable of holding 2,000 gallons of water.

As 1 cubic foot = 6.23 gallons, we have
 $2,000 \div 6.23 = 321.02$, say 321 cubic feet.
 $\sqrt[3]{321} = 6.84$ ft., say 7 ft.

Then the inside dimensions of the tank will be 7 ft. x 7 ft. x 7 ft.

Example (3): Find the dimensions of a rectangular bin whose length, breadth, and depth respectively are as 3 : 1 : 1, and whose capacity shall be equal to 1 ton of Portland cement.

Taking the weight of Portland cement at 90 lb. per cubic foot, we have
 $\frac{10 \times 112}{90} = 24.88$, say 25 cubic feet.

Considering the specified proportionate dimensions it is evident that the bin can be divided into thirty-six equal cubical parts, each representing $\frac{25}{36} = 0.695$ cubic feet.

The sides of these small cubes will measure
 $\sqrt[3]{0.695} = 0.885$ ft.

Hence the dimensions of the bin will be:—

Depth = $(0.885 \times 2) \times 1 = 1.77$ ft.
 Breadth = $(0.885 \times 2) \times 1 = 1.77$ ft.
 Length = $(0.885 \times 2) \times 3 = 5.30$ ft.

Example (3): Find the inside diameter of a semi-spherical boiling pan with the specified capacity of 200 gallons.

Here $200 \div 6.23 = 32.1$ cubic feet.

The volume of a sphere = $\frac{4}{3} \times 3.1416$ times the cube of its radius.

Whence

$$r = \sqrt[3]{\frac{\text{capacity}}{4 \times 3.1416}}$$

As we are here dealing with a semi-spherical vessel we must double the capacity for the purpose of calculation.

Then the radius will be
 $\sqrt[3]{\frac{2 \times 32.1}{4 \times 3.1416}} = 2.5$ ft. (nearly).

And the diameter = $2.5 \times 2 = 5.0$ ft.

Higher Roots.

Methods exist for extracting higher roots, but they are not used in practice.

The following relations, however, should be remembered, as they can often be applied with convenience:—

- 4th root = $\sqrt{\text{square root}}$.
- 6th " = $\sqrt{\text{square root}}$.
- 8th " = $\sqrt{\text{fourth root}}$.
- 9th " = $\sqrt{\text{cube root}}$.
- 12th " = $\sqrt{\text{fourth root}}$.

THE T-SQUARE CLUB.—The T-Square Club held a concert last Tuesday at the Café Montic, when the chair was occupied by Sir Aston Webb. There was a good attendance, and the programme consisted of vocal and instrumental music by members of the club and others. During the interval, Mr G H Fellows-Pryne proposed a vote of thanks to the Chairman, and remarked that Sir Aston Webb was a man of many capacities, who entered not only into their work, but sympathised with and joined them in their lighter moments of pleasure. Most of his work had benefited by the influence of those present or kind words, and he (Mr. Pryne) asked them to accord Sir Aston Webb a hearty vote of thanks for spending the evening with them. The vote was carried with musical honours. Sir Aston Webb, in reply, said he had greatly enjoyed the delightful entertainment, and the obligation really lay on his side for the privilege of being present.

METROPOLITAN ASYLUMS BOARD.

The usual fortnightly meeting of the managers of the Metropolitan Asylums District was held on Saturday last week at the offices, Victoria Embankment.

New Central Stores.—On the recommendation of the Finance Committee it was agreed to apply to the Local Government Board for an order authorising the expenditure of a sum not exceeding 18,000l. on the erection of the New Central Stores, the money to be repayable within thirty years.

South-Western Hospital.—It was agreed, on the recommendation of the Hospitals Committee, to install warming apparatus in certain parts of the lower administrative block of this hospital. The cost is estimated at 230l., and the matter was referred to the Works Committee to be dealt with.

Caterham Asylum.—The Works Committee submitted a plan of a proposed upholsterers' shop at this asylum, and it was agreed to forward the plan to the Local Government Board for sanction.

South-Eastern Hospital.—On the recommendation of the same committee it was agreed that certain defective drains at this Hospital should be replaced with cast-iron drains at a cost of 950l., the work to be an "extra" upon Messrs. Godson & Son's contract for the reconstruction of the hospital.

Dareth Asylum.—The Asylum Committee submitted a lengthy report from the Dareth sub-committee regarding the proposed new workshops and fire-station at this asylum, the matter having been referred back to the Committee for further consideration last December, owing to the Local Government Board asking for further information. The sub-committee's report stated that the scheme provided for the following accommodation:—

On lower level—shops for upholsterers, shoemakers, painters, and plumbers. On higher level—shops for carpenters (industrial) and tailors, and for mat-making, brush-making and basket-making industries, a mess-room for artisans, five water-closets, a room for fire apparatus, and a fire-escape shed. The building would be on sloping ground, which would necessarily enhance its cost. It would be bisected by the main corridor at the northern end of the male staff blocks nearest to the training-school. A new and up-to-date fire-station was included in the scheme, this station being a very necessary proposal in view of the size of the whole institution.

It was proposed that the yard (both high and low level) should be covered in with a glass roof in order that patients could work out in the yard in mild weather; this augmenting the cost of the scheme very considerably.

Having regard to the importance of the industrial work now being carried on at Dareth under somewhat adverse conditions, it was imperative that properly-constructed workshops, sufficiently large to admit of an increasing number of persons to work therein, should be provided with the least possible delay, in order to ensure the continued success of the industrial operations now being carried on by a large number of patients under the supervision and guidance of competent trainers.

The cost of the building worked out at the low price of 6d. per cubic foot.

It was decided to forward a copy of the report to the Local Government Board.

COURT OF COMMON COUNCIL.

A MEETING of the Court of Common Council was held at the Guildhall on Thursday last week, the Lord Mayor presiding.

International Congress of Architects.—A letter was received from the President and Secretary of the Seventh International Congress of Architects, London, 1906, inviting the Corporation to appoint two delegates to attend the Congress.

Tar Paving.—The City of London Schools Committee were authorised to renew the tar paving of the playground of the City of London School, at a cost not exceeding 400l.

Re-writing of the Guildhall.—Permission was given to the City Lands Committee to proceed with a further section of the work of the electrical re-wiring of the Guildhall, and to expend a sum not to exceed 500l. during the present year.

Improvement of the Guildhall.—Mr. William Rome moved that, with a view to restoring the Guildhall to its original beauty and impressiveness, it be referred to the City Lands Committee to consider and report on the desirability of removing from the walls and columns of the interior of the hall the plaster or stucco with which they have been incrustated and disfigured, and probable cost. Mr. Cooper hoped that it was not Mr. Rome's intention to deal with the interior of the Great Hall in the way he had dealt with the porch. Mr. Devereux Ellis said that the whole question was considered by the City Lands Committee in 1903. In reply Mr. Rome stated that the Guildhall porch excited general admiration among those who were capable of forming an opinion now that the

stucco had been removed. Mr. Seymour Lucas, R.A., had told the City Lands Committee that the Guildhall was one of the finest halls in the country, but that its beauty had been destroyed by plaster and stucco, the removal of which he strongly recommended so that the ashlar work beneath might be seen. The motion was adopted.

Obituary.

MR. HUNTER.—The death, on February 26, is announced of Mr. Adam Hunter. Mr. Hunter was taken into partnership in April, 1904, by Mr. J. M. Porter, under the style of Messrs. J. M. Porter & Hunter, of the Estate Office, Colwyn Bay, architects, surveyors, &c. The firm were architects of the Free Library in Woodland-road, Colwyn Bay, of a house and stabling at Groes Field for Mr. Richard Wood, and of a house in the same neighbourhood for Mr. G. Mould. A few months ago Mr. Hunter passed the Special Examination of the Institute of Architects, and his name was on the list for election as an Associate.

MR. T. BRETTELL.—On the 9th inst. the death was announced of Mr. Thomas Brettell, surveyor and mining engineer, which took place at his residence at Dixon's Green, Dudley, at the age of sixty-nine. The deceased gentleman was for several years surveyor to the old Sedgley Local Board.

General Building News.

WESLEYAN CHURCH EXTENSION, SOUTHAMPTON.—The memorial-stones of the extension of the Wesleyan church and school at Bevois Town have just been laid. The cost of the scheme is estimated at 3,000l. The school has already been improved and the accommodation is being increased, and the whole of the buildings will be modernised. The new buildings have been planned to harmonise with the present structure, and a guild-room, classroom, &c., have been so arranged as to form a connecting-link between the Sunday schoolroom and the church, which were formerly two separate buildings. They will be faced with red brick and Bath stone dressings, with pitch-pine wood block floors, cement dadoes, and plastered walls and ceilings. The porch on the Bevois Valley side will contain a new stone staircase to the gallery, and will be carried up to form a tower, terminating with a spire. The old vestries at the north end of the church have already been demolished, and the organ and rostrum have been removed. It is proposed to build a chancel, with Gothic arches between the choir gallery and the body of the church, the choir gallery is to be placed in the minister's vestry and the choir vestry. The church is to be re-seated throughout with modern seats of pitch-pine. The whole of the buildings are to be heated on the low-pressure hot water system, partly by pipes and partly by radiators, and the ventilation will be improved. The lighting is to be rearranged, and the buildings redecorated throughout. Mr. G. E. Smith, of Portswood, is the architect, and Mr. H. Jones the builder.

PARISH CHURCH, FORRES.—The new parish church at Forres was opened a short time ago. The building was erected from plans by Mr. John Robertson, architect, Inverness, and the following were the contractors:—Mason, Mr. Alex. Cameron, Inverness; carpenters, Messrs. A. & R. Dunbar, Elgin; slater, Mr. Davidson, Elgin; plasterers, Messrs. Angus & Rees, Forres; plumbers, Messrs. Boyne & Martin, Forres; painter and glazier, Mr. James Robertson, Forres; heating, Messrs. McKenzie & Moncur, Edinburgh; pulp, Messrs. Hardman, Powell, & Co., Birmingham; choir, chancel steps, and holy table, Messrs. Galbraith & Winton, Glasgow; baptismal font, Messrs. Stewart McLauchlan & Co., Edinburgh; organ, Mr. R. Lawton, Aberdeen; lectern, Messrs. Jones & Willis, London. The inspector of the works was Mr. J. W. Dorrell.

PRIMITIVE METHODIST CHURCH, ASHBY.—The foundation-stones of the new Primitive Methodist Church, on Burton-road, Ashby, were laid recently. The cost of the building will be about 2,500l. The contractors are Messrs. Orton & Son, Ashby, and the architect is Mr. Harry Smedley, of Ashby.

SECONDARY SCHOOL FOR GIRLS, MACCLESFIELD.

It is proposed to erect a new Secondary School for Girls in Fence-avenue, Macclesfield. From plans prepared by Mr. H. Bewick, county architect, Chester. PROPOSED RESTORATION OF SLK WILLOUGHBY CHURCH.—Mr. Hodgson Fowler, in a report on the condition of this church, states that new roofs are absolutely necessary, and he proposes to lower the aisle walls about 3 ft. 6 in., so as to get roofs of a moderate pitch. The colour was inside the church made of removing, and he proposes to lay a bed of cement concrete over the whole area, replacing the present stone flooring as far as possible in its present condition, and replacing decayed timber in the wooden floor with new oak.

The old oak seats with their richly carved bench ends need careful repair, and so does the chancel screen. These various works, with other repairs of masonry, glazing, and other fittings, are estimated to cost 2,810*l*. Mr. Hodgson Fowler has prepared the plans for the proposed restoration.

CHURCH RESTORATION, LINCOLN.—The church of St. Peter-at-Arches, Lincoln, was re-opened a short time ago after having undergone restoration. The work was carried out under the direction of Mr. Gamble (of Messrs. W. Scorer & H. G. Gamble, Lincoln).

VARIETY THEATRE, CAMBRIDGE.—The new Palace Theatre of Varieties in Botolph Claydon has just been opened. The seating accommodation is for about 1,400. Messrs. Owen & Ward, Birmingham, were the architects for the work.

CLUB PREMISES, BURTON.—The premises which have served the purpose of the General Post Office in High-street have been purchased with the object of forming club premises for the Unionist Party in Burton. The existing front of the premises will remain unaltered. The main portion of the ground floor area will be taken up by a lecture-hall, about 68 ft. by 26 ft. A refreshment bar is provided for this lecture-hall. The main staircase leads from the ground floor entrance-hall to the first floor only, on which are placed the billiard-room, reading or card room, a supper-room, and a bar. The top floor is reached by the steward's stone staircase, and provides a kitchen, scullery, two bedrooms, bath, lavatory, water-closet, pantry, and a private room for the secretary. There is a range of lavatories in connexion with the lecture-hall on the ground floor, and another for the billiard-room, etc., on the first floor. The lighting will be by electric lamps, and the buildings will be heated by hot water on the low-pressure system. Open fireplaces are also provided in the parlour and the billiard-room. Mr. A. Hodges for the general buildings; Mr. T. W. Biddolph, plastering; Messrs. T. Perkins & Sons, plumbing; Mr. H. Lea, painting; Mr. Thomas Jenkins, of Burton, is the architect.

PARISH ROOM, ST. LAWRENCE, IPSWICH.—A parish room has just been erected at St. Lawrence, Ipswich, at the rear of St. Stephen's parish-room, with entrance from St. Stephen's-lane. It is of red brick, and Gothic in style; the length of the main hall is 60 ft., and the width 27 ft. Messrs. Brown & Burgess were the architects, and Mr. Sidney Kenney the builder.

INSTITUTE PREMISES, WAKEFIELD.—Lady Constance Milnes Gaskell recently laid the foundation-stone of the Wakefield Social Institute. The scheme includes the provision of a lecture or concert hall to accommodate 200 persons, a billiard-room with three tables, a room for physical exercises, reading, writing, and smoking rooms, a small tea-room, and a refreshment buffet, as well as the main office. The work is being carried out from plans prepared by Mr. Abraham Hart, architect.

BANK PREMISES, YARMOUTH.—New premises have been erected on the Quay at Yarmouth for the National Provincial Bank of England. The architect was Mr. A. S. Hewitt, of Yarmouth, the general contractors being Messrs. B. J. Duggan, of Lowestoft, Mr. Potter, of Norwich, was responsible for the stone work; the ornamental plastering and decoration was by Mr. W. G. Crotch, of Norwich; the electric light installation by Messrs. Bowers & Barr (Yarmouth); the heating apparatus was supplied by Mr. R. A. Park (Yarmouth); the mosaic and tank floors were laid by Mr. J. E. Lott (London); and the furnishing of the manager's room, etc., was entrusted to Messrs. Palmer Bros., of Yarmouth.

RIVERSIDE DEPOT, SOUTHWARK.—Greenmore Wharf, Bankside, was opened by the Mayor of Southwark on the 10th inst. as a riverside depot of the Southwark Borough Council for the Northern end of the borough. It contains stables with forty-six stalls, two loose boxes, fodder store, a store for loose implements, and a cement store capable of holding about 100 tons of cement, offices, ballast bays, storage for vans, etc. The floor of the cement store is fixed at the height of a cart, so that the cement can be loaded in the cart without the necessity for being taken up to the stable buildings; there is also a basement and office facing Bankside. The cost of the work carried out, including the purchase-money of this portion of the ground, is 34,207*l*. 12*s*. 6*d*. Mr. Arthur Harrison, the Borough Engineer, acted as architect and quantity surveyor, and the builders were Messrs. Higgs & Higgel.

HYDRO HOTEL, RIPON SPA.—The plans of Mr. Sydney D. Kitson, M.A., architect, of Leeds, which were placed first in the recent competition by Mr. Woodhouse, of Manchester, the assessor, have been adopted by the directors of the Spa Hydro. The existing house of Elmersroffs has been taken as the nucleus of the scheme, and it is intended to produce two wings at an obtuse angle with the main point, thus catching all the south sun. The east wing, which will run parallel with the boundary of the Spa Gardens, will consist of one large room on the ground floor, some 70 ft. by 35 ft., the whole of which will ultimately form the dining-room. There will be a new service wing to the north, and another wing will be

thrown out at the back to form a Turkish bath. The roof of the existing building will be raised and modelled and surmounted by a balustrade and lantern.

ARCADE, NEWCASTLE.—An arcade is in course of construction in the triangular plot of buildings lying between Grainger, Market, and Grey streets, Newcastle. The plans for the work were drawn by Messrs. J. Oswald & Son, and the cost of the scheme will be about 40,000*l*.

HOTEL, ABERAVON.—The new Vivian Hotel, at Aberavon, which has just been opened, is situated in Victoria-road, Station-road, and Cross-road. Mr. Morgan Cox, Aberavon, was the builder, and the architect was Mr. Rowlands, of the firm of Messrs. J. P. Jones & Rowlands, Swansea.

THE WANDLE SCHOOL, WANDSWORTH.—The Wandle School, built by the London County Council at Dunt's Hill, Wandsworth, was opened for the admission of children last January. The school consists of two structures, one of three stories arranged for mixed departments, and the other a one-story building for infants. Accommodation is provided for 1,140 children. In the mixed school accommodation has been provided on the ground floor for 376 junior scholars in eight classrooms, and a central hall, 57 ft. 9 in. by 26 ft., together with the necessary cloak-rooms and lavatory accommodation. On the first floor similar accommodation is provided for a like number of senior scholars, while on the second floor are the drawing classroom and the science-room. The teachers have rooms provided for them on the mezzanine floor. The smaller building has accommodation for 388 infants in eight classrooms and a central hall, 54 ft. by 26 ft. 6 in. Cloak-rooms and lavatory accommodation for the children, and rooms for the headmistress and the teachers are also provided. Both buildings are warmed by low-pressure hot-water systems, with heating chambers in the basements; and they are ventilated by means of fresh air inlets in the eaves of the classrooms, and extracts at the ceiling levels. It is proposed to provide in the separate building in the boys' playground a manual training centre for forty students. The buildings are of simple design, with stock brickwork and red brick dressings, the doorways, balustrades, etc., being in Portland stone; they have been erected from the designs and under the superintendence of the Council's architect (Education), Mr. T. J. Bailey. The contractors are Messrs. Holliday & Greenwood, Ltd., whose tender amounted to 23,337*l*. The cost of the site, including legal charges, amounted to 3,800*l*., and the cost of furnishing to 850*l*., making a total cost of 27,987*l*.

Stained Glass & Decoration.

NEW ALTAR AND THRONE, EXETER.—The high altar and retables at the Church of the Sacred Heart, Exeter, have been completely transformed during the past three months. The retables, which was formerly built in a straight line across the sanctuary, has been taken down and reconstructed to fit the apsidal shape of the sanctuary. The old throne, with the canopy over, has been renewed, and the altar is entirely new. The tabernacle has been carried out by Mr. A. B. Wall, sculptor of Cheltenham, under the personal instructions and from the designs of the Very Rev. Canon Scoles and Mr. Raymond, joint architects, of Basingstoke.

Appointments.

AUCKLAND, NEW ZEALAND.—The appointment is announced as City Engineer, Auckland, at a salary of 1,000*l*. per annum, of Mr. W. E. Bish, Borough Engineer and Surveyor of Sudbury, Suffolk. There were a large number of applicants for the post.

ARMSTRONG COLLEGE, NEWCASTLE.—The Council unanimously appointed Dr. W. M. Thornton to the newly-established Professorship of Engineering at their meeting on March 19. Dr. Thornton is a Master of Engineering and Doctor of Science, Liverpool University College, and Doctor of Science, Victoria University, Manchester. When a student at Liverpool, 1892-6, he won the University scholarship for physics, gained the first places in "honours" for engineering and physics, and was a "special scholar" in electricity. He was during two years senior lecturer on engineering at University College, Bristol, and is the inventor of instruments for measuring and indicating the strength of electrical currents in cables, etc.

Sanitary and Engineering News.

SANITARY APPARATUS AND THE PUBLIC HEALTH ACT.—The decision in London and South-Western Railway v. Hills should be noted. The County Council has powers under sect. 39 of the Public

Health (London) Act, 1891, to make by-laws with respect to water-closets, etc., and the proper accessories thereof in connexion with buildings whether constructed before or after the passing of the Act. Under this section the authority had made a by-law (14) that "every person who shall intend to construct any water-closet . . . or to fix or fit in connexion with any water-closet any apparatus or any trap or soil pipe shall before executing any soil works give notice in writing to the clerk of the sanitary authority." The railway company had occasion to renew the pans and traps of certain closets constructed before the Act. The Court held that the by-law applied to the fitting of apparatus to existing closets as well as to those subsequently constructed.

THE REPAIR AND IMPROVEMENT OF DUNBAR HARBOUR.—The Town Council of Dunbar have resolved to employ Mr. W. F. Douglass, C.E., London, to prepare a report upon the best means of restoring that portion of the new harbour which has just fared so badly.

SEWAGE DISPOSAL, TEDDINGTON.—At the meeting of Teddington District Council recently Mr. M. Hainsworth, surveyor, presented a scheme for extensions and alterations at the sewage disposal works, and the scheme, which is estimated to cost 27,161*l*., was agreed to.

REFUSE DESTROYER, LIFFORD.—The refuse destructor which has been built for the King's Norton District Council at Lifford was officially opened on the 13th inst., although it has been in working order since October. The destructor has been built under the direction of Mr. Cross by Messrs. Heenan & Froude, of Manchester and Worcester. The building and machinery cost about 14,000*l*. The destructor is so arranged that the only outlet for the fumes and smoke is the tall chimney. The heat produced by the combustion of the dust and ashes is utilised for making steam, and it is expected that from this source there will be an income of 1,500*l*. or 2,000*l*. The clinker taken from the furnaces after combustion will be used for making roads and paving of the asphalt type.

PROPOSED SEWAGE DISPOSAL WORKS, IKESTON.—On the 13th inst. Colonel A. G. Darnton, R.E., Local Government Board Inspector, held an inquiry at Ikeston respecting a proposal to borrow 27,000*l*. for the purposes of sewage disposal. The Town Clerk said the question of adopting a new scheme of sewage disposal was one of urgency, as complaints had been made by the Derby and Notis County Councils as to the polluted condition of the Etwash, and an order of Court had been served to discharge a purified effluent into the river. Ikeston was expected to have the new works completed by 1910. Mr. Raikes (of Messrs. Wilcox & Raikes, engineers, of Birmingham) submitted particulars of the plans and methods proposed to be adopted.

IMPROVEMENTS, WARKWORTH HARBOUR.—The Warkworth Harbour Commissioners have had under consideration for some time a scheme of improvements for the harbour, and the result of their deliberations is that a scheme is about to be carried out, which has been drawn up by Mr. Sanson, the Harbour engineer. It is first of all intended to extend the south jetty to the south pier head, and to extend the south pier out a distance of 240 ft. seaward, parallel to the north pier, by which means it will be possible to obtain two extra feet of water on the bar, and thus facilitate the egress and ingress of vessels at the harbour. In addition to this a system of groins is to be established at the north sands in order to combat the inroad the sea has been making during the past year.

Foreign.

FRANCE.—A subscription is to be opened to raise a monument to Gambetta on the Place Gambetta, Paris. A committee has been formed to raise a monument at Nogent-sur-Seine to the memory of the sculptor Paul Dubois. It is to be carried out by his pupil M. Alfred Boucher. A committee has been formed with the object of ensuring the preservation of the sites and buildings of the pretty village of Gargilesse, and to oppose any alteration of its ancient picturesque quality.—The Municipality of Boulogne-sur-Seine are about to undertake the building of a Salle des Fêtes and a Cirque at Boulogne-sur-Mer.—The Municipality of Agen have opened a competition for rebuilding the theatre of that town.—The "Société pour le protection du Paysages de France" has communicated to the Municipality of Amnevy a resolution to the effect that, in case of the building of a Casino there, no portion of the lake nor of the alley of trees called the Albiqy should be interfered with. The Society has also passed a resolution to the effect that the route for the railway line from Paris to Chartres should be so laid out as to avoid injuring the district of Vaux de Cernay.—The works for the improvement of the port of Calais are shortly to be commenced, the total cost is estimated at nearly 4,000,000 francs.—For the first time this year, the New Salon is to have a section of music with a special

jury to decide on the awards. Eighty-six compositions have been accepted for performance between April 15 and June 30. The performances to take place twice a week, will be directed by M. Paul Viardot. —The General Council of the department of Lot-et-Garonne has voted for the rebuilding of the Hôtel de Préfecture at Agen, recently destroyed by fire, at an estimated cost of 870,000 francs. —Important works, at a cost of 2,100,000 francs, are to be undertaken for the improvement of the port of Bayonne, and for the cutting of two channels in the rocky bank of the Casquets. —A competition has been instituted, open to all French architects, for the erection of a new Hôtel de Ville at Fismes. —The Municipal Theatre of Saint-Germain-en-Laye is to be rebuilt on its present site, 300,000 francs are to be spent on the building, the design for which will be the subject of a public competition. —A competition has been opened for the erection of an Art-School at Nancy. —The Naval Museum Collection, hitherto at the Louvre, is to be transferred to the Invalides, where it will become an annex to the Military Museum. —A competition has been opened for the construction of a ferro-concrete bridge, 51 metres in span, over the torrent of the Vimpon, at Volonne, in the Lower Alps. —M. Goulier, Departmental Architect, has drawn out a scheme for the rebuilding of the Palais de Justice at Belfort. —M. Fornigé has prepared a scheme, to be submitted to the Commission des Monuments Historiques, for carrying out a restoration of the Roman theatre at Orange in such a manner as not to injure its archaeological value. He proposes only to build up rifts in the walls, to restore the gradins (the rows of seats), and the staircases which give access to them, and to re-cape the passages. He considers that this will fit it for the revival of classic drama, without any further restoration in detail. —A committee has been formed for the erection in Paris of a monument to Fragonard, of which M. Auguste-Millard will be the sculptor. —The jury in the competition opened for the construction of a group of school buildings at Franceville (Savoie-Oise), has awarded the first premium to M. Bassompierre-Seurin. —The death is announced, at the age of eighty, of M. Louis Leullier, formerly architect to the city of Amiens. Among other important works he completed the Hôtel de Ville of Amiens, and carried out a scheme for the water supply of the place. He was a member of the Société Centrale des Architectes. —The death is announced of M. Borrel, "architecte-correspondant" of the Department of Public Instruction, who took a considerable part in the architectural improvements of the towns of Brides, Salins, and Montiers, at which latter place he died. —The death is also announced at the age of 74, of M. Léon Painlevé, an architect who is credited with various discoveries in connexion with industrial chemistry; and also, at the age of 65, that of M. Edmond G. Andrieu, "architecte-expert" in legal matters.

SOUTH AFRICA.—At a recent meeting of the East London Municipal Council it was resolved that the Town Engineer, in conjunction with other officials, be instructed to prepare a plan of the site on the market square selected for the proposed market buildings, and all other particulars and conditions necessary for the purpose of enabling competitive plans to be called for the erection of the buildings in question, at a cost of about 20,000. —During the period December 16 1905, to January 13, 1906, forty-one building plans were under consideration by the Cape Town municipal authorities; of these twenty-three were approved, ten returned to the architects, and the remainder are under consideration. The approximate cost of the proposed work is 12,390. —The Building Committee of the St. George's Cathedral, Cape Town, have invited tenders for the erection of the superstructure of the eastern portion of the cathedral. —Mr. John Lyon has been awarded the premium for his design for new offices, to be erected in St. George's-street, Cape Town. —At Woodstock, near Cape Town, unusually rapid progress is being made with the storm water drainage scheme, which is being executed at an estimated cost of 70,000. —Speaking at the inauguration of a new congregational church at Booyens, Johannesburg, Lord Selborne said he regretted that the architects of South Africa so faithfully copied European models. He thought a country ought to have its distinctive architecture in the new world as well as in the old. He wished South Africa might have an architecture all its own. —The Grand Theatre, Bloemfontein, was recently inaugurated. It has been built from the designs of Mr. E. C. Choinier, architect, of Johannesburg. The contract for building was publicly tendered for, and tenders ranging from 30,000 to 42,000 were received. Messrs. Corlett & Jeddus, of Johannesburg, being the successful tenderers. The galleries are constructed on the cantilever principle. The theatre was built in fourteen months. —The foundation-stone of a new Government school in Johannesburg was recently laid by the Countess of Selborne. When completed it will provide accommodation for 312 scholars. The foundation

is of stone with brick plastered walls above. The school is built on a design prepared by the Public Works Department, and the work is being supervised by Mr. Gordon Russell, the local inspector of works. —Market buildings and town offices are to be erected at Klerksdorp, at a cost of 3,400.

Miscellaneous.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. R. E. W. Berrington & Son, civil engineers, Wolverhampton, have taken into partnership Mr. A. G. Martin, and the practice will be carried on in future under the style of "Berrington, Son, & Martin." —Mr. George Bell, contractor, Tottenham, has converted his business into a company, and it will be carried on in future by and in the name of "George Bell & Sons, Ltd." Mr. Bell will continue to control the business, and his sons will be associated with him in its management. —Mr. Louis P. Casella (now Casella & Co.), scientific instrument makers and mechanical engineers, have removed from 147, Holborn Bars to 11-15, Rochester-row, Victoria-street, S.W. —The British Promethons Company, Ltd., electrical heating specialists, Kingston-on-Thames, are removing their works and head offices to Birmingham, and on and after the 21st communications must be addressed to them at Salop-street Works, Highgate, Birmingham. Their Birmingham telephone number will be 4236 Central, and their telegraphic address "Cooking, Birmingham." The firm will retain their London showrooms at 27, Ely-place.

STATUE OF THE QUEEN.—Mr. George Wade is commissioned to execute a statue of the Queen, which the governors and staff of the London Hospital desire to erect in the central garden, in celebration of the recent extension of the buildings and of Her Majesty's acceptance of office as President of the Hospital. The garden will be laid out and tended by the East London Horticultural Society.

BATHER MEMORIAL, MEOLE BRACE.—A memorial to the late Rev. Henry Francis Bather is to be erected at Meole Brace. It will take the form of a cross, fashioned upon the lines of some of the old existing preaching crosses. The whole will be of red magnesian limestone. Above, will rise an octagonal monolith shaft, moulded at its base, and surmounted by a carved capital of conventional foliage of XVth century type. Surmounting all will stand a cross, having foliated ends of red granite. Above, will be of the die stone, which will be of granite. The work is being carried out under the direction of Mr. H. H. Treasury, of Shrewsbury, Diocesan Surveyor of Litchfield, by Messrs. Harry Hens & Sons, of Exeter.

DANISH MONUMENTS IN YORKSHIRE.—Dr. G. A. Auden lectured on the 12th inst. before the Yorkshire Philosophical Society at the Museum Theatre, York, on "The Remains of Danish Sculpture in Yorkshire and Derbyshire." He said this was a much-neglected branch of art of considerable historical value. York and Durham possessed the best collections of pre-Norman crosses, dating chiefly from the VIIIth and Xth centuries. In York there was a strong Danish element, the city having been the centre of the kingdom of Northumbria. Eric, the last Danish King of York, being Eric Bloody Axe of Scandinavia. Incidentally, the lecturer remarked that the Yorkshire Danish monuments were largely aggregated in a radius of twenty miles around Leeds, Ilkley, Collingham, Thornhill, and Dewsbury. A notable example of the Danish cross was that found at Leeds Parish Church, representing the legend of Weland and the Swan Maidens. He observed that the term Runic cross was as a rule a misnomer, because a cross was not Runic unless it bore a Runic inscription. Dividing pre-Norman crosses into two classes, Anglian and Viking, the lecturer said the characteristic of the former (date 700-900) was that they were strongly influenced by the Lindisfarne school, by truly Celtic art, with vine scrolls as a predominant decorative motive. The Viking (900-1050) monuments were distinguished by zoomorphic designs. The interlaced work was less regular, and displayed a want of finish, the key pattern and spiral of purely Celtic work being absent. The lecture was illustrated by several views of Danish sculpture, some notable examples being found in York and Derbyshire.

LONDON BOROUGH COUNCILS AND WAGES.—At a conference of representatives of the London Borough Councils who met at Lambeth Town Hall last week, a resolution was passed by a large majority in favour of a minimum wage of 30s. a week for all employees of the borough councils. On the question of a forty-eight hours' week being put to the vote, it was lost.

MEMORIAL TO J. M. WHISTLER.—Nearly half of the estimated cost, 2,000l., is subscribed for the international memorial which it is proposed to erect in Cheyne-walk, Chelsea. M. Auguste Rodin is engaged upon the work, and a contribution

of 500l. will be made by the International Society of Sculptors, Painters, and Gravers. **ARTISANS', LABOURERS', AND GENERAL DWELLINGS COMPANY, LTD.**—The Board have decided to discontinue for a while building operations on the Leigham-court estate of 66 acres at Streatham-hill, as they consider that the whole of South London is greatly over-built, and a large number of houses are unoccupied. The company possess 3,000,000l., invested, for the greater part, in freehold property, having a resident population of more than 40,000 persons. During the past year the shareholders provided an additional sum of 100,000l., which has been devoted chiefly to the completion of building works at Noel Park.

OPEN SPACES.—The threatened disfigurement of Hindehead by telegraph posts is averted. The Postmaster-General, in response to an appeal made by the National Trust, has agreed to carry the proposed new trunk telephone line to Portsmouth along the railway between Witley and Haslehurst and so avoid Hindehead. In co-operation with the amended scheme the London & South-Western Railway Company have consented to their rights of maintenance. The Hindehead property, which belonged to the late Mr. Whitaker Wright's estate and includes the Devil's Punch Bowl, Witley, and Gibbet Hill, has been purchased by a local committee with the object of preserving it as a public open space; the common land extends over some 750 acres. —The Crown have bought 100 acres at Long Meadow, on the bank of the river Liffey, as an addition to Phoenix Park, Dublin. —Gifts have been recently made of 10 acres of Valentine's Park, Hford, by Mr. Holcombe to the Hford Urban District Council; of his shares in the Leach Woods Land and Company by the late Mr. A. C. Pass, of Clifton Down, to the Merchant Venturers, of Bristol, with the expressed desire that they should use the influence thereby acquired to preserve the lands adjoining the river Avon (held by the Company) in their present condition and maintain the plantations thereon; of about 1½ acres, at Hford, for a playground, by Mr. W. Cadbury to Stretchley Urban District Council; of a parcel of land by the late Mr. W. W. Warner, of Stanley House, St. Ives, to the St. Ives, Hunts, District Council; and by the Lightwoods Estate and Varley Woods Committee of 26 acres as a public park and playing fields to the Birmingham City Council, together with an offer of nearly 14,700l., already subscribed towards the acquisition of 94 acres in addition, in respect whereof the total purchase-money amounts to about 1,000l. —Sir George Meyrick has accorded his consent to the construction by the Bournemouth Corporation of a drive along the under-elf from the pier to Meyrick-road. —It is announced that Mr. Andrew Carnegie proposes to present to the University Court of St. Andrews University securities yielding 500l. per annum, for the upkeep of the recreation park, with the gymnasium and hall, which at an outlay of 15,000l. he recently gave to St. Andrews University. —The vendors of the finely-timbered estate, Whitton Park, near Hounslow, have agreed to suggestions made by the Metropolitan Public Gardens Association to reduce the price at which they will sell the property to 45 acres, conditionally upon its being converted into a public park, and the Twickenham Urban District Council have offered 3,500l. towards the required sum of 15,000l. —The Association have taken steps to save, if possible, the estate known as Boleyn Castle, Upton Park, which comprises a fine old garden.

—A faculty has been granted to the Poplar Borough Council for the laying out of All Saints' churchyard as a recreation ground; and the Southwark Borough Council have agreed to rent for 80l. per annum to the London County Council a space of 6,000 sq. ft. in King James-street as a children's playground. —The Royal Horticultural Society are now entrusted with the charge of examining candidates for appointment as head-gardeners in the London County Council parks and grounds.

BUILDERS' EXCHANGE, BIRMINGHAM.—An address on "Canadian Cities" was delivered on the 15th inst. to the members of the Birmingham Builders' Exchange by Mr. Peter Ball, the resident agent in Birmingham for the Commercial Agency of the Government of Canada. The members assembled in the Exchange Hall under the presidency of Lieutenant-Colonel Barnsley. Mr. Peter Ball, in the course of his address, traced the history of Canada from the time of the capture of Quebec from the French by General Wolfe in 1759, and subsequently he spoke of the Canadian cities and municipalities, and specially referring to Toronto, the second city in the country, as typical of the whole. He gave the area of the city, the population, the number of streets, and described the tramway system. The city owned the streets and the authorities conceded the tramway rights to a company for twenty-one years, when they could be purchased by the municipality. The company paid the city 160l. per annum per mile for the right to run the trams, and in addition a percentage of the gross receipts. Up to 200,000l. the company paid 1 per cent., for 200,000 to 300,000l. 10 per cent., for 300,000 to 400,000l. 12 per cent., for 400,000 to 600,000l. 15 per cent., and from 600,000l. upwards 20 per cent.

In 1895, when that arrangement was entered into, the city drew in percentage and mileage upwards of 27,000l., and in 1904 more than 64,000l.; while in the nine years the amount received was 360,000. The cost of living, the cost of schools, and other things was much less than in this country, the rents of houses were pretty much the same, the water rates were lower, and the gas charges were a little higher; but the light and heating qualities were very much better. At the close Mr. Ball was warmly thanked for his address on the motion of Lieutenant-General Phelps, seconded by Mr. Wm. Sapcote.

THE DISFIGUREMENT OF SCENERY.—In the House of Commons on the 14th inst. Mr. Kennedy asked the First Lord of the Treasury whether he would consider the advisability of giving the Board of Trade or local public bodies the control of trade advertising and issuing licences for the same; and, in view of the fact that many beauty spots are disfigured at present, and that the revenue was lost to the State, would he introduce legislation on the above lines. Sir H. Campbell-Bannerman: The questions raised by the hon. gentleman require a little more attention than I have been in a position to give them. I sympathise with his desire to prevent the disfigurement of beautiful scenery, but whether this can be accomplished by the methods suggested by the hon. gentleman I am not so sure.

CHURCH BUILDING SOCIETY.—The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels held its usual monthly meeting on the 15th inst. at the Society's house, 7, Dean's-yard, Westminster Abbey, S.W. The Rev. Canon N. F. Norman in the chair. The following objects were made in aid of the following objects, viz:—Building new churches at Barry, All Saints, Glam., 175l.; Summertown, near Oxford, 200l. for the first portion, and Well Hall, S. Luke, Eltham, Kent, 200l. For the first portion; towards rebuilding the church of All Saints, Woking, Northumberland, 25l.; and also enlarging or otherwise improving the accommodation in the churches at Bourton, S. James, Berks., 200l.; Lower Guiting, S. Michael, near Cheltenham, 100l., making in all 500l.; Southchurch, Holy Trinity, near Southend-on-Sea, 800l.; and Stonebridge, S. Michael and All Angels, Middlesex, 700l. In lieu of a former grant of 500l. A grant was also made from the special Mission Buildings Fund towards building the Mission Church of S. Mary, South Bernoldsey, Surrey, 500l. The following grants were also paid for works completed:—Polabrooke, All Saints, near Oundle, 300l.; Great Ellingham, S. James, Norfolk, 250l.; St. Mary's, Christ Church, 400l.; Hucknall, Hucknall, All Saints, near Mansfield, 400l.; Stanton Harcourt, S. Michael, near Oxford, 650l.; Ben Rhydding, S. John, near Ilkley, 2000l. on account of a grant of 2250l.; Beeston Hill, The Holy Spirit, Leeds, 2300l.; Tudhoe Grange, The Venerable Bede, Co. Durham, 3000l.; and Swanton, 2500l. In addition to this the sum of 2967l. was paid towards the repairs of seventeen churches from Trust Funds held by the Society. The Society likewise accepted the trust of a sum of money as a Repair Fund for the Church of S. Clement, City-road, E. The Annual General Court of the Society will be held at the Church House, Dean's-yard, Westminster, on Thursday, May 17, at 3 p.m., when the chair will be taken by His Grace, The Lord Archbishop of Canterbury, President of the Society.

LABOUR RETURNS.—The Labour Returns, though still showing an improvement in most trades, prove that the building trade is still affected by the depression from which it has so long suffered. The Memorandum of the Labour Department of the Board of Trade for February states that only a "seasonal" improvement had taken place and the rate of employment remained the same as in February last year. With this continued depression it is hardly surprising to learn from an article in the Board of Trade Labour Gazette, that the Distress Committees under the Unemployed Workmen Act report that the classes of workpeople most generally affected by distress are those connected with the building trades and general labourers. It is sad to see the high proportion of skilled artisans who are affected by the distress.

DISFIGUREMENT OF A STREET.—In the Parliamentary Papers last week Mr. Wiles, M.P., asks the Postmaster-General if he is aware that telephone poles are now being placed in St. Peter's-street, St. Albans, thereby disfiguring one of the most beautiful streets in the Home Counties, and, if not, will he institute an inquiry as to and amend the regulations for these poles.—Mr. Sydney Buxton, in reply, states that he is giving attention to the matter, and if a practical alternative route can be devised, he will be very glad that the trunk line should avoid St. Peter's-street. So far, however, the Corporation have been unable to obtain the necessary wayleaves for an alternative route.

ELECTRIC LIGHTING AND IMPROVEMENT SCHEME, STRATFORD.—On the 13th inst. Mr. H. Hooper, M.A., M.Inst.C.E., Local Government Board Inspector, held an inquiry into applications by the Town Council for sanction to borrow 18,7500l. for purposes of electric lighting and

9,258l. for works of private street improvements. The Borough Electrical Engineer (Mr. Ullman) gave figures as to the electricity scheme, which, he said, had been in existence since 1901. Mr. Campbell, the Borough Surveyor, gave evidence as to the proposed private street improvements. They included the making up of the following private streets: Tulleyne-avenue, Basil-avenue, St. Margaret's-avenue, Southchurch-road, Lady-smith-avenue, Landseer-avenue, Church-road, and Gooseley-lane.

MEMORIAL TO THE LATE DR. R. MILNE MURRAY.—A monument has just been erected in the Dean Cemetery over the grave of the late Dr. Robert Milne Murray. It is in the form of a Greek stele in grey granite, which rests on a rough-hewn base. The inscription is in raised bronze letters on the face of the shaft. The rough-hewn base bears an alto relievo portrait bust of Dr. Murray. The monument is from the studio of Mr. H. S. Ganley, sculptor.

STREET IMPROVEMENTS, DEVONPORT.—Mr. M. K. North, M.Inst.C.E., Local Government Board Inspector, held an inquiry at Devonport on the 13th inst. into the application of the Devonport Borough Council for sanction to borrow 2,251l. for works of private street improvements, and 5,051l. for the laying out of certain parks or recreation grounds. Mr. J. F. Burns, Borough Surveyor, explained that the amount of 2,251l. for works of private street improvements included the following streets and lanes:—Lane between South-street and Victoria-avenue, estimated cost, 1927 6s. 1d.; lane between Whittington and Amherst streets, 503l. 6s. 1d.; lane between Alma-road and Amherst-street, 790l. 16s. 10d.; St. Aubyn-avenue (section 1), 385l. 15s. 11d.; Coldrenick-street, 379l. 3s. With reference to the proposed recreation grounds the Town Clerk stated that the loan applied for was made up of 3,820l. for Keyham Barton recreation ground, 569l. for North Down, and 5000l. for Rocky-hill. The Surveyor explained that the area of the Keyham Barton Park was about 3½ acres. It was proposed to enclose the site and also to construct a promenade path 25 ft. wide on the top of the site, and to form narrower paths leading to the various entrances. The North Down site at Ford was set apart as a recreation ground for children, and was about 4½ acres in extent, and the area of the Rocky-hill site was just over one acre.

