The Chairman said that, with regard to getting some finish on ferro-concrete by giving it a coating of plaster of Paris, he imagined that, in a few years, that would be an expensive building to maintain. As regarded the possibilities from the architectural point of view, that would be dealt with at the forthcoming Congress, but he thought the only means of treatment which could be suggested was to look on ferro-concrete as a plastic material, and, therefore, from the architect's point of view, they could be hopeful. It could be treated with a few strings, or mouldings, or panels, or something of the kind. There was also a great possibility of colour decoration of a permanent nature which could easily be employed, and he thought they would see examples in Persia, China, and Japan of permanent coloured decorative material applied externally.

Mr. Bylander, in reply, said the question of the cost of the building shown by Mr. Pearson would be a matter for the estimator. He thought 14 in. was the most practical thickness for walls. He would not advocate 4-in. walls on account of the dampness. As regarded the distance of the rods for the outer surface of the concrete, he should say 1½ in. if complete fire protection was required; but it must be remembered that the material used for a ferro-concrete structure was of much better quality than for ordinary steel-frame buildings. If coke breeze was used the adhesion between the steel and the material was not so great, and, further, it was porous. So far as fireproof was concerned, clinker was the best material, but if stone or gravel was crushed to a sufficiently small size the possibilities of cracking in case of fire was minimised. Water tanks were often treated with a wash of paint, but the most important thing was that the concrete should be made rich, and that the steel was properly embedded, and that there should be no voids.

MEMORIAL TO WHITEFIELD.—On the afternoon of Sunday, May 13, a marble bust of George Whitefield was unveiled in the Whitefield Memorial Building, the central hall of the London Congregational Union, Tottenham Court-road. The bust has been sculptured by Mr. H. A. Pegram.

THE ARCHITECTURAL ASSOCIATION SUMMER VISITS:

I.—ALL SAINTS' CHURCH, Tooting.

The first summer visit took place on Saturday, 12th inst., at the Church of All Saints, Tooting Graveyard, an important modern ecclesiastical work in the south of London. The church, which is erected from funds bequeathed by a lady, is the central object in a group of buildings, the remainder of which comprises a vicarage and a large parish hall.

The architect (Mr. Temple Moore) was unavoidably absent from the visit, but was represented by a member of his office staff and the general foreman.

The church has a seating capacity of 1,024 persons, distributed in a lady chapel at the south end, chancel with aisles, transepts, nave with aisles, and narthex, the latter at the north end. It will thus be seen that the axis is practically north and south instead of the usual orientation.

A large square tower rises above the east transept, and will eventually contain a full peal of bells. Vestries adjoin the west transept, and the passage connecting them communicates with the vicarage. In this transept the organ will be placed. The internal length is about 168 ft.; the width of nave and chancel is 25 ft., and the aisles each about 22 ft. The height is of generous proportion, so that an air of spaciousness characterises the interior.

There is no chancel arch, or, indeed, anything to mark the choir other than the steps and screen, so that the main arcades are uniform and continuous from end to end of the church.

Although the work was, as yet, two months from date of completion enough existed to show that dignity was achieved in the design, and that the plan was well adapted to the purposes of a large congregation.

Various stones are employed. In the interior the wall surfaces are plastered, but the material at and above the main arcade is chiefly Bath stone. Forest of Dean is used in shafts and piers and also in steps and flooring, and the interesting natural variation in tones gives a very satisfying effect. Another and kindred material, Quarrella, is used in the large bases of the piers. The exterior mainly consists of yellow stock brick-facing, and the sparingly-used stone is Ketton in the usual dressings, and Forest of Dean for bases and weatherings.

Heating is provided by means of hot water pipes at window-sill level, the pipes being hidden in the projecting cornice of an oak-panelled dado. Pipes are continued up to the clearstory, passing round the whole interior of the church.

The nave and chancel have a vaulted roof of a stone character entirely constructed in wood and painted. Stone springers are introduced to start the ribs of the vaulting. A XIIIth century English Gothic influence is the motif in the architecture.

Messrs. Sherwin & Son, of Boston, have carried out the entire works, including the vicarage and hall, both of which are very tasteful stock-brick buildings.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Alderman Spicer, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to sanction the borrowing of £800f. by Deptford Borough Council; and it was agreed to lend Finsbury Borough Council £5,65f. for paving works; and Lewisham Borough Council £1,845f. for constructing a public convenience.

Reconstruction of Tramways from Islington to Highbury—Supply of Electric Power.—The Highways Committee recommended, and it was agreed:—

"That the agreement entered into with the County of London Electric Supply Company, Ltd., in pursuance of the resolution of August 1, 1905, be extended so as to include a supply at the same rate of electric power for working the tramways from the Angel, Islington, via Upper-street, to Highbury (N.L.E.) Station, and to provide that the company shall give the Council facilities to erect switch panels at the Old-street generating station, and shall supply the cable-ducts necessary from the station to the Angel, Islington, and a telephone cable for coupling up to the Council's Great Queen-street sub-station."

Norbury Estate — Brickmaking. — The Housing of the Working Classes Committee recommended:—

(a) That the resolution of May 21, 1901, fixing the minimum rates of pay and the maximum hours of labour to be observed in the making of bricks on the Norbury estate be rescinded so far as it relates to minimum rates of pay.

(b) That the undermentioned rates of pay be fixed as the minimum rates to be observed in the manufacture of bricks on the Norbury estate, viz., digging, 4d. a cubic yard; soiling, 3d. a thousand bricks; shoring out, 6d. a thousand bricks; setting, 1s. 11d. a thousand bricks; moulding (stocks), 5s. 6d. a thousand bricks; moulding (reds), 8s. a thousand bricks; crowding, 2s. 6d. a thousand bricks; skilting, 5d. a thousand bricks; burning, 1s. 6d. a thousand bricks; drawing, 1s. 4d. a thousand bricks; runs, 12d. each; day work, 6d. an hour; engine driver, 8d. an hour.

Mansell-street and Great Prescott-street. — The Improvements Committee recommended:—

(a) That the supplemental estimate of expenditure on capital by the widening of Mansell-street and Great Prescott-street, as shown upon the plan of property included in such estimate be approved.

(b) That expenditure not exceeding 3,200l. be sanctioned in respect of the widening of Mansell-street and Great Prescott-street as provided in resolution (a); and that the Improvements Committee be authorised to arrange for the said widening.

The Council adjourned at 7.30 p.m.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Deptford.—Five gate piers at the entrances to the South-Eastern Hospital on the western side of Avonley-road, New Cross-road, Deptford (Messrs. T. W. Aldwinckle & Son for the Metropolitan Asylum Board).—Consent.

Woodrick.—Bay windows in front of Nos. 13, 15, 17, and 19, Glensfield-road, Eltham (Mr. J. J. Bisset for Mr. A. Cameron Corbett).—Consent.

Dulwich.—The retention of porches in front of Nos. 13, 14, 15, 16, 17, and 18, Ruskin-walk, Herne-hill (Mr. R. E. Mayo).—Consent.

Lambeth, North.—The retention of an iron and glass porch in front of No. 40, York-road, Lambeth (Messrs. Ohlson & Sons for Mr. Hitchcock).—Consent.

Norwood.—Re-erection of Lundsowne Hall, Canterbury-grove, West Norwood (Mr. W. G. Scott for the Rev. Fuller Gooch).—Consent.

Wandsworth.—Re-erection of buildings on the south-western side of Gerrard-lane, Wandsworth, with bank walls abutting on the north-western and south-eastern sides of Rostella-road (Mr. W. Bartholomew for Mr. P. C. Newman and Mr. C. Newman, jun.).—Consent.

Finsbury, Central.—Buildings on the northern side of Peptonville-road, to abut also upon Winchester-street (Mr. C. E. Pettit for Mr. T. Lilley and Messrs. Lilley & Skinner, Ltd.).—Refused.

Brixton.—Projecting one-storey shops in front of Nos. 5 and 7, Flaxman-road, Loughborough-junction (Messrs. Binsted Brothers).—Refused.

Kennington.—Projecting one-storey shop in front of No. 210, South Lambeth-road, Kennington (Mr. F. E. Williams for Mr. J. Hill).—Refused.

Width of Way.

Finsbury, East.—That the application of Messrs. Joseph & Smith for an extension of the period within which the erection of warehouse buildings on the north side of Great Arthur-street and south side of Bayer-street, Golden-lane, was required to be completed, be granted.—Consent.

Lines of Frontage and Construction.

Rotherhithe.—A deviation from the plans approved for the construction of an iron gangway to connect Hay's Wharf and Wilson's Wharf, over the public right-of-way leading from Battle-bridge-lane to Battle-bridge-stairs, Rotherhithe, so far as relates to an alteration in the position of the gangway (the proprietors of Hay's Wharf).—Consent.

Formation of Streets.

Westminster.—An extension of the time within which the roadway of a proposed street for carriage traffic to lead from Francis-street to Cobourg-row, Westminster, was to have been clearly defined throughout by posts and rails, or so otherwise as the Council should permit, and thrown open to the public as a highway (Messrs. R. B. Grant-ham & Son).—Consent.

Wandsworth.—Extension of time within which the roadway of a proposed street for carriage traffic to lead from Wimbledon Park-road to Granville-road, on the Wimbledon Park estate, Wandsworth, was to have been clearly defined

throughout by posts and rails, or so otherwise as the Council should permit, and thrown open to the public as a highway (Messrs. Clasier & Sons).—Consent.

Adaptation of Ways for Streets and Width of Way.
Newington, West.—The adaptation for carriage traffic of Jerome-place, Hillingdon-street, Walworth, and the erection of buildings at less than the prescribed distance from the centre of the roadway of Jerome-place (Messrs. Gedhill Brothers).—Consent.

Space at Rear.

Whitechapel.—A modification of the provisions of sect. 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a block of dwellings on the western side of Rupert-street, Whitechapel with an irregular open space at the rear (Mr. R. W. Hobden for Messrs. Hickman, Ltd.).—Consent.

Alteration of Buildings.

Southwark, West.—A bay window on the space at the rear of block "P" of the Peabody-dwellings, Peabody-square, Blackfriars-road and Webber-street, Southwark (Mr. R. Robertson for the Housing of the Working Classes Committee of the Council).—Consent.

The recommendations marked † are contrary to the views of the local authorities.

COURT OF COMMON COUNCIL.

A MEETING of the Court of Common Council was held at the Guildhall on Thursday last week, the Lord Mayor presiding.

Bishopsgate-street.—Mr. Baumberger asked if there was anything to report with regard to the proposed widening of Bishopsgate-street. In reply Sir George Woodman stated that new proposals on this subject would shortly be placed before the London County Council.

Loan Exhibitions.—A report was presented from the Coal and Corn and Finance Committee on the report of the Library Committee as to holding a Loan Exhibition of Pictures in the Art Gallery in the summer of 1907, at a cost of 4500l. exclusive of insurance; and recommending that no exhibition be held in the year 1907. Mr. Deputy Baddeley moved that the matter be referred back to the Coal and Corn and Finance Committee for further consideration. Mr. Clousdley seconded the amendment, and said that the loan exhibition at the Guildhall Art Gallery was a great attraction to the whole of London. Mr. Deputy Wallace thought that the Corporation could not afford to spend money in such a manner. Mr. Deputy Ellis pointed out that a Bill, promoted by the London County Council, who wished to establish an art gallery, was being opposed by the Corporation. Mr. Romer stated that as a result of several of the exhibitions which had been held substantial sums of money had been returned to the Corporation. Mr. Painter declared that it was a question whether the permanent exhibition did not suffer by having an annual loan exhibition. On a show of hands the amendment was carried, and the subject was referred back to the Committee for further consideration.

Central Markets.—Mr. Brinsley-Harper submitted a report from the Central Markets Committee recommending the covering-in of the space over the railway facing Charterhouse-street, comprising an area of about 14,000 ft. super between the fish, fruit and vegetable section of the Central General Market and the premises in the occupation of the London Central Markets Cold Storage Company, Ltd., and also the erection thereon of buildings for market and other purposes at a total estimated cost of 16,225l. The recommendations were referred to the Coal and Corn and Finance Committee.

Correspondence.

KING'S NORTON AND WREXHAM SCHOOLS COMPETITION.

SIR.—The two competitions for new schools at King's Norton and Wrexham have not yet, we believe, been decided. In view of the fact that the drawings had to go in for the former on February 7 and for the latter on March 2, it does not, we think, display an undue curiosity to inquire publicly through the medium of your columns into this latest example of the mysterious ways of a Borough Council's "COMPETITORS."

LIVERPOOL CATHEDRAL.—The contract for the portions of the Liverpool Cathedral which are to be immediately proceeded with has been let to a local firm of builders, Messrs. Morrison & Sons, of Wavertree, near Liverpool, who have already carried out the foundations. The portion to be proceeded with includes the choir up to the crossing, the Lady Chapel, the Chapter House, and the vestries. It is not expected that the choir can be ready for service before ten or twelve years.

Illustrations.

THE ALLIANCE ASSURANCE COMPANY'S BUILDING, ST. JAMES'S-STREET.

THE building is planned round a central court, and consists of a sub-basement, basement, ground, entresol, first and second floors, and two floors in the roof. In the sub-basement are vaults, etc., heating apparatus, and lift machinery. In the basement is a large office for clerks on the south side, and on the north side kitchens, etc., for the post-office.

On the ground floor in the centre of the St. James's-street front is the general entrance, opening out of which on the south side is the general office of the Alliance Assurance Company, a room 66 ft. long, 24 ft. wide, and 22 ft. high. This room is panelled to a height of 13 ft. with Italian walnut panelling, above which is Istrian marble, with bands of Siberian cippolino. The ceiling is of enriched plaster. On the north side of the entrance is the post-office.

The walls of the entrance-hall are lined with marble, the floor is of Portland stone and marble, the ceiling is of enriched plaster, the gates are of wrought-iron. On the entresol, first and second floors, and most of the third floor are bachelors' flats. The fourth floor consists of caretaker's rooms, kitchens, bedrooms for servants, etc.

The building is entirely of Portland stone. The roofs are covered with Westmorland slates. The floors throughout, and also the roof, are of steel and concrete. The partitions on the upper floors are of Aston's asbestos composition.

The whole of the general contract has been carried out by Messrs. Trollope & Sons and Colls & Son; the steelwork by Messrs. Mathew T. Shaw & Co.; the sanitary work, heating, and electric installation by Messrs. Wenham & Waters; the electric lifts by the Otis Elevator Company; and the electric-light fittings by Messrs. Shirley & Co. The architects are Mr. R. Norman Shaw, R.A., and Mr. Ernest Newton. The drawing is exhibited in the Royal Academy.

BUSBRIDGE HALL.

Our illustration shows the new house that is being built on this well-known estate, near Godaiming, for Mr. Percy N. Graham.

Its position has been chosen overlooking a series of lakes, which, with fine trees and lawns surrounding them, are of great natural beauty.

The old house, which stood by the water's edge, with its principal windows facing north, has been pulled down.

The design is simple in character, the south front being broken by three large five-sided bay windows, gables occurring above between the bays.

The forecourt is formed by the billiard-room wing on the west side and the offices to the east. At the one end of the southern terrace is an arched loggia. The balustraded terrace takes a lower level on the south-west side, where the hill falls away.

The architects are Messrs. Ernest George & Yeates, of Maddox-street, W., and the contractors, Messrs. Norman & Burt, of Burgess Hill, Sussex.

ROYAL EXCHANGE BUILDINGS, CITY.

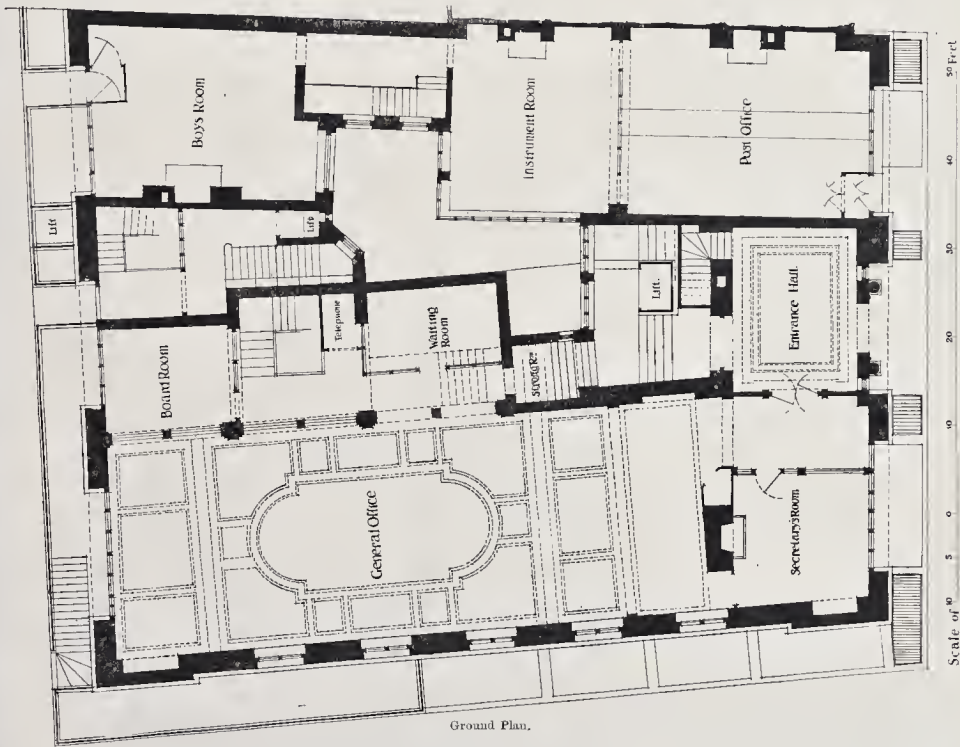

THE existing buildings are being rebuilt at the instance of Magdalen College, Oxford, who are the freeholders, the tenants of the greater part being the Union Assurance Society, while the lease of the south-west portion is taken by Messrs. Hayes, the present occupiers.

The site being shallow the architects have avoided any important breaks or recesses for their effect. The treatment is generally broad and simple, with rusticated arcading for the ground floor, quite a strong shadow being obtained by two deep recesses which form balconies to the upper windows. The front is of Portland stone.

The architects are Messrs. Ernest George & Yeates, who were appointed by Magdalen College.

OFFICES, CATHERINE STREET — AS ORIGINALLY PROPOSED.

It had been intended that the narrow and awkward strip of land left between the *Builder* office and York-street, Covent-garden, should have been occupied by premises built by the Bedford Estate and planned for occupation, in the basement, ground, and first floors, by a well-known specialist journal; and the plans were completed and a tender obtained for the building as represented in this illustration. Unfortunately difficulties about rights of light led to the Bedford Office abandoning the scheme as not sufficiently remunerative, and the block has been subsequently carried out in a planer form and with large ground floor openings for shop windows, which have naturally not improved its appearance.

The unusual arrangement of building the chimney stacks on the outer wall is explained by the second floor plan, for offices to be let, as otherwise it would have been impossible to get a passage past to the private office without cutting off the fireplaces; and as the long side has a south aspect, very large windows were not necessary. As the Building Act thickness of the walls was reducible above the first floor, the reduction was made outside instead of inside, so as to get the lines of the chimney stacks as an exterior feature; an expedient which might often be adopted as a means of making a little point in an exterior elevation; why, in fact, should the reduction always be made inside? The floor space saved is hardly worth counting. In order to stop the stone cornice against the projection of the chimney stacks, which looked much better than carrying it round them, it was, so to speak, flattened out, but so as to mitre with the front cornice; the same cornice mouldings were to be worked for three different projections in fact, as shown at A, B, and C.

The final balls were to be gilded, like those on the *Builder* office, only they come out dark in the lithograph. H. H. STATHAM.

ADULT SCHOOL-HALL, COALVILLE. — A new adult school-hall is in course of erection off Bridge-road, Coalville. The main building is 52 ft. by 33 ft. 6 in., with a classroom at the rear, provision being made for entertainments, etc. Mr. A. Boot, of Park-road, is the architect, and the executors of W. Moss the builders. The building will be of red brick and stone.

Competitions.

NEW BUILDINGS, UNIVERSITY COLLEGE OF NORTH WALES, BANGOR. — The following five architects have been selected by the Council of the College to send in competitive designs for the new buildings which it is proposed shortly to erect:—Mr. W. D. Carie, Mr. J. F. Doyle (Liverpool), Mr. H. T. Hare, Mr. A. Marshall Mackenzie, and Mr. Arnold Mitchell.

THE PALACE OF PEACE. — The competition for the Peace Palace at The Hague has been decided as follows:—First premium, 12,000 florins—M. L. M. Cordonnier, Lille; second, 9,000 florins—M. F. A. Marcel, Paris; third, 7,000 florins—M. Franz Wendt, Charlottenberg; fourth, 5,000 florins—M. Otto Wagner, Vienna. Premiums of 3,000 florins were awarded to Mr. Howard Greenley and Mr. H. S. Olin, of New York, and one of 3,000 florins to M. Franz Schwechten, of Berlin.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XIX.

SLIDE-RULES—GENERAL PRINCIPLE.

BRIEFLY defined, the slide-rule is an instrument by which logarithmic calculations can be performed mechanically.

As long ago as 1620 Edmund Gunter, the colleague of Professor Briggs at Gresham College, made public the logarithmic scales which are still identified with his name. By the aid of a logarithmic scale and a pair of dividers the operations of multiplication and division can be readily performed, as we demonstrated last week in the explanation of Fig. (1).

In its most elementary form the slide-rule comprises two parts—a body graduated so as to correspond with a Gunter's scale, and a similarly graduated slide whose functions correspond in some measure with those of the dividers, but are exercised in a far more convenient and more expeditious manner.

The mechanical principle of a slide-rule can be demonstrated in a very simple manner by taking two decimally graduated scales C and D, placing them side by side, as shown in Fig. (2); next moving C until 0, which we will call the index, is opposite 2 on D, and then comparing the relative positions of the figures marked on the two scales. It will be seen by Fig. 3 that when the index of C is opposite 2 on D, the value of every figure on D is 2 more than that of the contiguous figure on C, and the difference of any two numbers is constant for any adjustment of the scales. If the index of C were set opposite 3 on D, the value of every figure on D would be 3 more than that of the contiguous figure on C; if the index of C were set opposite 4 on D, the value of every figure on D would be 4 more than that of the

contiguous figure on C, and so on for the whole length of the scale.

Thus we are enabled to add any two integers, mixed numbers, or fractions within the range of the two scales by following the rule:—

Rule (1).—To add two numbers, set the index of scale C to one of the factors on scale D, and under the other factor on scale C read the sum on scale D.

Conversely, we are enabled to perform subtraction by observing the rule:—

Rule (2).—To subtract one number from another, set the subtrahend on scale C to the minuend on scale D, and under the index of scale C read the difference on scale D.

If we now place the two scales so that C is inverted, as shown in Fig. (4), we find that the sum of any two contiguous numbers has the constant value 10.

Next, moving scale C to the left until its index is opposite 8 on D, as in Fig. (5), we find that the sum of any two contiguous numbers has the constant value 8. Moving scale C more to the left until the index of C is opposite 7 on D, the sum of any two contiguous numbers has the constant value 7, and so on for the whole length of the scale.

Inasmuch as the difference of any two numbers is constant for any adjustment when the scales are in normal position, and the sum of any two numbers is constant for any adjustment when one scale is inverted, Rules (1) and (2) require reversal for application under the latter condition.

Hence we have Rule (3).—To add two numbers (with scale C inverted), set one number on scale C to the other number on scale D, and below the index of scale C read the sum on scale D.

Rule (4).—To subtract one number from another (with scale C inverted), set the index of scale C to the subtrahend on scale D, and under the minuend on scale C read the difference on scale D.

From the foregoing it is evident that by the aid of two exactly similar decimal scales any two numbers may be added or subtracted with great facility and with perfect accuracy to as many decimal places as are provided for by the subdivision of each unit length of the two scales. There is nothing to be gained by inverting one of the scales as described above for the purposes of addition and subtraction, but we shall see later the manner in which the inversion of a scale can be turned to useful account.

The operations of addition and subtraction are so simple that mechanical aid is quite unnecessary. Multiplication and division stand on a different footing, but cannot be conducted by the aid of two scales such as we have been considering.

If, however, we substitute for equal divisions from 1 to 10 graduated divisions corresponding to the logarithms of the numbers 1 to 10, the rules of logarithmic computation are brought into play. Consequently the attempt to perform addition and subtraction results in multiplication and division.

In Fig. (6) we have the elements of a slide-rule graduated logarithmically, the first figure being 1 instead of 0, as in the case of an ordinary scale, since $\log. 1 = 0$.

Now, assuming the index of scale C to be set opposite 15 = 15 on scale D, as in Fig. (7), every number indicated on scale C

points to 1.5 times its value on scale D. If the index of scale C be set opposite 2 on scale D, every number indicated on scale C points to twice its value on D, and so on for all other numbers until the product falls beyond the limit of scale D.

When the index of scale C has been slid to the right hand as far as the geometric mean between 1 and 10, no products higher than $(3.16+ \times 3.16+) = 10$ can be read on scale D.

To get over this difficulty scale D might be increased in length so as to give readings up to 31.6, thereby permitting the higher numbers of scale C to be used as multipliers.

But such an expedient is unnecessary, for the added portion of scale D would be simply a repetition of the first part of the same scale. We can obtain the same result by sliding scale C to the left, and using the right-hand end as an index (see Fig. 8).

Then, considering the decimal point to be shifted one place to the right, all products up to 100 can be read on scale D. Thus in Fig. (8) the right-hand index is set so that all products from 10 to 60, obtained by multiplying 6 by whole numbers or mixed numbers, are given on scale D. It will be understood, of course, that by suitable adjustment of the decimal point products

read on scale D may represent tens, hundreds, thousands, millions, and so on, or tenths, hundredths, thousandths, millionths, and so on, and that the same treatment can be applied to multipliers and multiplicands.

The theory underlying the two methods of employing the sliding scale C for multiplication ought to be clearly realised.

When scale C is moved towards the right we have

$$\log. a + \log. b = \log. ab.$$

As illustrated in Fig. (9) :-

$$\log. a = 2 \text{ and } \log. b = 3, \therefore \log. ab = (2+3) = 6.$$

As illustrated in Fig. (10) :-

$$\log. a = 3.5, \log. b = 3, \therefore \log. ab = x.$$

We cannot read the value of $\log. ab$, because the product is beyond the end of scale D. Therefore we must use the right-hand index of scale C and the left-hand half of scale D.

When scale C is moved towards the left $\log. 10$ is automatically deducted, and we have

$$(\log. a + \log. b) - \log. 10 = \log. \frac{ab}{10}$$

Therefore to obtain the correct result we must shift the decimal point one place to the right.

As illustrated in Fig. (11) :-

$$\log. a = 3.5, \log. b = 3, \therefore \log. ab = \frac{3.5 + 3}{10} = 1.05$$

Shifting the decimal point one place to the right gives $1.05 \times 10 = 10.5$, which is the correct result.

Two points now deserving special notice concerning the multiplication of whole numbers are :-

(1) That when the product is obtained with scale C projecting to the right hand the number of figures in the product is one figure fewer than the number of figures in the two factors.

Thus

$$\begin{aligned} 2 \times 3 &= 6 \\ 2 \times 30 &= 60 \\ 20 \times 30 &= 600 \end{aligned}$$

and so on.

(2) That when the product is obtained with scale C projecting to the left hand, the number of figures in the product is the same as the number of figures in the two factors.

Thus

$$\begin{aligned} 3.5 \times 3 &= 10.5 \\ 35 \times 3 &= 105 \\ 350 \times 3 &= 1050 \end{aligned}$$

and so on.

FIG. 11

FIG. 12

FIG. 13

FIG. 14

FIG. 15

In using scales C and D for division the process is a reversal of that adopted for multiplication.

The divisor on scale C is set opposite the dividend on scale D, and the quotient is read on scale D under the left-hand or the right-hand index of scale C.

When the significant figures of the divisor are not greater in face value than the significant figures of the dividend, scale C must be moved towards the right so that the left-hand index may point to the quotient.

Thus, as illustrated in Fig. (12), to divide 3 by 2 the figure 2 on scale C must be set opposite to figure 3 on scale D, and the quotient is found at 15 = 1.5 on scale D. The same figures answer equally for $30 \div 2 = 15$, $300 \div 2 = 150$, $3000 \div 2 = 1500$, and so on.

But when the significant figures of the divisor are greater in face value than the significant figures of the dividend, scale C must be moved towards the left, so that the right-hand index may point to the quotient.

Thus, as illustrated in Fig. (13), to divide 3 by 4, the figure 4 on scale C must be set opposite to figure 3 on scale D, and the quotient is found at 75 = 0.75 on scale D. The same figures answer for $30 \div 4 = 7.5$, $300 \div 4 = 75$, $3000 \div 4 = 750$, and so on.

The theory underlying these two methods of performing division is illustrated below.

When scale C is moved towards the right we have

$$\log. ab - \log. b = \log. a.$$

As shown in Fig. 12:—

$$\log. ab = 3, \log. b = 2, \therefore \log. a = 3 - 2 = 1.5$$

When scale C is moved towards the left the answer has to be read below the right-hand index, and $\log. 10$ is automatically added to the quotient. Then we have

$$(\log. ab - \log. b) + \log. 10 = \log. 10a.$$

Therefore to obtain the correct result we must shift the decimal point one place to the left.

As shown in Fig. 13:—

$$\log. ab = 3, \log. b = 4, \therefore \log. a = \frac{10 \times 3}{4} = 7.5.$$

Shifting the decimal point one place to the left gives $7.5 \div 10 = 0.75$, which is the correct result.

Two important points to be noted in connexion with the division of one whole number by another are:—

(1) That when the quotient is obtained with scale C projecting to the right hand it contains one figure more than the difference between the number of figures in the dividend and the divisor.

Thus

$$\begin{array}{r} 3 \div 2 = 1.5 \\ 30 \div 2 = 15 \\ 300 \div 2 = 150 \\ \text{and so on.} \end{array}$$

(2) That when the quotient is obtained with scale C projecting to the left hand it contains the same number of figures as the difference between the number of figures in the dividend and the divisor.

Thus

$$\begin{array}{r} 30 \div 4 = 7.5 \\ 300 \div 4 = 75 \\ 3000 \div 4 = 750 \\ \text{and so on.} \end{array}$$

The foregoing explanation should make clear, so far as concerns multiplication and division, the mechanical principle of the slide-rule, and the manner in which the mathematical principle of logarithmic calculation is combined therewith.

It should also serve to suggest the great saving of time to be effected by means of the slide-rule as compared with the use of logarithmic tables.

Of course, the very simple computations dealt with above could be performed with greater speed by mental arithmetic than by the employment of a slide-rule or a table of logarithms.

But take as an example

$$17.98 \times 5.675 = 102.0+$$

By the aid of a slide-rule with two logarithmic scales each 10 in. long and graduated with the ordinary subdivisions the approximate result 102.0 can be obtained in 15 sec.

By four-figure logarithms and antilogarithms (Tables XIV. and XV.) the result 102.1 may be obtained in about 50 sec.

By ordinary arithmetic the result 102.0365 is obtainable in about 70 sec.

Again, take an example such as

$$\begin{array}{r} 2620 \times 348 \times 575 \times 83 \\ 1740 \times 68.75 \times 470 \times 34.4 = 22.5+ \end{array}$$

We have worked this out by the three methods, with the following results:—

$$\begin{array}{r} \text{By slide-rule Result } 22.5 \text{ time } 70 \text{ sec.} \\ \text{By logarithms } \text{,, } 22.5 \text{ ,, } 150 \text{ sec.} \\ \text{By arithmetic } \text{,, } 2.4:8 \text{ ,, } 500 \text{ sec.} \end{array}$$

When we come later to inquire into the wonderful facilities offered by the slide-rule for dealing with more complicated calculations, wherein the powers and roots of numbers are involved as well as multiplication and division, it will be seen that the advantages of the instrument as a labour-saving device are still more marked.

This preliminary chapter may be closed appropriately by calling attention to the simple arrangement, included in all parallel slide-rules, by which the square and square root of any number can be instantly found. The arrangement is illustrated diagrammatically in Fig. 14, where in addition to scales C and D we have two other scales, A and B, the latter marked on the upper edge of scale C and the former assumed to be connected with scale D, but at a sufficient distance to permit the slide, on which are scales B and C, to be moved freely between scales A and D.

The graduations on scales A and B are exactly one-half the length of the graduations on scales C and D, and, as the graduations are logarithmic, the effect is that every number (*n*) indicated on scale D has opposite to it on scale A a number representing $\log. n \times 2$, and the same relation exists between scales C and B. Conversely, every number indicated on scale A has opposite to it on scale D a number representing $\log. n \div 2$, and the same relation exists between scales B and C.

We have already shown in Article XIV. that when the logarithm of a number is multiplied by 2 the result is the logarithm of the square of the number, and that when the logarithm of a number is divided by 2 the result is the logarithm of the square root of the number. These principles applied in the manner illustrated by Fig. 14 give the squares and square roots of all numbers without calculation of any kind beyond suitable adjustment of the decimal point. It is only necessary to find on scale D the number whose square is desired and to look on scale A for the result, and, conversely, to find on scale A the number whose square root is desired and to look on scale D for the result.

Further, as the same relation exists between the numbers on scales B and C, it is almost as easy to find the cube of any number.

In Fig. 15 the slide is drawn to the right so that the index of scale C points to 2 on scale D; the index of scale B points to 4, its square, on scale A; and the number 2 on scale B is opposite B, its cube, on scale A. In the same way are obtained the square and cube of any other number.

Although the square root of any number on scale A can be instantly found, the extraction of a cube root requires special manipulation, which will be described in a succeeding article.

It should be remarked, however, that by adding another scale with graduations one-third the length of those on scale D, the cube and cube root of any number can be read directly on scales A and D respectively, and, as we shall see later, the logarithmic principle has been extended in this manner to the construction of slide-rules.

CHURCH RESTORATION, BISHOP MIDDLEHAM.—The restoration of the parish church of Bishop Middleham has just been completed. The high pews have disappeared, and in their places are modern seats. The flat ceiling has been replaced by a pitched roof of dark timber. The organ has been transferred to the north aisle, and the chancel has been resented with carved stalls. There is now a choir vestry at the west end of the south aisle, and the whole of the walls have been plastered and tinted cream. The architects were Messrs. Stephen Wilkinson & Son, Newcastle, Messrs. G. Graddon & Crow, Durham, being the contractors. The undertaking has cost about 1,000.

Obituary.

MR. SALOMONS.—We regret to announce the death, on May 12, at Ireton Bank, Platt-lane, Rusholme, Manchester, of Mr. Edward Salomons, of Prudential-chambers, No. 78, King's-street, Manchester, and until lately of No. 39b, Old Bond-street, London, in his 79th year. Mr. Salomons was elected an Associate in 1851, and in 1860 a Fellow of the Royal Institute of British Architects, and served as a member of the Council. Mr. Salomons was the architect, in conjunction with Mr. John Ely, of a house at Knutsford, for Mr. C. J. Galloway (October 3, 1855, with two plans *); Beeston Lodge, Chester, about two years ago; and of the Midland Bank, Manchester. He was joint architect with Mr. R. Selden Wormum of a house at Françon, Biarritz, for Mr. J. Pennington Mellor (June 21, 1884 *); with Mr. J. P. Jones of Coen Wood Towers, Highgate, for Mr. E. Brooke (June, 1870, and June 1, 1872 *); and with Mr. A. Steinthal of the Crematorium, Manchester (October 22, 1892, two views, plan, and canopy of the bi-plateform *), and also for the reconstruction, with additional floor, stabling, etc., of Alveston Hall, Nantwich, for Mr. A. Knowles (April 17, 1897, drawing, three plans, and three drawings of the interior *). He was joint architect with Mr. N. S. Joseph of the Churches in Chichester place, Harrow-road, N.W., in 1862-3; in September, 1897, he was deputed to make the designs for the case of the organ in the Royal Manchester College of Music. Mr. Salomons was appointed to act as assessor in the competitions for the Board of Sanitary Officers in John-street, in 1892, and the North Wales student at Denbigh, in 1894. In our numbers of April 11 and May 2, 1896, we published illustrations of a set of five water-colour sketches drawn in Bruges by Mr. Salomons, comprising views taken from the Quai de Rosaire, with the belfry in the distance, and the Place de la Vigne, with the entrance to the Béguinage, and some of the old and picturesque houses on the canal-banks. On May 8, 1897, we published four of his drawings (then in the New Gallery), taken in Bretagne, illustrating St. Malo: some old houses in Morlaix; La Porte du Roi, Mont St. Michel; and La Maison Duquayroun, St. Malo.

MR. GEORGE LOW.—We have to record also the death, at the age of 82, of Mr. Geo. Low, architect, who had kept up his professional work till within a few weeks of his death. At the early age of 14½ years he was placed in the offices of George Smith (Surveyor to the Mercers Company) and Wm. Barnes, with whom he served his articles. In 1842 he was elected a student of the Royal Academy of Arts, and in 1844 was awarded, by the Council of the Academy, the first silver medal for the best measured drawings of the Church of St. Mary, Woolnoth. These drawings were presented by Mr. Low, some years ago, to the Royal Institute of British Architects' Library. In 1847 he commenced practice, and in 1850 was elected an Associate of the Royal Institute of British Architects, becoming a Fellow in 1860. In 1850 his design for a Town Hall and Market at Hemel Hempstead was selected in open competition, and the building was subsequently erected on his designs, and later added to, in conjunction with his son, Mr. Ralph Low, A.R.B.A. In 1855-65 he erected large business premises in Northampton and Dunstable. Subsequently up to his death he enjoyed a very large general practice, varied in character, and consisting of churches, church schools, board schools, private residences, and large commercial premises in the City and elsewhere. Since 1855, in partnership with his son, Mr. Ralph Low, he erected a large number of warehouses, blocks of shops, business premises, and private residences. Mr. Geo. Low was well known as a compensation surveyor and arbitrator, being engaged in a very large number of these cases for the Metropolitan and Metropolitan District Railway in the acquisition of property for the construction of their lines, and was one of the arbitrators employed by the Post Office Authorities in connexion with the property required for the new Post Office buildings in St. Martin's-le-Grand. The practice will be continued by his son, Mr. W. Ralph Low.

MR. HENRY FRANCIS FROGGATT.—The death is announced of Mr. Henry Francis Froggatt, the Hereford District Surveyor. The deceased had passed his 75th year.

MR. WRIGHT.—The death, on May 11, at No. 48, Kingsland-road, Oxford, S.E., is announced of Mr. Thomas Wright, aged eighty-four years. Mr. Wright was during thirty-five years Clerk of the Works to the Dean and Chapter of Westminster Abbey, and possessed a practical knowledge, which we believe was almost unrivalled, of the structural history of the Abbey and its appurtenant buildings.

CENSUS OF PARIS.—The general totals of the census taken on March 4 show that the population of the capital was then 2,731,728, as compared with 2,660,559 in 1901, and 2,511,629 in 1896.

* Illustrated in the *Builder*.

General Building News.

CHURCH, EVESHAM.—The foundation-stones and bricks in connexion with the new Wesleyan Church which is being built at Avon Bank, Evesham, have just been laid. There will be accommodation for some 950 people, and the complementary buildings will include schools, classrooms, and hall. The designs were selected in a limited competition, and the building will have Stoucheous brick facings relieved with stonework, the face work being in Bath and the weatherings in Taynton stone, while the roof will be of Bangor slates. The church will seat 630 on the ground floor, 150 in the gallery, and forty in the choir gallery. It is proposed to execute the seating and gallery front in American oak, and the roof timbers will be stained to imitate fumed oak. An organ is to be included, at a cost of at least 500*l.* The schools are to accommodate 150 boys and fifty infants on the ground floor, and 150 girls on the first floor, all arranged in classrooms round a large central hall. The cost of the buildings, including the organ, the site, and the minister's house, will be about 8,300*l.* The architect is Mr. Frederic Foster, of Coventry, and the work is being carried out by Messrs. Espley & Co., of Evesham, the amount of whose invoice contract is 6,350*l.*

BRAMPTON CHURCH TOWER.—On the 10th inst. the Bishop of the diocese dedicated the tower which has been added to Brampton parish church, and which completes the building as originally designed by Mr. Philip Webb. The tower now completed is not so elaborate as that originally planned, the new work being built at a height of 41 ft. above the floor of the church, and from there to the parapet it rises a further 35 ft., making a total height, if measured from the ground outside, of 82 ft. A feature of the tower is its great width, which averages 25½ ft. on each side, a width which allows an ample space for the bells as well as the very thick walls. The roof is a step and covered with lead, and it is crowned with a spirelet 30 ft. high. The erection of the tower was begun in May last year by Messrs. Laing & Son, Carlisle. Mr. Jack, of Carlisle, has acted as supervising architect for Mr. Webb, while Mr. Alexander Routledge has discharged the duties of clerk of the works.

CHURCH RESTORATION, EAST BERGHOLT.—East Bergholt was recently visited by Bishop Sheepshears, who held a dedication service at the parish church, which has undergone alterations, a new reredos and choir-stalls being constructed. The repairs included a solid re-construction of the south porch, the practical re-construction of the cupola on the roof, which was much decayed; attention to the stonework and the exterior of the chapel, as well as the relaying of the chancel roof and the North Chapel roof. The entire work has been carried out under the supervision of Mr. T. G. Jackson, R.A., by Mr. Wheeler, of East Bergholt, and the wood carvings and the marble work have been executed by Messrs. Farmer & Brindley.

BAPTIST MISSION CHAPEL, EASTVILLE, BRISTOL.—Memorial-stones of a new Baptist mission chapel at Eastville were laid on the 10th inst. The plans were prepared by Mr. B. Wakefield, and the contractor was Alfred Downing, of Bishopston. The new building is arranged to accommodate a congregation of 250, with four classrooms and offices. The cost of the scheme is estimated at 1,700*l.*

SCHOOL-CHURCH, TUNSTALL.—The foundation-stones of a school-church for the new district of St. Chad was laid recently on a site in King William-street. Mr. H. Dain was commissioned to design the building, and his plans are being carried out by Mr. C. Cope. Accommodation will be provided for 300, and the work will cost 1,400*l.*

EXTRADIOROADS, TABERNACLE.—This new building in Bloomsford-road, now near completion, has been erected at a cost of just over 3,000*l.* The architect was Mr. R. Norman Hewitt, Shepherd's Bush, and the builders Messrs. T. E. Mills & Son. The general design of the building is Gothic. The front is of red brick, dressed with Bath stone. There are three entrances on one side, the main porch reached by separate flights of granite steps, immediately inside the chapel is a vestibule, separated from the main building by a leaded glass screen to match windows, with Frazzo flooring, and double doors. The windows, all in lead lights, are by Messrs. Fry & Sons, Bricklayers' Works, Hammersmith. There is seating accommodation on the ground floor for about 350, and in the gallery for about 250.

NEW ELECTRICAL SCHOOL, CHATHAM.—We are informed that the general contractors for this building, referred to in our issue for April 27, were Messrs. W. Pattinson & Sons, Ltd., of Barking, Essex, London, and that Street's Brickworks Company were only sub-contractors for the reinforced concrete beams and floors.

SUNDAY SCHOOL EXTENSION, SOUTHAMPTON.—At Southampton on the 2nd inst. the foundation-stones were laid of the new classrooms which form an extension of the Wesleyan Sunday schools. The new buildings will be of stone, and will ac-

commodate a men's Bible classroom, 18 ft. by 20 ft., a women's classroom, 14 ft. by 18 ft., and two smaller classrooms, the total increasing the available accommodation by about 130. The work is being carried out to plans prepared by Mr. Fred E. Sargent, architect, of Southampton, the contractors being Messrs. W. Saunders & Son.

COUNCIL SCHOOL, HOPE, NEAR CAERGWYLE.—A new elementary school has been opened at Hope by the education authority of Flintshire. The building is of red brick, with the window woodwork painted white and green. There are ornamentalations of terra-cotta dressings, with blue slated roof. There is a central hall surrounded by six classrooms, with corridors and cloak-rooms. The accommodation provided is for a total of 330 children, 220 mixed and 110 infants. The total cost is about 3,300*l.* Mr. R. Williams, Brynho, was the contractor, and Mr. S. Evans (County Council Surveyor), the architect.

SCHOOL, SAMPBRIDGE. The new school which has been erected by the Gloucestershire Education Committee, in the parish of Slimbridge, was recently opened. The school is built to accommodate 200 scholars—100 boys and girls and forty infants. The architect was Mr. R. S. Phillips, the builders being Messrs. Baxter & Sons, Stroud. Messrs. Crisp & Sons, supplied the heating apparatus, and the clerk of the works was Mr. A. E. Morgan. The cost of the work was about 2,000*l.*

COUNCIL SCHOOLS, HUNTINGDON.—New schools have been erected by the Huntingdonshire County Council, at Huntingdon. The buildings will accommodate 310 in the mixed department, and 140 in the infant department. The cost has been about 5,000*l.* The designs were prepared by the County Surveyor, Mr. Leete, in conjunction with the Organising Secretary, Mr. Cook. The work has been carried out by Messrs. E. B. Thackray & Co., Ltd.

WESLEYAN SUNDAY SCHOOL, LEEDS.—The Park Wesleyan Sunday School, Dewsbury-road, Leeds, was opened on the 12th inst. The total outlay on the new school, which has been erected from designs by Messrs. Dunby & Stinson, architects, Leeds, has been 5,000*l.*, excluding the value of the building land. The school has a central hall to accommodate 630 persons. There is a gallery round the hall, and from this and the main floor open nineteen classrooms. To the rear of the hall are placed a mission hall capable of seating 150 persons, three other classrooms, and a caretaker's cottage. There is also a basement, which can be used for tea meetings and similar gatherings, accommodating 300 persons. The premises are built of stone.

SUNDAY SCHOOLS, TODMORDEN.—Twelve memorial-stones in connexion with York-street New Wesleyan Methodist Sunday School, Todmorden, were laid recently. The large room of the new building will seat about 700 people, and there is to be a suite of classrooms on the ground floor. The estimated cost is 3,600*l.* Mr. Morley, of Bradford, being the architect.

SUNDAY-SCHOOLS, SOUTHPORT.—The new Sunday-schools, which have been erected in connexion with the Baptist Tabernacle, Southport, were opened by Mr. W. P. Hartley, J.P., on May 16. Mr. E. H. Halsey, of Southport, was the architect of the new premises, and he has provided about fourteen ordinary classrooms, in addition to the principal rooms. Another feature is the provision of two new staircases from the Tabernacle gallery, there having up to the present been only one winding stone staircase. The large school-room, or assembly-hall, occupies the same, but more extended position of the old school, and is 63 ft. long by 32 ft. wide, and has a balcony round three sides, fitted with fixed seats, for the use of scholars occupying upstairs classrooms. The principal entrance to this school-room is on the Scarsbridge New-road side, and is semi-octagonal in shape, a staircase leading thence to the balcony and classrooms. The library adjoins this entrance, and alongside of this come two classrooms on the ground floor and three classrooms coming above. The lower rooms are separated from the main room by patent folding partitions filled in with clear glass.

On the opposite side of the school there are two new vestries for minister and deacons, with classroom for about seventy men above. This portion is not yet completed. On the Southbank road side is the lecture-hall, with separate entrance. It is 39 ft. long by 25 ft. wide and 12 ft. high, and above this are classrooms and kitchen, etc. There is a communicating passage between the Tabernacle and the schools. A special feature is a large mullioned and transomed circular-headed window at the south end of the school. The elevations have been carried out in Turkey and brick, with grey terra-cotta, the latter being from Jabez Thompson's, of Northwich. The school has been coloured internally with Duresco, and the woodwork is of pitch-pine, varnished. The total cost is expected to be about 2,600*l.*, exclusive of land and furnishing. The contractors were Messrs. Dunsell Brothers, and the following were sub-contractors: the Brickwork and terra-cotta, Mr. J. Marshall; stonemason, Mr. J. Rimmer; slater and plasterer, Mr. Tom Southworth; plumber, etc., Mr. Wm. Wright; painters, Messrs. Brandreth & Burdon; heating, Mr. Lewis Hill, of Liverpool; lead lights,

Messrs. Ockleston & Drayton, Johnson, of Liverpool and Chester.

NAUTICAL SCHOOL, PORTSEAHEAD.—Princess Christian opened the new nautical school at Portseahead on the 9th inst. The structure, which was designed by Mr. Edward Gabriel, and built by Messrs. W. Cowlin & Son, has been erected on a seaside slope, the ground inclining considerably from back to front. The drop in level has been utilised for the construction of a row of arches used as store-rooms and workshops, and having above them a broad, covered terrace, above which the school itself rises. The block has a frontage of 382 ft. in length. The building consists of two wings, about 45 ft. in height, measured from the terrace pavement, and connected by an ornamental central tower, beneath which is the chief entrance. The central portion of the building is carried up to a height of 70 ft., and is finished off with wood and copper "fliche" of ornamental character. This central tower stands well above the rest of the building, and has a clock in its front face. Red brick dressings and white rough-cast walls indicate the nature of the exterior treatment of this and other parts of the school. On one side of the main entrance in this middle section is located the committee-room, and on the other the captain superintendent's offices, while on its upper floors are cabins for the officers and for the old boys revisiting the institution. Passing through the central entrance the visitor would find himself in the gymnasium, a ground-floor building at the rear, 80 ft. by 60 ft., and useful not only for physical exercise, but for meetings and services. Both wings are relieved by smaller towers rising above the roof line, and the stretch of front wall, with its numerous windows, is divided off by red brick pilasters. The roof is also of red tiles. The south-west wing on the ground floor contains the mess-room, with kitchen, officers' mess-room, and stores at the back; at its extreme end is the chief officer's house, and also a residence for the schoolmaster. The ground floor of the north-wing contains the school accommodation, library, teachers' room, and at its end is the house of the captain superintendent. This residence is a separate building, but has covered communication with the main block, so that the captain superintendent will be able to go round the whole institution without coming into the open. The two upper floors of both wings are devoted to dormitories. The elder boys sleep in hammocks suspended in long lines on each side of the central avenue, while officers' cabins, located at the corners of the dormitories, command a view of each room. These dormitories are large, and, roundly, may be said to accommodate 100 boys in each. The one for the younger lads is fitted with bedsteads instead of hammocks. The heating, hot-water supply apparatus to baths and kitchen, laundry, drying apparatus, etc. has been installed by Messrs. James Crispin & Sons, of Bristol. In the arches of the basement are fixed two large steam Cornish boilers, and steam is supplied from these boilers to patent calorifiers or heaters, one of which generates the hot-water supply. This is stored in a large cylindrical container of 600 gallons capacity, and from this container secondary loop circulation pipes are carried. The heating calorifier connects a series of heating main pipes which are attached to radiators in the main entrance corridor near the gymnasium, and in each of the classrooms four radiators are fixed, fitted with regulating valves. The calorifiers are also fitted with Row's Patent Attachment, which allows of steam being automatically shut off, and any desired temperature is registered by the thermometer on the calorifiers. The condensed water from the calorifiers is carried to an automatic receiver which pumps the water back to the boiler, and thus ensures economy in maintenance. In connexion with the sanitary arrangements of building the committee adopted the bacteriological treatment system on the plan applied by Mr. F. Wallis Stoddart.—*Western Daily Press.*

PARISH HALL, KINGSTON.—A parish hall has been erected in Park-road, Kingston, in connexion with St. Paul's Church. The hall has been built by Mr. Frank Hawkey (Surbiton) of stone, with red brick dressings and roof of Broseley tiles. There are three entrances to the principal room, which is 48 ft. in length and 27 ft. wide, and has a platform 3 ft. above the floor measuring 18 ft. by 12 ft. From the platform exits have been planned to allow of its use for dramatic representations, and access is also gained to the cloak-rooms and lavatories for men and women on either side. The holding capacity of the hall has been fixed at 550 by the Surrey County Council. The cost, including site, has been about 1,650*l.* The plans for the work were prepared by Major Mearns.

PUBLIC LIBRARY, ARNOLD.—The new public library which is being built at Arnold is now nearly completed. The main entrance is central and leads into a hall which will be used as the lending library. On the right is a reading-room, on the left a ladies' room and reference library. The private room for the use of the librarian is so placed as to command a view of each of the departments. The floors will be of wood blocks,

and the rooms will have a wood dado to the height of 4 ft. 6 in., the upper part of the walls being plastered. Externally the building is of pressed bricks, with stone dressings. The heating will be on the low-pressure hot water system. The tenders were confined to Arnold builders, and the Council accepted that of Messrs. H. Jew & Son, amounting to 1,320, for the library, and 250, for the caretaker's house adjoining. The architect is Mr. H. Wigginton, of Arnold and Nottingham.

PROPOSED ELECTRIC LIGHT WORKS, WELLINGBOROUGH.—Colonel A. C. Smith, C.E., Inspector of the Local Government Board, attended at the Council Chamber, Wellingborough, on the 1st inst. to hold an inquiry respecting the application made by the Urban District Council to be allowed to let part of their storage-yard to the County of Northampton Electric Power and Traction Company. Evidence supporting the application was given by Mr. E. Y. Harrison, the Surveyor.

CHILDREN'S HOSPITAL, HESWALL.—The foundation-stone of the Liverpool County Hospital for Children, which is being erected at Heswall, was laid a short time ago. The site for the new hospital, comprising 10 acres, is on the side of Heswall Hill, off Telegraph-road. When the complete scheme is carried into effect the buildings will stand in the form of the letter H, the ward wings being connected by the central block, and accommodation for 200 beds will be provided. The total cost will be 60,000, but at present only the central block, in which temporary ward accommodation can be found for 100 beds until the ward blocks themselves are erected, is being undertaken. This part of the scheme will cost 25,000. The hospital is being built by Mr. W. H. Forde, of Birkenhead, and the architects are Messrs. H. & A. F. Fry, of Liverpool.

GOLF PAVILION, BELWELL FOREST, NOTTINGHAM.—The new pavilion recently erected in Balwell Forest for the convenience of golfers was opened on the 3rd inst. Mr. F. B. Lewis, the City Architect, prepared the plans for the work.

CYCLE FACTORY, COVENTRY.—Messrs. Harrison & Hattrell, of Coventry, are the architects, and Mr. Gray Hill, also of Coventry, is the general contractor for a new factory which is now being built, at a cost of upwards of 40,000, as an extension of their workshops, by the Rudge-Whitworth Company.

MANCHESTER INFIRMARY.—A special meeting of the Royal Infirmary Board was held on the 8th inst. for the purpose of receiving a report from the Building Committee on the tenders received for the superstructure of the new infirmary, and Mr. Hopkinson, Chairman of the Building Committee, in moving the adoption of the report, explained that the work had been divided into sections "A" and "B." Section "A" included four large blocks and all the general medical and surgical departments of the hospital, while section "B" consisted of the lodges, the casualty and special blocks, the out-patients' blocks, the superstructure of the laundry, and the pathological and ophthalmic blocks. The architect's estimate of the cost of section "A" was 240,000, and of section "B" 69,000. The tenders which had been received for section "A" were as follows: Arnold & Son, Doncaster, 239,640; Brown & Son, Salford, 244,480; Foster & Dicksee, Rugby, 253,620; Holliday & Greenwood, Brixton, S.W., 258,277; Morrison & Son, Liverpool, 251,300; R. Neill & Son, Manchester, 245,000; Rowbotham, Birmingham, 256,752. In considering the tenders the committee had regarded either price or time alone, but with regard to time they asked that the tender should be based on the completion of the contract in September, 1908. By that he meant both sections "A" and "B" together.—The tender of Messrs. Arnold & Son was accepted.

ELECTRIC POWER STATION, BIRMINGHAM.—The new power station in Summer-lane, which is being constructed by the Electric Supply Committee of the City Council for the provision of electricity for lighting and for power, is now nearing completion. The engine-house, which is 270 ft. long, 100 ft. wide, and 65 ft. high, is divided by a central gangway, the high-tension plant being installed on one side and the low-tension plant on the other. The switchboards are situated at the front of the engine-house, mounted upon a gallery. The cables connecting the generators to the switchboard are run along two subways under the central gangway. The boiler-house, which adjoins the engine-house, is equipped with underground flues, so arranged that any battery of boilers can be brought into use as required. When finished the boilers will be arranged in four batteries, each containing six water-tube boilers, fitted with super-heaters and economisers. The coal from the overhead store is automatically fed into mechanical stokers, and the ashes produced will be allowed to accumulate in underground chambers, now in course of construction, from whence they can be fed into a conveyor and taken away. Mr. R. A. Chattock is the City Electrical Engineer and manager, and Mr. J. P. Kenp the resident engineer.

UNIVERSITY SETTLEMENT HALL, BARDIE.—This building is shortly to be enlarged. Plans have been prepared by Mr. R. Weir Schütz, architect, of London, who also designed the hall,

and they have received the approval of the city authorities. The new building will be built of Somersetshire red bricks and roofed with pantiles. The walls inside will also have a brick face, and only the ceilings will be plastered. There will be a billiard and smoking room for men and a reading-room as well, while large playrooms are provided for the Lads' and Girls' Clubs, and several classrooms for each. The Mothers' Club will also have a separate room.

BUSINESS PREMISES, NORWICH.—New business premises have been erected in St. Benedict's-street, Norwich. They have been built from the plans of Mr. H. Tooley, architect, Buckhurst Hill, Essex, by Mr. T. Gill, Norwich. The internal lighting has been carried out by the Corporation Electricity Works. Electric bells and gas fittings have been installed by Self Brothers, Norwich, and the general decorations have been carried out by Mr. Taylor, also of Norwich.

FREE LIBRARY, NEWBURY.—On the 2nd inst. a new Free Library was opened at Newbury. The building, which was designed by Mr. S. J. Lee Vincent, Borough Surveyor, has been constructed of red brick, with Monks Park stone dressings. The design is based on the Elizabethan style. On the ground floor there is first the library, with borrowers' space, counter, and indicators for 10,000 volumes. Shelving has been provided for 8,000 volumes, and there is space for a further 2,000 volumes if necessary. Adjoining this room is the librarian's office, overlooking the reading-room. From the reading-room a lobby and staircase leads to the reference room, 30 ft. by 20 ft., over the lending department. Overlooking the reading-room is a railed-off space forming a library accommodation is provided. The cost has been 2,000. Messrs. Hoskings, of West Mills, were the builders.

SWIMMING BATH, CHELMSFORD.—An open-air swimming bath has just been opened by the Chelmsford Corporation. The bath, which with the inclosure covers an area of five-sixths of an acre, is 150 ft. by 100 ft., with a water area of 15,000 square ft. It has a depth of water from 3 ft. to 6 ft., and holds 400,000 gallons. It is constructed partly above and partly below the ground level, and is surrounded by two paved footpaths in the form of terraces, which are formed with the excavation material from the centre of the bath. The bottom of the bath is lined with 1,490 square yds. of concrete flags, grouted together, and the sides are formed of cement concrete. A sand filter 50 ft. by 20 ft. is provided at the end, through which the water passes before entering the bath. On the top terrace, which extends the full length of the site, and stands 2 ft. 6 in. above the water level, thirty-six dressing boxes are erected. There is also an open dressing shed, about 80 ft. long, for free bathers, with caretaker's shed and cycle store adjoining. An island built of timber is fixed in the centre, and arranged in the form of step platforms for diving purposes. In addition there are two spring diving boards. The water is supplied from the river Chelmer, and is conveyed from the dam at Springfield Mill by a 12-in. pipe main to the sand filter. The work has been carried out departmentally under the supervision of the Borough Engineer and Surveyor, Mr. Culbert Brown, and the total cost of the works is under 700.

Appointments.

BIRMINGHAM CITY COUNCIL.—The Public Works Committee have decided to recommend that Mr. Henry E. Stigloe, A.M.I.C.E., Borough Engineer and Surveyor to the Corporation of Dover, be appointed City Surveyor for Birmingham, at a salary of 1,250, per annum, vice the late Mr. John Price.

BRITISH SCHOOL, ATHENS.—Mr. R. McG. Dawkins has been elected as Director of the School in the place of Mr. R. C. Bosanquet, whose appointment to the chair of Archaeology in the University of Liverpool we recently announced. Mr. Dawkins is a Fellow of Emmanuel College, Cambridge; he has taken a prominent part in conducting the excavations at Palaikastro in Crete, and is at present Mr. Bosanquet's co-adjutor in the investigations recently undertaken on the site of ancient Sparta.

STAFFORDSHIRE IRON AND STEEL INSTITUTE.—Mr. William Somers, of Holesowen Forge, has been elected President, and Mr. William H. Corder has been re-elected Secretary, for the ensuing year.

Sanitary and Engineering News.

A REINFORCED CONCRETE BRIDGE OF 146 FT. SPAN.—A bold example of concrete-steel construction is to be found in the footbridge recently built across the river at Playa del Rey, California. This bridge has a total length of nearly 200 ft., and crosses the river in a straight line with a clear span of 146 ft. and a rise of 18 ft. The three arch ribs are each 14 in. thick by 24 in. deep at the crown, and spring from abutments of concrete

strengthened by grillages of rails and resting on pile foundations. The ribs are reinforced by angle bars, but the main and railway rails are connected by transverse beams of concrete, each reinforced by a railway rail which, from plates are riveted to form brackets reinforcing the connexion of the main ribs and transverse beams. The floor consists of a 4-in. slab of concrete reinforced by a network of $\frac{3}{8}$ in. diameter bars, 5 in. apart, crossing the bridge diagonally. The working was struck seven weeks after completion of the concreting, when settlement took place to the extent of $\frac{3}{4}$ in., but did not increase to more than $\frac{1}{2}$ in. in all. The bridge was afterwards tested by a dead load of 870 lb. per square foot, with satisfactory results.

MANHATTAN BRIDGE.—It is now hoped in New York that the last controversial question relative to the structural details of the Manhattan Bridge across the East River has been settled by the recent decision of the Bridge Department to carry out the design of their predecessors in office, providing for a cable instead of an eye-bar suspension bridge. No real importance attaches to the point raised, for other type of structure would be perfectly safe and reliable, if properly designed and executed. The New York public are little interested in the relative merits of eye-bars and cables—a matter upon which engineers are by no means in agreement. On the contrary, their chief anxiety is to have the bridge opened at the earliest possible date so that the additional cross-river communication may relieve the almost crushing traffic which takes place on the Brooklyn Bridge every morning and evening.

CONCRETE-STEEL IN MARINE ENGINEERING.—Owing to the fact that timber employed in tidal waters suffers to a serious extent from attack by the *teredo navalis*, and is also affected by other destructive agencies, the use of concrete-steel is rapidly extending in the construction of wharves, jetties, landing-stages, and kindred works, where timber piles and frameworks were once almost universal. The usefulness of ordinary concrete-steel in the design of wharves and jetties has been sufficiently demonstrated by various examples of such construction at Southampton and elsewhere in the United Kingdom, and as an illustration of the extent to which the Admiralty are availing themselves of the valuable properties exhibited by this material the fact is stated on the authority of Mr. L. G. Mouchel, that more than a dozen jetties on the Hennebique system are under construction at the present time. The works in question include two jetties at Haslar, and two torpedo-boat destroyer jetties at Portland for the Admiralty; an isolated breakwater in Waterford Harbour for the Public Works Department of Ireland; a jetty and approach at Hornchurch Marsh for the City Corporation to the designs of Mr. Frank Sumner, M.Inst.C.E., the Engineer to the Public Health Department; a coaling jetty at Erith, and a coal wharf at Rochester, for Messrs. Cory & Co., from the designs of Mr. H. Slocum, M.Inst.C.E.; a jetty at Coves for the Southampton and Isle of Wight Steampacket Company; an important jetty at Newcastle-on-Tyne on 18-in. by 18-in. hollow ferro-concrete piles for the Co-operative Wholesale Society; the Caledon Jetty, Dundee, from the designs of Mr. J. Thompson, M.Inst.C.E., the Harbour Engineer, and a jetty for the Great Western Railway at Plymouth Harbour. Our readers are chiefly interested in reinforced concrete as a material for the construction of buildings, but it may be pointed out that piles of the kind which are suitable for wharves and jetties should be found equally useful in ordinary foundation work as a substitute for timber piles or heavy masses of plain concrete, for timber is apt to decay sooner or later, and weighty foundation blocks and slabs constitute an undesirable additional load upon unstable soil, and so tend to cause settlement of the buildings which they are intended to support.

IRON AND STEEL INSTITUTE.—At the thirty-seventh annual meeting, opened on May 10, the President, Mr. H. G. Gulliver, presented the Carnegie gold medal to Mr. H. Gulliver, and Mr. W. Rosenbain, of Birmingham, and announced that the Bessemer gold medal for 1906 would be presented to M. Floris Omond, of Paris, a leading authority upon the diagnosis of steel. The council have recommended that scholarships, each worth 100, be awarded to Messrs. E. F. Lave (London), P. H. H. (United States), O. Stutzer (Germany), and C. A. P. Benedicks (Sweden). The statement of accounts for the year 1905 showed that the income amounted to 6,271, and the expenditure to 5,257. In order to meet the cost of publishing the journal, each worth 100, the Institute, Mr. Carnegie has supplemented his previous contribution of a sum of 25,000 dollars in 5 per cent. debenture bonds.

MANUFACTURE OF PORTLAND CEMENT.—The *Iron Age* states that the use of producer-gas instead of coal for calcining purposes has been successfully adopted in six rotary kilns by the Portland Cement Works of the National Cement Branch, Ohio, with a concurrent saving in expense, fuel, and labour. The kilns are 60 ft. long, with a

diameter of 6 ft. ; the tested output amounts to 40 barrels, of 380 lb. per barrel, in 24 hours, with a consumption of 110 lb. of coal-fuel to the barrel. It is deemed that the use of low-grade coal can be applied to existing kilns at a moderate outlay.

ELECTRICAL POWER SCHEME, CALCUTTA.—The *Indian Daily News* describes some proposals which are made to promote a company, with a capital of 300,000, with the object of supplying electrical current to the mills and factories along the river Hooghly, from a generating-station with mains laid along both banks of the river to a distance of seventeen miles south to Budge Budge, and a distance of twenty-five miles north to the town of Hooghly. Within that area are mills and factories using an estimated amount of 20,000 h.p., exclusively of those within the limits of the Howrah and Calcutta, covered by the existing rights of the Calcutta Electric Supply Association.

SEWAGE DISPOSAL WORKS, NEWCASTLE-UNDER-LYME.—The formal opening of new sewage disposal works, constructed by the Newcastle-under-Lyme Town Council, took place on the 6th inst. Mr. J. E. Wilcox (Messrs. Wilcox & Talbot, Birmingham) was engineer of the works, and Mr. S. Wilton, jun., Newcastle, was the contractor. The new works have cost about 35,000l. There is a new main outfall sewer (20 yds. long, special design chamber, and 19 operating apparatus, and old liquefying tanks re-utilised). The effluent from the tanks discharges into a main channel, along which it flows into a circular pump, well constructed in brick-work, 25 ft. diameter by 6 ft. 8 in. deep below the level of the overflow, and having a capacity of about 28,000 gallons. The pumping plant consists of three sets of 22-h.p. gas engines and 6-in. centrifugal pumps, having a total lifting capacity of 900 gallons per minute. After leaving the pumps the sewage passes through an 18-in. cast-iron rising main to the distributing chambers above the high level filters; these are three in number, each 112 ft. diameter, and having a total area of 3,260 yds. From the high level filters the effluent can be discharged direct to the stream; or, if desired, on to the low-level filters or double filtration.

EXPOSED NEW BRIDGE, STAKEFORD.—At a recent meeting of the committee having in hand the bridging over of the Wasbeck at Stakeford, it was agreed that Messrs. D. Balfour & Son, civil engineers, Newcastle, should be instructed to prepare details and plans of the structure. The estimated cost being 8,000l.

THE ROYAL SANITARY INSTITUTE.—The following is the list of members and associates elected this month:—*Members*.—W. Boby (Salisbury House, E.C.); E. A. Bush (Beeston, Notts); E. E. Collins (London, E.C.); F. Cottle (Donglas, N. Ireland); W. H. Dairo, (Gizeh, Cairo, Egypt); E. T. Hayes (Chotzenburg); L. L. Honey (Chatham); A. P. Maddocks (Stoneycross, Spendon, Derby); F. E. Marsh (Pinchley, N.); W. W. Lewman (Loughborough); A. C. Norman (Norwich). *Associates*.—H. G. Allen (Methergingham, Lincolnshire); H. Clapham (Ince, near London, W.); D. G. Carriff; W. Holt (Munzenberg, Cape Colony); W. A. Hullon (Lowey Crumpsall, Manchester); D. Llowellyn Blaengorn, near Bridgend); E. Mantell (Sparkhill, near Birmingham); Miss M. A. Raw (Tooting, W.); J. P. Shannon (Dunfriess, N.B.); Miss C. G. Cheskes (Melmas, S.W.); Miss E. Swain (Brincliffe, Sheffield); Mrs. A. C. Young (London, S.W.).

Foreign.

ROME.—Mr. Morgan, the British Consul, in his report for the year 1905, just received at the Foreign Office, observes that people who return to Rome after an absence of a decade or so can scarcely recognise the old city under its modern garb, which, however adversely it may affect its archaeological interest, cannot but impress the visitor. As population in the comparatively brief space of twenty years has risen from 1,015,035 to over 500,000, and the extensions around Rome have given way to suburban quarters, which, although unsightly, give shelter to thousands of new comers from all parts of Italy, who contribute their share of individual burr towards the economic development of the city. Numerous new hotels have been built on modern systems, and the discomforts of which so much used to be heard in the past have been removed. Smoking chimney-stacks, quite a new feature among the ruins of the past, mark here and there the presence of rising manufactures. Electric trams have superseded the lumbering omnibuses, and a large and rapid traffic of passengers is carried on daily. Notably the opposite quart of the town are now connected by the new tram lines, but the pretty half towns near Rome, such as Frascati and Cotterafatta, are now served by them. It is interesting to note that the price of commodities has risen. It was at first supposed that the rise was due to the manœuvres of speculators,

but there is every reason for believing that the improved local economic conditions have been determining factors. The scale of wages also tends to increase. It has been the prevalent custom in the past for a great many of the inhabitants of Rome to quit the city on the approach of summer, which fact is justly considered to be seriously detrimental to the economy of the district. A British company is now going to give effect to a plan whereby the inhabitants of Rome will be provided with a summer resort custom in the immediate neighbourhood of the capital. The site chosen for the new summer town is called "Pratone", a small plain, or table-land, surrounded by shady woods of chestnuts, acacias, and oaks. The "Pratone" is 3,210 ft. above the sea level, and general local conditions are reported as being favourable for the carrying out of the object in view—short distance from Rome (twenty-one miles as the crow flies), clear bracing mountain air, the temperature in summer rarely exceeding 70° Fahr., and good water. The company intend running electric carriages between Rome and the "Pratone", which distance they estimate will be covered in an hour. The ascent to the "Pratone" will be effected by means of a series of steep inclines. The electric energy will be derived from the river at Tivoli. The available supply is estimated at 800 horse-power, of which 500 will be required for working the railway and 300 will be utilised for lighting and industrial purposes. A large area on the top of the "Pratone" has been secured for the erection of a hotel and restaurant, as well as for a club house, theatre, etc., the remaining land will be sold to private individuals who may wish to build thereon summer residences. The cost of the railway and buildings is estimated at 150,000l. An electric tramway line connecting Rome with the surrounding villages has been opened for traffic. The advantages accruing to the population of the capital will be considerable, inasmuch as it is proposed to build houses for the less favoured classes in the districts near Rome served by the projected line, and thus enable them to live out of the city, where house rents have of late years increased very much owing to the dearth of apartments consequent upon the demolitions ordered by the municipal authorities and the increase of population.

GERMANY.—The old mint at Friedrichstadt is to be restored under the direction of Professor Haupt. A competition is to be held for designs for an Exhibition Hall in Frankfurt, the premiums for which will amount to 36,000 marks.—The new bridge at Dresden—the Augustus Bridge—is to be built from designs by Herr Wilhelm Kreis; the work will be begun on both sides of the Elbe simultaneously, in the autumn of this year.—The town of Kiel has voted the sum of 2,475,000 marks for the erection of a new land.—In the course of the instalment of a new organ in the Church at Pietenen (Canton Bern), a tablet, dating from the XIVth century, and several frescoes of this and later periods, were discovered.—The expenses of the restoration of the Church of St. Francis, at Lausanne, amounted to 14,761 francs less than was estimated; the surplus is to be employed to supply stained glass windows, which are now being designed by Herr Heaton, of Neuchatel.

Miscellaneous.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The business of Messrs. Alexander Boyd & Son, 105, N. Old Broad-street, has been transferred to Messrs. O'Brien Thomas & Co. (range, stove, and sanitary goods merchants), and the original business of Messrs. Boyd & Son will be carried on as a branch of theirs, at 297, Oxford-street, under the management of Mr. R. W. Boyd.—Messrs. Davis & Bennett, sanitary and hot-water engineers, have taken into partnership Mr. Leslie E. Wilton, and the style of the firm will in future be "Davis, Bennett & Co."

HOUSE PROPERTY AND INVESTMENT COMPANY (LIMITED).—The report for the twelve months ended March 31st, 1906, has just been published, 4,504l. for depreciation, and the payment of 2,341l. out of revenue for structural and sanitary repairs, the surplus amounts to 25,527l., giving a total available balance of 27,283l. The net revenue (25,527l.) is 192l. less than that during the preceding period, which was stated to be satisfactory, regard being had to the unusual amount of unimproved property in and around London, of which at present there is no sign of improvement. An interim dividend of 2 per cent. having been already paid, the directors recommend the payment of a final dividend of 2 per cent., making 4 per cent. for the year, leaving 1,950l. to be carried forward, and 500l. to be placed to the reserve which is thus increased to 42,000l.

TOWER BRIDGE.—In giving evidence before the Committee of the House of Commons respecting the Corporation of London (Blackfriars and other Bridges) Bill, Mr. Pellico, City Remembrancer, stated that under clause 64 the Corporation seek for powers to discontinue the

use of the upper part of Tower Bridge. The Tower Bridge Act required that provision should be made in that form for crossing the bridge when the bascules were lifted, but as a matter of fact the upper bridge is not used on those occasions, since foot-passengers prefer to walk until the roadway is lowered. The Committee found the preamble of the Bill proved, upon the understanding that the upper footway of the bridge will be kept in working order so that it may be availed of in the event of any temporary failure of the machinery which operates the lower roadway.

QUEEN VICTORIA MEMORIAL.—In the House of Commons, on the 9th inst., Sir W. Collins, asked the First Commissioner of Works what was the nature of the building operations which were now being carried on at Primrose-hill; whether the buildings to be erected were of a permanent or temporary character; and if he would undertake that the buildings in question should be so designed as not to interfere with the picturesque character of the neighbourhood.—Mr. Harcourt: About one-fifth of an acre has been raised off for a studio for Mr. Brook for his work on the Queen Victoria memorial; the temporary building will be removed when the work is completed. From my knowledge of the elevation I am satisfied that it is not likely to interfere with the surrounding scenery.

ST. LOUIS EXHIBITION.—The report of the Royal Commission which has just been issued contains a report, written by the secretary, Colonel Sir C. M. Watson, upon the transportation and installation of the collective exhibits of British Industries, and a description by Professor L. F. Vernon-Harcourt, British juror for Civil Engineering and Public Works, of the civil engineering exhibits which consisted mainly of models of maritime dock, navigation, and irrigation works, with some exemplars of military architectural engineering works. Mr. H. S. Cunyngame, C.B., furnishes the report of the committee for mines and metallurgy, and Sir Boverton Redwood one upon chemical industries. The United States Government Bureau of Standards bought the complete plant of the exhibited apparatus for the liquefaction of hydrogen.

TRAMWAY AND RAILWAY BILLS IN PARLIAMENT.—The House of Commons Committee, of which Sir Lewis Melver is chairman, gave their decision last week upon the London County Council (Tramways and Improvements) and the Middlesex County Council (Tramways) Bills. The Committee found the preamble of the former Bill proved except in so far as it relates to the proposed tramway along Edgware-road from Marble Arch to Cricklewood. They have amended the London County Council's Bill by providing that the terminus of the tramway on Victoria-embankment must be at a point opposite John Carpenter-street pending the widening of Blackfriars Bridge, and that the Council shall widen the roadway of Westminster Bridge by throwing into it 2 ft. of the footway on each side before they carry the tramway over the bridge. They have, moreover, reduced from seven to five years the period for the construction of the over-bridge tramways, in order that the term may synchronise with that taken by the Corporation of the City for the widening of Blackfriars Bridge. As regards the North-East London Railway Bill, the Select Committee of the House of Commons on Unopposed Bills, Mr. Emmott being the chair, have ordered to be reported for third reading a measure for conferring further powers in respect of the proposed construction of a railway from the Monument to Waltham Abbey. Sir Douglas Fox is engineer to the company, who seek to acquire additional land for a sub-station at Gresham House and to provide more rolling-stock in order to increase the service from a three to a two minutes' service, and to raise an additional capital of 333,000l. for those purposes. The Metropolitan District Railway Bill was passed through the Committee stage on May 8 by the House of Commons Private Bill Committee, presided over by Sir G. Doughty. The Bill relates to certain minor works and the construction of a subway from South Kensington Station, giving access to the Albert Hall. The Albert Hall Commissioners agreed, through their counsel, to the insertion in the Bill of a clause safeguarding their interests in respect of the subway.

STATUE OF THE LATE MR. W. E. H. LECKY, TRINITY COLLEGE, DUBLIN.—The statue erected to the memory of the late Mr. W. E. H. Lecky by the graduates of Trinity College and other Honorary degrees unveiled on the 10th inst. by the Right Honourable Lord Rathmore. The commission for the work was given to Mr. W. Goscombe John, A.R.A., and the statue has been placed in the open space between the library and the examination hall. Cast in bronze, it stands on a pedestal of Irish limestone. It is more than life-size, and represents Mr. Lecky seated in an easy attitude, an open book lying on his knees, and his left arm resting on the arm of the chair.

PROPOSED COAST PROTECTION WORKS, BOURNEMOUTH.—The Bournemouth County Borough Council having made application for sanction to borrow 18,000l. for the purpose of constructing an undercliff drive and works of

cliff preservation and protection between the Bournemouth Pier and Myrick-road, and 6,100 ft. for the purchase of certain properties known as "Elmhurst" and "Leyton Mount," for the purpose of a museum, etc., Mr. P. M. Crosthwaite, M.Inst.C.E., held, on behalf of the Local Government Board, an inquiry into the subject matter of such application at the Council Chamber on the 3rd inst. Mr. F. W. Lacey, M.Inst.C.E., the Borough Surveyor of Bournemouth, stated that during the seventeen years he had held his appointment he had watched and studied the condition of the cliffs and had found that they were wearing away through atmospheric influences. He described the scheme in question, submitting that there would not be any interference with the full enjoyment of recreation on the sands or with bathing, and the proposed drive would be well sheltered, being protected from the north winds which generally prevailed. In ordinary circumstances there would not be less than 50 ft. of sand between the sea and the drive, and it was only occasionally that the sea got as far as the foot of the cliffs. The area to be taken up by the drive would be on soft sand. It was proposed that the drive should be 35 ft. wide, and the promenade 20 ft. wide on the seaward side, with an elevation of 10 ft. above mean water mark. The toe of the wall would go down about 2 ft. below water mark, and the level would be of sloping character, two in one, with a flight of steps if required.

GLASGOW SCHOOL OF ARCHITECTURE.—An exhibition of drawings by students who attend at the School of Art and the Technical College the classes that jointly prepare for the diploma and certificate of the Glasgow School of Architecture will be on public view for a few days in the Exhibition Hall of the Technical College. The work comprises original designs for buildings, studies of classic examples pre-Christian and mediæval, measurements and sketches of actual examples—both local and as far afield as Oxford—and problems in constructional design. In all, over a thousand drawings are hung. The prizes awarded have been made by a jury comprised of Mr. Hippolyte J. Blanc, R.S.A.; Mr. T. L. Watson, F.R.I.B.A., one of the College Governors; Mr. David Barclay, F.R.I.B.A.; Mr. James Lindsay, A.R.I.B.A., representing the Glasgow Institute of Architects and the professors of the School and College. The maintenance scholarship of 200 has been gained for the second time by Edward G. Wylie, a day studentship of 150 falls to Wm. Jas. Anderson, travelling scholarships of 100 to William Lindsay and W. Alexander Robb, and the Glasgow Institute of Architects' prize to Thos. C. C. Mackie.—*Glasgow Herald.*

LONDON SQUARES AND ENCLOSURES BILL.—In the House of Lords on Tuesday, on the order for the second reading of this Bill, the Earl of Wemyss moved that the second reading of the Bill, which, he said, embodied a very dangerous and important principle, be postponed for a week. The Bill was proposed by the London County Council to prohibit or restrict the erection of buildings or structures on certain lands in the Administrative County of London, and, as far as he could make out, there was no compensation or purchase proposed. That was a very dangerous principle. The Earl of Onslow mentioned that this Bill was before the House last Session, when it was thrown out by the Committee to whom it was referred. It had been put down for second reading on several occasions, and it was postponed from time to time, so that the noble earl had had ample opportunity of taking objection to it. He would venture to point out that it was not usual to challenge a Bill of this kind on the motion for the second reading. There would be ample opportunities for doing this at subsequent stages. The Earl of Wemyss said he should call attention to the Bill later on, and, meantime, he should strongly advise their lordships to look carefully into the far-reaching principle embodied in it. The motion for postponement was not pressed, and the Bill was read a second time.

Legal.

DISTRICT COUNCIL'S REJECTED AWARD.

The case of the King v. The Colwyn Bay Urban District Council (*ex parte* Ward) came before the Divisional Court of King's Bench, composed of Justices Darling and Chunnell, on the 12th inst. Mr. Macnorrhan, K.C. (with him Mr. C. C. Hutchinson), said he had to show cause against a rule for a mandamus compelling the Council to show cause why they should not take up an award which had been made in the dispute between them and Mrs. Ward. Under an Act of 1902 the Colwyn Bay authority had power to construct certain promenades and similar works in their district, and it was provided that if in doing so any damage was done to property they should pay for it. The Council, in pursuance of their powers, altered the level of an existing street, and, it was alleged, thereby injuriously affected access to the land of Mrs. Ward, and in other ways injured her property. She made a claim for compensation amounting to 3000, and

arbitrators were appointed on each side. They disagreed, and an arbitrator called in under the Public Health Act. He had made his award, and the Council refused to take it up. The learned counsel argued that, though they would have been compelled to take it up had these proceedings been under the Lands Clauses Act, there was nothing to compel them to do so under the Public Health Act.

Mr. P. E. Smith, on behalf of the applicant, argued that the arbitration was under the Lands Clauses Act. He said that what was done was that the level of the road in front of Mrs. Ward's house was raised. It was a main work and not a subsidiary work, and therefore it came under the Lands Clauses Act. Their lordships held that there was nothing inconsistent with the Colwyn Bay Act to say that the Lands Clauses Act applied in connexion with work carried out under it, and therefore made the rule absolute for the Council to take up the award with costs.

Order accordingly.

ACTION AGAINST BUILDERS BY SUB-CONTRACTORS.

THE hearing of the case of Geary, Walker, & Co., Ltd. v. Lawrence & Son concluded in the Court of Appeal before Lords Justices Vaughan Williams, Stirling, and Moulton on the 11th inst. on the defendants' appeal from a judgment of Mr. Justice Kennedy, sitting without a jury in the King's Bench Division.

Mr. G. A. Scott appeared for the appellants, and Mr. J. Eldon Bankes, K.C., and Mr. Lewis Thomas for the respondents.

Mr. Scott, in opening the case, said the action was brought by the plaintiffs, wood flooring contractors, of No. 11, Queen Victoria-street, E.C., against the defendants, Messrs. Walter Lawrence & Son, of Waltham Cross, a firm of builders, to recover a balance alleged to be due under a building contract, the defendants being the main contractors and the plaintiffs the sub-contractors. The question the learned judges had to decide was, whether on May 12, 1904, the sub-contractors were entitled to sue the main contractors for the balance of their account. On that date the plaintiffs issued their writ claiming 106l. 2s. The case for the defendants was that the plaintiffs had commenced their action prematurely. Defendants said that they were entitled to hold the balance until all the work was approved by the architect.

Lord Justice Moulton said he understood the point was, whether the action was ripe at the date of issuing the writ.

Mr. Scott said that that was so. Although the amount sued for was comparatively small, the case raised a question of great importance, with reference to building contracts. The learned counsel went on to state that the defendants on January 23, 1902, entered into a contract with the Edmonton Urban District Council to erect swimming baths, a Council Chamber, Council offices, etc., the contract price working out at something between 30,000, and 40,000. Defendants agreed with the plaintiffs to do the wood flooring, etc., for 1,058l. Of this 952l. had been paid, and the action was brought to recover the balance. The contract between the plaintiffs and the defendants was dated March 11, 1903.

Under that contract the plaintiffs and sub-contractors, agreed that the work should be done and the materials supplied to the satisfaction of the architect, Mr. W. G. Scott, and that they would maintain it for a certain period. Defendants further said that under their own contract with the Edmonton authority they only received 80 per cent. of the amount due for work done until a certain period, and that the plaintiffs were subject to the same terms as to money being retained as security for the work being properly done. Mr. Justice Kennedy held that the retention clause did not apply to the plaintiffs, and gave judgment for them for 88l. 19s. The learned counsel submitted that at the time the plaintiffs issued their writ the money was not due under the contract and that therefore the decision of Mr. Justice Kennedy was wrong. The material clauses in the main contract between the Edmonton authority and the defendants were as follows:—Clause 20: "All specialists, merchants, tradesmen or other excoiting work or supplying any goods for which prime-cost prices or provisional sums are included in the specification, who may at any time be nominated, selected, or approved by the architect, are hereby declared to be sub-contractors employed by the contractor; but no such sub-contractor shall be employed upon other work against whom the contractor shall make what the architect considers reasonable objection, or who will not enter into a contract with the contractor upon terms and conditions consistent with those in this contract and securing the due performance and maintenance of the work supplied or executed by such sub-contractor and indemnifying the contractor against any claims arising out of the misuse by the sub-contractor or his workmen of any scaffold erected or plant employed by the contractor, or that may be made against the contractor in consequence of any act, omission,

or default of the sub-contractor, his servants, or agents, and against any liability under the Workmen's Compensation Act, 1897, or any amendment thereof." Clause 30 ran:—"The contractor shall be entitled under the certificate to be issued by the architect to the contractor and within fourteen days of the date of each certificate, to payment by the employer from time to time by instalments when in the opinion of the architect work to the value of 5000, or less (the reasonable discretion of the architect) has been executed in accordance with the contract, at the rate of 80 per cent. of the value of work so executed in the building until the balance retained in hand amounts to the sum of 2,0000, after which time the instalments shall be up to the full value of the work subsequently executed. The contractor shall be entitled under the certificate to be issued by the architect to receive payment of 1,5000, being a part of the said sum of 2,0000, when the works are practically completed and in like manner to payment of a further sum of 3000 within a further period of three months or as soon after the expiration of such period of three months as the works shall have been finally completed and in like manner to payment of the balance of 2000 within a period of twelve months from final completion and after all defects made good according to the true intent and meaning of the contract. The architect shall issue his certificate in accordance with this clause. No certificate of the architect shall be considered conclusive evidence as to the sufficiency of any work or materials to which it relates nor shall it relieve the contractor from his liability to make good all defects as provided by this agreement. The contractor when applying for a certificate shall if required, as far as practicable, furnish to the architect an approximate statement of the work executed, based on the original estimate. The contract of March 16, 1903, was as follows:—

"We, the undersigned, Messrs. Geary, Walker, & Co., Ltd., of 11, Queen Victoria-street, E.C., have agreed to consider and execute all mosaic and other work at the Town Hall, Baths and Council Chamber Buildings, Lower Edmonton, for Walter Lawrence & Son, of Canal Works, Waltham Cross, and to the architect's entire satisfaction, orders for which have been or will be sent us from time to time by the said Walter Lawrence & Son, the work to be carried out and when required by them, we further agree that no claim shall be made by us for any extras of any kind, unless the same have been ordered in writing by the said Walter Lawrence & Son, and that we will maintain in proper working order the whole of the work executed by us until the expiration of the time for which the said Walter Lawrence & Son are bound by their employment under their contract dated January 23, 1902, and we will also indemnify them against any loss upon any question which may arise under clause 20 of the conditions of the contract above mentioned, and the terms of payment for the work done in pursuance of the contract above mentioned set forth in clause 30 of the said conditions of contract above referred to; and in fact we are willing and hereby agree to be bound in every respect by the whole of the terms, clauses, and conditions as set forth in the contract dated January 23, 1902."

Mr. Eldon Bankes and Mr. Lewis Thomas having supported the judgment of Mr. Justice Kennedy.

Lord Justice Vaughan Williams, in giving judgment, said that, having regard to the documentary evidence, the Court must assume that the parties knew the course of business qualified to the extent that Mr. Walker in his evidence stated that he did not know the details of the retention scheme in the original contract between the defendants and the Edmonton authority. With that exception they must assume that both parties knew the course of business and that certificates were being given. It seemed to his lordship that the intervening certificates of the architect did not on the face of them say that any particular work was included in the amount certified for, and in these circumstances the onus lay on the plaintiffs to show that the certificates did in fact include the work in question. He thought the proper way to construe the documents of March 16, 1903, was to read the contract by *opposita materia* clauses 20 and 30 of the main contract between the contractors and the local authority. He thought the plaintiffs had failed to make out that they were entitled at the time they brought the action to succeed in recovering the balance of their account, and on these grounds he was of opinion that the judgment of Mr. Justice Kennedy should be set aside. Lord Justice Stirling said he always regretted to find himself differing from Mr. Justice Kennedy, but he came to the conclusion that his judgment could not be upheld. He agreed that *prima facie* the covering letter of March 16, 1903, ought to be treated as introducing a new term into the contract which was accepted by the defendants by their making no objection; but as neither side desired in any way to rely upon the letter, it was far better, he thought, that their judgment should not rest upon that, and he was quite content to proceed upon the formal contract of March 16, 1903. The question turned upon these

words: "And the terms of payment for the work in question shall be exactly the same as those set forth in clause 30 of the said conditions of contract above mentioned." It had been said that it was impossible to give effect to that stipulation. His lordship was not persuaded of that. What were the terms of payment as they appeared from clause 30 of the contract? First, that the contractor, meaning there the main contractor, was to be entitled under the certificates to be issued by the architect to him to payment by the employer by instalments at the rate of 80 per cent. of the value of work so executed in the building until the balance retained in hand amounted to 2,000*l.*, after which time the instalments were to be up to the full value of the work subsequently executed. The contract of which clause 30 was a part was a contract to erect buildings at a cost, speaking in round figures, about 28,000*l.*, and 2,000*l.* was to be the fund which was to be kept in hand by the employer by means of deductions from the amounts which appeared by the architect's certificates to be due. The sub-contract with which they had to deal was in comparison a very small contract. The whole sum which was to be received in payment was somewhere about 1,000*l.*, and obviously therefore literally the 2,000*l.* (if that was read as being part of the contract) would make it impossible to work; but what the document of March 16, 1903, said was not that clause 30 was to be in its very language, but that the terms of payment for the work were to be exactly the same as in that document. One of the terms of clause 30 was that a sum of 2,000*l.* of 28,000*l.* was to be retained. It seemed to his lordship that the exactly similar term would be that a like proportion of the 1,000*l.* should be kept in hand, and that the sub-contract should from time to time receive from the main contractor 80 per cent. up to the time when the sum bearing the same proportion as the 2,000*l.* bore to the 28,000*l.* had been accumulated, and after the full payment. Then that being the term of the payment, the instalments in the clause contained no provision as to how the 2,000*l.* which was to be kept in hand was to be dealt with. It provided that the contractor should be entitled, under the certificate to be issued by the architect, to receive a payment of 1,500*l.*, being a part of the 2,000*l.* when the works were practically completed, and in like manner to payments of a further sum of 300*l.* within a further period of three months or as soon after the expiration of such period of three months as the works had been finally completed, and in like manner to payment of the balance of 200*l.*, within the period of twelve months from final completion, and all defects were made good according to the true intent and meaning thereof. Having got over the difficulty as to the 2,000*l.*, it seemed to him that there was no difficulty in saying that the stipulation that the terms for the payment of the retention money should be dealt with in a similar manner, that the fund kept in hand should be divided into three parts, one of which bore the same proportion to the total retention money as the 1,500*l.* did to the 2,000*l.*; then the second part which would be dealt with would be a sum which bore the same proportion to the total amount of the retention money as the 1,500*l.* bore to the 2,000*l.*, and then there would be the ultimate balance a retained. So far it seemed to him that effect could be given to the contract, but then there followed the stipulation which had created a considerable amount of difficulty to him, because there was a positive stipulation that the architect should issue his certificate in accordance with that clause. Then, prior to the contract of March 16, 1903, the architect had positively declined to issue certificates to any sub-contractor under the main contract, and it did seem to his lordship a difficulty which had to be met as to what the effect of that was on the stipulation. He thought that both parties must have been aware of the course of business. In fact Mr. Walker, who was called, really admitted that, although he did not admit that he knew the details as to the distribution of the retention money. It seemed to him that the proper way to deal with the clause in that case was to treat them as being satisfied to deal with the certificates in accordance with which payments were to be made as being those which were to be issued by the architect to the main contractor, and not to treat this clause as introducing a separate bargain for separate certificates between the main contractor and the sub-contractor. That being so, if that was the true construction of the clause, it seemed to him that the plaintiffs failed to make out that they were entitled at the time when they brought the action to succeed in recovering the balance. That appeared to his lordship to be the case, and that was the result of dealing between the parties subsequently. The sub-contractor never made any objection to the deductions in fact being made at the time. They did not amount, it was true, excepting in the first place, to 20 per cent.; but 10 per cent. was always retained. Both parties were perfectly satisfied with that, and by course it was competent for the main contractor to waive his strict rights. No difficulty arose until the final application was made for the payment of the balance, the delay in which was caused, as it

seemed to him, by the delay on the part of the architect in giving to the main contractor a certificate which entitled him to any portion of the 2,000*l.* which was outstanding. He thought it was plain, therefore, that the plaintiffs failed to make out their case, that they were entitled to payment of the balance at the time they brought the action. On these grounds he was of opinion that the judgment of Mr. Justice Kennedy should be reversed.

Lord Justice Moulton gave judgment to the same effect, and the appeal was accordingly allowed, with costs, both in that Court and in the Court below.

THE ACTION AGAINST THE WARBINGTON URBAN DISTRICT COUNCIL.

MR. JUSTICE WALTON, in the King's Bench Division, on the 14th inst., concluded the further hearing of the case of *Foster v. the Urban District Council of Warblington*, in order to assess the damages the plaintiff was entitled to from the defendants.

The plaintiff, Mr. J. D. Foster, the owner of an oyster business at Ensworth, near Chichester, brought the action for an injunction to restrain the defendants from placing or maintaining their sewer outfalls near the plaintiff's oyster storage beds on the foreshore of Ensworth Creek, and from delivering sewage on the foreshore in the neighbourhood of the beds so as to contaminate the same and to render the oysters unsafe for human food. The plaintiff also claimed damages *ltd* at 10,000*l.* for loss and injury to his business caused by the alleged nuisance. The defendants denied liability on various grounds, but Mr. Justice Walton held that the defendants had no prescriptive right to discharge sewage into the sea so as to contaminate the oysters in private oyster beds and gave judgment for the plaintiff for damages to be assessed. From this decision the defendants appealed, but the Court of Appeal affirmed the judgment of Mr. Justice Walton. The case now came on again before his lordship in order to ascertain the damages to which the plaintiff was entitled.

In the result his lordship awarded the plaintiff 85*l.* damages, the plaintiff to have the costs of the former hearing, but each party to bear their own costs of the present hearing.

Mr. W. Willis and Mr. J. G. Pease appeared for the plaintiff; and Mr. Hohler and Mr. Pitman for the defendants.

THE LONDON BUILDING ACT.

MESSRS. HENRY SMITH & SON, builders, of South Kensington, were summoned, at the Thames Police court recently, for contravening the Building Act by erecting a large wooden screen at the rear of houses in Vauxhall-bridge-road without the permission of the London County Council.

The screen was erected, at a cost of 120*l.*, with a view of preserving the right of ancient lights. The owners would not allow the builders to remove the screen after notice from the District Surveyor, and counsel on their behalf stated that the application and plans for approval were twenty-four days at the London County Council offices before a reply was sent. This delay occasioned expense, time being an element of importance.

Mr. Paul Taylor supposed that the London County Council had such an enormous amount of work that a reply could not be expected sooner. There was such a large amount of machinery to be set in motion—he would not say red tape.

On behalf of the defendants it was said that they were ready to accept any reasonable suggestion, but any sort of structure was objected to, the real reason being that the London County Council were intending shortly to apply to Parliament for more stringent powers over light and air spaces.