ROMAN VILLA, WEST MEON.—Mr. A. Moray Williams, of Bedales School, near Petersfield, has given the following particulars of the newly-discovered Roman villa at West Meon. The villa stands in Little Lippen-wood on the slope of a hill, about half a mile from West Meon Church. The chief features that have been determined at present are a block of six rooms, what is thought to have been a gateway on the east side, a double hypocaust in the south-west corner, and a buttress backing the wall to the block of rooms. One of the rooms, measuring 10 ft. by 33 ft., was paved plainly with red brick tesserae, and was perhaps too broad to form a passage. As a sleeper wall underlies the tesserae at 10 ft. from its west end, it may have been divided by a folding door or other partition. The base of a moulded column in its original position, with a coat of red paint still adhering to it, is completely visible, and traces of a similar column opposite indicate a doorway leading to Room 2. This room, which measured 21 ft. by 10 ft., was also paved with red tesserae, but with a border of white ones, and there were also sleeper walls indicating partitions or folding doors. Room No. 3 measured 21 ft. by 11 ft., and was paved with mosaic of a somewhat elaborate geometrical pattern of red, black, white, and blue. In the centre there was an octagon panel, which may have contained a figure, but it has been wholly destroyed. To the right of Room 2 was a room measuring 11 ft. by 19 ft., also covered with a mosaic pavement. This pavement is well preserved, and is very beautiful, if only from the fact of its simplicity. It is only geometrical in red, white, and black. The pavement has sunk considerably, and perhaps lies over a hypocaust. The other two rooms have not been yet fully excavated. At the south-west corner the hypocaust presented most unusual features. It was 21 ft. in length, and consisted of two chambers, each fitted with an apsidal termination. It cannot yet be said with certainty to which type this house belonged. It may turn out to be a small courtyard house, but it is quite possible that a corridor may be found. Near the spot was found an abundance of iron slag, which indicates the former existence of a smithy. Further excavations will be undertaken this summer on the spot, and the two mosaic pavements already found will probably be permanently preserved.

SHEFFIELD WORKMEN'S DWELLINGS.—Colonel Durnford recently held a Local Government Board inquiry into an application by the Sheffield Corporation for the approval of a scheme of providing new dwellings for persons of the labouring class. Mr. W. E. Hart, who appeared for the Corporation, explained that by a Provisional Order (1902) they were authorised to purchase or acquire a number of houses occupied by persons

of the labouring class in or near West-street, Shalesmoor, and Moorfields, and required in connexion with the proposed widening of those thoroughfares. This application was to provide as many new dwellings as should be deemed desirable in accordance with Local Government Board requirements, in view of the number acquired. The Council had felt for some time that there was no need for the provision of additional housing accommodation for the working classes in the central parts of the city beyond what was already provided, and inasmuch as there was power to accept a scheme for providing housing accommodation for a smaller number of persons than those actually displaced, the Council asked the Local Government Board to accept a scheme which provided re-housing accommodation for thirty-nine persons in lieu of the 170 persons who would be displaced. On a part of the Crofts area the Corporation had erected, with the approval of the Local Government Board, a block of tenements consisting of single-room tenements. They had to provide certain additional buildings with accommodation to the number of persons whom they were under an obligation to provide for, and it was estimated that these additional buildings would give accommodation to 175, or thirty-nine more than were required. It was this excess number of thirty-nine which the Corporation asked the Board to accept as an adequate re-housing accommodation for the persons dispossessed under the 1902 Order. In proof of the statement that there was no need at the present time for the provision of further housing accommodation for persons of the working class in the central parts of the city, Mr. Hart offered the following information:—Number of uninhabited houses, 92,225; number of uninhabited houses of the rental of 100 and under, 1,595; of the rental 100 5s. and under, 1,269; of the rental of 200 and over, 649; total uninhabited houses, 3,513. Evidence was given by Mr. C. F. Wike (City Surveyor).

EDINBURGH BURGH ENGINEER'S REPORT.—The report of Mr. James Massie, Burgh Engineer and Master of Works to the Corporation of Edinburgh, for the year ending December 31, 1905, has been issued. Mr. Massie deals in detail with the work undertaken during the year in connexion with sewers and drains and building operations. The total expenditure on "unemployed" on the works carried on amounted to 2,792l. for labour and material. The works on which they were engaged were principally drainage. It is mentioned that the lowering of the rate of pay from 2s. 6d. to 2s. a day did not appreciably affect the numbers who availed themselves of the work offered by the Corporation. The only work in connexion with the housing of the working classes that was in progress during the year was the reconstruction of the old properties at Greenside. That had proceeded more slowly than was anticipated on account of carrying out the work in small sections so as to cause as little hardship and inconvenience as possible to the tenants. Up to the date of the report, six blocks had been reconstructed; two were in the course of alteration and were approaching completion, while schedules for the reconstruction of other two blocks were being prepared.

Capital and Labour.

STATE OF THE BUILDING TRADES.—Employment in the building trades remained dull in February, but there was a slight improvement on the whole as compared with a month ago. It showed little change compared with a year ago. Returns received through the trade correspondent from 61 London employers showed that in the last week of February they paid wages to 10,445 workpeople of all classes, compared with 10,339 in January, and 12,086 in February, 1905. Employment generally in London was much the same as in the previous month, but worse than a year ago. Returns were received from Employers' Associations in 71 districts outside London, and in nearly all of these employment was reported as dull generally. Compared with a month ago, no change was reported in 55 towns, while in 8, including Birkenhead, Lancaster, Blackpool and Dublin, employment was better, and in 8, including Stockport, Gloucester, Rugby, Newport, and Aberdeen, it was worse. Compared with a year ago, employment was reported about the same in 42 towns, worse in 22 and better in 7.—Labour Gazette.

Legal.

MUNICIPAL BEQUEST FOR THE ERECTION OF MODEL DWELLINGS.

The case of *in re Sutton* deceased—Sutton v. the Attorney-General, came before Mr. Justice Warrington in the Chancery Division last week for further consideration,

The facts of the case were shortly these:—The late Mr. Wm. Richard Sutton, who died in May, 1900, by his will gave his residuary estate, valued at about 1,745,000, to the plaintiffs as his trustees upon trust to purchase or acquire from time to time freehold or copyhold land in London or other populous centres in England as sites for the erection of model dwellings and houses, and to build upon the sites model dwellings and houses to be called the Sutton Model Dwellings, for use and occupation by the poor, and to let the dwellings and houses to the poor at such rents (being below the full rents obtainable) as his trustees in their discretion should determine, the rents to be held for the purposes of the trust. The testator expressed a wish that some rent, however small, should in each case be reserved and paid and that no person should be allowed to live in the dwellings rent free. The present action was commenced in March, 1901, by the trustees, asking for administration of the trusts of the will, and an order was made directing the usual accounts and inquiries. The Master's Certificate found that there was standing in Court to the credit of the action about 750,000, there being about 1,000,000 still outstanding. The trustees wishing to commence the active administration of the charity by acquiring sites and proceeding with the erection of model dwellings as soon as possible, minutes of an order were settled on their behalf asking that a scheme for the regulation and management of the charity should be settled by the judge. The Treasury Solicitor, however, suggested that the matter should be referred to Chambers and the reference be stayed for two years, so that time should be given to consult the Local Government Board and other persons whose opinion might be valuable as to the mode in which such a charity could be administered. The trustees contended that a delay of two years would be unreasonable, and asked that the reference to settle a scheme should be immediately made. They also asked for power to apply 250,000 out of the sum in Court for the acquisition of sites and the erection of dwellings in one or two centres immediately.

At the conclusion of the arguments of counsel, his lordship declined to stay proceedings and referred the matter to Chambers for the scheme to be settled in the usual way. He also gave the trustees liberty to apply for leave to make a start before the general scheme was finally settled. Sir Robert Finlay, K.C., and Mr. Ashton Cross appeared for the plaintiffs; and the Attorney-General and Mr. R. J. Parker for the defendant.

ACTION BY BUILDER ON ARCHITECT'S CERTIFICATE.

The case of Capel v. Axton came before the Court of Appeal, consisting of Lords Justices Vaughan Williams, Stirling, and Fletcher Moulton on the 19th inst., on the plaintiff's appeal from an order made by Mr. Justice Sutton in Chambers.

Mr. Turrell, in opening the case, said the plaintiff appealed from an order of the learned judge confirming the order of the learned official referee. The point in the case was whether the learned official referee and the learned judge were right in striking out from the statement of claim that part of the claim which asked for a declaration. The action was brought by a builder under a building contract for moneys which had been certified by the architect, and the position taken up by the defendant was that he was not bound by the certificate which had been given by the architect. The learned counsel said that in drawing the statement of claim he found a clause in the contract that 5 per cent. of the amount certified for should be retained in order to see if there were any defects in the work appearing within three months. It was the ordinary retention clause.

Lord Justice Moulton said he understood the learned counsel wanted to add a declaration that the retention moneys had become due.

Mr. Turrell: Yes.

Lord Justice Moulton: How does the declaration help you—by putting to your credit the sum found due to you?

Mr. Turrell replied that the retention moneys were not due at the date of the commencement of the action.

Lord Justice Moulton: The other side do not refuse to allow the official referee to give you credit for what is due in fact?

Mr. Turrell: Oh, yes, they take up any defence they are entitled to take up! The only way I can get these moneys is by asking for a declaration that the moneys have become due.

Lord Justice Vaughan Williams: It is the only way you can get the moneys under this writ. If you wait until the time of retention comes to an end you can issue a fresh writ. The only point here is that you have found, now you have looked into it, that, having regard to the retention clause, you issued your writ rather too soon. You do not want to drop your writ, but you wish to keep it by asking for a declaration that these moneys you are entitled to, after they have served the purpose of being a security for the fund.

Mr. Russell Spokes, in answer to Lord Justice Moulton, said the retention money was kept for

three months in order to see whether any defects in the work appeared within that time. It was in the circumstances impossible to say that at the date of the writ the plaintiff had a right to the declaration. He submitted that the plaintiff had no right to put the defendant to the expense of the appeals.

Lord Justice Vaughan Williams asked Mr. Spokes if he disputed the validity of the certificate.

Mr. Spokes replied that he did because there was nothing in the contract which made the certificate final. He did not object to the official referee bringing the retention money into the account.

Lord Justice Vaughan Williams, in giving judgment, said he thought they ought to allow the plaintiff to amend. Mr. Spokes being willing that the sum in question should be brought into account, even though it was not due at the time the writ was issued, the costs of the appeal would be left to the official referee to deal with.

The other lord justices concurred.

BURSTING OF A WATER MAIN IN PICCADILLY-CIRCUS.

THE hearing of the case of the London Hydraulic Power Company v. the St. James's and Pall Mall Electric Light Company concluded before Mr. Justice Farwell in the Chancery Division on the 19th inst.

The question in the case was as to who was responsible for the mischief caused in the West-end by the bursting of a water main in Piccadilly-circus on July 10 last. Plaintiffs are the owners of the main, and defendants were alleged to have caused the accident by constructing an inspection-chamber or manhole, so that it rested on the pipe and transmitted to it the vibration caused by traffic above.

Sir Edward Clarke, K.C., in opening the case said that although the amount actually claimed by plaintiffs was under 200*l.*, a declaration was asked for which would affect other liabilities of a very considerable sum. The plaintiffs had about 150 miles of hydraulic mains in London, and supplied about 6,000 customers with power for lifts and other purposes. In 1888 they had a main through Piccadilly-circus, and in 1889 defendants, without informing plaintiffs, constructed a manhole, or inspection-chamber, over the main in such a way that two of the walls, 2 ft. 6 in. in diameter, rested on the pipe. It was a strong 6-in. pipe, the metal being 1½ in. thick. The pressure at which the water entered the main was 75 lbs. per sq. in., whereas it had been tested to bear a strain of 2,250 lb. The accident happened at about 8.15 p.m. on July 10, and it was not until midnight that the escape could be located, by which time the wood paving almost as far as Pall Mall had been ripped up, and another serious mischief done. Plaintiffs would prove that the breakage of the pipe was not caused by pressure of water. Defendants counterclaimed in respect of damage done to them in the matter on the ground that there was something faulty in the construction of the pipe. Defendants also alleged that a great deal of damage was due to delay in remedying the mischief after it was discovered. They would prove that everything possible was done at the earliest moment. The damages claimed, apart from the declaration, were in respect of relaying the main, and the cost of 300,000 gallons of water that escaped.

A number of witnesses gave evidence to the effect that there was no defect in the pipe, that the bursting was not caused by excessive water pressure, and that immediately the pipe burst prompt measures were taken to stop the outflow of water and prevent further damage. Various witnesses gave it as their opinion that the two walls of the inspection-chamber, which rested on the defendant's main, transmitted the vibration of the traffic overhead and led to the fracture of the pipe.

For the defendants expert evidence was given with a view to proving that there had been a subsidence in the neighbourhood which was quite sufficient to have caused the breakage of the plaintiffs' main. Several of the defendant's witnesses also stated that, having regard to the point at which the break occurred, it could not have been occasioned by vibration arising from the passing of traffic over the inspection-box.

In the result his lordship held that the plaintiffs had failed to prove that the bursting of the main was due to any act of the defendants, and dismissed the action with costs. On the defendant's counterclaim he entered judgment for them for 35*l.* odd with costs.

Order accordingly.

THE COMPOSITION OF MORTAR.

At the Greenwich Police Court, before Mr. Baggallay, on Wednesday last week, Messrs. H. & G. Taylor, builders, of 51, Boyne-road, Lewisham, appeared to summonses, issued at the instance of the London County Council, alleging an infringement of the by-laws under the Building Act in regard to the composition of mortar used by them in the construction of

certain houses in Boyne-road and Belmont-road, Lewisham. Mr. Baggallay appeared for the Council, and the defendants were represented by Mr. Macmorran, K.C., with whom was Mr. Curvingham Glen. The point in which it was alleged that the mortar did not come up to the by-laws was that it did not contain lime in the proportion of one part to three of clean sand or grit, and evidence was given by Mr. J. H. Coste, an assistant in the chemists' department of the London County Council, who had analysed a sample, to the effect that the proportion was much lower than this. He and other witnesses, who described the mortar as of poor quality, were cross-examined by Mr. Macmorran, with the view of eliciting that if the mortar had been made with the sand on the site, and measured with slaked lime, the proportion of slaked lime would have been one to three. Mr. Macmorran contended that there was nothing in the by-law to show that the proportion of dry lime to sand should be one part to three, and that it was the custom to measure the proportion of slaked lime. He contended further that the by-law was bad in point of law, on the ground of uncertainty, as it did not say whether the proportions must be of volume or weight, nor whether the lime, for the purpose of measurement, should be slaked or unslaked, while there was a difference of opinion upon the point. He quoted the Lord Chief Justice as deciding that the by-laws of a local authority must be free from ambiguity.

Mr. E. A. Gruning, F.R.I.B.A., a member of the Tribunal of Appeal, said he had inspected the houses, and found the mortar suitable. Some of the mortar was mixed in his presence, in the proportions of fourteen spadefuls of sand, thirteen of clinker, and nine of slaked lime. Mr. Max Clarke, F.R.I.B.A., said it was a common practice to take slaked lime in measuring the proportions for mortar, and Mr. F. W. Pott, general foreman in the employ of Messrs. Nightingale, and Mr. J. W. Reed, manager to Messrs. Holloway Bros., spoke to the taking of slaked lime for the purpose of measurement.

The magistrate said that there appeared to be no difficulty about the facts—the proportions of the materials used in making the mortar were three of other materials to one of slaked lime, and there was evidence of a practice of measuring it that way. Before more evidence was brought he would consider the legal question, and adjourned the further hearing *sine die*.

Patents of the Week.

APPLICATIONS PUBLISHED.*

3,619 of 1905.—Dr. H. COLOSEUS: *Manufacture of Cement from Furnace Slag.*

This relates to the method of the manufacture of cement from blast furnace slag wherein dissolved salts of calcium, aluminium, or magnesium are added to the liquid furnace slag, according to its composition, in such a manner that the cooled slag in a pulverised condition will harden to cement without further additions.

3,693 of 1905.—R. V. NOTLEY and W. T. P. TAYLOR: *Tops of Chimneys and Ventilating Stacks or Shafts.*

This relates to tops of chimneys and ventilating stacks or shafts, and consists of a dwarf self-flanching and weathering top, constructed with a square or rectangular flanch so shaped that it slopes at top from the centre of the chimney shaft towards its sides, or from the centre of the chimney stack, or from a line mid-way between two sides thereof towards one or more sides of said stack according to its position thereon.

5,608 of 1905.—J. SHRES and J. M. WOOLLER: *Machines for Dovetailing or Trimming Floor Joists.*

This relates to machinery or apparatus for dovetailing and trimming floor joists, consisting of a reciprocating frame actuated by suitable means and carrying a saw frame in which are two saws fixed at angles corresponding with the dovetail required to be cut; the said saws are caused to move to and fro during the cutting operation by means of suitably-arranged gearing crank mechanism and connecting-rod, which gearing is operated by hand. In close proximity to the saws a tool or chisel is provided suitably mounted in a frame and adapted to effect the cut by actuating the same downwards and vertically, by means of a weighted lever, which tool is employed for the purpose of cutting away the cut portions of the joist or portion between the angular or dovetail cuts, and thus forming a recessed cut or a complete dovetailed cut prepared for the insertion of or to receive a prepared or correspondingly-formed part of another joist.

6,650 of 1905.—S. KEMP-WELCH: *Method of, and Apparatus for, Cleaning Walls and other Surfaces.*

According to this invention, high-pressure steam is employed as a means of cleansing hard surfaces.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

such as stone, brickwork, cement, wood, and the like. For this purpose a jet of high-pressure steam conveyed in a flexible or jointed pipe is applied, enabling the operator to direct the jet on any part of the surface to be cleaned. The high velocity of the steam, combined with the heat and moisture resulting from the condensation of the steam on the dirty surfaces, effectually and readily dislodges all dirt, leaving the surface in its original condition. In addition to the steam jet a spray of detergent material may be applied, such as soap, soda, or the like, prior to, or simultaneously with, the application of the steam jet.

7,155 of 1905.—W. E. DAVIS: Windows.
This relates to windows, and consists in the arrangement of two strips of leather or other material of a pliable nature, fitted at each side of the window-sash. The two strips are placed back to back at a slight distance apart, the bottom or short flanges, in case of the strips being turned up, being on the outside; these two parts are fastened to the frame of the door or window-sash, the fastening being made draught-tight. Small springs are fitted at each side to keep the long flanges together, the said strips being fitted to twice the depth of the window-frame. Then at each side of the window-frame is fitted, for the full depth of the window, a cast or stamped piece of material in the form of a letter T, having each of the short flanges either turned down or kept straight at the outer edges, in the case, when they are turned down, forming a groove at each side of the tongue. These tongues fit in between the two strips of leather, or other material of a pliable nature, fitted at each side of the window sash, the two top edges of the long flanges fitting into the grooves on the sash side of the T-pieces, if same are fitted, which are attached to the window-frame, thus allowing the window-frame to slide up and down as required.

7,938 of 1905.—E. SAVARY: Panelled Woodwork.
This invention relates to the construction of panelled woodwork, in which the various pieces may be fitted together and thus form a continuous piece or area of panelling without the necessity of hand labour thereon, except the labour necessary to fit together the pieces shaped as aforesaid, and so that this fitting may be done when the aforesaid panelling is being fixed to the surface it is intended to cover. The panelling is so designed and arranged that certain portions which form the styles and rails are grooved in such a manner that they may be secretly nailed and fixed to each other and to the area to be panelled, and at the same time the said grooves form an open mouth which facilitates the entrance into them of the panels. The styles and rails are also provided with tenons so formed that they exactly fit into the grooves which are also adapted to receive the panels.

8,323 of 1905.—SHARPE BROS. & CO., LTD., and N. E. COOKE: Overflow Chamber of Lavatory Basins and Baths.

This relates to a lavatory basin or a bath of the kind which is provided with an upright overflow chamber made integral therewith, and consists of a horizontal semi-circular or nearly semi-circular cover mounted on a central vertical pin at the front of the top of the overflow chamber, so as to turn about the pin and either close or open an overflow chamber, said cover fitting on a ledge at the top of the overflow chamber.

8,679 of 1905.—J. ARMOUR: A Detachable Device for Locking or Fastening Window-Sashes, and also for Enabling them to be Retained Slightly Open for Ventilation Purposes.

This invention relates to a detachable device for locking or fastening window-sashes. The upper sash is made with a sash plate having a keyhole or other slot therein and at the back thereof a square or cross-shaped slot or recess is made in the sash. The parting bead has a check or recess of any suitable length made in it. The locking device consists of a lever or bar which has a cross head at one end and a spring key at the other end, said spring key being capable of being pressed into a slot of the sash-plate and of being turned round by means of a cap made with a bayonet slot in which works a fixed pin on a casing surrounding the key spindle.

8,794 of 1905.—J. T. GINSON: Roofing Slates.
This relates to an attachment for roofing slates used for repairs, said attachment comprising a plate or holder secured to the upper end of the slate and having at its other end a spring clip to engage with a clip on to the upper edge of the lath when the plate is slipped into position.

9,306 of 1905.—W. GRIFFITHS: Show Stands or Brackets for Shop Window Dressing and the like purposes.

This relates to show stands or brackets for shop window dressing or the like purposes, comprising an arm or bracket, a sliding or movable carrier upon the said arm or bracket, and adjustable rods disposed in a star-like manner and passing diametrically through the said carrier. The carrier is made in the form of a circular cupped disc having a flanged open end. To the said flanged end are attached a pair of clip-like parts for sustaining the disc upon an arm or bracket which is detachably mounted on a suitable stand

or support in any ordinary manner. The disc can slide along the said arm or bracket for adjustment of its position as required.

9,967 of 1905.—V. PERRETT and L. PERRETT: Apparatus for Sanding the Surface of Partly-Finished Bricks or other like articles.
This relates to an apparatus for sanding the surface of partly-finished bricks or other like articles, comprising a box with open top, two separate compartments fixed upon the bottom of the box, their open ends extending up into the box, a fixed horizontal partition extending to the sides of the box and having openings fitted round the upper open end of the compartments, vertical plungers extending up through the bottom of the boxes into the compartments, a transverse lever pivoted to an arm below the box and having its ends jointed to the lower ends of the vertical plungers, platforms upon the upper ends of the plungers, and means to rise and fall alternately in the compartments by the oscillation of the lever, and a loose flexible diaphragm having its edge fixed inside the sides of the box resting and fixed upon the horizontal partition and having its loose part above the compartments and fixed to the edge of the platform at the upper end of the plungers, said means for causing the lever to oscillate upon its centre.

13,513 of 1905.—R. WHITEHEAD: Sash Fastener.
This invention relates to a method of jointing or locking the movable arm of a sash-fastener to the fixed plate without either pin, screw, or rivet. The arm has a short spindle attached to it which passes through the fixed plate and has a projecting part on its side at the bottom end, the fixed plate having a hole shaped to receive the spindle with the projecting part attached. When the spindle is inserted in the hole and the arm moved round the projecting part on the spindle is then on the underside of the fixed plate, and thus holds the two parts together in the same way that an ordinary key is held in a lock, and allows the arm to be moved sufficiently either way without coming unattached.

21,182 of 1905.—P. LÖSCHER: Trellis Work and Gratings Composed of Reeds, Canes, Wire, and the like.

This invention relates to trellis work and gratings composed of reeds, canes, wire, and the like, the characteristic feature being the fact that the longitudinal rods and transverse bars forming the trellis work or the gratings are fixed in apertures provided for that purpose in tubular bodies, such as tubes made of bamboo, wood, or metal, in which they are fixed by means of a wedge driven into the tubes.

21,496 of 1905.—W. L. MARCHAND: Wall Construction.

This relates to a wall construction comprising a plate with angular projections extending both vertically and horizontally, a second plate parallel with the first plate, bolts connecting said plates, a strip independent of said plates, and adapted to be supported between the inner and outer plates, and a series of cones depending from said strip and having vertical slits to straddle on said bolts, said bolts being removable and adapted to engage the upper end walls of the said slits, whereby the moulds may be removed from the wall after the blocks have been formed.

22,410 of 1905.—R. EVANS: A Down-Draught Preventer for Chimneys and Ventilating Shafts.

This relates to a chimney cowl or down-draught preventer, consisting of the usual body surmounted by a truncated cone secured to the said body so as to leave a space between it and the body, a cylindrical piece fixed at a short distance above the said cone, inside which is an inverted cone secured above a pipe, which connects the cylinder to the cone so as to leave a space between the pipe and the cylinder, and a number of vertical wings or flaps secured to the body and pipe beneath the said cone and cylinder.

22,602 of 1905.—A. THOMAS: Reinforced Concrete Buildings.

This relates to reinforced concrete buildings, and consists of a bonding device formed from a flat blank of metal with longitudinal slits so arranged that by suitably bending the strips a circular part is formed which embraces the tie rod, together with outstanding arms, which are embedded in the concrete to be strengthened, and with the tie rod. The arms can be bent at an angle to the tie rod, so as to lie at right angles to the shearing stress in the concrete. In this bending the arms will perform to be caused to twist somewhat about their longitudinal axis, so that the bending stress in the arms will be approximately diagonally through their section.

23,705 of 1905.—J. F. GREGORY: Shop Fronts, or the like.

This relates to a shop front, or the like, and comprises a window ledge which is open at the front end and is divided off at the back from the body of the shop or similar place by the use of a vertical front screen or window and by one or more high rearwardly-extending side-screens or returns, which partially enclose an accessible back space or area.

339 of 1906.—E. PRESTON: Adjustable Cramps for Use in Making Picture Frames and other Frames.

This relates to an adjustable cramp for use in making picture frames and the like, consisting of a series of four corner or mitre cramps having tubular or box-like guides or eyes at their corners, through which guides or eyes a tightening or cramping chain is threaded, the said chain being attached at one end to one of the corner or mitre cramps, the last-named corner or mitre cramp having attached to it a screw hook, which by a winged nut for adjusting the same, the hooked end of which screw hook engages with one of the links of the chain when the said chain has been tightened.

25,851 of 1905.—A. C. CUNNINGHAM: Caissons for Repairing the Bottoms of Floating Structures.

This relates to an under-water floating caisson, comprising an open-topped working chamber having a bottom and closed on two sides, said chamber being adapted to be entirely submerged and floated under the dock or other floating structure to be repaired, provided with means for exhausting the water therefrom, and having a shaft or shafts extending above the water level to permit workmen to enter the chamber after it is in place.

11,533 of 1905.—R. MIDDLETON: Arrangement of the Equipment for Jib Cranes for Derricking and like purposes.

This relates to the arrangement for jib for derricking and like purposes. The jib, pivoted at its foot to the mast in the usual manner, has its head attached to the mast by jointed links or side rods. These links or rods, which may be attached to any desired points on the mast and jib, are hinged or pinned together at any convenient point. This centre is attached preferably to a cross-head working in suitable slides fixed to the mast by a connecting rod. The cross-head is elevated or depressed in the slides on the mast by any suitable means, and thus the huge mass is made to ascend or descend accordingly, and so lengthen or shorten the distance, whereby the jib is caused to luff in or out as required.

13,989 of 1905.—R. DALE: Joints of Earthenware Drain Pipes.

This relates to the construction of water-tight joints between the ends of earthenware drain pipes, and consists in the use of a bitumen or bitumenised belt placed round the junction faces of the abutting ends, and an annular space formed between the collar and each pipe surrounding said belt, and filled with cement or the like.

16,017 of 1905.—J. A. SLOAN: Tiling.

This relates to the manufacture of tiling and consists of a tile having lateral projections defined by intersecting curves symmetrically arranged with respect to an axis, and ends defined by curves similar to, and continuous of, said first curves, said ends being developed by the revolution of the adjacent body curves of intersection.

16,082 of 1905.—A. WOLFF: Framework or Lathing for Use in Plastering Walls and the like.

The object of this invention is a framework, twined or woven from iron wire, to be used in building or isolating materials, especially for the coating or lining of walls, ceilings, and pillars. The characteristic feature of this framework consists in that the single wires are provided with lateral corrugations which secure the necessary space for the framework and the respective surface, and guarantee a solid hold of the coating material of the framework. When manufactured the netting is brought immediately from the twining machine on to rollers, which rollers are provided with length grooves or length rods, and which fit together, and thereby corrugate the wires of the netting.

AUCTION SALES.

Nature and Place of Sale.	By whom Offered.	Date of Sale.
*FREEHOLD VILLAS, etc.—Torrington Hotel, North Finchley	Charles Sparrow & Son	Mar. 26
*FREEHOLD WORKSHOPS, HODDESDON—Bull Hotel, Hoddedon	C. H. Ashford	Mar. 28
*STOCK OF BUILDERS, etc., 34, TRANQUIL VALE, BLACKHEATH.—On the premises	Henry W. Flag & Son	Mar. 28, etc.
*BUILDING SITE, HAYMARKET, S.W.	May & Rowden	Mar. 29
*SHOPFITTERS, ETC., STOCK, 30, VALLANCE-ROAD, R.—On the Premises	W. F. Liang	April 2
*FREEHOLD BUILDING LAND, SHEERNESS—At the Mart, E.C.	Thicket & Son	April 4
*FREEHOLD PROPERTY, EUSTON-ROAD, N.W.—At the Mart	Edwin Fox & Bousfield	April 9
*THE HOLBORN TOWN HALL, GRAY'S INN-ROAD, W.C.—At the Mart	Jones, Lang, & Co.	April 10
*FREEHOLD BUILDING LAND, SYDENHAM—At the Mart	Belmont, Tewson, & Co.	April 11
*FREEHOLD BUILDING LAND, STAMFORD HILL—At the Mart	F. W. Hobson	April 18
*BRICKWORKS AND BUILDINGS AS GOING CONCERN—Bordon Camp, Hants	R. C. S. Evvett	April 20
*FREEHOLD BUILDING SITE, MILE END-ROAD—At the Mart	S. Walker & Son	May 4
*FREEHOLD BUILDING SITE, TOTTERHAM COURT-ROAD—At the Mart	Venton, Bull, & Cooper	do
*RESIDENTIAL ESTATES, ROUSTON PARK, NR. HARKOW—At the Mart	Driver, Jones, & Co.	May 8
*FREEHOLD RESIDENCE, ETC., ALDERSHOT LODGE—At the Mart		

* Those with an asterisk are advertised in this number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, xviii. Auction Sales, xxviii.

TENDERS.—Continued from page 333.

DUDDLEY.—For erecting a galvanised iron cottage at the Infectious Diseases Hospital, Bawmer's Green, for the Corporation of Dudley. Mr. John Gannaway, Borough Surveyor, Town Hall, Dudley:—
Iron Buildings.
 Ginger, Lee, & Co., Longsight, Manchester* £135 0
Foundations and fittings.
 M. Round, New-street, Dudley..... 96 10

ENFIELD.—For making-up Leighton-road, Bush Hill Park, for the Urban District Council. Mr. R. Collins, Surveyor, Public Offices, Enfield:—
 T. Adams..... 2907 0
 J. Jackson..... £890 0
 Fry Bros..... 946 17
 E. J. Betts, Enfield
 Hardy, Bate, & Co. 925 12 | Highway*..... 885 0

GOLBORNE.—For enlargement of Golborne Church:—
 J. Ellison..... £1,668 0 0
 H. Owen & Co. £511 14 6
 Webster & Winstanley..... 1,020 0 0
 Sons, Atherton & Balshaw 1,013 10 0
 ton, Manchester..... 901 6 0
 J. Peet..... 1,002 0 0 | Chester*.....

GUILDFORD.—For eighteen semi-detached cottages on the Woodhedge Estate, for the Woodbridge Cottage Club. Messrs. Houlton & Houlton, architects, 145, High-street, Guildford. Quantities by Messrs. McEwan & Waghorn, M.Q.S.A.:—
 Chinchon A..... £8,550 0 0
 B. C. Hughes, £5,900 0 0
 C. Son..... £8,550 0 0
 A. & F. Gann..... 8,799 0 0
 W. Lawrence & Co..... 5,900 0 0
 T. G. Hawkins 6,790 0 0
 Mitchell Bros., 5,964 0 0
 R. Smith..... 6,790 0 0
 W. Lawrence & Co..... 5,875 0 0
 Sons..... 5,716 0 0
 G. Kemp..... 6,697 0 0
 Martin, Wells, & Co..... 5,670 0 0
 G. Willis..... 5,288 0 0
 R. Wood & Son 6,130 0 0
 A. Franks..... 5,262 16 6
 J. Smith & Sons 6,087 0 0
 Tribe & Robins & Co..... 5,250 0 0
 C. Ansell..... 6,000 0 0
 W. Mercer..... 6,000 0 0
 Hefer & Co. 6,000 0 0
 Guildford..... 4,950 0 0
 Tompsett & Co. 6,000 0 0
 Drowley & Co. 5,999 0 0
 * Accepted on reduction estimate, £4,418.

KENDAL.—For 900 yds. lineal of pipe sewers, for the Corporation. Mr. R. H. Cheas, Borough Engineer, Kendal. Quantities by the Borough Engineer:—
 R. Shuttleworth £321 11 6
 R. Woodburn..... 6,000 0 0
 W. Carradise..... 256 11 1
 Kendal*..... £240 13 6
 T. & W. Dirken 245 14 2

GURSHING.—For erecting twenty houses on Gorse-wald estate. Mr. C. T. Rutten, architect, Bank-chambers, Heathfield-street, Swansea:—
 T. D. Jones..... £4,600 0
 Fugs & Rosser..... £3,510 10
 A. & A. Thomas 4,300 0
 H. Billings..... 3,910 0
 W. Rogus & Sons..... 3,387 0
 Thomas & Jones 4,100 0
 J. Fry..... 3,380 0
 Thomas Bros..... 3,980 0
 B. & D. C. Jones 3,260 0
 W. Lacy..... 3,875 13
 T. Lewis, Ger. Morgan & Gough 3,990 0
 scion*..... 3,200 0

LEEDS.—For proposed new branch post office and sorting office, Hyde Park-corner, for Commissioners of H.M. Works and Public Buildings:—
 W. Wade & Co. £3,962 0 9
 Arncliffe & Hodgson & Co. £3,490 9 0
 W. Irwin & Co. Ltd..... 3,650 0 0
 T. Hannam & Sons..... 3,369 0 0
 R. Costain & Sons..... 3,596 0 0
 W. Wilson & Sons..... 3,337 0 0
 W. Nicholson & Son..... 3,591 15 5
 T. Blakey..... 3,235 0 0
 H. Atkinson & Sons..... 3,279 0 0
 J. Wood & Son..... 3,279 0 0
 Sons..... 3,579 0 0
 C. Myers & Sons 3,265 0 0
 W. H. Dewa & Co..... 3,240 12 6
 J. F. Wright..... 3,240 12 6
 W. H. Dewa & Co..... 3,569 0 0
 J. Pullan*..... 3,000 0 0

LONDON.—For the division of rooms, Lyndhurst-grove, Dulwich, for the London County Council Education Committee:—
 T. G. Sharpington..... £328
 J. Garrett & Son..... £218
 H. Herman..... 325
 H. Bragg & Sons..... 233
 W. Downs..... 309
 W. Johnson & Co., Rise & Son..... 292
 Ltd., Bellevue-road, H. Bouteau..... 272
 Wandsworth Com- H. Line..... 253
 mon*..... 193
 H. Line..... 249
 [The Architect's (Education) estimate, comparable with these tenders, is £295.]

LONDON.—For the erection of shops and flats at the corner of Weston-street, and Snowfields, Bermondsey, Messrs. Rings & Myers, architects, 21, Railway-approach, London Bridge. Quantities by Messrs. Campbell & Sons, 4, Finabury-circus:—
 Holland & Hannen £19,818
 Smith & Sons..... £18,214
 Spencer, Santo, & Co..... 19,300
 Putnam & Fother- W. Downs..... 19,140
 Ingham..... 17,973
 Cols & Sons..... 18,765
 G. Darlington..... 17,800
 Higgs & Hill..... 18,484
 F. & H. F. Higgs..... 17,260
 Holloway Bros..... 18,450
 Greenwood Ltd..... 17,181
 * Arrived late.

LONDON.—For external painting and repairs at the Norwood school, for the Lambeth Guardians. Messrs. Woodward, Brooks, & Latter, surveyors, 69, Kennington-oval, S.E.:—

E. H. Holtham.....	£1,762 17 9	22s.
W. King & Son.....	1,090 3 0	12
S. E. Moss & Co.....	998 10 0	15

 T. D. Leng, Czar-street Works,
 Evelyn-street, Deptford*..... 8,631 0 0
 [Architect's estimate, comparable with these tenders, is £10,253.]

LONDON.—For roadworks, part of Londhurst-road, Lewisham, for the Lewisham Borough Council:—

Table with 2 columns: Name and Amount. Includes W. Pearce, Forest Hill, £966 and Queenborough Cement Co., Ltd., £318 10.

LONDON.—For side slot rails and bolts for the reconstruction of portion of first section of northern tramway lines, for the London County Council:—

Table with 2 columns: Name and Amount. Includes P. & W. MacLellan, Ltd., £3,640 3 and Steel, Peach, & Tozer, Ltd., £3,640 14.

NUNEATON.—For constructing a service reservoir, capacity 500,000 gallons, in Hennebique's ferro-concrete construction, for the Nuneaton and Chilverton Urban District Council. Mr. F. C. Cook, Waterworks Engineer, Council Offices, Nuneaton:—

Table with 2 columns: Name and Amount. Includes Hobrough & Co., £2,631 10 1 and Liverpool Hennebique Ferro-Concrete Contracting Company, Ltd., £2,575 0 0.

POOLE.—For two and three-quarter miles of 10-in. cast-iron main pipes, etc., for Poole Waterworks Company. Mr. H. F. J. Barnes, engineer, Towngate-street, Poole:—

Table with 2 columns: Name and Amount. Includes I. Deau, £4,260 0 0 and J. T. Whetnam, 4,022 0 0.

RHOS.—For sewage disposal works, Rhos, Wrexham, for the Wrexham Rural District Council. Mr. J. Price Evans, O.E., Argyle-chambers, Wrexham:—

Table with 2 columns: Name and Amount. Includes J. B. Woolley, £4,509 8 2 and I. Jenkins, 4,382 9 11.

ST. ALBANS.—For kerbing and paving footpaths, Fleetville, for Hertfordshire County Council. Mr. Urban A. Smith, County Surveyor, Hatfield:—

Table with 2 columns: Name and Amount. Includes J. Dickson, £384 5 0 and O. W. Mann, 361 7 6.

SLIGO.—For the erection of a new wing to the Ursuline Convent. Mr. P. J. Kilgallon, architect, Abbey Vals, Sligo:—

Table with 2 columns: Name and Amount. Includes D. McLynn, £3,557 and C. Connolly, £2,650.

STAFFORD.—For 6,800 yds. of sewers, etc., Tillington and Castle Church, for the Stafford Rural District Council. Messrs. R. E. W. Borington & Son, Engineer, Bank-buildings, Wolverhampton. Quantities by Engineers:—

Table with 2 columns: Name and Amount. Includes C. J. Nevitt, Ltd., £4,195 9 6 and F. Espley & Sons, £3,220 0 0.

SOUTHEA.—For girls' secondary school, Southsea. Mr. C. W. Bevis, architect, Elm Grove-chambers, Southsea. Quantities by Mr. C. W. Ball, Whittington-chambers, Southsea:—

Table with 2 columns: Name and Amount. Includes J. J. Jerome, £24,044 13 8 and W. T. Dugan, 23,769 0 0.

SWANSEA.—For erecting a dwelling-house in De-la-Beche-road, Skelly, for Miss Elizabeth Hodge. Mr. C. T. Ruthen, architect, Bank-chambers, Heathfield-street, Swansea:—

Table with 2 columns: Name and Amount. Includes J. Marles & Sons, £465.

SWINDON.—For two lodges and entrance gates, etc., at "The Croft," Swindon, for Mr. L. L. Morse, M.P. Messrs. Road & Osborne, architects:—

Table with 2 columns: Name and Amount. Includes J. G. Norman, £780 and Tydesman Bros., £590.

TATTINGSTONE.—For alterations and repairs at Tattingstone workhouse, for Samford Guardians. Mr. H. J. Wright, architect, 4, Museum-street, Ipswich:—

Table with 2 columns: Name and Amount. Includes W. Aldous, £325 0 0 and E. Bird, Ipswich, £265 10 0.

WAMBROOK.—For Wesleyan chapel at Wambrook, near Chard. Mr. E. A. Fryer, architect. Quantities by architect:—

Table with 2 columns: Name and Amount. Includes Harris & Woolcott, £530 0 0 and Parsons Bros., £500.

WESTCLIFF-ON-SEA.—For proposed restorations, additions, and alterations, "Doric Lodge," Westcliff-on-Sea, for Mr. Murray. Mr. G. Cooke, architect and surveyor, Southend:—

Table with 2 columns: Name and Amount. Includes F. & E. Davey, Ltd., £204 1 3 and J. C. Flaiknauff, £155.

WORCESTER.—For enlargement of Post Office:—

Table with 2 columns: Name and Amount. Includes G. Wells, £5,994 0 0 and Watts & Co., 3,885 6 8.

J. J. ETRIDGE, JR.

SLATE MERCHANT, SLATER & TILER.

Penrhyn-Bangor, Oakeley-Portmadoc,

and every other description of Slates, except American, ready for immediate delivery to any railway station.

Red Sandfaced Nibbed Roofing Tiles always in Stock.

Applications for Prices, etc., to

BETHNAL GREEN SLATE WORKS, Bethnal Green, London, E.

The BATH STONE FIRMS, Ltd., BATH.

For all the Proved Kinds of BATH STONE.

FLUATE, for Hardening, Waterproofing, and Preserving Building Materials.

HAM HILL STONE. DOULTING STONE.

The Ham Hill and Doulting Stone Co., Limited (Incorporating the Ham Hill Stone Co. and G. Trank and Son, The Doulting Stone Co.)

Chief Office:—Norton, Stoke-under-Ham, Somerset. London Agent:—Mr. E. A. Williams, 10, Craven-street, Strand.

Asphalte.—The Seyssel and Metallo Lava Asphalte Company (Mr. H. Glenn), Office, 42, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. Asphalte Contractors to the Forth Bridge Co.

SPRAGUE & CO., Ltd., LITHOGRAPHERS AND PRINTERS.

Estate Plans and Particulars of Sale promptly executed.

4 & 5, East Harding-st., Fetter-lane, E.C.