Mr. Large, the District Surveyor, said that a previous screen erected was blown down. He did not think anything of this sort would be permitted.

Mr. Paul Taylor made an order for the newly-erected screen to be removed within four weeks.—*Morning Advertiser.*

Patents of the Week.

APPLICATIONS PUBLISHED.*

10,952 of 1905.—E. RUCKGAUVER: *Method and Means of Shifting or Removing and Turning Buildings.*

This relates to a method of shifting entire buildings, which consists in mounting in the base or foundation, and in front of the same, a supporting frame or stationary grating chiefly composed of a series of beams at right angles to the line of advance, inserting into the walls a movable upper frame, chiefly composed of a series of longitudinal beams arranged and shaped like the runners of a sledge, and of a main transverse

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

beam placed across the rear ends of the longitudinal beams, mounting behind the building a propelling mechanism adapted to press uniformly on numerous points of the width of the upper frame, detaching the building from the masonry foundation, operating the said propelling mechanism up to the end of its stroke, readjusting the propelling mechanism again operating, and re-adjusting the same alternately, and periodically extending the stationary grating in proportion as the work advances.

11,125 of 1905.—G. J. WILLIAMS: *Casement Stays or Fasteners and Opening Closing Apparatus.*

This relates to casement stays or fasteners, and consists essentially in the employment in combination of a cylindrical bracket secured to the casement, an operating screw carrying a ball located in said bracket and operating in a horizontal slot therein, a vertically pivoted nut on the casement frame, and a knob for rotating the aforesaid screw.

12,502 of 1905.—J. S. PULLAN and W. H. MANN: *Machines for Moulding Facing Tiles.*

This relates to a power machine for moulding facing tiles comprising in combination a press frame provided with a driven crank shaft adapted to operate an upper ram through the medium of toggle levers or cams, a table formed with a mould beneath the upper ram, a reciprocating feed-box on the table adapted to deliver the powdered substance into the mould, a lower ram, consisting of two elastically-connected members adapted to slide vertically on fixed guides, and carried on a strong, spiral spring located in a base box on the bed of the press frame, internal spindles situated within the lower ram adapted to form undercut or depressions in the tile, and a double-headed rocking lever in connexion with the lower ram, operated, through the medium of a two-part elastically-operated rod, by a cam on the crank shaft of the press.

7,752 of 1905.—A. B. C. DASKS: *Hermetically Sealed Doors of Cylinders and Chambers used for Creosoting or Vulcanising Vacuum Pans and Brick Hardening Chambers for High-Pressure, and the like purposes.*

This relates to doors which are sealed and secured by screw applied radiating arms engaging with slots or staples in a cylinder or chamber, and is characterised by a wrought and dished door having an encircling ring, the shoulders of which are provided with a recess containing soft metal, or other suitable packing, in combination with cam-shaped ends to the radial arms, which operate directly upon the ring, and thereby force the packing on to the chisel-edged projection on the shoulder of the cylinder.

8,285 of 1905.—DR. B. BRUHN: *A Process for the Preliminary Treatment of Blast Furnace Slag for the Production of Cementitious Material.*

This relates to a process for the treatment of blast furnace slags or other silicate mixtures for the manufacture of cementitious materials, in which the silicate mixtures are used in a molten state immediately after their burning or melting process with a small per cent. of alkalis or alkaline salts, and are then granulated and ground to a proper grade.

14,576 of 1905.—E. J. PROPPER and F. BACHSCHMID: *Blocks or Tiles for Covering Floors, Walls and Ceilings.*

This relates to blocks for covering floors, walls and ceilings, and consists of cross-shaped wooden tablets, the arms of which are rectangular, and have their angles or inner corners formed with rib-shaped projections, and the outer corners or edges of their end faces formed with corresponding grooves.

16,863 of 1905.—W. T. HARRISON: *Flooring Tiles and Surfaces.*

This relates to an elastic-faced flooring tile having an earthenware or hard grooved base and an applied rubber face consisting of two layers of varying elasticity, the base rubber being harder than the treading face so as to obtain a better effect.

17,015 of 1905.—H. OSBORNE: *Operation Devices for Hinged Fanlights or Windows.*

This relates to an operating device for hinged fanlights or windows, and consists of a transom fitted of the kind comprising a worm, means for pivoting the worm, and a worm wheel having on its shaft a lever for operative engagement with the transom, the provision of coil springs encircling the worm wheel shaft at opposite sides of the worm wheel, having the extremities of each engaged with the supporting fixture, and having their free extremities arranged in opposition, and a bar engaged with said free ends of the springs, and intermediately engaging the toothed edge of the worm wheel.

17,057 of 1905.—J. A. SHEPHERD: *Water-proofing Composition.*

This relates to a chemical proofing apparatus for treating fabrics to render them water-proof, made up of jelly soap, gum, tragacanth, wax and water.

PATENTS.—C continued on page 570.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xvi.; Auction Sales, xxvi.

Certain conditions, beyond those given in the following information, are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

Competition.

* JULY 4.—**Warblington**.—SEWERAGE WORK.—The Warblington U.D.C. invite schemes (with plans, specifications, and estimates) for main sewerage and sewage-disposal works for the parish of Warblington (including the town of Emsworth, Hants). Premium of 100*l.* is offered for the scheme, and estimate selected as first, if approved by the Local Government Board. In the event of the scheme being carried out the premium will form part of the engineer's commission: 50*l.* is also offered for the scheme selected as second. Schemes, plans, specifications, and estimates to be addressed to the Clerk, Council Offices, Queen-street, Emsworth, not later than July 4.

Contracts.

BUILDINGS.

MAY 18.—**Manchester**.—OFFICE BUILDING.—A new office building and alterations to adjoining property in Major-street, Manchester. Name and address to Messrs. J. H. Burton & J. A. Percival, architects and surveyors, 150A, Stamford-street, Ashton-under-Lyne, not later than May 18.

MAY 18.—**Newport**.—CLASS ROOM.—For erection of parish room, Newport, Sillon. Apply to Mr. Oswell, architect, Dane-chambers, Shrewsbury, not later than May 18. Quantities will be supplied on payment of 1*l.* Plans will be deposited with the Rev. W. Hedges, Newport Rectory.

MAY 19.—**Nottingham**.—WALL.—Nottingham Improvement Committee invite tenders for the erection of a brick retaining wall at the junction of London-road and Station-street. Drawings may be seen, and copy of the specification, bill of quantities, and form of tender may be obtained, on applying to Mr. Arthur Brown, M.Inst.C.E., City Engineer, Guildhall, on payment of a deposit of 1*l.* Sealed tenders, endorsed "Wall, Junction of London-road and Station-street," are to be delivered to Mr. Samuel G. Johnson, Town Clerk, Guildhall, Nottingham, on or before May 19.

MAY 19.—**Warley**.—SCHOOL.—Oldbury Urban District Education Committee invite tender for the erection of an infant school at Castle-road, Warley, to accommodate about 250 children. Particulars can be obtained on payment of 1*l.* deposit. Applications to be sent in on or before May 19. Mr. Sidney Vernon, Secretary, Public Buildings, Oldbury.

MAY 20.—**Ballynacash**.—MANSE.—The erection of a manse for the R.P. Church, Ballynacash, Killybegs. Plans and specifications may be had at office of Mr. James Scott, B.E., civil engineer and architect, Ocean-buildings, Belfast. Sealed tenders to be lodged not later than May 20.

* MAY 20.—**Crews**.—SCHOOLS.—The Crews Education Committee invite tenders for schools of Earle-street for 1,350 children. Names to be sent, with deposit of 2*l.*, to Mr. H. D. Struthers, Director of Education, Municipal Buildings, Crews, before May 20. Quantities and other information will be supplied by the architect to those tendering.

MAY 21.—**Batley**.—HOUSES.—The erection of two houses and boundary walls, in Deighton-lane, Batley. Plans and specifications may be seen, and bills of quantities obtained, at office of Mr. John H. Brovley, architect, Commercial-street, Batley, from Monday, May 14 to 21, on which latter date sealed and endorsed tenders are to be sent in.

MAY 21.—**Byfleet**.—HOUSE AND PREMISES.—For the erection of a house and premises to be built in Church-road, Byfleet, Surrey, for Mr. Arthur Sharp. The plans, elevations, sections, details, and specifications can be seen at office of Mr. D. G. Andrews, architect, Bridge-road, East Molesey. Tenders to be sent by post or delivered by 8 p.m., May 21, marked "Tender for House."

MAY 21.—**Fochabers**.—DWELLING-HOUSE.—Mason, carpenter, slater, plaster, plumber, and painter work of new dwelling-house and offices, to be erected at Fochabers, Gordon-Richmond Estates. Plans and specifications may be seen at the Estates office, Fochabers, and tenders will be received by Mr. D. J. Cunningham, Factor, up to 2 o'clock, on May 21.

MAY 21.—**Hinckley**.—SCHOOLS.—The erection of science buildings at the grammar school, Hinckley, for the Governors of the Schools. Conditions of contract, quantities, and form of tender may be obtained, and plans inspected, upon application to the architects, Messrs. Barrowcliff & Alcock, Town Hall-chambers, Loughborough, on payment of a sum of 1*l.* Sealed tenders, upon the forms supplied, to be delivered at office of Messrs. S. & S. H. Pilgrim, Solicitors to the Governors, Hinckley, not later than 11 a.m., May 21, endorsed, "Grammar School Extension." The successful contractor will be required to find two securities in one sum amounting to 20 per cent. of the total amount of the contract.

MAY 21.—**Raila**.—VILLA.—Mason, carpenter, slater, plumber, plasterer, painter, and glazier works of new villa at Raila, near Newtonmore. Plans and specifications may be seen with the architect, Mr. Alexander Mackenzie, C.E., Ringussie, who will receive offers up to May 21.

MAY 22.—**Halifax**.—REPAIRING ROOF.—The Improvement Committee of the Halifax Corporation invite tenders for repairing roof, etc., at Messrs. Holmes Foundry, Booth Fold. Quantities and forms of tender may be obtained on application to Mr. James Lord, M.Inst.C.E., Borough Engineer, Town Hall, Halifax, upon payment of the sum of 1*l.* Tenders, endorsed "Roof, Booth Fold," must be sent to Mr. Keighley Walton, Town Clerk, not later than 12 o'clock noon on May 22.

MAY 22.—**Newcastle**.—North-Eastern Railway Directors invite tenders for rebuilding of horse stables, Waverley-street, 11411. Plans and specification may be seen, and quantities and further information obtained, upon application to Mr. William Bell, the Company's architect, at York. Duplicate plans may also be seen upon application to the Clerk of Works' office, Barrington Station, Hull. Quantities supplied on persons applying for tenders, and pricing for the whole of the works. Sealed tenders marked "Stables, Waverley-street, Hull," to be sent to the Secretary, at York, not later than noon on May 22.

MAY 22.—**Newcastle**.—CONVERTING BUILDINGS INTO OFFICES.—North-Eastern Railway Directors invite tenders for converting old business premises at New Bridge-street, Newcastle, into offices and stores. Plans and specification may be seen, and further information obtained, upon application to Mr. William Bell, the Company's architect, Central Station, Newcastle-on-Tyne. Copies will be required to take their own quantities. Sealed tenders, marked "Offices, New Bridge-street, Newcastle," to be sent to the Secretary, at York, not later than noon on May 22.

MAY 23.—**Aquhorsk**.—RESTORATION OF DWELLING HOUSE.—The mason, carpenter, slater, and plaster works of restoration of dwelling-house at Aquhorsk, Kinellar, Glascoford Estate, Mr. William Ogg, ground officer, Glascoford, will show plans and specifications, and Messrs. Chalmers, advocates, 28, Golden-square, Aberdeen, will receive offers up to May 23.

MAY 23.—**Cardiff**.—PUMPING STATION.—Cardiff Corporation invite tenders for the erection of a pumping station and chimney stacks at Pontard-rhod, for Western District Sewer, Contract No. 7. Plans, specification, and conditions of contract may be seen, and bills of quantities obtained, at the office of Mr. W. Harpur, M.Inst.C.E., City Engineer, Cardiff, upon deposit of 3*l.* Tenders, on the prescribed form, and accompanied by the bills of quantities, and under separate cover, sealed and endorsed "Tender for Pumping Station, Penarth-road," to be delivered at office of Mr. J. L. Wheatley, Town Clerk, Town Hall, Cardiff, on or before May 23.

MAY 23.—**Carlisle**.—WESLEYAN CHURCH.—The erection of proposed new Wesleyan church in Lowther-street, Carlisle. Names to Messrs. Johnston Bros., architects and surveyors, 10, Lowther-street, Carlisle, before May 23, together with a deposit of 10*s.* 6*d.*

MAY 23.—**vedham**.—FACTORY.—For erection of a saw factory in Ervesham for Messrs. T. W. Beach & Sons, Ltd. Names and addresses to the architect, Mr. F. Foster, Masonic-buildings, Coventry, on or before May 23.

MAY 23.—**Kilcoleman**.—RESLATING ROOF.—For reslating the roof and executing other improvements at Kilcoleman Desert, Co. Cork, for Capt. J. E. Longfield, J.P., in accordance with plans and specification prepared by Messrs. W. H. Hill & Son, architects, 28, South-mall, Cork, with whom tenders are to be lodged on or before May 23.

MAY 23.—**Larne**.—SCHOOL.—Building additions and alterations to the Larne Grammar School. Plans, specification, and conditions of contract can be seen at office of Mr. William J. Fennell, architect, 2, Wellington-place, Belfast. Bills of quantities can be obtained from Mr. W. J. M. Carthy, surveyor, Scottish Provident-buildings, Belfast. Tenders to be sent to the Rev. J. Kennedy, Larne, on or before May 23.

MAY 23.—**Mirfield**.—HOUSES AND SHOPS.—The erection of two houses and shops at Lezard Bridge, Mirfield. The drawings and specifications may be seen, and bills of quantities obtained, at Dewsbury offices of Messrs. John Kirk & Sons, architects, Huddersfield and Dewsbury, from May 16 to May 23, on which latter day tenders are to be delivered at Dewsbury before 3 o'clock p.m., free of charge.

MAY 23.—**Netherton**.—ADDITIONS TO HOUSE.—Carpenter, slater, and plaster works of additions to dwelling-house at Netherton (Mrs. Fensholt, Glascoford Estate). The plans and specifications may be seen in the hands of Mr. William Ogg, ground officer. Offers will be received by Messrs. Chalmers, advocates, 18, Gukien-square, Aberdeen, up to May 23.

MAY 23.—**Strata Florida**.—HOUSE.—The erection of a house at Fair-rhos, near Strata Florida, for Miss Thomas, M.Inst.C.E. Plans and specification may be seen on application to Capt. J. Williams, Pretoria House, Pontrhydfryd, or to the architect, Tenders should be sealed and enclosed and delivered to the architect, Mr. G. T. Bassett, A.R.I.B.A., architect and surveyor, Aberystwyth, by May 23.

* MAY 24.—**Maldon**.—SCHOOL, ETC.—The Essex Education Committee invite tenders for new secondary school and pupil teachers' centre shortly to be

erected at Maldon. Names to the architect, Mr. P. M. Beaumont, High-street, Maldon, on or before May 24.

MAY 24.—**Slaithwaite**.—RESIDENCE, WAREHOUSE, ETC.—The erection of a residence, warehouse, etc., in Union-street, Slaithwaite. Plans may be seen, and quantities obtained, at office of Mr. Arthur Shaw, architect, Golear, from May 17 to May 24, on which latter date sealed and endorsed tenders must be delivered not later than 6.30 p.m.

MAY 25.—**Livwoodcoed**.—HOUSES.—Tenders are invited for the erection of fourteen houses in Thwaite-street and Brewery-street, Barrow-in-Furness, for the Barrow Co-operative Society, Ltd. Bills of quantities may be obtained at the office of the architect, Mr. Henry T. Fowler, A.R.I.B.A., 6, Cornwallis-street, Barrow. Tenders to be forwarded to Mr. James Clarkson, Barrow Co-operative Society, Ltd., Abbey-road, not later than 12 o'clock noon on May 25.

16,249 of 1905.—P. N. HOOPER and E. A. DUCKHAM: Method of Constructing and Laying Under Ground Mains for the Distribution of Electricity.

This relates to a method of constructing and laying under ground mains for the distribution of electricity, and consists in the conductor or conductors of copper, aluminium or other suitable metal, being supported by insulating rings or bushes in a duct or ducts made of some permanent material such as concrete, ferro-concrete, stoneware, and the like, the insulating material such as bitumen, bituminous compound or other suitable substance, vulcanised or otherwise for its protection, and the exclusion of moisture, being filled to a molten state after the conductor is in place. The whole may be then covered by a guard against mechanical injury by a removable covering or a cover made in situ.

3,960 of 1906.—W. WALLIS and J. WALLIS: Ventilators.

This relates to a ventilator having a central air shaft provided with slots or windows and a partial outer casing, and consists in the formation at the angles of the said outer casing of auxiliary

air shafts of triangular section having openings opposite to each of the said windows.

7,732 of 1905.—P. V. VAUDREY: Means for Electrically Indicating and Recording at a Distance Changes in Level of Liquid in Reservoirs, and for Giving Warning of any Pre-Arranged Maximum or Minimum Level.

This relates to an electrical apparatus for automatically recording or indicating at any distance the variations of level of water in a reservoir and consists of means whereby a wheel in the transmitter part of the apparatus is rotated in harmony and synchronously with the variation of said levels, said rotation causing the intermittent oscillation of a lever bringing into action a reversing commutator so adapted as to change the polarity of the line current, said rotation also setting and then discharging a propelling lever adapted to propel a rolling mass along a movable-inclined plane so as to set in action by the weight of said mass a balanced arm which closes the line circuit.

9,100 of 1905.—G. VERNON: Gully, or like traps.

This relates to a gully or like trap having a removable grid, and consists of a locking device

23,418 of 1905.—A. HERMANN and H. HERZFELDER: Process and Apparatus for the Manufacture of Slabs of Artificial Stone, or the like.

This relates to a process for the production of artificial stone slabs from a mixture of hydraulic cementing materials and filamentous materials in which a woven surface is plunged as deep as possible into the fluid mass, and is there caused to oscillate for the purpose of the uniform distribution of the mass upon the woven surface, and when the woven surface is raised, the material deposited thereon is pressed into a layer and partly deprived of moisture by means of the motion of the woven surface through the mass, and the filaments retain their position in various directions but parallel to the surface of the slab, and the finished slabs possess a uniform consistence and strength in all directions.

358 of 1906.—C. H. R. SCHWARZ: Pile Driving Machine.

This relates to a pile-driving machine with variable gth, provided with a divided front sleeper or outer portions and hinge-jointed to the middle portion, and two front ties, so that by turning back the outer sleeper portions the machine can be used in corners.

formed that the grid may be secured therein by partially turning the latter round by means of a key or other removable instrument.

26, 345 of 1905.—A. J. BOUT (J. J. HAROLD): Piling for Subways, Foundations, Shafts, and Other Structures.

This relates to a piling for subways, foundations, shafts, and other structures, and consists of beam members provided with flanges on opposite sides of one face thereof, planks adapted to engage the channels formed by said flanges, one of the flanges on one beam member being adapted to slide between the flange on another beam member and its plank, a plate at the outer edge of each of said planks extending over the back of the adjoining beam member, the plate being secured to the plank by bolts passing through its beam member.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the office to residents in any part of the United Kingdom at the rate of 10 shillings PER ANNUM, 7 shillings 6 pence for Europe, America, Australia, New Zealand, India, China, Ceylon, &c. Remittances (payable to J. MORGAN) should be addressed to the Publisher of "THE BUILDER," Catherine Street, W.C. SUBSCRIPTIONS IN LONDON and the SUBURBS, by prepaying at the Publishing Office 19s. per annum (53 numbers) or 4s. 9d. per quarter (13 numbers), can ensure receiving "The Builder" by Friday Morning's Post.

TO CORRESPONDENTS.

W. C. B. (there is no positive limit in law as to the angle of light; 45 deg. is a common requirement, but it has no legal force except as a custom). W. H. R. (too late; next week). NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographic manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications. We are compelled to decline pointing out books and giving addresses. Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. The Editor cannot undertake to read and consider articles offered for acceptance unless they are type-written. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

MEETINGS.

The New Vauxhall Bridge.

THE new bridge over the Thames at Vauxhall, which will be formally opened this (Saturday) afternoon by the Chairman of the London County Council, is the outward

and visible sign of a very satisfactory termination to a long series of esthetic criticisms and unæsthetic retorts which, however they may have caused some regrettable excess of temper on both sides at the time, are justified in their results. By dint of fighting for it, we have got a new bridge which, in its own method of structure, revives something of the simple, purpose-like, and unpretending character of the older masonry bridges of the Thames, and is in point of design a worthy successor to old Vauxhall bridge, with a wider roadway and a wider water-way.

The printed Report issued by the County Council gives a brief history of the older Vauxhall bridge, and of the reasons which rendered its removal practically necessary. As a roadway the bridge was said to have become inadequate to the traffic, besides being inconvenient in respect of its heavy gradients. The first of these complaints we believe to have been entirely imaginary in regard to any traffic up to this time existing; we never saw the bridge in the slightest degree over-burdened with traffic; in fact, you might stand for some

time and hardly see anything cross it. In future it may become much more fully occupied, especially as it is now prepared for tramway traffic; but there was little real pretext for the old bridge being condemned as insufficient at the time when its demolition was first mooted. Nor did we ever attach much importance to the arguments of the Thames Conservancy, that the arches were dangerously or inconveniently narrow for the river traffic. The river traffic of the Thames, which since the days of Metropolitan railways and trams, and the extension of the City north and south, has long ceased to be the highway of London it once was, is a very small matter, limited to a few barges going up and down, sometimes with a tug and sometimes only with the tide, and it appears that even a passenger steamboat service on the river cannot be made to pay. A more decisive reason for interfering was found, however, in the unsatisfactory condition of the foundations of the piers. The engineer's statement is that the scour of the river due to the high velocity of the current had tended to expose the foundations of the bridge: a mischief which had been met by depositing material from time to time around the foundations. It is suggested that the velocity of the current had been increased by the removal of old London Bridge in 1831, and of old Westminster bridge about thirty years later. That the removal of old London bridge admitted a much larger body of water up the Thames at flood tide, and was mainly the cause of

the frequent flooding of the Lambeth district, there can be no doubt; but it is urged also that the scour, and consequent injury to the foundations, was due very largely to the obstruction caused by the numerous and thick piers of the bridge. This is a logical consideration, and if it became obviously necessary to take steps to render the piers more secure, it was no doubt well to take the opportunity of reconsidering the whole structure and rebuilding it with wider spans so as to cause less scour. This was a definite reason for action, though we do not believe that the inconvenience either to river traffic or land traffic was, at the time, sufficient in itself to justify the building of a new bridge. It may become so, however, and in view of future possibilities the increase in width and decrease in gradient of the roadway no doubt constitute an important public street improvement.

In regard to the construction of the new bridge, the Engineers' Report states that the total length between abutments is 759 ft. 4 in., the total waterway 699 ft. 4 in. The two central piers are each 15 ft. 8 in. wide, the intermediate ones 14 ft. 8 in., at the level of Trinity high water. The central span is 149 ft. 7 in. wide with a headway of 20 ft. above high water; the intermediate spans 144 ft. 4½ in. with 19 ft. headway, and the shore spans are 130 ft. 5½ in. with 14 ft. 11 in. headway. The width of the bridge between the parapets is 80 ft., the carriage-way 50 ft. wide, and a very noble and spacious bridge-road it makes; the gradients are 1 in 40.75 on the Surrey side and 1 in

37.29 on the Middlesex side. Some further particulars we may quote direct from the Report:—

"The superstructure of the bridge is constructed entirely of steel and iron, and consists of five arches each formed of thirteen ribs bearing on steel skewbacks built into the abutments or resting on the piers. The steel plate decking, when it does not rest directly on the ribs, or on the steel framing of the piers, is carried on longitudinal joists supported on stanchions also formed of rolled joists, standing on the ribs. . . . Of the thirteen ribs in each arch, eleven are alike, the two outer ones being somewhat lighter to allow of their showing under the projecting plinth of the parapet (the meaning of this is not very clear). These outer ribs are 2 ft. 9 in. deep at the crown, and 3 ft. deep at the ends, the others varying from 3 ft. 6 in. to 4 ft. in depth. All bear at their ends on hinges formed of cast steel bearings with a forged steel pin 9 in. in diameter between them."

"The erection of the arches themselves was carried out in the following manner:—Three ribs of each span were floated into position, and when these were fixed the remainder of the ribs were successively built on staging supported from the first three. The manner of floating in the ribs was as follows:—They were first erected on a large pontoon moored below the bridge, and when completely riveted up and braced together, the barge was placed at high water, by means of steam tugs, in the span to be erected, the barge being fixed in the exact position by means of hawsers and buffer timbers so that the ribs were immediately over their points of support. The gradual fall of the tide then allowed the ribs to drop on to the hinges prepared for them."

The arch-ribs thus have that appearance, at once light and workmanlike, which is given by the design of a heavy girder resting almost on a point at its bearing, and obviously free to turn on its abutment with changes of temperature; the method of design which had so striking an effect in the immense roof-principals of the Galerie des Machines at Paris. In the case of the Vauxhall bridge the principals are free to rise slightly at the crown with expansion, the steelwork connected with them being designed to allow the necessary play in that case.

Nothing whatever is said in the Report as to the successive stages through which Vauxhall bridge has passed in regard to its proposed character and architectural treatment; but as this is the view of the subject in which we are specially interested, we may briefly recapitulate the history, which is, in a sense, both amusing and instructive. The first proposal made by the County Council's late engineer was almost a repetition of that flagrant piece of vulgarity in design, Blackfriars bridge, with its tawdry ornament and absurd stumpy columns carrying nothing; a design which we believe a good many engineers still consider to be "a very handsome bridge." We may be thankful indeed that we were spared a repetition of that piece of gewgaw. That this design was not carried out was probably mainly due to the Institute of Architects, who memorialised the County Council as to the desirability of having a monumental bridge of granite, and offered them some very good suggestive designs for the piers thereof, of which it was hoped that some use would be made. Eventually it was decided that a solid granite structure was unnecessarily costly, but the bridge was to be of concrete with a granite facing. This was something of a sham, but it offered at least a bridge monumental in appearance and structure, and the decision to use concrete afforded an opportunity for putting in practice a then rather new system of construction by which the concrete arches were to be constructed with

what was practically a joint at their abutment, and another at the crown, not only giving a certain amount of play to the material, but enabling the engineer to control with more certainty the line of pressure in the haunches of the arch. But when the model of the design (illustrated in the *Builder* of January 7, 1899) showing the granite treatment, was produced, there was consternation on the part of those anxious for the architectural result. The sketches and suggestions of the Institute of Architects had been entirely thrown aside. The stumpy columns of Blackfriars bridge still exercised their fascination, and re-appeared on the face of the piers, surmounted each by columns which were made to do duty as lamp-posts, for which they were completely out of scale. The excuse for these was the bridge at Coulommiers, which had apparently been regarded as a kind of model, and which has some columnar erections of this kind, but purely as features to give a certain dignity to the entrance and exit (in the same manner as pylons), not as lamp-posts. A cornice of the coarsest type of moulding was run along the bridge; the granite facing arches were made with immense rusticated voussours of a foot projection, to give an appearance of cyclopean construction to what was really only a facing; and an enormous plinth-moulding, a single moulding 3 ft. deep, put the finishing touch to the destruction of all idea of scale in the details. Criticism and objections were in vain; a representative Committee of the Institute of Architects called on the engineer and endeavoured to explain that some of the points which he most admired in the Coulommiers bridge were exactly what people with an architectural training in design would at once condemn; it was all in vain; Coulommiers was the most beautiful bridge he had ever seen and this was to be like it; as to the vaunted new bridge at Paris, this one at Vauxhall would be far superior to any bridge at Paris (this was an actual statement by the engineer!); and the representatives of the daily press, who of course had no opinions of their own on such a subject, obediently echoed these instructions.

It was only a change of engineers which prevented this preposterous design from being carried out; though, as we shall see, the change was not due to any æsthetic predilections on the part of the new engineer. The County Council had assumed a position of refusal to listen to any further criticism; their engineer, they said, must be protected from the intrusions of people who had no business to interfere in the matter; the idea that they were responsible to the public for a public work carried out with public money not apparently having occurred to them. But the next step was that we learned that the concrete bridge with granite facing must be abandoned, as the ground of the foundations under the piers was not calculated to bear its weight. How it came about that of two engineers sufficiently eminent to be appointed to so important a post, one should have been mistaken on such a practical matter as the adequacy of the foundations, and which of them it was that was mistaken, we shall never know. But the result was that a new design was exhibited at the

Council room for a bridge of steel spans; a design which was typical of all that is worst in engineering ideas of "ornamental" architectural treatment, with immense spandrels of coarse would-be Gothic iron tracery. This design, indirectly, saved the situation; it was too bad to put up with. Sir W. Richmond and the editor of this journal successively addressed letters to the *Times* pointing out its absurdity in terms which were denounced by those directly concerned as harsh and un-measured; but it is necessary to speak strongly sometimes, and the strong speaking had its effect. The County Council, or their Bridges Committee, had turned a deaf ear to private remonstrance in regard to the previous design, but they did not like public ridicule, and it was at last forced upon them that something must be done to satisfy their architectural critics, professional and amateur. What was done is rather *sub rosa*; it is believed that they obtained suggestions and sketches from a very eminent architect who has always been ready to lend his aid in improving public architecture; at all events, the result was the design which was published in our issue of May 23, 1903; a very different thing from anything that had been previously proposed.

With the exception of the pylons at the entry on the bridge, which are still under debate, this bridge has now been carried out pretty nearly as shown in the illustration; and the result is exceedingly satisfactory. We have at last got a modern steel bridge, on the most modern constructional principles, erected over the Thames, in which there is no gewgaw ornament, nothing in bad taste; and this is not only a great gain in itself, but it will unquestionably have its effect upon future erections of the same kind, and will have inaugurated a new era of taste in respect to steel bridges on a large scale, in London at all events. And this result shows that it is worth while to persist in criticism on matters of this kind. The result has been fairly fought for. It is almost amusing to read in the Report that in designing the steelwork, "the avoidance of all ornament, save such as formed part of the structural design of the bridge, was kept steadily in view," as if this were the innate desire of the official constructor and the Committee, whereas it has simply been forced upon them by repeated representations from without. Very probably the architect to the County Council has had his say in the matter, and we surmise that more is due to his collaboration than is allowed to appear in the Report; but if so, it is due to external criticism that he has been able to exercise any influence on the engineer's design.

We should have preferred, as we said at the time the illustration was published, to have seen the parapet carried by a visible corbel construction instead of having this boxed up by a riveted plating, giving it rather the appearance of a long pontoon; but we admit that in execution it looks less objectionable, and catches the eye less prominently, than it did in the drawing. For the rest, all the steel work is admirable; the low simple railing with plain square balusters; the turned steel balusters at intervals,

of very good design, which carry the upper rail; the plain vertical braces on the haunches of the arch, which somewhat recall the similar treatment in the old bridge—all this is excellent and in the best taste. The masonry bases of the piers are well treated, without any immense mouldings to destroy the scale; above these the piers are faced with riveted steel plating so constructed as to leave a sunk panel; these panels, which were the device of the Council's architect, are to be occupied by bronze figures on each face, of heroic scale, to be executed by Mr. A. Drury and Mr. W. Pomeroy, and to represent respectively "Local Government," "Education," "Science," "Fine Arts," "Pottery," "Engineering," "Agriculture," and "Architecture." The lamp-standards at present on the roadway of the bridge are only temporary, the permanent lamp-standards are to be of a graceful design by (we believe) Mr. Drury. There is a little mistake in the masonry design, in the balustrade under the arches adjoining the pylons at the Middlesex end; the balustrade is terminated by piers, similar to those generally interpolated in a continuous balustrade, which are in this position quite unnecessary, either architecturally or constructively; the balustrade should simply have been carried across the arch opening and stopped against the jamb of the arch; there might have been a flat plaster as a respond, but the piers are out of place and come in awkwardly.

In regard to the possible pylons, for which the bases alone at present exist, the County Council architect is desirous to erect a model of the proposed design *in situ*, before carrying out anything permanently. The model would cost about 200*l.*, but it would be quite worth while to spend this in order to see how the thing will look before spending a great deal more in carrying it out.

We ought not to conclude without a word in recognition of the contractor, Mr. Charles Wall, who has carried out this great work, involving no little difficulty and anxiety, with complete success.

NOTES.

The Labour Party and Trade Disputes. VERY little sympathy will be felt with the Labour Members of the House of Commons in their indignation at the rejection by the House of Lords of a Bill introduced by a private member to amend the Aliens Act. The object of the amendment was to exclude an alien "if he is being brought into the United Kingdom under contract to take, or with the intention of taking, the place of a workman during a trade dispute." The Labour Members have expressed themselves over and over again as strongly opposed in principle to the Aliens Act, yet they have not hesitated to at once advocate its extension with the sole object of furthering their own ends. Our readers will no doubt recognise that the Building Trades are more than any other industry affected by this measure. Our present freedom to import manufactured goods does not help us in the case of building operations. It is well to remember that when the present Law Courts were being built in the Strand the stonemasons struck work

because stone arrived from the quarries partly worked, and they demanded that all the stone-cutting should be done on the job in London. The Stonemasons' Union was very strong and persisted in their claim, which, however, was resisted by the masters, and the building operations came to a stand. As a last resource stonemasons were brought over from Holland and lodged in the building enclosure, and after some time the London masons gave way. Although such a remedy may seldom be needed or enforced, the knowledge that it exists is a healthy check on extravagant demands.

Municipal Monopolies. It will be within the recollection of our readers that in the recent case of Atterney-General v. Mersey Railway Company the railway company, at the instance of the Birkenhead Corporation, was restrained from running omnibuses as feeders to their railway system. The railway company have now promoted a Bill to obtain the necessary powers to enable them to run these omnibuses, which were a great convenience to the inhabitants of the district they served. The clause of the Bill which related to these powers was the subject of debate in the House of Commons, and it was not only opposed by the representative of Birkenhead on behalf of the Corporation, but other Corporations who owned tramway systems also were able to bring opposition to bear, and the result was that an instruction was passed directing the Committee to leave out this clause. It would seem that this was a question which might have been left to the discretion of the Parliamentary Committee, where the matter could have been better examined with a view to the necessities of the case, and we would also point out that this is a serious development of municipal trading. The Corporations are seeking protection for their municipal enterprises, the tramways, for which they are anxious to obtain a monopoly; they already possess enormous advantages in having the rates to draw upon, and it is a serious question if they are to be allowed to stifle competition. This is bad for private enterprise and the public alike.

International Science. In his lecture on this subject at the Royal Institution Professor Shuster alluded to the new difficulty found in the fact that international organisations had increased to such an extent that they were beginning to overlap and to present some danger of mutual interference. This may be a correct view of the present position, but we must say that it is not very obvious to men who are engaged in practical applications of science. No doubt the International Catalogue of the World's Scientific Literature and the Astrological Chart, both in course of preparation, are great and praiseworthy undertakings; the Bureau International des Poids et Mesures and the Convention which led to a general agreement on the standards of electrical measurements have done good work, and the International Geodetic Association has made good progress in a gigantic task of the utmost importance. But there is little evidence of activity in more prosaic

directions, such as the establishment of International specifications of structural materials, or the assimilation of practice in the testing of such materials. It is true that the International Association for Testing Materials of Construction still exists, and has branches in Great Britain and the United States. Yet no one ever hears of the British branch, and that in America seems to have become a purely local organisation. There is at the present time a distinct need for general agreement with regard to the design of concrete-steel structures, as also in respect of standards for light, heat, power, and other measurements entering into the daily practice of architects and engineers. Hence, while admitting that the interchange of views between the scientific men of different nations is actually on the increase, we do not observe any striking signs of that congestion which appears to Professor Shuster in the light of a practical difficulty.

Water and Building Operations. A QUESTION of great importance to the public, and to builders in particular, was decided by a London police magistrate in the case of Paine v. The Metropolitan Water Board on May 21. The complainant was a builder who owned certain houses adjoining a road along which a water main had been laid by the East London Water Company, the predecessors of the Water Board. He was carrying on building operations upon a piece of land which had hitherto formed a garden for one of the other houses, and he had applied to the Board for a supply of water by measure for use in his building operations and had tendered the maximum price for the supply. The Water Board neglected to supply him and he was proceeding against them for penalties. The defendants relied upon certain provisions in the East London Waterworks Act, 1853, and contended that the complainant could only be entitled to water by agreement, since he was not the owner or occupier of any "premises" adjoining a street in which a water main was laid. The magistrate held that, as there was no provision in the Act about the supply being upon the premises, the complainant, by virtue of his ownership of the other houses adjoining the main, was entitled to a supply of water for purposes other than those for which the rates provided at a fixed price, as distinguished from owners or occupiers having property not so situated as regards the main, who would have to obtain water by agreement. But apart from this the magistrate also held that if he had to consider the vacant land by itself, it also came within the meaning of the word "premises," and the claimant was entitled to a supply by measure. The exact terms of the East London Waterworks Act are not before us, but unless the word "premises" followed a series of words of more limited meaning, it would seem impossible to construe the word "premises" as meaning only houses or buildings.

"Op., In., or About Engineering Work." TWO DECISIONS under the Workmen's Compensation Act were given by the House of Lords last week. In *Back v. Dick Kerr*

& Co., Ltd., the question was whether a man had been employed "on, in, or about an engineering work," and the House was divided three to two. The engineering work in question was the alteration of the Exeter tramways from horse to electric traction, and the work of taking up the old rails had been commenced near St. David's station, 700 yds. from the place where the man was injured. The man was in the employ of the contractors who were carrying out the work, but he was engaged at the Queen-street station, where the new rails were being received, and by agreement with the railway company they were being stacked in the station-yard of the railway adjoining Queen-street, along which street the tramway also ran. The majority in the House of Lords held that this work of stacking the rails upon which the man was engaged was not work upon the engineering work, the man not being engaged about the area of the engineering work. If the new Bill becomes law the importance of this decision will disappear, since questions of locality will not arise, and the question to be determined will be, whether the man is a "workman" and whether the accident arose "out of and in the course of the employment."

THE second case, Johnson v. Marshall, Sons, & Co., Ltd., turned upon the question whether a man had been guilty of "serious and wilful misconduct," and this question is preserved in the new Bill. The evidence was very slender; the man, who was killed, was a joiner in the respondents' works, and at work in the gallery; there were good means of approach to the gallery, but also a lift, and a notice was upon this lift that no man should use it unless in charge of a load. The breakfast hour was at 8 a.m., and the man, who had previously been seen working with his coat off, was found crushed in the lift with his coat on and without a load. The lift was obviously safe for use, as the men might use it with a load; and the House of Lords, reversing the Court of Appeal, held that the man had not been guilty of "serious" misconduct, a word which qualifies "wilful misconduct." "Serious wilful misconduct" has been held incapable of exact definition, but depends upon the facts of each case; when the misconduct endangers the safety or lives of others, then there is no doubt; and even if a man wilfully and unnecessarily endangered his own safety by obvious rashness or disobedience to orders it would probably fall within the definition, but it must be remembered that this question only arises if the misconduct takes place in the course of the employment—if it is outside the scope of the employment, then the man is outside the Act.

WHATEVER may be the ultimate decision of the Parliamentary Committee with regard to the London County Council (Electric Power) Bill, we hope the construction of the great power house at Battersea will not be sanctioned. At that establishment it is proposed to consume some 240,000 tons of coal annually, and as every ton may be

expected to generate fully 20 lb. of sulphurous acid, to say nothing of other deleterious products, the prospect is by no means an alluring one. To whatever height the chimneys might be carried, the gases evolved must be brought down by rain, and floating particles of carbon and ash by gravitation, thus counterbalancing much of the benefit claimed for electric light and power as substitutes for gas and steam. In his evidence given on Friday last week before the Committee, Professor Thorpe suggested that to minimise the quantity of sulphurous acid emitted, the coal might be carefully screened, hand-picked, and treated with lime-water. These palliative measures, however, could only serve to mitigate the proposed nuisance; and, from experience of the ways of steam users, we do not for a moment believe that they would ever be carried out in a really efficient manner. No doubt the huge Battersea power house would take the place of numerous smaller installations and abolish many boiler chimneys in the Metropolis, but the generation of gaseous products would be concentrated and their effects so intensified as to constitute an intolerable nuisance, and a serious menace to vegetation in the surrounding districts. As we have said before, large generating stations of the kind should be established quite outside the Metropolitan area.

PARTICULARS of another test of fire-resisting floor construction are given in the report issued this month by the British Fire Prevention Committee. The test in question was conducted in February last upon a floor consisting of rolled steel joists, expanded metal, and concrete, the latter material being mixed with aggregate consisting of old firebrick for one bay of the floor, and of broken stock brick for the two other bays. Most of the plaster covering the concrete fell during the earlier stages of the test, and some portions of the concrete fell from one of the joists, a circumstance which, in view of similar experience in previous tests, indicates that large masses of metal are far less desirable in fire-resisting construction than a well-distributed system of small bars. As for the concrete in the bays, reinforced by expanded metal sheets, little damage was done beyond a few small cracks chiefly in the vicinity of the steel joists. Apart from demonstrating the value of Portland cement concrete as a fire-resisting material and the superiority of distributed over-massed reinforcement, the test does not convey any very direct lesson. But it is worthy of note that the stock brick concrete seems to have shown to slightly better advantage than the concrete, made with old fire bricks which have been used in boiler furnaces. Thus, the test furnishes an additional reason for the faith justly reposed by architects in stock bricks.

DISCUSSION upon the paper read last December before the American Society of Civil Engineers is continued by letters published in the last two issues of the *Proceedings*. Several members refer to the relative merits of high and low carbon steel and of distorted bars as reinforcement.

Mr. W. J. Watson, being sceptical as to the safety of permitting such stresses as will produce hair cracks in the concrete, considers low unit stresses only should be allowed in the reinforcement, and consequently that very little advantage is to be gained in using high carbon steel. He mentions also the fact that high carbon steel is less reliable than mild steel, and moreover cannot be safely bent on the site of works under execution. Mr. Clarence Noble quotes authorities to support the view that under no circumstances need the adhesion between concrete and plain steel bars be taken at less than 250 lb. per square inch, and disputes the argument brought forward by the advocates of deformed bars that the lengthening of a plain bar under tension tends to relieve the grip of the concrete. By a simple calculation he shows that even if a $\frac{1}{2}$ -in. diameter bar were stressed up to 50,000 lb. per square inch, the reduction of area would only be 0.000,215 in., an amount too small to have any appreciable effect. Mr. C. A. P. Turner refers to the same point, saying that when the longitudinal reinforcements in continuous beams is bent towards each support as usual, this simple bend gives an anchorage which from his experience appears to discount any form of mechanical bond yet invented. These are only one or two notes from the voluminous discussion mentioned above, and which should be read by all who are interested in the economical design of reinforced concrete floor systems.

OWING to the rapid development of electric tramways and light railways in the United States many highway bridges have become seriously overloaded, and the occasional collapse of railway bridges in the same country shows that a similar state of things has arisen from the increased weight of modern rolling stock. Comparatively little trouble and expense have been caused so far in Great Britain by the steadily increasing loads imposed upon highway and railway bridges, partly because masonry construction of superabundant strength has prevailed so largely, and partly for the reason that iron and steel bridges have almost invariably been designed with most liberal factors of safety. Still, it is always necessary for public authorities and railway companies to consider from time to time the stresses occasioned in their bridges under modern conditions of traffic, and for this reason the paper by Mr. Wilbur J. Watson in the *Proceedings* of the American Society of Civil Engineers is one which deserves attention. The author has been engaged for some years in the investigation of existing iron and steel bridges which are subjected to loads greater than those for which they were originally designed, and his paper makes clear the point that the rules for designing new structures are quite different from those for investigating old ones. One circumstance particularly worthy of note is that in old bridges of iron and steel the construction of the compression members should be carefully examined. Speaking from personal experience, the author states that he has found more failures to occur in compression members than in

"Serious and Wilful Misconduct."

Fire Tests with Floors.

The Investigation of Overloaded Bridges.

The Proposed Power House at Battersea.

Reinforced Concrete Floors.

tension members, owing to the insufficient stiffening originally provided. This may be a useful hint for people who are inclined to think that tie-bars constitute the chief source of risk in early structures of iron and steel.

ALTHOUGH it is now fifty years since Lord Kelvin showed how the electric intensity of the atmosphere can be measured, yet it is only recently that meteorologists have begun to take regular records. In his paper on "Measurements of Atmospheric Electric Potential," read to the Royal Society on March 15, Dr. Charles Chree, the superintendent of Kew Observatory, makes some notable additions to our knowledge. For the last six years careful records have been taken of the electric intensity of the atmosphere outside the Observatory by means of a Kelvin "water-dropping" electrometer. By analysing these records Dr. Chree proves conclusively that there is a regular rise and fall of the electric intensity twice a day. It is a minimum at four o'clock in the morning and again at two o'clock in the afternoon. The times at which the maximum values occur are, however, not so definite, the interval between the two maximum values being greater in summer than in winter. The electric intensity is greatest in the month of December, but the amplitude of the diurnal inequality is greatest in February. The possible influence of various meteorological elements is considered from several standpoints. The influence of temperature is found to be by far the most important. With the exception of July, it is found that in every month of the year a low temperature coincides with a high value of the mean electric intensity and with a large diurnal variation. We have now data by means of which we can check the scientific guesses—which are often quoted in this country as if they were absolute laws—of several German physicists. Elster and Geitel found that the air which escaped from the soil was strongly ionised. They therefore suggested that a low barometric pressure would cause an increased escape of air from the soil, and thus increase the electric intensity, and a high barometric pressure retarding this escape would diminish the intensity. Unfortunately, however, for this ingenious suggestion Dr. Chree's curves prove conclusively that if there is any "cause and effect" relation between the height of the barometer and the electricity in the air it must be the latter that produces the change in the former, and not *vice versa*.

THE collection of engraved portraits from the Royal Collection of Windsor Castle, now on view at Messrs. Agnew's Gallery, illustrates a great deal of fine mezzotint engraving, and is exceedingly interesting in a historical sense, as bringing before us in one room the portraits of a number of people eminent in the XVIIIth and early XIXth centuries; statesmen, authors and artists. Collectors of prints, and special connoisseurs in "states" and "impressions," may no doubt find another and higher interest in it.

Illustrations of Glacier and Moraine.

At the Fine Art Society there is a collection of water-colours by Mr. Ernest George, under the title "Glacier and Moraine about Arolla, Saas Féc, and Bel Alp." We have been familiar for many years with Mr. George's picturesque water-colours and etchings of architectural subjects; the present collection is of a kind new to us from him, the result of several holidays spent in the neighbourhood illustrated. It is quite a success, and shows that this artist can handle other subjects besides architecture; and yet there is something of the intuition of the architectural observer in the manner in which the construction of moraine and glacier is indicated in some of these sketches; in No. 27, "Moraine of Zigiorenove Glacier," for instance, and in "The Long Moraine leading to the Pigne d'Arolla" (45), we seem to see quite clearly how the moraine has built itself up as the rampart or retaining wall of the glacier; in other drawings we see the line of the crest of the glacier curving away into the distance like the backbone of a huge serpent; while in various pictures of the "snouts" or lower ends of the glaciers we have their constructional section. This is a kind of landscape sketching which has something of scientific observation as well as mere effect. There are some interesting bits of architectural picturesque also in the sketches of various chalets and villages, the group at "Grimentz" especially (51), where the chalets are piled one above the other on the face of the rock. This is altogether a very interesting little exhibition, and ought to be especially so to our readers, as the work of an architect.

The Baillie Gallery.

THE Baillie Gallery appears to be the special home of "sketchiness" in painting—what the President of the Royal Academy characterised as "the art of leaving off where the difficulties begin." Some of Mr. Studd's paintings of Venetian subjects contain really good pieces of colour effect, such as the "Red Brick House" (24), a Venetian canal scene; "Venice in Summer" (58), and "The Great White Dome" (3), that of La Salute seen in a misty light; but when he invites us to accept, under the magnificent title "The Glorious Temple" (17), a shapeless smudge of colour as the front of St. Mark's, we can only repeat what we have said before, that painters who can do nothing better with a great piece of architecture than reduce it to a colour smudge, had better let it alone. Mr. J. D. Fergusson, in another room, takes us into his confidence, and tells us that "the painter having found the beauty of nature ceases to be interested in the traditional beauty, the beauty of art," which is obviously true as far as he is concerned, but is hardly to be accepted as a general dictum *sans phrase*. Also we learn that "to be true to an emotion, is to deal with that impression only which has caused the emotion," which is the reason, no doubt, why in some views of "Paris Plage" the surf is represented only by a formless wavy band of white pigment, and the figures are nearly as formless. Painters who go on this principle seem

to forget that the "impression" produced by the real scene is the result of combined detail, and that to try to paint the impression itself only without anything behind to back it up is to produce merely a visionary unreality. Messrs. Dikkers & Co., of Helgelo (Holland), who have a collection here of brass *repeussé* work, seem to think that they also have a mission—viz.: to explain to us the nature and artistic value of this class of work, of which they appear to believe they are the special exponents. Their small exhibition contains fairly good work, but we have seen better from English hands.

Messrs. Dickinsons' Gallery.

At Messrs. Dickinsons' Gallery there is on view a collection of water-colour sketches, by Miss Agnes Turner, of London's River and Byways, and other drawings. The large pictures, of buildings seen from the river, are not very successful, in some there is rather a lack of composition, and the treatment of the water is not always good. There are some very effective little paintings of narrow, picturesque alleys, in "Farringdon-street" (31), the effect of lighted stalls at night is well treated, and in the sketches of the "Cloth Fair" (7, 13, and 14) the colour is good. The style of the paintings varies a great deal, among the best of the landscapes are the two sketches of "Bog Ennis, co. Clare" (15 and 23).

Trade Commissions to Architects.

AN architect sends us a letter that he has received from a firm of billiard-table makers, on this wise:—

"We note you are the architect for alterations and additions to the licensed premises in street. We shall be glad to know if there is likely to be a new billiard-room built; if so, if you will kindly favour us with full particulars, we shall be glad to allow you a commission on any business that may result."

Very likely the writers of this letter think that they are only taking a legitimate way of trying to extend their business, but all tradesmen ought to be made to understand that an architect is bound to consult only his client's interests in regard to any order, and not his own, and that such an offer is exceedingly improper, and could have no influence with a respectable architect, except to prevent his having any further dealings with the firm that had made it.

NOTES FROM ROME.

An important paper has recently appeared from the pen of Professor Mau, of the German Archaeological Institute, on the "Rostra Casaris" (*Römische Mitteilungen*, XX., 1905, 250-266). He follows Richter (*Beiträge zur Römischen Topographie*, ii., 1903) in reaffirming Nichols' view, expressed in his *Notizie dei Rostrî del Foro romano* (Rome, 1885), that the hemicycle, so called (for the curve is really only about one-sixth of a circle), behind the rectangular Rostra of *opus quadratum* is earlier in date than the structure in front of it; and he follows Richter also in his advance on Nichols' view—namely, that the curved structure was itself the Rostra of Julius Cæsar, and that the rectangular structure in front of it belongs to a later period.* In so doing he meets, and in my opinion successfully, the objections of Hülsen to Richter's theory

* Nichols held that the curved structure was the *Græco-stasis*, and that the rectangular structure was the Rostra. A good plan will be found in Hülsen's "Roman Forum," page 73, Fig. 30.

(*Römische Mitteilungen*, XX., 1905, 16 sqq.). According to Hülsen's view, we have to suppose that in the reign of Septimius Severus a triangular courtyard was cut out of the northern half of the Rostra, and the curved west wall of this court ornamented with slabs of red marble (Porta Santa) and pillars of *marmo africano*. . . . On the side towards the arch of Severus the wall was broken away, and the courtyard seems to have been shut off merely by a simple gate* ("Roman Forum," page 76 and Fig. 33). Hülsen's theory, which until 1903 was held by Richter also, does not commend itself at first sight as the most natural explanation of the facts, and would therefore require strong arguments to support it; and these hardly seem to be forthcoming.

Professor Mau points out that at the points of contact the hemicycle is seen to be certainly the older building of the two; the question is practically decided by the relation of the travertine foundation blocks on the north. He also proves that the existence of a gate or railing on this side is not vouched for by the holes in the marble plinth of the rectangular structure, but that some are for bolts to join the blocks together and to the wall (now no longer existing) behind them, others for lifting the blocks, while others, of later date, are present in other places where the wall is still preserved. He also remarks that the fact that the sides of the rectangular structure end, and must always have ended, precisely where the curve begins is easily explicable under the supposition that the latter is posterior in date to the former, while otherwise it is an almost incredible coincidence.

Another new point that he raises is the existence of the concrete upon which the travertine foundation of the plinth of the hemicycle rested all along the curved front, and of layers of travertine chips at different levels, corresponding with those of the foundation of the plinth and the plinth itself—layers which are not found in the concrete at the back of the brick wall,† which, according to either theory, formed the back wall of the chamber under the rectangular Rostra at the period of their original construction. Finally, a study of the marble facing of the hemicycle as far as preserved shows (1) that it is so arranged as to postulate a large central slab, and a corresponding series of slabs and pilasters on the other side of the curve; (2) that the holes in the slabs may quite possibly have supported rostra of some sort.

It must be admitted that the moulding of the plinth of the hemicycle is not good; the profile is flat and weak. As to the objection, however, that the summit of the hemicycle as it stands is far too narrow ever to have served as the Rostra, the answer is that it was originally a good deal wider, and was only made narrower when it was transformed into a mere approach to the rectangular structure which was placed in front of it.

At a recent meeting of the German Institute Professor Hülsen spoke of an inscription in large letters about 1 ft. 4 in. high (the letters were originally of bronze) cut in the travertine pavement of the Forum close to the Lacus Curtius, recently brought to light by the removal of the late steps round the column of Phocas, which preserves the name of L. Nævius Sardinus, the same man who set up an inscription, in which he appears as *praetor peregrinus* (in the time of Tiberius), which was found close to the Lacus Curtius in 1552 or 1553.‡ Near the same spot was found in 1817 another inscription of a man who gives himself the title of praetor only,§ and Professor Hülsen inclines to conjecture

* The theory is, that the marble plinth blocks alone were left, and that the gate or railing was fixed in them.

† An objection may be raised that this wall must belong to the early portion of the 1st century, A.D., inasmuch as it is not built of regular triangular bricks, but of irregular fragments of roof tiles, broken to the required shape (Hülsen, *op. cit.*, page 20, n. 1). But as Mau notices, similar materials, though far less carefully laid, are employed in the walls of the newly-excavated building near the Lacus Curtius (the so-called imperial tribunal), which must be later than the time of Domitian.

‡ Upon the back of the slab was afterwards cut the remarkable relief of Curtius; the slab is built into the staircase of the Palazzo dei Conservatori so that both sides are visible. See *Römische Mitteilungen*, 1902, 32.

§ C.T.L., vi, 1278.

that not the imperial,* but the praetorian tribunal, stood near the Lacus Curtius.

Not far off is a small square enclosure, which from its position may have contained the statue of Marsyas and the fig-tree, olive, and vine, which stood at or near this point.† The statue of Marsyas and the fig-tree occur in the well-known reliefs depicting episodes in the reign of Trajan, which stand close by.

Recent additions to the municipal collections of antiquities have necessitated the enlargement of the Antiquarium, near the Arch of Constantine, both the museums on the Capitol being already full, and on the 24th ult. a new room was opened, which contains the more important sculptures, among them some interesting specimens from the tunnel under the Quirinal Hill. Their removal from the place they formerly occupied has permitted of a general rearrangement of the contents of the Antiquarium, and of the exhibition in a room to itself, where it is hung on the walls in sections, of a large coloured mosaic of the IIIrd century A.D. representing hunting scenes, which was discovered not long ago in the goods yard of the central station. Professor Lanciani spoke at the opening ceremony, devoting a portion of his discourse to the memory of Marchese Vitesleschi, who had been, until his death a few weeks ago, one of the original members of the municipal Archaeological Commission, which was founded in 1872. He then went on to speak of Julius Caesar's project for changing the course of the Tiber by taking it in a straight line from the Ponte Molle below the hills of Monte Mario and the Vatican (which in his time formed a single range), so as to add the Campus Vaticanus (now the Prati di Castello) to the Campi Martius. The scheme reappeared in the XVIIth century, when it was proposed by one Antonio Treviso, of Lecce. Two letters of his, with details of the project, dated November 16, 1560, and addressed, one to Pope Pius IV., the other to the Conservators of the city of Rome, are printed upon the plan of Bufalini (the first issue of which dates from 1551); and Professor Lanciani exhibited a tracing of this plan, made no doubt by Treviso himself, on which a strip of paper shows the proposed course of the river. The project was even recommended by a Departmental Committee of the Ministry of Public Works as lately as 1879.‡ It was claimed that the cost would be only just over a million sterling, that the city would be protected from floods, and that expansion would be rendered easy when the old bed was filled up, and so much land on the right bank joined to that on the left. But the construction of the popular quarter of the Prati di Castello in recent years has dealt a death blow to any possibility of its being carried out in the near future.

THOMAS ASHBY, JUN.

BURLINGTON FINE ARTS CLUB.

The collection of early German art at the Burlington Fine Arts Club is a very interesting one, and affords opportunity for a great deal of study of the styles and methods of various schools of early German painting. Those who obtain access to it, which is generously accorded by the Committee or by members of the club on application, will probably find occasion for more than one visit before they have extracted from the exhibition, and from the excellent introductory essays to the catalogue by Mr. Peartree, Mr. Alban Head, and Mr. Campbell Dodgson, all the information which can be obtained. We have only space here to notice a few of the most interesting objects.

In regard to the pictures, by "a self-denying ordinance" it was decided to exclude Holbein and his immediate followers who worked in England, as the number of their works obtainable in England is so large that it seemed best to leave them in reserve for a future exhibition. It is not claimed that the

* He does not accept Comm. Boni's identification of the building recently discovered close to the statue of Domitian, with the imperial tribunal of Trajan; and I, too, am unable to do so. I have discussed the question in the *Times* (January 12) and the *Classical Review*, 1906, 132.

† Pliny, *Historia Naturalis*, xv, 78.

‡ *Relazione che accompagna il progetto di una nuova inalveazione del Tevere attraverso i Prati di Castello della risvolta della Farnesina a valle di Ponte Molle fino a quella di S. Spirito a valle di Ponte Elio.*

exhibition represents really primitive German art of the XIVth and XVth centuries, such works hardly existing in British private collections. The majority of the works exhibited are of the XVIIth century, the list ending at Elsheimer, with whom the modern German schools may be said to have begun, and whose beautiful little picture of the Death of Procris, hung on the stairs leading up to the large room, is in fact very modern in style and feeling. As to the general run of the pictures exhibited, they illustrate very well the remark in the prefatory note to the catalogue, that if we do not meet here with the tender idealism of Italian or the grace of French art, "we receive compensation in a certain masculine force and directness, which possesses a charm of its own, and appeals strongly to those to whom it appeals at all." None of the works exhibited so well illustrate this as those which are classed as of the "School of Westphalia"; more particularly the "Christ on the Road to Calvary" (8), "Plate Washing His Hands" (12), lent by the Royal Institution of Liverpool (which has one of the best collections of early art in this country), and the large picture of the "Procession to Calvary" (25), lent by Mr. Sulley. In these, in the two last named especially, there is more freedom of action and drawing than in the works of the Cologne school; and in spite of the hardness of style and execution and the entirely mediæval conception of the scenes and characters, there is in these works a vigour and dramatic force of expression and action which is most remarkable. Among the other pictures is the wonderful little grey-toned picture crowded with small and highly finished figures, of the "Procession to Calvary" (35), lent by Sir F. Cook; this is attributed to Albert Dürer, though not with entire consensus of opinion; if not his, it is certainly the work of some one upon whom Dürer's mantle had fallen. The same owner's large painting "The Virgin with the Iris" (36), on the other hand, we should feel very doubtful of attributing to Dürer as far as regards actual execution, though there appears to be definite reason for attributing the design at all events to him.

A small half-length portrait of a lady (42), mentioned doubtfully as the possible work of Lucas Cranach, is remarkable for the exceedingly fine design and execution of the head. Among others to be specially noticed are the portrait of a lady by Mark Huber or Hauher (53); that of a young man with a rosary (54) by Baldung Grien, a remarkably fine work in regard to colour; the Duke of Devonshire's curious design of the "Wheel of Fortune," attributed to Dürer's pupil Schüßlein; and Mr. Buxton's "Portrait of a Jeweller" (62), credited to the "School of Saxony," with a head almost worthy of Holbein in force and finish of execution.

There are among the cases of "objects of art" many works of rich and fine execution and curious fancy, though not generally remarkable for grace or delicacy of design. In case A is a small bowl with four deep depressions in it (looking rather like a scent-bowl or something of that kind) with a flat open-work handle in which figures of Adam and Eve in a bower are worked with great delicacy and minuteness; but this is rather exceptional in character. In the same case a curious folding pocket dial is worth notice, and a gummer's level of gilt bronze, with a little plummet worked in at one side of it. Medals were very numerous, and a case with a few carved reliefs of figure subjects in hone-stone should be looked at (Case H), especially the remarkable and elaborate small carved panel representing "The Triumph of Charles V.," lent by Mr. Pierpont Morgan. In case E a "biberon" of rock crystal, in the form of a dragon, the property of Mr. Wertheimer, though certainly not beautiful in line, is a most sumptuous piece of work of its class. In the same case is a beautiful little cylindrical cup, silver-gilt, by Kossman, of Nuremberg, with low relief medallions of scenes from the Old Testament; and a remarkable gilt bronze table clock, lent by Mr. Morgan; it is surmounted by a dome with a figure playing a violin, and has five dials, unsymmetrically arranged, on the front, and two at the back; each dial intended to show different things—the months, the days of the week, the hours, etc.; whether it actually showed them all faithfully when in working order is another matter; if so, it was as remarkable for

mechanism as for design. It is late XVIII century work, and bears the inscription "Me. tecti Chasparus Bohemus in Vienna, Austria."

COMPETITION FOR NEW PREMISES FOR THE BRITISH MEDICAL ASSOCIATION.

CONSEQUENT upon the ever-increasing work of the British Medical Association both with regard to its general work and in connection with the publication of the Journal, the Committee recently decided upon pulling down the present somewhat unsuitable premises and rebuilding over the whole site owned by the Association at the corner of the Strand and Agar-street. For this purpose a limited competition was promoted, and six architects were selected by the Committee and invited to send in drawings. These were on view last week to members of the Association and others interested.

In the conditions and outline of general requirements issued to competitors attention was called, among other points, to the necessity of placing the new entrance in the centre of the Agar-street frontage and to the desirability of taking special care to guard against the noise of street traffic. As the reports presumably sent in with each design were not available it is impossible to say how the latter requirement was to be fulfilled, nor was there any special information to be gathered from the drawings.

Of the six sets of designs submitted, the first promiated scheme, that by Mr. H. Percy Adams, is in many respects the best. The plan very nearly follows, as, indeed, it could hardly help doing, the general arrangements indicated by the instructions, the greater part of the ground and basement floors being devoted to shops, which it is intended to let off. A good square entrance-hall is provided with a subsidiary entrance for the use of the compositors; for them, too, Mr. Adams has provided an open iron staircase at the back, which serves both as access to their workroom on the fifth floor and also as an escape staircase for the rest of the building. This is an economical way of dealing with the separate staircase required by the Building Act, and at the same time procures a certain amount of supervision over the incomings and outgoings of the compositors. The main staircase is rather cleverly contrived in one straight length of two or more flights, divided from the hall and corridors by arched screens; a double row of columns supports the arches on the first floor. On this floor are placed the general offices and the library and council-room. The latter is a large room covering nearly half the available space on the site, and capable, no doubt, of good architectural treatment; but one cannot help regretting the presence of the light area at the back, which cuts badly into the room, and is unnecessary, for the front windows appear ample to light a room only 32 ft. wide with a height of about 16 ft. This contraction on one side, with its accompanying feature opposite, would also be detrimental to the acoustic properties of the room—a point which the competitors were instructed to bear in mind.

The elevation to Agar-street is well arranged, with a small central portion supported by plain and solid pieces of masonry; the shops on the ground floor are to have flat, segmental arches over the openings, and ranging over these are large semi-circular-headed windows to the principal floor with frieze and cornice carried across as the springing line, the lower light being divided into three by Ionic columns. Above is a tier of square-headed openings flanked by sculptured figures slightly larger than life-size. The absence of a large cornice, the steeply-pitched roof, and the general "blockiness" of the treatment, helped by the severe and bulky stacks, go to the building up of an individual design, which is not detracted from by the slight affectation of simplicity that is displayed.

Apart from certain meritorious features in the plan, such as the small amount of space devoted to passages, the large general offices, and the skillful disposition of the lavatories, it is difficult to appreciate the reason for the award of second place to the late Mr. Woodthorpe's design. The elevation has a very commonplace order of Ionic pilasters running

through the second and third stories, and a segmental bay, corbelled out on the first floor on the cant angle of the site, and carried up as a turret above the roof, and finished with a cupola, is an unsatisfactory feature.

Of the four sets that receive no mention, that by Mr. W. Curtis Green deserves attention for its straightforward and workable plan. It is the only scheme in which a real attempt has been made in the hall and staircase, as well as in the principal rooms on the first floor, to get a good architectural effect out of the plan itself. This is specially marked in the library and council-room, which would have made a fine unobstructed chamber the full width of the site. On the second floor, which is chiefly made up of small rooms, the awkwardness of the canted front wall is cleverly minimised by the insertion of bay-windows round the entire frontage. There also are a useful feature in the scheme of the elevations, which in other ways are admirable; the general effect produced by the severe and heavy lower portion and the elaboration of the bays and cornice above would be very good.

Mr. Paul Waterhouse sent a plan with many good points. His staircase, oval on plan, is a nice feature, but his entrance-hall is not very well managed. The large committee-room across the Strand front would make a good room, and the composing-room is well arranged, but there does not appear to be any means of access to the roof. The elevations are interesting, though somewhat marred by the very flat pediments over the windows and the rather useless interpolation of brickwork on the third story.

Mr. G. Hornblower's set has an excellent entrance-hall, but his library is spoilt by the large area cutting into it, and the general office is obviously too small; there does not appear to be a separate staircase for the compositors. The elevations have a good deal of merit, though the weak semi-elliptical arch over the front door is unfortunate.

Mr. W. Campbell Jones was the other competitor.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The usual fortnightly meeting of the Royal Institute of British Architects was held on Monday at No. 9, Conduit-street, Sir John Taylor in the chair.

Fellowship Procedure Committee.

The Chairman announced that the meeting would, in the first place, be special for the acceptance of the recommendations of the Fellowship Procedure Committee, which were as follows:—(1) That the regulations under by-law 9 be amended by omitting all words after 'respective proposers,' and adding the year in which the candidate was article, and in the case of a candidate for Fellowship the year in which he commenced practice; the regulations further to state that the voting-papers shall be in the form of the papers issued for the election of the Council. (2) That the directions to voters printed at the foot of the voting-paper should read as follows—(a) the voter (Fellow or Associate) is to strike out in ink the name of any candidate for whom he does not wish to vote; all names not so struck out will be counted as voted for. (3) That a notice be printed in bold type at the head of the voting-paper urging the importance of the papers being returned.

It was moved by the Chairman that the regulation under by-law 9 be amended so as to read as follows:—'The voting-papers, which shall be in the form of the voting-papers issued for the election of the Council, shall state the name and address of every candidate, with the names of his respective proposers, the year in which he was article, and, in the case of a candidate for Fellowship, the year in which he became engaged as a principal in the practice of architecture.'

The resolution was carried.

The International Congress.

The Chairman announced that a further special meeting was convened by the Council in order to get confirmation of the resolution already passed to the effect that the President and members of the Council for the

current session should retain office until the conclusion of the International Congress of Architects.

This was formally moved and carried.

The Late Mr. Salomons.

Mr. Graham said he regretted to announce the decease of Mr. E. Salomons, elected an Associate in 1851 and a Fellow in 1860. Mr. Salomons, as all of them knew, was an architect of very high repute in Manchester, where he had a very large practice. He was President of the Manchester Society of Architects on two occasions, and many years ago he represented that Society on the Council of the Institute. He formally moved that a letter of condolence be forwarded to the relatives of their deceased colleague.

This was carried in silence.

London Traffic.

A paper by Mr. Paul Waterhouse on "London Traffic Commission Report" was then read, the following being an abstract:—

The author centred his attention chiefly on the proposal of the Commission that the traffic congestion of London should be relieved by certain alterations of existing streets, and notably by the construction of two new thoroughfares, one traversing the town from north to south, the other linking Bayswater with Whitechapel. The architectural problems connected with these new streets he put briefly in the form of three questions, viz.:—(1) Granting the necessity for two new thoroughfares more or less in localities selected by the Commission, what attempt, if any, should be made to control the architectural treatment of the new buildings which will form their frontages; (2) what relations should these new roads bear to existing roads, streets, and squares; and (3) what shall be their effect as regards the destruction and retention of existing buildings of value or interest? Alluding to the question of locomotion, the author noted that the Commissioners' proposals were based on the continued use and development of surface tramways. Recent experience of the motor-omnibus, however, had upset the Commissioners' decision, "that tramways would continue to be the most efficient and the cheapest means of street conveyance." This question of locomotion affected the architectural problem in two points. In the first place, there were objections to the direction and position chosen for portions of the new avenues, the choice of which had been regulated by the location of existing lines of tramway. Secondly, the width recommended for the main avenues—viz., 140 ft.—was obviously an outcome of the proposal that each avenue should be encumbered with four lines of tramways. If these lines were given up wholly or partially a less width—say, 100 ft.—would be acceptable. Discussing the Commissioners' plan, the author pointed out that the map the Commissioners had made use of was not a scale map, and his intentions were not very clear. He had, therefore, transferred the problem to a survey drawn strictly to scale, and he presented for consideration, not the Commissioners' authentic plan, but his own interpretation (drawn to true scale) of their intentions.

Dealing first with the west-to-east avenue, which it was proposed to strike north-eastward from Hyde Park at a point adjoining Victoria Gate, forming at that point a continuation of the Bayswater-road, which it was intended to widen all the way from Shepherd's Bush Station, the author pointed out the undesirable oblique junction of two important thoroughfares which would take place, and showed how by a slight deviation it could be overcome. As to the question whether in adopting the line of an existing street the widening should be effected by the abolition of the existing buildings on both sides, or by the pulling down of one side only, leaving the remaining frontage to form the building line of the new street, the author recommended, in the case of Connaught-street, the destruction of both sides, so that Hyde Park-square might indicate the axis of the first straight length. At Connaught-square he would appropriate the north portion of the garden, leaving the south of the square intact; and in Portman and Manchester squares the new street would follow respectively the north and south sides. Coming to the junction of Regent-street and

Portland-place, he proposed the removal of Queen's Hall, and the formation of a circular roadway round All Souls' Church. At this point he offered for consideration a route alternative to that of the Commission, giving reasons for its adoption and illustrating by means of a specially-prepared plan showing the route proposed. Passing through East Marylebone, the avenue, he said, could glide between the Churches of St. Andrew and All Saints, and cross Berners-street nearly at right angles. Touching on the absorption of square gardens which the adoption of either the Commissioners' scheme or his own would entail, the author observed that the loss of air-space would be nil; the ground would be absorbed, not by inhabited buildings, but by houseless space. The avenues themselves would be substantial additions to the breathing-ducts of London. He proposed also that at certain points in the route new open spaces should be formed. The route he suggested would lead through Russell-square and run parallel past the Foundling Hospital. Here, explained the author, contact was rapidly being approached with the great north and south avenue—a feature of the Commissioners' scheme most open to criticism. Assuming that the official lines were accepted, the abrupt changes of level which characterised Mount Pleasant would lend themselves admirably to what was undoubtedly desirable at the intersection of two such gigantic roads, viz., an "over-and-under" or viaduct treatment. At the eastern end of the avenue there was a problem which the Commissioners seemed hardly sufficiently to have considered. The plunge through the Finsbury district, cutting through Finsbury Pavement House and the site of the displaced Roman Catholic Church, involved the destruction of a mass of very costly new buildings and the mutilation of an attractive formation of frontage—the curve of Finsbury-circus—which seemed likely to result in a very heavy expenditure, not sufficiently balanced by compensating advantages. Might not the avenue, instead of passing along the south of Liverpool-street and Broad-street stations, cross the rails at a point north of the station buildings, where a road bridge already exists? If this proposal were adopted, the avenue would connect with Whitechapel-road and Commercial-road at the same point as is intended by the Commission; but it would fall in from a more northerly direction, and would face the end of Leman-street.

As regards the north and south avenue, the author pointed out the very serious difficulties in the way of adopting the route proposed by the Commissioners, owing to the many important buildings between Holborn and the river, and suggested an entire change. Assuming that the Temple Pier was the point at or near which a new bridge was wanted, why not strike a nearly straight line for a magnificent street running from the great entrance of the Law Courts to the dome of Bethlem Hospital? This street would, of course, be treated as regards level in the same way as Waterloo-bridge-road. That is to say, it would not descend to the level of the Embankment, but, retaining the high level secured at the Fleet-street or Strand end, it would pass over the Embankment-road, and would only descend on the south side of the river to pass under the railway lines near Waterloo Junction Station. It would, in fact, pass over Commercial-road, which would not need to be slightly dipped, and, getting level with Stamford-street, would pursue the existing roadway levels under the railway. The south end was sufficiently near the "Elephant" (the southern haven of the Commissioners), and the junction with the Strand was an approximation to the eastern horn of Aldwych. From Aldwych northward the avenue was ready made to Theobald's-road, and thence the bargain already effected between the London County Council and the Duke of Bedford for the widening of Southampton-row seemed to suggest that the avenue should take that line to Russell-square, where the author proposed the two great avenues should intersect. This intersection would be in a sense the most important street centre in London. It was essential that it should be an "over-and-under" intersection, an engineering feat which, if steep gradients were to be avoided, must influence, as far as levels were concerned, some hundreds of yards of

roadway on each side of the intersection. If it were possible to acquire enough land to extend the open space some 300 ft. eastward the inconvenience of the changes of level by making the intersection, so to speak, in the open would be minimised. To avoid robbing Bloomsbury of its best breathing-space, the author suggested the open ground being left free of building. The cutting and viaduct proposed would meet, not in a huddle of shops, but in an open pleasure of grass and green trees, nearly all the best of the present noble trees remaining undisturbed. North of Russell-square the line of route might continue along Woburn-place—effecting the widening on the left-hand side so as to avoid injury to St. Pancras Church, and taking beyond the Euston-road the track of Seymour-street. But here, again, the author suggested an alternative going east of St. Pancras Church. Assuming that the Commissioners were right in their idea that Upper Holloway was the district with which connexion must be made, it seemed obvious that the Camden-road was an existing thoroughfare of which advantage should be taken. The author claimed that by carrying the avenue up to his proposed termination near Camden Town Station he had not only brought it within touch of a ready-made avenue to Holloway, but had put it into a position from which connexion could at once be made with Highgate and Hampstead trams, and in the future avenues could be prolonged thence to either or both of these places.

The author claimed for his new north and south route that it performed its purpose with more dignity, at less cost, and with far fuller efficiency than the Holloway-to-Elephant route of the Commissioners. It collected traffic from Euston, King's Cross, and St. Pancras Stations with much more impartiality than theirs. It utilised a mile and a half of existing roadway almost unaltered (in Camden-road and Kingsway), and avoided a mass of interference with sentimental and other interests by abandoning the hopeless attempt to get from Holborn Bars direct to the river.

As regards the question of architectural design in the streets themselves, the author deprecated any insistence upon uniformity of design on a large scale, referring to the failure of recent attempts to dispose of valuable frontage sites under conditions which debarred the free exercise of personal architectural wishes and commercial requirements. Individualism in street architecture in London was by no means unsuccessful. Our atmosphere, again, rendered ineffectual that long-drawn straightness and uniformity which in Continental cities had an intrinsic merit. The author assumed, however, that if his or a similar scheme were eventually adopted certain points would be selected as demanding homogeneous and continuous design. For instance, the first departure from the Bayswater-road, the All Souls' circle, the "place" opposite the British Museum, Russell-square, the bridge over the Thames, and the viaduct over the Embankment, with their immediate approaches, would necessarily be committed each to an architect (not necessarily all to one man) for continuous connected treatment. If the proposed Traffic Board were appointed, it must certainly have as one of its chief duties the safeguarding and promoting of a concrete and definite plan of street improvement, and this could only be carried out in consultation with one or more who were architectural artists in the best sense. He suggested the appointment of an architectural adviser to the Board (or, if preferred, three architectural assessors); that the architectural adviser should not himself design any portion of the new streets, unless in the matter of bare plan; that for each building centre demanding continuous treatment a separate architect should be appointed, and that on no consideration whatever should individual licence on the part of lessees or purchasers be allowed to prevail within the boundaries of such prescribed portions; finally, that on all parts of the new frontages perfect liberty of design and choice of architect should be allowed, subject to the control of the Board's architectural assessor or assessors, who should have absolute powers of censorship over all designs submitted. The author, in conclusion, pointed out some of the difficulties in the way of the Commissioners' projected device for crossing

Piccadilly, and put forward an alternative route.

Sir R. Melville Beachcroft, in proposing a vote of thanks to the reader of the paper, said he took it that the reason why he had been asked to do this was because he had been a member of the London County Council for seventeen years, and had served on the Improvements Committee of that body during the period when they were considering the great scheme of the street from Holborn to the Strand. He also remembered some thirty-four years ago he had something to do in opposing a scheme for carrying a new thoroughfare from the Marble Arch to Whitechapel. That was a scheme brought before the then Metropolitan Board of Works, to cost some 3,000,000, or 4,000,000, and the Board were asked to contribute about 1,500,000, but did not see their way to do it. He had listened to the paper with the greatest possible interest. Mr. Waterhouse had asked what they were aiming for, and he supposed they hoped that a scheme, such as that suggested that night, would be possible some day, but, of course, Mr. Waterhouse had said nothing about the cost. Mr. Waterhouse simply put it out in anticipation of the recommendations of the Royal Commission being given effect to, and urged that they must take into account the architectural effect of any scheme. Speaking as an overburdened payer of taxes in London, he could not help feeling that it would be some time before they saw such a scheme undertaken. He had heard a sum of 25,000,000 mentioned as the cost which would be involved, and he thought it would be some time before an expense of that kind was embarked upon. At the same time he agreed with what Mr. Waterhouse had said as to the Royal Commission having seemed to have gone mad on tramways. In believing that tramways were going to occupy the whole of the streets of London he thought they were rather counting their chickens before they were hatched. There was the motor-bus, which they heard and smelt so much about, and which, although at present in an infantile state, undoubtedly would in course of years, if not months, throw a different complexion on the matter. He certainly believed that, as regarded the cross-traffic, the motor-bus would meet all the wants of the day. With regard to the Bill which Mr. Waterhouse had mentioned, he learned that day that the Government were opposing it, and so he was afraid that the chances of its passing were very remote. The Bill was not one favoured by Mr. John Burns, who, in a letter to the *Times* that day, said that there was no necessity for an Advisory Board, as one already existed at Spring-gardens, whose achievements were seen in the street improvements which had been completed by the London County Council in the last eighteen years. Although a member of the London County Council he could not help saying that he agreed with the Royal Commission that if there was to be a Board it should be an independent one. If the London County Council gave up its trade enterprises and its house-building, and so on, then it would be right that they should be the body selected. His feeling was that it was the duty of the London County Council to supervise only, and if they occupied themselves with that he would not say that they would not be a good tribunal. He agreed that the architectural treatment of all new streets was of momentous importance to London. They had no Architectural Minister or anyone even to direct the London County Council when they made new streets, and it was left to accident. He was much interested in what Mr. Waterhouse had said about a line of straight houses not being desirable, yet, if their streets were left haphazard he was sure the result would not be a good one, and he hoped there would be in the future some authority which would exercise some supervision over the streets. He endorsed what had been said about having too wide streets, for when they were over 100 ft. wide they were not only a detriment but a positive danger to traffic. How Mr. Waterhouse had managed to glide through London avoiding this and avoiding that was a positive miracle to him. He well remembered that when Mr. Fredk. Harrison was advising the scheme from Holborn to the Strand he took up a ruler and ruled

a line on the map, and said, "That is our new street," and that was how the plan was carried out. Possibly Mr. Hanson was right, but it certainly was an unusual course to take in planning out a new thoroughfare. As regarded the tramways, they naturally followed what were called radical lines. Unfortunately, they were now built, and they could not prevent them, and the difficulty was to connect them with belt lines when they got to the outskirts of London. They had designs at Spring-gardens for 11 route miles of tramways, at a cost of 8,000,000. or 9,000,000., and that was nothing to what they could do. If the London County Council were given another ten years it might be that the great proposal of Mr. Waterhouse would be carried out.

Sir Geo. T. Bartley, in seconding the resolution, said that, although a member of the Royal Commission which had been criticised, he should not enter at length on the subject, but it must be remembered that the subject the Commission had to consider was the traffic of London. While he acknowledged the great importance of architecture in changes which were made, still it was not their business to go into the architectural question very fully. Of course, that came in, and showed the difficulty of dealing with a question where one subject ran into another. The conclusion that the Royal Commission adopted the idea of these two new thoroughfares was hardly correct. The Commission had an Advisory Board, which recommended the thoroughfares, and what they recommended were merely what he might call broad outlines of a scheme. The Commission in its report was not bold enough to adopt these two thoroughfares, and he dissented from that. He believed that the whole solution of the traffic difficulty was in the creation of some large new streets. It was shown before the Commission that the traffic multiplied fivefold every ten or fifteen years, and this showed that new thoroughfares were needed to solve the problem for at least a century. It was a question which, he supposed, would never really be solved in one sense, as in ten years there might be things better than motors to give them travelling facilities. He would like to defend the Commission on the charge of having gone mad on tramways. He agreed that some of those who gave evidence appeared to have gone mad on this subject, for one suggested a tramway in Lombard street, and another a tramway going across a piece of Hyde Park. In his supplemental report he did suggest that they ought to wait and see if motor-buses would not do even more than tramways. At present motor-buses were in their infancy, but there was no doubt they would be a great advantage. The fact that they did not move on a rigid line was a great advantage in narrow streets, and when they got rid of the noise and smell he hoped they would be substituted for many of the tramways. They must remember, however, that the problem was the rapid locomotion of people for business purposes, and, to his mind, these avenues led to the solution, and particularly the east to west street, which was by far the most important of the two. Although motor-buses might take the place of many tramways, yet he thought that a subway under these great thoroughfares through which light railways or tramways would run would be an enormous advantage in the bringing of hundreds of thousands of people into London from the suburbs. As regarded an Advisory Board, he would resent the London County Council being made the tribunal, as he feared they would be under present circumstances. Not only did he think the London County Council had enough to do, but they must remember that the area which the Council governed was but a fraction of the area concerned in the locomotion of London. It would be monstrously unfair to make the London County Council the judge and jury when Middlesex, Surrey, Essex, and Hertford were all intimately connected with the question, and so the tribunal should be an absolutely impartial one, appointed by the Government of the day. The paper raised the architectural question, which was not specially before the Royal Commission. He felt its great importance, and he believed that if the avenues were ever made there was the chance of making London even more beautiful than it was. He was a Cockney,

and was proud of it, and he agreed with Mr. Waterhouse that the view of absolutely straight streets, as in New York, was not the pleasant form of architectural treatment of a street. He thought that turns and bends did enhance the beauty, and it was less fatiguing to walk along a curved street than a straight one, and if architects paid attention to that these thoroughfares, if ever constructed, would be not only commodious for traffic, but would give them a fine architectural city, as he believed of late years they had shown they were desirous of seeing London made.

Mr. H. H. Statham, in supporting the vote of thanks, said he was a little sorry to hear Mr. Waterhouse rather sum up against the idea of symmetry in the architectural treatment of great streets, although he noticed that he recommended it at certain points. It had been remarked by Mr. Grant Allen, the novelist, that Paris was a city, but London was a collection of villages. If they wanted a city to look like a great city it seemed to him its great thoroughfares should be treated with a certain degree of symmetry. He did not say that they should make the whole thing one design from end to end, but it should be divided up into blocks, which should have a certain harmony with each other. In regard to a single block, like a terrace, he had always thought that there should be symmetry of general treatment with perhaps differences in detail which did not affect the general design, but which gave each owner a little personal interest in his own house. He must say that he thought the argument that it was difficult to let or get rid of sites unless they allowed a free hand to the individual owner was made too much of. Something must be sacrificed for the public dignity of a city, and individual owners ought to be a little less selfish. They ought to consider that it was their duty to the public to give up something of their individual tastes for the sake of the grandeur of the city. In Paris they had to do so. They tried to alter some of the houses in the Place Vendôme, but it was not allowed, and he thought for a great city like London, with thoroughfares on such a large scale, that was a very important point. It was especially important when they came to anything like geometrical curves and crescents. The moment he saw the plans for the crescent road at the end of Kingsway he said that it should be treated as one design, and in the competitive drawings sent in as suggestions all the competitors, he believed, had so treated it. Of course, it was not going to be treated so, and they had lost it, but he could not help thinking that they had lost a great opportunity. Then, with regard to Mr. Waterhouse's proposition for a small circus round All Souls' Church, he quite agreed that All Souls' Church was a building worth preserving, but, in regard to circuses of too small a scale, they must remember that if they had several wide streets coming into such circuses they never realised to the eye that it was a circus. To make circuses was introducing rather an awkward shape for planning the houses, and he would rather say they should keep the open space as a square, as it would look better and be more convenient. He admired the way that Mr. Waterhouse had dealt with the question of "dressing up" streets in passing great buildings, and also the remarks he made as to the inconvenience of oblique streets. That was rather the pet fad of America, and they had already got a plan out for rebuilding San Francisco on that scheme. They knew what the effect of that was from the illustrations they saw in the architectural journals of America—the Grid-iron plan and the Flat-iron buildings. They could not have a worse architectural form for appearance or a worse and more inconvenient site for planning. He thought that was a point which Mr. Waterhouse had brought out exceedingly well. With regard to the scheme of the Royal Commission for cutting across the Green Park and through Devonshire House, he would say that, while Devonshire House was not beautiful architecture and was very old, still it was what was known as a historical London house, and they must judge such monuments not solely for architectural value but for their historical interest also. Therefore, a proposal to drive right through that house was a vandalism.

Sir Geo. Bartley pointed out that the idea was to tunnel under Devonshire House.

Mr. W. D. Caroe said it was rather distinctive of the feeling towards architecture in this country that the instructions to the Royal Commission did not make the slightest reference to architecture as even having any part in the question of traffic. If the instructions to the Commission had been to deal with the traffic of London consistently with making a dignified addition to the architecture of London that would have been better, and that would have been done in Paris or Berlin. He had looked at the report of the Royal Commission, and found that there was not a single reference to architecture in it. There was just one point Mr. Statham had mentioned as to symmetry through the whole course of a street of this kind as opposed to picturesque treatment. It had often struck him that the treatment of Regent-street by which each block between the cross-streets was treated as a single symmetrical block could not possibly have been improved upon. They secured a sufficient element of the picturesque and an essentially monumental treatment. Comparing Regent-street with Brompton-road they had a sufficient object lesson as to which was the better treatment.

Professor Beresford Pite proposed, in view of the importance and interest of the subject, that the discussion be adjourned till June 11.

Mr. Hudson seconded the motion, and it was carried.

Mr. Waterhouse briefly thanked the mover and seconder of the vote of thanks.

The Chairman announced that a business meeting would be held on June 11 to receive the Report of the scrutineers, the election of Council and Standing Committee for next session and to elect members. Mr. G. A. T. Middleton has given notice of his intention to move at the meeting, "That the Council be instructed to consider the practicability of including all architects practising in the United Kingdom within the scope of the Institute."

THE SOCIETY OF ARTS.

On Monday evening Mr. George W. Eve gave his second lecture on "Heraldry in Relation to the Applied Arts."

The first part was devoted to imaginary heraldic creatures such as the unicorn, griffin, and dragon, considered from both the symbolic and decorative standpoint, and all illustrated by curious fact and fable of the Middle Ages. Thus the unicorn, with head and body of the horse, legs and hoofs of the stag, and tail of lion, symbolised untamed natural vigour, and none could ever be captured save in one particular way—the method being that the hunters chased the unicorn towards a maiden who sat in the forest, and he, running towards her, laid his head on her lap and slept, whereupon his pursuers crept up and made him prisoner.

The griffin has the eagle's head, but with large ears, and the body of a lion—and the audience were reminded of the fact that the Temple Bar "Griffin" is a dragon. The latter, the symbol of evil terrible but overcome, is generally associated with St. Michael and St. George. The dragon varies in appearance according to the result desired, but in English practice always has four legs, as opposed to the wyvern, which has two.

Among heraldic birds, the eagle, holding the first place, is more important even than the lion, and generally symbolises imperial rule. This use dates from very early times; and later, as the badge of the Byzantine emperors, the eagle was woven in silk and textiles, and so, by way of Sicily, came into Western Europe. In mediæval times it was shown very conventionally and always "displayed," appearing as a bird soaring towards one, but in later practice it follows classical models, becomes more natural, and is often shown in profile. Among other birds were the peacock and pelican, symbols of immortality and eternal love, and the phoenix, one of the most beautiful, with crested head, and all coloured blue and gold.

Diapers were next considered, and are valuable when a rich effect is desired. They should, however, be introduced with discretion, and when used in connexion with a coat of arms, must bear no resemblance to a

"powder of charges." However, in the treatment of surfaces, such as wall hangings, it is legitimate to use diapers of badges or other heraldic elements.

In the choice of colours a good deal of freedom is allowable, always provided they are kept distinct and clear, and it should be remembered that the brightness of the mediæval examples was the necessary result of development in the open air.

Next in importance to the shield is the crest, which, at first of a fan shape, with the arms painted on, was later modelled in leather in the round. Crests were little used in the rough-and-tumble of actual battle, since they gave a dangerous handle for pulling down, but they became very important in the artificial and strictly-regulated tournament, and latterly grew to an enormous size. They were laced or bolted on to the helm, and tilted slightly back, to allow for the bearer's bending forward. Needless to say, they should always face to the front, in spite of modern examples to the contrary.

In conclusion, it was suggested that the use of models as an aid to designing would help to prevent such mistakes as that mentioned above.

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A METROPOLITAN district meeting of the members of the Association of Municipal and County Engineers was held at Battersea on Saturday. The presence of the President of the Local Government Board brought together an unusually large gathering of members from all parts of the country. Mr. A. E. Collins, M.Inst.C.E., President, occupied the chair, and there were present:—Messrs. W. Weaver (London), N. Scorgie (Hackney), T. W. A. Hayward (Battersea), O. E. Winter (Hampstead), P. Dodd (Wandsworth), J. Rush Dixon (Woolwich), B. J. Angel (Bermundsey), J. P. Norrington (London), W. Nisbet Blair (St. Pancras), W. Brooke (Strood), J. T. Eavrs (Birmingham), A. D. Greatorex (West Bromwich), J. S. Pickering (Cheltenham), T. Caink (Worcester), J. Lobley (Hanley), A. H. Campbell (East Ham), A. M. Fowler (Manchester), C. H. Cooper (Wimbledon), W. Harpur (Cardiff), W. Howard Smith (London), W. H. Prescott (Tottenham), A. H. Prescott (Eastbourne), J. W. Walshaw (Peterborough), and many others.

The Mayor (Councillor W. Rines) offered the Association a hearty welcome to Battersea.

Mr. Burns on Public Health and Sanitation.

The President of the Local Government Board (Mr. John Burns, M.P.) welcomed the members in the three-fold capacity of an engineer, the Member of Parliament for the constituency, and their official chief as President of the Local Government Board. Their work, with that of the medical officer, was the basis of that public health without which large communities could not exist. He congratulated the English engineers and surveyors on the excellent strides they were making through their profession to raise British municipal sanitation, not only to the first place, but to maintain the best traditions that the English people had of being the pioneers of health and sanitation for the rest of the world. Municipal engineers were often criticised by the indignant ratepayer, by the uninformed journalist, and frequently by public men who did not understand, and therefore could not appreciate the difficulties under which they carried on their fruitful labours. The council, in the first instance, decided what should be done, the ratepayer sometimes cheerfully assented, but more frequently grumblingly paid, but it was on the engineers' shoulders and through their hands that the work was carried out, and in their slow, stable, and enduring way they were straightening the crooked path for the rest of mankind to follow in every town and city in the country. They were always combating dirt, disease, and death in the interest, he was glad to say, of an increasingly-sober and educated democracy. London had many things to inspire the engineer, and to evoke both his scientific and artistic admiration. Cavour said it was worth coming from Italy to see the arch of Waterloo Bridge. No one could look at the Tower Bridge and not feel proud of that structure. No one could look at Blackwall tunnel completed, and the larger

Rotherhithe tunnel in construction, without having object lessons of solid, useful engineering triumphs for the health and convenience of that large city. There had recently been a wave of self-depreciation, and they had Paris idolised, and Berlin idealised, and were told to go to America, Vienna, and other places where they would find their municipal guides, philosophers, and friends. He did not share that depreciation, or identify himself with that criticism. On the contrary, he said, with the pride of a Londoner, that, taking into consideration its great size, its density of population, its physical and other difficulties, he knew no city in the world where the triumphs of the surveyor, the architect, and the engineer were so conspicuous. London was to him the most interesting, as he believed everyone would admit, the most fascinating gathering of mankind. If they could keep up the rate of progress of the last eighteen years, London, apart from being the most interesting and fascinating city, would begin to be as he wanted it to be, the most beautiful city in Europe. No city in the world had shown the progress in sanitary improvements that London had done, and the test of this was the low death rate. In 1870, with only 54,000 people, Battersea had a death rate of twenty-six per 1,000. In thirty years the population had grown to 175,000, or more than three times, and yet the death rate had dropped from twenty-six to fourteen per 1,000. What was more, infantile mortality had dropped in ten years from 176 to 131 per 1,000, and on the Battersea artisan estate, known as Latchmere Estate, the death rate was as low as eleven per thousand, almost equal to Brighton or Bournemouth, and the infantile mortality seventy-seven per 1,000, or twenty per 1,000 less than in the servant-keeping class of the West-end of London. What was true of Battersea was true of London, and also of the country.

The Litter of London Streets.

London had got a variety no other city could show. It had still left much picturesque. But it had still got a good deal of the cheap and nasty about it. In his opinion—and they saw it perhaps better than he did—London had got too many squalid, ugly, cheap, and nasty shops; too many ugly advertisements on flank walls, obtruding themselves everywhere. And, what was more, the streets of London were too often occupied by obstructions which impeded traffic, destroyed the decent appearance of the streets, and added to the litter and avoidable dirt that was too conspicuous in their public thoroughfares. They had got rid of the foul and noxious nuisances which used to be in London streets twenty-five to thirty years ago. What was the pest of London streets to-day? It was the trade litter; it was the shop refuse; it was the flying newspaper placard; it was the refuse from barrows, and the refuse from shops, and the daily dirt and litter in itself not particularly offensive or insanitary, was to the eye particularly repugnant to one who had a love of the tidy street.

What was more, there was no need for it. The borough councils were rapidly abolishing the system which made the shopkeeper pay for the removal of trade refuse. Now that the councils were removing trade refuse without payment, the cheesemongers and the egg seller should not take the opportunity, when no one was looking, of jerking that which he ought to save for election times under the passing tramcar or the fleeting horses' feet. They had no right to have their streets the repository of election eggs, rotten bananas, and decaying tomatoes, and he hoped the day was not far distant when they would see a conference of borough surveyors, with the Chief Commissioner of Police, the officers of the London County Council, and representatives of the shopkeepers and the costermongers all making up their minds to co-operate together to prevent the untidy refuse and litter in the streets of London being continued, and what was more, taking drastic steps to bring its abolition about as early as possible. He knew such a conference would be difficult to arrange, but he did not mind, as an impartial man, taking the chair. And he would even go further and suggest that, where the borough councils did not provide bins, the railway companies might provide large bins in the yards of railway stations into which cab-drivers and busmen and newspaper boys could put their

litter, instead of putting it down in the streets as they did now, to the indignation of every surveyor in the neighbourhood of large railway stations. He thought the time had arrived when a person like himself should tell the public that if they were as energetic for street tidiness as they were in blaming the surveyors for not bringing it about, it would be astonishing what an improvement would take place in the streets of London. They could see well-dressed men walking along the street throw away a newspaper, and, though he could understand some men wanting to get rid of some newspapers, no man had a right to take a four, six, or eight page paper open and extended, and, because he had done with it, throw it away on the side walk, and be a positive danger to any young and restive horse under whose nose the wind blew it. He believed, if the ordinary foot-passenger were to select the gutter for the discarded paper, and roll it up before he cast it down, it would add enormously to the tidiness and appearance of the streets of London. The untidiness of the individual citizen was often attributed to the neglect of the surveyor and his staff, and he sincerely trusted, if the newspaper men did not report anything else, they would report his suggestions to his fellow-citizens on how to make London litter less conspicuous than it was.