QUANTITIES, etc., LITHOGRAPHED accurately and with despatch. Telephone No. 44

METCHIM & SON (INCORPORATING THE WESTMINSTER "QUANTITY SUBVEYORS' DIARY & TABLES," For 1896, price 6d., post 7d. In leather, 1/., post 1/1.)

GRICE & CO., MERCHANTS, ADDISON WHARF, 191, Warwick Rd., KENSINGTON.

FOR ALL THE BEST Building & Monumental Stone

A LARGE STOCK OF BEST CAEN STONE (FOR HOME TRADE AND EXPORT, in Block, Slab, and Scantling).

ASPHALTE

For Horizontal & Vertical Damp Courses. For Flat Roofs, Basements, & other Floors.

Special attention is given to the above by THE

French Asphalte Co.

CONTRACTORS TO H.M. Office of Works, The School Board for London, &c.

For estimates, quotations, and all information apply at the Offices of the Company,

5, LAURENCE POUNTNEY HILL, GANNON STREET, E.C.

Twelve Gold & Silver Medals Awarded.

F. BRABY & CO., LTD.

Very Prompt Supply. Large Stock Ready. Cylinders for Hot-Water Circulation.

PARTICULARS ON APPLICATION.

LONDON: 352 to 364, EUSTON RD., N.W., and 218 and 220, HIGH ST., BOROUGH, S.E. LIVERPOOL: Havelock Works, Litherland. GLASGOW: 47 & 49, St. Enoch Square. BRISTOL: Ashton Gate Works, Coronation Road.

The Builder.

The National Physical Laboratory.

FROM the Reports of the Executive Committee and the Director of the National Physical Laboratory it is evident that satisfactory progress is

being made in every direction at that valuable institution. In the record of work performed during the year ending December 31, 1905, the items more particularly affecting our readers are those mentioned below.

Wind pressure research has been confined mainly to observations of the resultant wind pressure on two rectangular plates of 50 sq. ft. and 100 sq. ft. area respectively, the data so far available indicating that for the same wind velocity the mean intensity of pressure is the same for a surface of 50 sq. ft. as for one of 100 sq. ft. area. Owing to the abnormal quietude of the atmosphere last year only ten days were suitable for the conduct of experiments, but it is hoped that the research will be concluded this year. Investigations into the resistance of iron and steel to alternations of stress have been completed, and the Report on this subject is nearly ready for publication. Sufficient data have been obtained to determine the breaking range of stress for one million reversals of stress in each of the material tested. In the Optics division of the Physical Department research was carried out on behalf of the Institution of Gas Engineers

into the relation between the candle-powers of the Pentane, Hefner, and Carcel standards of light used respectively in America, Germany, and Great Britain, and the investigation will be continued during the present year. The result of the comparisons ought to be of considerable value. Two investigations of great importance have been conducted in the Metrological division, the first being to determine, as far as possible, the difference in dimensions between shafts and bearings, and the tolerance on cylindrical machine work as found in actual practice, and the second a similar inquiry relating to screw threads. Much valuable work has been performed also in the Electrical and Metallurgical divisions, and in the Chemical Department.

The programme for the present year includes an investigation into the resistance of materials of construction to impact, as suggested in the discussion of the Sixth Report of the Alloys Research Committee at the Institution of Mechanical Engineers in 1904. A machine for the purposes of the research has been designed, and is now nearing completion. The wind pressure research will include tests upon models of a lattice girder and a roof, and it is hoped that sufficient data will be obtained to enable designers to predict the effect of the wind on open framework and roof structures. Further work may be undertaken with regard to the resistance of materials to alternating stress and to the properties of superheated steam. Various important points will receive attention in the Electricity Division of the Physics Department,

including the further investigation of light standards; while the Thermometry Metrology, and Metallurgy divisions will be equally busy.

One very satisfactory announcement made in the Report is that the Government communicated their intention in December last to grant a sum of 5,000*l.* for buildings during the year, and to increase the annual grant. But a still more gratifying piece of news is that the Chancellor of the Exchequer has recently announced his intention of making the building grant for the year 10,000*l.* instead of 5,000*l.*, as at first contemplated: The Goldsmiths' Company have also made a donation of 1,000*l.* to the laboratory for application to some specific object. Owing to the increased Government grant various additions to the buildings will be made at the earliest possible moment. We may mention that the new electrical buildings now nearing completion have been designed to accommodate all the electro-technical work under one roof. The eastern block, for photometric work, covers a ground area of 100 ft. by 25 ft., and consists of two floors, with the battery-room above; the other two bays run east and west, with north roof lights, each having a ground area of 120 ft. by 25 ft. One of these is arranged for testing direct and alternating current instruments and machines, and the other is sub-divided into two portions—one for resistance work and the other for heavy test work. In addition to the two main bays there is a smaller space for office, workshop, and store accommodation. The whole block of buildings

covers the greater part of the site between the Engineering and Physics buildings, and when completed in June next will prove a most useful and necessary addition to the laboratory.

ELECTRICITY METERS.

THE manufacture of electricity meters is now happily an important branch of the electrical industry, and the great majority of the meters in every-day use are thoroughly trustworthy. For this satisfactory state of affairs we have to thank the somewhat rigorous rules of the Board of Trade and possibly the able way in which manufacturers advertised the defects, generally by implication, of their rivals' meters. An immense amount of skill and patience has been devoted to the invention and perfecting of electric meters; in most cases unfortunately with a very poor return to the inventor. Almost every electric phenomenon has been utilised by the inventor as a principle on which to devise a meter. The rotation of mercury when placed on a magnet and traversed by a current does not strike one as a very suitable method of moving the counting mechanism of a meter, and yet tens of thousands of meters constructed on this principle are at present in operation. Some inventors also have managed to avoid the apparent necessity of a mechanism with index fingers actuated by toothed wheels. In the Schattner meter the diminution in weight of a plate of copper immersed in copper sulphate is measured, and in the Bastian meter the fall in level due to electrolysis of acidulated water contained in a graduated glass tube measures the consumption of the electric current.

Perhaps in no other field of industrial research has the labour of inventors so overlapped as in the devising of electricity meters. For this reason we welcome the important treatise on the subject by Mr. H. G. Solomon,* which has recently been published. It shows clearly what has already been done on the subject, and the youthful electrician will be able to find out for himself whether the device he is perfecting is original, and whether its performance is likely to rival in accuracy the many types of successful meters described in this volume.

To the non-technical reader and even to the electrician—if he be not already an expert in meters—there is much that will be quite unintelligible without hard thinking, and possibly a good deal of reference to mathematical works to relearn forgotten symbols and theorems. He will, however, be well repaid for the trouble, and it is no small satisfaction to the engineer to be able to see for himself the reason why meters must be connected in certain ways with polyphase networks rather than to take it on authority. The author is evidently thoroughly familiar with the German literature on the subject, but occasionally he follows German methods a little too closely. For instance, on p. 124, there are many neat trigonometrical theorems, but the whole page is quite unnecessary. The two wattmeter method has been already

proved on p. 121; it is, therefore, quite unnecessary to prove it again. The mathematical equations, however, given by the author are most important. As a rule they are omitted from electrical works written for the "practical engineer," although, judging by experience, the meaning of these equations is what the practical engineer needs and wants to know.

The author divides meters into three main classes—Continuous Current, Induction, and Tariff Meters. The first chapter gives a useful introduction to the subject. Perhaps it would have been better to make the explanations fuller. On p. 10, for instance, the reader naturally supposes that the voltage drop in the meter is a constant at all loads, and that the equations given apply to alternating current meters. He would also suppose that the pressure between the supply mains was always kept equal to the "declared pressure." As a matter of fact it is often above it, and so, notwithstanding the pressure drop in his meter, his lamps will be sometimes giving out more than their normal light. On the same page also, instead of saying "Assuming as low a shunt loss as 1 watt per 200 volts," it would be better to say, "Assuming that the shunt loss for a 200 volt meter is 1 watt."

The chapters describing the mechanical features in meter designs and on meter testing are excellent, and will prove most useful. The author has obviously been at great pains to collect accurate data about modern electric meters, and the numerous diagrams are clear and instructive. We can heartily recommend the book to meter manufacturers, central station, and consulting engineers, and all who require a thorough knowledge of the subject.

CHARTERHOUSE.

AS our illustrations this week consist entirely of measured drawings of Charterhouse Hall, a summary of the history of this ancient Institution, and the manner in which it came into being, may be considered to be not out of place under the circumstances.

Sutton's Hospital of King James in Charterhouse—"a master-piece," says Fuller, "of Protestant English charity"—has its origin in the benefactions of a Bishop of London and a Flemish retainer of Philippa the bride of Edward III. When the Black Death reached London Bishop Ralph de Stratford bought, 1348, some three acres, "No Man's Land," or Pardon Churchyard, then lying in St. Sepulchre parish between the present Sutton-street and Clerkenwell-road (Wilderness-row), and enclosing it with a wall dedicated it for burial of those stricken by the pestilence. Sir Walter de Manny, K.G., acquired from St. Bartholomew's Hospital the adjoining Spital Croft to the south, about 13 acres, for the same purpose. On the testimony of an inscribed stone cross he had seen on the spot Stow avers that more than 50,000 were buried there. As the plague abated Michael de Northburgh, Bishop of London, 1354-71, entrusted Sir Walter with the founding of a religious house on the ground, bequeathing 2,000*l.* to that intent. In the wall of the Registrar's

house were discovered, 1891, coloured portions of a tomb with a shield charged with de Manny's coat-arms. The wealthy Carthusian convent of the House of the Salutation of the Mother of God consisted of a prior, twenty-three monks, and lay brethren, who at the Suppression were treated with the utmost cruelty; some of them with Prior Houghton suffered at Tyburn in 1535-6. Having served for a short term, like the adjacent Priory of St. John of Jerusalem, for the King's equipments for the chase the buildings were granted in 1542 to Thomas Hall and John Brydges for their joint lives. The King then bestowed them upon his lord chancellor, Sir Thomas Audley, Lord Audley of Walden, who in April, 1555, sold Charterhouse to Edward, Lord North of Kirtling, co. Cambridge, who entertained Queen Elizabeth in November 23-8, 1558, on her way from Hatfield, and rebuilt the gate-house in Charterhouse-square. North sold it for 2,500*l.* to John Dudley, Duke of Northumberland, on whose attainer it reverted to him by grant of the Crown. By deeds of May 31 and June 7, 1565, Roger, second Lord North, conveyed the property for 2,820*l.* to Thomas, fourth Duke of Norfolk, and after his conviction and attainer, 1572, Howard House was returned by Elizabeth to his second son Thomas, Baron Walden, whom on May 4, 1603, James I. advanced Earl of Suffolk whilst sojourning there on his entry into London. The Earl of Suffolk, busy with the building of Audley End, alienated Howard House on May 9, 1611, to Thomas Sutton the opulent coal-miner and Master-General of the Ordnance in the North, who died on December 12—ever since commemorated as Founder's Day—of that same year. In that brief interval he made dispositions for the founding of a hospital for eighty brethren, a number since reduced, and a free school for forty poor children or scholars.

We there have a unique example in London of a nobleman's house in the XVth century, embracing the typical plan of St. Bruno's La Grande Chartreuse near Grenoble. Edward North pulled down the chapter-house and laundry to the east of the chapel, as well as the twenty-three cells—each consisting of a little two-storied house with pentises and garden, as we see at Mount Grace—about Great Cloister, now Upper Green, the boys' playground. Some traces yet remain in the cloister wall of a cell doorway and of the hatches through which the monks took in their food. Beyond lay north-west, some offices, the kitchen garden, and the two old graveyards; and north-east, the gardens overlooked from the terrace-walk on the east cloister, the Mount, and the Wilderness. The Wilderness, latterly covered with Foresters' Hall and other buildings, gave a name to Wilderness-row. Along the north-east side of Little Cloister wherein the stone-work has been covered with brick, stands the Guesten Hall; to the south-west is the small oblong Wash-house Court of or shortly before Prior Houghton's day, bearing evidences of much structural alteration. That corner of the convent constituted the lay-brethren's and the strangers' or visitors' quarters. In the wall of squared flint and stone next the gate-house are the remains of "Egipte fleysche kychyne"

* "Electricity Meters." By H. G. Solomon, A.M.I.E.E. London: C. Griffin & Co. 1906.

as plotted on a little-known XIVth century plan showing the windmill, brew-house well, old chapel (to the north), twenty-three cells, etc., drawn on the four skins of the parchment roll of a survey of the spring-heads, wells, and conduits belonging to St. John of Clerkenwell and the Charterhouse. The initials of the Duke of Norfolk with date, "T. N. 1571," are repeated in the carving of the Hall, wherein the brethren, familiarly known as "Cods," dine together; Sutton added the quasi-clearstory and new roof, as well as the music-gallery and screen, with some panelling, and the chimney-piece with a side gallery above. The fine late XVIth century staircase (see Mr. R. W. Paul's drawings in the *Builder*, May 22, 1886) ascends to the Presence Chamber or (old) Governors'-room, restored in 1838, which stands over the Fraternity, and has a mantelpiece and ceiling bearing the Howard coat-arms, and some contemporary tapestry. In the north aisle of the chapel is Sutton's tomb, with his effigy; Nicholas Stone's MS. account-book in the Soane Museum contains an entry:—

1615. Mr. Sutton's Tombe in the Charterhouse including Mr. Lawes mount, 4000.

The chapel has south and east walls of the choir of an early date, the ground ante-chapel and evidence, or monument, chamber above are of about 1509-10.

Preacher's and Pensioners' courts are by Edward Blows, who in 1825 rebuilt "Schoolmaster's House"; on the south side of Schoolmaster's-court is "Gownboys," by P. C. Hardwick, who also modernised the old school and the boys' hall. The "Grey Friars" and "Smiffes" of Trackcray migrated to Godalming in 1872. The Merchant Taylors Company paid 90,000*l.* for 5½ acres of ground and the school buildings, and in 1874 removed their school from Suffolk-lane, E.C., to the new buildings built by E. P. Anson for 500 boys on the western side of Upper Green; P. Anson converted "Gownboys" and "Schoolmaster's House" for class-rooms, adding a library and a lecture theatre to the latter. On June 11, 1898, we illustrated Mr. W. Hilton's Nash's designs for the headmaster's house and dinner-rooms in Rutland-place; in our columns of December 19, 1885, we printed an interesting letter from R. Herbert Carpenter, an old Carthusian, recounting his reminiscences of the school and other buildings as in his time, 1851-7; a view of the Charterhouse by Gainsborough is preserved in the Foundling Hospital.

NOTES.

ACCORDING to the Report of the Registration and remarks published in the last issue of the *Journal* of the Institute of Architects, and which we reprint on another page, the proceedings of the Registration Committee have resulted, not in the adoption of the exceedingly undesirable system of wholesale Registration, reducing architecture to the level of a business, but in what appears to us to be the best result which could possibly have arisen out of the recent disputations, viz.—the recommendation to obtain a legal status and a power of granting diplomas by the Institute to qualified practitioners in

architecture, who after a certain period must have passed through a definite course of architectural education "in a recognised school." We do not quite understand whether the latter sentence is intended to nullify the system of office apprenticeship, which in our opinion ought to be taken as constituting an education (if properly carried out on the part of both master and pupil); but in general the result of the Report would be to put the Institute of Architects in a stronger position before the public than it has hitherto had, and to secure whatever benefits, real or imaginary, were to be derived from Registration, without its concomitant evils. We must not be understood to say that we think even this movement to define and limit the art of architecture is in itself either desirable or necessary—the example of the engineering profession proves that it is not so; but it will have the indirect result of adding to the power and dignity of the Institute, and will practically supply the demands made by the Registrationist agitators in the least harmful manner; so that we hope it will be accepted as the ending of an acrimonious piece of polemics which has done little to advance the art of architecture. One thing the Registrationists may be sure of: that however they might obtain a majority of mere numbers, Parliament would never grant an Act in the face of the expressed opposition of a minority who would include nearly all the leading men in the Profession. We must add, however, that we object strongly to the proposal to change the title of "Institute" to "College," for which we can see no possible reason, and which is simply throwing away the prestige of seventy years attached to the title under which the Charter was originally granted.

The New Government Offices.

We presume that the question and answer in Parliament on Tuesday evening, in regard to the towers in the late Mr. Brydon's design for the Great George-street block of Government Offices, refers to the towers with cupolas which are seen at the back in our view of the design published in the *Builder* of March 25, 1899. It will be seen from that view that these are the most important exterior architectural features of the building, and that, as far as can be judged by that small scale perspective, they are features of very fine design and outline. It is now proposed to discontinue them for the present, and in any case to reduce their height, not as the First Commissioner assured the House, on any ground of economy, but because they would obstruct the light for the India and Local Government Board Offices on the north side of Charles-street "so as to render their already limited accommodation practically useless." Considerations of light are important, of course; but is not that statement a little exaggerated? At all events, if this alteration is to be carried out, we should like to know who is to re-design poor Brydon's towers. And then there are the corresponding towers towards Great George-street, where no question of light arises; are they also to be docketed to agree with the others? It seems to us that Brydon's design is in great danger of being maltreated, and deprived of one of its finest

features. When this kind of conscientious interference with the design of a deceased architect is once begun there is no knowing where it will stop; and we do not see that any absolute proof of its necessity has been given.

The Workmen's Compensation Act.

THE New Workmen's Compensation Bill was introduced into the House of Commons on Monday last and read a first time, after some speeches which might well have been reserved for the second reading. At present it is not possible to do more than indicate a few leading features of the new measure, and detailed examination of it must be postponed till the Bill is circulated. It is a consolidation as well as an enacting Bill. In other words, it will be a limited code of law on the subject of compensation. It includes more workers under the system of compensation, but it excludes workmen of employers of less than five workmen, with some exceptions. Small builders and contractors will apparently, therefore, be excluded. It is, on the whole, a further step towards a complete system of workmen's compensation, and was admitted by the Home Secretary to be a measure which hereafter, as has happened to its predecessors, would be enlarged. The system of insuring risks is now growing so largely that in time there will, no doubt, be a complete and universal system of compensation, the payment of which will fall on the insurance companies.

British Forestry.

IN view of the rapidly-diminishing sources of the world's timber supply and the corresponding increase of consumption, much attention has been devoted to the conservation of forests and woodlands by the Governments of the United States, Canada, France, Germany, Russia, Sweden, and other countries, as well as by private individuals interested in the timber industry. We have alluded more than once to the urgent necessity for similar action in the United Kingdom, and it is satisfactory that the question is at last about to be taken up, in conjunction with other subjects, by a Royal Commission. But inquiry by a body of the kind is notoriously extremely previous to beneficial action, and in this particular case we are merely about to inquire, while other countries are acting. As Sir Herbert Maxwell pointed out last week in his lecture at the Carpenters' Hall, Germany is sparing her own forests, knowing that in the future the price of timber must be enormously increased, and in that country the State forests are already returning substantial profits. It is quite a mistake to think that climatic and other conditions in the British Isles are unfavourable to forestry enterprise, and there is much to be said for the scheme outlined by Sir Herbert Maxwell for forestry under Government direction. It certainly seems ridiculous that the 2,700,000 acres of our woodlands in private hands should be a source of expense instead of yielding profits to the owners, with concurrent advantage to the country.

Niagara Falls.

A FEW days ago the Commissioners for the Queen Victoria Falls Park reported that the present abstraction of some

17,5000 cubic feet of water per second has made no appreciable difference in the aspect of the Niagara Falls, but they very reasonably expressed the opinion that it would be wise to take steps with a view to cancelling charters for water power in respect of which no works have been commenced. At present the existing charters represent an abstraction of 60,900 cubic feet per second, or more than one-fourth the normal flow over the Falls. Americans have been the chief aggressors in this matter, even on the Canadian side, where the only companies with intakes above the Falls belong to the United States. The necessity for preventing further injury is fully recognised by the United States and Canadian Governments, and it is probable that the deliberations of the International Commission will ultimately result in legislation of suitable character. So far, there appears to be a little difference of opinion between the American and Canadian members of the Commission, although fortunately both sides are agreed as to the desirability of limiting existing powers, and of adopting regulations to prevent further depletion of the water, and to maintain the beauty of the Falls.

THE restrictive legislation our manufacturers are now subject to is well illustrated by the case of *Rogers v. Barlow & Sons*. On an information preferred by an Inspector of Factories, the respondents, cotton-weavers, were proceeded against for employing a child during meal-times. The machinery had been stopped for the day at 5.30 p.m., and at 5.34 the child in question was wiping the oil from the spindles, a necessary operation when the machinery is stopped. The persons in charge after that summoned the employees to leave, and it was proved that this was the practice within five or ten minutes of the stopping of the machinery. The magistrates dismissed the information on the ground that the respondent had used every possible means to carry out the intention of the Act, but the Divisional Court have reversed this decision, and remitted the case to the magistrates to convict. It was urged for the respondents that even if a technical offence had been committed, it was too trivial for judicial notice. This is how it certainly strikes the lay mind, and a lay-man would like to know when the legal maxim *de minimis non curat lex* comes into operation. The case, moreover, seems distinguishable from that cited to the Court, *Prior v. Staithwaite Spinning Company*, because there the child was found working in his dinner-hour, whereas here work was done for the day, and the detention from the boys' tea amounted to four minutes. How are business men to carry on business with such legislation to hamper them, administered in a microscopic spirit?

THE complications connected with what we may term "underground London" are well illustrated by the case of *London Hydraulic Power Company v. St. James and Pall Mall Electric Light Company, Ltd.* The plaintiffs, acting under statutory powers, have a main running 5 ft. below the ground in Piccadilly, laid

in 1888. The defendants, acting under Provisional Order granted by the Board of Trade under the Electric Lighting Act, 1882, had in connexion with their electric plant constructed an inspection-chamber, and one side of the brickwork rested on the plaintiffs' main. This inspection-chamber was constructed in 1889 without the plaintiffs' knowledge. In July last the main burst and the plaintiffs, alleging this was caused by the defendants' manhole, were suing the defendants for the expenses of restoring the damage and the loss of water, and they further required a declaration that the defendants were liable to repay the plaintiffs any damages which the latter might be compelled to pay to other persons owing to the bursting of the main. The defendants, on the other hand, counterclaimed for damage done by the water to their plant. The substantial allegation on the part of the plaintiffs was that the damage, which was a transverse split, was caused by the vibration of the traffic over the manhole, which was communicated to the main; the defendants, however, alleged that the damage was due to subsidence. The evidence was very conflicting, but the defendants' witnesses were of opinion the fracture was not caused by the vibration; whilst the plaintiffs' witnesses could not say that subsidence was not a possible cause, and in the result the learned judge held that the plaintiffs had failed to prove their case that the defendants had become liable for a nuisance under sect. 17 of the Electric Lighting Act, whilst on the authority of the case *Midwood v. Mayor, etc., of Manchester*, a case we carefully considered in a Note, July 22, 1905, he held that the defendants could recover on the counterclaim as for a nuisance, the damage caused to their plant by the bursting of the water main.

EMPLOYERS should note the decision of the House of Lords in *Williams and others v. North's Navigation Collieries (1889) Ltd.*, on the Truck Act of 1831. Some workmen having been fined in proceedings under the Employers and Workmen Act, 1875, for absenting themselves from work in breach of contract, and an order having been made against them by the magistrates for three fortnightly payments to the employers of 10s., the employers paid the men their wages less the 10s. due to themselves. The House of Lords held that this deduction is illegal, as being contrary to the provisions of the Truck Act. The amount due to the workmen must be paid to them in the current coin of the realm without deduction. The judgment decides that the right of set-off mentioned in the Act is limited to a set-off in an action. It is curious to find such an apparently simple point coming to the House of Lords for decision some seventy-five years after the coming into operation of a statute, but that the statute does not admit of easy interpretation is proved by the fact that the Court of Appeal took an opposite view.

IF when determining the proportions of a column to be used in a building of several stories the total length be taken

into account without any allowance for the lateral support given by intermediate portions of the structure, the strength of the column will obviously be greater than that of a short column of one-story length proportioned by the formula applied to the first considered column. In other words, the effect of "continuous-column action" is disregarded. This is by no means necessary, and in the case of an axially-loaded column fixed at successive floor levels in a secure manner the same allowance might be made for increased resistance as for that of a continuous beam in comparison with a non-continuous beam. In practice, however, the lateral support afforded by the members connected with a column is not of particularly rigid character, and such members generally tend to cause non-axial loading. Consequently, if allowance be made for continuous-column action there must be suitable allowance on the other hand for eccentric loading wherever that is caused, in addition to proper consideration for accidental eccentricity due to variations in the quality of the material or to defects of workmanship. To arrive at an approximately true idea of the resistance afforded by a continuous column it would also be necessary to take into account the relative lengths in all stories of the building. For example, a 20 ft. free length of a continuous column in any given story will be stronger if the lengths in the stories above and below measure 14 ft. than if they were 20 ft. long. At present no convenient formulae exist for solution of the problem here indicated, although a theory has recently been propounded by Mr. E. F. Johnson in a paper read before the American Society of Civil Engineers. This communication fully deserves the attention of architects and structural engineers, and its value to general practitioners would be much increased if the author had concluded with a set of working formulae in a form convenient for everyday use.

THE useful paper read by Mr. C. P. Sparks to the Institution of Electrical Engineers last week, on the "Electrical Equipment of the Aberdare Collieries," proves that electricity is particularly adapted for lighting and power purposes in collieries. The group of mines supplied with power is situated about twenty miles north-west of Cardiff, and several of them had isolated direct-current plants before it was decided to build a central generating station for them all. The district served is eight square miles in area, and the power is transmitted by overhead transmission lines at 3,000 volts. The wires are as a rule supported on wooden poles, but where the stress is specially heavy lattice steel poles are used. To prevent any one climbing the poles they have barbed wires spiralled round them, and at 10 ft. from the ground there is a ring fitted with spikes. The overhead system extends for nearly nine miles, and over thirty miles of wire have already been erected. Special care has been taken to prevent any accidental contact from live wires. Wherever existing wires are crossed or in the neighbourhood of the collieries where there is traffic, guard-netting is

The Electrical Equipment of Collieries. THE useful paper read by Mr. C. P. Sparks to the Institution of Electrical Engineers last week, on the "Electrical Equipment of the Aberdare Collieries," proves that electricity is particularly adapted for lighting and power purposes in collieries. The group of mines supplied with power is situated about twenty miles north-west of Cardiff, and several of them had isolated direct-current plants before it was decided to build a central generating station for them all. The district served is eight square miles in area, and the power is transmitted by overhead transmission lines at 3,000 volts. The wires are as a rule supported on wooden poles, but where the stress is specially heavy lattice steel poles are used. To prevent any one climbing the poles they have barbed wires spiralled round them, and at 10 ft. from the ground there is a ring fitted with spikes. The overhead system extends for nearly nine miles, and over thirty miles of wire have already been erected. Special care has been taken to prevent any accidental contact from live wires. Wherever existing wires are crossed or in the neighbourhood of the collieries where there is traffic, guard-netting is

used. Steel catchers are also fitted to each pole to ensure that a broken wire will be immediately earthed. By grouping the mines together a great economy in the working costs has been secured, the cost per unit consumed being about one-third of a penny. It is satisfactory to notice that the special advantages of three-phase current for colliery work are being appreciated by engineers. The three-core cables used in the mines are very substantial and are duplicated. They are almost absolutely safe, being covered with a Board of Trade "earth shield" of copper, a thick lead sheath, and a heavy armouring of galvanised steel wires over the lead. We are sorry, however, that overhead wires are used. We quite see that it would have been prohibitive to use three-core cable for the transmission lines as expensive as that used in the mines. We think that at the comparatively speaking low voltage used cable manufacturers could easily make a cheap type of three-core cable if a demand arose for it. The Board of Trade regulations might easily be relaxed with advantage for underground transmission wires in country districts.

The Starting of Electric Motors. In order to start the electric motors which are used in heavy mechanical work it is necessary to employ elaborate starting devices. These devices are often a source of trouble even in the hands of skilled attendants, and hence many inventors have tried with more or less success to make them entirely automatic. Professor Steinmetz, one of the best-known American electricians, has recently perfected an electrical device which entirely surmounts all the mechanical difficulties which have to be overcome in making an automatic starter. He has discovered a material—apparently either magnetite or a mixture of chromite of iron and magnetite—which gradually becomes a good conductor when heated by the passage of an electric current. The material is formed in rods, and is mechanically strong even at a red heat. When the switch is closed the magnetite rod allows only a very small current to pass owing to its high initial resistance. As this current gradually heats the rod its resistivity gets less, and so the current gradually rises with the temperature. When it is almost red hot it offers practically no resistance to the passage of the current. It therefore acts electrically in exactly the same way as the usual mechanical starting device of a motor acts as the attendant gradually moves the lever over the rubbing contact pieces. This property of magnetite can also be usefully employed in the starting of single and polyphase induction motors. Professor Steinmetz places magnetite washers between the copper bars and the end rings in the usual "squirrel-cage" armature. These present excessive rushes of current in the armature at the start, and at the same time very considerably increase the starting torque. When the motor stops the washers cool almost immediately, as they are in contact with a large metal ring which has considerable radiating surface. It can, therefore, be started again almost immediately

without risk. As there is an excellent prospect of power being obtained in London for motive purposes at very cheap rates in the immediate future, it is highly probable that large motors will be started by unskilled attendants, and so purely automatic starting devices of the Steinmetz type will be most useful.

Architects and Timber Specifications. We have received in a pamphlet form an article* on this subject, reprinted from the *Timber News and Sawmill Engineer*. The writer quotes, "from architects' specifications of recent date," certain clauses relating to the quality of Scandinavian and Russian timber, and points out that they are in many respects unreasonable or even impracticable. There can be no doubt that the timber clauses still used by some architects and surveyors are hopelessly out of date, and betray ignorance of modern conditions. Some of the ports from which the best timber was shipped thirty or forty years ago have now lost their pre-eminence, and from many new ports, which tap virgin forests, better and larger scantlings can be obtained. The port of shipment is, however, of very little moment, and may indeed be in a different country from the forest where the timber was grown. The writer of this note, when inspecting one of the sawmills near Sundsvall (a Swedish port), saw piles of yellow (red) deal which had been grown in Finland, but which would be shipped to our own country from Sundsvall. Then, again, we may point out that there is not any uniformity in the classification adopted by the various shippers. In some cases the timber may be shipped as "unassorted," while in others it may be sorted into as many as six different qualities. What is required in a specification is a clear definition of quality, and the clauses suggested by the writer of the pamphlet meet this requirement fairly and reasonably. The pamphlet is temperately written, and cannot fail to be of use in reducing or removing one source of friction between architects and builders. Perhaps the writer of it may be induced to issue a second article dealing with American pines and spruce and with hardwoods.

Stanley Abbey. Two MILES to the south-east of Chippenham was the Cistercian Abbey of Stanley colonised about 1154 by monks sent from Quarre in the Isle of Wight. The site, which belongs to the Marquis of Lansdowne, is an open field, and the buildings are indicated by mounds of earth in the middle of which is the level square of the cloister. The river runs on the north side, and part has been deflected by a straight ditch, which marks the drain of the Abbey. With the permission and kind loan of men from the owner, Mr. Harold Brakspear, F.S.A., of Corsham, has been able to make some excavations on the site. These were begun on the line of the eastern range, which from the church was over 200 ft. in length. The chapter-house is only 27 ft. wide, but was divided by two rows of marble columns, one of which was found as it fell and was a monolith 8½ in. in diameter and 6 ft. 2 in. long. There was also some of the

tile pavement and a coffin found *in situ*. Northward from the chapter-house was the dortor sub-vault, 27 ft. wide, divided into at least twelve bays by a row of octagonal columns down the middle, one of which, owing to being bedded in a cross wall, remains to its full height. Nearly the whole of the outer walls, so far as at present traced, have been entirely removed, and, this being the case, it is remarkable that the centre of the buildings remain as they fell. Work has now been started on the church, which has revealed large patches of the original tile paving, and it is hoped that in time the whole abbey may be systematically explored, and so add another apparently lost plan to those of Cistercian Abbeys in this country.

Turner's Drawings. It is satisfactory to find by the Report of the Trustees of the National Gallery that there is to be a chronological and descriptive catalogue made of the Turner drawings in the possession of the Trustees. It seems, however, that a private individual, Mr. A. J. Finberg, was the originator of this plan, for, after, on his own initiative, a careful examination had been made of the many drawings possessed by the Trustees, it was decided by them to entrust to Mr. Finberg the task of undertaking the above work. Mr. Finberg has for a number of years given much time, thought, and labour to the study of Turner's drawings, and it is to the credit of the Trustees that they have taken advantage of a capable worker for this special purpose when he—providentially as it were—turns up. It is to be hoped that no over-enthusiasm will cause Mr. Finberg to state doubtful dates or conclusions, but at any rate we congratulate him on so satisfactory a conclusion to his previous studies, and the Trustees on seizing their opportunity.

Water-colours by Mr. Sutton Palmer. THE three first numbered drawings in the collection of Mr. Sutton Palmer's water-colour drawings of Surrey subjects, at the Leicester Galleries, are well placed to attract the visitor, for they are all beautiful—"Twilight, Wotton" (1), "A Slope of Bluebells" (2), and "The Wey—near Ripley" (3)—the first-named in particular of exquisite beauty and finish, yet not over finished. As we go on we come on other beautiful drawings, but we realise that this accomplished water-colour artist has never yet settled on his style. "The Silent Pool" (12), one of the larger works, is what we call a scenic drawing—over-finished and rather like a stage effect; whereas "Frensham Common" and "The Great Pond, Frensham" (10 and 15) are in a far better and broader water-colour style, and No. 12 hardly seems to be the work of the same artist. We find a good many other beautiful drawings, and then in "Flanchford Mill" (45) we suddenly come across a mere piece of commonplace, and in "Spring Time" (56) we are reminded of Birket Foster. Among the best of those which represent the best side of the artist are the panoramic view of "The Vale of Albury" (62); "The Cloud" (30); "The Last Glow" (37); "Shere Heath" (42), which shows a fine sky; "From the Rim of the Punchbowl

* Published by Alfred Haworth & Co.

Head" (50); and "A Gravel Pit" (70). At his best Mr. Palmer is a really fine artist; it is curious that with these capabilities he should be content sometimes to relapse into the pretty commonplace of water-colour art.

At this Gallery in Bond-street there is on view a fine collection of etchings by Mr. Cameron, Mr. Alfred East, Mr. W. Monk, and other artists in etching. In the upstairs Gallery Mr. Ernest W. Haslehurst exhibits his collection of water-colours illustrating "The Thames—from Source to Sea," which are apparently being reproduced in colour to form an illustrative volume of Thames pictures. Their style of execution is well suited for colour reproduction, and has perhaps been dictated by this consideration; but among them are some which are very successful as water-colours—"Early Morning, Upper Thames" (23), "Cliveden Woods" (26), "Looking Southward to the Nore" (31), and others.

THE EXHIBITION OF THE ANCIENT ART OF THE MARCHES AT MACERATA.

I MENTIONED in my notice of the exhibition of ancient Abruzzese art at Chieti (*Builder*, December 23, 1905, p. 667) that a similar exhibition had been held at Macerata during the latter part of last summer, in which specimens of the art of the Marches—the district includes the provinces of Pesaro and Urbino, Ancona, Macerata, and Ascoli Piceno—were for the first time brought together.

The elements of which the exhibition was composed differed considerably from those which gave its main importance to that of Chieti; and, unlike the latter, it was associated with a modern industrial exhibition,* of which it only formed a section. Goldsmiths' work was far less prominent, and majolica was almost entirely absent—rather from lack of space, perhaps, than from any other reason, considering the celebrity which the productions of Urbino justly enjoy; though from an artistic point of view they might more correctly, it is true, be considered to belong to Umbria than the Marches. Pictures, however, occupied the predominant portion of the space, in strong contrast to what was the case at Chieti—and, indeed, what was seen of the pictorial art of the Marches was something of a revelation, so that it may be well to devote attention in the main to this branch of the exhibition.

The first room was devoted to works of minor importance, but the second and third formed the centre of interest, as in them the progress of the painter's art was illustrated step by step.† Though the condition of some of the pictures was not very good, they had at least not suffered from restoration.

The first stage was marked by some frescoes, transferred from the refectory of the Augustinian monks at Fabriano, and belonging to the municipality of that town. They date from the XIIIth century, and are almost "Byzantine" in style, with stiff, conventional figures and faces, and decorations and architecture in the backgrounds which recall those of slightly earlier mosaics, the latter revealing as yet no traces of Gothic, and being, it would seem, purely traditional.

The next step came with the works of Allegretto Nucci in the following century—in the usual early Umbrian style, still somewhat wooden, but making an attempt towards emancipation. Allegretto was the master of Gentile da Fabriano (1370-1423), no examples of whose work were exhibited. Progress was, however, somewhat gradual, and, in a large picture by Andrea da Bologna, from Fermo, painted in 1369, we find him simply

copying Nucci's work of forty years earlier. In the XVth century, however, the art of the Marches begins to develop on independent and interesting lines.

A Madonna in tempera by an unknown master, from Matelica, though pleasing, still shows much of the traditional restraint, but Antonio da Fabriano, in a *tavola* from Genga, painted on both sides, shows decided traces of Flemish influence, though, in his Crucifixion, from Matelica (1452), and his Death of the Virgin, from Fabriano, he is less progressive. Lorenzo Salmehi, of San Severino, whose works occupied the beginning of Room III., still clung to the old style; Lorenzo di Maestro Alessandro da San Severino marks a decided advance, and his works have quite an individuality of their own. There is much fineness and delicacy in the rendering of the details, though some of his works show a little stiffness (e.g., an otherwise beautiful Madonna, from the Collegiata at Pausula, bearing the date 1481); but the Marriage of S. Catherine, from Matelica, which belongs to the Confraternita di S. Angelo of that city, is an even more successful work, soft in colouring, and pleasing in expression, and of a style distinct from contemporary Umbrian work.

A contemporary of his was Alvise Vivarini (1464-1503), to whom are doubtfully attributed some figures of saints in richly-carved frames, from the cathedral at Pausula.

Carlo Crivelli, the Venetian (ca. 1430-1494), though he was active in the Marches, is not well represented—a small Madonna from his hand, in the gallery at Ancona and a large picture in several compartments in the cathedral at Ascoli (1475) were considered too precious for transportation—but there are some very good specimens of the work of his brother, Vittore (about 1485), among them a Madonna adoring the Child dressed in a splendid brocade robe, with winged angels' heads above her and a kneeling cherub at each side behind her, playing a violin and mandoline respectively, from S. Francesco at Sarnano; a Madonna and Child, with a saint in a separate compartment on each side, and the Crucifixion in the central compartment above, from Monte San Martino, bearing the date 1490; and several works from Ripatransone. Other contemporary painters, such as Pietro Alemanni and Stefano Folchetti of S. Ginesio, were less successful; but Cola d'Amatrice, the architect of the handsome facade of S. Bernardino at Aquila, also produced some good pictures. His style varied considerably; at first he copied the Crivellis, then developed a style of his own, while, in some of his works, the influence of Michelangelo may be clearly traced.

A few isolated works of Umbrian masters—Giovanni Santi, Timoteo Vite, and Raphael himself (the predella of a Madonna by Perugino, from S. Maria Nuova at Fano, belonging to the period when he was still under the influence of Perugino), came next, and the last few pictures in the room were works by Vincenzo Pagani (fl. 1529), which show the influence of Umbrian masters. The pictures in the later rooms, though belonging to collections in the Marches, were not the work of local artists, except for several Madonnas by Sassoferato (G. B. Salvi, 1605-1685), and included no works of first-rate importance, and belonged, for the most part, to the XVIIIth and XVIIth centuries. With the section of modern art I do not propose to deal.

The room devoted to sacred art contained some fine specimens of vestments, especially a part of the cope of Gregory XII., who died at Recanati in 1417, and many vestments from the cathedral at Ancona; there was also some good church plate, though neither so fine nor so extensive an exhibition of it as that at Chieti. Two fine processional crosses from Visso, of the School of Nicola di Guardiagrele, may be mentioned, and also some reliquaries given to the city of Sassoferato by Niccolò Perotti, the learned author of the *Corrucoipia*,* in 1473, and another given by Sixtus V. to Montalto, his native city, in coloured enamel (French work?) in high relief. The objects suffered, however, from lack of space.

The prehistoric antiquities of the Marches were fairly well represented; the museum of

Ascoli sent a selection of its finest objects, and various private exhibitors also contributed—two enormous bronze sacerdotal *fibulae* from Sirolo, about 2 ft. long, from which hung a large block of amber, were especially noticeable. The Roman antiquities were of less importance. There was also a large collection of statutes, deeds, etc., from the archives, and a room was devoted to works written or printed in the local dialect.

The exhibition was, on the whole, a considerable surprise, especially as regarded the development of pictorial art in the Marches; and its promoters deserve high praise for the energy they displayed. It was unfortunate, however, that no adequate catalogue was to be had during the exhibition. T. A.

A NEW MOVE IN THE ARCHITECTURAL PROFESSION.

A SPECIAL general meeting of the Royal Institute of British Architects will be held on Tuesday, April 3, at 8 o'clock p.m., to receive formally the Draft Registration Bill and the Report and recommendations of the Registration Committee adopted at a meeting on March 20 when it was resolved to recommend the Royal Institute to adopt the scheme outlined in the Report instead of the Draft Registration Bill already published. The following resolutions are to be proposed from the chair:—(1) That the Report and recommendations of the Registration Committee, dated March 20, 1906, be adopted; (2) that the Council be requested to take the necessary steps forthwith to apply to His Majesty the King for a revised or supplemental charter embodying the said Report and recommendations, and also as soon as possible to prepare and present a Bill to Parliament to give effect to the same.

The following is the Report of the Registration Committee:

"The Royal Institute of British Architects—The Committee have the honour to report that a Sub-Committee have held fifteen sittings, and have heard the evidence and views of twenty-four architects from various parts of England, Ireland, and Scotland.

As a result of their deliberations the Committee is impressed with the desire of many architects (especially those who are practising in the provinces) that a legal status should be given to only qualified practitioners in architecture, and they are of opinion that this can be met by applying to Parliament for a legal diploma of membership of the Royal Institute of British Architects, it being made compulsory that after (say) 1910 all architects, before receiving this diploma, must have passed through a definite course of architectural education in a recognised school.

The Committee believe that in a short time if this were done the holding of such a diploma would prove to be of professional value to all practising architects.

It is generally admitted by the advocates of the present draft Bill that the only chance of getting Parliamentary powers to carry out such a penalising proposal as the restriction of the title of architect would be (1) by placing the registration in the hands of a board partly composed of members outside the Institute, though it is suggested that the Institute should be largely represented; and (2) by exempting from its operations all the members of the Institutions of Surveyors and Civil Engineers. The Committee also generally admitted that the standard for admission to such registration would have to be a low one.

The Committee believe that unless the profession can approach Parliament with approximate unanimity there is little chance, in the present state of public business in the House of Commons, of getting any contentious measure passed.

The Committee therefore recommend that at present the Institute should confine itself to attempting to obtain Parliamentary recognition for its membership, an attempt which, they believe, would meet with very general support. Such State recognition would encourage education and raise the qualifications of architects, and would at the same time avoid the temporary necessity of granting a statutory title to unqualified men.

The Committee recommend that the title of the Institute be changed to that of the Royal College of Architects, and that a temporary third class of professional members be established.

As an appendix to this Report the Committee submit an outline of suggestions to give effect to the recommendations herein contained.

The Committee beg leave to state that this Report has been adopted by them unanimously at a meeting on March 20, 1906, at which the following members were present:—

Edwin T. Hall (Vice-President), in the chair.	J. S. Gibson, Alexander Graham (Hon. Secretary).
R. S. Balfour.	E. A. Gruning.
W. H. Atkin Berry.	G. H. Gouley (Bristol).
A. W. Brevill (Nottingham).	George Hubbard.
J. J. Burnet (Glasgow).	H. V. Lancaster.
J. C. Cackett (Newcastle).	A. N. Prentice.
W. D. Caroe.	G. H. Fellowes-Pryme.
T. E. Colclitt.	John Slater.
A. W. Cross.	Leonard Stokes (Vice-President).
E. Guy Dawber.	C. G. Townsend.
E. M. Gibbs (Sheffield).	Paul Waterhouse.
W. Gilliland (Belfast).	Sir Aston Webb.
	Edmund Woodthorpe.

* The good work done by the technical schools in drawing, woodcarving, etc., is worth mentioning.

† The Ministry of Public Instruction has, as in the case of the Chieti Exhibition, photographed all the more important objects.

* A Latin glossary, the first edition of which was published by Aldus in 1499.

The President, whose absence through illness was deeply regretted, together with Mr. T. Hare, unavoidably prevented from attending, have desired their names to be added to those appearing.

By order of the Registration Committee,
W. J. Locke (Secretary).

Appendix to the Report: Heads of Scheme for Raising Qualification of Architects.

(1) Revise the Charter, and (2) submit a Bill to Parliament.

Charter Revision.

(a) Change name to Royal College of Architects, and Local name: F.R.I.B.A. and A.R.I.B.A. to F.R.C.A. and A.R.C.A.

(b) Substantive provision—In future Fellows to be elected (1) after 1906 from those who have passed the Associates' Examination; or (2) by Council in special cases.

(c) To authorise the constitution of a scheme of education to be compulsory of all candidates coming in for examination after 1912.

(d) Create new subscribing class of temporary duration, without the power of voting, to be called "Members of the Club," at a low fee for adult household architects who are not eligible for F or A.R.C.A.

All members of allied or other societies of architects found eligible by the Council of the R.C.A., to be admitted as Licentiates without election. Admission to class in be closed within a year after the passing of the Bill.

All to sign declaration and obligation as to professional conduct.

(e) F., A., and L. to be defined as professional members.

(f) Disciplinary powers to be increased with power of appeal.

Bill to Parliament.

Declare it is in public interest that employers should be empowered to recognise architects who are recognised as qualified by a competent authority and those not so recognised.

Enact.

(a) Following the precedent of the Law Society, the Royal College of Architects (already recognised by Parliament as authority for granting certificates required by public surveys) before they can receive appointments be empowered and required, by its Council, to institute and supervise education and examination of architects for admission to the R.C.A. and to confer the titles F.R.C.A. and A.R.C.A.

Confirming all such present titles.

(b) Give statutory force to present charters.

(c) Localise scale of charges, to be charged by Privy Council, for all professional members of R.C.A.

(d) Municipalities and other public bodies acting in fiduciary position shall on the erection or alteration of buildings in cities or towns employ a professional member of the R.C.A.

(e) Amend clause (d) of the Bill to be introduced, but it is likely to commend itself to Parliament, and it follows a policy long supported by the Council and by a large number of the members of the Institute. At the worst it could be struck out of the Bill.

Memorandum to be Considered at the General Meeting.

In accordance with a resolution of the Registration Committee, the President appointed in October last a Sub-Committee, consisting of the following:—Sir William Emerson, Sir Aston Webb, Messrs. J. Slater and T. E. Colcutt on the one side, and Messrs. J. S. Gibson, A. W. S. Cross, W. H. Smith, and George Hubbard on the other side, with the President as chairman. Subsequently, owing to Sir Wm. Emerson's absence in India, Mr. E. H. Hall was nominated by the Committee to take his place, and the President's selection was subsequently confirmed by the Registration Committee.

At a meeting of the Sub-Committee, on October 25, 1905, the following procedure was agreed upon—viz., to summon twenty-four witnesses, comprising six metropolitan and six provincial architects, and a similar number of metropolitan and provincial architects holding the opposite view, the witnesses to be summoned to give their personal opinion on the question.

The first meeting for the examination of witnesses was held on November 22, and eleven subsequent meetings were held, when the following twenty-four gentlemen were good enough to attend and express their opinions before the Committee. Those in favour were Messrs. W. Gillibe Scott, H. A. Saut, Lewis Solomon, Ellis Marsland (Hon. Secretary, Society of Architects), H. W. Mills, F. R. Farrow, H. L. Goddard (Leicester), S. Perkins Pick (Leicester), H. Smith (Bristol), W. J. Gilliland (Belfast), W. S. Beaumont (Manchester), John Koppie (Glasgow); and against them Messrs. J. Macvicar Anderson, Professor Baresford Pite, Reginald Blomfield, A.R.A., Basil Champneys, H. H. St. B. Jackson, A. C. Hedfield (Sheffield), Professor Capper (Manchester), J. J. Burnet (Glasgow), J. A. Gulch (Kettering), W. M. Fawcett (Cambridge), and Professor C. H. R. Rely (Liverpool).

A short time was present throughout the proceedings to place the evidence on record.

The Sub-Committee then proceeded to consider the evidence before the Registration Committee. The general effect of the evidence may be briefly summed up as follows:—On the one hand it was strongly felt by the witnesses in favour of registration that the standard of architectural ability would be raised by instituting compulsory training and examination; and also it was thought that, in the interest of the public, it was the province only of those who had proved their competence by passing a qualifying examination should be legally entitled to call themselves architects.

On the other hand there was an equally strong feeling that the measure proposed would have a tendency to lower the art of architecture, and that, as the test to be applied must, in the opinion of many, be a low one, there would inevitably be a tendency to register very poorly qualified men; and that, though examinations might fairly test a man's constructive knowledge, they could not fix a standard in art.

It seemed obvious that with these strongly conflicting views there would be the greatest possible difficulty in obtaining Parliamentary sanction to the measure proposed, and the Sub-Committee, after due deliberation, therefore unanimously agreed to the terms of a Report, which was subsequently submitted to and approved at a well-attended meeting of the full Registration Committee held on the 20th inst. It was considered that, amongst the incidental advantages to be obtained by these proposals, and in addition to those mentioned in the Sub-Committee's Report, (a) it would ensure legal recognition of the Institute's scale of charges; (b) it would enable the Institute to deal more effectively with cases of disreputable professional practice; (c) and it would be likely to meet with the fairly unanimous support of the whole body of the Institute.

THE ARCHITECTURAL ASSOCIATION.

An ordinary general meeting of this Association was held on Friday last week at No. 18, Tufton-street, Westminster, Mr. E. Guy Dawber, President, in the chair.

In the unavoidable absence of Messrs. H. Tanner, jun., and A. Marjony Watson, the Hon. Secretaries, Mr. Francis Hooper read the minutes of last meeting and the nominations.

The Chairman said that they would all regret to hear that Mr. Watson had been obliged to resign his position as Hon. Secretary owing to ill-health. They were all sorry to hear this, and they would all wish to express their appreciation of what Mr. Watson had done for them in the past, and they hoped he would soon be recovered.

The Building Fund.

Mr. W. Kaula having been elected a member, the following further donations to the Building Fund were announced:—

Horace Cheston	£	s.	d.
Walter Gilbert (further donation)	2	2	0
F. Dare Clapham (double sub.)	1	1	0
V. T. Bolton	10	6	
W. Milford	10	6	
D. Newman	10	6	
H. K. Boreham	10	6	

Deceased Members.

On the motion of the Chairman, votes of condolence were passed to the relatives of the late Mr. Zephaniah King, Mr. Lancelot Simmons, and Mr. Frank Whittingham. Mr. King, he said, was a very old member, who joined in 1854.

Mr. Hooper announced that the Camera and Cycling Club would make an Easter tour to Winchester, commencing on Thursday, April 12.

The House List.

The Chairman then read the following House List for session 1906-07, remarking that it was open to any member of the Association to put forward any name for nomination before the meeting on April 6:—

As President, Mr. R. S. Balfour.
As vice-presidents (two to be elected), Messrs. Walter Cave and A. Needham Wilson.
As Council (nine to be elected), Messrs. Louis Amber, F. D. Clapham, E. Guy Dawber, J. B. Fulton, Theodore Fyfe, J. S. Gibson, W. Curtis Green, Arthur Keen, Arnold Mitchell, John Murray, J. N. Peckham, E. A. Richards, J. MacLaren Ross, J. Tatchell, A. Marjony Watson, R. Douglas Wells, R. F. Wheatly.
As hon. treasurer, Mr. Henry T. Hare; as editor of the *Architectural Association Journal*, Mr. Maurice E. Webb; as hon. librarian, Mr. E. Gunt; as hon. secretaries, Messrs. H. Tanner, jun., and C. Wainwright Smith. Other officers—Hon. solicitor, Mr. W. H. Jamieson; hon. assistant librarians, Messrs. H. J. Worror and Percy May.

The London Club-house of the Last Century.

The following paper, prepared by Mr. A. W. Soames, M.P., was then read by Mr. D. G. Driver, Secretary, in the absence of the author:—

"Man is said to be a sociable animal," says Addison in opening his 'Essay on Clubs,' and it seems indeed to have been the custom for men, and women also, to associate themselves together in clubs from a very early period of the history of the world. These clubs, however, in the early days usually partook more of the nature of religious or trade guilds than of the modern social club, although in ancient Rome instances of the purely social club are not wanting.

But, as far as I have been able to ascertain, the erection of buildings devoted exclusively to the use of a social club in England does not go further back than about the middle of the XVIIIth century. Before that date these clubs met in taverns or at coffee-houses, usually on fixed days, and they did not as a rule appear to have had any room or rooms reserved for their permanent exclusive use.

The earliest known club in London of the social type seems to have been the Broad-street, or Friday-street, Club, originated by Sir Walter Raleigh, which met at the Mermaid Tavern; and among others which sprang up later may be named the Green Ribbon Club (1675), which apparently was the first to provide permanent headquarters for a political party at the King's Head Tavern, at the south-west corner of Chancery-lane. In the course of the XVIIIth century we find that White's was founded, or re-founded, in 1750; the Cocoa Tree, 1746; Boodle's, 1762; Brooks's, 1764; and Arthur's, 1765. And these clubs, outgrowing the accommodation of coffee-houses or taverns, erected buildings for themselves. During the next half century only two clubs—and those of a different character—the M.C.C. (1787) and the Smithfield (1798) were founded, and it was not until the year 1813 that clubs began to spring up in any numbers in London. Between 1815 and 1852 no less than fourteen clubs were founded:—The Guards', 1813; United Service or Senior, 1815; Portland, 1816; Travellers', 1819; United University and Union, 1822; Athenæum and Oriental, 1824; Junior, 1827; Wyndham, 1828; Oxford and Cambridge, 1830; Garrick, 1831; Carlton and City of London, 1832. Following these, we find in 1857 the Reform and Army and Navy (or Rag), and in 1840 the Conservative Club. This may be said to terminate the earlier period of club building, as in the next quarter of a century comparatively few new clubs were founded; and indeed, the bulk of the newer clubs belong to the last twenty years of the century.

The evolution of the club-house, as might be expected, reflects changes in our social habits. Two, at any rate, of the older club-houses—the Athenæum and the United University—when built contained no smoking-room. It was not until 1857 that Thackeray succeeded in persuading the committee of the Athenæum to allow smoking on the premises. In the case of the United University it was found necessary to add a third floor in order to provide a smoking-room. This house, which was built by Wilkins, the architect of the National Gallery, has lately been pulled down, and a new club-house is being erected on the site by Mr. E. T. Blomfield, A.R.A. In a remote corner of the Oxford and Cambridge Club may still be seen the row of pegs on which the few members who smoked in the early days of the club used to hang their coats, which they wore when indulging in that pleasant, but then unpopular, habit.

The greater facilities for travelling of the present day have also had their effect on the clubs. Not only have they increased in number, but also in size, and within the last few years it has become usual for clubs to provide bedrooms for members, which was only the case in a few of the old clubs, where perhaps a dozen might be found; while the modern political club, such as the National Liberal or the Constitutional, with its 108 bedrooms, is really more like a hotel than the old-fashioned club. Consequently we find that, whereas the Carlton and Conservative Clubs have only one floor above the ground floor, the Constitutional runs into six stories and 200,000, while the Travellers' was built for the modest sum of 23,160*l.*, and the Athenæum cost no more than 34,239*l.* 2s. 6d.

Two circumstances may be noticed which had a considerable influence on the early clubs, the one beneficial and the other adverse. The removal of Carlton House, which faced the bottom of Waterloo-place, gave some excellent sites, now occupied by the Senior, Athenæum, Travellers', Reform, etc.; but, unfortunately, the period was one when exteriors were almost invariably rendered in stucco or cement, and this detracts seriously from the appearance of nearly all the older clubs.

The planning of a club-house, of the earlier type at any rate, given a well-lighted and sufficient site, is not a very complex problem, and it is one that gives excellent opportunities to the architect. The hall and staircase naturally play an important part in the design, but, with a few notable exceptions, the designers of our club-houses have not made the most of their opportunities in this respect. In many cases we find a spacious hall with an ample staircase, but

the effect of the whole completely destroyed by the approach being at one side of the hall, and not opposite the staircase. A notable instance is the United Service Club. The hall is central and on a vast scale, occupying indeed a very large part of the site, and a central flight of stairs rises boldly, branching right and left and returning on both sides to the first floor. But the approach to this hall is by dodging out of a corner of the outer hall or lobby at one side of the staircase, with the result that there is no vista, and the effect is absolutely lost. The same is very largely true of the other old service club, The Army and Navy (or Rag), which contains a large, florid staircase, similarly placed and planned, except that the central flight, instead of descending in an unbroken line to the ground floor, branches right and left shortly before reaching the ground, with a questionable effect. In the Conservative Club, also, the effect of a somewhat remarkable hall and staircase is diminished by a side approach in one corner of the hall.

As an example of how not to do it the Oriental may be cited. Here, again, we have an outer lobby, not particularly well designed, communicating near the corner again, with a central hall which is little better than a well, and has a poor geometrical staircase.

The Union Club has also a geometrical staircase, but the approach is better, and the space not so cramped. As, however, the main staircase ascends to the second floor, the well-like effect is not entirely avoided; and, indeed, there seems to be a good deal to be said for the plan adopted in many of the older houses of carrying the main stairs only up to the first floor, and reaching the second and upper floors, if any, by a subsidiary staircase.

At the Oxford and Cambridge Club an outer hall leads by thirteen steps into an inner hall, with stairs facing, but, as they are dog-legged, and the return flight cuts in half the large windows on the half-landing, the effect is far from good.

The hall of the Junior United Service is entered through a small glazed lobby, probably an addition to the original scheme, and immediately opposite is a very broad flight of stairs, returning dog-legged both ways; but the effect is much marred by coarse and heavy detail, and the dog-legged flights are not happy.

At the Reform the hall, of the *cortile* type, is very successful, but the stairs are almost concealed, and hardly enter into the design at all.

The Conservative Club possesses a fine hall, to which allusion has already been made. It is square in plan, and the stairs ascend through an archway in the middle of one side, but the distinctive feature is a coved circular gallery at the first-floor level, with a domed glazed light above. This gives four rather awkward spandril-shaped soffits to the gallery, but the effect is striking and distinctly good, though one could have wished for rather more refined detail.

The treatment of the stairs in the National Liberal Club is somewhat unusual. The site is of an awkward shape, and it was no doubt a matter of difficulty to contrive a stately staircase for so lofty a building of so irregular a plan. The stairs ascend round an oval well, and the result is not particularly happy.

The most successful treatment of the hall and staircase is found in the Athenæum. The plan is both simple and effective. The site is a regular oblong, about 103 ft. by 79 ft. This space is divided into three portions by walls parallel to the shorter sides, of which the middle part, occupied by the hall and stairs, is considerably the largest, and is roughly two-fifths of the whole. The entrance-hall, which is only one story in height, is divided by irregularly-spaced colonnades somewhat in the manner of a basilica, with a low segmental coffered ceiling over the nave and flat ceilings to the aisles. At the end of this hall, which is somewhat dimly lighted by windows alongside the main entrance, is seen a broad and lofty flight of stairs, branching right and left and returning on both sides, the whole flooded with light from above. This plan of lighting is very pleasing, and the effect of the whole is very good.

The lighting of large rooms 20 ft. high or

more is a matter of some little difficulty. The older architects for the most part frankly gave up any attempt to produce a window that would reach anywhere near the top of their rooms, and took refuge usually in a coved ceiling. As these clubs mostly occupy positions where there is a good light, and their rooms are not very wide, I am not sure that they were not right. Certainly the elevations gained in solidity and dignity by having sufficient wall space, where it is not frittered away or overloaded, and the attempt to use very large windows in the New University, Junior Constitutional, National Liberal Club, etc., is not so successful as to be likely to induce anyone to follow their example. In a few cases—e.g., Oxford and Cambridge and Junior Carlton—an additional height has been obtained by using round-headed windows. In one case—the 'Rag'—this difficulty has been met in another way. The ground floor rooms have a window of ordinary dimensions, surmounted by an entablature carried on engaged, rusticated columns, and above this a sort of fanlight, square-headed externally, but arched on the interior. The result is not pleasing; externally it suggests an entresol, and I do not think the interior is any the better for them.

The majority of the large rooms are, of course, lighted from the side, but the coffee-room at the Oxford and Cambridge (65 ft. 10 in. by 32 ft.) is lighted by lofty windows at both ends, a method of lighting which does not give a pleasing effect.

Some of the earliest clubs—e.g., the Athenæum and United Service—have the ground floor very little raised above the street level, but it was a very usual practice in later houses to raise the ground floor a few feet higher, and get a fairly well-lighted mezzanine to provide lavatories and offices.

One of the principal objects of the designer of a club is, of course, to provide three or four rooms on a large scale which shall have some architectural character and look comfortable within. I hold, then, that the ideal room for a club, whether it be coffee-room, drawing-room, library, or smoking-room, is one which provides a considerable number of nooks or recesses, where little coteries can assemble, or where a quiet table for reading or writing can be placed. Nothing gives an air of less comfort to a coffee-room than a bare space of straight wall with an interminable row of little tables set against it, all of the same size and shape. Therefore I would say to anyone who has the good fortune to design an important club-house, break your room up boldly into bays, with columns and ante of ample projection. An excellent instance of this is the library at the Travellers', the most charming room in any club in London. The dimensions are 65 ft. by 22 ft. 6 in. The central bay is end bays by three grouped windows, and the end bays by one each. Slender coupled shafts stand well away from the ante on pedestals connected to them, and some 7 ft. or more from the side walls. The entablature is returned across the room over these shafts, and the effect is most happy.

In Barry's later house, the Reform, we find a similar arrangement. Here the coffee-room and library are each about 117 ft. by 27 ft., and 20 ft. high, and are divided again into three bays and recesses at each end. But here, instead of a single entablature crossing the room, he has separated his bays by two entablatures about 10 ft. apart, with a soffit between at a lower level than single columns in ante and in the other on coupled shafts on pedestals standing boldly away from the walls. This arrangement gives additional nooks for small tables, and somewhat disguises the excessive length of the room in proportion to the width. Both rooms are very successful, and the library is second only to that in the adjoining house.

The L-shaped room was not employed in any of the older houses, but it is not to be despised for a club. A more sociable method of entertaining strangers is to allow them the use of the smaller arm of such a room, instead of relegating them to a badly-lighted and stuffy little back room, as is so often the unhappy lot in the older and less made an alteration to its coffee-room, and adopted this plan, and two good examples of L-shaped rooms are to be found at the Junior Carlton.

Time will not permit me to give more than a few notes upon some of the more important club-houses, and, indeed, an elaborate description of buildings whose appearance must be familiar to all would be a work of supererogation. Taken as a whole, I should put the Reform Club first in order of merit. The plan is very simple. The main building is a rectangle 120 ft. by 105 ft., and the interior is a covered courtyard, 56 ft. by 51 ft., surrounded by a colonnade of Ionic pillars on un moulded pedestals supporting a gallery, above which a Corinthian colonnade carries the roof. This arrangement gives a perfectly symmetrical, dignified, and spacious interior, but the effect is a little marred by the interlacing cove lantern light, apparently of cast-iron. The use also of scagliola for the columns and wall surface is to be regretted.

This plan relegates the staircase to a very unimportant place in the design. It is entirely included, and leads up through an arch opening in the middle of one of the shorter sides. The plans of the ground floor and first floor are almost identical. On the south there is on both floors a room about 117 ft. by 27 ft.; on the west one of 50 ft. by 25 ft., plus a 7 ft. recess; and on the north or entrance side and east or staircase side smaller rooms. As regards the exterior, the composition is of the simplest. The north and south elevations show three floors each of nine windows equally spaced, and of one design for each floor, bound together by mouldings and enriched bands, broken only by a central door on the north, while the side elevation shows eight windows, with the four middle ones grouped rather closer together. A bold cornice and rusticated quoins complete the composition. The result of the simplicity of the treatment and ample space of plain wall is to produce a building of which breadth and repose are the leading characteristics. It may be said by some that there is not enough window for our northern clime, but, as no room in the club is more than 27 ft. wide, they are, as a matter of fact, sufficiently lighted, and I, for one, am thankful that Barry kept his wall space as ample as it is.

Its neighbour, the Travellers', an earlier work of the same architect, has a frontage of 72 ft. to Pall Mall, and a depth of 104 ft., with light only to the back and front. The architect has dealt with this by placing his entrance at the west end of the façade; from an outer hall a corridor, broken up into three bays and lighted by an open courtyard, leads to stairs on the left and the coffee-room beyond. This is well managed, and gives a good vista, while the courtyard lights a small house dining-room on the other side, and there is a good morning-room to Pall Mall. Of the charming library on the first floor I have already spoken. The elevation to Pall Mall is very quiet, simple, and well-proportioned, and in treatment much resembles its neighbour. But it suffers from being in stucco and from the necessity of placing the entrance at one end. The elevation to Carlton House-terrace, with its three grouped round-headed windows, is not so successful, and does not merit the praise which has been bestowed upon it. It is said, with what truth I do not know, that the Pall Mall elevation was suggested by the Pandolfini Palace at Florence.

The Athenæum, by Decimus Burton, is, or was, another building simple and formal in character, but it has been ruined beyond redemption by the unfortunate addition of a third floor set back some 7 ft. or 8 ft. inside the main walls of the building. It surely should not have passed the wit of man to design a third floor without committing such an outrage upon an important building in one of the most prominent sites in London. The removal, too, of the balustrade surrounding the area can hardly be considered an improvement. The continuous balcony at the first floor level is one of the rather unusual features of this building, and the small windows contrived in the panels under the balcony towards Pall Mall are certainly not happy. On the whole the exterior, though well proportioned and refined in feeling, leaves one rather cold.

The Oxford and Cambridge Club, by Robert and Sydney Smirke, was built in 1836-7, and cost no more than 26,743*l.*, though the frontage is about 90 ft., and the L-shaped site is 130 ft. in extreme depth, the whole

of which, however, is not covered above the basement. It cannot be considered as particularly happy either in plan or elevation. The dog-legged stairs and end-lighted coffee-room have already been mentioned as not pleasing, but the other rooms are more satisfactory. The elevation is not particularly successful. Sculptured panels over the first floor windows hardly succeed in concealing the fact that there is a vast height of wall above the windows, of which the use is not apparent, and the long, vertical lines which they introduce detract from the solidity of the whole.

The Conservative Club shows a symmetrical facade, with small wings of slight projection, the northern containing the entrance and the southern a large bay window. The ground story is rusticated, and the central block has a detached Corinthian order above, and the whole is finished with a balustrade. It is a building of some dignity, and the front is one of the most successful. The plan gives a fine room to the front, and there is a spacious coffee-room behind.

The United Service Club occupies a fine site, and the main lines of the building are not bad, though not of any striking originality. Exception might be taken to some of the details, but the building has a massive air, and is not inappropriate to a club of warriors.

The designer of the Junior United Services has not attempted any symmetry in his main elevation, but, by boldly placing his main entrance out of the centre of the facade, has secured a fine room with a large bay on the east. The impression, however, of the whole is one of heaviness without dignity, and the end elevation to Regent-street, with its windows of varying heights and shapes, is particularly unfortunate.

The Army and Navy Club, by Parnell & Smith, was completed in 1851 at a cost of 54,000*l.* It owes some of its features to the Palazzo Rezzonico, on the Grand Canal in Venice, which was designed by Longhena in 1680, and owes its upper story to Massari sixty years later. The entrance in the side street enabled the architects to provide a fine room to Pall Mall, but the details of the interior are over-florid, and not in the purest of style. The exterior is not unimposing, but one could have wished for a little more plain surface for the eye to rest upon.

The Carlton Club occupies a fine site, with a light on three sides, like its neighbour, the Reform, and the building is an elaborate one—a little too elaborate, in fact—and is open to the same criticism as the last. The surface is worried and cut up till there is hardly a square foot of plain surface to give repose to the eye. The polished granite columns, too, afford an unpleasing contrast to the stone, especially as the surface of the stone-work is now unfortunately disintegrating badly.

The Junior Carlton is a building which has been completely remodelled. As originally designed by David Brandon, and opened in 1869, it showed a projecting portico, with the entrance at the east end and a corresponding bay at the western end. A few years later, however, the club acquired the site of the houses which then existed beyond it on the west, and the club was extended and entirely remodelled by Mr. MacVicar Anderson, and reopened in 1886. The entrance is now central, and the plan, which has been skillfully rearranged, gives spacious L-shaped rooms to the east both on the ground and first floors, and provides amply for all the needs of a large club. The elevations cannot be considered as satisfactory as the interior. They are wanting in style, and of no particular interest.

The Garrick is a club of modest dimensions. Though founded in 1831, the present building was not opened till 1864. It was designed by F. W. Marrable, and presents no very remarkable features in itself, though it contains an extremely interesting collection of pictures, mostly portraits of members and of theatrical celebrities. The site is cramped, and irregular at the back, and the architect was compelled to place his entrance out of the middle in order to get a good room to the front on the ground floor.

Of the huge buildings that have been more recently erected for political clubs, it is difficult to speak in terms of much commendation. The National Liberal Club has

certainly more architectural character than the Constitutional or the Junior Constitutional, but, while fully admitting that the site was a difficult one, it is impossible to avoid feeling that more might have been made of it. The tower at the angle suggests either a back staircase or a chimney, or both, and a treatment of the angle might have been adopted which would have utilised it as a good and characteristic feature internally as well as externally, as witness the New Gaiety Theatre.

The change in scale between the windows of the lower and upper floors is so great as to be disagreeable, and if the lower windows had not been so vast the building would have gained much in breadth. If, however, it was considered absolutely necessary to keep them so large, more subdivision by mullions and transoms would have brought the large and small windows into better relation with one another.

The Constitutional Club occupies perhaps an even more awkward site, and it has not been successfully dealt with. Terra-cotta, too, is a poor material for a building on so large a scale, but a better material would not have redeemed it. The Junior Constitutional cannot, however, be said to suffer from a poor material, nor does the frontage so precariously offer any difficulties, but a marble front will not carry off a poor design, and this one is quite wanting in breadth and dignity.

With regard to all these three, the question arises whether buildings so lofty and on so large a scale can be satisfactorily treated with gables. I am inclined to doubt it. More emphasis to the horizontal lines is, I think, required than can be obtained with such a treatment.

Before closing a somewhat rambling and discursive paper a word of thanks is due to the secretaries of the various clubs for their courtesy and kindness in affording me facilities for viewing the buildings and valuable information with regard to them—a courtesy which, I fear, is somewhat ill-requited by adverse criticisms upon some of the houses."

Mr. Arthur Keen, in proposing a vote of thanks to the author, said that he had been much pleased with the form and method of the paper, and the subject, interesting in itself, was treated from a wide and comprehensive standpoint. The author had avoided the trivial and minor matters which might have been touched upon, and had gone to the root of the matter. He remembered a paper by Mr. W. Millard, who warned his hearers to be careful of the bugbear of architectural detail, and he was undoubtedly right. In cases where the detail was weak or poor, it was apt to offend to such an extent that we were prejudiced against the building, which might be in all essentials entirely admirable. On the other hand, where the detail of a building was fine and interesting, it might divert our attention from perhaps serious defects in plan and disposition, and from the composition as a whole. The only regret about the paper that he felt was that the author had not shown illustrations of the buildings, which were very interesting, and plans and photographs would have added to the interest. Club buildings were great opportunities for architects, and opportunities which were offered to very few of them. They were generally erected on fine and important sites; they were large buildings, and simple in their parts, and one always imagined that the committee of a club wanted a dignified, quiet, and refined building, rather than one of pretentious character. One must feel a certain amount of disappointment in viewing London club-houses as a whole; several of them were fine opportunities thrown away, and the buildings were of very little architectural importance. Many of them were solid, imposing, and dignified, but dull to a degree. Leaving out of the question the XVIIIth-century ones, which were pleasing and interesting in their way, the only ones which could be considered fine architectural compositions were the Reform, the Travellers', and the Athenæum. As to the Athenæum, he supposed that it was a drawback that the building was fronted with stucco, but it was the fashion of the time, and one must not be too severe for that reason. Moreover the building was so well kept and looked after that we

could forget the fact that its front was stucco, especially as it was architectural to a degree and very fine in its proportions, and there was a homeliness and a picturesqueness about the building which were enhanced, he thought, by the paint and distemper with which it was treated externally, and at the present time the paint and distemper had been so well applied that the building was made particularly attractive.

Mr. Soames had spoken about raising the building by the addition of an extra story, and they must all regret that that was necessary to the done; but, assuming that it was necessary, he failed to see how it could have been better done. The alternatives presented to Mr. Colclutt, the architect, were very few. The walls might have been raised, or a steep-pitched roof might have been put on, which would have had the drawback of a large number of dormers for the purpose of giving light to the building. Considerable reserve had been shown in the way in which the architect had treated the problem, and addition was made as unobtrusive as possible. It was a difficult matter satisfactorily to add to a building by heightening it; it was easier to widen it. There was the Sun Fire Office in the City which had recently been raised, and no expense was spared to make a satisfactory addition to what was perhaps one of the best buildings in London. The top story was taken off, stone by stone; a second story was then put on to agree in character with the first story, and the top one was replaced as it was before. He felt that the particular charm the building enjoyed before was quite gone; it had previously delightful proportion, exquisite feeling, with a fineness of detail which was particularly pleasing, and which distinguished it from all other buildings in the City, and that all seemed to have gone, although the work could not probably have been better done. The addition of a story was a detriment as a rule, especially in the case of classical buildings, but he supposed such additions were necessary in some cases. Of the other clubs, he felt that the Reform came first among them; it was a magnificent opportunity, and it was finely dealt with. The fact that the building was on the shady side of the street was a drawback, but, apart from that, there was hardly anything about it which failed to please; it seemed to possess all the good qualities of fine architectural design—fitness for purpose and site, fine proportion, exquisite feeling, and scale throughout the front—and there was fine proportion between the voids and solids. The windows and interspaces were judged with admirable feeling, and the whole was extremely fine. As to some of the other clubs, he felt that there were many good opportunities which had not been made the most of by the designers, and one had an uneasy feeling that such opportunities would not come again, for it was rarely that such sites were obtainable; nowadays ground rent is so enormous that a building had to be increased in height to meet the ground rent, and a bank or an insurance office had to be provided on the ground floor. Moreover, nearly every problem offered to architects now was more difficult than in the XIXth century, and he did not know that even Sir Charles Barry, if he were to come back to life, would be able to erect a block of flats with much success. As to the National Liberal Club, he understood that all the main lines of the adjoining building had to be adopted in the club—all the main cornices and strings ran through continuously, and Mr. Waterhouse did not have a free hand, except at the corner, where he had the opportunity of carrying out that well-designed turret at the angle, which gave some scope for his imagination; but the key of the building was set by the adjoining premises.

Mr. Matt Garbutt seconded the vote of thanks. The author, he said, worked rather disparagingly to the terra-cotta of the Constitutional Club; but whatever the sins of terra-cotta, it did provide its own sunshine. Red terra-cotta on a dull day was effective, and we ought to be glad of that.

Mr. H. P. G. Mauld in supporting the vote of thanks, said he did not think that the author did sufficient justice to the authors of modern clubs, seeing what great difficulties they had to contend with as compared with the difficulties of architects of earlier clubs

buildings. In the older clubs, the requirements were to provide large rooms, which meant that the architect could retain the same scale throughout the building, but, in the modern clubs, there were large rooms on the ground floor and small rooms above, and there was a contrast in scale between the upper and the lower floors. The author was rather emphatic in condemning the modern elevations, but he did not say that the plans were often very good; he thought that all would agree that the plans were in many cases admirable, and fulfilled their purpose in a striking way.

The Chairman then put the vote of thanks to the meeting, and expressed regret that Mr. Soames was not present, and that there had been no illustrations to accompany the paper. He also referred to the great difficulty the modern architects of club buildings in London and big cities had to contend with.

The vote of thanks was heartily carried, as well as a vote of thanks to Mr. Driver for reading the paper.

It was announced that the next meeting will be held on April 5, when Mr. E. Greenop will read a paper on "Valuations, Compensations, and Light and Air."

The meeting then terminated.

THE ARCHITECTURAL ASSOCIATION SPRING VISITS:

V.—FLATS IN HIGH-STREET, KENSINGTON.

AN important block of residential flats, known as Hornon-court, now in course of erection in High-street, Kensington, was selected for the scene of the fifth spring visit on Saturday, March 24, by the Architectural Association. The salient feature of the scheme lies in the fact that no effort has been made to overcrowd the site; but, on the contrary, some praiseworthy attempt is made in the spacious planning to give the building the idea of a bold architectural conception. A clear, regular site was at disposal, surrounded by streets, and, fortunately, the longest frontage, 242 ft., faces the High-street, which, with the average depth of 120 ft., produces an area nearly equal to three-quarters of an acre.

The ground floor and basement are utilised for shops or business premises, while the five upper floors are built as flats, of which there are fifty, of varying sizes. The shops extend over the full width and length of the ground; but the main group of flats is set back considerably from the noisy High-street, and connects two large wings extending the full length of the side streets. Two large enclosed terraces above the shops are thus formed, which Messrs. Daw & Son, the lessees, intend to lay out as gardens, the more important of which will have two fountains.

A large pediment is arranged on the central projection in the recessed front, built entirely of stone, and the only reason for its existence appears to lie in the desire to avoid all external expression in the central party-wall. In this, Messrs. Coleridge & Chesterton, the architects, have succeeded, but the result generally is to convey the idea of a large public institution rather than that of a collection of independent residential suites.

Portland stone is used on the ground story. The upper floors have all their dressings in "Palotte," a soft French stone which is said to harden with exposure, sufficient to withstand the action of the London atmosphere. The carvings and other enrichments are well done, the stone offering greater facilities than any other widely-used material. The upper wall surfaces are faced in red brick. The shop fronts below the main terrace have a stone cornice and balustrade, so that the usual effect of a large plate-glass window appearing to assist the support of a massive superstructure is here fortunately absent.

Steel construction is largely introduced. In this respect Messrs. Moreland have used solid wrought-steel columns in preference to cast-steel to ensure greater reliability and freedom from flaws.

MEMORIAL TO DEAN FARRAR.—The memorial which has just been erected on the south side of the nave of Canterbury Cathedral was executed by Mr. Albert B. Joy. It consists of a frame of grey marble of two shades, with a medallion portrait in Carrara marble of the late Dean as in middle life. The inscription bears an appropriate stanza quoted from "In Memoriam."

THE SURVEYORS' INSTITUTION.

AN ordinary general meeting of the Surveyors' Institution was held on Monday last at No. 12, Great George-street, Westminster. Mr. George Langridge in the chair.

The minutes of the last meeting having been read and confirmed, and some donations to the Library Fund having been announced,

Mr. J. H. Sabin resumed the details on Mr. W. Woodward's paper on "The Means of Locomotion and Transport in London," read before the Institution on March 12. He said he thought Mr. Woodward had almost overstepped the mark in attacking the London County Council and the British workman. They had before them at the present moment the completion of the London County Council's splendid scheme of a fine thoroughfare from Holborn to the Strand, and, after all, it was the British workman who put into form the creations of Mr. Woodward's brain. It was impossible to do away with the obstruction of traffic. That was a difficulty that had come to stay, and all that could be done was to modify it as far as possible. Obstruction in vehicular traffic arose either wilfully or unavoidably, and Mr. Woodward hit those responsible for it when he named the borough councils and those responsible for the streets, and the drivers of vehicles. He was passing along Albany-street recently in a motor-car, and found the road "up" close to a drinking fountain. Every driver of a horsed vehicle considered his horse in need of water, and drew up at the fountain, with the result that a great obstruction was created. This happened within 100 yds. of the police station, and should have been avoided. An order from the officer on duty would have prevented the obstruction, and he considered that it was possible by stopping this kind of thing to give some relief in crowded streets. What was wanted was a corps of traffic managers—a body of alert, sharp men who would see what difficulties arose, and act immediately. It would be necessary to have an Act of Parliament by which wilful obstruction could be avoided. There was a constant obstruction at the junction of Tottenham Court-road and Oxford-street, and quite recently, at the corner of Euston-road and Tottenham Court-road, he saw two brewers' waggons, one distiller's wagon, and two mineral water waggons making deliveries, and, added to this, a dust cart collecting house refuse. This, at 9.50 a.m., was a scandal. An alteration was needed in the hours of delivery, and should not be collected between the hours of 9 a.m. and 6 p.m. The traffic managers, he suggested, should be independent of police. There were narrow streets in which it was impossible to avoid delay, but even there it must be reduced as far as possible. There were very few main streets without other streets running parallel with them. Neither fast or slow traffic took these streets, and the traffic managers should have power to direct certain classes of traffic to them. There were, here and there, blocked ends to these parallel roads, and at a comparatively small cost it would be possible to remove the houses at the end and get a road through. With regard to trams, he could join issue with Mr. Woodward, because he found himself with the Advisory Board, who had just reported. It was said there were 350 miles of lines, but he did not know whether this referred to single or double lines. Even supposing it referred to double lines, it was not enough for it meant a mile of tramline to a square mile of street. Moreover, he had such a number of dead ends, which it was suggested should be joined up in the centre. But there was another method, and that was the introduction of circular routes. Under this system a car need never stop dead on its route except at the outer suburban end, and then a number of cars could follow each other without difficulty. If the Embankment were used as an exchange, there could be continuous services over the bridges. It seemed to him a lamentable thing that this was not done. He had occasion to visit Manchester recently, and the system in vogue there filled him with admiration. The cars followed each other with rapidity, and occasionally six cars cross roads they divided naturally, and disappeared without the least confusion or obstruction.

Mr. Hudson said he did not sympathise

with the previous speaker's condemnation of the police, who had only power to interfere with stopping places. Traffic certainly ought to take routes. He did not think Mr. Woodward's proposals would have the effect that was desired, and he was firmly convinced that nothing less than the re-alignment of our streets would affect the metropolis in a permanent way. What was done now should not be for this generation alone to carry out, but should be borne by two or three generations. People said: "Let posterity look after itself," but it must be remembered that what could be done now could not be done so easily some years hence. If, after the Great Fire, the metropolis had been replanned, or even had a plan of 120 years ago been carried out, we should be in a much better position to-day, and every year of delay increased the cost of reform. We must also consider the nature of vehicles. Mechanical traction was being extensively used now, and when horse omnibuses were superseded by motors, a quarter of the space would be gained, and a great deal of delay avoided. With regard to tramways, he thought municipal tramways should be checked, as motor-omnibuses were preferable. He would be very sorry to see tramways along the Embankment. The view along the Embankment from Westminster Bridge was very fine, and it would be unfortunate to see such a disfigurement. There was no objection to trams coming over the bridges. In Paris they did so without any aesthetic loss. He made a plea to everyone to do what they could to prevent a bridge being built through Temple-gardens, 600 yds. from Blackfriars Bridge. Overhead lines were undesirable. Anyone who had seen them in New York would know they would never be tolerated in London, because of trains passing in front of windows, the awful noise, and accidents. He believed that in New York they were about to be abolished. Mr. Woodward considered street refugees should be dispensed with, but with wide streets and fast-traveling vehicles, it seemed necessary to increase the number of them, for the people must be safeguarded. It had been suggested that there should be fixed stopping-places for stage vehicles, but he pointed out that the fewer the stopping-places the longer must the vehicle be kept waiting to let a greater number of people down, and so no time would be saved.

Mr. Walter Beer said he thought if any improvement could be effected, it was only by a bold and comprehensive scheme. It was not passenger traffic that required immediate consideration. We had about to come into operation a number of tube railways, and motor-omnibuses were being rapidly brought into service. We must, therefore, wait and see what improvement these would effect. It was vehicular traffic that required consideration. He was somewhat disappointed with the report of the Commission taken as a whole, for it did not contain an expression of opinion as to what should be done. It was only in the independent report of Sir George Bartley that one found any expression of opinion. He found, after giving a great deal of thought to the subject, that the only way in which the problem could be solved was by two main arterial roads north and south and east and west. He believed it had not been previously suggested that these roads should start in the country and finish in the country, or they would not have a sufficient collecting area to attract traffic and make the expenditure worth while. These roads must be carried at a high level through crowded areas, or else at congested places the traffic would be held up, and it would then not be worth while for a driver to go out of his way to get on the road. They must have railways along the route either under or overhead. The construction of the roads would displace a large number of people whom it would be impossible to rehouse in the neighbourhood, and these railways would carry them out in the country to their homes. Having made these railways at enormous cost, they would have formed a valuable route which would help to repay the cost. It would be necessary to acquire three times the width of road that was required, in order to recoup themselves, and, working in this way, recoupment came out nearly all right. He was firmly convinced there was no other means of relieving traffic but by main arterial thoroughfares, and they would pay their way.

See our issue for March 17.