The President, on behalf of the Association, thanked Mr. Burns for the kind way in which he had received them. It was only the second time they had been honoured by the presence of the President of the Local Government Board. Ever since the Association was formed, municipal engineers had felt that, in many ways, they had not been fairly dealt with by the powers that be. He felt sure Mr. Burns would receive a deputation from their Association, and if they had any grievances he would put them right.

On the proposition of Mr. T. W. A. Hayward (Battersea), seconded by Mr. C. Jones (Ealing), Mr. J. Rush Dixon (Woolwich), was re-elected Hon. Secretary for the metropolitan district.

Battersea Public Works.

Mr. T. W. A. Hayward, Assoc.M.Inst.C.E., Borough Engineer and Surveyor, read a paper entitled "Engineering Notes on the Public Works of a Metropolitan Borough—Battersea." He said Battersea was in many respects a most interesting district of the metropolis. Originally a marsh-covered area, swamped by the river Thames at times of flood or high water, it had now, owing to the energy and enterprise of the several governing bodies who had from time to time had control of its municipal affairs, become one of the most healthy boroughs in London. The borough was 2,307 acres in area. The population was estimated at 200,000, and the rateable value was 1,163,119*l.* The rate for the current half year was 4*s.* 2*d.* in the pound. The general district rate was only 1*s.* 5*d.* in the pound.

The health of the district was exceptionally good, as the death rate for the year ending December, 1905, was only 14*·*4 per 1,000, as against 17*·*2 per 1,000 for the metropolis.

Battersea had been described in the past (and that description holds good to-day) as a high of industry.

The total number of streets in Battersea was 461, while the length when last recorded was approximately eighty miles. The widest street was 80 ft., and the lowest 20 ft., but more than 90 per cent. of the whole were 40 ft. wide. The proportion of ordinary macadam unfortunately ranked rather high, but the Council now recognised the advisability of paving the streets with more durable and economical material.

Battersea had adopted tarred-slag macadam to a considerable extent, with a view to obtaining a more impervious paving. The results obtained after two-years' wear had been most satisfactory, both in streets used mainly for vehicular traffic, and also in some of the by-streets, which were largely used as playgrounds by the children. In the latter case, it had been much appreciated, and medical evidence was strongly of opinion that it conduced to the better health of the inhabitants. Altogether about five and a half miles of streets had been paved with this material, several of which were main thoroughfares subjected to omnibus and other heavy traffic. In adopting this material for road-making, the principal point to bear in

mind was that the slag must be of the best quality. All honeycombed or otherwise defective material must be rejected. The mixing with tar should also be scientifically carried out, so as to ensure the right amount of tar only being used. This was essential, as, if too much were used, the road would not consolidate, and would only bring discredit upon all concerned. On the other hand, if too little tar was used, the surface became dry, and would readily break up. Subject to the material being properly selected and mixed in the right proportions, there was no doubt, in the author's opinion, that it would prove to be one of the best substitutes for ordinary macadam on our public highways. The cost worked out very favourably in London, as compared with Guernsey granite or similar material.

In side streets, where the traffic was only light, 3 in. or 3½ in. of material was ample, and could be laid at a cost of 3s. to 3s. 6d. per super. yard, whereas, on the more busy thoroughfares, where the traffic was heavy and concentrated, the thickness should be not less than 3½ in. to 4½ in. when rolled, in which case the cost would be from 3s. 6d. to 4s. 6d. per super. yard.

All the footpaths in the borough, with the exception of those in main streets, had been allowed during the existence of the late vestry to get into very bad condition. They were mostly paved with tar-paving made from the clinker refuse obtained from the destructor, and it was not until the year 1902 that the Borough Council took the matter seriously in hand. It was then decided to expend a sum of 50,000l., spread over a period of five years, or about 10,000l. per annum, provided a loan could be obtained for the work, and this scheme was now being carried out.

In Battersea, as in other boroughs, the havoc played with the carriageways and footways by the incessant openings for gas, water, electric light, telegraph, telephone, and other purposes had to be borne in mind, and to give some idea as to what this meant it might be mentioned that no less than 4,241 openings were made in the streets of Battersea during the year ending March, 1905.

Practically the whole of the land in Battersea available for building purposes was now built over. It was only when any of the few remaining old houses with large grounds came into the market that new streets were laid out.

Battersea had been alive to the importance of wide thoroughfares, and during the past twenty-five years a sum of about 100,000l. had been expended in street and bridge improvement works. This did not include the improvements carried out in conjunction with the London County Council, and to which that body had contributed. The cost of the latter improvements had amounted to an additional sum of 135,000l.

Battersea was well supplied with parks and open spaces, which no doubt partly accounted for the very low death rate. The chief of these was Battersea Park, abutting upon the river Thames, and comprising some 200 acres. It was laid out partly as a recreation ground and partly as an artificial lake for boating.

Wandsworth and Chapin commons, 200 acres of which were in Battersea, had also been greatly improved during recent years, accommodation being provided for cricket, football, etc., as in Battersea Park.

In addition to these, the Borough Council maintained a recreation ground at Christ Church-gardens, also a small recreation ground in Vicarage-road, formed partly by reclaiming waste land from the foreshore of the river Thames, and partly in connexion with an important street widening in that district. At the present time the Council were laying-out a recreation ground on the northern portion of their housing estate in the Latchmere district. This work was being done partly by help received from the Central (unemployed) Body of London, and partly by loan. Trees had been planted in the streets of Battersea to the number of 2,170.

At the present time 60,000 tons of house and trade refuse were being collected in Battersea per annum. Of this about one-third, which included garbage and trade refuse, was burnt in the destructor, the remaining two-thirds being sent away by barge. The destructor, which was of an early type, was erected some twenty years ago by Messrs. Manlove, Alliott, & Co., of Nottingham, and

was without forced draught. The destructor consisted of twelve cells constructed back to back, with one common flue midway between the two rows of cells, and although it was now out of date, it had done good work in the past. The Council had the question of the erection of an up-to-date destructor now under consideration.

The question of how often the refuse should be collected was a very wide one. In Battersea endeavours had been made to meet the wishes of the whole community, and in some cases the collection was made daily, except Sundays, in some three times and in others once a week, according to requirements.

A large quantity of artificial paving had been made by the works department from destructor clinker.

The Council, in 1904, purchased and erected one of Messrs. Musker's (Liverpool) three-mould hydraulic flag-making machines, and had since made the stones by machinery. The press was provided with three sets of moulds and dies to make slabs, 3 ft. by 2 ft., 2 ft. by 2 ft. 6 in., and 2 ft. by 2 ft. The machine worked at a pressure of 2,000 lb. to the square inch, and exerted a pressure of 500 tons on the slabs. The total cost of the plant was about 1,800l. Since its erection the machine had been in constant use, and at present worked by two shifts of men; at present a ganger and thirteen men were engaged in working the machine, and these turned out about 600 yds. per week.

The material used for the base of the slabs was composed of crushed clinker from the destructor, and Portland cement in the proportion of three to one, about 1½ in. thick, and the face was composed of ¾-in. granite grit and Portland cement in equal proportions. Several kinds of granite grit had been tried for this purpose, and experience had decided in favour of Norwegian washed grit not exceeding ¼ in. in size.

The cost of making the slabs and stacking complete, including all charges, was less than 2s. per yard; 64,000 yds. of machine-made slabs had been made and laid in the borough during the past two or three years.

In Battersea there were many instances where originally "premises within the same curtilage" were now premises not in the same curtilage. The total cost to Battersea during the last nine years of reconstructing drains which had become sewers had amounted to nearly 20,000l., and the liability of maintaining these sewers still continued.

The London County Council had, on several occasions, endeavoured to obtain Parliamentary powers to deal with this unjust state of affairs, and some time ago Battersea, in conjunction with other metropolitan borough councils, appointed a deputation to wait upon the President of the Local Government Board, but up to the present the desired relief had not been obtained.

Battersea was so intersected with railways that it had been necessary to construct a large number of bridges, both over and under such railways. These bridges were originally narrow brick arches, which had now nearly all been reconstructed, widened, and converted into steel girder bridges. This had invariably been accomplished by imposing the condition when the railway companies had promoted Parliamentary Bills for widening their lines, etc.

The great undertaking of electrifying the tramways south of the Thames by the London County Council was commenced in 1900, and up to date over forty miles of route had been converted. The Battersea lines were left undisturbed until last year, when negotiations were advanced sufficiently to permit contracts to be concluded for the conversion of the Westminster and Wandsworth tramways. The total extent of lines comprised in this scheme was slightly over six miles, of which considerably more than half was situated in the borough of Battersea. The most difficult portion to deal with in respect of widenings for tramways had been in Nine Elms lane. A considerable section of this road had a carriageway under 30 ft. in width, whereas, when the improvement had been completed, the least width would be 33 ft., and this only for a short distance. The operations in effecting this change had involved pulling down and rebuilding various warehouses and other buildings, and setting back of long lengths of boundary walls, and shifting a large number of mains from under-

neath the tramway area to the side of the widened roadway.

In no other part of London had the obstructions been so numerous, and it was expected, when the works were completed, that over 50,000l. would have been expended in removing obstructions for the six miles of route.

It might be very interesting to know that the Battersea Borough Council had been enterprising in respect of water supply. The cost of water for baths and other purposes was so excessive that the Council decided to attempt to obtain a supply of its own.

Four artesian wells were sunk on the site of the Latchmere baths to a depth of about 520 ft., and two of similar depth at Nine Elms baths, and one at the electric generating-station.

The pumps delivered into tanks, and were capable of lifting 10,000 gals. of water each per hour, so that, if need be, 60,000 gals. per hour could be pumped.

A tank was provided at each establishment for storage purposes, and in order to more rapidly fill the swimming-baths.

The greatest quantity of water pumped in any one day since the wells had been in operation was 400,000 gals., but considerably more could be obtained, particularly at Nine Elms, where the supply appeared most prolific, the level of the water in the boreholes never having been lowered.

The supplies were used for the swimming-baths, slipper-baths, public wash-houses, street watering, and the artisans' dwellings on the Latchmere Estate. The cost worked out at 3d. per 1,000 gals., but it should be pointed out that steam was already generated on the premises, and only a proportion of this was charged to the pumping account.

The town hall and municipal buildings were originally designed by Mr. E. W. Mountford, F.R.I.B.A., and were built by Mr. W. Wallis, the foundation-stone being laid on November 15, 1895, by the Right Hon. the Earl of Rosebery, K.G. The buildings had a frontage of 110 ft. to Lavender-hill, and a return frontage to Town Hall-road of 295 ft.

The style of the town hall and municipal buildings was Renaissance, and the facings were of red Suffolk brick, relieved with Bath stone, the roofs being covered with Westmorland slates. The cost of the buildings, including the recent alterations, new organ, etc., totalled 45,000l.

The borough possessed three libraries, the central library, Lavender-hill, in close proximity to the town hall, and branches at Lurline-gardens and Lamma Hall, Bridge-road West.

The electricity generating-station had an area of about 5,500 sq. yds., of which 2,900 sq. yds. were covered by buildings, leaving ample room for future extensions.

The maximum load registered on the station during 1905 was 1,515 k.w., and at the present moment, over thirty miles of mains were laid.

The whole of the work of erection of building, etc., was carried out by the Council's Works Department, under the direction of the Borough Engineer, at a cost of approximately 55,000l.

The Latchmere-road baths contained three swimming-baths, with a full complement of slipper-baths.

The ladies' swimming-baths, Burns-road, adjoined the existing Latchmere-road baths. They comprised swimming-bath, waiting-hall, dressing-room, six first-class and three second-class slipper-baths.

The whole of the work, including the ornamental wrought-iron gates and railings, and the steel roof trusses, was carried out by the Works Department at a cost of 8,100l.

The baths and wash-houses, Battersea Park-road, were in the Renaissance style of architecture, plainly treated, and had a frontage to Battersea Park-road of 137 ft., and a depth to Cringle-street of 265 ft.

They comprised swimming-bath, six men's first-class slipper-baths, thirty-two men's second-class slipper-baths, three women's first-class slipper-baths, nine women's second-class slipper-baths, public wash-houses and ironing-room, establishment laundry, boiler-house, and engine-room.

The buildings were erected with stock bricks, with red brick facings, relieved with Portland stone dressings, the whole of the work having been carried out by the Council's Works Department at a cost of 45,000l.

The swimming-bath was covered over in the winter, and the buildings were used for public meetings, dances, concerts, etc.

There were upon the estate 138 three-roomed tenements, 146 four-roomed tenements, twenty-eight five-roomed houses, one four-roomed house, and one three-roomed house, providing in all accommodation for 314 families. The height of all rooms was 8 ft. 9 in. in the clear.

The whole of the tenements and houses were fitted with kitchen, copper, bath, and sink, and the tenements on the first floor were provided with teak staircases, giving access to the back gardens.

An interesting feature in the living-room and scullery bath-room was the "Model Cottager" combined kitchen range, copper, and bath arrangements, which were manufactured and installed by Ellkay & Cornes, Ltd.

Each tenement had its own separate entrance and back garden, and the whole of the floors were fireproof throughout, being constructed of coke breeze, cement-concrete, and steel joists.

The houses were provided with electric-light fittings, and electrical energy was supplied on the penny-in-the-slot system.

The rents of the various houses and tenements were as follows:—Five-roomed houses, 11s. 6d. per week; four four-roomed tenements to Sheepcote-lane, 10s. 6d.; other four-roomed tenements, 10s. per week; three-roomed tenements, 7s. 6d. per week, which worked out at 2s. 6d. per room, exclusive of bathroom scullery.

The area of the land occupied by streets and buildings was 7 acres 3 roods $2\frac{1}{2}$ poles; the remainder, 3 acres 3 roods 35 poles, being built upon, but it was hoped that before long a portion of this would be available for the erection of three-roomed tenements, the remaining portion being left as a recreation ground, which was now being laid out.

The estate (although the buildings were not all completed at the time) was formally opened by the Right Hon. John Burns, M.P., who stated that, in his opinion, "by building this colony Battersea had contributed more to meet the alleged decadence of physique than all the articles that had ever been written in the newspapers, and the result of their scheme was a tribute to the unity of Parliament with other bodies."

The scheme on the Latchmere Estate proving so successful, the Council, having regard to the great necessity which existed for further working-class houses in Battersea (915 applications, in addition to those accommodated, having been received at that time for the tenancy of the houses and tenements on the Latchmere Estate), and to the fact that there was practically no other available housing land in the borough, decided to take the necessary steps to appropriate for such purposes certain surplus land at the rear of the town hall and municipal buildings, and which had been used by the Council chiefly as a depot.

Fourteen houses, each containing two three-roomed tenements, and four houses, each containing two two-roomed tenements, had been erected, accommodating in all thirty-six families. A new street, in continuation of Town Hall-road was also formed through a portion of the land. The living-rooms measured 14 ft. 7 in. by 10 ft. 7 in., bathroom scullery 8 ft. 9 in. by 7 ft. 3 in., and bedrooms 15 ft. by 8 ft. 9 in. One bedroom to each first-floor tenement was slightly larger, and measured 15 ft. by 11 ft. 6 in., exclusive of space over staircase.

The rents charged were 6s. 6d. per week for two-roomed tenements, and 8s. 6d. per week for three-roomed tenements.

The capital expenditure was 114,185/., which amount included 5 per cent. for establishment charges.

With the exception of the first year the estates had been self-supporting, and as the loan was paid off, and a consequent reduction in the interest, a substantial income would be derived.

Mr. J. Lemon (Southampton), in moving a vote of thanks to Mr. Hayward for his paper, said they could not find fault with the variety of paving in London, for they had something of everything. He thought they could get better results if they had a little

more uniformity in their roads. He had recently been visiting Berlin, and was much struck with the streets, which were all made of asphalt. Horses did not slip and fall down there, which he attributed to the fact that they were always travelling on the same material.

Mr. J. Lobley (Hanley) seconded the vote of thanks.

Mr. A. M. Fowler (Manchester) considered the tar-macadam roads at Scarborough the best he had ever seen.

Mr. O. E. Winter (Hampstead) was of opinion that in London refuse should be collected at least twice a week, and he was rather surprised that Battersea had not come up to date in that particular.

Mr. R. J. Angel (Barnes) did not think sufficient work could be secured from men working in the streets at an advanced stage of life. Instead of men going to the Union, they were pushed on to the Surveyor, who had to put up with a very inferior class of workman. As a member of the Royal Institute of British Architects, he very much objected to a statement in the paper as to the artisans' dwellings. It was stated that the Borough Engineer was asked to prepare plans for the artisans' dwellings, but, having failed to obtain a satisfactory design, a competition was inaugurated, plans were invited, and the designs chosen. Having got the successful architect's plans, the Borough Engineer was instructed to prepare revised plans based upon the premiated design. That he regarded as a very retrograde proceeding, and one which ought to be discouraged in any council which aimed at purity in commercial life.

Mr. Norman Scorgie (Hackney) pointed out how small a proportion of the rates the borough councils were responsible for. In Battersea, of the total rate of 4s. 2d., only 1s. 5d. was for expenditure over which the Borough Council had control. He could not congratulate Battersea that no man was employed on the roads under forty years of age. He regarded it as wrong to the men, as they could not put in sufficient years of service to get proper superannuation. Battersea was suffering, as they were all suffering, from the confusion in the law as to sewers *versus* drains. Battersea's contribution to the property owners had exceeded 2,200. per annum for the last nine years. His experience was the same, and it might safely be said that the ratepayers of London were paying 50,000. a year which the owners should morally and equitably, if not legally, undertake.

Mr. A. H. Campbell (East Ham) was of opinion that a Works Department, given plenty to do, and not tied up with red tape, would give good results to the district it served. But until such time as the councils made up their own minds, these Works Departments would not be the success they could otherwise attain.

The President remarked that he found the proper addition for establishment charges was 10 per cent.

The vote of thanks, having been passed, Mr. Hayward, in reply, referred to the experiment in tar-macadam made by the London County Council on the Thames-embankment after inspecting the roads at Battersea. They put down three sections—slag, granite, and limestone. After four months the limestone was worn through, the granite broke all to pieces, but the slag was as good to-day as when it was put down.

The members were then entertained to luncheon in the grand hall by Mr. Hayward, and in the afternoon proceeded in motor-omnibuses to inspect the artisans' dwellings in Latchmere-road, the swimming-baths, the works' depot, and other public works. On returning to the municipal buildings tea was served.

SURVEYORS' INSTITUTION JUNIOR MEETING.—The annual dinner held in connexion with the junior meetings of the Surveyors' Institution took place at the Trocadero Restaurant on May 16, the chair being taken by Mr. G. P. Knowles. There was a large attendance of members, and the invited guests included Messrs. Howard Martin, A. R. Stenning, E. B. Tanson, H. Chatfield, Clarke, C. Longridge, J. H. Townsend Green, M. C. Elwell, W. H. Elwell, H. Courthorne Munro, W. A. Hawes, A. Goddard (Secretary of the Surveyors' Institution), S. Cutler, and Adam Hunter. During the course of the evening a presentation was made to Mr. Sydney A. Smith, the Hon. Sec., by the members of the Committee to commemorate his term of office.

THE ARCHITECTURAL ASSOCIATION: ANNUAL DINNER.

THE members' dinner of the Architectural Association took place on Thursday last week at the Georgian Hall, Gaiety Restaurant, Strand, Mr. E. Guy Dawber, President, in the chair. There were also present—Sir Henry Tanner, and Messrs. R. S. Balfour, President-Elect, Arthur Bolton, Cole A. Adams, Louis Ambler, A. H. Belcher, Walter Cave, Basil Champneys, J. D. Crace, Owen Fleming, W. A. Forsyth, K. Gammell, E. Greenop, Alexander Graham, Leslie W. Green, H. A. Hall, E. T. Hall, H. T. Hare, F. Hooper, Arthur Keen, H. Lovegrove, G. H. Lovegrove, John Murray, J. Douglass Mathews, H. P. G. Maule, G. Northover, M. G. Pechell, W. A. Pite, Ernest Runtz, J. Osborne Smith, H. Tanner, jun., A. H. Ryan Tenison, Maurice E. Webb, W. Wonnacott, D. G. Driver, Secretary, and others.

The toasts of "The King" and "The Queen and Royal Family" having been honoured.

Mr. Arthur Keen proposed "The Royal Institute of British Architects," coupled with the name of Mr. Hall. He said that for them to honour that toast was almost akin to proposing their own health, as so many members of the Association were members of both societies. He was sure that they would accept the toast with enthusiasm, for he thought that all of them believed that the Institute represented the best interests of the profession. The Council were alive to what was taking place around them, and were doing their best for the profession, and the Association wished them every success in their work. The Institute took a great interest in the Association, and the Association was grateful to them for doing so.

Mr. Edwin P. Hall, in reply, said that the Institute felt the keenest sympathy with all that was done in the Association, and they admired its spirit, ability, and, above all, its enthusiasm. Youth, it was said, was the father of man, and we the older sons had to borrow from them, hoping to retain that enthusiasm which prevailed in the junior society. It was in that way only that the elder men could hope to hold their places, for it was astonishing, when they walked through the Association rooms, to see the excellent work which was done, and which made one feel that one would have to take a back seat in the competitions of the future. That state of affairs was largely due to the active interest the Committee took in the Association; but there was one man he should like specially to mention—i.e., Mr. Maule, who so ably directed the day school, for Mr. Maule and his assistants were keenly interested in everything which was done in the schools, and the young men who went there owed the gentlemen a debt of gratitude for the interest they took in them. The Board of Education connected with the Royal Institute of British Architects took the greatest interest in the schools, and Sir Aston Webb and Mr. Basil Champneys both took an active share in their work, and had the best interests of architecture at heart. As was generally known, the Board of Examiners of the Institute had decided, with the concurrence of the Council, that the four years' course in the schools of the Association should exempt men from the Intermediate examination. There had been rather exciting times at the Institute lately. The burning question of registration had been before them, but he thought they would all agree that the best register they could have was that of earnest work, zealously and strenuously achieved, and to that alone should a man owe the reputation he might make in the world.

Mr. Ryan Tenison then proposed "The Architectural Association," and in the course of his remarks he referred to the great progress which the Association had made within his recollection—more lectures, much finer premises, and a rapidly-increasing membership. Anyone seeing the work done in the classes and the schools, and knowing the work which had been accomplished by the Association, must be proud of what had been done, and he hoped that the progress would be as rapid in the future as in the past. With the toast he coupled the name of the President, Mr. Guy Dawber.

Mr. Dawber, who was very heartily received, in acknowledgment, said he felt very deeply the kindness and help which the

Council of the Association during the last two years had given him. Without that help the duties of the President of such a large body would be most difficult to carry out successfully. The President, the Council, and all the members of the Association were under a debt of gratitude to the Hon. Secretaries and the Secretary, Mr. Driver, and they would unite with him in offering their best thanks to their Secretary for all he had done, and was likely to do. The position of the Association in the architectural world was well assured, and they were well established in their new home in Tufon street. Every year the membership was increasing, and he was glad to say that the building debt had been greatly reduced, and it did not want much to relieve them of it altogether. Educationally, they had progressed by leaps and bounds, and the Association could now fairly claim to be the chief architectural educational body in the country, and the work the students did in the schools was equal to anything done in any other architectural educational body in the country. As had been said, they were under a deep debt of gratitude to Mr. Maule, the master of the day school, but they must not let the occasion pass without expressing their gratitude to Mr. F. T. Green for the way he is working the evening school; the two masters, with their friend, Mr. Lewis, had done all that could possibly be done to make the educational work of the Association the great success that it is. Last year, he said he trusted that the social side of the Association would not be neglected, and he was glad that, during the past session, they had established an athletic club and a social and dramatic club, and he felt sure that this would tend to unite and bind together the members of the Association in a way which would conduce to a spirit of good fellowship. He desired to introduce to them their new President, Mr. Balfour, whose work as an architect they knew. Mr. Balfour had been Hon. Secretary for four years, and he had also been Vice-President. The welfare and honour of the Association would be well maintained in his hands.

Mr. Cave then briefly proposed the toast of "Our Guests," coupled with the name of Professor Hume, who replied, remarking that one of the pleasures of this annual meeting was to meet old students, and put aside for a short time the burden and turmoil of life. An informal toast was then proposed by Mr. Clapham. He said that the building debt was still 8000*l.*, and it was a disgrace to the profession that they had not wiped it off long ago. The Purple Patch had started a shilling fund in aid of the debt, and he desired to bring this to the notice of the 1,500 members of the Association. Every shilling given to the fund would be doubly given—it would be a parting tribute to a hard-working President, and the best compliment they could show to the incoming President was to let him take office with the debt removed. The toast he proposed was, "Death to the Building Debt."

The toast having been drunk, the proceedings terminated.

THE SURVEYORS' INSTITUTION: COUNTRY MEETING AT BIRMINGHAM.

The Council accepted an invitation from the Warwick and Worcester Provincial Committee to hold their Country Meeting this year at Birmingham, on May 24 and 25.

The Right Honourable the Lord Mayor of Birmingham (Councillor Alfred John Reynolds) received the visiting members at the Council House on the 24th inst., and delivered an address of welcome on behalf of the Corporation.

By the courtesy of the Lord Mayor and Corporation the general meeting of the Institution was also held in the Council House. Immediately after the reception by the Lord Mayor the chair was taken by the President of the Institution.

The business of the morning sitting consisted of the reading and discussion of the following papers:—

- (1) An address by Sir Oliver Lodge, F.R.S.
- (2) "The History of Birmingham," by Mr. H. A. Pritchard.
- (3) "The Economic Geology of the Birmingham Country," by Professor Charles Lapworth, F.R.S.
- (4) "Proposed Legislation affecting Real Estate," by Mr. John Willmot (Fellow).

At the conclusion of the morning meeting the members of the Warwick and Worcester Provincial Committee entertained the visiting members at luncheon at the Grand Hotel.

After the luncheon arrangements had been made to enable members to visit places of interest in and near Birmingham. Visits were also to be made to:—Messrs. Callery's model village at Bourville; the Wolseley Tool and Motor-Car Company's Works, Salley; Messrs. Eldington's Electro-Plate Works; and Messrs. Osler's Glass Works; the generating station of the City Electric Supply Department in Summer-lane; and the New University.

The dinner was to be held at the Grand Hotel on the 24th inst.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, Alderman Spicer, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Islington Borough Council 2,000*l.* for works at public baths, 2,000*l.* for site for public library, and 1,776*l.* for street lighting and pipe sewers; and Lewisham Borough Council 25,554*l.* for paving works, etc.

Main Drainage Extension: Middle Level Sewer.—The Main Drainage Committee recommended:—

"That the estimate of expenditure on capital account of 16,600*l.* submitted by the Finance Committee for the construction of the portion of the middle level sewer No. 2 from Old Ford to Queen's road, Shoreditch, and of a branch sewer across London-fields connecting this sewer with the existing high-level sewer, such estimate including the cost of supervision, general incidents, etc., be approved."

List of Contractors Selected to Tender.—The Education Committee recommended, and it was agreed:—

"That, subject to the conditions specified hereunder, the names of the undermentioned firms be added to the list of contractors to be invited to tender for structural alterations, repairs to buildings, etc.—H. Brazg & Sons, 19, Rolsart-street, Brixton-road, works not exceeding 1,000*l.* in value; P. J. Gerrard, Point-hill, Greenwich, works not exceeding 2,000*l.* in value.

That the names of the undermentioned contractors be retained on the list of contractors to be invited to tender for works in connexion with schools on probation for a further period of one year as from May 16, 1906:—Balfour, Fane, & Co., 298 and 300, Goswell-road, Islington; W. & J. Freys & Co., 11, Old Queen-street, Westminster, heating works; R. Harding & Son, 75, Aroldene-road, Brixton, cleaning, painting, etc.; J. Banks, 2, Howard's-lane, Islington, repairs to buildings, cleaning, and painting; W. Penn & Co., 5, The Broadway, Highbury-park, cleaning and repairing blinds.

That the names of the undermentioned contractors be retained on the list of contractors to be invited to tender for works in connexion with Council schools, on probation for a further period of six months as from May 16, 1906:—Prait Bros., Bradford-street, Birmingham, supply of ironmongery; J. Knight & Sons, 24, Gertrude-street, Chelsea, repairs to buildings and cleaning and painting.

That Palowkar & Sons, of 50 and 51, Queen-street, Clerkenwell, Manchester, firms who have recently been re-constituted, be allowed to tender for heating works. That J. Esson & Son, Ltd., of 102, 7, Peter-lane; W. H. Lascelles & Co., Ltd., of Binhill-row; L. Teale & Co., of 48, Woodhouse-lane, Leeds; Stevens & Sons, of 14, Yonge-park, Seven Sisters-road; and the Lancashire Heating Company, Ltd., of 11, Temple-street, Manchester, firms who have recently been re-constituted, be allowed to tender as heretofore.

That the names of the undermentioned firms who do not desire to tender for cleaning and painting work be removed from the list of contractors to be invited to tender for such work in connexion with Council schools:—W. & B. H. Davey, Ruskin-lane, Victoria-avenue, South-end-on-Sea; H. Lovatt, Ltd., Darlington-street, Wolverhampton; Waring White Building Company, Ltd., 14, Cockspur-street; T. Whitehead & Co., Ltd., Portland-place North, Clapham-road."

Cooking-grates.—The Public Health Committee reported as follows on the recommendations of the Inter-Departmental Committee on Physical Deterioration:—

"The Committee point out that 'in tenement houses often only one room in the whole house contains a grate of proper service for cooking, with the result that a large number of tenements do not contain the requisite apparatus for the preparation of food.' We have had before us a report by Dr. Young, who until recently was in the service of the Council, on 'Houses Adapted as Tenement Houses,' in which the question was considered. The medical officer, in presenting Dr. Young's report, stated that, as the result of inquiry made by the Council's inspectors, it was found that 'of 739 tenements of one, two, three, and four rooms, a third of the tenements there was no oven in which food could be baked, the fire-grate being the same as that provided when the house was originally constructed, or of the same kind, and not more

adapted for cooking purposes than an ordinary bed-room grate. This condition was found especially in tenements of one room, more than half of which were so circumstanced; in tenements of two rooms about a quarter were without coal fire or gas oven for cooking purposes, but in tenements of three or four rooms (all oven) heated in one or other of these ways was always found to be provided. In tenements of one room in which an oven was provided this oven was always heated by a coal fire, in exceptional instances the oven was associated with a gas stove, and in one or two instances the tenement had both. In tenements of two rooms provided with an oven, in about 85 per cent. the oven was heated by the fire-grate, in about 2 per cent. there was a gas cooking stove, and in about 12 per cent. there were both. In tenements of three or four rooms an oven was found, with a single exception, in association with the coal fire-grate, and in 16 per cent. of these tenements there was also a gas cooking stove. It was often found that no provision had been made for carrying off the products of combustion of such gas stoves. In giving evidence before the Committee, the medical officer drew attention to this subject, and that Committee has arrived at the conclusion that the law should require a grate suitable for cooking to be provided in every tenement let for the occupation of a family. We propose to meet with this point when submitting our recommendations as to public health legislation to be sought in the session of 1907."

Fire-resisting Scenery.—The Theatres and Music-halls Committee reported as follows:—

"The Council on March 1, 1904, included in the rules to be observed by licensees of premises licensed by the Council for public entertainments, one requiring that "All scenery, wings, sky borders, cloths, draperies, gauze cloths, floral decorations, properties, hangings, curtains, etc., whether on the stages in the auditorium, or in other parts of the premises, must be rendered and maintained non-inflammable. The Lord Chamberlain subsequently issued a similar rule with regard to the use of scenery in his jurisdiction. Before March, 1904, it had only been necessary to render fire-resisting the hangings, curtains, and draperies used in places of public entertainment, and not the scenery. It was to be expected, in view of the considerable trouble and expense which it occasions theatre managers, that the rule made in March, 1904, would at once meet with general acceptance, and until recently reports made to us by the chief officer of the fire brigade of non-compliance with the rule were very numerous, more especially in the case of scenery brought into theatres by touring companies. The practice which is generally adopted for complying with the rule is to dip the lighter fabrics in a solution made from one or more of the chemical salts technically known as 'antipyres' (ammonium phosphate, borax, alum, etc.), and as regards the scenery generally, to brush over the back of the canvas and woodwork with this solution.

The method adopted by the Council's officers for testing whether the scenery is fire-resisting is to obtain samples, selected at random in the presence of the manager, from the scenery to be tested, and to subject these samples to the headquarters of the fire brigade to the flame from a plumber's portable lamp, the temperature of the flame being about 1,000 deg. F. If when subjected to this test the samples do not support flame, the scenery is deemed to possess the requisite degree of resistance to fire. Complaints have been made from time to time to the Council and the Lord Chamberlain that the superficial treatment of the scenery with fire-resisting solution is of little, if any, use in making it fire-resisting, and it has been urged that only scenery formed of wood and canvas which has been thoroughly impregnated with fire-resisting solution should be allowed to be used in theatres and music-halls.

We have accordingly given careful consideration to the question whether it is necessary and practicable to insist upon the adoption of some more thorough method than is generally employed for rendering scenery fire-resisting, and to this end in arriving at a decision on this point we arranged for the chief officer of the fire brigade to submit in our presence to the usual test imposed by him samples of materials which had been treated with fire-resisting solution and similar portions of materials which had not been so treated. In all thirty-three tests were made, the articles tested consisting of scenery cloth, profile boards, wooden scenery battens, artificial flowers and palms, hay, straw, gauze cloths, muslin, chintz cloth, flannel, etc., and linen.

As a result of the tests, we are of opinion that the degree of fire-resistance obtained by dipping light fabrics in the fire-resisting solutions usually employed is quite satisfactory, and that as regards the scenery generally the degree of the safety which is attained by brushing over the back of the canvas and the woodwork with fire-resisting solution is all that can reasonably be required. It is therefore, in our opinion, unnecessary to insist that the woodwork and canvas of scenery which has been so treated should be thoroughly impregnated with fire-resisting solution.

It appeared to us probable, however, that as regards the canvas and woodwork of scenery, which has only been treated superficially, the efficacy of the treatment might be impaired when the scenery was in constant use, but we are not in a position to form an opinion as to the extent of the deterioration likely to take place, or consequently, as to the frequency with which scenery in such a position should be re-treated. We have, therefore, instructed the chief officer of the fire brigade to collect evidence on this point and report to us thereon in six months' time. We report the course taken for the information of the Council."

Proposed New Asylum.—The Asylums Committee reported as follows:—

"The number of lunatics on January 1, 1906, for whom the Council was responsible under the Lunacy Acts to provide accommodation (including patients on the private list and private patients at

the Manor Asylum and Claybury Hall), was 18,598. The total beds in the London asylums on that date was 17,078, showing a deficiency of 1,520. The average annual increase of lunatics in the County of London since 1880 is 527, but the average for the past five years is 614. The preparation of plans and estimates, and their approval, and the subsequent erection and equipment of an asylum will cover a period of at least five years. At the estimated rate of annual increase (550 a year) the number of lunatics for whom the Council will be responsible to find accommodation on January 1, 1911, will amount to 21,348.

The accommodation in course of erection, or contemplated, is as follows—Longgrove Asylum, Epsom, 2,015 beds (superstructure now being erected); Bexley Asylum (additional villa), 50 beds (in course of completion); addition to Colney Hatch Asylum, 315 beds (in place of buildings destroyed by fire); addition to Manor Asylum, 240 beds—total, 2,617. Add present accommodation, 17,078—total accommodation on January 1, 1911, 19,695.

If by this date an additional asylum for 2,000 patients were provided, the total accommodation would be 21,695 beds. This would be more than sufficient to meet the estimated patient population on that date (21,348) but with a continuation of the increase of patients the vacant beds would be filled during the year 1911.

It is, therefore, apparent that the commencement of a new asylum should be no longer delayed. There are many points to be taken into consideration in the choice of a site for an asylum, e.g., its accessibility for patients and their friends, the soil and contiguity to the building proposed, and the proximity of a railway, which would considerably affect both the cost of the building and thereafter the cost of coal and other supplies. We have mentioned these facts as a justification of our proposal to recommend the purchase of a new site whilst some 350 acres on the Horton Estate remained unappropriated for asylum purposes. Having regard to the views of the Finance Committee, we now recommend the Council to utilise the unappropriated area of the Horton Estate for the new asylum.

The asylum which it is proposed to erect will be a departure from the present type of building, being designed entirely upon the villa principle. It will be divided into two sections, i.e., a hospital section and a chronic section, and in connexion therewith there will be provided a chapel, recreation hall, administrative centre, stores, kitchen, boiler-house, bath-house, workshops, laundry, isolation hospital, and staff quarters, all to be covered by the buildings will be approximately 40 acres. We are not at present in a position to give any estimate as to the cost of construction of an asylum built upon the lines suggested, as it is entirely a new departure in asylum construction so far as Great Britain is concerned, although the villa principle is adopted to some extent in other countries, notably in the County of London, and we believe that the more home-like surroundings of an asylum built upon these lines, as compared with the usual "barrack" type of building, will have a beneficial effect upon the patients. Facilities will also be afforded for a more extended classification of patients than is possible in an ordinary asylum. Another advantage of this scheme of asylum construction is that it lends itself readily to reduction or extension. Before we are in a position to inform the Council of the probable cost of this building, it will be necessary for a detailed scheme, working drawings, and estimate based on bills of quantities to be prepared, and for this purpose it is estimated that a sum of 9,000 will be required. We recommend (a) That the estimate of expenditure on capital account of 9,000, submitted by the Finance Committee in respect of the preparation of plans, estimates, etc., in connexion with the proposed erection of a new asylum on the Horton Estate, be approved. (b) That an expenditure not exceeding 9,000 on capital account, be sanctioned for the purposes referred to in recommendation (a).

The consideration of the matter was deferred.

Colney Hatch Asylum: Erection of Additional Buildings.—The same Committee reported as follows:—

On March 1, 1904, the Council authorised an expenditure of 1,500, for the preparation of plans, etc., of permanent buildings to be erected at Colney Hatch Asylum to accommodate 310 patients and the necessary staff in place of the temporary buildings (which housed 320 patients and staff) which were destroyed by fire in 1903. We then reported that the cost of the proposed buildings was estimated at from 60,000 to 70,000, exclusive of equipment.

We are now in a position to submit an estimate of the total cost of erecting and equipping these buildings, which, as regards the cost of erection, is based on priced bills prepared by a firm of quantity surveyors.

The scheme for the accommodation, set out in preliminary sketch plans, has received the informal approval of the Commissioners in Lunacy. It provides for the erection of seven buildings, five being connected with a covered way open at the sides on the site of the late temporary buildings, and two detached buildings on other suitable sites. These buildings will provide accommodation as follows:—

	Dormitory.	Single Staff room.	
One villa for boys	36	4	3
One block for phthisical cases	20	4	2
One infirmary block	42	6	4
One infirmary block	42	6	4
One block for chronic cases	54	6	3
One block for acute cases	54	6	3
One block for dysentery cases	26	2	1

A mess-room, general bathroom, and accommodation for head attendant will also be provided in connexion with these blocks. The buildings of ground floor height, and the estimated cost of their erection, and the engineering works involved, is as follows:—Building work (quantity surveyors' priced bills, 1902), including the covering of the building, 750; padded rooms, 675; engineering works (heating, lighting, hot and cold water services, telephones, fire-alarms and a local boiler for the public hospitals and boys' villa, which are detached from the other buildings), 6,650; paths and drainage for airing courts, tar-paving, and fencing, 1,750—total, 55,207.

The estimated cost of the equipment of the buildings, including the cost of laying out and planting airing courts around them, is 5,500, the total cost of the buildings and equipment being (say) 62,000, or 197l. 3s. per bed. We would remind the Council that the original equipment of the temporary buildings was lost when they were burned down, otherwise this would have been available for transfer to the new buildings. The money recovered from the insurance companies in respect of the buildings destroyed, including equipment and fixtures, was 17,700, and this sum was paid over to the Council. We propose to have the necessary erection of the superstructure, which will be carried out under the supervision of the asylums engineer, whilst the foundations will be put in by men directly employed under the Council's office. We recommend (a) That the estimate of expenditure on capital account of 62,000, submitted by the Finance Committee, in respect of the erection and equipment of additional buildings at Colney Hatch Asylum, be approved. (b) That expenditure, not exceeding 62,000, on capital account, be sanctioned for the purposes referred to in recommendation (a).

The consideration of this matter was also deferred.

Manor Asylum: Erection of Additional Buildings.—The Committee also reported:—

On June 28, 1904, the Council authorised an expenditure of 1,300 for the erection of villas, etc., of two villas to be erected at the Manor Asylum, each to accommodate sixty female patients and the necessary staff. The asylum at present accommodates 472 patients (222 females and sixty males), and it is proposed to increase the numbers to 1,000. The scheme of enlargement allows of it being gradually carried out so as to minimise the difficulties which will consequently arise in the administration. Part of the work in connexion with the scheme has already been executed, i.e., the laundry, bakery, and main kitchen have been extended to meet the requirements of the extra patients eventually to be accommodated, a disinfecting house and apparatus have been provided, and an isolation hospital is in course of construction. The Council having voted the necessary money for these works, we now propose to continue the enlargement by erecting two blocks, each to accommodate sixty-four patients (female) and a block to accommodate two head attendants and twenty-six nurses (to replace an existing block, which accommodates nine nurses and one head attendant, part of the temporary structure).

Preliminary plans of the buildings referred to have been prepared and informally submitted to the Commissioners in Lunacy. The buildings will be similar in character to the villa now accommodating male patients, and those for the patients are of ground floor height only. Although primarily designed for acute cases, the blocks will be so constructed as to enable them to be utilised, if necessary, for infirmary cases. The walls are to be brickwork throughout and the flooring of deal battens on sleeper walls. The heating will be by low-pressure steam (as in existing structures) and the buildings will be lighted by gas. The estimate of cost of erection and equipment of the buildings, drainage, heating, hot and cold water supplies, gas services, telephones, etc., systems, airing court paths and fencing, and the making up of a road 10 ft. wide to connect the road outside the present airing courts and the main drive. The total estimated cost of the work now proposed to be proceeded with is 22,000, made up as follows:—Quantity surveyors' estimate, including drawings, 16,870; padded rooms, 150; road, paths, drains, and gullies (including tar-paving), 860; engineering work (which includes heating, lighting, hot and cold water services, telephones, fire-alarms, etc.), 1,920; equipment at 15l. 10s. per bed, 1,984—total, 21,824, (say 22,000).

The total cost per bed for building and equipment is, therefore, approximately 172l. We would point out, however, that the nurses' block to be erected provides accommodation for a larger number of nurses than is required for the patients to be immediately accommodated, although not for the total number for the completed scheme.

The mains included in the engineering works are of sufficient capacity to meet the requirements of the further buildings to be erected later on to complete the scheme.

We propose to invite tenders for the works, which will be carried out under the supervision of the asylums engineer. We recommend (a) That the estimate of expenditure on capital account of 22,000, submitted by the Finance Committee in respect of the erection and equipment of two new blocks, staff quarters, etc., at the Manor Asylum, be approved. (b) That expenditure not exceeding 22,000, on capital account be sanctioned for the purposes referred to in recommendation (a).

The consideration of this matter was also postponed.

Victoria Embankment.—The Highways Committee recommended, and it was agreed:— That expenditure, on maintenance account, not exceeding 5,000, be sanctioned for re-metalling the carriageway of the Victoria Embankment; that it be referred to the Works Committee to execute the work generally as a jobbing work; that the Highways Committee be authorised to arrange for experimental

lengths of special paving to be laid; and that the seal of the Council be affixed to any necessary documents relating to such experimental paving works.

Totterdown Fields Estate: Erection of Cottages and Shops on Section B.—The Housing of the Working Classes Committee reported that, on July 12, 1904, the Council accepted the tender of Messrs. F. & F. Higgs for the erection of cottages on section B of the Totterdown Fields Estate, Tooting, and on July 25, 1905, approved a variation of the contract so as to allow of the erection of blocks Nos. 46 to 54 in accordance with a modified specification. Several blocks of cottages either have been or are about to be completed, but five blocks, included in the original contract and consisting of twenty-one cottages and two shops, still remain to be commenced. The contractors have offered to erect these five blocks in accordance with a modified specification for the sum of 9,650, including 275, as provision money, and to undertake the work upon terms and conditions of contract similar to those adopted for blocks Nos. 46 to 54. The Committee recommended:—

That the contract with Messrs. F. & F. Higgs, for the erection of cottages on section B, of the Totterdown Fields Estate, be varied to allow of the erection of blocks Nos. 55 to 59, both inclusive, in accordance with a modified specification, at a cost of 9,650, inclusive of 275, set apart as provision money for the work, and that the contractor do prepare and obtain the execution of a supplemental agreement to give effect to such arrangement, and that the seal of the Council be affixed to such agreement when ready.

Fulham Palace-road and High-street: King's Head Public-house.—The Finance Committee reported as follows:—

In accordance with the instructions of the Council on November 28, 1905, passed upon the recommendation of the Improvements Committee, we are arranging for the payment to Messrs. Harrington & Co., of 4,000, being part of the consideration for the settlement of their claim in respect of the freehold interest in and (by an acre of land which it was found necessary to acquire by agreement with the Council) the site of the public-house, a sum of 60,000, making a total expenditure of 64,000, exclusive of legal and other incidental costs. The only return for this expenditure is that the Council has obtained the (by an acre of land which is needed for the widening. The licence of the public-house has not been extinguished, the benefit of such licence having been conveyed to the freeholders—this being a condition attached by them to their acceptance of the 4,000, above mentioned. The net result of the transaction is, therefore, that the Council has paid more than 64,000 for about 1/4th of an acre of land which, considering the locality and the fact that the licence has not been extinguished, appears to us a very expensive transaction. We understand, however, that connected with the present case, there were exceptional circumstances which, in the opinion of the Improvements Committee will explain to the Council.

Improvements.—The following recommendations were made by the Improvements Committee:—

That the estimate of expenditure on capital account of 1,150, submitted by the Finance Committee in respect of the widening of Darimouth-road, Fore-st-hill be approved.

That the estimate of expenditure on capital account of 1,441, submitted by the Finance Committee, in respect of the widening of Putney-hill and Upper Richmond-road, be approved.

The Council, having transacted other business, adjourned.

APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Clapham.—Buildings on the southern side of High-street, Clapham, to abut also upon Aristotole-road and Cato-road (Mr. J. Donkin for the Trustees of the Pease Estate).—Consent.

Hammersmith.—Retention of a show case in front of No. 340, King-street West, Hammersmith (Mr. G. H. Varnell).—Consent.

Holborn.—A projecting clock in front of Messrs. Griffin & Sons' premises, Kemble-street, Holborn (Messrs. J. J. Griffin & Sons, Ltd.).—Consent.

Kenington, South.—Retention of a wooden oriel window at No. 3, Holland-lane, Kenington, abutting upon Holland Park-road (Mr. J. A. Minty for Mr. W. T. Lord).—Consent.

Lewisham.—Projecting porches over the doorways of Nos. 32 and 34, Oakcroft-road, Lewisham (Messrs. Kennard Brothers).—Consent.

Lewisham.—A projecting porch in front of No. 16, Oakcroft-road, Lewisham (Messrs. Kennard Brothers).—Consent.

Lewisham.—An addition at the rear of No. 33, Vancouver-road, to abut upon Hurstbourne-road, Lewisham (Mr. T. Harris for Dr. C. E. Bennett).—Consent.

Lewisham.—Porches and bargeboards to twelve houses on the eastern side of Cranston-road, Forest-hill, southward of No. 12 (Mr. A. R. Westworth).—Consent.

St. George, Hanover-square.—A projecting oriel window to a building in course of erection at the corner of Oxford-street and Davies-street, and projecting shop fronts to the Oxford-street and Davies-street frontages of such building (Mr. W. A. Lewis for Messrs. Perry Brothers).—Consent.

St. George, Hanover-square.—A one-story shop on the forecourt of Victoria Station, Pimlico (Mr. L. W. Livesey for the London, Chatham, and Dover Railway Company).—Consent.

Strand.—An addition over the existing porch in front of No. 10, Carlton House-terrace, Westminster (Messrs. D. Blow and F. Billery for the Right Honourable the Viscount Ridley).—Consent.