Mr. Lynden Macassey remarked that a great distinction had to be drawn between what should and what could be done at present, and what could and should be left to the future. One had to satisfy oneself that the existing streets were used to their full capacity. They might find some cause of congestion and obstruction in the action of borough councils in divided streets. He had heard of a case where one council proposed making a shelter, to which the other council would not agree, and, as a consequence, a shelter, with only one side, was built by the council desiring it. Then these divided streets were broken up one side at one time of the year, and the other side at another time, as the respective councils thought fit. Then, where new estates are laid out, or streets made, one continually found that the roads were laid out at right angles to those on an adjoining estate, with no possibility of amalgamation into one arterial route. Tramways also were constructed so that changing became necessary, and this changing taking place on main routes caused delay and obstruction. Further, new railways were constructed without consideration as a whole, but each as an independent unit. With regard to streets, tramways, and railways, the first thing to do was to secure co-ordination. This must be taken in hand by some impartial and comprehensive tribunal. In France, when roads commenced to be laid out and railways constructed, they were part of a great scheme, and railways recently constructed were part of this scheme of years ago. Before any attempt was made to construct new streets and railways, there must be a tribunal to decide whether what was proposed to be done fully met the requirements. This tribunal should have advisory powers, and any new Bills should be referred to it for report. It should also have supervisory powers, and report on the shortcomings of various undertakings, and expose the action of local authorities in allowing streets to be constructed in haphazard ways, and in opposite directions. It should have some control over regulation of traffic, so that certain streets should not be used for heavy traffic at certain hours of the day. It should have mediatory powers. A great deal of trouble now was due to friction between various authorities, and if those differences could be reconciled a great improvement would result. The enormous advantage of such a tribunal was felt in Boston. Put it to work in London, give it a fair trial, and then see what really was wanted. He did not say many new streets were not wanted, but, before commencing, see that those already in existence were used to the best advantage, and find out exactly what and where new ones were required.

Mr. Assiter said he agreed with some of Mr. Woodward's conclusions, particularly with regard to the conservatism of Londoners. They would not take up any new scheme. He advocated measures that would give immediate relief rather than wait for those grand avenues which could not come for many years. When these new thoroughfares were constructed, the State should assist, London being already over-rated. Sir George Bartley struck the right note in saying that the streets were for London to carry out its trade, and they must be made to fit the trade, not the trade to fit the streets. Traffic must not, therefore, be restricted. The rules of the road should be enforced, and slow traffic made to take the sides of the road, as, in fact, it was supposed to do now, but did not. Carmen also drew up without regard to public convenience, and scavenging went on at all times of the day and made matters worse. He did not agree with Mr. Woodward's remarks on tramways. He thought trams, especially electric trams, were very useful on established routes. The cars were much quicker than the old horse cars, and with motor-omnibuses also on the road, we might hope for some improvement in the condition of the streets. Trams should not come into the central parts of London—certainly not surface trams, and underground trams should be for further consideration. In London we never did anything until we were absolutely obliged; warnings were neglected, and far-seeing people were regarded as revolutionists. We had to spend millions to do what might have been done at a small cost after the Great Fire, and now we were leaving things for our descendants to do in the same way. With

regard to the development of outer London, some supervision was desirable. Estates were regarded independently, each as an isolated scheme, and the only desire seemed to be to get as many houses as possible on them, and give adjoining owners as little opportunity as they could for getting out of their land. These works were carried out under the authority of local governing bodies, whose officials were frequently incompetent, and thus there was no continuity or comprehensiveness in the scheme. While we respected private interests, we must also remember there were public interests, and we must be careful to avoid in outer London the mistakes and difficulties of inner London. Country lanes in outer London were built upon without any attempt to widen or straighten them, and in thirty years' time these places would probably be densely populated, and have to be improved at enormous cost. There was a need for cross-country communication. When one got ten or twelve miles out of London, one had to go seven or eight miles to get a short distance across country. He suggested the formation of a central body to deal with the whole of Middlesex and those parts of Surrey, Kent, and Essex lying within twenty miles of Charing Cross.

Mr. Nicholson observed that there was a difficulty in regard to expenditure. If London called in State aid, why should not other large towns do the same? and if they did, we should have the cost taken off the rates and put on the taxes. One remedy was decentralisation, as far as factories were concerned. The head office of these concerns should remain in London because of telephone and other facilities which could not be had elsewhere. This would remove a great deal of obstruction to traffic. The suggestion as to directing traffic was a good one. Commercial vehicles and cabs carrying a passenger might go into the side streets. The advantages of tramways had been severely criticised, but other places found them to answer. Of course, if they were put in narrow streets the result would be confusion. They did not depreciate the property although they changed the nature of it. Trams should approach as nearly as possible the centre of London, and then connect with tubes. He considered the statement that motor-omnibuses were better than trams was open to question on account of the skidding of the former on wet roads. If suburban traffic was going to be diverted to omnibuses, special roads would have to be constructed for them. The dust from them would be unbearable, while the steel rails of trams would give no dust.

Mr. Penfold having spoken, Mr. Woodward replied. There were a great many people, he said, who thought that trams outside London would be beneficial. Tramways along the Embankment must not, however, be permitted. There would be conveniences, no doubt, but the splendid effect from Westminster Bridge of the great amphitheatre terminating in St. Paul's Cathedral would be ruined. He had no objection to horse trams or electric trams, but what he did say was that, although the policy of the London County Council five years ago in developing them was correct then, it was now open to question. He simply desired that they should now stay their hand and watch the effect of the motor-omnibuses. They would find, however, that, having made up their mind to incur this expenditure on tramways, the London County Council would do so. What was wanted was a traffic board consisting of practical men, independent of the London County Council, or any other body, with great powers to act at once.

It was announced that the next meeting would be on April 23, at 4 p.m., when a paper on "The Effect of the Education Act of 1902 on Rural Districts" would be read by Mr. J. Willis Bunn.

ROMAN CATHOLIC CHURCH, PUTNEY.—The foundation-stone of the new Roman Catholic Church of St. Simon Stock was laid by the Right Rev. Peter Amigo, D.D., Bishop of Southwark, on the 3rd inst. Mr. J. C. Radford prepared the plans. The building will be of stock brick, with red brick dressing and blue brick plinth. There will be an organ gallery over the main entrance and the baptistry, whilst on the outer wall of the building, and facing Hazelwell-road, will be a statue of the patron saint of the church. The cost will be about 3,000l.

THE INSTITUTE OF BUILDERS.

The twenty-second annual general meeting of the Institute of Builders was held at the offices of the Institute, 31 and 32, Bedford-street, Strand, W.C., on Wednesday, the 21st inst.

The minutes of the last annual general meeting were read and confirmed, and the Report of the Council was received and adopted, as also were the audited accounts and balance-sheets of the Institute General and Benevolent Funds for the year ending December 31, 1905.

In the annual Report the Council state that all proposed legislation affecting the building trade introduced into Parliament during the year has received careful attention and consideration, and in cases where the Bills have been carried efforts have been made to eliminate or modify clauses that were calculated to operate injuriously to the trade. A petition against the London County Council London Building Acts (Amendment) Bill was presented in concert with the London Master Builders' Association, and the Council specially mention the services rendered by Mr. W. Shepherd, who gave evidence before the Committee of the House of Commons. Proceeding, the Report says:—

"As the expenses in connexion with Parliamentary work and opposing measures which would injuriously affect the building trade (one of the special objects of this Institute as a representative body) are very heavy, and necessarily fluctuate in different years, it has been considered desirable, as the normal income of the Institute from its ordinary subscriptions is sufficient only to provide for the normal cost of administration, to establish a special fund to provide for the expenses attending Parliamentary proceedings and other exceptional expenses, and your President has issued a circular to the members asking for contributions to this fund. Your Council relies upon receiving a generous response to this appeal.

In consequence of a legal decision, which it was unfortunately established the extraordinary proposition that in reference to bills of quantities of omission was not an error, representations were made to your Council to amend the official form of contract so as to provide against any such interpretation. This proposal was in due course submitted to the Royal Institute of British Architects, who replied that, as in its judgment the clause in the contract (124) was perfectly clear, no alteration was desirable. As your Council was of the same opinion no further proceedings were taken.

At the request of the Royal Institute of British Architects two members of your Council have been appointed to confer with them on the subject of reinforced concrete, and two representatives have also been nominated by like request, to represent this Institute at the seventh International Congress of Architects of 1906.

A representative of this Institute has been appointed to attend the Congress of the Chamber of Commerce summoned to consider the proposed compulsory official audit of the accounts of municipal bodies. This is an important matter for the building trade, as, under existing arrangements, the real results of municipal trading are frequently not apparent, and much misapprehension exists as to the profit or loss involved in such enterprises.

As the present office accommodation is quite inadequate, and as on the expiration of the present lease an increased rent is required, your Council is acting jointly with the London Master Builders' Association in the selection of more suitable premises.

Members are reminded that the council-room of the Institute is almost always at their service for meetings or appointments, and the secretary will be pleased to make all necessary arrangements for their comfort and accommodation. Members from the provinces should especially find this to be of real service to them.

During the past year the following grants were made from the Institute Benevolent Fund:—(1) Builders' Benevolent Institution, 50l.; (2) Provident Institution of Builders' Foremen and Clerks of Works, 10l. 10s.; (3) Builders' Clerks' Benevolent Institution, 10l. 10s.

During the past year the Institute has had a good accession of new members. Your Council regrets to report the loss by death of Colonel Stanley G. Bird, C.B., Mr. Benjamin Hannon, and Mr. G. J. Lough. Colonel Bird was one of the founders of the Institute, and, in order to mark the distinguished services he rendered to the building trade, efforts are being made, in conjunction with other bodies interested, to raise a sufficient sum of money to endow in his memory a bed or cot at St. Mary's Hospital, with which Institution Colonel Bird was long associated.

Mr. Frank May, J.P., was elected by the Council to succeed Colonel Bird as Treasurer of the Institute and Trustee for the Institute Benevolent Fund. In accordance with the articles of association the President (Mr. Benjamin I. Greenwood), one Vice-President (Mr. Woodman Hill), the Treasurer (Mr. Frank May), one Auditor (Mr. J. Hill), and four members of the Executive Council (Mr. R. C. Foster, Mr. F. G. Minter, Mr. G. Kett, and Mr. G. E. Skinner) will retire, but are eligible for re-election.

The following elections then took place:—As President—Mr. F. L. Dove; Vice-Presidents—Messrs. W. F. Wallis and F. Higgs; as Treasurer—Mr. H. H. Bartlett; and as Honorary Auditor—Mr. H. A. Bartlett; the Executive Council (to fill vacancies caused by "rota" retirements) elected consists of Messrs. G. Kett, J. W. Lorden, J. S.

Holliday, F. G. Rice, E. J. Hill, T. Holloway, C. E. Skinner.

A vote of thanks was passed to the retiring President (Mr. Benjamin I. Greenwood) for his services during his year of office.

CARPENTERS' HALL LECTURES: THE NEGLECTED RESOURCES OF OUR BRITISH WOODLANDS.

On Thursday evening last week a lecture was given at Carpenters' Hall, London Wall, by Sir Herbert Maxwell on "The Neglected Resources of our British Woodlands." The Earl of Leonfield presided.

The lecturer said it was generally recognised that the resources of our woodlands had been sorely neglected in the past for a variety of reasons, but they were capable of slow development if they could be put under a sound system of management. The rapid diminution of the world's timber supply and simultaneous increase in the consumption had occupied the attention of the chief Governments in Europe. In Germany, where the average annual value of the forest products was estimated at twenty-two millions sterling, they had for some years past imported timber at the rate of four and a half million tons per annum, valued at nearly fifteen millions sterling. So long as Germany could obtain timber at a reasonable price abroad her people would spare their own forests, well knowing that the price of timber would enormously increase for every cubic foot. What had we been doing to meet the coming scarcity by developing our resources? We had not yet gone beyond the stage of inquiry. Certain schools had been established, it was true, but this was a mere nibble at a great question, and private enterprise was directly discouraged by the State in the rating of growing woodlands before one penny could be touched, and in the valuation of woods by the Death Duties Act of 1894.

The lecturer quoted the import returns for 1892 and 1893 to illustrate the large quantity of timber, paper, and paper materials (mostly made from wood pulp) imported into this country, and argued that much of that timber might have been grown in the British Isles. He also said that the Government should establish some source of sound information on the subject that the nation might obtain instruction and advice. It had been said that the climate and soil of Great Britain were unfavourable to profitable forestry, but this idea was groundless. He had laid a modest scheme before the Government for the investment of 10,000l. in State forestry, which, though favourably considered, had not been acted upon. One thousand acres might be purchased, even at twenty-five years' purchase, for 2,500l.; planting might cost 6d. per acre, or 6,000l.; preliminary expenses, 1,000l.—a total of 9,500l., and allowing 500l. for expenses and charges, made up the 10,000l. laid out in the purchase of suitable hill pasture. The annual expenses would be 650l. It was difficult to obtain any trustworthy returns of British forestry, for the simple reason that British forestry scarcely existed. He could produce only one example, and it showed that sound management would ensure profitable returns from British woodlands, even in the present haphazard condition of the home timber trade. He took the balance-sheet of the Novar Woods in Ross-shire, showing the profit and loss account upon 3,670 acres of woodlands during the years 1835 to 1899. The Novar Estate was distinct from other private properties in this country in that successive proprietors continued planting on a regular system from 1800 to 1850. Had this been continued we should have had an example unique in the United Kingdom of an extensive woodland arranged for progressive annual maturity. This system was suspended between the years 1850 and 1881, but was resumed in the latter year by the present proprietor. From the results we might expect that land worth at present from 6d. to 2s. per acre might be made to yield a net return of 2,024l., or 11s. per acre. If the State were to decide on an investment of 10,000l. a year in the purchase and planting of land, at the end of fifty years they would have made a progressive investment of half a million sterling. The property, which could be acquired on a rent basis of 2s. per acre, would yield 11s. per acre over the whole period—a rise in value of 550 per cent., and this estimated on the

supposition that the price of timber would remain stationary for half a century. In Germany there were 583,000 people in direct employment in the woods, supporting probably three million persons, and no greater boon could be devised than healthy and remunerative work in the country for British people, and in no part of Great Britain would forest growth be more profitable or flourish more vigorously than in Ireland. He should not recommend a large investment of capital, and probably not one landowner in a thousand could afford the necessary lock-up capital. The price of young forest trees in England was practically prohibitive, larch costing 12l. per acre. If forestry was ever to be a remunerative industry this obstacle must be got over, and he suggested co-operation and combination with proper business connexions for the disposal of produce. Young nursery stock could be bought abroad cheaper, and the woods should be placed under capable and well-paid men, whilst a form of limited liability company would escape from paying death duties.

Out of three million acres of British woodlands nine-tenths were in private hands, and if rendered productive, as in Germany, would return two millions a year net profit, or 6s. 8d. per acre. Owing to the failure of agriculture, the increase of rates, and the paralysing effects of the death duties, the time was at hand when woodlands must cease to be treated as ornamental luxuries or be allowed to disappear.

On the motion of Lord Leonfield, a vote of thanks to the lecturer was carried.

It was announced that prizes had been awarded for an essay on "The Treatment of Woods and Plantations from the age of twenty years to maturity, with full details as to thinning, marketing, and demand for various purposes at different periods of growth." The examiners (Mr. George Marshall and Dr. William Somerville) awarded the first prize of 20l. to Mr. Leslie S. Wood, of East Grinstead, and the second prize of 10l. to Mr. P. T. Maw, of Nutfield, Surrey.

THE BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

The 27th annual dinner of the Builders' Clerks' Benevolent Institution was held on Tuesday evening in the King's Hall, Holborn Restaurant, W.C., Mr. Howell J. Williams, L.C.C., President, in the chair. There were also present Alderman Evan Spicer, J.P., Chairman of the London County Council, and Messrs. J. A. Anderson, E. and R. Bartlett, J. Carmichael, Stephen Collins, M.P., L.C.C., H. J. Leaning, F. Higgs, F. T. Mullett, G. W. Humphreys, John Murray, M. Murphy, Alex. Ritchie, J.P., C.C., E. Smith, J.P., L.C.C., G. Sykes (of Messrs. Paterson, Candler, & Sykes, Hon. Solicitors to the Institution), W. T. Walker, and J. Austin, A.C.I.S., Secretary, and others, nearly 450 members and friends being present.

The loyal toasts having been honoured, Mr. J. A. Anderson proposed "Municipal Bodies." He thought it might be said without contradiction that in no other European nation did the civic spirit exist to the extent it did in our country, and we had reason to be proud of our municipal bodies, because they did unpaid work. The spirit which animated these municipal bodies throughout the country was one of absolute honesty and straightforwardness. With the toast he coupled the name of Alderman Spicer.

Alderman Spicer, in response, said that they were gathered together to assist the Builders' Clerks' Benevolent Institution, and when he remembered that the building trade and its allied trades in London represented something like 450,000 men, he thought that that was a very fair proportion of the inhabitants of this great metropolis. He was glad to be present because the London County Council employed directly a very large number of men—in fact, the Council was almost a building association. If there was anybody he sympathised with more than another it was the clerks of London, many of whom were badly paid, and there was very little cohesion amongst them. There was one problem which they as heads of firms had to solve, and that was, the clerk who, through misfortune, often not from his own fault, found himself out in the cold at the age of forty to fifty. He did not think that the

public realised how great was the work the London County Council did; that very day they had passed twenty-two reports of various committees, and the work the Council and other bodies did was often of very great importance.

The Chairman then proposed "The Builders' Clerks' Benevolent Institution," and said he was there for the purpose of reminding them of those who were less fortunate than others. He, as a builder of twenty years' standing, acknowledged with all heartiness the assistance he had received from his clerks and staff. Many prosperous firms today would not have been prosperous probably were it not for builders' clerks, who, perhaps, as time went on might need assistance, or they might pass away leaving widows and orphans unprovided for. It was a matter of great admiration to him that builders in the past had recognised that some such institution as this was necessary to meet the demands of those who were unable in time of stress and trouble to help themselves. Was the Institution to cease for the sake of funds? He was sure they desired to do everything they could for their less prosperous colleagues or assistants, and he made an earnest appeal to them for assistance to the cause of the Institution. The Institution started in a most humble way, and all honour to those who started it. It had grown greatly, and it now required an income of between 700l. and 800l. to keep it going. The annual subscriptions were supplemented by donations, but the work of the Institution ought to be extended to meet the most urgent cases that had been brought to the notice of the committee. The Institution was founded for builders' clerks, but he was told that the clerks did not support the Institution as they ought. Builders' clerks did not know at any time how the hand of prosperity might change, and they should do all they could to help the Institution. He suggested that the lifeboat method of collecting should be tried, and that every builder's office should have a little box so that the numerous callers should have an opportunity of making some contribution to the funds of the Institution.

Mr. E. Brooks, whose name was coupled with the toast, said they had to thank all those gentlemen who had presided, for many years past, on such occasions. The Institution required quite 800l. a year to carry on the work with their present pensioners, but there were some very sad and eligible cases which they should like to see enjoying the pension, and they hoped that the result of the appeal which had been made would enable them to go to election, and put their cases on the pension list. He should like to see the invested funds, which now amounted to 7,000l., greatly increased, but they should go on and do what they could for those who needed help.

Mr. Stephen Collins, M.P., then proposed the toast of "Architects and Surveyors." He said he agreed with a speaker at a previous dinner that architects were the aristocrats of the building trade. If the building was to be a success, and what every architect would like it to be, a thing of beauty if not a joy for ever, it depended upon the architect, and if he made his building a thing of beauty he was entitled to be called the aristocrat of the building trade. He did not think that there could be a greater pleasure in life to an architect than to watch a building grow from the foundation to the topmost stone. In London, architects had great difficulties to contend against; space was limited, and the streets were narrow. In the City, for instance, there were many beautiful buildings hidden in courts and alleys, and one could not stand afar off to see the beauty of them. St. Paul's Cathedral was hemmed in by warehouses, but Sir Christopher Wren desired it to have a great approach from the river, so that people could see it to advantage. London was being rebuilt to a large extent through the efforts of the London County Council, and he believed that the architects of the future would have greater opportunities of exercising their great talents. With the spread of education people were showing a love of the beautiful, and ugly buildings were being got rid of. With the toast he coupled the name of Mr. H. J. Leaning.

Mr. Leaning, in reply, said he was not

an architect, but he could endorse what had been said about that profession. They were men of high ideals, who were worth working for. At the present time there were a good many architects preparing designs for the International Peace Palace at The Hague, and he hoped that an English architect would win the competition. He had seen several of the designs, which were very noble conceptions. Recently a distinct step had been made towards registration, and that was a matter of importance to architects, surveyors, and others, and the attitude of the leading professional body had been so modified that registration was within the region of practical politics. Surveyors appreciated highly the help they received from builders' estimating clerks, and the best surveyors were those who had an opportunity of going through a builder's office and seeing the whole routine and becoming thoroughly acquainted with the state of the market, prices, etc. He felt that a London code of measurement was necessary, and, of course, the support of the builders was necessary in such a movement.

Mr. E. Smith, L.C.C., then proposed "Builders and Building Industries," and said that it might appear an extraordinary thing that the Chairman of the Works Committee of the London County Council should be asked to propose this toast, but really the Chairman of such a committee was the best person to do so, for having established the principle that it was desirable that there should be direct employment of labour, he felt that there should not of necessity be divisions between the builders of London and the Council, but that they should work in harmony and in a spirit of co-operation for the benefit of the community. In their difficulties with labour, the Council was indebted to the Master Builders' Association for invaluable assistance and advice, and to them they had never appealed in vain. While the Council was always ready to pay due regard to the representations of labour organisations, they refused to be governed and dominated by them, and were always ready to listen to the masters' representations on any subject germane to work they had in hand.

There was a spirit of healthy competition between the Council and the builders of London. The Council had nearly 4,000 men working in the Works Department, and his experience had brought him into touch with the great difficulties builders had to contend with. He wished London could be built over again; he felt that it would be rebuilt, and the London County Council had only started upon the work, though a good deal had been done during the last quarter of a century.

Mr. F. Higgs, in reply, said he thought that the Chairman had made a good suggestion as to the lifeboat boxes, and he would be glad to have one in his office, and at the end of the year he would add an amount equal to what was in the box. He was delighted to hear that Mr. Smith had said as to the Works Department not being a competitor with builders, though he should hardly have thought that was the case. The department employed 4,600 men, and he would rather have seen those men employed by those whose natural business it was to employ them. He thought the department ought to be members of the Association, as employers of labour, and pay their quota as such, seeing that they took advantage of the work the Association did in regulating trade affairs, etc.

The remaining toasts were:—"The Past-Presidents," proposed by Mr. Alex. Ritchie, J.P., and acknowledged by Mr. J. Carmichael; and "The Merchants and Visitors." During the evening subscriptions and donations to the amount of about 500l. were announced, including 100l. from the Chairman and 10l. 10s. each from the Institute of Builders, the Worshipful Company of Carpenters, W. Curling Anderson, and Messrs. Trollope & Colls.

COROT EXHIBITION.—The collection of pictures by Corot formed by the late Mr. Staats Forbes will be exhibited at the Leicester Galleries, Leicester-square, for a few weeks from Saturday, March 31, when it will be dispersed. The exhibition will include, in addition to twenty-two examples of Corot's art, a large number of representative pictures by the other painters of the Barbizon school—Daubigny, Diaz, Jacque, Dupré, Rousseau, and Troyon.

THE INCORPORATED INSTITUTE OF BRITISH DECORATORS.

The annual dinner of this Institute was held on Monday, at "The Trocadero," Piccadilly-circus. Mr. J. D. Crace, President, in the chair. There were also present—Messrs. E. Guy Dawber (President of the Architectural Association), Cole A. Adams, M. Cowtan, G. C. Haité, H. F. Hare, F. de Jong, W. Hayward Pittman, J. C. Nicholson, J. Scott, J. Sibthorpe, W. G. Sutherland, J. H. Turner, F. W. Englefield (Secretary), and others.

The loyal toasts having been honoured, Mr. Sutherland proposed the toast of "The British Institute of Decorators." In the course of his remarks, he said that the Institute was proposed by the late Mr. Thomas Bonner at the meeting at Manchester when the National Association of Master House Painters was established, and the aim of the founders was to institute a common meeting-ground of the three National Associations of England, Ireland, and Scotland, and to do work which the National Associations could hardly do, and to carry on educational work in the trade and craft of the decorator. Unfortunately, Mr. Bonner did not live after the establishment of the Institute, and the objects of the promoters had not been quite realised, though the blame for that did not rest with the Council or the officers, but with the members themselves. The progress and status of other institutes and societies was due to the realisation by the members of the capacity which their society gave them to work for themselves. He was afraid that some of the members had a nebulous idea that the Council in London ought to prepare some scheme which, without effort on their part, would confer some unheard-of benefits upon them. That was not the purpose of the Institute, which existed to provide a common ground where the members could meet and discuss questions as to the higher branches of education, etc., which would react on themselves and throughout the country. If the members would not work to this end, the Council could do very little. The aims of the Institute were good, and if members would take advantage of the means which the Institute provided for discussing questions which affected the welfare of the trade, then there would be a larger realisation of the hopes which they set out to accomplish. All great movements of advancement, if permanent, came from within. In Mr. Crace they had a gentleman who was intimately in touch with the practical side of the decorator's craft, and whose knowledge of all the ramifications of it in connexion with art, both past and present, was intimate and profound, and they hoped that he would long serve in his position of President.

Mr. Crace, in response, said he could endorse what had been said as to the objects of the Institute. The Institute existed for and by the members. There was no man who knew much about a subject who could not learn something from someone else. He had to confess that there was not enough individual initiative amongst the members themselves in dealing with questions which affected them. Subjects for consideration should not be limited to the art and craft of decoration; that art had many aspects—the practical, the artistic, and the intellectual, while there were the side issues of chemistry and materials.

The Chairman then proposed "The National Association of Master Painters," consisting of three branches—i.e., for England and Wales, for Scotland, and for Ireland. The Association had grown largely, as the result of the great energy and wholeheartedness of the Secretary who had organised it and infused life into the whole machinery; and also because it was a means of reinforcing the several legitimate interests from a business point of view. The Association was prospering also, because it had taken up technical and art education for the rising generation of house painters. The Association numbered some 2,000 members, and it was full of activity, and likely to continue for a long time.

Mr. Turner, President of the Association for England and Wales, in response, said that the three branches of the Association were doing good work in the matter of the education of the rising generation of painters, and he considered it the duty of master

painters to teach their apprentices and others the art or trade they followed.

Mr. Anderson replied on behalf of the Association for Scotland, and remarked that in his Association they were proposing to establish an exhibition of decorative art in order that the public might see the various adjuncts of the craft and the opportunities there were of making houses more comfortable and more beautiful.

Mr. Sibthorpe, who replied for the Irish Association, said that the reason why the Association had flourished was that it regulated trade relations between masters and their workmen, and as these relations and such a question as apprenticeship were felt to be pressing questions they secured a more ready interest from house painters throughout the country. The higher development of the master was not thought to be such a pressing need, and this, he thought, accounted for the comparative apathy shown in regard to the Institute, but he hoped that in the future the need of the work and influence of the Institute would be more realised.

The Chairman, in proposing the toast of "Architecture and the Arts of Design," said that the Institute had decided to offer medals for the encouragement of colour decoration, and on the reverse side of the medal was the inscription, "Decoration, the handmaid of Architecture," and that really expressed in a few words the real position of decoration. Decorators had a strong obligation to architecture, because the business of the decorator was to learn how to beautify architecture—not by the costly use of colour on some indefinite plan, but by so placing colour that he did the best for the architecture, and no decorator could treat architecture in the right spirit unless he had studied it. The first element of knowing anything about decoration was to know something about architecture. They as decorators were also indebted to other arts of design. Just as the study of architecture was the foundation of decoration, so the production of design in its various artistic forms was the essential of the execution of successful decoration.

Mr. H. F. Hare, who responded for architecture, said that the art of decoration in this country had been most shamefully neglected, and architects felt very much at a loss if they wished to introduce colour into their buildings, and they did not know where to go in order to get suitable suggestions as to the best methods of treating them. Architects themselves had not, as a rule, any definite and clear ideas as to schemes of colour decoration. Whether there was anything in our extraordinary English climate and in the greyness of our skies which militated against any clear conception of proper colour treatment he did not know, but certain it was that in England we had very few examples of successful colour decoration. One of the directions in which the Institute might exercise its useful influence was in the education of the coming generations of decorators, and he gathered that they were instituting prizes, open to the whole country, for the best scheme of decoration of some building or part of a building. That was a very excellent proposal, and he suggested that, if possible, the drawings submitted should be publicly exhibited, for they would be of interest to architects and others. He also suggested that it would be an excellent thing if there should be some sort of condition to the award of the medals as to study and travel. He did not think that any student of decoration could do much good in his studies unless he travelled, for there were very few successful schemes of colour decoration in England. We were gradually coming to a better appreciation of architecture and the fine arts, and the public bodies and private individuals were more or less desirous of getting really good work. The decorator, therefore, should be prepared for more encouragement than he had received in the past. A little while ago he saw an exhibition of drawings and other things in a school of art, where there were some works by painter decorators—some very beautiful examples of graining and marbling, and he was much struck that a school of art should teach such an exploded craft as that of warbling and graining.

Mr. Geo. C. Haité, President of the Society of Designers, in replying for the arts of design, said that the question of design was of the greatest

national importance. It took a great deal of time to get people to realise that architecture was an art, and *the art*. But architecture was never in such a bad condition as design had been from the beginning, and he had tried to raise it from the position it was in, although the success had not been as great as he hoped yet to achieve. Architects were interesting themselves in colour and ornamentation and decoration, and that was a good sign, and also that painters were condescending to know something about decoration. The difficulty about colour decoration was that in this country we rarely ever had two days alike, whereas in Italy and Spain and elsewhere on the Continent we saw colour under the most favourable conditions of light. Moreover, there was the feeling in this country that strong colour would be detrimental to form; but that was a mistake, for strong colour did not destroy form if properly applied. The idea had been to have things in low tone; but what we wanted to get into homes as much as possible was the effect of sunshine, and in a country like England strong schemes of colour were very successful. As to design, the fine arts were the result of commercial prosperity, in which design took a prominent part, and if men were prosperous they bought pictures and decorated their houses. It was to be hoped that the country would see the great importance of design, but he must say that now there seemed to be no encouragement for the designer. There were schools in which good work was done, but was it possible for students to get at these schools that knowledge which came from the association with trades and those who used materials? He thought not, and his solution of the difficulty was that students, when they left the Government and London County Council schools, should go to a school of design, where they would have the tuition of men who had proved themselves to be designers worthy of consideration—men who, without degrading art, supplied the manufacturer and the trade with what was wanted.

The concluding toasts were "Our Guests," proposed by Mr. Pitman, and acknowledged by Mr. Nicholson, and "The Secretary," proposed by the Chairman, and replied to by Mr. Englefeld.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. Evan Spicer, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend Battersea Borough Council 2,000*l.* for laying out of a recreation ground; Lewisham Borough Council 15,000*l.* for a street improvement; Mile End Old Town Guardians 1,420*l.* for poor law purposes; and St. Pancras Borough Council 12,100*l.* for electric lighting.

Schools.—The following recommendations of the Education Committee were agreed to:—

"That the resolution of March 14, 1905, so far as it relates to the approval of an estimate and the sanctioning of expenditure in respect of the acquisition of a site for the purpose of enlarging a school for mentally defective children, be rescinded.

"That the resolution of March 21, 1905, so far as it relates to the approval of an estimate and the sanctioning of expenditure in respect of the acquisition of a site for the erection of a school for physically defective children, be rescinded.

"That the resolution of July 5, 1904, sanctioning the taking over of certain temporary premises, be no further acted upon.

"That the estimate of expenditure on capital account of 38,000*l.*, submitted by the Finance Committee in respect of the accommodation referred to together with other similar accommodation and accommodation for children attending ordinary public elementary schools on one site (in lieu of several small sites as previously proposed, be approved."

It was also agreed that the Board of Education be informed that the Council will raise no objection to the proposal of the managers of the St. Charles-square R.C. Training College (Kensington, N.), to provide a new public elementary school for about 200 girls and infants to be used as a practising school in connection with the college.

Tramways.—The Highways and Improvements Committee recommended, and it was agreed:—

"(a) That expenditure, on capital account, not exceeding 23,167*l.* 15*s.* 8*d.*, be sanctioned for the

execution of the roadwork and platelaying for the reconstruction and doubling of the existing single line of tramways in Goswell-road, between Clerkenwell-road and Upper Ashby-street, for the underground conduit system of electric traction, and for the widening of the paving works in connection with the widening of Goswell-road, between the points named, being 22,200*l.* for the tramway works, and 10,968*l.* 15*s.* 8*d.* for the street improvement works.

"(b) That the offer of Dick, Kerr, & Co., Ltd., to execute (i) the roadwork and platelaying in connection with the reconstruction and doubling of the existing single line of tramways in Goswell-road, between Clerkenwell-road and Upper Ashby-street, for the underground conduit system of electric traction, upon the same schedule of prices and upon the same general conditions as those contained in the contract entered into with the company in pursuance of the resolution of March 6, 1906, for the reconstruction of the tramways from Bloomsbury to Poplar, and (ii) the paving works in connection with the widening of Goswell-road, between aforesaid points, upon a schedule of prices involving a total cost estimated at 10,968*l.* 15*s.* 8*d.*, be accepted."

The Highways Committee also recommended, and it was agreed:—

"That expenditure, on capital account, not exceeding 35,000*l.*, be sanctioned for the laying of the first section of the Council's electric works."

"(b) That the contract entered into with Messrs. Reed Brothers, as reported on October 10, 1905, for the laying of cable-ducts in certain portions of the Council's tramways, be extended so as to include the laying, at a cost not exceeding 33,000*l.*, of the cable-ducts required for the electric working of the first section of the Council's northern tramways."

Bexley Asylum—Repair of Fireproof Ceilings.—The Asylums Committee reported as follows:—

"We have to report that certain fireproof ceilings on the female side at this asylum have been pronounced by the architect of the Council to be dangerous, and that the necessary repairs, estimated to cost 2,750*l.*, have been put in hand. Bexley Asylum was designed and its erection supervised by Mr. G. T. Hine, architect, 35, Parliament-street, S.W. The contractor for the erection of the super-ceiling work on the female side was, by permission, sublet to Messrs. Wilkinson & Co. The certificate of completion of the whole building was issued in July, 1902. The ceiling concerned are those of blocks A, B, and C, which were the first blocks occupied. In February, 1900, a deflection of about 2 in. in the fireproof ceiling of 42 dormitory was first reported. This deflection has gradually increased, and we have had reports from time to time from the architect, and sub-contractor. Eventually we thought it advisable to obtain the opinion of the architect of the Council, with the result we have reported. There is considerable divergence of opinion between the architect and the contractor and sub-contractor as to the cause of the deflection, and as to the remedy to be applied."

Aldwych Site.—Mr. Austruther asked the Chairman of the Improvements Committee whether any action had yet been taken on the minute of the Council passed that day week as to the letting of the central portion of the site at Aldwych which would preclude the further deliberate consideration of the prior offer of M. Gérard to rent the site? Lord Monkswell asked whether it was a fact that on December 12 last M. Gérard's syndicate requested an option to take over the site at 55,000*l.* a year; that on February 13 the same syndicate made a formal offer; that on February 16 the Council's valuer wrote that the Committee was prepared to entertain the proposal; whether, on March 14, Mr. Young, the valuer, wrote to the syndicate to the effect that the Committee had decided to accept an offer from a rival syndicate, and whether the syndicate did not then offer a further 1,500*l.* a year, and if so, why the rival offer was accepted and the amended offer not considered?

Mr. Hubbard, the Chairman of the Committee, in reply, said he was prepared with a complete answer to the several questions, but, in view of the fact that the letters had been addressed to the Chairman and members of the Council respecting the matter, he would consider it in the interest of the Council that a full report should be brought up next week. Nothing had been done in the matter since last week, further than to instruct the solicitor to prepare an agreement signed until the Committee had had an opportunity of further considering the subject. The matter accordingly stood adjourned. The Council adjourned soon after seven o'clock.

PROPOSED NEW THEATRE, SUNDERLAND.—It is proposed to erect a new theatre on a site in Crowtree-road, Sunderland. The plans for the new building have been prepared by Mr. William Hope, architect, Newcastle, and they have been approved by the Sunderland Corporation.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Conversion of Buildings.

St. George, Hanover-square.—The conversion of Nos. 6 and 7, George-street, Hanover-square, into a domestic building (Mr. C. H. Worley for Mr. T. Stevens).—Refusal.

Lines of Frontage and Projections.

Lewisham.—Buildings on the northern side of Stanstead-road and western side of Ravensbourne-road, Lewisham (Messrs. Norfolk & Prior for Mr. J. Watt).—Consent.

Finchley, Central.—That the application of Mr. T. H. Watson for an extension of the periods within which the erection of buildings at Nos. 2 to 5, White Lion-street, Pentonville, was required to be commenced be granted.—Consent.

Kennington.—That the application of Mr. F. A. Powell for an extension of the periods within which the erection of an institute building for the Beaufoy Charity, on the site of Nos. 65 to 71 (inclusive), and of eight houses on the site of Nos. 56 to 64 (inclusive), Princes-road, Kennington, was required to be commenced and completed, be granted.—Consent.

Lewisham.—That the application of Mr. W. Stephens for an extension of the periods within which the erection of a building on a site abutting upon the east side of High-street and north side of Limes-grove, Lewisham was required to be commenced, and completed, be granted.—Consent.

Marylebone, West.—A projecting oriel window in front of No. 16, James-street, St. Marylebone (Messrs. Forsyth & Maule for Mr. H. Friedberg).—Consent.

Whitechapel.—Additions in front of Nos. 49, 51, 53, and 55, Mansell-street, Whitechapel (Messrs. Selby & Kilsingbury for Mr. S. Harris).—Consent.

Clapham.—That the Council do consent to the application of Mr. E. S. Barr on behalf of Messrs. Hillier & Parker, for an extension of the periods within which the erection of a two-story building on land at the rear of Nos. 20, 22, 24, and 26, St. John's road, Battersea, was required to be commenced, and for a deviation from the plan approved, so far as relates to the erection of an addition on the eastern side of the building.—Consent.

Brixton.—An iron structure upon the forecourt of No. 205, Clapham-road, Brixton (Mr. J. H. Doughty).—Consent.

St. Pancras, South.—Construction of underground cellarage in the forecourt of No. 13, Euston-road, St. Pancras, and to a deviation from the plan approved for the construction of underground cellarage in the forecourts of Nos. 15, 17, 19, and 21, Euston-road, St. Pancras, so far as relates to the omission of the steps in front of No. 15, Euston-road (Mr. W. Floekhart for Dr. Pavy).—Consent.

St. Pancras, West.—A conservatory over the porch in front of No. 3, Albert-road, Regent's-park (Mr. E. C. Macpherson for Mrs. Desmond).—Consent.

Wandsworth.—A horticultural show-house on the western side of Trinity-road, Wandsworth, to abut upon Magdalen-road (Mr. A. Southam for Mr. R. Neal).—Consent.

Wandsworth.—(a) That the resolution of January 23, consenting to the erection and retention of houses on the east side of Garratt-lane and west side of Trannere-road, Wandsworth, be rescinded. (b) Erection of three houses, and the retention of nine houses, on the east side of Garratt-lane, Wandsworth, between Quinton-street and Littleton-street, and the retention of a house on the west side of Trannere-road, abutting upon Quinton-street (Messrs. Holloway Brothers).—Consent.

Isleworth.—Bay windows in front of Nos. 9 and 11, Clough-street, Egham (Mr. J. J. Bassett for Mr. A. Cameron Corbett).—Consent.

Chelsea.—An addition at the western end of Christ Church, Christ Church-street, Chelsea (for the Rev. J. P. Thompson).—Consent.

Clapham.—Projecting balconies at the southern end of the ward block of the Bellingbrooke Hospital, Wandsworth Common, to abut upon Bellevalle-road (Messrs. Young & Hall for the Council of the Bellingbrooke Hospital).—Refusal.

Width of Way.

Southwark, West.—A building on the southern side of Webber-street, Southwark, to abut upon Barron's-place, and to exceed in height the width of that street (Mr. A. E. Chasemore for Mr. Sumption).—Consent.

Whitechapel.—An addition to the London Hospital, Whitechapel-road, Whitechapel, at less than the prescribed distance from the centre of the roadway of East Mount-street (Mr. R. Plunbe for the Committee of the London Hospital).—Consent.

Projections and Construction.

Southwark, West.—Two external iron gangways

over the roadway of Pump-court to connect Nos. 114 to 118, with Nos. 120 to 128, Union-street, Southwark, at the second floor and roof levels, and two iron balconies and two iron ladders at the rear of Nos. 114 to 118, Union-street (Mr. R. J. Lovell for the General Electric Company, Ltd.)—Consent.

Line of Frontage and Space at Rear.

Chelsea.—An addition at the rear of No. 57, Cadogan-gardens, Chelsea, to abut on Droycott place (Mr. G. L. Wilson for Mr. P. Holland).—Consent.

Hammersmith.—Retention of a greenhouse in front of No. 329, Kings-street, Hammersmith (Mr. L. G. Brinby for Mr. T. Grant).—Consent.

Deviation From Approved Plan.

Strand.—Deviation from the plans approved in connexion with the rebuilding of No. 32, Rupert-street, and No. 6, Upper Rupert-street, St. James, so far as relates to an alteration in the position of an air duct (Mr. R. H. Kerr).—Consent.

Buildings for the Supply of Electricity.

Hammersmith.—That the Council do approve the drawings submitted by the Kensington and Notting Hill Electric Lighting Companies, showing the details of the construction of the bunkers and other steelwork in connexion with the proposed erection of a generating-station on a site eastward of the generating station of the Central London Railway Company, and approached from Wood-lane, Hammersmith.—Consent.

Southwark, West.—Additions to the western power house of the Summer-street and Bankside generating station, Southwark (City of London Electric Lighting Co., Ltd.)—Consent.

Formation of Streets.

Lewisham.—That an order be issued to Mr. A. W. Osborn, sanctioning the formation or laying out of a new street for carriage traffic on the Summerfield estate, Catford, to lead from Ravensbourne-park-road to Ravensbourne-park, and in connexion therewith the widening of portions of Ravensbourne-park-road and Ravensbourne-park (for Mr. J. Watt).—Consent.

Hampstead.—A deviation from the plans approved for the formation of Glenilla-street and Howitt-road (late Howitt-street), Hampstead, so far as relates to an alteration in portions of the boundaries of the said streets (Mr. C. J. Bentley for Mr. J. C. Hill).—Consent.

Space at Rear and Alteration of Building.

Paddington, South.—An addition on the half landing between the first and second floors at the rear of No. 43, Cambridge-street, Hyde-park-square (Messrs. Thurgate & Cope for Mr. J. Asher).—Refused.

Alteration of Building.

Paddington, North.—The uniting of No. 31, Westbourne-terrace with No. 19, Craven-road, Paddington, by an opening at the first floor level (Messrs. Macey & Sons, Ltd.).—Consent.

The recommendation marked † is contrary to the views of the local authorities.

Architectural Societies.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—At a meeting of this Society on Thursday, the 22nd inst., Mr. W. H. White read a paper on "Modern Town-house Architecture." Mr. G. B. Balmer in the chair. The lecturer said:—"I had occasion some time ago to look up a great many illustrations of old and modern town-houses, and I found it very interesting to trace the development of the town-house, both externally and internally; but what particularly struck me in studying the exterior designs of most modern town-houses was the utter absence of 'consistency' as to style. As compared with old work, I could not help noticing the 'restlessness' of our modern work; indeed, it seems to me to be the keynote of modern architecture, as it is of our everyday life. I shall show you a series of views which I hope you will find interesting, and which will serve to give point to my remarks—at the same time please remember that most of the slides represent 'picked' work of its kind. The town-house may not, I fear, prove a very interesting subject to your members, as I do not suppose you have to meet quite the same conditions here in Leeds that we have in London, but I thought that it might be of some interest to you to know how such problems are dealt with by your brother professionals in London. With regard to the planning, there are a few characteristics I should like to mention, the chief of which is the relation of the hall and staircase to the rest of the plan; this point settles to a great extent the whole scheme

of the house. Assuming, for example, the case of an ordinary good-class town-house, with a frontage of from 22 ft. to 30 ft., and (according to position) of a rental value from 300l. to 500l. per annum, the accommodation required would be dining room, library, and morning-room upon the ground floor, drawing-rooms and boudoir upon the first floor, and some eight or ten bed and dressing rooms, two or three bath-rooms, a well arranged basement with all the necessary offices, service lifts, a good hall and staircase, and, if possible, a back staircase, and to be quite up to date, an electric passenger lift. The first point to be considered is the position of the hall and staircase. If 'double' drawing-rooms are required on the first floor the staircase must be at the side of the middle room. There is no doubt that what has been termed the half-sitting-room adds greatly to the attractions of a house if sufficient space can be afforded. Wherever possible, a second or back staircase is very desirable, and in houses of more than three square stories a passenger lift adds greatly to the attractiveness of the house; it should, however, be arranged so that it can be used without a special attendant. The position of the kitchen must be carefully considered in relation to the staircases and service lifts. As to the upper floors, in addition to good bedrooms, dressing-rooms will be required on the second and third floors; these should be so planned that they can be used as additional bedrooms, and there should be a bath-room and water-closet upon each bedroom floor. It should not be forgotten that the basement is not the least important part of the house, for upon its satisfactory arrangement depends, to a great extent, its economical working and the comfort of its inmates. No part of a house will pay better for able planning, as if badly arranged the comfort of the occupiers must certainly be lessened, and an abnormal staff of servants required. It is obvious that the planning and fitting up of a good class town-house is a more complex problem than formerly, and requires expert knowledge on the part of the architect." The lecture was illustrated by lantern slides.

The following officers were elected for the ensuing session:—President—Mr. H. S. Chorley, M.A. (A.); Vice-Presidents—Messrs. P. Robinson (F.) and S. D. Kitson, M.A.; Hon. Treasurer—Mr. G. F. Bowman; Hon. Librarian—Mr. F. Musto (A.); Hon. Secretary—Mr. A. E. Kirk (A.); Members of Council—Messrs. W. G. Smithson (A.), F. E. P. Edwards (F.), C. B. Howdill (A.), H. A. Chapman (A.), A. R. Hill (A.), and G. E. Reason (Assoc. Member).

SHEFFIELD SOCIETY OF ARCHITECTS.—A meeting of the Sheffield Society of Architects and Surveyors was held on the 22nd inst., when Mr. H. L. Paterson delivered a lecture on "English Renaissance, 1750 to 1800." The lecturer said that this period was considered by some to be the closing one of the Renaissance, and by others the commencement of strictly modern architecture. It has been vigorously denounced by the leaders of the Gothic revival last century, and it was almost universally held to be the period of the Renaissance least worthy of study. There was, however, no doubt about the high estimation in which it was held at the time; architects and public were agreed in regarding it as the greatest architectural age since the days of Imperial Rome. The principles of that architecture as interpreted by Palladio and others were considered binding for all time, and no further development was desirable. Mediæval architecture was almost ignored, although Chambers expressed great admiration for it, without, however, taking any steps to revive it. Chambers was the most cultured exponent of the style and the most worthy of study, but his violent prejudice against Greek detracted somewhat from the value of his counsels. The latter half of the XVIIIth century was a period of great national prosperity, in spite of the wars and revolutions that involved nearly the whole of Europe. Many of our finest mansions were erected or remodelled, and much of the work was in the hands of a small number of architects. The order was essentially the basis of design in this period, and dominated not only the elevations but the plans. To obtain a dignified external order people were willing to sacrifice internal convenience. The type of house which had already been developed, and

of which Castle Howard, Fonthill, and others were examples, gave place towards the end of the century to the self-contained plan of the brothers Adam and others. Slides were shown illustrative of the different types. The treatment of interiors was next touched upon, and the introduction of the Adam style of decoration illustrated. One of the main features of this period was the great attention paid to street design, notably in the West-end of London, in Edinburgh, and in Bath. In Bath the development of the city, which had been largely in the hands of Wood, senr., was continued by his son. The works of Wood, junr., were then illustrated, and the architecture of the new town of Edinburgh, and it was stated that both in the planning of the city as well as in the style of architecture, Edinburgh and Bath had much in common. The treatment of gardens was referred to, and it was stated that the landscape garden had almost entirely taken the place of the old formal garden, and that a great feature was made of the casinos, temples, and ornamental bridges. At the close of the century the Greek influence ousted in popularity the XVIIIth century style. The style of Chambers, however, continued to be used throughout the whole of the Greek revival, and even through the Gothic revival down to the present time. The lecturer concluded by claiming for the latter Renaissance style generally an adaptability to almost all classes of buildings, and pointed out that whatever was the fashion in architecture this style never lost its charm, if reasonably handled, and that it was the architecture of the greater part of the civilised world. Slides were lent by Mr. Mowbray A. Green, by the London Architectural Association, and Mr. J. R. Wigfull. At the conclusion of the lecture a vote of thanks was accorded to Mr. Paterson on the proposition of Mr. A. E. Turnell, seconded by Mr. C. Ridley, and supported by Messrs. F. M. Gibbs, T. W. Green, J. R. Wigfull, and Mr. J. B. Mitchell-Withers (the Chairman).

Archæological Societies.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—A meeting was held on Wednesday, March 21, the Hon. Treasurer, Mr. R. H. Forster, in the chair, when the Rev. Henry Cart, who was appointed by the Council to represent the Association at the recent International Archæological Congress at Athens, gave a very interesting account of the Congress. The success of the Congress was attributable in a large degree to the great interest taken in its proceedings by the King, Queen, and Royal Family of Greece, most of whom attended the daily meetings and readings of papers, while the Crown Prince made an ideal chairman. A large number of photographic views of events and scenes of the meetings were exhibited by lantern light, and many charmingly artistic ones, taken by Mr. Cart himself, of places in the interior and other parts of Greece which he visited after the Congress, particularly the celebrated Vale of Tempe, Corinth, Salonica, etc., were greatly admired. The Rev. W. S. Lach-Szirma, Mr. Emanuel Green, Mr. Gould, the Chairman, and others took part in the discussion which followed. In answer to an inquiry, Mr. Cart said he was glad to be able to assure the meeting that at the Congress it was decided that the talked-of restoration of the Parthenon should not be attempted.

Competitions.

BUILDINGS FOR THE INSTITUTION OF ENGINEERS AND SHIPBUILDERS, GLASGOW.—Forty-three competitive designs have been received by the Institution of Engineers and Shipbuilders in Scotland in connexion with the erection of their new buildings at the corner of Elmbank-street and Elmbank-crescent, Glasgow. The successful design is by Mr. J. B. Wilson, architect, 92, Bath-street, Glasgow.

ST. PANCRAS CENTRAL LIBRARY.—The Libraries Committee of St. Pancras Borough Council reported on Tuesday having considered and approved of the conditions

prepared by the assessor for the guidance of the competing architects for the Central Public Library.

Books.

The Encyclopedia of Practical Engineering and Allied Trades. Edited by JOSEPH G. HORNER, A.M.I.Mech.E. London: Virtue & Co.; Vols. 1 and 2.

There is certainly an opening for a work of the kind foreshadowed by the first two volumes of this encyclopedia, which is announced as intended to cover "the entire practice of civil and mechanical engineering." No mention is made of electrical engineering in the title-page or preface, but examination of the text shows that this important branch of engineering has received a fair share of attention. Bearing in mind the numerous subdivisions of modern engineering practice and the different educational requirements of those connected with the same subdivisions of the subject, it is scarcely to be anticipated that anything like exhaustive treatment will be found in the present publication. Judging by the two volumes we have received, the editor has decided to give prominence to the needs of those who follow engineering as a trade, in contradistinction to others who make it a profession. Mechanical engineering in its practical aspect is undoubtedly the most prominent feature of the new encyclopedia, although, so far as the letters A and B have been treated, civil and electrical engineering, metallurgy, physical science, engineering chemistry, and mathematics are by no means neglected. Still, the true value of the work is to be found in the articles dealing with the strictly practical side of mechanical engineering. These contributions have evidently been written by men thoroughly familiar with the department of work discussed, and one excellent characteristic is that mechanics and others will be able to glean useful information relative to operations in which they are not actually engaged and of which, owing to modern methods of specialisation, they have few opportunities of gaining knowledge and familiarity. Thus the pattern-maker and the iron-moulder, the smith and the turner, will each be enabled to learn something of the work conducted in departments other than their own, and draughtsmen will be able to obtain some hints respecting workshop practice. In those subjects which are beyond the boundaries of mechanical engineering the treatment is less detailed, and in one or two articles may be described as popular rather than technical. So far as publication has proceeded, a few of the subjects appear to be inadequately discussed, but we understand that the articles will be supplemented by others in the remaining volumes, so that by the aid of cross references the reader may be able to fill up the gaps now apparent. Taken as a whole, the two volumes contain much useful and well-selected information, carefully arranged and concisely expressed. The illustrations are exceptionally good, most of them having been reproduced from drawings specially prepared for the purpose of the work.

Modern Milling Machines, their Design, Construction, and Working. By JOSEPH G. HORNER, A.M.I.Mech.E. With 269 illustrations. London: Crosby Lockwood & Son, 1906.

Mr. HORNER gives in this book detailed consideration to a single department of workshop practice, but one which has developed in a remarkable manner during the past twenty years. At one time looked upon with disfavour by some engineers, the milling machine is now extensively employed for work of almost every kind. Its general use practically dates from the introduction of emery wheels, without which it would be impossible to grind the milling cutters. Although milling machines are particularly suitable for specialised methods of manufacture, it would be a mistake to suppose that they are not equally useful in shops where work of general character is undertaken. Consequently the subject-matter of this book has more extended application than might be assumed after mere inspection of the title. Mr. Horner has treated the subject in an exhaustive manner, and the illustrations are admirable, consisting largely of reproductions from actual drawings.

His treatise is not one for people who merely desire general knowledge, but forms a special study, appealing to practical men and engineering students. The brevity of this notice must not be attributed to lack of appreciation for a most excellent book, but to the demands on our space by matters more directly associated with architectural and constructional practice.

Martin's Up-to-date Tables of Imperial, Metric, Indian, and Colonial Weights and Measures. By ALFRED J. MARTIN, F.S.I. London: T. Fisher Unwin; 1904.

In view of the controversy which has arisen with regard to the proposed adoption of the metric system in the United Kingdom, this book will be of service to those who are interested in the subject, as well as to others having occasion to employ tables of various kinds that are not published in all works of reference. Mr. Martin's work is only incidentally a table-book, for in Part I. the author has concerned himself chiefly with the task of showing the inconsistencies of the British system, and of formulating proposals for the decimalisation of British units. Briefly stated, his views are that by bringing our system of weights and measures into line with those of other countries we shall derive direct benefit, besides contributing in a most material manner to the consummation of that desideratum—a universal medium of arithmetical expression in commerce. Part II. contains a collection of miscellaneous tables and data, and the volume is provided with a very complete index, which enables the user to pick out any required particulars from the argumentative portion of the manual.

Trade Catalogues.

We have received from the General Electric Company, of Queen Victoria-street, a leaflet announcing that the price of their well-known "Geeko" ignition accumulators has been considerably reduced. These accumulators can be used in motor-cars and launches, and for stationary engines. They have also sent us a leaflet describing a novel direct working telephone, an insulated hand-lamp, which is stated to be thoroughly trustworthy, a novel form of cover for a Nernst lamp, etc. The bracket-holder for an electric lamp, or the "bracket fitter," as it is called in this leaflet, is distinctly novel. Any bracket to which it may be attached can be easily taken down at once for cleaning or other purposes.

Messrs. Waygood & Co. send us two new catalogues—one an eight-page list relating to their specialities in general, but giving prominence to electric lifts for motor-car factories and garages, while the other is a circular containing particulars of the latest novelty represented by the introduction of lifts into ocean steamships. Considering that vessels such as the great liners virtually reproduce the essential features of a large hotel, it is only natural that they should be furnished with similar conveniences. The popularity of the lift installed by Messrs. Waygood & Co. on the *America* may be gauged by the fact that during the first voyage of this vessel the lift made 2,154 journeys and carried 4,469 passengers.

Messrs. A. Ransome & Co., of Newark, send us their catalogue of sawmill accessories, such as tend to increase the efficiency and profit-earning capacity of the machinery to which they are applied. Many of the auxiliaries described and illustrated in this book are not infrequently omitted from specifications of sawmill plant, and are generally ordered from time to time as suggested by the practical experience of the manager. This is evidently not the best way of furnishing a mill, and the publication of the present catalogue should assist prospective sawmill proprietors to obtain

thoroughly efficient plant at the outset, and be of use to those who desire to complete their equipment by the addition of the most modern appliances. The catalogue also includes particulars of wood-trimming machines, glue-heaters, saw guides, anti-guards, and various apparatus useful in the wood-working industry.

Fifty Years Ago.

FROM THE *Builder* OF MARCH 29, 1856.

ALUMINIUM AND THE ELECTRIC LIGHT.

The new metal which excited so much attention lately as a hopeful cheap substitute for silver, has by no means fulfilled the public expectation as yet, mainly from the cost of its production. Still, however, the endeavour to economise the means of its evolution from clay-prone or alumina is being persisted in, and the desire to produce it at a moderate cost has already contributed much towards the cheapening of the previous processes, whereby other metalloidal substances, particularly sodium, required to be evolved from their alkaline or earthy oxides. A new step has just been made at Lyons, by Messrs. Lacassagne & Sheers, who have invented a galvanic battery, in which the usual fluids are replaced by anhydrous salts in a state of igneous fusion, and by means of which alumina is reduced into aluminium, while the electric light is evolved in the course of the process. The inventors are also trying their hand at the regulation or steadying of the electric light. M. St. Clair Deville, we observe, has been assisting at a lecture on the subject of aluminium at the London Royal Institution.

Illustrations.

THE CHARTERHOUSE HALL.

THIS old "Guesten" Hall of the Charterhouse seems to have been built about the year 1500, and, although of so late a period of Gothic, the mouldings to the window-jamb are of considerable beauty, the oak-work, however, excepting a few remaining portions of the old monastic panelling, was added by the Duke of Norfolk, who, long after its disuse as a monastic building, made the Charterhouse his London residence between 1555 and 1571; he entirely transformed the hall, raising the walls and adding the top tier of lights and the rather interesting roof, which is of hammer-beam construction, with a plaster core down the centre, divided into panels with oak ribs. Very beautifully-carved pendants hang from the trusses, which spring from moulded stone corbels projecting from the walls.

The screen, which is dated 1571, was also built by the Duke of Norfolk, and is of Italian character, although probably of English workmanship; it originally extended the entire width of the hall, the narrow side gallery being constructed at a somewhat later date for the purpose of connecting up the great staircase with the westernmost chambers of the building. This addition involved the removal of the end Caryatid panel, and shifting the console above one of the capitals, so that the next Caryatid which it carries should stand clear of the gallery, an alteration which sadly affects the appearance of the whole; the upper panels of the screen are removable, so that the space behind could be used as a minstrel's gallery as well as a passage. The carving on the whole, is of good design and workmanship, notably the fine lion-headed consoles over the archways, the frieze above with its interlacing strapwork and delicately-designed cartouches; the interesting capitals are also well done, and worth notice. The Caryatides are of unusual character, and each is represented carrying a huge bunch of fruit upon its head.

The screen, being placed at the western end of the hall, forms the approach to the monastic buteries and kitchens, while at the opposite end is the very fine door which originally led to the prior's lodgings. The floor is modern, but still retains the raised dais at the eastern end; there is also the usual bay window found in halls of this period. The panelling, which is delicately moulded, is of the same date as the screen,

and extends all round the walls to a height of 13 ft. The connecting gallery before mentioned is elaborately carved with quaint figures and has a row of standards rising above the rail, probably used for fixing rushlights and torches upon to give light to the hall below. The stone fireplace under was also added by the Duke. It is of fine proportions, with many subtle and vigorous mouldings, and forms a very pleasing example of the open-fire hearth of the period.

On entering the hall one is struck with its size and lofty proportions, it being 49 ft. by 27 ft. 8 in. by no less than 55 ft. to its highest point; a goodly height, indeed, and one notices the effect of the general classic influence of the time upon the dying traditions of the medieval builders. The Charterhouse has played no mean part in the history of our country, and it is interesting to note that it was here that Thackeray laid the last scene in Colonel Newcome's life.

ALEX. S. CARTER.

Correspondence.

SEA SAND FOR MORTAR.

Sir,—Through the medium of your paper could any authority enlighten me as to why there is a great tendency of late to utilise sea sand in preference to good pit sand, in connexion with building and sewer works.

In the past the outcry has been concentrated against the presence of salt in sea sand.

Has this difficulty been overcome by process, otherwise one fails to understand such a course, unless with a view to economy. ENQUIRER.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XII. LABOUR-SAVING CONSTANTS.

ALCULATIONS of various kinds frequently occurring in practice can be wonderfully simplified in many cases by the employment of constants, especially if these are prepared in such a manner that one multiplication or division of a given quantity will furnish the required result.

To show the desirability of constants which represent in concentrated form the result of several preliminary arithmetical processes, let us suppose that it is required to find the weight of a hollow cast-iron cylindrical column 20 ft. long by 12 in. external diameter, the metal being $\frac{3}{4}$ in. thick.

Clearly the first thing is to find the volume of metal in cubic inches or cubic feet, and the second to multiply the value into the weight of metal per cubic inch or cubic foot.

(1.) The volume may be found by calculating the areas of two circles, one corresponding with the outside diameter and another with the inside diameter of the column, multiplying the difference of these values—which represents the net area of metal—into the length of the column in inches.

Thus the area of a circle 12 in. diameter
 $= 12^2 \frac{\pi}{4}$
 $= 144 \times 0.7854$
 $= 113.1$ sq. in.

Similarly, the area of a circle 12—(2 × 0.75)
 $= 10.5$ in. diameter
 $= 10.5^2 \frac{\pi}{4}$
 $= 110.25 \times 0.7854$
 $= 86.6$ sq. in.

Th refore the area of metal in the cross section of the column is

$113.1 - 86.6 = 26.5$

and the volume is

$26.5 \times 240 = 6360$ cub. in.

Then, taking the weight of cast-iron at 0.26 lb. per cubic inch, the required weight is

$6360 \times 0.26 = 1653.6$ lb.

(2.) The volume can also be found by calculating the circumference corresponding with the mean diameter of the annular ring (that is the external diameter less the thickness of metal), then multiplying the mean circumference by the thickness of metal, and the product by the length of the column in inches, and by 0.26, the weight of cast-iron per cubic inch.

Thus the mean diameter of the annular ring
 $= 12 - 0.75$
 $= 11.25$ in.

and the corresponding mean circumference is

$11.25 \pi = 11.25 \times 3.1416$
 $= 35.34$ in.

Therefore the area of metal in the cross section of the column is

$35.34 \times 0.75 = 26.5$ sq. in.

and the volume is

$26.5 \times 240 = 6360$ cub. in.

Then the required weight is

$6360 \times 0.26 = 1653.6$ lb., as before.

Although we have not needlessly occupied space by detailed workings, the general character of the foregoing calculations is sufficient to indicate the comparatively large amount of work they involve, and to suggest the desirability of shorter methods.

The following is a demonstration of the way in which method (1) can be simplified for general use:—

As employed above, the operation is represented by the equation

$W = \left(D^2 \frac{\pi}{4} - d^2 \frac{\pi}{4} \right) l w$

Where W = weight of the column, D = external diameter, d = internal diameter, l = length in inches, and w = weight of cast iron per cubic inch.

This may be written

$W = (D^2 - d^2) \frac{\pi}{4} l w$

Whence, employing $\left(\frac{\pi}{4} l w \right)$ as a constant, denoted by the symbol c , and assigning a constant value to l , we get

$W = (D^2 - d^2) c$

Taking l at 12 in., the value of c becomes

$0.7854 \times 12 \times 0.260 = 2.45$.

Then to calculate the weight of the given column is a very simple matter.

First we get the weight per foot length,

$w = (12^2 - 10.5^2) \times 2.45$
 $= 33.75 \times 2.45 = 82.68$ lb.

and next,

$W = 82.68 \times 20 = 1653.6$ lb., as before.

But method (2) points to a still more simple process, as shown below.

The operation previously performed is represented by the equation

$W = d_m \pi l w$

where d_m = mean diameter of the annular ring, and the other symbols have the same significations as before.

Separating variable from constant values we get

$W = (d_m l w) (\pi w)$.

Assigning the constant value of 12 in. to l , and treating $(\pi l w)$ as a constant with the value $(3.1416 \times 12 \times 0.26) = 9.8$, we have for the weight per foot length

$w = (d_m l) 9.8$.

Then to calculate the weight of the specified

column, we first find the weight per foot length,

$w = (11.25 \times 0.75) \times 9.8$
 $= 84.437 \times 9.8 = 82.68$

and next

$W = 82.68 \times 20 = 1653.6$ lb., as before.

To facilitate calculations relating to the weight of hollow cylinders, such as are represented by columns, flues, drains, and pipes, we give in Table IV. constants for different materials, by the aid of which the weight can be readily computed per unit length of one foot or one yard, from the diameter and thickness in inches, or in feet. This table has been calculated for use with the equation

$W = (d_m \times l) c$

where $c = (\pi l w)$.

By preparing in a similar manner constants for unit lengths of hollow columns and conduits of other sections, the corresponding weights can be readily computed.

Ellipse.—The constant for a hollow elliptical body may be determined by one of the two following methods:—

(1.) The circumference of an ellipse is given approximately by the rule

$\left(\frac{D + D'}{2} \right) \pi = (D + D') 1.5708$

where D = major axis and D' = minor axis.

Consequently the area of material in the cross section in a hollow ellipse may be found by employing mean values for the major and minor axes.

Thus

$A = (D_m + D_m) \times t \times 1.5708$

and the weight per unit length is

$w = [(D_m + D_m) \times t] (1.5708 l w)$

which may be stated

$w = [(D_m + D_m) \times t] c$.

(2.) An alternative method of finding the area of material in the cross section is to take the difference between the areas of two ellipses, one calculated from the outside axes, and the other from the inside axes.

The area of an ellipse being equal to the product of its semi-axes into π , the process of finding the net area of a hollow elliptical body is

$A = \left(\frac{1}{2} D \times \frac{1}{2} D' \right) \pi - \left(\frac{1}{2} d \times \frac{1}{2} d' \right) \pi$
 $= \left(\frac{DD' - dd'}{4} \right) \pi = (DD' - dd') \frac{\pi}{4}$

Therefore the weight per unit length is

$w = (DD' - dd') \left(\frac{\pi}{4} l w \right)$

which may be expressed

$w = (DD' - dd') c$,

where D = external major axis, D' = external minor axis, d = internal major axis, d' = internal minor axis, l = unit of length adopted, and w = unit weight of material.

If method (1) be adopted the values of c for a unit length of 1 ft. are

$c = (1.5708 \times 12 \times w)$ for dimensions in in.
 $c = (1.5708 \times 1 \times w)$ " " ft.

If method (2) be adopted the values become

$c = (0.7854 \times 12 \times w)$ for dimensions in in.
 $c = (0.7854 \times 1 \times w)$ " " ft.

TABLE IV.—CONSTANTS FOR CALCULATING THE WEIGHT OF HOLLOW CYLINDRICAL COLUMNS, CONDUITS, AND PIPES OF VARIOUS MATERIALS FOR A LENGTH OF 1 FOOT AND OF 1 YARD.

Material.	Values of Constant. (c)					
	Per Foot Length.		Per Yard Length.			
	Diameter,		Diameter.			
Description.	Weight per cubic foot in lb.	In in.	In ft.	In in.	In ft.	
Brickwork.....	112	$c = \pi l w$	352	7.2	$c = 3 \pi l w$	1,056
Cement.....	86		272	5.7		816
Cement mortar.....	130		408	8.4		1,224
Concrete.....	115		408	8.4		1,224
Earthenware.....	450		361	7.5		1,083
Cast-iron.....	480		1,413	29.4		4,239
Wrought-iron.....	480		1,538	31.8		4,524
Mild steel.....	480		1,538	31.8		4,524
Brass.....	549		1,725	35.0		5,175
Copper.....	712		2,237	46.5		6,711
Lead.....	450		1,413	29.4		4,239
Zinc.....	450		1,413	29.4		4,239

The constants in this table are calculated upon weights per cubic inch where diameter and thickness are intended to be taken in inches, and upon weights per cubic foot where diameter and thickness are intended to be taken in feet.

As addition involves less trouble than multiplication, it will save time to employ constants calculated in accordance with the former method.

Square.—(1) The area of material in a hollow square is

$$A = D^2 - d^2,$$

and the weight per unit length is

$$w = (D^2 - d^2) (lw),$$

where D = length of external side, and d = length of internal side. The constant is $c = lw$.

(2) Another method is to use as factors the mean length of side s_m , the thickness of side t, and the number of sides n.

Thus the mean length of side s_m is obviously $S - (2 \times \frac{t}{n})$, and the number of sides, $n = 4$.

Then the area of material in the cross section of a hollow square is

$$A = [S - (2 \times \frac{t}{n})] \times 4 = (s_m \times t) \times 4$$

and the weight per unit length is

$$w = (s_m \times t) (4lw)$$

the constant being $c = (4lw)$.

Hexagon.—(1) The area of material in the cross section of a hollow hexagonal body can be ascertained by taking the difference between the areas of two hexagons, one calculated from the outside dimensions, and the other from the inside dimensions.

The rule for calculating the area of a regular polygon is

$$A = S \times n \times (r \div 2)$$

where S = length of external side, n = number of sides, and r = radius of inscribed circle.

To find the area of a hexagon is perfectly easy, as the length of outer side is constant for any given hexagon. But the length of inner side for a hollow hexagon varies with the thickness of metal or other material, and must be determined for any given thickness either by measurement from a specially prepared drawing or by calculation.

To ascertain the length of the inner side by calculation we must first determine the length of the perpendicular of a right-angled triangle, of which the hypotenuse is a line joining the points where the inner and outer surfaces of two sides meet, the base of which equals the thickness of the sides of the hexagon, and the angle opposite the perpendicular = 30 deg. As the internal angle of a hexagon = 120 deg., the angle opposite the base = 63 deg., and—since the three angles of a triangle are together equal to 180 deg.—the angle opposite the perpendicular = 30 deg.

By trigonometry the perpendicular of a triangle = base $\times \tan \theta$.

Whence in this case the length of the perpendicular

$$= (t \times \tan 30 \text{ deg.}),$$

and as one such triangle has to be considered at each end of each side the length of side for the inner hexagon is

$$s = S - (2t \times \tan 30 \text{ deg.}).$$

Table V. gives the value of r for a hexagon = 0.866, when the length of side = 1. So it is necessary to multiply this factor by the length of side.

TABLE V.—DATA RELATIVE TO POLYGONS.

Description.	No. of Sides.	Internal Angle.	Length of Side of Polygon = 1.	
			Radius of Inscribed Circle (r).	Area.
Triangle	3	deg. min.		
Square	4	90 0	0.7071	1.0000
Pentagon	5	108 0	0.6882	1.7208
Hexagon	6	120 0	0.8660	2.5980
Heptagon	7	128 34	1.0383	3.6398
Octagon	8	135 0	1.2071	4.8284
Nonaagon	9	144 0	1.3747	6.1818
Decagon	10	144 0	1.5388	7.6942
Undecagon	11	147 16	1.7028	9.3656
Dodecagon	12	150 0	1.8660	11.1961

The general rule for the area of material in the cross section of a hollow hexagonal body is

$$A = (S_n \times \frac{r}{2}) - (s_n \times \frac{r}{2}).$$

Inserting the factors in full the equation becomes

$$A = [S_n \times (\frac{0.866}{2} S) - [S - (2t \times \tan \theta)]_n \times (\frac{0.866}{2} (S - 2t \times \tan \theta))]$$

which reduces to

$$[S^2 - (S - t \cdot 1.1548)^2] 2.598.$$

When the area has been found, it only requires multiplication by the length in inches or feet and the weight per cubic inch or cubic foot to give the required weight.

Therefore the weight of a hollow hexagon per foot length is

$$w = [S^2 - (S - t \cdot 1.1548)^2] \times (2.598 lw)$$

The constants are

$$c = (2.598 \times 12 \times w) \text{ for dimensions in in.}$$

$$c = (2.598 \times 1 \times w) \text{ " " " ft.}$$

$$\text{Apply the equation to the case of a hollow hexagonal cast-iron column 12 ft. long with the length of side = 6 in. and } \frac{1}{4} \text{ in. thickness of metal, and taking the value of } c \text{ at}$$

$$(2.598 \times 12 \times 0.26) = 8.1$$

we have

$$W = [S^2 - (S - t \cdot 1.1548)^2] c \times 12$$

$$= [36 - (6 - 0.5 \cdot 1.1548)^2] \times 8.1 \cdot 12$$

$$= [36 - 29.4] \times 97.2$$

$$= 641.5 \text{ lb.}$$

(2) Instead of applying the foregoing method, which is based upon the rules given generally in text-books and works of reference, we may arrive at the area and weight of a hollow hexagon far more expeditiously by the following alternative method:—

Multiply the mean length of side by the thickness and number of the sides.

$$\text{The mean length of side, } s_m \text{ is}$$

$$s_m = S - (2 \cdot \frac{t}{n} \times \tan \theta)$$

$$= S - (t \cdot 0.5774)$$

Therefore the weights per foot length are

$$w = [(S - t \cdot 0.5774) t] n \cdot 12 \text{ w for dimensions in in.}$$

$$w = [(S - t \cdot 0.5774) t] n w \text{ " " " ft.}$$

Applying this method to the case of the hollow hexagonal cast-iron column in the example above, and taking the value of c at $(6 \times 12 \times 0.26) = 18.72$, we have

$$W = [(6 - t \cdot 0.5774) t] \times c \times 12$$

$$= [(6 - 0.5 \times 0.5774) 0.5] \cdot 18.72 \cdot 12$$

$$= (5.7113 \times 0.5) \cdot 224.64$$

$$= 641.5 \text{ lb., as before.}$$

Hollow octagons and other hollow polygonal bodies can be treated in similar manner, taking due account of the internal angle in each case.

Next week we shall give a table of constants for hollow columns of different sections in various materials, and a selection of useful constants for general use.

NORTHCOTE-ROAD, BATTERSEA, FIRE-STATION.

On February 8, 1898, the London County Council approved a scheme for further increasing the means of protection from fire in London. This scheme included the provision of a permanent fire-station in the neighbourhood of South Battersea, a district which is intersected by several lines of railway, which interfere greatly with direct means of communication. For the site of the station, the Council required Nos. 61 to 71 (odd) Chatham-road, and the rear portions of the gardens of Nos. 41-59 (odd), Chatham-road, at a cost of 2,386l. 19s. 2d., including all costs. The Council decided on November 22, 1894, that the station should be erected by the Works Department, and work was commenced in December, 1904. The architect's estimate was 12,500l. The staff of the station consists of an officer, ten firemen and a coachman, and there will be kept at the station a motor fire-engine, a horsed escape, a long ladder (drawn by hand), and a hose cart. It is proposed that the fire-engine at this station shall be a motor engine, but stalls for four horses have been provided, as until motor traction has been adopted more extensively for the brigade appliances, it is necessary that stations should be adapted for both types of appliances. The following is a detailed description of the station taken from particulars furnished by Mr. W. E. Riley, F.R.I.B.A., the superintending Architect to the Council:—

Ground Floor.—The appliance room (with run-out to Chatham-road) is 39 ft. 7 in. by 38 ft. 3 in., with accommodation for a steam fire-engine and a horsed escape, and stalls for four horses arranged as at the Kensington fire-station. A covered shed is provided for the long ladder in the north-west corner of the yard. The walls of the appliance-room are lined with white glazed bricks, the floors paved with ironstone in same to assist the horses in starting. The stalls are drained into covered enamelled iron gutting, flushed automatically, a sinking has also been formed in the floor under the appliance to take the drippings from the boiler, and this is connected with the gutting referred to. The waiting-room, 9 ft. 9 in. by 12 ft. 4 in., is entered from the appliance-room, and has an inspection window overlooking the passage which commands both the separate entrance and the entrance to the waiting-room. The waiting-room is a small

room opening from the corridor which leads from the separate entrance to the staircase and appliance-room. The recreation-room is also entered from this corridor, is 24 ft. by 19 ft. (with panelled dado), and is capable of containing four full size billiard tables. There is a lavatory and water-closet adjoining. The laundry, 19 ft. by 13 ft., with hot closet and stoker's, is lined with white glazed bricks, and paved with granolithic paving, and is entered from the yard, in the north-east corner of which are situated the workshop, fodder store, stores for coal in bulk, coal in sacks, coke, oil and wood, general store, and twelve coal stokers to quarters, and also the urinal and water-closet. The yard, which is entered from the run-in from Chatham-road and the back of the appliance-room, is about 10.584 sq. ft. in area, and is paved with granite sets. The surface has been made level throughout for purposes of drilling. At the western end of the yard near the ladder-shed, is the drill tower and hose hoist combined. This is an iron-framed structure covered with oak weather-boarding; the ground story contains a smoke chamber enclosed with concrete, having a trap-door in the ceiling for the liberation of the smoke, the upper stages have open wood batten flooring, ordinary sash windows (but without glazing) are fitted in the vertical face of tower, and access is obtained to the "look out" on top by means of an iron ladder in the hose hoist portion.

First, Second, Third, and Fourth Floors.—On the first-floor are provided one set of three-room quarters, and one set of two-room quarters, also single men's quarters, consisting of two dormitories, mess room, bath-room and lavatory, water-closet, and scullery. On the second floor there are one three-room set, one two-room set, and the station-officer's quarters, consisting of four rooms. On the third and fourth floors there are three three-room sets of quarters. A bath-room is provided on each floor. A sliding pole leads from the single men's dormitories into the appliance-room in front of the pier between the first and second floors. The station is lighted by electricity. The east and west elevations of the building are faced with red brick, the front elevation to Chatham-road is faced with red bricks and has Portland stone dressings. The appliance-room is heated by hot water, a subsidiary boiler being provided for this purpose in the stoker's.

STANFORD'S MAP OF METROPOLITAN RAILWAYS, TRAMWAYS, AND MISCELLANEOUS IMPROVEMENTS.

Owing to the general lull in Metropolitan railway projects the new issue of Mr. Stanford's useful map does not present quite so many suggested lines of communication as in the last two or three years. Nevertheless, the record of railways under construction, sanctioned, and proposed is satisfactory so far as it extends. Of lines in progress and practically completed the Great Central new route and the Baker-street to Waterloo Railway are the most important, the former being intended to open up a great suburban district in the north-west and the latter to link North and South London.

In the north-east district an extremely valuable route sanctioned is the North-East London Railway from the City to Walthamston via Bethnal-green, Hackney, and Leyton, and the proposed Hammersmith, City, and North-East London line, passing through Shoreditch, Haggerston, Dalston, and Stoke Newington to Tottenham and beyond, is equally desirable. Both of these are termed "underground railways," but we assume they will emerge into daylight when open country is reached.

In South-East London no railway projects are in hand. Existing companies do not appear anxious to compete with tramways, and the district is scarcely suitable for underground electric railways. In North-West London the Great Northern Railway appear to be widening their Edgware branch, although Mr. Stanford does not make quite clear the precise work in contemplation. The Baker-street and Waterloo line we have already mentioned as nearly ready for operation. Two other sanctioned lines shown on the map are the Great Northern, Piccadilly, and Brompton, the Charing-cross, Euston, and Hampstead, but, curiously enough, neither of these is marked with any distinguishing sign or number, rather an omission. The District Railway is accompanied by a dotted line indicating the sanction of some additional work, the nature of which ought to be explained in the key to the map. A new loop on the Great Western system from Acton to the West London Railway practically completes the category of railway projects sanctioned in this quarter of London. Two useful underground lines proposed are the North-West London Railway from Victoria along Edgware-road, to Cricklewood, and the Hammersmith, City, and North-East London Railway, with a feeder branch from the Marble Arch.

In the south-west district no new railways are in contemplation, this part of Metropolitan being left to tramways, so far as fresh traffic is concerned.

Turning now to tramway projects we find abundant evidences of progress. A number of useful little lines have been sanctioned and proposed in North-East London, such as those from Aldgate to the Mint, Stoke Newington, Cross St. Forest-hill, Camberwell—Peckham, East Dulwich—Forest-hill, and lines in the Croydon and Beckenham districts joining up Croydon, Beckenham, Anerley, Penge, Lower Sydenham, and Norwood.

The list of sanctioned lines in the south-east is more extensive, and includes routes such as the following:—Blackwall Tunnel—Greenwich, Woolwich—Plumstead, Woolwich—Eltham, New Cross—Forest-hill, Camberwell—Peckham, East Dulwich—Forest-hill, and lines in the Croydon and Beckenham districts joining up Croydon, Beckenham, Anerley, Penge, Lower Sydenham, and Norwood.

In the north-west quarter tramways are sanctioned between Child's-hill and Willesden, Harlesden and Sudbury, Harlesden and Acton, Harlesden and Putney, and in some portion of the map occurs the Kingsway route now in full operation.

In the south-west there are evidences of much activity on the part of the London County Council, and the London United Tramways Company Lines already sanctioned include those between Tooting and Mitcham, Tooting and Wandsworth, Sumner, Barnes and Richmond, and various lines in the Kingston district. The Surrey extensions of the London United Tramways are of the utmost importance, and constitute a remarkable testimony to the energy and perseverance of Sir Clifton Robinson, who has worked so hard to bring pleasant places within reach of those who require fresh air and recreation in the true sense of the word.

Mr. Stanford's map is issued, as last year, on two sheets, to the scale of 3 in. to a mile, and in addition to means of Metropolitan communication it includes other proposed undertakings, such as additional arrangements for the distribution of electric power, new buildings for public purposes, and some street and bridge improvements. We think the general utility of the map would be increased by a more detailed explanatory table for the benefit of the uninitiated. In fact, a good many people who are interested in the question of London traffic, but have not at hand full records of the undertakings indicated on the map, would be glad to purchase at a small additional charge a supplementary sheet or pamphlet containing brief particulars as to the origin and scope of the various projects.

Obituary.

M. CARRIÈRE.—The eminent painter, Eugene Carrière, has died after a long and painful illness of three years. He had suffered several operations for cancer in the throat, which had only the effect of delaying the final result. At the last he passed away, without suffering, in his sleep. Carrière was born at Gourmay-sur-Marne in 1849; he lived for a long time at Strasbourg, and after his captivity during the German war he returned to Paris and to the atelier of Cabanel. In 1876 he contracted successfully for the Prix de Rome. In 1879 he exhibited a picture entitled "Jeune Mère," in which he showed already the peculiar style which was to distinguish his work. It was the first of a series of pictures all dealing with the idea of motherhood. Married early, and always poor, he found most of the models for his pictures in his wife and children. His works were too numerous to mention here, but among them may be named the frescoes which he painted in the Salon des Sciences at the Paris Hôtel de Ville; "L'Enfant Malade"; "Premier Voile," suggested by the first communion of his oldest daughter; "Maternité," which is in the Luxembourg; a decorative panel for the Sorbonne; a "Crucifixion" exhibited at the Salon of 1897; portraits (among them the curiously original one of Daudet), lithographic drawings, etc. He had latterly been occupied mainly in the decoration of the Mairie of XII^e Arrondissement, which he executed unskilfully. Carrière was "Officier" of the Legion of Honour.

General Building News.

CHURCH RENOVATION, KINGSTONE.—The Church of St. John and All Saints, Kingstone, was reopened on the 15th inst., after having been renovated. The work comprised, in the interior, the entire removal of a coating of thick mortar, discoloured, as was the stone work, by damp. This, in the chancel, has been replaced with thin cement, whilst in the nave the walls have been pointed. The decayed plank floor has been replaced by wood block flooring; a dwarf-wall, with steps, all of Han-stone, has been erected as a boundary to the chancel. The old seating has been refitted and revarnished. The Ecclesiastical Commissioners have related the chancel floor with dark tiling, and beneath the choir-stalls with wood block flooring.

The sanctuary floor, which is paved with ancient memorial stones of the Tripp family, has been polished. The outside work consists chiefly of pointing the walls and draining. The work was done under the supervision of Mr. L. Hepworth, whilst Mr. William Hutchings and Mr. Hazlewood have been the contractors. Messrs. Hann & Son, of Beaminster, have done the chancel work for the Commissioners.

CHRIST CHURCH, TOTLAND BAY.—Improvements have recently been made to this church at a cost of over 1,500*l*. The old transept on the south side of the church, which had been closed for a number of years owing to its insecurity, has been taken down, and in its place there has been constructed a new south aisle of late XIIIth century English Gothic style, in keeping with the remaining portion of the church. A feature of the work is the polished Hoptonwood stone columns supporting the arcades, the shafts being monoliths. Additional seating accommodation is provided for 120. A vestry is also provided. Another alteration is the erection of a western porch, with a gallery over, giving thirty additional sittings. This porch is closed with iron gates, and the architect's designs by Mr. Bundy, of Carisbrooke. The church has also been re-heated on a new system by Messrs. Parker, of Birmingham, under the architect's superintendence. This work marks the completion of the first portion of an extensive scheme for enlarging Christ Church from the designs of Mr. Percy Stone, architect, which embraces an additional aisle on the north side of the church, a lengthening eastward of the chancel, and the erection of a tower at the north-west. In addition to the improvements already mentioned, a lych-gate of XVth century design has been placed at the north-west angle of the churchyard. The stonework and carving has been executed by Messrs. Garrett and Haysom, Southampton, and the general work has been carried out by Mr. R. D. Medway, Frelswater, Mr. C. Noble, of Bournemouth, was the clerk of the works.

CHURCH EXTENSION, BRIDGFORD.—The parish church of St. Giles, West Bridgford, is to be enlarged. The proposed work includes the completion of the body of the church, giving it a length of 67 ft. by 28 ft. wide, with two classrooms or vestries at the west end which can, if necessary, be thrown into the main building, giving it a total length of 90 ft. It has been designed by Mr. W. R. Gleave, of Nottingham, who has been architect for the whole scheme.