Strand.—A projecting clock and sign in front of the Lyceum Tavern, No. 354, Strand (Messrs. Brown and Barrow for Messrs. Heneky).—Refused.

Battersea.—Station buildings on the northern side of St. John's-hill, Battersea (Mr. C. L. Morgan for the London, Brighton, and South Coast Railway Company).—Consent.

Clapham.—The completion of a one-story shop connected to be erected on the forecourt of No. 850, Wandsworth-road, Clapham, abutting upon Queen's-road (Mr. W. C. Poole for Mr. M. Jones).—Consent.

Width of Way.

Strand.—A showcase at No. 224, Regent-street, at less than the prescribed distance from the centre of the roadway of Argyle-place (Messrs. F. Sage & Co. (1905), Ltd., for Messrs. T. & J. Perry).—Consent.

Hackney, Central.—That the application of Mr. G. H. Lovegrove, on behalf of Messrs. J. King & Co., Ltd., for an extension of the periods within which the erection of a warehouse building on the site of Nos. 74 and 76, De Beauvoir-crescent, Kingsland, with external walls at less than the prescribed distance from the centre of the roadway of Hertford-road, was required to be commenced and completed, be granted.—Consent.

Westminster.—An addition to the Newport Market Army Training School, Coburg-row, Westminster (Mr. E. T. Hall for the Committee of the Newport Market Army Training School).—Consent.

Hampstead.—An addition to a coach-house on the eastern side of Shepherd's-walk, Rosslyn-hill, Hampstead, with a boundary wall at less than the prescribed distance from the centre of Shepherd's-walk (Mr. F. R. Hasluck for Mr. W. Clark).—Consent.

St. Pancras, East.—A building at the rear of No. 168, Camden-road, St. Pancras, at less than the prescribed distance from the centre of the roadway of Camden-mews (Mr. G. Stapley for Mr. J. Boulting).—Consent.

Width of Way and Lines of Frontage.

Lewisham.—A projecting one-story shop in front of No. 14, Montpelier-vaie, Blackheath (Mr. A. Roberts for Mr. E. F. Blow).—Consent.

Lewisham.—An addition with half-timber work, in front of "West Lodge," Love-lane, Blackheath, with a forecourt fence at less than the prescribed distance from the centre of the roadway of Love-lane (Mr. G. F. Havell for Mrs. Penn).—Consent.

Wandsworth.—An addition at the side of No. 90, St. Ann's-hill, to abut upon All Farthing-lane (Mr. W. West for Mr. F. R. Turtle).—Refused.

Hackney, Central.—Retention of a greenhouse and covered way at the rear of No. 33, Middleton-road, Hackney, abutting upon Mayfield-road (Mr. J. Hamilton for Mr. A. Miskall).—Consent.

Lines of Frontage and Construction.

Rotherhithe.—One-story stables and water-closets on the western side of Raynuth-road, Rotherhithe, in front of railway arch No. 28 (Mr. J. Barrett).—Refused.

Formation of Streets.

Woolwich.—That an order be issued to Mr. W. B. Sheppard sanctioning the formation or laying out of two new streets for carriage traffic, one to lead out of the northern side of McLeod-road and the other to be in continuation eastward of Blithdale-road, Bostall Estate, Abbey-wood, Plumstead (for the Royal Arsenal Co-operative Society, Ltd.).—Consent.

Wandsworth.—A deviation from the plans approved for the formation or laying out of new streets for carriage traffic on the Furze-down-park Estate, Back (or Rectory) lane,

Streatham, so far as relates to an alteration in the direction of a portion of the road (Mr. W. J. Janes for Mr. R. H. Miller).—Consent.

Lewisham.—That an order be issued to Mr. R. Stewart refusing to sanction the formation or laying out for carriage traffic of a street out of the southern side of Downhill-road, Hither-green, Lewisham.—Refused.

Space at Rear.

Lewisham.—A modification of the provisions of sect. 41 with regard to open spaces about buildings, so far as relates to the erection of No. 29, Brightside-road, Hither-green, with an irregular open space at the rear (Messrs. Norfolk & Prior for Mr. J. Laird).—Consent.

Space at Rear and Height of Buildings.

Strand.—A building, to be known as the Piccadilly Hotel, on a site abutting upon Piccadilly-place, Piccadilly, Vine-street, Regent-street, and Air-street (Messrs. W. Woodward and W. Emden).—Refused.

Cubical Extent.

Hackney, Central.—The erection on land at the rear of Shrubland-road, Hackney, of a building to exceed in extent 250,000 cubic feet and to be used for the purposes of a garage for motor omnibuses (Messrs. F. Borham & Son for the Motor Bus Company, Ltd.).—Refused.

The recommendations marked † are contrary to the views of the local authorities.

Architectural Societies.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The annual meeting of this Society was held in their room, Leopold-street, on the 17th inst., Mr. E. Holmes, President, in the chair. The Treasurer's statement of accounts and the Auditors' report, which showed a satisfactory increase of the balance in hand to last year, were adopted, with thanks to the Auditors. The annual report of the Council, which showed a membership of 122, being the highest number in the Society's record, was read and adopted. A ballot was taken, and the following gentlemen were elected officers:—President—Mr. E. Holmes; Vice-President—Mr. W. C. Fenton; Treasurer—Mr. F. Fowler; Secretary—Mr. J. R. Wigfull; Council—Fellows: Messrs. H. Coverdale, C. B. Flockton, W. J. Hale, H. L. Paterson, A. E. Turnell, and J. B. Mitchell Withers; Associates: Messrs. W. G. Buck, C. F. Innocent, and H. I. Potter. A prize of 5l. 5s. for the best set of measured drawings was awarded to Mr. A. W. Kenyon. The Society's prizes for the best work in the designing class were awarded as follows:—1l. 1s. to Mr. J. M. Jenkinson, and 1l. 11s. 6d. was equally divided between Mr. J. W. Green and Mr. G. R. Bower. A hearty vote of thanks was accorded to the President and Hon. Secretary for their work during the year.

Archaeological Societies.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—A meeting was held on Wednesday, May 16, when Mr. C. H. Compton, Vice-President, occupied the chair. Dr. Winstone exhibited a fine copy in black letter of a book of sermons, or homilies, printed in 1587, in original binding, but with the clasps missing. The Rev. W. S. Lach-Szyrma read a paper entitled "Relics of the Cornish Language," in which he described the relics of an ancient language as belonging to a class of antiquities in England of a philological nature which is almost unique in Europe. Nowhere, he believed, except in England, could we fix any death place of a language, one of the reasons European language besides the Cornish that had died out in modern Europe, he believed, was the Prussian, and he questioned if we could fix the time or place of its expiration. Most of the lesser languages of Europe which 100 years ago it might have been prophesied could not last much longer, instead of dying out were more vigorous now than in the middle of the XIXth century. Although Cornish as a spoken language was dead, we yet possessed quite a little literature in it for academic and philological purposes preserved for us (like a mummy in a glass case in a museum) in the MSS. of the Cornish dramas, some of which had been published, and in

other writings, some in print, some still in MS.; in the names of places, in the names of families, in the tradition of the numerals and some words, and in Jordan's "Creagon," the last Cornish drama of 1611. The Cornish MSS. as yet unprinted in the British Museum and elsewhere were of more special interest to archaeologists than the published works in and on the old language. It was very desirable that these MSS. should be printed, with proper editing and translation, that they might be available to all Celtic scholars throughout Europe.—A very interesting discussion followed, in which it appeared from the remarks of Mr. Jenner, Mr. Hall (a Cornishman), and others that there were still some fifty actual Cornish words in use with the miners; the numerals were also extant, and probably there were between 300 and 400 words still in use. Mr. Jenner considered that Cornish was not a dialect at all, but a distinct language, but if it should be a dialect, then more so of Breton than of Welsh.

WESTMINSTER CITY COUNCIL.

The usual fortnightly meeting of this Council was held on Thursday last week at the City Hall, Charing Cross-road, S.W.

Water Circulators for Boilers.—The Baths and Washhouses Committee reported that they had considered the advisability of fitting circulators to the boilers at the various baths and washhouses belonging to the Council, and had received a report from the City Engineer in which he recommended that circulators should be fitted to all boilers having Cross or Galloway tubes, such boilers being of the Lancashire or Cornish type. The Committee recommended, and it was agreed, that circulators be fitted to nine of the boilers at the Buckingham Palace-road, Davies-street, and Marshall-street baths, at a cost not exceeding 225l.

Workmen's Dwellings, Marshall-street.—The Housing Committee reported that good progress was being made with the erection of those dwellings, and that the buildings would be roofed in very shortly.

Wardour-street Widening.—Some discussion took place on a recommendation by the Improvements Committee that Messrs. Ferbrother, Ellis, & Co. be informed that the Council were prepared to pay the sum of 660l. for the land required for the widening of this street at No. 107 to 40 ft. Ultimately the recommendation was agreed to, but a proposal to negotiate for further land and to ask the London County Council to contribute to the cost was referred back.

North-West London Railway Bill.—The Law and Parliamentary Committee reported that they had instructed the City solicitors to withdraw the Council's petition against this Bill, the promoters having agreed to satisfactory clauses for the protection of the Council.

Prince Consort-road: Paving Works.—The Works Committee brought up a report dealing with the paving of Prince Consort-road and other roads adjoining the Albert Hall. It was agreed that, subject to the formal dedication to the public of certain of the roads, and the payment by the Commissioners of the Exhibition of 1881 of the sum of 11,000l., the Council should pave the carriage-way of Prince Consort-road, and maintain the paving, and should undertake the maintenance of certain of the other roads for the sum of 8d. per yard super. per annum, to be paid by the Commissioners.

Having transacted other business the Council adjourned.

THE INCORPORATED CHURCH-BUILDING SOCIETY.

This Society held its annual general meeting at the Church House, Dean's-yard, on Thursday, the 17th inst. The eighty-eighth annual report, which was presented at the meeting, shows that last year's income of the Society was 16,168l., as against 7,878l. the previous year; the increase being principally due to "Legacies," but not entirely so, as the amount received under every head except one is more, and in one instance considerably more than in the previous year.

The Committee were not in a position to make any further report on the progress made in the account of the churches to which the Society voted grants of 1,000l. each under the name of "Wheatley Balme Grants." As stated in the last annual report, all the thirteen churches are now consecrated, and three are finished in accordance with the sealed plans, and the grant of 1,000l. has been paid in full in each case; the other ten churches have received a payment on account, varying in amount according to the different circumstances of each case. Of the 13,000l. voted by the Society for these special cases, where a large, serviceable, but inexpensive church was a felt want, a sum of 9,100l. has been paid on account. When all these churches have been finished, the total free accommodation

provided will be 10,645, at an estimated cost of 111,772, making an average cost of 102. 10s. per sitting. It had been a matter of great satisfaction to the Committee, in dealing with the munificence of the late Mr. E. H. Wharley Baine to the Society, to perpetuate his memory by associating these thirteen churches with his name and placing in them memorial tablets, and the Committee hoped that other friends of the Society might be encouraged to imitate his example.

The past history of the Society showed that it had been instrumental in aiding in the erection of no less than 2,482 additional new churches, and in assisting in rebuilding, enlarging, or otherwise improving the accommodation in 6,426 other churches or consecrated chapels of ease. By these means more than two million additional seats had been secured, by far the greater part of which were for the free use of the parishioners according to law. The actual amount of money entrusted to the Society and used in making grants toward the objects named had reached 912,761.

The Committee took this opportunity of thanking the members of the Committee of Honorary Consulting Architects, who gave their services so ungrudgingly to the Society by examining with the greatest care the designs submitted to them at their monthly meetings. By the recent death of Mr. J. P. Seddon the Society had lost an able and conscientious architect, and the Committee of Architects their President and Secretary. The following was the text of the resolution of sympathy it was unanimously agreed should be forwarded to the widow and family:—

"That the committee of the Incorporated Church-Building Society, having deep regret of the decease of John P. Seddon, Esq. for many years a member of the committee of Honorary Consulting Architects, desire to record their sense of the loss they and the church have experienced by his death, and to bear testimony to the very careful and thorough way in which he rendered most valuable service to the Society; and they further desire to express their sympathy with the widow and family of the deceased gentleman, who was so universally respected by those who knew him."

Mr. Temple Moore, in moving the adoption of the report, gave from an architect's point of view a few thoughts and suggestions on the relations between the honorary advising architects for the Society and the architects of the various proposed works. The work of the honorary advising architects might be thus defined:—To criticise and advise on plans submitted of works proposed: First, as to construction; secondly, as to convenience and suitability of arrangement; thirdly, as to architectural design; fourthly, as to restoration of ancient churches. He assumed that one of the objects of the Society was to raise the standard of design in church architecture, so that (so far as lay in their power) not only solid and suitable, but also architectural church buildings might become traditional of the work which passed through the Society's hands. It was obvious that no rules except of a general nature could be laid down on the subject of design, and hitherto the honorary advising architects had refrained from interference, except where the design had been flagrantly bad or unworthy. He felt, however, that they should no longer be content to leave the matter like that. He granted that design was indeed a matter of personal taste and preference, but there was a certain correct and appropriate feeling in design upon the broad lines of which, despite diverse personalities, their advising architects could agree. If the Society was to have any real influence towards the raising of the standard of church work in building, the hon. architects clearly *must* criticise the designing, and make suggestions wherever such were felt to be needed. He regretted that, generally speaking, the standard of design in the new church work brought before the Society's hon. architects was often very inferior, and did not appear to improve. Perhaps, after all, this was not very surprising, for in these days of hurry and many special architectural needs not known formerly, church design had become very largely a special branch of architecture. The busy general architect, though an able practitioner, had not the time, or, it may be, the opportunity, to devote himself seriously to this study. Therefore, he suggested that the hon. architects should, sitting as a committee for the purpose, criticise and make suggestions on the design outside the printed rules. It might be objected that his proposal would have the effect of discouraging originality or novelty in design, but he did not think so; for novelty, when good, had a certain recognisable appropriateness and fitness. It was only when it was novelty for the sake of novelty that it became a defect. He believed that in most cases architects whose training, experience, and general practice had not been in church work especially would welcome the suggestions of the Committee. In schemes for restoration there was some improvement; the great importance of the more careful preservation of their ancient churches was generally beginning to be felt, but here again they had a special branch of architecture, requiring very much experience, which did not fall in the way of all architects. He considered that the role of the Society which gave the advising architects power to ask one or more

of the members to visit the proposed work should be more frequently exercised even in the case of less important churches. It was sometimes difficult to make any really useful suggestions by merely inspecting drawings or even photographs of the building in its actual state. In conclusion, if the hon. architects could be put into direct communication with the architects for the works, it would materially assist the good understanding between them. He ventured to make these suggestions in view of the great importance of the work which the Society sought to promote, with the hope that they might point to a means of increasing its popularity and adding to its already considerable influence in helping to make their churches, whether in the restoration of ancient ones, or in the building of new, in some measure more worthy of their sacred purpose.

The Society held its usual monthly meeting on Thursday, the 17th inst., at 7, Dean's-yard, the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.:—Building a new church at South Tiverton, Church of the Ascension, Somerset, 250*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Ashbury, S. Mary, near Ipswich, 100*l.*; Ickford, S. Nicolas, near Thame, Oxon, 30*l.*; Kilnington, S. Mary, near Bath, 10*l.*; Radlett, Christ Church, Herts, 100*l.*; South Perrott, S. Mary, near Crewkerne, Dorset, 30*l.*; Weston-in-Gordano, S. Peter and S. Paul, near Bristol, 15*l.*; and Egg Buckland, S. Erasmus, Devon, 20*l.*, in lieu of a former grant of 10*l.* Grants were also made towards the Spence Mission Buildings Fund towards building Mission Churches at Fochriw, near Cardiff, 35*l.*; and the Heads Nook, Wetheral, near Carlisle, 20*l.* The following grants were also paid for works completed:—Keelby, S. Bartholomew, Lincs., 15*l.*; Lower Guiting, S. Michael, near Cheltenham, 15*l.*, making in all 500*l.*; Seaton Hirst, S. John, near Morpeth, 100*l.*; Heigham, S. Barnabas, near Norwich, 180*l.*; and Upper Edmonton, S. John, Middlesex, 250*l.* In addition to this the sum of 325*l.* was paid towards the repairs of twelve churches from Trust Funds held by the Society.

Fifty Years Ago.

FROM THE BUILDER OF MAY 24, 1855.

ARCHITECTS AND DECORATION.

THE decorator by trade contrives to get a degree of license, which it seems never the system to give to architects. We hear of those who are generally quite unlimited as to expense, and who will submit to no dictation. They *supply* everything; and they design all new fittings, such as gas-lights, just as may seem to them requisite. In one house at Manchester, the gaseliers alone have cost as much as a fair-sized house. When the work is done the bill is sent in, and paid without complaint. What, we ask, is the position of the architect's profession compared to this? How does the difference arise? Is the architect to be positively the worse off for the maintenance of a professional status?

Whilst his proper position is that of chief artist of a building, and sole controller of the works, is he thus to be made to resign really the bulk of his real duties to one who, whatever his merits, is, after all, tradesman and contractor, as well as artist? The question involves the very existence of our profession. We crave, rather than express, opinion on the subject. We only point to what seems a strange anomaly.

Our own doctrine as to the importance of interior decoration as a positive branch of professional architecture, has been adhered to from a very early period in the course of this journal. We contended for the comprehensiveness of architecture as a subject, and in favour of attention to decorative art by architects; and in our pages it was shown that the forms and principles of decorative art, and art-manufacture, were to be, and had ever been, deduced from architecture and structure; and that we said long before such views were given forth by their present chief promoters, and, of course, before a Department of Art had been dreamed of. We claim no merit for any discovery; no one assuming to have the slightest insight into architectural principles, or art-history, could do so; but it does seem, that even yet the application of structural principles, no less than the true relation of nature to art, requires to be pressed upon the attention of many persons.

To apprehend, as some appear to do—even yet—that mechanical resources and new inventions are antagonistic to art, would betray a crudeness of judgment, which no educated architect should be guilty of. What is done

in cast work, may be inferior to what has been done in wrought; but surely that is by those who have not invented designs suited to casting, but have preferred to promulgate that certain things their new process could not do. It is this very "confession of weakness," as we have heretofore called it, that has been the error in all that has been done in interior decoration, with the aid of manufactures; and it is most erroneous to disclaim against the manufacture, simply because some have chosen to turn it to a wrong account.

That which it is most important just now to do, is to moderate the desire for excessive ornamentation, or the imitation of it, in every article of furniture or decoration.

Illustrations.

PARK STRUCTURE, LANCASTER.

HIS MODEL, now exhibited at the Royal Academy, represents the new structure in the Williamson Park, Lancaster, presented to the town by Lord Ashton.

The building will be reached from the lower level of the park by flights of steps. It will be surrounded by a terrace set up about 70 ft. above the lower level. This terrace will communicate with the lower hall, 42 ft. in diameter and of similar height. From this hall there are two staircases leading to a stage or outlook around the building and into the main domed chamber. Another staircase will lead from the main chamber to higher galleries and to the angle turrets. A third gallery will run above the upper colonnade surrounding the drum of the dome. There will be four groups of statuary at this level, representing Commerce, Industry, Science, and Art.

The total height of the building to the vane will be 220 ft. from the ground below the main stairway. There are six stages, from which views of different parts of the country can be obtained. At the base of the main steps, enclosed by two semicircular flights, will be an ornamental water 51 ft. long by 20 ft. wide, with a niche under the landing for a sculptured figure.

The lower hall will suitably serve as a museum, and the upper hall as a reading-room and lounge. The external parts of the main building will be constructed of Portland stone.

The figure seen in the recess between the steps of the steps is a rough indication in the model for a design for a fountain, the detail of which is still under consideration.

Mr. John Belcher, A.R.A., is the architect.

HYES, RUDGWICK, SUSSEX.

THIS is an illustration of an additional wing to an old Sussex manor-house, connecting it to the old tide barn, and bringing the latter into domestic use.

The work has been built in local brindle bricks. Old hanging tiles and Housham stone slates have been obtained and used in the additions, and every endeavour has been made to assimilate and harmonise with the existing house.

The work has been executed by Messrs. Reeves & Port, builders, of Rudgwick, from the designs of Mr. Fredk. G. Knight, of Westminster.

INGRAVE RECTORY, NEAR BRENTWOOD, ESSEX.

THIS house is to be built in brick and coated with cement rough-cast, and colour-washed. It is to be roofed with Broseley tiles, and the overhang on north side will be supported on Portland stone columns. The builders are Messrs. W. H. Archer & Son, of Gravesend, and the architect Mr. A. H. Skipworth.

HILL CHURCH, SUTTON COLDFIELD, WARWICKSHIRE.

THIS illustration is taken from a drawing exhibited in the architectural room of the Royal Academy, and shows the appearance of the church from the south-west when completed. At the present time it is proposed to build the church vestries and one bay of the nave on the site of the existing church, which is to be taken down, and the nave is to be extended westwards as funds admit, accommodation being provided for about 520 chairs. The external facing is to

of red sandstone, and the roofs covered with stone slates, the interior being plastered with a barrel ceiling continuous from east to west.

Mr. Bateman's design was selected in a limited competition by Mr. W. H. Bidlake, who acted as assessor.

DESIGN FOR FOUR OAKS CHURCH, SUTTON COLDFIELD, WARWICKSHIRE.

This design, by Mr. C. E. Bateman, for a hall church to seat 300, was submitted at a recent competition, when Mr. W. H. Bidlake acted as assessor. The external design was to be of red sandstone bricks with stone dressings, and stone steps for the roofs. The organ was to be placed upon a screen, and an external pulpit as suggested, in addition to the one inside, to use on Sunday evenings in summer when large numbers of people congregate in Sutton Park, which is adjacent to the site.

Trade Catalogues.

The Saxon Portland Cement Company, of Cambridge, send us a neatly-produced little pamphlet describing in detail the process of manufacture conducted at their Saxon works, where Schneider continuous kilns are employed, and at their newly-built Norman works, equipped with rotary kilns and other plant of the most modern types. The raw material used in the production of Saxon cement is the Cambridgeshire marl, a deposit of chalk mixed with clay, and combining all the chemical elements necessary for the manufacture of Portland cement. When the marl was first employed for cement-making, the practice was simply to calcine the material as it came from the quarry without any correction of its chemical composition. The result of this "natural" cement of varying and unreliable character, and although this method has long been abandoned, there still lingers a little suspicion as to the quality of the cement produced in the Cambridgeshire district. No justification of any uncertainty exists as to the thorough reliability of the Saxon cement, which is made from material carefully mixed so as to insure the correct proportions, and is a genuine Portland cement produced in accordance with the specification of the Engineering Standards Committee, and capable of passing successfully the most stringent tests. While not prepared to endorse the opinion of the company that their cement is the best, we quite believe it to be fully equal to any other on the market at the present time.

The Stanhope Water Engineering Company send us their latest catalogue of apparatus for the softening and purification of water for industrial purposes. The troubles occasioned by hard and impure water are sufficiently known, but there still remain some people who have not been convinced that such difficulties can easily be got over, and probably there are more who do not know that greasy water can be purified at small cost. The apparatus illustrated and described in the present catalogue includes Jolle-Stanhope softeners of rectangular and cylindrical types for small establishments, and automatic softeners in sizes up to 10,000 gallons per hour capacity, all of these being provided with sand filters for removing any minute particles of material which have not been deposited in the clarification vessel. Apparatus for the purification of water without softening is not illustrated separately, but a brief summary is given of the different methods of treatment advocated by the firm.

Messrs. Arthur Cort & Co. send us their wholesale price list of hard and flexible

insulating vulcanised fibre in sheets, tubes, rods, washers, and other forms, as a substitute for leather and indiarubber in various branches of electrical and mechanical apparatus. Material of this kind possesses great tensile strength, and, owing to the fact that it is not affected by hot or cold water, oils, and spirits, it can be applied to many uses where ordinary packing and insulating materials would be unsatisfactory. It is also recommended as an efficient insulator in dynamos and electrical apparatus of all kinds.

Correspondence.

PALACE OF PEACE, THE HAGUE.

SIR.—It must be with some dismay that architects in England realise that not one of their compatriots has found favour with the judges, and that dismay is not lightened when the English architects contemplate the selected design.

In a Palace of Peace we expect to see a building which shall be reposeful and strong, and the essence of the selected design should interpret that sentiment, but what do we find? A design which is both fretful and feeble and more suited for a Palace in the Isle of Unrest.

It is said on the Continent that "The Englishman takes his joys sadly." Perhaps we may retort to our friends on the other side that they treat serious affairs with levity.

GEORGE HUBBARD.

FERRO-CONCRETE.

SIR.—In your issue of the 19th inst. I notice that the remarks made by myself at the discussion of Mr. Bylander's paper on "Ferro-concrete" at the Architectural Association Discussion Section on the 16th inst., have been incorrectly reported, and as at present stand are quite useless.

From my notes I find that the following is what I said:—

"Speaking more particularly of places abroad, viz., in the Colonies, the materials required—cement, steel rods, sand, and stone—were more easily obtained than structural steelwork, which has generally to be sent from England.

"As to formwork, it was pretty well understood on the Continent and in America that a concrete of 1-2-4, viz., 1 part cement, 2 sand, and 4 broken stone to pass a 3-in. ring, was strong enough to take sheering stress up to 50 lb. per square inch for a load causing vibration, and up to 80 lb. per square inch for a steady load. Any further stress caused in the beam would have to be taken up by the steel reinforcement."

May I ask for the favour of the insertion of this letter in your next issue?

R. GRAHAM KEVILL, A.M.I.Mech.E.

Ordinarily proofs of their remarks would have been sent to the several speakers, but the meeting being on a Wednesday evening there was not time for this. We were puzzled at this report, especially at the phrase "one in twenty-four," but not having been present at the meeting we were not in a position to revise it. It is, of course, difficult for a reporter to follow correctly technical details in which he is not himself an expert; but there is also sometimes difficulty from the speaking not being clear.—Ed.

RE GEARY, WALKER, & CO., LTD. v. LAURENCE & SON.

SIR.—With reference to this matter—reported at length in your last issue—we wish to state that we have no connexion whatever with the appellant firm.

The use of the name Geary by the above-named firm is our justification for calling attention to the matter. ELLIS, GEARY, & CO.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XX.

THE ORDINARY SLIDE-RULE—CONSTRUCTION AND NOTATION.

HAVING explained the mechanical and mathematical principles embodied in the slide-rule, we have now to deal with the construction and notation of the most generally-used form of the instrument.

Fig. 16 is an illustration showing the face of the ordinary slide-rule sold by all the leading makers of mathematical instruments. Several special types of slide-rule are made by various firms, but for the moment we leave these alone, as their characteristics will be better understood after the essential features of the usual type have been considered.

The rule illustrated in Fig. 16 is frequently termed the Gravet slide-rule, having been made originally by Tavernier-Gravet, of Paris, in accordance with the specification of M. Mannheim, of *l'Ecole Polytechnique*. Similar instruments are made in Germany and Austria, and, as a matter of fact, most of the ordinary slide-rules sold in this country are of Continental manufacture.

A slide-rule such as we now have in view consists of three parts:—

- (1) The body.
(2) The slide.
(3) The cursor.

(1) The body is a grooved frame, sometimes made entirely of boxwood as a practical tool for the workshop, but for office use the frame is of mahogany, and to 11 six celluloid strips are secured, as shown in the cross-section (Fig. 17). On strips 1 and 2 are engraved the logarithmic scales A and D (Fig. 16); on strip 3 is a metric scale, 25 centimetres long; on strip 4 is a scale of inches, 10½ in. long; on strip 5 is a continuation of the centimetre or the inch scale, by the aid of which a total length of about 50 centimetres, or of 20 in., may be measured. Strip 6 is intended to equalise strains due to atmospheric variations, and so to obviate the warping of the wood which frequently occurs in rules where celluloid strips are fixed on one side only of the body.

(2) The slide, as made for office use, is a tongued strip of mahogany faced on each side with celluloid. On the upper face are engraved the logarithmic scales B and C (Fig. 16), and on the under face are engraved three scales—one at the top marked S, by which may be obtained the sines of angles; one at the bottom marked T, by which may be obtained the tangents of angles; and one in the middle, by which the mantissæ of logarithms may be obtained.

(3) The cursor, sometimes consisting of an I-shaped metal frame with index points, is more generally a light frame of metal fitted with a glass panel on which a hair-line is drawn, the object of the cursor being to facilitate readings, and particularly to facilitate reference of the graduations on scale A to those on scale D, and vice versa.

Denoting the scales on the upper face of the rule, illustrated in Fig. 16 by the same letters as those employed in Fig. 14, it will be found that scale A apparently comprises two exactly similar logarithmic scales from 1 to 10, the latter number being represented in each case by the figure 1.

As a matter of fact, however, the right-hand portion of scale A is a continuation of the left-hand portion, and others should be added mentally to the significant figures in the former, thus making the entire scale read from 1 to 100. On the Faber slide-rule the scale is figured in this manner, thus making clear the real character of the numbers represented.

No practical inconvenience arises from the method of notation usually adopted, for in all computations made with the aid of the slide-rule the significant figures of a result are sufficient, the operator assigning proper values by adjustment of the decimal place in accordance with the rules given in Article XIX. The chief advantages of the Faber system of notation are that beginners obtain a more correct idea of the value of the numbers indicated, and that confusion may be avoided when square roots are being read.

On the other hand, the customary method of numbering the divisions is not without compensating conveniences. As illustrated in Fig. 16, the two halves of scales A and B are precisely similar, and in complex calculations it frequently becomes necessary to employ the scales as if the figures engraved upon one half were equal in value to those upon the other half.

Referring to scales C and D, we find that the interval between the left-hand index 1 and the figure 2 is of sufficient length to permit of ten subdivisions figured 1 to 9 in small characters.

When read in conjunction with the large figure at the index, and taking 1.0 as the value of that figure, the intermediate small figures give the values 1.1, 1.2, 1.3, and so on.

Each of the ten subdivisions is further divided into two parts, enabling us to read 1.15, 1.25, 1.35, and so on; and each of these two parts is further divided into five smaller

FIG. 17

FIG. 16

FIG. 18

Illustrations to Student's Column.

spaces permitting decimal readings in two figures at intervals of one-hundredth from '01 to '99, giving values, intermediate between 100 and 200, from 101 to 199.

The smallest of the spaces mentioned can be further subdivided by the eye with more or less accuracy so as to give a third, and sometimes a fourth, decimal place, the correctness of which depends upon the judgment of the operator and the part of the main division 1-2 where any value in question may happen to be.

Thus, it is not very difficult to read such values as 1.055, 1.0525, and 1.0575 almost exactly, but such values as 1.746, 1.833, and 1.964 cannot be obtained with any certainty as to the last figure, while the attempt to introduce a fourth decimal place, as in the values 1.7425, 1.8325, and 1.9675, could not possibly be attended with numerical success, although the assigned positions might be fairly near the correct values.

In each of the two succeeding main divisions, 2-3 and 3-4, there are ten subdivisions, each further divided into five spaces. Hence, exact readings are only possible to two places of decimals at intervals of one-fiftieth from '02 to '98, enabling us to obtain intermediate values from 2.02 to 2.98, and from 3.02 to 3.98, respectively.

For the remainder of the scales each main division is divided into ten subdivisions, and each subdivision into two spaces only. Therefore, exact readings are obtainable only at intervals of one-twentieth, as '05, '10, '15, '20, and so on.

On the upper scales A and B, the shorter length of the main divisions makes it impracticable to subdivide them to the same extent as in the lower scales C and D. Thus, the interval 1-2 contains ten subdivisions, each divided into five parts only; the intervals 2-3, 3-4, and 4-5 have ten subdivisions with two spaces each, and in the remaining intervals of each half of the scales, the main divisions have simply the ten subdivisions.

Consequently, exact readings can only be obtained between 1 and 2, and 10 and 20, to two places of decimals at intervals of one-fiftieth; between 2 and 5, and 20 and 50, only at intervals of one-twentieth; and for the remainder of the scales only at intervals of one-tenth.

Notwithstanding the paucity of subdivisions at the right-hand end of scales C and D, and throughout the greater part of scales A and B, the operator who has a fairly correct eye can soon learn to estimate intermediate values with a very fair approximation to accuracy, and quite closely enough for all practical work.

For the purpose of saving time, and also of insuring accuracy, it is customary for makers of slide-rules to engrave on the scales some special division lines representing certain constants.

It is curious that the meanings and uses of these special marks are not properly explained in the instruction books supplied with slide-rules by makers of mathematical instruments. Even in text-books on the slide-rule explanatory references to the marks in question are not always made in a convenient manner, being buried in the middle of

calculations and not set forth clearly, as they should be, at the very beginning.

Makers of slide-rules probably know what the special divisions on their rules really mean, but we know, as a matter of fact, that some dealers are quite ignorant on the point, or have only just enough information to put them in the position of being able to mislead inquirers.

To make matters perfectly clear we give in Table XVI. a list and explanation of the special marks on the slide-rule illustrated in Fig. 16, which represents the arrangement adopted by A. G. Thornton, of Manchester.

marked on one or both of the scales A and B, and in others they are indicated on the scale of sines S, at the back of the slide.

There now remain to be mentioned two markings on the front of the rule, illustrated in Fig. 16, one being Q+1 at the left-hand of scale D, and the other P-1, at the right-hand of the same scale.

These marks are simply intended as a reminder to the operator that quotients read with the slide projecting to the right hand must contain one digit more than the difference between the number of digits in the dividend and divisor respectively, and that

TABLE XVI.—SPECIAL CONSTANTS INDICATED ON SLIDE-RULE.

Scale.	Mark.	Signification.	Position on Scale.	Value to be Read.

C	c	$\sqrt{\frac{3}{\pi}}$	1.128	1.128
C	c_1	$c \times \sqrt{10}$	3.568	3.568
C	ρ'	$(90^\circ)^2 \times 3,600 = \frac{1}{\sin 1^\circ}$	2.06234	206,264
C	π	(see def. p. 49)	3.1416	3.1416
C	ρ'	$(90^\circ)^2 \times 60 = \frac{1}{\sin 1'$	3.438	3438
C	ρ_1	$\frac{2}{\pi}$	6.3662	0.63662
D	ρ''	$(90^\circ)^2 \times 3,600 = \frac{1}{\sin 1^\circ}$	2.06234	206,264
D	π	(see def. p. 49)	3.1415	3.1416
D	ρ_1	$\frac{2}{\pi}$	6.3662	0.63662

The constants π and $\frac{\pi}{4}$ are chiefly used for determining the circumferences and areas of circles, and the cubic contents of cylinders.

The constant c, being the square root of the reciprocal of $\frac{3}{4}$, affords a still more ready

means of finding the areas of circles by the slide-rule and the cubic contents of cylinders.

The constant c_1 is used in the same manner as c, when the slide has to be moved towards the left hand, and, being situated at exactly the same distance from the centre of scale C as c is situated from the left-hand index of the same scale, it gives readings on scale A having the same nominal value as those given by c.

The constants ρ' and ρ_1 are used for finding the sines of small angles expressed in seconds and minutes, respectively.

The constant ρ_1 , being the reciprocal of 1.571—the measure of a right angle in radians—is of general utility, and also serves as a ready means of determining the relative areas of circles and inscribed squares.

In one form of slide-rule the constant $\frac{4}{\pi}$

= 1.273 is indicated on the cursor by two lines separated by an interval equal to 1.273 on scale A. By setting the right-hand line of this special cursor opposite to the diameter of a circle on scale D, the area can be read on scale A at the left-hand line of the cursor.

In some rules the constants ρ'' and ρ_1 are

products read with the slide projecting to the right hand must contain one digit fewer than the number of digits in the sum of the factors.

Before referring to the scales at the back of the slide a few words are desirable with regard to the assignment of values to the figures marked on the ordinary scales. As previously stated, these characters can be considered simply as significant figures which may stand for units, tens, hundreds, thousands, or for tenths, hundredths, thousandths, and so on, the correct position of the decimal point being settled at the end of all calculations, in accordance with the rules already given. Only when square roots and cube roots have to be ascertained is it necessary to take into account, during the progress of calculation, the actual values of the numbers.

Thus, such a calculation as $(100 \times 500 \times 760) \div 10,000 = 3,800$, can just as well be worked in the form $(1.5 \times 7.6) \div 1 = 38$ and completed by the addition of two ciphers. But it will not do when dealing with square roots to consider the characters on the right-hand portion of scales A and B to be of equal value with those on the left-hand portion of the same scales.

Below 4 on the left-hand part of scale A we have 2 on scale D, and below 4 on the right-hand part of scale A we find 632.

In the first case, 2 is a significant figure representing the square root of 4, 400, 40,000, 4,000,000, and so on, while, in the second

case, 632 are significant figures representing the square root of 40, 4,000, 400,000, 40,000,000, and so on.

Similar distinctions occur in the case of decimal fractions, and neglect of them will inevitably lead to serious errors.

The scales at the back of the slide are represented in Fig. 18, which also shows the under side of the rule with the slide withdrawn.

Scale S is marked with divisions representing the logarithms of the sines of angles from 34° to 90°. The main divisions on this scale—numbered 1, 2, 3, and so on—indicate degrees, and the subdivisions vary according to the available space. Thus, each of the main intervals from 1° to 10° is divided into six groups of 10', and each group into two units of 5'. Between 10° and 20°, each degree is divided into two groups of 30', and each group into three units of 10'. The scale is read by aid of the upper index mark, shown in Fig. 18, at the top of the right-hand slot in the body. Between 20° and 30°, each degree is divided into three intervals of 20'; between 30° and 40°, each degree is divided into two intervals of 50'. Between 40° and 70° each division represents 1°, between 70° and 80° each division represents 2°, and between 80° and 90° there are no subdivisions.

Scale T is marked with divisions indicating angles from 5° 42', whose tangent = 0.1, to 45°, whose tangent = 1.0. The graduations are generally similar to those in scale S, but are less crowded, as the range is not so long.

The centre scale at the back of the slide is divided into ten equal spaces, each subdivided into smaller spaces, and these in turn divided into five spaces. This scale can be used to obtain the mantisse of logarithms by placing the slide in an inverted position in the body, when the instrument becomes a complete table of logarithms. For ordinary calculations it is more convenient to leave the slide in its normal position, reading the values at the lower index mark, shown in Fig. 18, on the right-hand slot in the body.

LONDON BUILDING ACT TRIBUNAL OF APPEAL:

MARWOOD v. SUPERINTENDING ARCHITECT OF THE LONDON COUNTY COUNCIL.

ON Friday last week the Tribunal of Appeal sat at the Surveyors' Institution to hear an appeal by Mr. Francis O. Marwood against the certificate of the Superintending Architect dated February 10, defining the general line of buildings on the east side of Cliddon-road, Fulham, between Edith-road and the Metropolitan District Railway, and further defining the general line of buildings on the south side of Talgarth-road, Fulham, between the building known as No. 83 in that road and Gliddon-road. Mr. Schiller was counsel for the appellants, and Mr. A. Moresby White appeared for the London County Council.

Mr. Schiller said that in the seventies the whole of the district was undeveloped land. The land belonged to various persons, and interchanges of land took place owing to the building of St. Paul's School. In 1879 Talgarth-road was made, and there was a retaining wall for the Metropolitan Railway, along the whole of that road, which ran across the mouth of what was now Gliddon-road. Talgarth-road ran at right angles with the Gliddon-road. In 1881 Gliddon-road came into existence, and a house was built at the Edith-road end of the road, and the road for a short distance was kerbed and channelled. In 1882 a house was built at the other end of Gliddon-road, where it met the Talgarth-road. At this time the retaining wall of the railway was still across the mouth of Gliddon-road, which formed, of course, a barrier to the road. In 1883 the idea of developing the land on the other side of the railway occurred, and to do this a bridge across the railway was projected, and contributions for such bridge were made by the Metropolitan Board of Works and the Fulham Vestry. The bridge was finished in 1885, but before it was finished houses were built on the west side of Talgarth-road. No one at the time dreamed that Gliddon-road was further than the old retaining wall, and it had been left to the ingenuity of the Superintending Architect to find that the bridge was part of Gliddon-road. It was formerly known as St. Paul's Bridge, and had only lately been christened by the London County Council "Gliddon-road Bridge." In 1905 Mr. Marwood prepared plans for blocks of flats to be built at the corner of the east side of Gliddon-road, and these plans were passed by the District Surveyor, and were proceeded with. It was not until October 25, 1905, that the District Surveyor raised the question of balconies and bays, and other matters, and mentioned the building line in a tentative manner. Mr. Marwood

then made formal application to the London County Council with regard to the question of balconies, etc., and hearing nothing from the Council he proceeded with the building of the flats, and practically completed them. Then the Superintending Architect defined the building line now appealed against.

Mr. Hudson asked what the position was with regard to Talgarth-road.

Mr. Schiller said the flats were built between the Gliddon-road and the Talgarth-road. If the County Council allowed the bay windows on the Talgarth-road frontage, he was satisfied with the line as fixed by the Superintending Architect as far as the Talgarth-road was concerned, but if they did not consent then he wanted the Talgarth-road line defined.

Mr. White said the County Council did not consent to the bay windows.

Mr. Schiller argued that the line fixed by the Superintending Architect which ran from the house built at the Edith-road end of Gliddon-road could not be mentioned, inasmuch as the plot of land on which the appellant had erected the block of flats was part of the bridge, and was not a continuation of Gliddon-road. If such a line was upheld it meant pulling down the block of buildings and inflicting serious loss on his clients. After evidence had been called for the appellant, the Tribunal adjourned, May 28 being provisionally fixed for the continued hearing of the case.

Obituary.

MR. A. J. HAMILTON-SMYTHE.—Mr. A. J. Hamilton-Smythe, B.A., M.Inst.C.E., who was appointed chief of the staff at the County Surveyor's office at Hatfield last October, died suddenly on the 15th inst.

General Building News.

NEW CHURCH, EDMONTON.—The foundation-stone of a new church, to be dedicated to St. Stephen, has been laid at Bush Hill-park, in the northern portion of the parish of Edmonton. It is proposed at first to erect the chancel and side chapel, organ aisle, and three bays of the nave and aisles, accommodation being thus provided for 500 persons at a cost of 6,347l. The style of the church will be Late Decorated Gothic. The architect is Mr. J. S. Aldor.

METHODIST FREE CHURCH, NEWCASTLE-ON-TYNE.—The foundation-stones have just been laid of the new Methodist Free Church which is being erected in Sandford-road, Newcastle. The church is part of the extension scheme in connexion with the Prudhoe-street Church, and the premises it is estimated will cost at least 18,000l. when completed. The plans have been designed by Mr. W. H. Knowles, F.S.A., and the contract has been let to Mr. W. T. Wear. The total area of the site is about 2,466 sq. yds., of which about 825 sq. yds. in front of the church are to be kept in perpetuity as an enclosed shrubbery. The main entrance to the church will be by a Benton-terrace, with a central vestibule lobby with open doors, cloak-room and staircase to a gallery over the lobby. There will be an arched recess with choir seats, pulpit, communion-table, and organ-chamber, and the body of the church divided by a centre and side aisles. The church will accommodate 600. To the school premises the main entrance is from Grautham-road. On the ground-floor there will be a corridor or crush lobby, 13 ft. wide; a lecture-hall, 27 ft. by 30 ft.; infants-room, 24 ft. 3 in. by 20 ft.; ministers' and stewards' vestries, etc. The main school hall will be 45 ft. wide by 48 ft. 6 in. long, square at platform and circular at the opposite end, with a gallery carried round three sides and divisions for classes. On the first floor there will be a secretary and librarians' vestry, church parlour, ladies' vestry and cloak-room, caretaker's self-contained residence with two bedrooms on second floor. Below the level of the church and school hall, but on the level of back Portland-road there will be a room, the size of school hall, which can be used as gymnasium or be divided into classrooms; heating apparatus room, boys' and girls' lavatories, service lift to upper floors, etc. The buildings will be of stone, with green slate roofs, and the church, in the interior, will be divided into bays with traceried windows; the ceilings being of wood in arched form.

CHURCH RESTORATION, WARRFORD.—Warrford Church has just been reopened after having been restored at a cost of 1,250l. The work has been carried out under the personal superintendence of Mr. G. Weeks, builder, of Winchester, in accordance with the instructions and under the direction of Mr. N. C. H. Nisbett, of Colson, Farrow, & Nisbett, architects, Winchester.

CHURCH RESTORATION, CHILDEWALL.—Childewall Church has recently undergone considerable alteration and improvement in its fabric. Messrs. J. F. and S. Doyle were the architects, and Messrs. Tavis & Wevil the builders.

WESLEYAN CHAPEL, CASTLE DONNINGTON.—A new Wesleyan Methodist Chapel, costing upwards of 6,000l., was opened at Castle Donnington on the 16th inst. The new building occupies a position in the centre of the town, its front elevation covering nearly the whole of the south side of the Market-place. The vestibule at the main entrance is divided into three sections, separated by panelled screens carrying leaded lights of stained glass, whilst the balconies are approached from either side of the building by stone stairways, protected by iron balustrades. A feature of the chapel is the oak pulpit with rostrum. To the rear of the pulpit is a chancel for the accommodation of the organ and choir. The building operations have been conducted by Mr. Wm. Evans (Nottingham), the architect, being Mr. A. E. Lambert (Nottingham), and the contractor Mr. Thos. Barlow (Nottingham).

BAPTIST CHAPEL, EASTVILLE, BRISTOL.—The foundation-stones of a new Baptist mission chapel at Eastville were laid on the 10th inst. The plans were prepared by Mr. E. Wakefield, Bristol, and the contract has been let to Alfred Dowling, of Bishopcote. The new building, which is arranged to accommodate a mixed congregation of 250, and has four classrooms, in addition, will consist mainly of brick. The external walls will be lime-whitened and relieved by cherry-red sand-faced bricks for arches, sills, and copings. The roofs will be tiled. The hall will have an open-timbered roof, stained a green shade and varnished; the floors will be of pitch-pine wood blocks, and the walls will be plastered with a hard patent plaster. The hall will be heated by gas hot-water radiators, and the lighting will be by gas with incandescent lamps. The cost of the scheme is estimated at 1,700l., and this total includes 400l. for site and 1,200l. building contract.

MEMORIAL CHAPEL, LIVERPOOL.—The memorial chapel of the Bluecoat Hospital, Liverpool, was opened on the 18th inst. The structure is octagonal, with transepts on three sides, and a semi-dome, the walls being of Bath stone, and the whole of the fittings of oak. There is seating accommodation for 570. The architects were Messrs. A. Thornley, F. G. Briggs, and F. B. Hobbs.

SCHOOL CHAPEL, TAUNTON.—The foundation-stone was recently laid of the new chapel which is being erected in connexion with Taunton School. It is Early English in character. The main entrance is at the west end, and the vestibule is separated from the chapel by an oak traceried screen. There is a gallery over this portion, approached by a staircase in the bell turret on the north side. The seats in the nave and choir are arranged facing each other, and are ascending, finished in oak, with high dado panelling on either wall. On either side of the choir are transepts—one used for the organ, which is placed over the heating chamber, and the other used as vestry, with gallery over. The eastern end is finished in assial form, with ascending, pierced with small windows on the upper part, and the lower portion is to be lined with marble dado. The aisle and apse floors also are to be laid in marble. The accommodation is calculated for about 300. Mr. Frank Wills, of Bristol, is the architect; Messrs. W. Cowin & Son, of Bristol, are the general contractors; Messrs. J. Crispin & Sons, of Bristol, are carrying out the heating arrangements; and Mr. E. Turner is acting as clerk of works.

SCHOOLS, GLOUCESTER.—The memorial stone of the new Council schools to serve the Derby-road district of the city was laid recently by Councillor W. Colwell. The schools are being erected in Derby-road, opposite the Alington Hall, on a site acquired by the late School Board, and containing 6,216 sq. yds. The new buildings will include a two-storied block to accommodate 350 boys and 350 girls, and a separate one-storied block to accommodate 400 infants, with floor space for 50 additional infants, should future requirements demand extension. There will be three central halls—boys' hall, 50 ft. by 28 ft.; girls' hall, 50 ft. by 28 ft.; infants' hall, 58 ft. by 25 ft.—from which all classrooms will be visible and accessible. The buildings are being erected with local Severn side bricks, with Bath stone dressings, while the floors, ceilings, and staircases will be of Hennebique's ferro-concrete construction. The roofs will be covered with slates. In the boys' department there will be five classrooms to accommodate 60 scholars each, and one classroom to accommodate 50. A similar number of classrooms are provided for in the girls' department. In the infants' block there will be five classrooms for 60 scholars, and two for 50 scholars. All classrooms will be carried up square to the ceiling. Teachers' rooms, with lavatories and stores, are provided for in each of the three departments, the teachers' rooms being so placed that they overlook the entrances and playgrounds. Shelters and sanitary conveniences will also be provided externally for each department. The contractor is Mr. J. C. Norman, of Swindon. The architect is Mr. J. Fletcher Trew, of Gloucester, and the clerk of works, Mr. W. H. Bush.