BAPTIST CHURCH, SOUTHELD.—A new Baptist church is in course of erection on a site at the corner of Wimbledon Park-road and Bright-road, Southfields. The work is being carried out by Mr. William Hammond, of Battersea, to the plans of Mr. Weymouth, of Westminster. The portion of the church now being constructed will cost nearly 2,800*l*., and the whole church, when completed, with galleries, tower, vestries, etc., will cost some 4,500*l*. to 5,000*l*. WESLEYAN REFORM CHAPEL AND SCHOOLS, HUCKNALL TORKARD.—On the 10th inst. the memorial stones were laid of the new chapel and schools of the Wesleyan Reform community at Hucknall Torkard. The chapel is designed in the Gothic style with frontage to Amnesley-road, and will be 32 ft. by 45 ft., with a roof of the open hammer-beam principle, and will provide seating accommodation for 555 persons. The front will be executed in red Istock bricks, the vestibules will be laid in mosaic, and the aisles in wood block. Entrance to the schools will be gained from Ogde-street. The scheme includes a central hall, and various classrooms with folding partitions. A gallery will run on either side of the central hall, and as the Ogde-street end of the site is lower than that of Amnesley-road, this gallery is on a level with the chapel floor. The building is from the designs of Mr. Harry Spencer, architect, of Hucknall, and the contract has been let to Mr. J. A. Munks, builder, Hucknall, for 2,560*l*.

SUNDAY-SCHOOL, IPSWICH.—Memorial stones have just been laid of a new Sunday-school for Bethesda Chapel, Ipswich. The architect of the building is Mr. Frederick C. Fauchel, and the builder Mr. C. A. Kenney. The schoolroom will have lavatories and a kitchen attached. In external design the building is Gothic, and is being constructed with red brick facings, with ornamental red brick dressings. The schoolroom will accommodate about 300 children, and will be so arranged that it can be divided by curtains into separate classrooms.

ADDITIONS TO EXETER DIOCESAN COLLEGE.—The Bishop of Exeter opened on the 16th inst. a new dormitory and laboratory which have been erected at the Exeter Diocesan Training College on a portion of the grounds of St. Luke's, Baring-crecent. The walls are of brick, the floors and staircase are constructed with concrete, with steel reinforcement, the partitions and divisions of cubicles are constructed in steel framing and uraltite asbestos panels. The ground floor contains a master's room, a physics laboratory, a manual workshop, and an heating chamber, with entrance doorway and hall from Heavitree-road, an exit door on the garden front, and an entrance to the master's room from Baring-

crecent. The upper floor, approached by a fireproof concrete staircase, has a dormitory, divided into fifteen cubicles, with a corridor running the whole length, and a panic egress door and stairs on the outside of the building on the garden front, for use in case of emergency, and a master's bedroom, bath-room, etc. The dormitory is ventilated with inlet ventilators and extraction air pumps. The building is warmed with hot water circulating pipes. The plans were prepared and carried out by Messrs. Lusscombe, Exeter, the surveyors and builders of the college.

PUBLIC LIBRARY, FENTON.—A public library was opened at Fenton on the 7th inst. The building is situate at the corner of Station-road and Baker-street. The style of architecture is in keeping with that of the Town Hall, which adjoins. The exterior is of red Acerington brick and white Hollington stone—the roofs being covered with brindled tiles. A flight of steps lead to the main entrance, and through doors of solid oak a small vestibule is reached. Van Kannel patent revolving doors separate this from the hall. The hall floor is laid with ceramic mosaic with the Fenton arms as a centrepiece. The walls have been painted green, having a tiled dado, continued up a staircase immediately opposite the entrance, and round the landing. The lending library is on the left of the entrance. The librarian's office is at one end of the counter and communicates with the hall, and a private staircase runs from the lending department to the filing room above. The reference library is entered from the public space of the lending department, with which it communicates. The general reading-room is on the right of the main entrance. The walls have a tile dado shoulder-high, and the roof is north-open with pitch-pine principals and plaster panels, divided by pitch-pine ribs. This room will accommodate seventy-eight readers. On the ground floor a caretaker's store-room is also provided, and in the basement there is a heating chamber, with coke and coal grate. The staircase from the entrance-hall is constructed of Stuart's granolithic, and has a wrought-iron balustrade supporting the handrail. The principal room of the first floor is a lecture hall, to seat over 100 persons. It has a rich ornamental plaster ceiling, with moulded ribs; and a faience mantel with a wrought-iron grate. There is lavatory accommodation in connexion. Also on the first floor there are a ladies' reading-room, and a committee-room. Most of the walls in the building are painted with Harland's flat enamel. The woodwork is of selected varnished pitch-pine. The ranges of balustrades, grates, and gas fittings are executed in wrought-iron from designs by the architect. The floors are fireproof and of steel and concrete. All the rooms are laid with wood blocks. The entire building is heated by means of low-pressure hot water apparatus on the one-pipe system, with radiators. The furniture and internal fittings have been designed by the architect and have been executed by Messrs. G. Fleet & Co., of Stoke. Messrs. Minton, Holius, & Co., of Stoke, supplied all the mosaic, faience, and wall tiling; Messrs. Thos. Brawn & Co., of Birmingham, the wrought-iron grates and gas fittings, the remaining fittings being supplied by Mr. W. Durose, of Tunstall; Messrs. Burgess & Co., of Liverpool, the wood block floors; the Crittall Manufacturing Company, of Braintree, Essex, the wrought-iron casements; Messrs. E. Peake & Sons, of Fenton, the heating apparatus; and Mr. C. T. Lysons, of Burslem, the blinds, and the sanitary ware by Messrs. F. White & Co., of Stoke. The architect of the work was Mr. F. R. Lawson, whose designs were accepted in a competition confined to local architects.

HOTEL IMPROVEMENTS, PORTFUSH.—Improvements, including the erection of a new wing, are being made to the Northern Counties Hotel at Portfush. The work has been designed and planned by the chief engineer to the Midland Railway Company, Mr. Berkeley D. Wise, C.E., and Mr. McNeill had personal supervision. The contractors for the building were Messrs. McLaughlin & Harvey, Belfast, and Messrs. Wilkinson, Newcastle-on-Tyne, supplied the marble for staircase; Messrs. Wm. Coates & Son, Ltd., Belfast, electrical fittings and installation; Messrs. Riddels, Ltd., fire escape, steam heating apparatus and radiators, and plumbing work.

THE NEW MUNICIPAL BUILDINGS, COWDENHEATH.—New Municipal Buildings are being erected in High-street, Cowdenheath. Red Dumfriesshire stone has been used in their erection. The town clerk's room, general offices, burgh court room, magistrates' room, and police accommodation are all on the ground floor, while above is situated the council chamber. The architect is Mr. T. Hyslop Ure, Dumfries.

PADDINGTON WORKHOUSE EXTENSIONS.—The Paddington Guardians are considering questions connected with (1) providing additional infirmary accommodation, and (2) the provision of work shops. In regard to the latter scheme revised plans for a single block of two stories have been prepared. The estimated cost of the workshops, according to these plans, is 2,350*l*.

NEW OFFICES, FALL MALL.—The London and Lancashire Fire Insurance Company are about

to erect new offices in Pall Mall, opposite Marlborough House, from the design of Mr. Guy Dawber. The constructional steelwork and fire-resisting floors are to be done by Messrs. Mark Fawcett & Co.

WESLEYAN HALL AT WHITLEY, READING.—The new Wesleyan Hall, at Whitley, Reading, was formally opened on the 14th inst. The hall forms a part of the Reading Wesleyan Methodist Extension scheme, and is the fifth building which has been erected under the scheme. The foundation-stones were laid on July 12, 1905. The cost of the building, including the purchase of three old houses and the land connected with them, was 6,314*l.* The large hall measures 51 ft. by 68 ft. on the ground floor, but on the gallery level the length is increased to 78 ft. It has an open pitch-pine roof. The hall is approached from the front through a vestibule with two stone staircases leading to the gallery; a third staircase (also of stone) gives access to the other end of the gallery. Behind the hall is a schoolroom measuring 33 ft. 6 in. by 53 ft. It is faced internally with sand-lime bricks supplied by Messrs. S. & E. Collier. The other accommodation comprises an infants' room, minister's vestry, various classrooms, kitchens, and the usual sanitary accommodation. The main hall and approaches are lighted by electricity, and the schoolroom block by incandescent gas. The building contract has been carried out by Mr. Robert Curtis. The stained-glass was from the studio of Messrs. Swaine, Bourne, & Sons, of Birmingham; the electric lighting and heating works have been carried out by Messrs. Callos, Sons, & May, and the wrought-iron work is by Mr. Girdler. The design and superintendence of the whole work was in the hands of Mr. W. Roland Howell, architect, of Reading.

ALMSHOUSES, PAIGNTON.—Two memorial stones were laid at Paignton on the 21st inst. on the site of two blocks of almshouses and flats. These will consist of forty distinct tenements, in two separate blocks, in Merritt-road, off the Totnes-road, in contiguity to an existing range of flats. The ground-floor tenements, sixteen in number, are to be used as almshouses, and the flats above let at moderate rents for small families. The architect is Mr. W. G. Coudrey. The total cost will be about 6,000*l.*, irrespective of the land.

NEW BUILDINGS, NATIONAL PHYSICAL LABORATORY.—The new electrical buildings are nearly finished. They are being erected by Messrs. Mowlan & Co., at an outlay of about 8,000*l.*, after the designs of Messrs. Mott & Hay, who act as honorary architects; the contractors' tender was based upon the cost price of the works. In their report for 1905, recently approved by the general board, the executive committee state that the Government have agreed to make a building grant during the current year of 16,000*l.*, instead of 6,000*l.*, as promised a few months ago, and to increase their annual grant by 500*l.* The laboratory work for the present year embraces the continuation of the wind pressure and steam researches, enquiry into the resistance of materials of construction to impact, experiments upon the effect of the continued application of high pressure to insulators, research into the properties of aluminum bronze, and completion of the work with the Ampere balance.

Stained Glass & Decoration.

ST. MARK'S, KENNINGTON.—A memorial window illustrative of the Sermon on the Mount was unveiled on March 25 in memory of a former vicar, the late Rev. Arthur G. Bowman. The window and tablet were executed by Messrs. Heaton, Butler & Bayne.

INSTITUTE OF BRITISH DECORATORS.—The Council of this Institute has decided to offer for the encouragement of colour decoration, a gold medal, to be awarded yearly, or at intervals of not more than three years, for either one of the following forms of distinction:—(1.) Executed decorative work of notable excellence. (2.) Effect of conspicuous value to decorators. (3.) Scientific invention or improvement in the manufacture of pigments or other materials used in decoration. The competition is to be open to Great Britain, Ireland, Canada and British Colonies. We are glad to notice the proviso that as each medal will be awarded to one person only, any firm whose work may be considered will be required to declare the name of the individual to whom the merit of the work, as a whole, is chiefly due. The Institute also announces that silver medals will be awarded annually to students in the training classes of the London Technical Schools, or in such technical classes for students) as may from time to time be nominated by the National Association of Master-Painters of England and Wales, the National Association of Master Painters in Scotland, or the National Association of Master Painters in Ireland. One such medal is to be awarded in each of the four above-mentioned District Divisions for each of the following subjects:—(a) To the student who shows the best general knowledge of the principles of

architecture in relation to design. (b) To the student submitting the best scheme of colour decoration as applicable to the interior of some existing building. All inquiries must be addressed to the Secretary of the Institute of British Decorators, Painters' Hall, Little Trinity-lane, E.C.

Sanitary and Engineering News.

THE ROYAL SANITARY INSTITUTE.—The following is the list of members and associates elected during March:—*Members:* Dr. J. A. Beaudry (Montreal); T. K. Dealy (Magazine Gap, Hong Kong); N. F. Dennis (Borough Engineer, West Hartlepool); E. C. Douglas (Montreal); H. R. Gray (Montreal); R. T. Hewlett (Director of Public Health Laboratories, King's College, W.C.); W. J. James (Streatham, S.W.); A. Johnson (Glasgow); E. P. Lachapelle (Montreal); J. J. Leckland (Water Engineer, St. Helens); E. S. Lea (Montreal); J. A. Luudie (Montreal); T. Moulding (City Engineer and Surveyor, Exeter); E. Pelletier (Montreal); H. J. B. Rowall (Provincial de Lima, Peru); J. F. Revill (Leytonstone); J. W. Seane (Montreal); H. J. C. Turner (Bombay); D. Millar (Glasgow). *Associates:* A. Ainley (Huddersfield); W. G. Bell (Plymouth); Miss M. B. Box (South Benfleet, Essex); J. A. K. Cooper (Gatford, S.E.); H. R. Crisp (W. Ealing); H. Crossley (Oldham); Miss I. Curwan (W. Hampstead); J. Duncan (Ayr, N.B.); H. J. W. Gidley (Victoria, Hong Kong); T. Gray (Mid-Caldor, Midlothian); Miss K. E. Griess (Westminster, S.W.); W. J. Hutchings (Beckham, S.E.); E. J. Johns (Alabar, S. Nigeria); S. Matthews (Middleton Junction, Lancs.); W. H. McDowell (Ballsbridge, Dublin); H. McKinnon (Rothsay, N.B.); Miss E. G. Moyrhan (Regent's Park, N.W.); H. F. Naughton (Rochampton); J. Smith (Glasgow); J. Thorley (Chorlton-cum-Hardy).

SEWERAGE SCHEME, GLENFIELD.—At the Co-operative Hall on the 22nd inst. Mr. W. O. E. Meade-King, Local Government Board Inspector, had an inquiry into the application of Blaby Rural District Council for sanction to borrow 4,250*l.* for purposes of sewerage and sewage disposal for the township of Glenfield. In the course of the inquiry Mr. Turner (Surveyor) said the population his scheme provided for was 900. The treatment of the sewage would be by open septic tanks, filters, and automatic revolving sprinklers; and the effluent would be discharged into the brook.

PROPOSED ADDITIONS TO THE SEWAGE FARM, SALTLEY.—The Birmingham, Tame, and Ryland District Drainage Board having applied to the Local Government Board for sanction to borrow 73,000*l.*, an inquiry into the subject matter of the application was held on the 22nd inst. at the Council House by Mr. R. H. Bicknell, Inspector to the Local Government Board. Mr. H. A. Pritchard (Deputy Town Clerk) informed the inspector that a few years ago the Board put down at Saltley certain storm-water filters, but these had not proved quite so useful as was anticipated at the time, and Mr. G. D. Watson, engineer, had recommended to the Board a scheme for dealing with the difficulty. It was proposed to remove the percolation media from certain of the beds on to other beds, so as to make the depth of the media 5 ft. instead of 3 ft., as previously, and new media would be placed in the remaining beds to a similar depth. Close by the existing storm-water filters there were thirty acres of land, and Mr. Watson proposed to use that area for storm-water filtration. In connexion with the storm water proposal, it was necessary to deal with the three main outfall sewers bringing the sewage to the farm. Mr. Watson proposed to carry these outfalls to the back of the present beds at a higher level, to pump the sewage up to that height, and then to take it over the river, through two conduits instead of one as at present. The carrier would be provided with means for cutting off the sewage in times of normal flow, and the sewage would then be conveyed to the various beds for treatment. For the purpose of lifting the sewage to the higher level electric power, which had already been installed, would be used. The beds were to be divided into three separate sections of ten acres each. In answer proposed to deal with twice the present dry weather flow by means of gravitation, and four times by pumping, and this method would release a large acreage of land. Mr. Watson also gave evidence as to technical details.

SEWERAGE SCHEME, KESWICK.—The Local Government Board having approved of a scheme of sewage disposal for the town of Keswick, the contract for the work has been let to Mr. J. W. Broadhead, of Furston, Pontefract. The work consists in the construction of an open storage tank at the end of the existing main outfall sewer. Adjacent to this tank a pumping station is to be erected. The sewage will be lifted by centrifugal pumps, driven by gas engines, and delivered at the high end of the works into

a receiving reservoir, from which it will gravitate at a slow rate to bacterial tanks and filters, the effluent being finally treated on land. The storm water is to be dealt with separately in specially constructed storm water filters. The works have been designed by Messrs. D. Balfour & Son, consulting engineers, of London and Newcastle.

WATER SCHEMES, PENARTH.—At a recent meeting of the Penarth Urban Council a report was read from the Special Water Committee, which recommends the adoption and carrying out of the Glenderamakin scheme as prepared by Mr. Baldwin Latham, the engineer, and that a Bill should be promoted in Parliament for the necessary powers with clauses giving the Rural Council the privilege of taking a supply for their area from the Urban Council up to 100,000 gallons a day.

Foreign.

ST. PETERSBURG BUILDING AND ARCHITECTURAL EXHIBITION.—Mr. H. Cooke, British Commercial Agent in Russia, writes to the Board of Trade that he has now been officially informed by the Exhibition Committee that the opening of this Exhibition, which was originally fixed for Tuesday next, has been deferred until April, 1907.

Miscellaneous.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The partnership which has existed for some five years between Mr. R. S. Balfour and Mr. W. A. Pitt, architects, has been dissolved as from February 24 last.—Mr. Philip Sturdy, architect and surveyor, has removed his offices from 4, Clarendon-buildings, Bournemouth, to 84, Poole-road, Bournemouth (near County Gates).—Messrs. Carter & Banks have purchased the business of Alfred T. S. Carter, Ltd., tile and mosaic manufacturers and builders' merchants, which will in future be carried on at 283, Brockley-road (not 288, as hitherto), and St. Margaret's Works, Brockley.

UNBREAKABLE TIE-BARS AND AXLES.—An invention by Carl Fox, of the London Salvage Corps, is intended to obviate the risk of fracture in the tie-bars of steel structures and the axles of railway rolling-stock. The idea is based on a method of manufacture in which a steel bar constituting the core is surrounded by a series of other bars and the whole welded and forged so as to form a solid mass. As it is highly improbable that a flaw would exist in every bar at the same place it is contended that perfect safety would be assured. To a certain extent bars so made would be produced in a manner similar to that necessarily adopted in the early days of wrought iron, and it may be doubted whether they are wanted in structural engineering, as no evidence exists to show that ordinary steel bars are lacking in reliability.

ESTIMATES (PUBLIC BUILDINGS), 1906-7.—The estimates which have just been issued for the ensuing financial year show a decrease of 8,050*l.* on a vote of 51,800*l.* for the Houses of Parliament. There are votes of 13,340*l.* for official residences of the First Lord of the Admiralty, the Second Lord of the Admiralty; 24,000*l.* for new works, Royal College of Science; 23,200*l.* for the vaccine station at Hendon; and 12,000*l.* for Eskdale Muir magnetical observatory. Other votes relate to the royal palaces—66,000*l.* (an increase of 3,000*l.*); Osborne House, 16,400*l.* (1,500*l.*); art and science buildings, 70,800*l.* (23,828*l.*); and public buildings in Great Britain, 517,000*l.* (53,000*l.*). The aggregate estimates for public works and buildings amount to 2,790,280*l.*, being an excess of 86,247*l.* over the sum for the last year.

HOLBORN TOWN HALL.—The property which the Holborn Borough Council will offer for sale at the Mart on April 9 extends over 12,000 ft. superficial, with frontages to Gray's Inn and Clerkenwell roads. The Town Hall, of which we published illustrations on December 13, 1879, was built after Mr. L. H. Isaac's designs, and some improvements were carried out since by Messrs. Isaacs & Florence. The building comprises a large concert-hall with galleries, two smaller halls, and a range of offices. At a recent meeting of the Council it was stated that the Hall was valued at 57,160*l.* when the Council took it over from the former Vestry, and that the loans on the building which will mature in March, 1908, amount to 11,574*l.* For the twelve months 1903-4 the income derived from the premises, which are assessed at 1,914*l.*, was 4,556*l.*, the cost of maintenance being 2,277*l.*

FOAMING GLUE.—It is well known that glue varies very much in the amount of foam they produce when treated with water, and technical chemists have for some time past been endeavouring to discover the causes which induce this objectionable foaming. Two papers have recently been communicated to the Society of Chemical Industry on the subject, and although a method of producing glue which will not foam has not yet

a claim for trespass in connexion with the party-wall.

By their defence the defendants denied that their new buildings had, or would, cause any nuisance to the plaintiff as alleged, and that they would to any appreciable extent affect the plaintiff's light, or interfere with the comfortable enjoyment by the plaintiff or his tenants of the premises. (The case was reported in the *Builder* of March 3 last.)

Mr. Hughes, K.C., and Mr. Crossfield appeared for the plaintiff, and Mr. Younger, K.C., and Mr. Edward Ford for the defendants.

In giving judgment his lordship said that by the action the complaint was of a two-fold nature. The first was as to the erection by the defendants of the party-wall above the height which the plaintiff authorised them to raise it, and which it was alleged on behalf of the defendants was done in error. However that might be, it was clearly unwarrantable, but as during the trial the defendants had offered to take it down, it was not material for him (his lordship) to say anything more about it except perhaps on the question of costs. The other complaint was as to the obstruction of light to certain windows in the plaintiff's building. On the hearing of the motion for an interlocutory injunction it was agreed as regarded the plaintiff's claim for a mandatory injunction the rights of the parties were to be the same as if the trial had taken place at the date of the motion, and that his lordship should assume that the defendants' new buildings were then in the condition shown on the ground plans and elevation. The plaintiff was an under-lessee for the residue of a not long term of years—seven years from December, 1904. His immediate reversioner was not a party to the action, and the ultimate reversioner was the ground landlord of the defendants as well as of the plaintiff. That gentleman did not desire to have any part of the defendants' building removed, and his lordship thought that under the circumstances the plaintiff could be properly compensated by damages being awarded to him if he was entitled to any relief. His lordship having specifically described the windows in the plaintiff's building alleged to have been affected by the defendants' buildings, said he came to the conclusion that none of the plaintiff's windows, or the rooms lighted by them on the ground and first floors, were ever specially well lighted in any sense, or more than sufficiently lighted for the ordinary use and occupation of rooms in a dwelling-house or flats. He thought that really the light was deficient according to the notions of ordinary people. He was of opinion that the light to the studio through its only light—the skylight—had been greatly diminished by the defendants' new buildings. The defendants by their new buildings had not only obstructed a considerable amount of light coming to the room, but they had rendered it less comfortable, and had made it unfit for the immediate purposes for which it was formerly used. With regard to the window "K" that was the only window lighting a bed-room on the ground-floor in the plaintiff's building, it would be idle to say that that room had ever been well or sufficiently lighted. The light to it had always been obstructed. Some of the witnesses alleged that the room, although badly lighted, was sufficiently lighted for a bed-room. His lordship said that the room had always been a dark room, and by reason of the defendants' buildings the light coming to the upper portion of the window had been further diminished, and actual damage thus occasioned to the plaintiff. The window "C" on the first-floor lighted the staircase, and "D" was a window lighting a water-closet and bathroom. These windows had been rendered darker by reason of the defendants' new building. The rear room on the first-floor was lighted by the windows "A" and "B," the room being at present unoccupied. He found that this room was never well lighted. It was dark before and uncomfortably dark now by reason of the defendants' buildings, and the room thus rendered less comfortable. His lordship, having referred to the other windows in the plaintiff's building said to have been affected by the defendants' new buildings, said he was of opinion that what the defendants had done could fairly be held to be a nuisance, and he so decided. He must award the plaintiff some damage, and he fixed the amount at 120*l.*, and the defendants must pay the costs of the action.

Mr. Younger, on behalf of the defendants, agreed to pull down the portion of the party-wall which was too high within three weeks.

BUILDING DISPUTE IN ST. MARTIN'S-LANE.

THE case of *Borwick v. the London Coliseum, Ltd.*, came before Mr. Justice Grantham, sitting by consent without a jury in the King's Bench Division this week, an action by the plaintiff for damages for alleged breach of an agreement. In this case the plaintiff is an engraver, and carrying on business at No. 42, St. Martin's-lane, W.C., the defendants being the owners of the adjoining premises, No. 41, St. Martin's-lane. In June, 1904, it was alleged defendants began to

pull down the premises on the site of No. 41, and thereby deprived plaintiff's premises of the support of No. 41, and caused the party wall to crack and become unsafe. In consequence of these matters a dispute arose between the parties, which was compromised by letters of July 14 and August 6, 1904, which it was agreed between the plaintiff and the defendants that the defendants should rebuild the wall on the following terms, viz.:—(a) That the work should not be begun until the specification and plans had been approved by the plaintiff; (b) that all damage done in making the proposed alterations should be made good at the defendants' expense, even to rebuilding if necessary, and including repapering and painting the parts affected by the alterations; (c) that the defendants should erect a partition to enable the plaintiff to carry on his business during the alterations; and (d) defendants to pay the plaintiff's surveyors' and solicitors' charges. Plaintiff said it was an implied term of the agreement that the work should be completed within a reasonable time. In breach of this agreement plaintiff alleged that the defendants had pulled down the said wall and started the work before the plans and specification had been approved by him, and so indignantly erected the partition to be erected that the plaintiff was unable to carry on his business or reside at the premises, owing to the dust, draught, and damp, and plaintiff had to remove his business, and therefore, as he said, had suffered considerable loss. In further breach of the agreement plaintiff said the defendants had not made good all damages done by the alterations, and put the shop or fittings or fixtures into the proper condition for carrying on the business. Plaintiff claimed 700*l.* special damages, including 300*l.* for loss of trade and loss of profits.

Defendants, by their defence, denied that they were guilty of any wrongful acts. They said that any work done by them in or about the premises in question was executed by them in accordance with a notice duly served by them upon the plaintiff in December, 1903, and also under the powers conferred upon them as building owners by the London Building Act, 1894. Defendants denied that they had deprived the plaintiff's house of support, or caused the party wall to crack or become unsafe as alleged. Defendants admitted that after the dispute arose a compromise or agreement was made, but they denied that those terms were according to those set out by the plaintiff. Defendants admitted the terms numbered b, c, and d, and said they were part of the terms arrived at, but they denied that there had been any breach of b or c, and further said with regard to d that they had always been ready and willing, and still were ready and willing, to pay all the proper charges of plaintiff's solicitors and surveyors, but no accounts had yet been rendered. In the alternative defendants said that if no compromise was arrived at plaintiff's remedy was by arbitration in accordance with the provisions of the London Building Act, 1894. Defendants contended that the items of 300*l.* odd claimed by plaintiff for loss of trade and business, and expenses of having to remove elsewhere, were not recoverable in law. Defendants brought the sum of 150*l.* into court, and said that the same was sufficient to satisfy the plaintiff's claim.

Mr. English Harrison, K.C., and Mr. Colam appeared for the plaintiff, and Mr. Foote, K.C., and Mr. T. Hunnifreys for the defendants.

After hearing a great deal of detailed evidence, and the addresses of counsel, his lordship, in giving judgment, said the case ought never to have been brought into that court for trial. The defendants had endeavoured to persuade the plaintiff to have the case referred, but, as the plaintiff refused, it thus came on for trial before him. There was very little law in the case, practically the whole "hug" being a question of account. With regard to the case itself it was not free from difficulty. He thought he ought to say that so far as the defendants were concerned they had behaved in a very liberal manner, and they had done everything which honourable people should do in the peculiar circumstances in which they were placed. The result of what had been done was that the freeholder of No. 42 had been very much benefited. He also thought that the plaintiff (the leaseholder) had also been benefited by having a better house, now that it was finished, than it was before. He (his lordship) agreed that the plaintiff had been benefited by having now a good corner house and a good shop and a wall very well built. But that had nothing to do with the case. Defendants could not rely on the fact that they had been that the plaintiff, who had been there for a good many years, should be disturbed in his occupation of the house. One could quite understand that the party wall was a perfectly good party wall, while it was up. The moment the defendants pulled down the house, the plaintiff's position was quite right in trying to protect their client as much as possible. He had no doubt that the plaintiff was damaged more than expected, and

that by what was done he did suffer in his casual trade. Plaintiff made no claim with regard to his general trade. He did not think that the work was carried out in its entirety, as it was intended to be. He came to the conclusion that the partition was not done as it might have been done to protect the plaintiff from injury.

He thought that it was badly done, and did not keep out the dust and damp. He was of opinion that the defendants were liable for some of the loss which the plaintiff had sustained. He considered, however, that the plaintiff's claim was an extravagant one. He could not hold that the plaintiff was entitled to the large sum he claimed for loss of trade, but he believed there was a loss of trade. On the whole he thought the plaintiff was entitled to judgment for 280*l.*, which included the 150*l.* paid into court. That would mean that there would be judgment for the plaintiff for 130*l.* above the 150*l.* paid into court, which amount the plaintiff would take out of court.

Order accordingly.

NUISANCE TO PROPERTY BY NOISE AND VIBRATION.

THE case of *Hawkins v. Nichols* came before Mr. Justice Buckley in the Chancery Division on the 28th and 29th insts., an action by Mr. H. J. Hawkins and his wife against the defendant, Mr. Jas. Nichols, for an injunction restraining the defendant from carrying on the business of a saw-mills in such a way as by reason of the noise and vibration and the violent and disgusting language of the men employed by the defendant or otherwise as to cause a nuisance or injury to the plaintiffs and their property. There was an alternative claim for damages. The defence was a general denial of the allegations of the plaintiffs. Mr. Duke, K.C., Mr. Hamilton, K.C., and Mr. Wainson appeared for the plaintiffs, and Mr. Ruckmaster, K.C., and Mr. Sargent for the defendant.

Mr. Duke, in opening the case, said the plaintiffs resided at Brookside, near Barnes Common, and their premises adjoined the defendant's saw-mills and timber-yard. The action was brought in respect of a nuisance and noise. Plaintiffs were the owners of house-property in Barnes, and they themselves occupied one of these houses. Defendant was a neighbouring owner. At the end of 1900 the defendant set up immediately at the back of the plaintiffs' premises a saw-mills and joinery-yard on a large scale, and had converted residences and houses which were quiet residences into places where now it was impossible to enjoy quiet and comfort. Defendant was the owner of a house called the "Grove," plaintiffs' house was of a rental value of about 100*l.* a year. Plaintiffs were also the owners of the surrounding houses, let at about 40*l.* a year. The neighbourhood was essentially a residential one, and he contended that to establish this factory as the defendant had done would entirely upset the whole character of the district. Mr. Mills occupied an acreage of 24 acres, and was equipped with modern and up-to-date appliances for the business. Defendant had several machines running, and this caused a substantial nuisance as the mills seemed to be constantly in operation. Besides that there was vibration caused by the running of the machinery and the constant hammering of men in the joinery works. Plaintiff also complained of the bad language used by the men. Defendant had offered to erect a wall 14 ft. high to mitigate the nuisance complained of, but it had been found ineffective. Defendant had offered to erect a wall 22 ft. high on plaintiffs' own property, but this offer had been declined.

His lordship said he thought the offer reasonable. Defendants were entitled to have saw-mills and joinery works, but not to cause a nuisance to the neighbourhood. Plaintiffs' only proposition appeared to be to close the works.

Mr. Duke said he was not instructed to ask for anything less than the closing of the mills. His lordship said that that appeared to be too large a proposition.

Evidence was then called in support of plaintiffs' case. After hearing evidence on behalf of the defendant, his lordship, in giving judgment, said the question he had to determine was whether the defendant's acts on his land had been such as to create a legal nuisance. He was not satisfied at all with the evidence given by the plaintiff's witnesses, the evidence being greatly exaggerated. He thought the defendant had acted in a perfectly straightforward and honest way, and that the question for him was to a great extent imagined. The conclusion at which he arrived was that it was not a *bona-fide* action. He thought it was brought for the purpose of compelling the defendant to pay the plaintiff a sum of money. He came to the conclusion that it was a dishonest action, and dismissed it with costs.

THE COMPOSITION OF MORTAR.

MR. BAGGALLAY gave his decision at Greenwich Police Court on Wednesday in the matter of the summonses, issued at the instance of the London County Council, against Messrs. H. & G. Taylor, builders, of Boyne-road, Lewisham, alleging

that they had used in the construction of certain houses mortar not in accordance with the Council's by-laws. The point in which the mortar was said to fail was that it was not composed in the proportions of one part of lime to three parts of other materials.

Mr. Bagallay said he found as fact that the mortar used was in the proportion of one of lime to three of sand or grit if the proportions were measured with slaked lime—that if unslaked lime had been used for the purpose of measurement the proportions would have been about one to five. He also found evidence that many leading builders used slaked lime as the basis of measurement in the composition of mortar, and—a third fact—that this particular mortar was good enough for the purpose for which it was employed. There was a further question however, in regard to the by-law, it having been argued that it was bad, as nobody could understand what it meant. Mr. Macmorran had contended that it must be so clear that anyone looking at it would know what it meant. He said that even if it were good, it did not seem to him an unreasonable construction to put upon it, that the lime should be slaked before measurement. He dismissed the summons with 50s. costs. The case had been taken upon one summons of several, and he deferred his decision upon the others until Mr. Boulton, who appeared for the London County Council, had decided whether he would ask for a case to be stated.

Mr. W. P. Neal, solicitor, was for the defendants.

Patents of the Week.

APPLICATIONS PUBLISHED.*

5,272 of 1905.—W. H. BODIN: *Baths, Lavatory Basins, and Sinks.*

This relates to baths, lavatory basins, and sinks, and consists of runners, forming gutters, at the sides of the bath, and emptying into an outlet pipe at the end of the same, and a cover made in two or more parts shaped so as to drain into the gutter, and adapted to slide under the lavatory basin when the latter has been slid along the bath to the foot end of the same.

5,514 of 1905.—R. ZELLENKA: *A process for Making of Foundations and Bond in Laying Stone Blocks, Bricks, and Masonry.*

This invention relates to a process for making a binding material for foundations, in which broken up stones, clean and sharp sand, pebbles, slag, and the like are mixed with a binding material made from finely ground sulphur or pyrites and ferrous sand, and the mixture heated in a suitable vessel to a temperature of about 150° C.—180° C., whereby the binding material melts to a thin liquid, thus completely filling up interstices between the stones, and the like, covering the same perfectly, and forming of the whole a plastic mass of similar properties to concrete, which mass can be rammed or stamped in moulds or between boards to any shape or form and for any kind of foundation work. After a few minutes the mass sets to a hard structure, which is at once able to stand against heavy pressure.

9,180 of 1905.—W. S. THOMPSON: *Cranes.*

This relates to cranes, and consists in the combination of a slidable clutch on the crank shaft, which has mounted on it a spur pinion of a diameter greater than that of the main spur pinion, with a spur wheel on the barrel shaft of a diameter less than that of the main spur wheel, and a hand lever for actuating said clutch.

9,615 of 1905.—R. DUNCAN: *Coin Freed Locks for Lavatories, Water-closets, and the like.*

This relates to coin freed locks for lavatories, water-closets, and the like, which may be operated by one key when the indicator reads "vacant," and consists in the combination therewith of means whereby the entrance can also be effected by a different or master key when the door is bolted and the indicator reads "engaged."

10,005 of 1905.—J. CALLEE: *Windows.*

This relates to a collapsible ventilating hopper for windows, consisting of a main pivoted part and pivoted side parts articulated to the said main part so that they open and close therewith in a direction about the vertical, so that the edges of the side parts coincide, when the hopper is open.

* All these applications are in the stage in which opportunity to the grant of Patents upon them can be made.

with the edges of the main part, and so that when the hopper is closed the necessary leverage to open the side parts is provided; the construction being such that the main part may be disconnected from the side parts for the purpose of cleaning or removal.

10,367A of 1905.—S. BEAL: *Mixing and Timing Bakes, or apparatus for Water and other Liquids for use in Showers or other Baths, and such like applications.*

This relates to a mixing valve or apparatus provided with a timing cylinder, for the purpose of cutting off the supply after any given interval, following the opening of the valves, even against the will of the bather. A further supply of water can only be passed or obtained after a second or longer period has elapsed following the automatic closing of the valves.

16,388 of 1905.—A. T. LINDENMAN: *Lumber Joining Machines.*

This relates to a machine for joining lumber, and consists of oppositely moving carriers, the section or carriages whereof are provided with normally depressed dogs for pushing the stock, in combination with automatic selecting mechanism for positioning the proper dogs for action, and means for tripping the dogs automatically. The invention further consists of a rotably rotating cutter mounted upon an inclined arbour, said arbour having its bearings located eccentrically in a cylindrical casing capable of a turning adjustment and a spring actuated ejecting device consisting of an arm lying normally in the path of, and positioned for action by the lumber.

11,822 of 1905.—W. E. HIFKINS: *Weightbridges.*

This relates to weightbridges, and consists of a rocker bearing consisting of two U-shaped end pieces connected by a bridge piece, preferably formed in one with the said end pieces, said bridge piece containing or forming the bearing steel of the knife edges of the main levers, the said bridge piece being recessed back to allow the legs or verges of the weightbridge to be supported by the upward projections in the hollows of the U-pieces.

15,014 of 1905.—S. H. ADAMS: *Flushing Arrangements for Water Closet Basins.*

In this invention a ridge or projection is formed at the entry to the trap, which causes the water to leap into the trap, and having passed this ridge or projection, which may go around the closet-pan if desired, the matter will very readily pass through the trap, because there will be an immediate widening of the trap after the ridge has been passed.

25,963 of 1905.—E. BRADBURY: *Spigot and Socket Earthenware Pipe Joints.*

This invention relates to a spigot and socket earthenware pipe joint, and consists in the combination of a notched or recessed annulus in the socket having its back face formed with inclines, a spigot with exterior lugs set back from the end of the spigot, a ring on the end of the spigot, and a ring in the interior of the socket with which it is adapted to engage. The invention further comprises a facing ring on the shoulder of the socket, and a ring on the end of the spigot wide enough to fill up the space between the spigot and the annulus when the joint is made.

8,392 of 1905.—W. P. INGHAM: *Bricks or Blocks for Building, Paving, the Construction of Floors, or other purposes.*

This relates to a brick or block for paving, the construction of floors, or other purposes, having longitudinally inclined planes upon only two opposite sides or ends, or faces thereof, arranged diagonally or in opposite directions so as to cross one another, thus constituting tapered flanges or shoulders adapted when the bricks are placed side by side, end to end, or face to face, to interlock with the next adjacent bricks in the same course or row.

18,242 of 1905.—T. W. ADSHEAD: *Fenders and Curbs for Fireplaces.*

This relates to a dog-ended fender or curb in which the dogs are tied to the base of the article and thereby braced or stiffened by means of a curved or dropper rail, whose extremities are connected to the front of the dog ends, whilst the middle part of the same is attached to the front of the base, and consists in securing the middle of the dropped bracing rail to the front of the curb or fender base by an ornamental connexion.

24,750 of 1905.—A. C. BREWERTON: *Roofing Tiles.*

This invention relates to roofing tiles, and consists in a process of "aging" tiles, so that a new tile shall have the appearance of an old tile. According to the invention the upper surface of the tile whilst still in the state of clay and before baking is sprinkled and scrubbed with sand either by hand and a brush or by machine. In one way of carrying out this invention, the upper surface of the clay as it leaves the mill in the process of the making in the form of a flat band is sprinkled and scrubbed with sand either by hand and a brush or by a machine. The sheet is afterwards cut into tiles and baked in the usual manner. The sand may be contained

in a hopper attached to the mill and be supplied continuously on to the band, and a brush may be continuously reciprocated across the band.

24,969 of 1905.—F. M. H. JONES: *Building Block.*

This relates to a building block having a groove upon the sides and bottom chamfer or recesses within the sides, a projection upon the top of an outline corresponding to the channel upon the bottom, but of such dimension as to leave a space between it and the said projection, which is filled with cement or the like, and channels upon the edges of the block.

17,922 of 1905.—A. H. CORN: *Domestic Fireplaces.*

This relates to an open domestic fireplace, and consists in the combination of a removable heat-resisting frame having a hole or orifices through its sides supporting a back and a removable metallic grid with heat-resisting blocks having a channel or passages through same with a rotatable or slidable metallic shutter fitted to their inlet end, and built or erected upon a heat-resisting base, the upper surface of which is level or nearly level with the flooring of the room.

4,758 of 1905.—D. M. NESBIT: *Steam Heating Systems and Apparatus employed therewith.*

This relates to a heating system including a combined heater and condenser, and consists in the combination of an auxiliary coil in the jacket of the condenser or in a water chamber in connexion therewith, and a thermostatic device, influenced by the heat of the water in the jacket, for automatically controlling the supply of live steam to said coil.

5,765 of 1905.—THE ASSOCIATED PORTLAND CEMENT MANUFACTURERS, LTD., H. K. G. BAMBER and G. R. M. LAYTON: *Manufacture of Portland Cement.*

This relates to the manufacture of Portland cement, and consists in the combination of two rotary kilns, the space intervening between the two being so cased in that the hot gases from the lower pass into the upper, and a mixing or grinding machine for acting on the raw material, between its delivery from the upper and its entry into the lower.

12,133 of 1905.—D. MCINTYRE: *Floors of Buildings.*

This relates to the construction of floors for buildings in which the flooring boards are carried by auxiliary or floating joists placed in between the main joists and supported by metal straps extending over said main joists, the latter being kept under the level of the flooring boards, and cushioned pads being interposed between the straps and the joists.

4,191 of 1905.—A. J. BOULT (M. REICHER): *Process for Manufacturing Hydraulic Binding Substances or Cements.*

This relates to a method of manufacturing binding substances containing water, and is characterised by causing hydrate of lime, in proportions suitable for forming cements, to act on cement-forming oxides or hydroxides or salts in a finely-ground flaky condition in the presence of water in an atmosphere of high pressure, or, if desired, super-heated steam, until the complete or nearly complete opening up of the fine meal takes place.

7,043 of 1905.—K. H. WOLMAN: *Composition Matter for Impregnating Wood.*

This relates to a composition matter for impregnating wood, consisting of such mixed solutions of salts of strong mineral acids and of weak organic acids as are capable of existing together in a solution, the mixture being so composed that when the basic salts are formed no strong mineral acid is liberated. In a modification of the invention ammonium acetate is used instead of the weak organic acid.

20,085A of 1905.—A. G. BAGOT: *Apparatus for Extending or Exhibiting Maps, Charts, Rolled Drawings, or the like.*

This invention comprises a cylindrical casing containing a number of spring rollers constructed preferably of a corresponding number of longitudinal strips pivotally mounted in end plates and normally urged by suitable springs to close on each other and form a continuous envelope or casing. By raising one or other of the strips, the roller of the corresponding map may be withdrawn from or admitted to the casing. The cylinder itself is journaled in the end plates of a protective casing, and this is conveniently done by entering the ends of the cylinder spindles in slots in the end plates and securing them by spring catch hooks. The casing is supported automatically by a rod attached thereto, and stepped in a socket tube which may be fixed to the floor, front, or side of the vehicle by suitable means. The rod is urged upwardly by means of a spring, and the elevation of the casing is controlled and its upward movement checked by a spring trigger or other suitable device. To prevent rotation of the casing about the axis of its support the rod and socket tube may be of a section other than circular, or a transverse pin in the rod may be arranged to move in a longitudinal slot or guide way in the tube.

List of Contracts, etc.

(For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, xix.; Auction Sales, xxxii. Certain conditions, beyond those given in the following information, are imposed in some cases, such as; that the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.)

BUILDING AND ENGINEERING.

APRIL 2.—BRADFORD.—ALTERATIONS.—For various works required in sundry alterations to the Bradford Church Institute. Plans may be seen and quantities obtained at 42, Tyne-street, Bradford, until Monday, April 2, when tenders are to be delivered to T. H. & F. Healey, architects.