The contract price is 11,908*l.*, being about 10*l.* per scholar.

SCHOOL-ROOM, RUSTHALL.—A new room has been added to the Rusthall Infants' School. Mr. E. Cronk prepared the plans.

ENLARGEMENT OF THE MUNICIPAL TECHNICAL SCHOOL, LINCOLN.—At a special meeting held on the 7th inst., the Lincoln City Council decided to carry out extensions at the Municipal Technical School at an estimated cost of 7,000*l.*, and to take steps to obtain the sanction of the Local Government Board for the raising of a loan. The plans provide for four new classrooms, a new lecture-room for demonstration in physics and general science work, a new physics laboratory, a new ordinary electrical laboratory, an open-air space for physical exercises, cloak-rooms, etc. A number of rearrangements are proposed. The additional classroom accommodation would be 120. The plans have been prepared by Messrs. W. Watkins & Son.

CO-OPERATIVE PREMISES, PERTH.—The new premises of the City of Perth Co-operative Society, Ltd., erected on the site of the old gas-works, were opened recently. The building, which is four stories in height, occupies a corner site in Scott-street and Canal-street. The principal elevation, with main entrances, is to Scott-street, along which it extends about 150 ft. The elevation to Canal-street extends to over 70 ft., and contains the goods entrances and access to workrooms. The building is of Palmaria stone and is fireproof throughout, with automatic door arrangements for the isolation of each floor in case of fire. An electric hoist is provided for conveying goods and passengers to the several floors. The heating of the premises is by steam pipes and radiators. The boilers are placed in the heating chamber situated in the basement. Each floor has lavatory and cloak-room accommodation. The whole building has been fitted up with a system of electric lighting. The structure was erected from plans prepared by Messrs. Maclaren & Mackay, architects, and the works were carried through under their superintendence. The clerk of works was Mr. John W. Penney, and the various contracts are as follows:—Mason and brickwork, Messrs. B. Brant & Sons; carpenter and joiner work, Messrs. Thos. Leith & Co., Ltd.; plumber work, Messrs. MacLeish, Morrison, & Co., Ltd.; plaster work, Mr. John Sharp; slater work, Mr. Thomas Taylor; all of Perth. Steel and iron work, Messrs. Redpath, Brown, & Co., Ltd.; fireproof floors, Messrs. William Little & Sons, Ltd.; heating engineers, Messrs. Henry Walker & Sons; electric lighting, Messrs. Campbell & Borthwick, Perth; blinds and sunshades, Messrs. A. Westwood & Sons, Perth.

BEDWELLY WORKHOUSE EXTENSIONS.—The Guardians of the Bedwelly Union Workhouse have had to provide extensive additions to the workhouse at Fredegar. Cottage homes were recently erected at a cost of about 8,000*l.*, and the addition to the workhouse itself will cost between 27,000*l.* and 28,000*l.* The work is being carried out by Mr. D. W. Davies, contractor, Cardiff, from plans prepared by Messrs. James & Morgan, Cardiff. Messrs. Bradford & Co., London, supplied all the machinery, and the electrical plant was erected by Messrs. Edwards & Armstrong, Cardiff, and the wiring was carried out by Messrs. Vaughan & Co., Bristol, the whole of the electric installation being carried out from plans and under the superintendence of Messrs. Herbert Lewis & Fletcher, Cardiff. The administrative block has just been opened. The whole of the machinery in the different departments is driven by electric power.

PUBLIC LIBRARY, KELSO.—The opening of Kelso Public Library took place on the 16th inst. The building occupies a frontage of about 45 ft., and is some 40 ft. in length. The front building is two stories in height, the features on the ground floors being the public doorway with carved panels over the lintel bearing the Burgh Arms, and two mullioned and transomed windows lighting the reading-room. The vestibule leading from the entrance has a vaulted ceiling and is paved with black-and-white marble squares. On the right of this vestibule is the reading-room, affording accommodation for fifty readers. This room is lined with wood panelling to the height of 9 ft. The walls above the panelling are painted a pea-green colour, the cornice, in which is incorporated the Burgh Arms, being in white, as is also the ceiling. Behind the reading-room is the lending library, the walls of which have been similarly treated. The reference-rooms, entered from the public space, and situated at the back of the building, will accommodate ten readers. Above the reading-room is the librarian's house. The roofing has been done with rustic slates. Messrs. Peattie & Washington Browne (Edinburgh) were the architects of the building, and the principal contractors were—Messrs. Inglis & Bruce & Son, builders (Kelso); Messrs. A. Inglis & Son, joiners (Havick); Messrs. P. Bell & Son, smiths (Edinburgh); and Messrs. MacKenzie & Moncur, heating engineers (Edinburgh); Mr. A. R. Burns, plumber (Kelso); Mr. W. Bryce, plasterer, (Kelso); Mr. W. W. Bain, slater (Kelso); and Messrs. A. Hogarth & Son, painters (Kelso). Mr. Thomas Scott (Edinburgh) acted as clerk of works.

FALKIRK GASWORKS.—Mr. William McCrae, gas manager and engineer, Burgh of Falkirk, made the plans and designs for the new corporation gasworks which were opened a few days ago at a total cost of some 2,000*l.* The works will enable 1,500,000 cubic ft. of gas to be made each day; the retort-house contains eight 20-ft. through-retorts and a stage for twelve ovens, of which only nine are fitted as yet. The two charging and discharging machines are of a novel kind, and electrical motors are used for driving all the stoking machinery, and the plant for dealing with coal and coke. The site extends over 12 acres, with storage room for 3,000 tons of coal.

BUSINESS PREMISES, DEVIZES.—New business premises have just been completed for Messrs. Stratton, Sons, & Mead, Ltd., in Monday Market-street, Devizes. Mr. E. C. Isborn, architect, of Devizes, prepared the plans, and the contractors were Messrs. Bigwood & Co., of Melksham.

FREE LIBRARY AND PUBLIC HALL, MEXBOROUGH.—The Carnegie Free Library was formally opened at Mexborough on the 21st inst. The general contractors who have carried out the work are Messrs. George Sauls Exors, of Rotherham. The design was prepared by Messrs. C. E. Deacon and Horsburgh, architects, of Liverpool.

NEW WING, KEYSHAM WORKHOUSE INFIRMARY.—The new wing of Keysham Workhouse Infirmary was opened on the 19th inst. by Mr. W. B. Bennett, M.P. Mr. H. M. Bennett, the architect, gave details of the dimensions and equipment of the wards. The cost of the building was 1,422*l.*, apart from furniture—40*l.* a bed.

LIBRARY EXTENSION, RICHMOND.—The opening of the new reference-room adjoining the old Free Library buildings, Richmond-green, took place on the 15th inst. The addition consists of a room 45 ft. long by 18 ft. wide, and has accommodation for about fifty persons, and has been constructed out of a portion of "The Cottage," the remainder being devoted to the uses of the librarian as a dwelling-house. The plans were prepared by Mr. J. H. Brierley, the Borough Surveyor.

VALLEY QUARTERS, CHRISTCHURCH.—The foundation-stone of the new armoury and drill hall for the Christchurch Company of the 4th V.B. Hants Regiment was laid recently by Lady Meyrick. The new premises are situated in Portfield-road. It is proposed to erect at present only the armoury and quarters, and for this part of the work a contract has been entered into with Mr. Thomas Hill, builder, of Christchurch, at 1,990*l.* The plans for the work have been prepared by Mr. Fogarty, architect. Electric light is to be installed by Mr. G. Bryant, of Bournemouth.

HEARTS OF OAK NEW OFFICES.—The first section of the Hearts of Oak buildings in the Euston-road, which is to be opened by His Majesty King Edward VII. on Saturday, May 26, is the central block of the complete scheme. It has on the ground floor a large general office, and on the mezzanine level are the secretary's rooms in the front, with a gallery for clerks around the general office in the rear. The approach to the delegates hall, which is on the first floor, is by means of the grand staircase in the centre of the building, separated only by a columned screen from the general office, and surmounted by a large domed light. The delegate hall is seated for 210 delegates, exclusive of platform and gallery; it has an Ionic order on the walls, and is roofed with a dome; the decorations consist of modelled plaster enrichments, an oak panelled dado, coloured glass in the windows representing the various towns and counties represented by delegates, and painted decorations in some of the bays. The suite of committee-rooms next the Euston-road have the walls panelled in oak and rich chimney pieces. The public offices, staircases, etc., are lined with a cream-coloured Doulton ware, richly modelled and inlaid with colour. The façades are of Portland stone. The internal fittings, screens, etc., are all of oak, inlaid with mahogany and ebony, and the metal work being mostly of bronze. The architects were Messrs. Essex, Nicol, & Goodman, of Birmingham. The contractor is Mr. C. Gray Hill.

BISHOP'S PALACE, SOUTHWELL.—The new residence for the Bishop of Southwell is now in course of erection on the site of the ancient palace of the Archbishops of York. The contract is in the hands of Messrs. Fish & Son, of Nottingham, and will amount to about 7,000*l.* Mr. W. D. Caröe prepared the designs of the work.

DISTRICT LIBRARY, GLASGOW.—The Bridgeton District Library was opened on the 17th inst., making the twelfth district library which has been opened in the city out of a total of eighteen provided for in the Corporation scheme. The building has been designed by Mr. J. B. Rhind, architect, and including the larger fittings, is estimated to cost 8,500*l.*

PROPOSED PUBLIC OFFICES, BURSCOUGH.—At Burcoough, on the 10th inst., in the Stanley Institute, Mr. M. K. North, M.Inst.C.E., Local Government Board Inspector, held an inquiry respecting an application by the Lathom and Burcoough Urban District Council for sanction to borrow the sum of 2,000*l.* for the erection of

public offices, etc., at Mill-lane, Burcoough. In the course of the inquiry Mr. Charles Samuel Beeston, Ormskirk, the architect of the scheme, stated that the site was an exceptionally good one. A part of the buildings would be used as a mortuary and for post-mortem examinations. He was of opinion that if the work was carried out according to the plans it would not cost more than 2,000*l.*

NEW CLUB ROOMS, KIRKINTILLOCH.—The Committee of Kirkintilloch Conservative Association have selected from the thirty-one designs submitted in competition that of Mr. Wm. Baillie, architect, of Glasgow. The building, which is to be of three stories, with basement, will occupy a prominent site at the corner of the High-street and the Backcausway. The front facing the High-street will be built of square dressed rubble, with dressings of polished sandstone. The main entrance is from the street, and gives access to a large entrance-hall and staircase, from which all the floors are approached. On the ground floor there is a reading-room and two large committee-rooms. These rooms are divided with folding partitions, so that the whole of the ground floor may be thrown into one large hall to accommodate about 300 persons, with anteroom and lavatories adjoining, and an exit from the hall to the street. The first floor consists of a summer ice-room for two tables, and a large card-room, as well as a room and kitchen-house for the caretaker. On the upper floor there is a billiard-room having accommodation for four tables, with a bay window at either end, and lighted also from the roof, which will be entirely open to the apex. Suitable lavatory accommodation has been provided on each floor. The building will be heated throughout by means of hot-water pipes and radiators connected to a boiler in the basement.

HOTEL, LONDON.—A private and residential hotel with public restaurant is to be erected on the site of Wellington-house, Buckingham-gate, recently vacated by the War Office. The building will have a frontage of 177 ft. to Buckingham-gate, with a return frontage to York-street of 144 ft. The public restaurant will be entered from the apex of the site, which is triangular—and the hotel proper from Buckingham-gate. The hotel will be provided with three electric passenger lifts, goods and service lifts. The elevations will be carried out in cherry red bricks and terra-cotta dressings, and enrichments with a dressed surface. The cost of the scheme—including the site—will be 100,000*l.* Mr. Charles Gray, of Kensington and Shepherd's Bush, is the contractor for the works, and Messrs. Palgrave & Co. have been appointed architects.

Stained Glass & Decoration.

MEMORIAL WINDOW, OXFORD.—The west window of St. Philip and St. James's Church, Oxford, has just been filled with stained glass. It was designed, and the work carried out, by Mr. C. E. Kempe, M.A.

Sanitary and Engineering News.

GASWORKS, TAVISTOCK.—The opening of the new gasworks which have been erected at Tavistock took place on the 16th inst. The new works are situated about half a mile from the centre of the town, and occupy about 12 acres. Throughout they are constructed of local stone, relieved by red and buff bricks. The retort-house and coal store are of equal size, 70 ft. by 30 ft. and 20 ft. high at the ends. The former contains, at present, three settings of retorts, with one additional arch empty, and with room for two further arches to be built when required. Adjoining the retort-houses a line of buildings has been erected for the housing of the boilers, pumps, and exhaustor, and to serve as a workshop and mess-room for the employees. The retort-house adjoining contains three purifiers. The two gasholders are erected in steel tanks on the ground level, and are of 50 ft. diameter and 20 ft. deep, both prepared for telescoping, and having at present a storage capacity of 80,000 cubic ft., and an ultimate capacity of 150,000 cubic ft. Situated immediately in front of the mess-rooms is the meter and governor house. The pipes and connections throughout the works are of 10-in. diameter. The manager's house, with offices and showroom, adjoin the works, and the whole is enclosed by a stone boundary wall 8 ft. high. The work was carried out according to the designs, and under the superintendence of Mr. W. Packley, M.Inst.C.E., Devonport, and the contract was placed with Messrs. Willey & Co. (Ltd.), of Exeter, for the engineering work, and Mr. Brealy, of Exeter, for the buildings.

SEWERAGE WORKS, SILEBY.—The opening of the new sewerage works for the parish of Sibley took place recently. The scheme provides for a

population of 3,000. The dry weather flow is only 45,000 gallons, and the pumping plant is capable of dealing with three times this amount. The pumping-station is of brick, and attached to it there is a workshop. The settling tank has a capacity of 118,000 gallons. The works, which have been carried out by Mr. J. T. Ball, of Barrow-on-Soar, were designed by Mr. W. H. Simpson, of Leicester. The cost is estimated at 12,000l.

SEWERAGE WORKS, SOMERLEYTON.—The Sewage Disposal Works at Somerleyton have now been completed. They are designed upon the bacterial system, and comprise a septic and storage tanks and six contact beds, arranged in two series of three each. The works, which have been carried out according to the directions of Mr. Kerry Rix, were designed by Messrs. Anson & Shepton, of Westminster. The contractors were Messrs. Youngs & Son, of Norwich; and the manufacturers of the automatic apparatus were Messrs. A. G. Enock & Co., Ltd., of London.

SEWERAGE SCHEME, FRODSHAM.—On the 17th inst. Mr. W. O. Meade King, an Inspector of the Local Government Board, held an inquiry at Frodsam Town Hall into the application of the Runcorn Rural District Council for sanction to borrow 4,500l. for works of sewerage for Frodsam. Mr. James Diggle, Engineer to the Council, explained that the present application had arisen in consequence of the passing of the Manchester Ship Canal Act, 1904, under the provisions of which the Canal Company are granted power to raise the height of the water in the canal 2 ft. above the level sanctioned by their original Act of 1885. In consequence of this the sewerage in Frodsam would be submersed, and rendered inoperative. The Council have a protective clause in the Act of 1904, and the Ship Canal Company had entered into an agreement under which the Council would carry out the necessary works, and the company contribute 7,500l. towards the cost of the works, and lay a cable and provide electric energy to pump the sewage to a syphon under the canal, and into the river Mersey at Holpop-gutter, in the parish of Helsby. The total estimated cost of the scheme was 12,000l. There would thus be 4,500l. to be provided by the Council. Mr. W. H. Hunter, Engineer to the Manchester Ship Canal Company, stated that in consequence of raising the water in the canal from 26 ft. to 28 ft., it was necessary to convey Holpop-gutter under the canal, and it was proposed to do this and also carry the sewage by means of a syphon underneath the canal. The syphon was double-barrelled, and 250 ft. long, each pipe was 3 ft. internal diameter. The canal pipes were provided with electric power to pump sewage up to 750,000 gallons; above that quantity they would charge the District Council.

ROYAL SANITARY INSTITUTE.—At an exhibition in Hygiene in its bearing on school life, held in Edinburgh on May 18 and 19, five candidates presented themselves. Four certificates were awarded, as follows:—A. McKinna (Edinburgh); Ethel A. Roberts (Dumfermline); A. Small (Edinburgh); E. O. Vulliamy (Edinburgh). The following candidate was successful in Part II. only:—Katherine Vulliamy (Edinburgh). At an examination in Sanitary Science as applied to buildings and public works, held in Edinburgh on the same dates, four candidates presented themselves, and the following two were awarded certificates:—P. J. O'Brien (Edinburgh); F. C. Tweedie (Edinburgh).

Foreign.

FRANCE.—The ancient convent of the Abbaye aux Bois, at the angle of the Rue de Sèvres and Rue de Raspail, where Mme. Récamier lived and died, is to be pulled down for the erection of business premises on the site.—The "Association Provinciale des Architectes Français" will hold its annual Congress this year at Marseilles and Avignon, from June 1 to 15.—The Municipality of Lyons is about to spend over half a million francs on street improvements and sanitation.—The "Conseil Général des Bouches de Rhône" has voted 7 million francs towards the construction of a canal from Marseilles to Lyons.—The Municipality of Monton will shortly commence the necessary operations for the improvement of the sanitation of the town, at an estimated cost of 600,000 francs.—A Society for the protection of monuments and picturesque sites of Savoy has been formed at Chambéry.—A new fountain is to be inaugurated at Beauvais by M. Gréard (sculptor), which was in the Salon of 1905, and has been commissioned by the Société des Amis des Arts de Poise.—A monument to Gréard, former Rector of the University of Paris, will be erected this summer in the square of the Sorbonne. This monument, the work of M. Nénot, is composed of an architectural section surmounted by a bust of Gréard, and decorated with a bas-relief illustrating his life.—The monument to Cornéille in the Place du Panthéon,

adjoining the Ste. Gèneviève Library, is to be inaugurated in a few days. The sculptural work is by M. Allouard, and the architectural portion the design by M. Latour.—M. Guadet, in restoring, at the Palais Royal, the ancient apartments of the Regent, has discovered two splendid columns and some fragments of woodcarving, formerly part of the decoration of the Salons de Reception of the Duc d'Orléans. They have been placed in the Musée des Arts Décoratifs.—The old church of Sarlat (Dordogne), at present serving as a post-office, and which is classed among the "Monuments Historiques," is to be restored at the cost of the State.—An asylum for 1,200 patients is to be built at Orléans.—The jury in the competition for a new Hôtel de Ville at Troyes have awarded the first premium to a design the author of which is still anonymous. The second premium has been awarded to MM. Balley and Gustave Monceaux, and the third to MM. Emile Hochereau and Gabriel Brun.—On June 2 the monument to Dumas fils, on the Place Malherbe, is to be inaugurated. M. Saint-Mars is the sculptor.—The "Société d'Encouragement à l'Art et à l'Industrie" has founded two prizes which are to be awarded annually to decorative artists belonging respectively to the Société des Artistes Français and to the Société Nationale des Beaux-Arts.—As a memorial of the visit of the King of Spain a certain number of Spanish residents in Paris have founded, at Ville d'Avray, a dispensary for consumptive patients. The establishment has been very well planned and installed by M. Saint-Père, the architect.—The Académie des Beaux-Arts has elected, as Corresponding Member in the section of Architecture, M. Famin, of Chartres, in place of M. Martenot, of Rennes, recently deceased. M. Famin, a Corresponding Member is ninety-seven years of age; he had quite passed out of notice; but he obtained the Grand Prix de Rome in 1835. This venerable architect, who had been supposed to be dead, addressed recently to the Académie a remarkable study on the degeneration of the Cathedral of Chartres, and it was this work that led to his receiving this tardy honour at his hands.—The next Sunday, at Algiers, will be inaugurated the monument to the memory of Commandant Lamy, the explorer of the Sahara. The monument, of which M. Gaudissart is the sculptor, consists of a bronze bust carried on a column, the pedestal of which was ornamented with military emblems.—The death is announced, at the age of sixty-three, of M. Charles Abrizio, member of the Société Centrale des Architectes, and a pupil of M. Vaudremer. He had been for a long time attached to the architectural services of the Paris Hôtel de Ville and of the Department of the Seine, and was commissioned, as the result of a competition, with the carrying out of the parish church of St. Mandé.—The death is also announced, at the age of fifty-eight, of M. Felix Le Névé, a former pupil of Questel, and architect-expert to the Council of the Préfecture of the Seine. He was also a member of the Société Centrale. He had executed numerous private commissions—residences, offices, etc.; among them the fine Hôtel, 64, Avenue du Bois de Boulogne, and the Château de St. Maigrin, in the Department of the Charente.

EGYPT.—H.M. Consul at Cairo (Mr. A. D. Alban) has forwarded copy of the conditions of an international competition for the construction of a "Bourse Khédiviale du Caire," in connexion with which a first prize of 250EL is offered and a second of 100EL. Designs must be submitted to the "Corporation des Agents de Change," Cairo, before October 31.—Board of Trade Journal.

Miscellaneous.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The partnership between Mr. James Henderson, jun., and Mr. John Hall, architects and surveyors, 28, John-street, Sanderland, has been dissolved, Mr. Henderson being about to leave England. Mr. John Hall will continue to carry on the business in the same style at the above address.—Mr. Max Clarke, architect, of 4, Queen-square, Bloomsbury, has taken into partnership Mr. Matt Garbutt, at present the architect to the Metropolitan Railway Company. The style of the firm will be "Max Clarke & Garbutt," to whom all professional communications are to be addressed in the same style as the above, which date the partnership will commence.

THE RUSKIN MUSEUM, SHEFFIELD.—The annual report of the Ruskin Museum states that this year the total number of visitors was 43,659, as against 50,736 in the year 1904-5, a difference accounted for by the fact that in the preceding year a special exhibition was held, consisting of etchings and engravings illustrating the history and processes of these arts, which alone attracted several thousands of visitors. The Museum Lectures were continued this season in connexion with the Free Public Lecture Scheme inaugurated four years ago, and embraced examples of Italian art, which had occupied special attention during their connexion with the objects of the museum,

particularly illustrating them. The lectures were illustrated by specially prepared lantern slides of the edifices, monuments, and paintings dealt with, and were considered in their special relation to the criticisms and teachings of Ruskin. The lecture-room previously used proved too small, and a fresh departure had to be made in order to provide accommodation; the larger picture gallery was therefore fitted up and used for the purpose, the improved conditions being much appreciated by the audiences. Two hundred tickets were issued for the lectures and the gallery was well filled on each occasion. The tickets are issued to any visitor who makes application for them, and to students at the principal educational institutions. The Sheffield Ruskin Club held its monthly meetings of the Meersbrook Circle at the Museum, as in previous years, and about thirty meetings in the different circles have been held in the city during the year. The members of the club meet to read and discuss the Works of Ruskin, with the view of ascertaining how his teachings may be applied for the betterment of social relations and conduct at the present day. The museum is open to the public free every week-day, except Friday, from 10 a.m. until sunset, and from 2 p.m. to 5 on Sunday afternoons.

DAMAGE TO BUILDINGS FROM SUBSIDENCE.—The important decisions have recently been given in the Courts relating to the right to support which is given to those in possession of lands under which are mines. In Butterknowle Colliery Company v. Bishop Auckland Industrial Co-operative Flour and Provision Society, Ltd., the plaintiffs, the owners of certain lands and buildings, claimed damages for subsidence caused by the appellants in the working of their mines. The defendants' predecessors in title had been the Lords Bishops of Durham, who had owned the mines and the lands, subject only to certain rights of common and pasturage. The rights had been extinguished by an Enclosure Act in the reign of George II., when allotments had been granted amongst the commoners, to some of which the plaintiffs had become entitled. This Act contained provisions enabling the mine owners to work and win the mines "as fully and freely" as they might have done "in this case Act had not been made." This, amongst other provisions of the Act, was relied upon by the defendants as giving them the right to work the mines so as to lower the surface. The House of Lords negatived this contention, and the judgments contained a valuable exposition of the law governing this subject. The right to support is rigidly presumed, and this presumption can only be removed by unequivocal and express words, and in the interpretation of such instruments if the introduction of a clause regulating the working of the mines so as not to lower the surface can be read into any document regulating the rights of the parties without causing inconsistency, this is the proper interpretation to be placed on such instruments. The second case, Tunncliffe & Thompson, Ltd., v. West Leigh Colliery Company, Ltd., turns on the damages recoverable where buildings have been damaged by a subsidence caused by the working of mines. Certain mills had been damaged by subsidence, and besides the actual structural damage present at the time of the inquiry into the damages, there was a fear that further damage to the buildings would ensue, and the question, shortly stated, was whether the depreciation in the property consequent upon this fear could be taken into consideration. The majority of the Court of Appeal, reversing the Court below, have held that, since the measure of damage is the difference in the selling value of the property before and after the inquiry, this item should be taken into consideration. Lord Justice Romer however considered it too remote, and the case is likely to go to the House of Lords.

HOLIDAY RESORTS.—The Health Resorts Development Association send us copies of illustrated booklets giving information as to the attractions, as holiday places, of Southampton, Weston-super-Mare, Deal, Bournemouth, and Woodhall Spa. One of these booklets will be sent free on receipt of a request on a postcard to the town clerk of any of the places named.

MR. BROCK'S STUDIOS.—In the House of Commons few days ago, Mr. Harcourt, having been asked by Sir W. Collins whether his attention had been called to the objection in the neighbourhood to the erection of a studio for Mr. Brock, R.A., on Primrose-hill, whether he will state what are the height, length, and breadth of the proposed building; and whether the dimensions were indicated on the plan to which he gave his approval, and on the strength of which he considers that the building in question is not likely to injure the surrounding scenery, says:—My attention has been drawn to this building, the site for which was determined under the late Government. The dimensions of the building are:—Height to eaves, 25 ft.; breadth, 50 ft.; length, 100 ft.; and appeared upon the plan approved by me. The building will be removed as soon as Mr. Brock's work on the Queen Victoria Memorial is completed. I will endeavour by some external decoration to make the building as little unsightly as possible.

STOCKTON HOUSE, WILTSHIRE.—The fine

collection of XVIII.-XVIIIth century furniture at Stockton House, near Heytesbury, has been placed in the market. The items include a XVIIIth century oaken bedstead, illustrated in Nash's "Mansions," and a Queen Anne pulpit, formerly in Wimborne Minster. The main portion of the house was erected by John Topp, woolstapler, who founded the almshouse in 1857. The house was carefully restored some years ago by a brother of the Bishop of Worcester, to whose family the property has belonged during a long period.

MEMORIAL IN WHIPPINGHAM CHURCH, I.W.—The Landgraf of Hesse has placed a tablet in St. Michael's Church in memory of eighty-four men of the Hessian contingent who were quartered in the Isle of Wight in 1794. The tablet, designed by Mr. A. Y. Nutt, resident architect at Windsor Castle, consists of a marble panel in a frame of moulded Staffordshire alabaster, with a trefoil cusped head; above is a shield bearing the lion of Hesse, and surmounting a crown.

ARTISTS' GENERAL BENEVOLENT INSTITUTION.—Lord Claud Hamilton presided over the ninety-first anniversary dinner of this institution on May 12 at the Hotel Métropole. The chairman stated that during ninety-one years past a total sum of 152,260l. had been distributed in 8,495 separate donations. The income from invested funds is about 8,000l.; during the year 3,000l. had been given in grants of from 10l. to 100l. Donations and subscriptions were announced to the amount of 2,829l.—Mr. C. Morland Agnew contributing 1,097l., mainly derived from the exhibition of the "Rokeby" Velasquez. The company included Sir Aston Webb, R.A. (Treasurer), Sir W. Emerson, Mr. Hans Thorey, Mr. R. A. B. Joy, Sir Charles Holroyd, Mr. Pomeroy, A.R.A., Mr. W. Oulss, R.A. (Honorary Secretary), Mr. Alfred East, A.R.A., Mr. J. S. Sargent, R.A., and Mr. Solomon J. Solomon, R.A.

A SEPARATE DIOCESE FOR ESSEX.—Proposals are made for setting up a separate diocese for Essex, with a cathedral and bishop's palace in Chelmsford. Subscriptions to the requisite total of about 50,000l. are already promised to an amount of 20,000l. The scheme provides for a rearrangement of the dioceses of St. Albans, Ely, and Norwich, whereby that of St. Albans would consist of Hertfordshire and Bedfordshire.

AMERICAN SOCIETY OF ENGINEERS.—An executive committee of the Iron and Steel Institute are making arrangements for entertaining the American Society of Engineers who will visit England in July. The programme comprises a reception by the Lord Mayor at the Mansion House on July 24, and visits to the Crystal Palace and the Imperial Austrian Exhibition, Tottenham Court. The American Society will visit the chief centres of manufacturing industry in the midlands and northern counties.

LONDON OUTER CIRCLE RAILWAY.—A Committee of the House of Commons, presided over by Sir G. Doughty, has under consideration a Bill for the construction of a line 32 miles in length through the northern suburbs to be worked by electricity under the single-phase system. Sir J. Wolfe Barry and partners are appointed engineers for the railway; the estimate for the actual construction, equipment excepted, is 3,320,000l. The track proposed starts from West Ham, taking in its course Barking, Tottenham, London, Kingsbury, Wembley, Harrow, Northolt, Southall, Edmonston, Finchley, and so to a junction at Feltham with the London and South-Western line, affording numerous connexions on the way with existing railways, as well as with Tilbury Docks.

AN ELASTIC PAINT.—"Velure" is the name of a paint which is said to possess remarkable elastic and weather-resisting properties. As is usual in the case of paints which after becoming dry remain elastic and do not crack, this paint does not become thoroughly hardened until it has been exposed to the air for several days. The paint is prepared in all colours, and samples of the white variety which have been submitted to us by the manufacturers, Messrs. Chancellor & Co., lead us to regard "Velure" as an excellent paint for use in those cases where rapid drying is not of the first importance.

MILAN FIRE SERVICE CONGRESS.—The biennial International Fire Service Congress will be held at Milan next week, and a Special Commission of Executive Officers of the British Fire Prevention Committee have left London to attend this Congress (including their Chairman and Honorary Secretary). Some eight other members of the Committee are also attending the Conference, which has been organised under the auspices of the International Fire Service Council and at the invitation of the Italian authorities. Among papers that will be read by members of the British Fire Prevention Committee are one by Mr. Edwin O. Sachs entitled, "International Relations in the Fire Service and the International Fire Service Council"; one by Mr. Ellis Marsland entitled, "The Different Systems of Fire-resisting Shutters, etc.," in Fire-resisting Doors and Windows"; one by Mr. James Sheppard entitled, "Fire Resistance of Buildings Constructed with Reinforced Concrete"; and one by Mr. Percy Collins entitled, "Fire Risks Due to New Industries and the Motor Industry in Particular."

APPOINTMENT OF SANITARY OFFICERS.—The Local Government Board has sanctioned the appointment of Miss A. K. Harris as sanitary inspector in the Metropolitan Borough of Bethnal Green; also of Mr. T. W. Dee as sanitary inspector in the Metropolitan Borough of Stepney, in the place of Mr. A. W. Willey, deceased.

Capital and Labour.

CONDITION OF THE BUILDING TRADES.—Employment in the building trades continued to show a general improvement. It was better than a year ago on the whole. Returns received through the trade correspondent from fifty-nine London employers showed that in the last week of April they paid wages to 11,306 workpeople of all classes, compared with 11,487 in March, and 12,792 in April, 1905. Employment generally was much the same as a month ago, but worse than a year ago. Painters and decorators were fairly busy. Other branches were very quiet. Returns received from Employers' Associations in sixty districts outside London. In rather more than half of these employment was dull generally. At Burnley it was good; at Ashton, Stratford-on-Avon, Exeter, and Taunton it was fairly good; and at the remaining towns (rather more than a third of the total) it was moderate or fair. Compared with a month ago, no change was reported in forty-five towns. At Nuneaton and Cheltenham employment was worse, and at thirteen towns, including Burnley, Bury, Birkenhead, Stockport, Swansea, and Dublin, it was better. Compared with a year ago no change was shown in thirty-six towns, in seven employment was better, in seventeen worse.—*Labour Gazette.*

Legal.

POWERS OF A DISTRICT COUNCIL.

IN the Court of Appeal, composed of the Master of the Rolls and Lords Justices Romer and Cozens-Hardy, on the 23rd inst., the hearing of the case of the Attorney-General v. the Pontypridd Urban District Council was concluded on the defendants' appeal from a judgment of Mr. Justice Farwell in the Chancery Division. (The case was reported in the *Builder* of August 19, 1905.)

The action was brought by the Attorney-General at the relation of the trustees of the Baroness Llanover, deceased, against the defendants, to restrain them, their contractors, servants, and workmen, from erecting or permitting to remain upon any portion of the land at Gwynygerwn, Treforest, near Pontypridd, which was purchased from the trustees in 1902, any building or works not required or intended for the purposes of the defendants' electric lighting undertaking, and from permanently using the land, or any part of it, for any other purpose than that for which it was acquired, viz., the production and supply of electricity. The relator trustees, on their own behalf, claimed an injunction to restrain the defendants from using any part of the land or any building on it in such a manner as to create a nuisance or cause damage to the Llanover estate. It appeared that after the purchase of the land by the defendants in April 1902, application to the Local Government Board for permission to use a part of the land for the purpose of a refuse destructor, but were told that the Board had no power to sanction the use of the land for any other purpose than that for which it had been acquired. In the following April the trustees were applied to to accept a re-conveyance of the part of the land on which it was proposed to erect the destructor, and then to convey it back again to the defendants, the latter paying the costs, but the trustees declined to accede to the application. Failing in both quarters, the defendants went through the form of conveying this part of the land to a Mr. Davis, and taking a re-conveyance from him, the undertaking to re-convey being a condition of the conveyance to Davis, and although informed by the trustees that they objected to the refuse destructor being built there, the defendants commenced the construction of the destructor, although no sanction had been obtained for it from the Local Government Board. The trustees' view was that the destruction of dust and refuse on any portion of the land in question would cause a serious nuisance, and would materially diminish the value of the trust property in the neighbourhood. The nature of the defence was that the scheme of the Council for establishing their works for generating electrical energy included a scheme, which was not uncommon in practice, for utilising the heat derived from a refuse destructor for working the electric generating machinery. This plan they had for reasons of economy adopted in 1901, on the advice of their electrical engineer. Mr. Justice Farwell held that the proposition put forward by the defendants, that they had the powers of user over the land as suggested, was entirely contrary to the

powers given to the Council in regard to the supply of electricity. He held that the defendants acquired the land in question under the Electric Lighting Acts for the purpose of electric lighting only, and that they had no power to erect upon it a dust destructor. His lordship accordingly decided that the action of the defendants was *ultra vires*, and granted an injunction with costs. Hence the present appeal of the defendants.

Mr. Danckwerts, K.C., and Mr. R. J. Parker appeared for the appellants; and Mr. W. H. Upjohn, K.C., and Mr. Hornell for the respondents.

At the conclusion of the arguments of counsel, the Master of the Rolls, in giving judgment, said the question to be decided was whether or not the defendants' Council were authorised under their powers in using the plot of land they had bought from the trustees for the purpose of building and using a dust destructor. The learned judge had come to the conclusion that the powers conferred upon the authority by the Electric Lighting Acts, under which the plot of land was acquired, did not embrace the right of the defendants to use the land so acquired for the purpose of a dust destructor. The first question was, under what powers did the local authority acquire the site in question? Mr. Justice Farwell had found that they unquestionably acquired the land under their powers under the Electric Lighting Acts. He (the Master of the Rolls) entirely concurred with Mr. Justice Farwell in the conclusion that the action of the dust destructor was authorised under those powers by coming to the conclusion that the dust destructor was necessary and incidental to such supply. Mr. Justice Farwell had found that the dust destructor was not necessary or incidental to the supply of electricity, but was to enable the defendants to carry out their obligations in getting rid of the dust. He was of opinion that Mr. Justice Farwell was right in the conclusions he had come to, both of fact and law, and that what the defendants proposed to do was *ultra vires* their powers. He thought, therefore, the appeal failed, and should be dismissed with costs. The Lords Justices concurred.

ACTION BY BUILDERS AND CONTRACTORS.

The case of Neale and others, the Corporation of South Shields case before Mr. Justice Buckley on the 18th inst. on a motion on behalf of the plaintiffs for an order that the Corporation of South Shields might be restrained until judgment from acting upon a notice of March 24, 1906.

Mr. Astbury, K.C., who appeared in support of the notice, said his learned friend, Mr. Buckmaster, K.C., who appeared for the defendants, had a cross-motion to stay the proceedings under an arbitration clause, and that the matters in dispute other than certain excluded matters might go to arbitration. He said the case was a very serious and complicated one. The plaintiffs were large builders and contractors in Manchester, who some time ago entered into a contract with the Corporation of South Shields to build some municipal buildings at a large cost. The arbitrator was a gentleman of the name of Fitch, in London, and the architect and he had a number of discretionary and absolute powers to reject and order things to be re-opened up, and so on. Unfortunately for the parties there had been constant friction from the commencement between the plaintiff and this architect. Up to the present time buildings to the extent of about 10,000l. had been completed, and the architect's certificate given. Under the specification the plaintiffs were bound to put in mortar of a certain kind. They said they had done that, and that the mortar had from time to time been passed by the architect. They had a large body of evidence that the proportion of sand and cement was a very unwise one to take. The architect said they had not done that, and that the defects in the mortar which he complained had arisen from other causes. The architect had ordered the plaintiffs to remove forthwith from the works the whole of the mortar and concrete, which could not be done without pulling the building down. The notice said that this was to be done at the cost of the plaintiffs, who were to substitute therefor mortar and concrete in accordance with the specification. That was the notice the plaintiffs sought to restrain the defendants acting upon, and their writ asked that the notice might be declared invalid and not authorised by the contract. The plaintiffs asked for arbitration as well as the defendants. They said they had not ordered the mortar to be pulled down, for many reasons, amongst them being that the mortar and concrete had been passed by the architect, and that he had not exercised a *bona-fide* discretion or come to a reasonable decision. There was a

Patents of the Week.

APPLICATIONS PUBLISHED.*

8,804 of 1905.—T. M. THOM: *Manufacture of Artificial Stone and Marble.*

This relates to a process of manufacturing artificial marble and stone which consists in submitting the slabs to the action of carbonic acid gas in a special manner; that is to say, the slabs being placed in a vacuum, carbonic acid gas is admitted thereto until the vacuum is largely reduced by the presence of gas, the admission of gas being repeated if necessary to maintain the reduced vacuum constant as the carbonation progresses and the carbonic acid gas is taken up by the slabs.

9,017 of 1905.—E. CHATILLON: *Process for the Preparation of Antimoniai Substances Used for Painting and other Purposes and the Products thereof.*

This relates to a process for the manufacture of antimoniai substances, and is characterised by the employment of a first cupola charged with ore and combustible, and, if necessary, substances rich in sulphur, a vapourising chamber supplied with water, a second cupola charged with combustible, and a second chamber where water is injected and atomised by means of exhaust ventilators; the injected water holding in solution or suspension alkaline earth sulphides, carbonates, sulphites, hydrates, or a mixture of these substances.

9,017A of 1905.—E. CHATILLON: *Process for the Preparation of Products of Antimony for Painting and other Purposes.*

This relates to a process for the preparation of antimony for painting and other purposes, and is particularly applicable for the preparation of antimony of violet colour. Black antimony is obtained as hitherto by distilling sulphide ores containing antimony in a cupola with a restricted supply of air for supporting combustion. For this purpose a cupola furnace with relatively small ventilators is used, either a cupola of wide section and great depth filled with coke and ore on the grating, and a small ventilator which is a fan revolving at high speed, exhausting or forcing such a quantity of gas that the oxidation will be little or nothing, the combustion of the coke merely evolving CO and not CO₂, or the ventilators may be dispensed with and a draught from chimney at the end of the long condensation chambers may be substituted. For antimony violet the installation for the blacks is employed, but on emerging from the cupola the gases will pass on to a specially heated hearth, where they will be further heated to a red cherry heat—that is to say, to a temperature of about 800 to 900° C., and afterwards condensed by the ventilators or in a tower.

9,694 of 1905.—W. LITTLE: *Cooking or Water-heating Boxes Especially Suitable for Field Use.*

This relates to a cooking or water-heating apparatus having a protective casing with air inlet, and consists in the construction wherein said casing, which is double walled, extends around both the vessel and the heating space, leaving a narrow space around said vessel, the inner wall of said casing being provided with upper and lower guides or inward projections.

9,984 of 1905.—R. LEGGOTT and W. R. LEGGOTT, LTD: *Opening and Closing of Fan-lights and Pivoted Windows.*

In carrying this invention into effect an attachment of the ordinary description may be made with the fan-light or window frame, and a vertical rod extend to said attachment, and held in line by a series of guides secured in a rigid manner. Engaging with the vertical rod and clamping one of the before-mentioned guides is a swivelling bracket, to which a lever is jointed, and on another portion of the vertical rod is a collar, held but capable of rotation or like swivelling to some extent, around the vertical rod. The connexion is made between the collar and lever by a link jointed in such a manner that when the vertical rod is raised to the full the lever and link are so engaged that the fan-light or pivoted window is securely held in position without the aid of a nipping screw or the like.

10,592 of 1905.—J. MADDER: *Apparatus for Cleaning Windows, and for Brushing, Washing, and Painting the Fronts of Buildings.*

This relates to an apparatus for cleaning windows and for other purposes, and consists in the combination of a rotary brush mounted upon a shaft journaled in a bearing at the upper end of an extensible rod or long arm, sprocket wheels mounted on said shaft, and towards the lower end of said rod or long arm respectively a crank handle for rotating the latter sprocket wheel and an extensible endless band passing over both

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

said sprocket wheels for conveying motion from one to the other.

12,310 of 1905.—J. WEIR: *Door Lock.*

This relates to a door lock having in combination a bolt, a pin which is prevented from revolving, and has a hollowed part internally screwed, said pin being adapted to engage the bolt, and a screw or equivalent arranged within a pin in such manner that, when it is turned by a key, it causes the pin to engage with or disengage itself from the bolt.

16,790 of 1905.—J. E. H. PADDON: *Radiators for Heating Buildings.*

This relates to a radiator for heating buildings, comprising a series of hollow vertical sections arranged parallel to each other and communicating with each other at their upper and lower ends by means of horizontal ducts, and having flow and return connexions in the opposite end-sections, such radiator being characterised by a vertical partition closing the portion of the horizontal duct between the lower ends of the intake end-section and that next to it, and a horizontal operating valve, controlling the communication between the upper ends of the said intake end-section and the section next to it.

13,450 of 1905.—G. LANGFIELD & Co., LTD., and J. D. P. ASHWORTH: *Humidifying of Air in Air Heating Stoves.*

This relates to air heating stoves and consists in the combination with air heating tubes connecting a through air chamber with a hot air delivery chamber, of a valve chest connected to the lower end of one of said tubes, said valve chest being controlled by a valve or valves so as to allow either air or water to enter this tube.

19,145 of 1905.—E. W. DENNISON and R. F. TOWLER: *Metal Collapsible Screens, Guards, Gates, Shutters, and the like.*

This relates to metal collapsible gates, screens, guards, shutters, and the like, and consists in the application and use of gaurds, each of which has its two shoes or runners cast or otherwise formed in one piece with a connecting cross-web.

20,309 of 1905.—J. H. HOPE, JR.: *Adjustable Frames for Door Locks and Latches.*

This relates to a lock or latch frame provided with an outer plate, a front plate extending across the edge of the door, an inner plate secured to the flanged end of the front plate, and a tie piece arranged to hold the inner and outer plates in rigid connexion with each other, and to support the front plate against the action of the fastening screws.

15,634 of 1905.—F. TRIER: *Means for Cutting Stone and the like.*

This consists of an apparatus for cutting stone and the like by means of magnetisable abradant material magnetically held to the circumference by a revolving disc, which is magnetised by passing electric current through coils encircling the shaft encircling the disc and preferably on both sides of the disc, so that the disc is rendered free to cut to the maximum diameter allowed by the diameter of the coils on the shaft.

23,136 of 1906.—A. COWINGS: *Door Closing Apparatus.*

This relates to a door closing apparatus of the kind having a spindle carrying a roller, inclined planes mounted on a weighted lever, and adapted to rise and fall vertically, and to bear against said roller, and an additional weighted arm adapted to bring the roller to a central position.

102 of 1906.—D. A. HARRIS: *Adjustable Supports for Shelves, Display Tods, and the like.*

This relates to an adjustable support for shelves and the like, having the bracket or the like provided with a downwardly directed hook projecting therefrom, adapted to engage an elongated hole in the standard, and consists in the construction wherein a plurality of said hooks are used, having their downwardly projecting portions parallel to the contact face or edge of the bracket, and in line with the holes in the standard.

1,922 of 1906.—A. A. PAULY: *Concrete Block-forming Machines.*

This relates to concrete block-forming machines, and consists in the combination with a frame work having rollers journaled therein of standards carried by said frame work, a plate connecting said standards together, a frame slidably mounted upon said standards, a plunger carried by said frame, a shaft journaled in said frame, and having suitable crank handles, a toothed wheel mounted upon said shaft, a rack carried by said plate, and meshing with said toothed wheel, and a pawl pivotally mounted upon said frame and normally engaging said toothed wheel.

8,432 of 1906.—J. COLLIER: *Stairs.*

This relates to stairs constructed of a winding and inclined arch formed of two or more thicknesses of brushes, with broken or crossed joints united

great deal to be tried, and he asked that the trial of the action be expedited.

Mr. Buckmaster, for the defendants, said that so far as the question involved whether this mortar was right or wrong, that was a matter in the discretion of the architect.

His lordship:—Supposing that for twelve months he has passed the material, and it has been put in the building, and then he turns round and says, "This mortar is all wrong—pull the building down!"

Mr. Buckmaster said that under the contract the parties had agreed that the architect should be the final judge of the matter.

His lordship: If he acted reasonably.

Mr. Buckmaster admitted that the architect's capacity as a judge could be questioned, but he failed to see on what ground the exercise of his authority could be questioned.

His lordship then, by consent, made no order on the motion except that the costs be costs in the work again at his own cost?

Mr. Buckmaster said he did not intend to give up whatever rights the defendants had in the arbitration.

His lordship suggested that the proper course would be to make the costs of the motions costs in the action, and let the case go to trial without prejudice to any application either party might make to refer any of the questions to arbitration.

Mr. Buckmaster said defendants were prepared to give an undertaking until the hearing of the action not to interfere with the buildings, the plaintiffs giving a cross undertaking in damages.

Mr. Astbury said he could not give an undertaking in damages, as he did not know what it would involve—the liability might be enormous.

His lordship then, by consent, made no order on the motion except that the costs be costs in the action, reserving to either party liberty to say that something ought to go to arbitration.

It was agreed that pleadings should be delivered as soon as possible, and leave to apply to advance the trial was given.

HEAVY DAMAGES AGAINST A BUILDER.

The case of Ward v. Green came before the Court of Appeal, consisting of Lords Justices Vaughan Williams, Stirling, and Fletcher Moulton, on the 21st inst., on the defendant's application for a stay of execution pending appeal.

Mr. Shearman, K.C., in support of the application, said the action was brought by the plaintiff, a widow, to recover from the defendant, a builder, damages under Lord Campbell's Act, plaintiff's husband having lost his life in an accident in a building in Camberwell some time ago. The action had had to be tried three times before a result could be arrived at, the jury having disagreed on two occasions. At the last trial, before Mr. Justice Phillimore, the jury returned a verdict in the plaintiff's favour for 500l. damages, and judgment was entered accordingly.

After the verdict he (counsel) asked the learned judge for a stay of execution on the defendant agreeing to pay the plaintiff 2l. a week until the appeal was heard, the money so paid not to be returned if the appeal proved successful, the defendant also to bring the amount of the damages into Court and paying the costs to the plaintiff's solicitor on his giving an undertaking to return them if the appeal was allowed. Mr. Justice Phillimore, however, refused to grant a stay.

After hearing Mr. McCall, K.C., on behalf of the plaintiff, in opposition to the application, Lord Justice Vaughan Williams said he considered the defendant's offer a very handsome and proper one, and in the result a stay was granted on the terms that defendant paid the plaintiff, pending the hearing of the appeal, 2l. a week, brought 450l. into Court within seven days, and paid the taxed costs on the usual undertaking.