APRIL 2.—LEEDS.—SHOP PREMISES.—For the whole or any of the several trades, viz., excavator's, bricklayer and mason's, carpenter and joiner's, shopfitter's, plumber and glazier's, painter's, slater's, ironfounder's, and concretor's work required in the erection of block of shop premises at Hyde Park Corner, Leeds, for Mr. Joseph Pickerskill, Names to Messrs. Thomas Winn & Sons, architects, 84, Albion-street, Leeds, on or before April 2, when bills of quantities will be duly forwarded.

APRIL 2.—BELFAST.—WATER TANK.—The enlargement of a cast-iron water tank at Ormeau, near the Gattorna, alternative tenders for the erection of a new tank, for Belfast Baths and Lodging-House Committee. Form of tender, etc., on application at the City Surveyor's Office, Sealed tenders, endorsed "Tender for Storage Tank," to Mr. R. Meyer, chief clerk, by April 3.

APRIL 3.—EDINBURGH.—WALL.—A retaining wall at the Queensberry road, on the estate of Binkbonny, Schedules of quantities and bills of materials, by James City Architect, Public Works Office, City-chambers, Edinburgh. The estimates must be sent by 10 a.m. prompt on Tuesday, April 3, sealed and marked "Tender for Retaining Wall at Queensberry-road."

APRIL 4.—BADMINTON.—RECREATION HALL, SCHOOLS, ETC.—A recreation hall, schools, cottages, etc., at Badminton, Gloucestershire, for the Badminton Estate. Names by April 4, to Mr. Frank W. Will, F.R.I.B.A., 8, St. George-street, Bristol. Bills of quantities supplied upon payment of the sum of 1l.

APRIL 4.—BARNSELY.—HOUSE.—House to receive the chalk-mixing apparatus, etc., for Midhope filter-beds, for the Corp. Form of tender, etc., may be obtained (on payment of two guineas) on application at the office of Mr. J. Henry Taylor, Manor House, 10 Barnsley, and at the offices of Messrs. T. & C. Hawley, Civil Engineers, 30, Great George-street, Westminster, S.W. Tenders must be delivered at the office of the Town Clerk by April 4.

APRIL 4.—CARLETON.—SHELTERS.—Materials and erection upon the Newport Borough Asylum, Carleton, Mon. Estate of four airing court shelters. Plans and specifications may be seen at the Asylum. Tenders, endorsed "Airing Court Shelters," must be delivered, addressed to the Visiting Committee, Newport Borough Asylum, Carleton, Mon., by April 4.

APRIL 4.—INVERARY.—SCHOOL.—Mason, joiner, slater, plumber, plaster, and painter work (either for the whole or separate) of proposed new school in the burg of Inverary, for School Board. Plans and specifications may be seen at the Office of the Clerk, National Bank, Inverary, and copies of the scheduled quantities may be obtained from him on payment of a few shillings. Sealed offers, marked "Tender for New School," to be lodged with Alister Macnabth, Clerk to the Board, Inverary, on or before April 4.

APRIL 4.—PORTLAND.—JUSTICE ROOM.—A justice-room, adjoining the Police-station, at Portland, for the Dorset Standing Joint Committee. Forms of tender, etc., obtained from the County Surveyor, at his office, Wimborne, or at the Bhirre Hall, Dorchester. The sum of two guineas will be charged for the bills of quantities. Tenders, marked "Justice Room, Portland," must be sent to E. Archibald Crooks, Clerk to the Standing Joint Committee, County Council Offices, Sherborne, on or before April 4.

APRIL 4.—STORE.—REPAIRS TO WORKHOUSE.—Repairs to the workhouse buildings, for Stoke-upon-Trent Guardians. Specifications, etc., from Mr. C. Daniel, Clerk to the Guardians, Union Offices, Stoke-upon-Trent. Tenders, marked "Repairs," to be delivered by 9 a.m., on April 4.

APRIL 4.—TATWORTH.—CHURCH.—SCHOOL.—New infants' school at Tatworth, for Somerset County Education Committee. Drawings, specifications, and conditions of contract may be seen at the Chard Tatworth Council School, and bills of quantities and forms of tender obtained from Messrs. Sanson & Cottam, 43, High-street, Bridgwater, on depositing one guinea. Tenders, endorsed "Tatworth Infants' school," must be delivered at the County Education Office, Weston-super-Mare, not later than April 4.

APRIL 4.—WIMBORNE.—ALTERATIONS, ETC., TO WORKHOUSE.—Additions and alterations to the juvenile wards at the Wimborne Workhouse, for the Guardians of the Poor of the Choriton Union. Plans, etc., may be seen, and bills of quantities obtained, at the offices of Messrs. Charles Knapp & Sons, architects, 21, Spring-garden, Manchester, upon payment of 1l. 1s. Sealed tenders to be delivered to David S. Bloomfield, Clerk to the Guardians, at the Union Office, All Saints, Manchester, not later than 12 p.m. on Wednesday, April 4.

APRIL 5.—BATH.—CHURCH.—New U.M.F. church, etc., Shakerspare-avenue, Bath. Plans, etc., on application to Rev. H. Walker Elliott, 28, Devonshire-buildings, Bath, to whom tenders may be obtained, not later than 1 p.m. Thursday, April 5. Quantities obtained from Mr. W. Hughlin Dinsley, architect, Chorley, Lancashire, on deposit of 10s.

APRIL 5.—EDINBURGH.—WALL.—Retaining wall at Western-terrace, Murrayfield, required in the widening of the public road, for the magistrates and council of the City of Edinburgh. Specifications and schedule of the measurement may be obtained from Mr. James Massie, Burgh Engineer, 1, Parliament-square, who will exhibit the plans and give all information. Sealed tenders, endorsed "Tender for Retaining Wall, West-

terrace, Murrayfield," must be lodged with Mr. Thomas Hunter, W.S., Town Clerk, City-chambers, by April 5.

APRIL 5.—POWERTOWN.—CONVERTING.—Converting present premises into three shops at Pontottoy for Mr. M. Morgan, Railway Inn, Pontottoy. Plans and specification can be seen at the office of Mr. T. Boderick, architect, Ashbrook House, Aberdare. Endorsed tenders to be sent in to Mr. Morgan not later than April 5.

APRIL 5.—WOODBRIDGE.—VENTILATION AND ALTERATIONS.—Ventilating and making small alterations to Board Room at Woodbridge, for the Woodbridge Guardians. Plans and specifications of the proposed work may be seen at the office of Messrs. Brown & Burgess, Architects, Arcalet-erect, Ipswich. Tenders, sealed and endorsed "Alterations to Board Room," to be delivered at the Board Room on April 5.

APRIL 6.—CROSTWATE AND TREKLENO.—BRIDGE.—A stone skew bridge, of 30 ft. square span, at an angle of 40°, across the giechlermuckin, in the parishes of Crostwate and Threkelno, within a quarter of a mile of Threkelno Railway Station, C.K. and P. Railway, for the Highways and Bridges Committee of the Cumberland County Council. Sealed tenders may be seen and particulars obtained at the office of Geo. Jos. Bell, M.Inst.C.E., County Surveyor and Bridge Master for Cumberland, The Courts, Carlisle. Sealed tenders, endorsed "Towald Bridge," addressed to the Chairman of the Highways and Bridges Committee, must be delivered by April 6.

APRIL 6.—EAST GRINSTEAD.—REPAIRS, ETC.—New works and repairs, decontaminating in connection with Wesleyan Church, East Grinstead, for the Trustees. Specification and further particulars may be obtained on application to Mr. H. Criswell, 57, Queens-road, East Grinstead. Tenders, endorsed "Tender for Painting," to be sent to Rev. J. G. Gill, "York House," East Grinstead, not later than 10 o'clock, April 6.

APRIL 6.—NARBOROUGH, ETC.—BRIDGES.—A brick and concrete bridge, 20 ft. span, over the River Soar, near Narborough ugh, and a similar bridge, 20 ft. span, over stream at Little Bowden, near Market Harborough, for the Highway Committee of the Leicestershire County Council. Forms, etc., from the County Engineer, Mr. S. Perkins Pick, 6, Millstone-lane, Leicester, on payment of the sum of one guinea (1l. 1s.) for the quantities of each bridge. Tenders, marked "Mr. George Rowlat, Clerk to the Highway Committee, 10, George-street, Leicester, not later than 10 o'clock in the forenoon of Friday, April 6, endorsed (a) Tender for Enderby Mill Bridge," (b) "Tender for Little Bowden Bridge."

APRIL 7.—BRADFORD.—ALTERATIONS.—Alterations and renovations to the Old Dolphin Wesleyan Chapel, Clayton Heights, near Bradford. Plans, etc., may be seen and quantities obtained at the office of Mr. Sam Spencer, architect, Old Bank-chambers, Gt. Horton, Bradford, from Monday, April 2, to Saturday, April 7.

APRIL 7.—RUSWARY.—HOUSES.—For erection of a pair of semi-detached houses to be built at Ruswary, Whitby, for Mr. H. B. Bell. Plans, etc., at the office of Mr. Edward H. Smiles, A.R.I.B.A., architect, 5, Flower-gate, Whitby. Tenders to be sent in by noon on April 7.

APRIL 9.—DARTFORD.—POLICE STATION.—The enlargement of the existing police station at Dartford, ordered by the Standing Joint Committee, form, etc., on deposit of 2l. at the office of the County Architect, 18, West-street, Maidstone. Tenders, endorsed "Dartford Police Station," are to be delivered to Mr. Charles Turner, Clerk, Sessions House, Maidstone, not later than April 9.

APRIL 9.—KINGSTON.—PREMISES AND WORKSHOP.—For pulling down old premises and erection of new premises and workshops for Messrs. Knapp, Drevett, & Sons, Ltd., of Kingston-on-Thames: (a) New premises for the Surrey Comet offices, at No. 20, Clarence-street, Kingston-on-Thames; (b) new workshops on land at rear of No. 18, Church-street, Kingston-on-Thames (adjoining above-named premises). Information by Mr. William H. Hope, C.E., architect and surveyor, of Hampton Wick, Middlesex. The plans may be seen and copies of specification and quantities obtained on application to the Secretary, Messrs. Knapp, Drevett, & Sons, Ltd., 20, Clarence-street, Kingston-on-Thames. A deposit of two guineas for these particulars is required by the company. Sealed tenders to be delivered to the Secretary not later than April 9.

APRIL 9.—LEEDS.—URINALS.—The erection of a range of urinals in Burmaholts-street; additional entrance to urinals at Victoria Cattle Market. Particulars may be obtained at the City Engineer's office, Municipal-buildings, Leeds. Tenders delivered at Mr. Clark's office, not later than 10 a.m. on Monday, April 9.

APRIL 9.—LOCKERHEE.—ROOF.—The steel and iron work required in the renewal of roof over Dummies Dock Lines at Lockerbie Station, for the Caledonian Railway Company. Drawings, etc., at the office of the Company's District Engineer, Princes-street Station, Edinburgh, on payment of two guineas. Tenders, endorsed "Tender for steel and iron work required in the renewal of the Roof over Dummies Dock Lines, Lockerbie Station," to be lodged with Mr. J. Blackburn, Secretary, Caledonian Railway Company's Office, 302, Buchanan-street, Glasgow, on or before April 9.

APRIL 9.—PENDLETON.—STORE-ROOMS AND PUMP-HOUSE.—Store-rooms and pump-house at the electricity station, Frederick-road, Pendleton. Forms, etc., at the Borough Engineer's Office, Town Hall, Salford. Tenders, endorsed "Store-rooms, Electricity Station," addressed to the Chairman of the Electricity Committee, must be delivered to Mr. C. Evans, Town Clerk, Town Hall, Salford, by 5 p.m., Monday, April 9.

APRIL 9.—STONE.—FENCING, SHEDS, ETC.—Wood or canvas and wood-fencing; also shedding, with loose-boxes or partitions for stock and implement; also a grand stand, etc., in the showyard at Stone, on July 18

and 19 next, for the Staffordshire Agricultural Society's General Committee. Forms, etc., from the Secretary, J. F. Jones, and all tenders must be sent to the Secretary, Newcastle, Staffordshire, not later than April 9.

APRIL 10.—ISLEWORTH.—IRON STAIRCASE.—Supply and erection of an iron escape staircase to be fixed at Percy House, Mill Hill, Islington, for the Bradford Guardians. Plans, etc., may be seen at Union Offices, Isleworth, W.

APRIL 10.—KENSINGTON.—DEMOLITION OF EXISTING HOUSES AND ERECTION OF WORKING MEN'S FLATS AT NOTTINGDALE.—For the Council of Royal Borough of Kensington. Specification and drawings of Town Clerk, Town Hall, Kensington High-street, W. Deposit of 3l. 3s. will be required (payable to Borough Treasurer at Town Hall), to be returned conditionally. Tenders, sealed and endorsed "Tenders for Working Men's Flats," to be sent in to the Council, not later than April 10.

APRIL 10.—SOUTH SHIELDS.—SCHOOL.—A public elementary school, situated in Dean-road, South Shields, for the Education Authority. Forward names to Mr. J. W. Allen, R.F.S., 10, South Shields, on or before April 10. Sealed tenders, together with a deposit of 3l. 3s. Forms of tender and bills of quantities prepared by Messrs. J. P. Allen & Partners, of Newcastle-upon-Tyne. Plans can be seen at the offices of the architect, Sealed tenders, endorsed "Tender for Dean-road School," must be addressed to the Secretary, Education Office, Gean-road, South Shields, and delivered not later than 4 p.m. on Tuesday, April 10.

APRIL 11.—EXETER.—ELECTRIC TRAMWAYS.—Contract No. 6A, for the construction of two additional bays at the end of Festivity-road; contract No. 7, for the construction of permanent way and paving (including bonding) of about five-eighths of a mile of route length line (with line), with passing places, for the Corp. Forms, etc., at the office of Mr. Thomas Moulden, City Engineer and Surveyor, Municipal Offices, Southwestern Street, Exeter, on payment of a deposit of one guinea for each set. APRIL 3.—PORTSEA.—FLINTS.—Portland-by-Sea U.D.C. invite tenders for 350 yds. of clean hill flints and 500 yds. of screened sand flints. Forms of tenders from the Surveyor, St. Andrew's-road, Portland-by-Sea. Tenders, endorsed "Tender for Flints," to be addressed to T. Austen, Clerk, Council Office, Portland-by-Sea, not later than 12 o'clock noon on Tuesday, April 3.

APRIL 3.—SHEPPY.—STONE.—Blue rag stone and pit flints (quantities likely to be required being 1,070 yds. of blue rag stone and 210 yds. of pit flints), for the R.D.C. The materials to be free from haddock and dirt and samples to be delivered with tenders. The materials to be delivered free alongside in barges at the following wharves and delivery places, viz.:—Harty Ferry and the several sidings on the Sheppy Light Railway in proportions as specified in forms of tender. Forms of tender can be obtained from John Copland, Clerk Sheerness; and sealed tenders, marked "Tender for Road Materials," must be sent by April 3.

APRIL 3.—SUTTON.—MATERIALS.—Supply of the following materials during the year ending March 31, 1907:—(1) Broken granite and basalt; (2) gravel flints and ballast; (3) hand-picked surface flints; (4) granite setts and cubes; (5) hardwood paving blocks; (6) granite kerbing and channelling; (7) Honevare and sanitary pipes; (8) Portland cement; (9) manganese of soda; (10) sulphuric acid; (11) disinfectants; (12) tar-paving materials; (13) lantern-glass, tools, oils, paints, soaps, etc.; (14) manhole covers, gully grates, etc.; (15) street lamp columns; (16) horse hire; (17) horse forage; (18) coal and coke; (19) smith's work; (20) purchase of street furniture, including benches, etc., for the town, for Sutton (Surrey) U.D.C. Conditions and forms may be obtained on payment of 2*s.* 6*d.* (which will not be returned on application) to Chamberlain, Smith, Engineer and Surveyor to the Council, Municipal Offices, Sutton, Surrey. Sealed tenders, endorsed "Tender for Materials," will be received up to 3 o'clock p.m. on April 3.

APRIL 4.—BROMSGROVE.—GRANITE.—600 tons of 24-in. broken granite, delivered free at Bromsgrove Station. Tenders and small samples to be sent to Francis J. Luxon, Clerk, New-road, Bromsgrove, not later than April 4 next.

APRIL 6.—SMETHWICK.—STORES.—Materials and articles for the year ending March 31, 1907:—Broken Cleo Hill granite, broken and unbroken Rowley ragstone, kerbs, circles, elbows and setts; steel chisels and steel picks, scrapers, mud scoops, digging forks, and galvanised sanitary ashbins—1 all Smethwick pattern; bricks (Staffordshire bricked and common); scavenging and dandy brushes and pickhelves, gully grates, frames and manhole and lamp-hole covers and cast-iron trunks—all Smethwick pattern; glazed earthenware pipes; cement (best heavy) Portland; lime (best); instant powder. All the above to be delivered at the contractor's cost to the Highway Stores, Stony-lane, except the following: ragstone—separate prices to be given for delivering to Spire-lane Wharf and Bovey-street Dandy Wharf. Forms from Mr. C. J. Fox Allen, Borough Surveyor, Town Hall, Smethwick, Tenders, addressed to the Chairman of the Streets and Buildings Committee, not later than 10 a.m. on April 6, endorsed "Tender for Stores."

APRIL 6.—STAFFORDSHIRE.—ROAD MATERIALS, ETC.—Supply and cartage of road materials, tools, and road implements for Leek, Newcastle, Uttoxeter, Stafford, Lichfield, Sedgley, to March 31, 1907, for the Staffordshire County Council. Specifications and forms from Mr. James Moncur, Chief Surveyor of Main Roads, County-buildings, Stafford, on or after Saturday, March 24, and the applicants are requested to state which form of tender they require, and also the name of the district. Sealed tenders, endorsed "Tender for Road Materials," to be delivered at the offices of the Clerk of the Council, County-buildings, Stafford, on or before April 6.

APRIL 7.—BEDFORD.—TIP WAGGONS, ETC.—Supplying and delivering iron on rail at Bedford station two tip wagons for the removal of horse refuse, two street watering vans, and three general purpose carts, for Streets and Buildings Committee of the Corp. Full particulars can be obtained from the Borough Surveyor, Town Hall, Bedford. Sealed tenders, endorsed "Tender for New Vans, etc.," and addressed to the Chairman of the Streets and Buildings Committee, to be delivered not later than 12 noon on April 7.

APRIL 7.—BLYTHING.—GRANITE.—2,900 tons of granite, consisting of 800 tons of 24-in. granite, 1,900 tons of 14-in. granite, and 500 tons of granite chips, to be delivered on or before July 31, at the following places, viz.:—Saxmudham, Darsham, Halesworth, Beccles, Leiston, Brampton, Westhamton, Blythburgh, Walberswick, Southwold, and Laxfield Stations, Beccles Quay, and Lowestoft South Quay, for the R.D.C. Tenders to Mr. Harold A. Mullens, Clerk, Union Offices, Bulcamp, Halesworth, not later than April 7. No printed form of tender is issued.

APRIL 7.—BRUMBY.—WHINSTONE.—400 tons of Whinstone, delivered free at Frodingham and Guinness Stations Great Central Railway, for Drummy and Frodingham U.D.C. Specifications and forms of tender may be had on application to Joe Geener, Surveyor, Council Offices, New Frodingham, Doncaster, to whom tenders must be sent not later than Saturday, April 7.

APRIL 7.—WROTHAM.—ROAD MATERIALS.—For flints, ragstone, ironstone, and gravel, also for cartage for Wrotham U.D.C. Conditions of contract may be

inspected and forms of tender obtained upon application to Mr. A. J. Powell, the Surveyor of the Council, at his office, 10, St. Andrew's, Leith, on Tuesday, April 3, to be sent to the Clerk of the Council, sealed, and endorsed outside "Tender for Road Material" or "Cartage," not later than Saturday, April 7. Samples of the different stone must be sent to the Surveyor's Office.

APRIL 9.—EDINBURGH.—STORES.—The Edinburgh and Leith Corporations' Gas Commissioners invite tenders for the supplying of oils and paints, timber, meters, gas fitters' stores, wrought-iron tubes and fittings, cast-iron pipes and connections, yarn, etc., iron, steel, and implements, iron castings, etc., caseway repairs, cast cooking stoves, for their various undertakings during the year from Whitlunday first. Tender forms can be had on application to the Chief Engineer and Manager at the Gas-works, New-street. Offers must be lodged on April 9 to Mr. James McG. Jack, Clerk, 25, Waterloo-place, Edinburgh, marked "Tender for Oils and Paint," or as the case may be.

APRIL 9.—MANCHESTER.—MATERIALS.—The Tramways Committee of the Manchester Corporation are prepared to receive tenders for the supply of the following:—(a) Steel girder tram rails, (b) steel tie bars, (c) granite setts, (d) pitch for paving purposes. Specifications and forms may be obtained on application to Mr. J. M. McElduff, General Manager, Tramways Department, 55, Piccadilly, Manchester, on deposit of 2*s.*, which will be returned on receipt of bona-fide tender. Tenders are to be addressed to the Chairman of the Tramways Committee, 55, Piccadilly, Manchester, and must be received not later than 5 p.m. on Monday, April 9.

APRIL 10.—WEST ASHFORD.—ROAD MATERIALS.—Granite, sand, broken stone, and other materials for the Parishes of Bethersden, Great Chart, Little Chart, Charing, Epserton, Hothfield, Kingsnorth, Pluckley, Inceaden, Shadoxford, and Westwell, and for the purchase of granite, broken stone, and other materials for Charing and Ashford Railway Stations; also from Great Chart Siding, for West Ashford R.D.C. Forms, etc., from Mr. Alfred Sims, Surveyor, Surveyor's Office, Charing, Sealed tenders, endorsed "Tender for Materials and Haulage," addressed to the Chairman of the R.D.C., are to be delivered at the Union House, Westwell, Ashford, by April 10.

APRIL 11.—HORSHAM.—GRANITE, ETC.—Granite or other approved stone and flints (total, about 7,000 cubic yds.), delivered to the various railway stations in district of the Horsham R.D.C. Also for cartage of materials from railway stations to the roadsides. Forms of tender and further information to be obtained of the Surveyor, Mr. Wm. Dengeate, 58, Park-street, Horsham, to whom prepaid samples must be sent. Tenders, marked "Highways Tender," to reach A. C. Cook, Clerk to the Council, 9, Carfax, Horsham, on or before April 11.

APRIL 11.—YEARSELEY-CUM-WHALEY.—GRANITE.—500 tons of 2-in. and 20 tons of 1 1/2-in. granite delivered free at Whaley Bridge Station (L. & N.W. Railway) at such times and in such quantities as the Council may require during the ensuing year, for the U.D.C. Tenders, marked "Tender for Granite," to Mr. S. Taylor, solicitor, Buxton, and samples to be forwarded to the Council Room, Whaley Bridge. Tenders by April 11.

APRIL 12.—DEVONPORT.—STORES.—Devonport Corporation Electricity Department invite tenders for the supply of general stores for a period of twelve months. Items, etc., may be obtained of the Borough Engineer, Electrical Engineer, Newport-street, East Stonehouse. Tenders to be sent in, sealed, and endorsed "Tender for Electricity Stores," to H. J. Fitzall, Esq., Town Clerk, Devonport, on or before noon, April 12.

APRIL 14.—LEITH.—TIMBER, ETC.—Timber, iron, and stores required by the Commissioners for the harbour and docks, Leith, from May 1, 1906, to May 1, 1907. Particulars on application at the office of the Superintendent, Tower-Place, Leith. Tenders to be lodged with Mr. Victor A. Noel Paton, W.S., Clerk to the Commission, 31, Melville-street, Edinburgh, by April 14.

APRIL 14.—SOUTHBOROUGH.—STONE.—600 yds. of hard Sevenoaks or other stone, broken to pass 1 1/2-in. ring, to be delivered into the various districts of Southborough U.D.C., at Southborough, in accordance with the Surveyor's instructions. Also for about 450 tons, more or less, of Chertsey, Glastonbury, Rhinish Basalt, or Norway Granite, machine broken to 1 1/2 to 2-in. gauge, to be delivered to Toulridge Station of the South-Eastern and Chatham Railway. Tenders, with samples, by 14th day of April, endorsed "Tender for Stone," and addressed to Philip Hamner, Clerk to the Council, Council Offices, Southborough.

APRIL 17.—SEVENOAKS.—MATERIALS.—Quartzite, basalt or pebble, rag stone, chert, flints, etc., at the various stations or on to the various roads within the district, cartage iron stations and depots, and steam rolling for the whole of the district, for the year ending March 31, 1907, for Sevenoaks R.D.C. Forms, etc., from Mr. R. Bailey, Sundridge, Sevenoaks, and Mr. W. H. Bolt, Leigh, Kent, Surveyors to the Council, or Mr. George F. Carmel, Clerk of the Council. Samples of material to be delivered, cartage paid, at the Union Workhouse, Sundridge, Sevenoaks, and sealed tenders, marked "Tenders" on outside of envelope, to be returned with the conditions of contract, to Clerk, by April 17.

APRIL 18.—BRADFORD.—ROAD METAL.—For 20,000 tons of road metal. Form of application, etc., to be sent to Mr. J. H. Cox, City Surveyor, at the Town Hall, Sealed tenders, endorsed "Tender for Road Metal," to be sent to Ernest Sturt, Town Clerk, Town Hall, Bradford, on or before Wednesday, April 18.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. The Editor cannot undertake to read and consider articles offered for acceptance unless they are type-written.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those regarding advertisements and other purely business matters should be addressed to THE PUBLISHER, and not to the Editor.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom at the rate of 18s. per annum (62 numbers) PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., 26s. per annum.

SUBSCRIBERS IN LONDON and the SUBURBS, by prepaying at the Publishing Office 18s. per annum (62 numbers) or 4s. 9d. per quarter (13 numbers), can ensure receiving "The Builder" by Friday Morning's Post.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of Tenders accepted, unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 1000, unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

The Trade Unions Bills.

It is doubtful if the public at large as distinguished from capitalists and workmen take much interest in the two important Bills which are now before the House of Commons in regard to the law as to Trade Unions, one brought in by the Government, the other by Mr. Hudson, a private member. It is only, as a rule, indirectly that strikes affect the general public, and so it is inclined not to trouble itself about these measures. It is nearly as certain, therefore, as anything can be that, having regard to the electoral power of the organised working men, these Bills will pass into law in the form of a single Act—that is, that the clause in the private Bill as to the immunity of Trade Union funds from liability for acts committed by members of Trade Unions will be incorporated in the Government Bill before it leaves the House of Commons. But we doubt if it would become law were the matter more one of general public interest, for it is intended to make a Trade Union, which is a registered and definite body, with members, officers, and funds, not liable for the acts of its agents. In other words, the Bill would authorise a departure in the case of these bodies of men from a clearly recognised principle of law applicable to every other like body in Great Britain. The proposition really

needs to be stated to stand condemned as unjust. One of the newly-elected lawyers—the victorious opponent of Mr. Balfour at Manchester—in the debate last week pointed out that whilst the particular clause would give immunity to Trade Unions it would confer the same benefit on capitalist corporations. The words of the Bill are, “a trade union or other association aforesaid.” Whether the supporters of the Bill will be altogether grateful to their advocate may perhaps be doubted, for if his views are right an action cannot be brought against a railway company for damage. Moreover, there is a popular saying that two blacks do not make one white, and if capitalist associations or companies were exempted from liability by this Act we should regard this also as unjust; for as long as the law of agency—that is, the liability of a master for the act of his servant, of the employer, in the broadest sense, for the act of the person he employs—remains part of the law of the land, so long should there be no departure from the general principle.

Ordinary people may reasonably ask for good cause to be shown for this demand of the Trade Unionists, but in the recent Parliamentary debates we look in vain for any reply to this question. One labour member expatiated on the benefits conferred on the community by Trade Unions; but even if this be admitted, it is no answer to the question—Why should Trade Unions be placed outside the ordinary law? Mr. Keir Hardie seemed to find an analogy in the Factory Acts and the Workmen's

Compensation Acts, and said that as these Acts took workmen outside the operation of the common law, therefore they were justified in their present demand. But factory legislation does not deal, any more than does the Compensation Act, with exemption from general legal principles. The truth is that, as one sentence of Mr. Keir Hardie's speech shows, the Trade Union leaders desire the exemption, not in justice, but because it will enlarge their power during strikes. “All they asked,” he said, “was that their organisations should be maintained in efficiency so as to be able to carry on a strike successfully.” That is the long and short of the whole matter, and there is no more to be said about it.

On the other points of the two Bills less need be said. “Peaceful picketing” is to be legalised, and any number of men may surround a factory or a house. Everyone knows that crowds do not congregate at a factory-gate merely for the nominal purpose of peacefully persuading non-strikers. They do so for the purpose of intimidation, none the less improper because it is done without actual physical violence. There, again, the Trade Unions are seeking to enlarge their offensive powers, as is plain to the mere ordinary understanding. Peaceful picketing should, therefore, only be allowed by a limited number of men. The amendment of the law of conspiracy, which is common to each Bill, is reasonable. The law has on this point become at once confused and technical, creating artificial offences, and neither strengthening the law nor adding to its value. In regard to this subject,

Trade Unions have a good case, but we regret that they should be desirous of seeking also to obtain an extraordinary position, one of immunity from the general law, which in time to come may cause a strong popular reaction against what tends to produce a tyranny of labour. For it should be remembered that in the past Trade Unions have received support because in their inception they were regarded by the country generally as organisations intended to place workmen, men without capital, on an equality with powerful employers. This public approval will cease when Trade Unions seek to obtain exceptional power and to limit individual freedom.

THE BRITISH SCHOOL AT ROME.

THAT the British Archaeological School at Rome is doing good and useful work is evident from the quality of the papers collected in this publication,* the third volume of the series. The papers deal chiefly with subjects hitherto scarcely touched upon by writers on archaeology, and consequently furnish much valuable new material for a study as wide as it is absorbing.

The volume, plentifully illustrated, includes a paper on Pythagoras, dealing with a problem in the difficult field of iconography, another on some drawings attributed to Pisanello, two papers on Roman historical sculpture, and the second instalment of Mr. Ashby's valuable work on the lost history of the Roman Campagna.

The scrupulously accurate observations collected in this latter paper, and the untiring energy it displays, testify to the well-deserved reputation the author has won for himself. The two excellent maps which illustrate the article are of great help in travelling with Mr. Ashby step by step, but unless one is acquainted with the environs of Rome it would be difficult to follow the author, so full is the detail he offers us. To rightly appreciate this paper it should be read on the spot. It teems with information gathered from previous writers as well as from personal research. Its completeness should recommend it to students, for it will be the means of saving them many a weary hunt in literary paths. Not its least merit is a full index, which is invaluable in a paper of such length relating to so much detail.

The three roads dealt with are the Via Salara, the Via Nomentana, and the Via Tiburtina, all leaving the city on the north-east, within a short distance of each other. The first two are among the oldest of Roman roads, and from that fact alone their history is of the deepest interest; while the Via Tiburtina, which came into existence during the establishment of the Latin League, led to a very populous and important district, and hence supplies considerable archaeological material. Besides two maps, the paper is illustrated with photographs of the author's own taking, and with copies of inscriptions and sketch plans, which are of great assistance in supplementing the text.

Mr. Stuart-Jones's "Notes on Roman

* "Papers of the British School at Rome," Vol. III, Macmillan & Co. 1906. Price 30s. net.

"Historical Sculptures" throw much light on a study which only recently has received its due share of attention—*i.e.*, the growth and development of Roman historical sculpture. Mr. Stuart-Jones has selected for examination three sets of reliefs which up to the present have on insufficient grounds been assigned to periods to which they in no way belong. The reliefs dealt with are the "Aurelian" panels of the Arch of Constantine, which were attributed to Trajan's time till Professor Petersen demonstrated in 1890 that they belonged to a different period; the medallions of the same arch, which were also assigned to the period of Trajan, but which Mr. Stuart-Jones considers to be late Flavian work; and the reliefs in the portico of Villa Borghese, which were held to be Claudian, but which the author recognises as Trajanic in style and execution. The arguments he employs in proving this latter point are of peculiar value.

Not only was a wrong date assigned to these Borghese reliefs, for by no process of orderly development could they belong to such an early period, but a wrong origin was given them. Mr. Stuart-Jones does not content himself with pointing out that Nibby's mere conjecture was the only foundation for the theory that these reliefs once belonged to an arch erected by Claudius: he gives satisfactory reasons for denying that they were discovered in the excavations which from time to time have taken place in the Piazza Sciarra, and offers in place of these assertions a practically certain pedigree of the reliefs in question. He bases his opinion on writings of the XVIIth century which give descriptions of certain reliefs in the Church of S. Martina, tallying with the Borghese reliefs. As this church stood on the site of the Secretarium Senatus, it is reasonable to suppose the reliefs were found near the spot, and that they might have adorned the Forum of Trajan. Mr. Stuart-Jones's opinion is further corroborated by the stylistic affinities between these reliefs and those on the Arch of Constantine which are known to have been removed from Trajan's Forum. The most noteworthy feature, says the author, of the Trajanic style is its attempt to substitute height for depth in perspective. This practice is characteristic not merely of the Borghese reliefs, but also of the great frieze of the Arch of Constantine and of the column of Trajan. Thus there can be no doubt as to the period to which our reliefs belong, a period to which they were rightly assigned by Wincklemann, the founder of archaeological science.

The relief medallions on the Arch of Constantine were more troublesome to identify on account of the large amount of touching up to which they have been subjected. Authorities assigned them variously to Trajan and to Hadrian, but Mr. Stuart-Jones was the first to give them that minute scrutiny which alone could render possible a final decision as to their date. As a result of his examination, the author suggests that the reliefs originally came from the gens Flavia or some monument of the Flavian dynasty, and he assigns them to the closing years of Domitian's reign. The subjects represented, *viz.*, hunting scenes, are

characteristic of the time and personality of Domitian, and although the technical detail might as well belong to a later period, still style is more than mere technical conventions, and the balance, spaciousness, and freedom of these reliefs are in sharp contrast to the style of Trajan's later years.

Mr. Wace's paper on "Fragments of Roman Historical Reliefs in the Lateran and Vatican Museums" deals with the same period discussed by the previous author, and is especially valuable as it treats of Roman sculpture during a time to which as yet no historical reliefs have been assigned, *i.e.*, the time of Domitian. It certainly appears strange that, in spite of Domitian's activity in building, no historical reliefs should exist which would illustrate the progress of that art from the death of Titus to the last years of Trajan, a period of some forty years.

If, as Mr. Wace claims, he has discovered fragments of reliefs belonging to this period, he has won the merit of filling a gap in our knowledge of the development of Roman historical reliefs. His researches were conducted along lines so simple that the result of his discoveries appears the more convincing. Having noticed the gap in the history of reliefs, he expected very reasonably to find in Roman museums fragments of such, belonging to the period in question. He consequently examined closely the stylistic and technical details of the sculpture on two characteristic monuments of the Flavian and Trajanic periods—*i.e.*, the Arch of Titus and the Arch of Trajan at Beneventum. These differences he analyses in the most instructive manner, and sums up his analysis in the form of two tables, the characteristics in the Flavian table having their relative counterpart in the Trajanic table. With such data before him Mr. Wace has been able to identify hitherto unrecognised fragments, and to classify them chronologically, according as they retain more or less of Flavian naturalism and evince more or less definitely Trajanic hardness.

The paper is of exceptional interest, both from its material and from the way in which this is handled, and it leaves one with the satisfactory feeling that the author has accomplished what he set out to do—*i.e.*, he has clearly traced a well-defined and progressive series of Flavian historical reliefs.

THE COLUMN OF TRAJAN.

ACCORDING to the account given by Dio Cassius (LXIX. 2) and other writers, the ashes of the Emperor Trajan, after his death in Cilicia, in 117 A.D., were conveyed to Rome for burial, and, enclosed in a golden urn, were deposited within the column which still stands in his Forum, and with its series of bas-reliefs illustrates his campaigns in Dacia. Some recent writers have stated that no trace of any sepulchral chamber was to be seen in the square base of the column; but some uncommon engravings of the middle of the XVIIth century bear clear testimony to its existence. The plates in question form part of the series known as the *Speculum Romanæ Magnificentiæ*,

published in Rome by one Antoine Lafreÿ and his successors (Nos. 94 and 95* of the copy which was formerly in the hands of Mr. Quaritch, and, though not complete, is the finest hitherto known—see *Bernard Quaritch's Rough List*, No. 135, p. 122). On each of them is given an elevation and vertical section of the column, with detailed horizontal sections also. The plan of the base shows that, opposite to the entrance to the staircase leading to the summit of the column (which is immediately on the right as one enters the base by the door under the inscription recording the erection of the column in Trajan's honour, and bearing the date 113 A.D.), there was a doorway about 3½ ft. in width leading into a corridor, which turned to the right, and by a second doorway, 3½ ft. wide, led into a chamber measuring 11 ft. long by 4½ ft. wide, which was lighted by a small slit window on the south-west side, near the door. This chamber left a rectangular mass of solid material, about 5 ft. by 7 ft., in the centre of the base, the rest being hollow.

The chamber and corridor had, however, been filled in (not very long ago, it is true, for on the lintel of the doorway leading to the chamber is the inscription "Radel, 1764") with brickwork, and the outer door had been plastered over. Nibby (*Roma nell' anno 1838, Parte Antica, II.* 188) was still able to point to what he rightly considered distinct traces of the existence of a chamber in the base at the column, and it is worth notice that Piranesi, in his *Colonna Traiana*, dedicated to Pope Clement XIII. (1758-1769), gives a plan and sections of the chamber, which must therefore have been still accessible in his day, though more recent writers, as we have seen, have denied its existence. Commendatore Boni has, however, rediscovered the blocked entrance independently, and has already reached the doorway leading to the chamber. He has also noticed that the torus immediately under the column itself, with laurel leaves sculptured upon it, had on the north-west side been broken by a violent blow—perhaps, as he conjectures, by the fall of the bronze statue of Trajan from the top of the column. The missing pieces have been found below the ground level, and it can be seen that the shock was so violent as to damage the travertine foundations of the base itself. The progress of the examination of the column will produce interesting results.

NOTES.

The Institute Registration Report. We give on another page the wording of the resolutions consequent on the Registration Committee's Report, which were passed at the Institute of Architects' meeting on Tuesday last; and which, as will be seen, differ somewhat from those originally proposed; the first one committing the Institute to the principles of the Report while leaving it open to consider and (if necessary) to modify

* In No. 95 the plan of the base is shown reversed, but the measurements are more correctly given than in No. 94. Labacco (*Libro appartenente a l'Architettura* (1832) pl. 12) gives a reduced copy of No. 95, with slight alterations in the arrangement, and the plan of the base correctly placed, but without measurements.

details before presenting a final Report. As we have felt obliged to strongly oppose the general policy of those whom we may call the "Registrationists," we have pleasure in adding that in this case we almost entirely agreed with the speech made by a prominent member of that party, arguing that some of the points in the Report were far too much open to difference of opinion to admit of being adopted there and then without further discussion, and which led to the modification of the Resolution. The two points which we wish to see reconsidered are (1) the phrase referring "to a definite course of architectural education in a recognised school," the meaning of which certainly ought to be explained, as it looks like a definite blow at the articulated-pupil system, which at all events deserves better than to be knocked on the head without benefit of clergy; and (2) the proposal to alter the name from "Institute" to "College," to which we are absolutely opposed, and to which there was evidently an almost universal feeling of opposition among those present. In general it was gratifying to see that a meeting on a subject which has been discussed with a good deal of acrimony passed off in such an entirely friendly spirit on all sides.

The Port of London.

By the motion which was carried in the House of Commons last week it is made clear that all parties are in substantial agreement as to the extreme desirability of placing the management of the greatest port in the world in the hands of a public authority. Notwithstanding the great increase of business which has taken place there have been practically no dock extensions during the last twenty years, and in point of fact the dock companies are unable to raise the capital necessary for the new works that are required, and the resources of other authorities are equally limited. Moreover, owing to the state of uncertainty created by the Report of the Royal Commission, and by the various Bills brought before Parliament, none of these bodies are inclined to make any serious movement with the object of improving the present conditions. Something more than a purely theoretical service has been rendered by the motion to which we refer; for, although no action can be taken this year, we gather from the remarks of Mr. Lloyd-George that a conference will probably be summoned by the Board of Trade to discuss the whole subject, and so to prepare the way for a satisfactory scheme for approval by Parliament.

Cement for Concrete Blocks.

NOW THAT concrete is beginning to be employed in the form of building blocks, it ought to be pointed out that considerable discretion must be exercised in the choice of cement used in block-making. Too many architects seem to act as if Portland cement were produced only in one standard quality, and too many builders as if price were the only criterion by which its quality ought to be judged. The indifferent material that can be employed without much risk for ordinary foundations must not be used under the more exacting conditions obtaining when

concrete building blocks are applied to finer classes of work. For such blocks the three essential qualities are durability, strength, and colour. To make enduring blocks it is absolutely necessary to obtain cement capable of passing the test for soundness in a satisfactory manner. If the cement is not absolutely sound the blocks may appear good when made, but after a year or two will begin to crack, the faces will crumble, and, in the case of very inferior cement, they will slowly but surely disintegrate. Strength is a property more easy to gauge, but as a building may have to support its full load within three months after the blocks have been made, fairly quick-setting cements are most suitable. While the foregoing considerations apply to the architect in his capacity as a constructor, the question of colour appeals to him with equal force as an artist. Uniformity in this respect can only be secured by adopting uniform materials, proportions, and methods of manufacture. Calcium sulphate, always added to regulate the set of cement, is one fruitful cause of efflorescence on the surface of concrete. Hence the proportion should be strictly limited, and the same applies to all other soluble alkaline salts. Sulphide of iron and excess of clay are apt to produce brown blotches of unsightly appearance. Even when uniformity of colour has been secured, the tone of concrete is decidedly cold, and the problem of imparting to it a pleasing tint is one still awaiting a satisfactory solution.

ON Monday last Professor Fire Risks.

Lewes delivered the last of his four Cantor Lectures on "Fire, Fire Risks, and Fire Extinction" before the Society of Arts. The first three lectures were of a popular character, and discussed mainly the theory of combustion and the fire risks attendant upon the use of various materials. The fourth lecture calls for special mention in these columns because it dealt with the precautions which it is possible to take to prevent the spread of fire in buildings. We agree with Professor Lewes in his contention that properly fire-proofed timber is a better material for staircases and upper floors than iron, stone, or concrete. Iron being a ready conductor of heat, a partition of this material does not prevent heat from one room being speedily conveyed to the room adjoining; while stone supported by iron, when subjected to intense heat, becomes a source of great danger to the firemen. The extra cost of using fire-proofed timber in place of untreated timber is admitted to be heavy, but there are many cases in which this additional cost ought to be incurred and regarded as an insurance premium. In proposing a vote of thanks to the lecturer, Captain Hamilton, Chief of the London County Council Fire Brigade, explained that one of the reasons why the cause of a fire is so often entered in the records as "unknown" is that litigation between private individuals sometimes follows the fire, and his official reports are liable to be taken as evidence. He also referred to the danger of a number of different trading firms jointly occupying a large block of buildings, for in such cases much time is sometimes lost before the