The costs of the application was made costs in the appeal.

ACTION ON A BUILDING CONTRACT.

A DIVISIONAL COURT of King's Bench, composed of Justices Ridley and Darling, on the 19th inst., concluded the hearing of the case of Williams v. Griffiths, on a motion on behalf of the plaintiff to set aside the award of an arbitrator on the ground of excess of jurisdiction.

Mr. J. Jones appeared for the plaintiff, and Mr. McCarthy for the defendant.

It appeared that the arbitration was held in common form and was on the question of the construction of a building contract in which the builder was entitled, in the event of the architect refusing a progress certificate, to go to arbitration upon that amongst other disputes. The defendant was the builder of a villa in Morriston, Swansea, and during the course of the work he claimed a progress certificate, which was refused by the architect. The builder then claimed an arbitration, and the arbitration was held to determine whether he was entitled to the certificate, and, if so, for how much. The result of the arbitration was that an award was made whereby the builder was awarded a larger sum than he claimed. The plaintiff now moved to set the award aside on the ground of excess of jurisdiction.

At the conclusion of the arguments of counsel their lordships set the award aside.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, xviii.; Auction Sales, xxx. Certain conditions, beyond those given in the following information, are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bonâ-fide tender unless stated to the contrary.

Contracts.

BUILDING.

May 16.—**Aughton**.—REBUILDING INN.—The rebuilding of the Black Bull Inn at Aughton, for Messrs. Mappin's Masboro' Old Brewery, Ltd. Names and addresses to Mr. J. E. Knight, architect, 35, College-street, Rotherham, on or before May 26, along with a deposit of 1*l.* 1*s.* for quantities.

Hillside, Raphael, Greek Consul, Duke Street, Cardiff, on or before June 1. Messrs. James & Morgan, F.R.I.B.A., architects, Charles-street, Cardiff.

June 2.—**Antrim**.—VILLA.—The Committee of Management of the County Asylum, Antrim, invite tenders for the erection of a villa on their Holywell Estate, near Antrim. The plans and specifications may be inspected in the office of the Clerk of the above institution, and at the office of Mr. S. C. Hunter, 2, Wellington-place, Belfast, from which latter copy of the bill of quantities may be obtained, on payment of a deposit of 1*l.* 1*s.* Sealed tenders to be sent to the Chairman of Asylum Committee, Holywell, Antrim, to be sent in on or before 12 noon on June 2, copies of the plans and specification may be obtained on application to Mr. Basil Wilson, M.Inst.C.E., Maryville, Malone, Belfast, on payment of the sum of 1*l.*

June 2.—**Arnside**.—RESIDENCE.—The erection of a residence at Arnside, for Mr. W. F. Bolton. Plans and Specifications may be seen, and particulars obtained, at office of Mr. Geo. L. Hogarth, architect, Kendal and Arnside, from May 24 to June 2, to which latter day tenders must be sent to architect.

June 2.—**Blunts**.—CHAPEL.—RENOVATION OF Wesleyan Chapel, Blunts. Specification may be seen at the architect's house, Landrake. Tenders to be sent to Rev. A. S. Williams, Callington, on or before June 2. Mr. Harold A. Hosking, P.A.S.I. Hon. architect.

June 2.—**Urquhart**.—STRADDLING.—Mason, carpenter, and slater works of new firm standing to be erected at Parks of Innes, Urquhart (James Estate). The plans and specifications can be seen at the Estate Office, Urquhart, and intending offerers will be met at Parks of Innes, on Thursday, May 31, between 2.20 and 4 p.m., when the works will be pointed out. Offers to be addressed to Mr. Gilbert R. McGarva, factor, Innes, Elgin, on or before June 2.

June 4.—**Antrim**.—SUM.—Great Northern Railway Company (Ireland) Directors invite tenders for the construction and erection of 4 timber sheds, 50 ft. by 12 ft., with galvanised iron roof, at their Antrim Station. Parties wishing to tender for the work must send the drawings and specification at the office of Mr. W. H. Mills, Engineer in Chief, Amiens-street terminus, Dublin, or copy of same at the District Engineer's Office, Belfast, and can be obtained at the office of the Secretary, Town Management of 18 (not returnable) each. Tenders made out on the forms supplied by the company, and endorsed "Tender for Shed at Antrim," should be delivered to Mr. Morrison, Secretary, Secretary's Office, Amiens-street terminus, Dublin, not later than 10 a.m. on June 4.

June 4.—**Croydon**.—WORKSHOP ADDITIONS.—Croydon Guardians invite tenders for erection of small first floor additions to the workshop at 4, Underwood, Queen's-road, Croydon. The plans, specification, and conditions of contract may be seen, and bills of quantities with forms of tenders obtained, at the office of Mr. Henry Berney, architect, 124, George-street, Croydon. Surveyor to the Guardians, upon depositing the sum of 3*l.* 3*s.* Tenders, sealed and endorsed "Additions to Workshops," to be addressed to Mr. Harry List, Clerk to the

Guardians, Union Offices, Mayday-road, Thornton Heath, Surrey, and to be delivered at the Union Offices, Mayday-road, Thornton Heath, Surrey, on June 4.

4.—Ludlow.—EXTENSION OF INFIRMARY.—Ludlow Guardians invite tenders for the extension of the infirmary at the Union Workhouse, and for the execution of works for drainage to the same. Plans and specifications apply to Mr. B. Weate, architect, East Hamlet, Ludlow. Separate tenders for each of the works must be sent to Mr. Arthur W. Weyman, Clerk to the Guardians, Ludlow, on or before June 4.

5.—Grimsby.—HALL.—New hall, Garibaldi-street, for the Ancient Order of Foresters. Plans, specifications, form of tender, and all particulars may be obtained at the office of the architect, Mr. Herbert Heap, Assoc. M. Inst. C.E., Osborne Chambers, between the hours of 9 a.m. and 6 p.m. Sealed tenders, which must be endorsed "Tender for proposed New Hall," and addressed to Mr. T. Street, Secretary, must be delivered at No. 164, Oxford-street, Grimsby, not later than June 5.

6.—Penryn.—COTTAGES.—Thirty or more cottages near Penryn, Cornwall, for the Fecod and Aberdrief Building Club. Plans and specifications can be seen at office of Mr. P. Vivian Jones, P.A.S.T., architect and surveyor, Henged, Penryn, and addressed to Mr. David Phillips, Hanbury Hotel, Bargoed, on or before June 5.

7.—Llanfihell.—SCHOOL.—New Council School at Llanfihell for the Anglesey Education Committee. Plans and specifications may be inspected at offices of Mr. Jos. Owen, F.R.I.B.A., County Architect, at Bangor, and Mr. David Tenders, under contract and endorsed "Llanfihell Council School," to be delivered to Mr. R. H. Williams, Secretary of Education, Education Offices, Llanfihell, not later than 10 a.m. on June 7. Forms of tenders will be supplied by the architect.

8.—Downe, Kent.—SCHOOL.—The erection of Council School for 120 children at Downe, near Bromley, Kent, for the Kent Education Committee. Plans and specifications may be inspected (by the architect to the Committee), which may be inspected at the Committee's Offices, between 10 a.m. and 4 p.m. Those desiring to tender, are to send their tenders to Mr. J. G. Campbell, 124, St. Paul, not later than May 30. Tenders, on form supplied, to be delivered to Mr. Edward Hasselhurst, Park House, Bromley, Kent, not later than noon on Friday, June 8.

9.—Dunblane.—SCHOOL.—The Building Committee invites tenders for the mason, iron, joiner, plumber, slater, plaster, painter, and glazier work for the erection and completion of the Queen Victoria School and Memorial to Scottish Sailors and Soldiers, to be erected at Dunblane, houses on needed therewith, and offices also for drainage, fencing, and laying out roads, sewers, water and gas supplies, and relative works. The relative schedules may be obtained on application to the Executive Committee, 124, St. Vincent-street, Glasgow. Printed copies of the conditions of contract, specifications, and measurements and general conditions will be supplied to intending offerors, on a deposit of 2s. The schedules shall be priced and extended, but it is intended to accept a lump sum from one offeror for the whole work. No offers for separate works will be entertained. The building contract will be allowed to sub-contract with the approval of the building committee. The schedules and tender must be sent in a sealed envelope, which shall be addressed to the Secretary to the Executive Council, Queen Victoria School, care of Mr. R. Addison Smith, Hon. Treasurer, 19, Heriot's Edinburgh, not later than June 9.

10.—Snodgrass.—MORTUARY.—Snodgrass Parish Council invite tenders for building a mortuary at the cemetery. Plans and specification can be seen at office of Mr. Tom Hilder, Clerk to the Council, Park Hill, Snodgrass, on or after May 25, before noon on June 9, endorsed "Tender for Mortuary."

11.—Burley.—ADDITIONS TO SCHOOL.—Additions to Burley Council School, for the Southampton County Council. Plans, specification, and conditions of contract may be seen, and bills of quantities obtained from the County Surveyor, The Castle, Winchester, on and after May 25, between 9 a.m. and 5 p.m. (Saturdays, 9 a.m. to 1 p.m.), on deposit of 2s. (to be made by cheque). Tenders, endorsed "Proposed Additions, Burley Council School," to be delivered on or before 10 a.m. June 11.

12.—Little Heath.—SCHOOLS, &c.—The Herefordshire C.C. Education Committee invite tenders for new elementary school and teacher's residence at Little Heath. Drawings, specification, agreement, &c., can be seen at the County Surveyor's Office, Hereford, on or after May 28, between 10 and 4 (Saturdays 10 and 12). A copy of schedule of works and prices (quantities), and form of tender, can be obtained at County Surveyor's Office on payment of 2s. Sealed tenders, endorsed "Tender for School and Teacher's Residence, Little Heath," to be delivered to Mr. Urban A. Smith, County Surveyor, Hereford, before noon on June 11.

13.—Swindon.—LAUNDRY BUILDINGS.—Swindon and Highworth Guardians invite tenders for the erection of laundry buildings and disinfecter house. Plans and specifications can be seen and particulars obtained at the office of the architect, Mr. R. J. Beswick, 10, Victoria-road, Swindon. Sealed and endorsed tenders to be delivered to Mr. John H. Clark, Clerk to the Guardians, Union Offices, Victoria-road, Swindon, on or before 5 o'clock in the afternoon of June 11.

14.—Rugby.—NEW WING TO HOSPITAL.—For erection of new wing, Hospital of St. Cross, Rugby, for the Building Committee. Bills of quantities and forms of tender to be obtained from the architect, Mr. J. D. Hooper, Albert-street, Rugby, on deposit of 1s. Sealed tenders, which must be delivered, addressed to the Chairman of Children's Wards Committee, endorsed "Tender for New Wing," before noon on Tuesday, June 12.

15.—Walworth, S.E.—UNDERGROUND CONVENIENCE.—The Northwark Borough Council invite tenders for underground convenience for women in Ariside-street, London. Plans may be seen, and specification, conditions, and terms of tender obtained, between 10 and 5, on application to Mr. A. Harrison, Borough Engineer, Town Hall, Walworth, on or after May 25, on or after May 25, on prescribed form, sealed, and endorsed "Tender for Construction of Underground Convenience," must be sent to Mr. J. A. Johnson, Town Clerk, Town Hall, Walworth-road, S.E., before 12 noon, June 13.

16.—Tooting, S.W.—TWO WARD BLOCKS, &c.—Erection of two ward blocks, Recreation Hall and Staff Quarters, at Tooting Bee Asylum, Tooting, S.W., in accordance with specifications, etc., prepared by the Engineer-in-Chief for the Metropolitan Asylums Board. Drawings, specifications, bills of quantities, conditions of contract, and form of tender can be inspected at the Board's Offices, Embankment, E.C., on and after May 24, and bills of quantities and form of tender obtained on deposit of 5s. Tenders, on prescribed form, to be delivered at the Board's Office not later than 10 a.m. on June 15.

17.—Finsbury Park, N.—BASE STAND.—The erection of a band stand in Finsbury Park, composed of brick, wood, and tiles, for the L.C.C. Drawings, specification, bill of quantities, form of tender, &c., may be obtained from the Architect, Department of Parks, East, on deposit of 10s. Tenders to be delivered at the County Hall in a sealed cover, addressed to the Clerk of the L.C.C., Spring-garden, on or before Friday, June 15.

18.—Knock.—VILLAS.—One detached and two semi-detached villas at Kensington-road, Killybeg, and specifications may be had at office of Mr. Thomas Houston, architect and civil engineer, Kingscourt, Wellington-place, Belfast. Sealed and endorsed tenders to be lodged with architect on or before June 15.

19.—Bristol.—SUEDS AND GRANARY.—The Docks Committee of the City and County of Bristol invite tenders for the construction and maintenance, or for the repair and completion, of the following works at the Royal Edward Dock, Avonmouth, now in course of construction:—Two upper-storied transit sheds, each 500 ft. long, one single-floor transit shed, 450 ft. long; a granary to contain 50,000 q. of grain. Parties desiring to tender may submit tenders for any one of the four buildings alone, the two upper-storied transit sheds together in one tender; the whole of the four buildings together in one tender; any other combination of two or more buildings in one tender. Tenders for the upper-storied sheds are invited by one or both of the following alternative methods of construction:—(1) Steel construction; (2) ferro-concrete construction. Tenders for the granary are invited by one or all of the following methods of construction:—(1) Brick construction; (2) ferro-concrete construction; (3) timber construction. Copies of the specifications, form of tender, and bills of quantities can be obtained from Mr. W. W. Squire, engineer, Engineer's Office, Cumberland-road, Bristol, on production of a receipt from the Secretary of the Docks Committee, showing that 2s. has been paid as deposit on each set of drawings applied for. Tenders must be enclosed in a sealed envelope, endorsed "Tender for Sheds and Granary, Royal Edward Dock," and addressed to the Secretary of the Docks Committee, 19, Queen-square, Bristol, and must be delivered to him before 10 a.m. on June 15.

20.—Cheltenham.—SCHOOLS.—The Cheltenham Education Committee invite tenders for new school buildings, to accommodate 1,100 children, for the Gloucester-road District of Cheltenham, in accordance with specifications and conditions, and copy of contract, to be seen at the offices of Messrs. Chatters & Smithson, architects, 17, Regent-street, Cheltenham. Early application requested for bills of quantities, which will be supplied by the architects on payment of 2s. Tenders, sealed and endorsed, to Mr. W. Preston, Secretary, Education Offices, Redcliffe, Cheltenham, before 12 o'clock on June 22.

21.—Brentwood.—ALTERATIONS.—The Visiting Committee of the Essex County Lunatic Asylum invite tenders for remodelling one of the blocks of Buildings as to form attendants' quarters. Drawings, specifications, and forms of contract may be inspected at the office of County Architect, Mr. Frank Whitmore, Duke-street, Chelmsford, between 10 and 4, except Saturdays. Names and address to County Architect before noon, June 4. Sealed tenders on the form supplied, endorsed "Tender for Female Attendants' Block," to be delivered to Mr. W. P. Zapp, Clerk, at the Visitors, Chelmsford, before 10 a.m., June 23.

22.—Alfreton.—VILLAS.—Two villas at West Houses, near Alfreton. For quantities and plans and specifications apply to Mr. Tom S. Wilcockson, architect and surveyor, Knifesmith Gate, Chesterfield.

23.—Basford.—SPRINGS.—The Cinderhill Co-operative Society, Ltd., invite tenders for the erection of new stores upon land situate in Egypt-road, Basford. Bill of quantities may be obtained from the architect, Mr. P. E. Moser, 69, Handford-road, Old Basford, on payment of two guineas.

24.—Hereford.—ADDITIONS TO LAUNDRY.—Additions to the Sanitary Laundry, Ledbury-road, Hereford. Apply in writing to Mr. W. W. Robinson, architect, 10, King-street, Hereford.

25.—Kendal.—RESTORING PREMISES.—Restoring the premises in Highgate, Kendal, destroyed by the late fire, for Mr. P. E. Moser. Plans and other information may be obtained by applying at office of Mr. John Stalker, architect, Kendal.

26.—Barnstaple.—WORKHOUSES.—The various departments of work required in (first) the erection of workmen's houses at Polmaise Colliery, near Fallin, Striling, for Messrs. Archibald Russell, Ltd.; (second) for Mr. W. E. Moser, 69, Handford-road, Old Basford; and (third) for an outfall drain. Schedules of quantities to be had after 25th, from Messrs. M. Larkie & Walker, C.E. and architects, 11, Dunbarton-road, Striling.

27.—Barnstaple.—WORKHOUSES.—The Barnstaple Board invite tenders for about 200 yds. of brick wall for burial ground. Particulars to be obtained from Rev. A. Fisher, Skilton Rectory.

ENGINEERING, IRON, AND STEEL.

28.—Southampton.—SEWAGE PLANT.—The New Forest Union Board invite tenders for the construction of a sewage disposal plant at the New Forest Union Workhouse, and other work in connection therewith. Plans and specifications may be seen, and forms of tender obtained, on application to Mr. W. Allen, the Board's Surveyor, Totton, Southampton, on or after May 25. Tenders, endorsed "Sewage Disposal," to be delivered at office of Mr. William Coxwell, Clerk to the Guardians, Totton, Southampton, not later than May 26.

29.—Bengal.—WAGGONS, &c.—Directors and North-Western Railway Company Engineers invite tenders for the supply and delivery of:—(a) Steel and wrought-iron material for 154 covered goods waggons; (b) 402 pairs wheels and axles; (c) 804 laminated bearing springs, as per specifications, to be seen at the Company's office. Tenders, addressed to Mr. Alexander Izat, Managing Director, 257, Greenhouse, Old Broad-street, London, E.C., and marked "Tenders for Waggons," or as the case may be, are to be lodged not later than noon on May 26. For each specification a fee of 10s. will be charged, which cannot, under any circumstances, be returned.

30.—Aston.—HEATING APPARATUS, &c.—The Aston Guardians invite tenders to provide and to heating and hot-water apparatus in new buildings at the workhouse, Gravelly Hill. Plans and specifications may be seen on application to the Clerk of the Works, at the Workhouse, Gravelly Hill, Birmingham, not later than noon on May 29.

31.—India.—TYRES ENGINE AND TENDER.—The Secretary of State for India in Council invites tenders for the supply of tyres, engine and tender. Conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., and tenders are to be delivered at that office by 2 o'clock p.m. on May 29.

32.—Monaghan.—WATERWORKS.—The U.D.C. of Monaghan invite tenders for the following works:—The providing, laying, etc., of 150 in. yds. of 9 in. cast-iron pipes at Tregon Reservoir; the extension of the distribution system through the enlarged urban district, which requires the providing, laying, etc., of 2,383 yds. of 3 in. cast-iron pipes with all sluice valves, hydrants, street fountains, water troughs, and fittings; the maintenance of the whole work for six calendar months after completion. Plans and specification may be seen, and forms of tender obtained, on application and payment of 1s. to Mr. J. L. Devenish Meares, C.E., Newry, or Mr. J. H. M. Wilson, C.E., Monaghan. Tenders must be in the form supplied, and the names of two responsible sureties or a guarantee society approved by the Urban Council be given for the due performance of the contract. Tenders to be sent in not later than 10 a.m. on May 29, in a sealed envelope, addressed to the Chairman of the Urban Council, and marked "Tender for Waterworks," on the outside of cover.

33.—Runcorn.—RAILING.—RUNCORN U.D.C. invite tenders for the supply of about 230 lin. yds. of cast-iron railing, similar to those now surrounding the enclosed portion of the Runcorn Cemetery. Particulars can be obtained from Mr. James Wilding, Surveyor and Engineer to the Council. Tenders, endorsed "Cemetery Railing," and addressed to the Chairman of the Runcorn Cemetery Committee, to be delivered to Mr. C. Marshall, Secretary, Town Hall, Runcorn, not later than 9 o'clock on May 29.

34.—Handsworth.—PUMPS, &c.—Manservy & Co., Ltd., of Edgburyston, invite tenders for a horse-ham, electric motor, etc., for their Gravelly-lane baths. Copies of the specification, drawings, and conditions of contract can be obtained from Mr. H. Manservy, the Surveyor to the Council, on payment of 3s. 6d. Tenders, on the prescribed form, in sealed envelopes, endorsed on the outside "Pumps and Machinery," must be delivered at Mr. H. Ward, Clerk, at the Council House, Handsworth, before noon on May 30.

35.—London.—IRONWORKERY.—The Metropolitan Asylums Board invite tenders for the supply of builders', engineers', smiths', plumbers', gas-fitters', and miscellaneous ironmongery and electrical accessories. Forms of tender (upon which alone tenders will be received), giving all particulars, can be obtained at the office of the Board, Embankment, London, E.C., where tenders, duly filled in, must be delivered not later than 10 a.m. on May 30.

36.—Poole.—BOILERS, &c.—Poole Guardians invite tenders for the supply and fixing of a Galloway boiler, laundry and steam-heating appliances, and the execution of other work at the Workhouse, Long-lee, Poole, according to specifications which can be seen on application to the Master of the Workhouse. Sealed tenders, endorsed "Workhouse Contract," to be delivered to Mr. P. E. L. Butler, Clerk, Union Offices, 139, High-street, Poole, not later than 9 a.m. on May 30.

37.—Halifax.—BOILERS.—Tenders are invited for the erection of No. 2 Cornish boilers and fittings thereto, also sundry works in connexion with same, at the Workhouse, Gifford-lane, Halifax. Plans may be seen, and specifications obtained, at office of Mr. W. Clement Williams, architect, 29, Seaford-street, Halifax. Sealed tenders to be delivered at the office of the Clerk to the Guardians, Mr. Arthur T. Longbottom, Esq., solicitor, Carlton-street, Halifax, not later than 10 o'clock a.m., May 31, endorsed "Tender for Boilers, Halifax Workhouse."

38.—Hathersage.—WORKHOUSES.—Hathersage and District Gas Company, Ltd., Directors, invite tenders for the building, erection, and equipment of a complete gasworks, at Hathersage, Derbyshire; the works to be ready for gas-making for October 1, 1906. Drawings and specification may be seen at the office of the engineer, Mr. Thomas Brown, Bakewell-road, Matlock. Tenders, sealed and endorsed, to be delivered to Mr. Robert Hall, Gas Offices, Matlock, on or before June 1.

39.—Hull.—BOILERS.—Hull Corporation invite tenders for two Lancashire boilers, 30 H.P., 6 ft. 6 in., for the tramway power station. Forms of tender and other particulars may be obtained at the office of Mr. A. E. White, M. Inst. C.E., City

Engineer, Town Hall, Hull. Tenders, endorsed "Tender for Boilers," are to be addressed to the Chairman of the Framways Committee, and delivered at the Town Clerk's office, Hull, before noon on June 1.

JUNE 1.—**Shipton**.—**PARAPET WALL**.—Worcestershire C.C. Highways and Bridges Committee invite tenders for the rebuilding of the retaining parapet wall in connexion with Shipton County Bridge at Shipton-on-Stour. Copies of drawings and specification and form of tender may be obtained on application to Mr. J. H. Garrett, County Road Surveyor, Shirehall, Worcester. Sealed tenders, endorsed "Retaining Wall, Shipton Bridge," to be sent not later than June 3.

JUNE 2.—**Glasgow**.—**PIPES**.—Gt Sewer Corporation invite tenders for supplying about 500 tons of cast-iron pipes, 15 in. and 4 in. in diameter. The drawings may be seen, and copies of the specification and forms of tender obtained, on application to Mr. J. R. Sutherland, the Engineer to the Water Department, at his office, 45, John-street. Sealed offers, marked "Water Department—Tender for Pipes," and addressed to Mr. A. W. Mylre, Town Clerk, City Chambers, Glasgow, will be received by him on or before June 2.

JUNE 5.—**Ballynasloe**.—**ENGINE AND PLANT**.—Ballynasloe U.D.C. invite tenders for the supply and erection of a gas-engine and suction-producer plant, in accordance with plans and specifications prepared by the Council's consulting Engineer, Mr. G. B. Meanan, C.E., 5, Charleville-road, Rathmines, Dublin, from whom, or Mr. R. J. Gill, Town Clerk, Town Office, Ballynasloe, copies may be obtained on receipt of 1s. Parties tendering will be required to enter into a bond for the due performance of the work, and to furnish the names of two solvent sureties. Tenders to be sent in on or before June 5.

JUNE 5.—**Horwich**.—**PLANT**.—Horwich U.D.C. invite tenders for sludge pressing and other plant required at their sewage-disposal works. Plans can be seen, and all particulars obtained, from Mr. H. L. Eimmet, M.Inst.E., Engineer, 41, Corporation-street, Manchester. Sealed tenders, endorsed "Sludge Pressing Plant," to be delivered to Mr. Peter Taberner, Clerk to the Council, Council Offices, not later than June 5.

JUNE 9.—**Paignton**.—**WATER MAIN**.—U.D.C. of Paignton invite tenders for the supply, delivery, and laying of 7 1/2 in. cast-iron water main, together with the requisite fittings, valves, air valves, washouts, and other fittings, meter-house and store, and other works, in the parishes of Marldon and Paignton, from Churcombe Cross to the Paignton and Chardon Rivers Parish boundary. Drawings may be seen, and copies of specification, bills of quantities, and forms of tender obtained, at the office of the engineer, Mr. Fred. Wm. Vandone, Palace Chambers, Paignton, on payment of 1s. Sealed tenders, upon the form provided, endorsed "Paignton Waterworks," are to be addressed to Mr. James R. Mill, Clerk to the Council, Town Hall, Paignton, on or before June 9.

JUNE 11.—**Nottingham**.—**VALVES, HYDRANTS, ETC.**—Nottingham Water Committee invite tenders for the supply of the under-mentioned goods for the ensuing year:—(1) Cast-iron double-flange sluice valves and hydrants; (2) cast-iron main pipes and special pipes; (3) lead piping, lead joints; (4) zinc-metal taps and ferrule fittings. Specifications and drawings, together with samples, weights, etc., may be seen, and other information obtained, at the office of the Water Engineer, Mr. F. W. Davies, St. Peter's Churchside; and forms of tender may be obtained at that office on payment of 1s. Sealed tenders, endorsed "Tender for Valves," "Tender for Pipes," "Tender for Lead," "Tender for Taps," to be delivered to Mr. Samuel G. Johnson, Town Clerk, Guildhall, Nottingham, on or before June 11.

JUNE 12.—**Kempston**.—**WATERWORKS**.—Kempston U.D.C. invite tenders for (a) the provision, delivery, laying, and jointing in the rural district of Bedford of about 350 tons cast-iron pipes (nominally 7 in. and 8 in.), and for the construction of certain ancillary works; and (b) the supply, delivery, laying, and jointing of about 5 miles 325 yds. of 7 in., 6 in., 4 in., and 3 in. cast-iron socket pipes, with air pendages, including all necessary sluice and air valves, hydrants, and other works, for the water supply of the Urban District of Kempston. Plans, specifications, and conditions may be seen as regards Contract a at the offices of the engineer, Mr. George F. Deacon, 16, Great George-street, Westminster, W., and as regards Contract b at the offices of the engineers, Messrs. Beesley, Son, & Nichols, 11, Victoria-street, Westminster, from whom respectively specifications, bills of quantities, and forms of tender can be obtained on payment of 5s. for each contract. Sealed tenders, endorsed "Tender for Waterworks Contract a or b," to be addressed to Mr. William Payne, Clerk of the Council, U.D.C. Offices, Bedford-road, New Town, Kempston, Beds., at or before noon on June 12.

JUNE 18.—**Middlesex**.—**STEEL FLOORING BRIDGE**.—The Kings, Seelmore and Cary Valley District Drainage Board invite tenders for supply and fixing a steel flooring bridge at Greylake's Fosse, Middlesex, Somerset, in part substitution for the existing bridge, and for other alterations of the approach thereto. Specifications and plans may be seen, and blue prints of the plans, and tender forms, may be obtained on application at office of Mr. Walter J. R. Poole, Clerk, 9, Dimple-street, Bridgewater, and sealed tenders may be sent in on or before noon on June 18, marked "Tenders for Greylake's Fosse Bridge."

JUNE 30.—**Leicester**.—**BRIDGE**.—Corporation of Leicester Water Committee invite tenders for the execution of the works required in the construction and erection of a steel bridge over the River Trent, together with the cast-iron cylinders and all dredging, excavating, bricklaying, and masonry work in the abutments and hauling path belonging thereto in connexion with section No. 2 of the main for bringing the Derwent supply to Leicester. The bridge will be in one span of the bowels (two supports) on four cast-iron cylinders, and having a clear opening of about 220 ft. between the cylinders, and a width between the centres of the main arches of 19 ft., and is estimated to weigh about 350 tons, including the cast-iron and steel work in the cylinders and hauling path. The drawings may be

inspected at the offices of the engineers, Messrs. Eyraud, Son, & Pick, 6, Millstone-lane, Leicester, and conditions of contract, specification, quantities, and form of tender obtained from them upon payment of 4s. Sealed tenders, upon the form supplied, addressed to the Chairman of the Water Committee, Town Hall, Leicester, are to be delivered not later than 6 o'clock in the forenoon of June 30, endorsed "Tender for Bridge over Trent."

JUNE 11.—**Aberdeen**.—**PAINTING**.—The Town Council of Aberdeen invite tenders for the whitewashing of courts and closes, of which a specification and list lie at the Sanitary Inspector's office, 63, Union-street. Tenders, addressed to the Council, and endorsed "Tender for Whitewashing," to be delivered with the Sanitary Inspector on or before June 9.

JUNE 11.—**Normanton**.—**PAINTING**.—Normanton Burial Board invite tenders for painting cemetery house and railings. Specifications may be seen at any time at Cemetery House. Tenders to be sent to the Secretary, Burial Board, not later than 6 o'clock on June 11, to Mr. Edwin Backhouse, Curator, Burial Board, Normanton.

JUNE 12.—**Broad-street, W.C.**—**PAINTING, ETC.**—For painting, distemping, and whitewashing, and for repairing all gutters and drains at the Receiving House for Children and Nurses'

Home in Broad-street, W.C. for the Guardians of the Poor of St. Giles in the Fields and St. George's, Hanover, in connection with the copying of specifications at the Guardians Offices 57, Broad-street, Holborn, W.C. Tenders must be delivered at above offices not later than 10 a.m. on Tuesday, June 5.

NO DATE.—ARCHITECTURE.—PAINTING AND PAINTING.—Plumber and painter work at the Old U.P. Church, Archdeaconry, Knocking. Copies of specifications and further information to be obtained on application from Mr. Alexander Gauld, architect, High street, Falmouth.

NO DATE.—New Hartley.—RENOVATING, ETC.—For renovating and painting workmen's institute, greenhouse, railings, etc. For particulars apply to the Secretary, 7, F. Kneebone.

NO DATE.—STEAMING, ETC.—Steneby Guardians invite tenders for the carrying-out of certain distemping and painting works at their workhouse, 2, Leonard-street, Bromley-by-Bow, E. Printed form of tender and specification can be obtained upon application to Mr. T. G. Stacey, Clerk, Guardians' Offices, Barnes-street, Stepney, E.

ROADS, SANITARY, AND WATER WORKS.

MAY 28.—Evesham.—DRAINS AND PATHS.—The Burial Board for the united parishes of All Saints Church, Levenshoe, and St. Andrew's, County of Worcester, invite tenders for the laying of certain drains and construction of a road and footpaths at the ground recently purchased by the adjoining parishes of Little Hampton, in the County of Worcester. Plans and specifications, prepared by the Surveyor to the Board, may be inspected at the office of the Board, 11, Bridge-street, Evesham. Sealed tenders, marked "Evesham Burial Board Drainage," must be sent to the Clerk to the Board not later than 10 a.m. on Tuesday, June 5.

MAY 28.—Urmston.—FLAGGING AND KERBING.—The Urmston U.D.C. invite tenders for the flagging and kerbing of the footways of Station-bridge, Urmston, in Lancashire. Plans and specifications, and form of tender may be obtained from Mr. James Heath, Surveyor to the Council. Sealed tenders must be delivered to Mr. F. A. Rowland, Clerk to the Council, Council Offices, Urmston, not later than 4 o'clock on May 28.

MAY 28.—Walsend.—CEMENTING.—The Corporation of Walsend invite tenders for the cementing of footpaths or parts of footpaths in certain of the streets in the borough as may from time to time be ordered to be done up to the end of September, 1906. Specifications may be seen at the office of the Corporation, and forms of tender may be obtained on application to Mr. George Hollings, Borough Surveyor, Corporation Offices, Walsend. Tenders sealed, and endorsed "Tenders for Cementing," to be sent to Mr. W. V. Mukelster, Town Clerk, Walsend, 28, Sandhill, Newcastle-on-Tyne, on or before May 28, 1906.

MAY 28.—Ashton-under-Lyne.—WATER CARRIAGE CONVERSIONS.—The Sanitary Committee are prepared to receive tenders for work required in converting water closets into water closets and Holden-street. Plans and specifications may be seen, and bills of quantities obtained, from Mr. J. Davey, Sanitary Surveyor, Health Department, 2, Holden-street. Sealed tenders, endorsed "Conversion," to be addressed to, and delivered at the office of, Mr. John Neal, Borough Comptroller, Town Hall, Ashton-under-Lyne, not later than 12 o'clock noon, May 28.

MAY 28.—Methley.—SEWERAGE.—Methley U.D.C. invite tenders for the construction of the Methley Sewerage Extension. Plans and specifications may be seen, and quantities, with form of tender, obtained from the Engineer, Mr. John Stocks Richardson, C.E., Eastgate, Methley. Tenders, endorsed "Tender for Sewerage Works," must be delivered to Mr. Robt. S. Wiggin, Clerk, 85, Abbot-street, Leeds, not later than 12 o'clock noon, May 28.

Tydesley-with-Shakerley.—DRAINS.—Tydesley-with-Shakerley U.D.C. Gas Committee invite tenders for alterations to hydraulic drains, and for the erection of two 30 in. diameter stone-ware pipe sewers, the construction of a small bacterial filter, and other appurtenant works in connexion therewith, at Cross Inn-road, Tydesley. Plans and specifications may be seen at the office of the Engineer, Mr. H. G. Gimson, Sealed tender, endorsed "Tenders for Sewerage Works," to be delivered at the Town Clerk's office, not later than 12 o'clock noon, May 29.

MAY 29.—Barnrow.—STREETS.—Barnrow-in-Furness Corporation invite tenders for the construction of various streets. Further particulars may be obtained, together with bills of quantities and forms of tender, upon application at the office of the Borough Engineer, Town Hall. Sealed tenders, suitably endorsed, and addressed to the Chairman of the Health Committee, to be delivered at the Town Clerk's office, not later than 12 o'clock noon, May 30.

MAY 31.—Llantisant and Tonypool.—SEWERS, ETC.—Llantisant and Llantwit Fawr R.D.C. invite separate tenders for the following works:—(a) Providing and laying about 200 lin. yds. of 12 in. diameter stone-ware pipe sewer, with manholes, lampholes, etc., and laying only 340 lin. yds. of 3 in. diameter cast-iron water main, together with the necessary valves, at Gilfach-road, Tonypool; (b) the widening of the Ely River Bridge and erection of a masonry arch at Wauwhilly, Tonypool; (c) the widening of a culvert and construction of wing walls at Hill-street Tonypool. Plans and specifications may be seen, and bills of quantities obtained, from Mr. George S. Morgan, Surveyor, School-street, Tonypool, and Mr. H. in respect of each tender. Sealed tenders must be delivered to the Council's Clerk before 10 a.m. on May 31.

JUNE 1.—Hanwell.—SEWERAGE.—U.D.C. invite tenders for sewerizing, leveling, paving, metalizing, flagging, channelling, providing means of lighting and making-up of the under-mentioned

roads and footways thereof, within their district, viz.: Billmore Park-road (extending from No. 47, Elthorne-street, to the existing boundary), Elthorne-avenue (extending from No. 62 Elthorne-avenue to Seward-road); Seward-road (extending from No. 62 Elthorne-avenue to the existing boundary); Jersey-road; Thurlow-road. The plans, etc., and forms of contract may be seen, and bills of estimated quantities, and forms of tender obtained, on payment of 1s. to the Engineer, on application to the Surveyor, Mr. Sidney W. Barnes, Assoc. M.Inst.C.E., at the Council Offices, between the hours of 10 a.m. and 5 p.m. Sealed tenders to be delivered to Mr. P. J. Dennis, Clerk to the Council, U.D.C. Offices, Cherington-road, Hanwell, W., in envelopes supplied, not later than June 4.

JUNE 4.—Ludlow.—DRAINAGE.—Ludlow Guardians invite tenders for drainage works at the Union Workhouse. Plans, etc., from Mr. B. Wade, architect, East Hamlet, Ludlow. Tenders to be sent in before June 4, to Mr. A. W. Weyman, Clerk, Ludlow.

JUNE 5.—Finchley.—PAVING.—U.D.C. of Finchley invite tenders for the supply and delivery of about 5,555 super. yds. of 2 in. artificial sand paving, and for supplying and laying about 2,359 super. yds. of Portland cement paving, together with the cost of supplying and laying such paving of a similar description as may be required by them during the period ending March 31, 1907. Specification and conditions, together with form of tender, may be obtained on application to the Engineer and Surveyor at the under-mentioned office: Sealed tenders, addressed to Mr. E. H. Lister, Clerk to the Council, Council Offices, Church End, Finchley, N., and endorsed "Paving," must be delivered not later than June 5.

JUNE 5.—Woodford.—PAVING.—Woodford U.D.C. invite tenders for providing and laying concrete slabs in footway in Snakes-lane, Woodford Green. Estimated quantity, 1,100 yds. super. Plan and specifications may be seen, and bills of quantities and form of tender obtained, from Mr. William Farrington, Surveyor to the Council, Council Offices, Woodford Green, upon deposit of 1s. Sealed tenders, endorsed "Tender for Footway Paving, Snakes-lane," to be sent in, on the official forms, not later than noon on June 5.

JUNE 5.—Manningtree.—PAVING.—The Manningtree Town Council invite tenders for making-up Belsize-avenue (second portion), Leighton-road (second portion), and Corton-road (second portion). Plans and specifications may be seen, and form of tender, together with schedule of quantities and other particulars, obtained, from Mr. Charles Jones, Borough Engineer, Town Hall, Manningtree. Sealed tenders, endorsed "Tender for Making-up," to Town Clerk, Town Hall, Manningtree, before 5 p.m. on June 6.

JUNE 6.—Finchley.—SEWERAGE.—The U.D.C. of Finchley invite tenders for the construction of a 12-in. sewer of about 700 yds. in length, together with manholes and other incidental works, for the drainage of the Victoria Estate. Copies of specification, schedule, and form of tender may be obtained from the Engineer on application, accompanied by deposit of 2s. to the Council Offices, and addressed to Mr. E. H. Lister, Clerk to the Council, Council Offices, Church End, Finchley, N., to be sent in by not later than June 6.

JUNE 6.—Hove.—PAVING.—Hove Corporation invite tenders for excavating and other works in Lawrence-road (between Rutland-gardens and Regent-road) and in Langdon-road (between Portland-road and Montgomery-street). Further particulars may be obtained, and plans and specifications seen, at the office of the Borough Surveyor, Mr. H. H. Endcote, Town Clerk, Town Hall, Hove, and endorsed "Tender for Lawrence-road and Langdon-road" as the case may be, will be received, up to 6 o'clock on June 6.

JUNE 7.—Blything.—DRAINAGE WORKS.—The Guardians of the Blything Union invite tenders for works required to be done in taking up the old drains, etc., and in laying a new system, and other works in connexion therewith, at the workhouse at Bulcamp, near Halesworth, according to plan and specification prepared by Mr. Henry J. Wright, architect and Surveyor, Ipswich. Copies, plan, and specifications may be seen at the Clerk's office, Bulcamp. Tenders, sealed, and endorsed "Tenders for Drainage," to be delivered at the Clerk's offices at Bulcamp, not later than 6 p.m. on June 7.

JUNE 8.—Hebburn.—ROAD-MAKING.—The U.D.C. of Hebburn require tenders for excavating and laying out, and supplying and laying, concrete paving, concrete footpaths, etc., at Hebble-road, Whickham-road, Alm-street, Station-road, Back Station and Alm-street, Back Alwin and Alm-street, North Beck, Whickham-road, South Beck, Hebble-road, Hebburn. Plans, specifications, and quantities may be seen at the office of Mr. H. Paterson, surveyor, Council Offices, Argyle-street, Hebburn. Tenders, endorsed "Road-making," to be addressed to the Chairman of the Building and Sanitary Committee, Hebburn, and forwarded not later than 12 o'clock noon, June 8.

JUNE 9.—Glasgow.—SEWER.—Glasgow Corporation invite tenders for the work necessary in the construction of sewer No. 1 (Contract No. 13), extending from Moss-road, north of Cardonald Station, to a point near Paisley-road, south of Drox Station. Plans, specifications, and working drawings may be seen at the office of the Engineer, Mr. J. G. Mackenzie, at the office of the City Engineer at his office, City Chambers, 64, Cochrane-street, Glasgow, on payment of a fee of 5s. Sealed offers, to be delivered at the office of the Surveyor, Mr. A. W. Myles, Town Clerk, City Chambers, Glasgow, not later than 12 o'clock noon, June 9.

JUNE 11.—Alnwick.—SEWERAGE WORKS.—R.D.C. of Alnwick invite tenders for replacing the stone-built conduits in connexion with sanitary pipes. The plan and specification may be seen upon application to the Clerk, Mr. H. W. Walton, Alnwick, to whom sealed tenders, duly endorsed, are to be delivered before 1.30 p.m. on June 11.

*** JUNE 11.—Beckenham.—TAR MACADAM.**—The Beckenham U.D.C. invite tenders for the tar-macadaming of Bromley-road, Beckenham, and Manor-road. Plans may be seen, and bills of quantities, specifications, and forms of tender obtained, on application to Mr. John R. Birtwell, Surveyor, on and after May 25, on payment of 1s. Tenders, sealed, and endorsed "Tender for Tar Macadam," to be delivered to Mr. F. Stevens, Clerk to the Council, Beckenham, not later than 4 p.m. June 11.

JUNE 11.—Ilford.—PRIVATE STREET WORKS.—Ilford U.D.C. invite tenders for leveling, metalizing, channelling, kerbing, paving, and making good Durban, Coleridge, Wellwood, Lockwood, and Durden roads, Kimberley-avenue, and right-of-way leading from Lockwood-road to Simmside-road. Plans and specifications may be seen, and form of tender obtained, on application to Mr. H. Shaw, A.M.Inst.C.E., Surveyor to the Council, at the Town Hall, Ilford, during the usual office hours, on payment of a deposit of 2s. Sealed tenders, endorsed "Tender for Private Street Works," are to be delivered to Mr. John W. Beaton, Clerk to the Council, Town Hall, Ilford, on or before June 11.

JUNE 15.—Hoveley.—SEWAGE DISPOSAL.—The Hoveley and South Cleveland Joint Sewerage Board invite tenders for the construction of sewage disposal works at Berry Brow. The works comprise bacterial continuous filter beds, circular tanks, and lead-laying out storm water main, and land disposal, with carrier, etc., small pumping station, the construction of new road, etc. The plans may be seen, and quantities and form of tender obtained, at the office of the Engineer, Mr. W. H. Radford, C.E., Albion Chambers, King-street, Nottingham, on deposit of 3s. Sealed and endorsed tenders must be sent in to Mr. Alfred J. Sissons, Clerk to the Joint Board, Huddersfield, on or before June 15.

NO DATE.—Garden.—WIDENING.—Tarniv R.D.C. invite tenders for widening Haud-lane, Garden. Particulars can be obtained on application to Mr. H. Grant, Bailey, Clerk to the Council, Crypt Chambers, Chester.

NO DATE.—Moortown and Headingley.—EXCAVATING, ETC.—Excavating, concreting, etc., at Moor-town Reservoir. Also for renewing brick walling, rebuilding, etc., at the Headingley Pumping Station. Apply Fritz Blakeley Company, engineers, Thornhill, Dewsbury.

STONE, MATERIALS, AND STORES.

MAY 28.—Barry.—PIPE, LEAD, CASTINGS, ETC.—Barry U.D.C. invite tenders for the supply and delivery during the year ending May 31, 1907, of:—(1) Lead and copper pipe, pig and sheet lead, tin, and galvanized iron; (2) leather, rubber, and asbestos goods. Tender may be obtained at the Clerk's office, 158, Holton-road, Barry. Sealed tenders, endorsed "Tender for Lead," to be delivered to Mr. F. B. Tordoff, Clerk, not later than 10 a.m. on May 28.

MAY 28.—Feltham.—ROAD MATERIAL.—Feltham U.D.C. invite tenders for the supply of about 500 tons of granite—(a) 1 in. to 1 1/2 in., (b) 1 1/2 in. to 2 in., (c) 2 in. to 2 1/2 in., to be delivered free at Feltham not later than June 30, 1907, in such quantities and at such times as shall be directed by the Surveyor of the Council; also from 150 to 200 tons of best Kentish flints, to be delivered free at Feltham in quantities of (a) 50 tons, (b) 100 tons. Sealed tenders, endorsed "Tender for Road Material," must reach Mr. H. Merton Taylor, Clerk of the Council, Town Hall Chambers, Feltham, not later than May 28. Forms of tender may be obtained from the Council's Surveyor, Mr. E. T. Newark, Town Hall Chambers, Feltham, to whom samples of granite should be sent.

MAY 28.—St. Marylebone.—WOOD BLOCKS.—For the supply and delivery of about 250,000 ft. cub. of 5 in. by 9 in. best Swedish yellow deal crotched paving blocks for the St. Marylebone Metropolitan Borough Council. Forms of tender to be obtained on application from Town Hall, and other particulars from the Borough Surveyor. Tenders to be addressed to Mr. James Wilson, Town Hall, Marylebone, etc. Sealed and endorsed "Tenders for Wood Blocks," accompanied by four unretouched samples, to be delivered at above address on or before 12 noon on May 28.

MAY 29.—Stratford-upon-Avon.—ROAD METAL.—The Stratford-upon-Avon Town Council invite tenders for the supply of broken and unbroken road metal required for the maintenance of the borough roads during the ensuing year, according to specification to be obtained, together with form of tender, on application to Mr. Reden Dixon, A.M.Inst.C.E., Borough Surveyor, Municipal Offices, Stratford-upon-Avon. Tenders to be lodged with the Borough Surveyor, sealed and endorsed "Tender for Stone," not later than May 28.

MAY 29.—Great Yarmouth.—GRANITE SETTS.—Great Yarmouth Town Council invite tenders for the supply of 2,000 tons of granite paving sets, 5 in. deep. The sets to be delivered either in trucks at railway station or over ships' side at the Fish Wharf Quay, Great Yarmouth, in lots not exceeding 600 tons; in the latter case the Town Council will pay the landing dues of 2s. per ton and provide for stacking on the quay. Tenders, properly endorsed in sealed envelopes, stating the price per set, are to be delivered at the office of the Borough Surveyor, Town Hall, Great Yarmouth, not later than 10 a.m. on May 29. A sample set is to be delivered to the office of Mr. J. W. Croker, M.Inst.C.E., Borough Surveyor, Town Hall, Great Yarmouth, prior to or at the time of delivering the tenders.

MAY 30.—Kingsington-upon-Thames.—GRANITE.—Kingsington-upon-Thames Corporation invite tenders for the supply of 1,500 tons of granite paving sets, or other granite, suitable for road making, 1,000 tons to be broken so as to pass through a ring having a 12 in. internal diameter, and the remainder through a 14-in. ring. Tenders to be on forms to be obtained of the Borough Surveyor at the Municipal Offices, Kingsington, and sealed and endorsed "Tender for Granite," to be delivered at office of Mr. Harold A. Winsor, Town Clerk, Municipal Offices, Kingsington-upon-Thames, on or before May 30.

May 30.—**Workshop.**—**GRANITE.**—Workshop U.D.C. invite tenders for the supply of 120 tons of granite, broken to 24 in. gauge, and 80 tons of granite, broken to 12 in. gauge, delivered at Workshop Station. Tenders must be sent in to Mr. Geo. J. Featherston, Clerk, Town Hall, before 10 o'clock on May 30.

May 31.—**Highbridge.**—**STONES, ETC.**—The Highbridge U.D.C. invite tenders for supplying and delivering to the Highbridge Railway Station 1,600 tons (more or less) of fine or other stone macadam, broken to 24 in. gauge, and also for the supply of coarse and dust chippings, in such quantities as may be directed, the respective materials not to be delivered in quantities exceeding 40 tons per day. The contractor will be subjected to a penalty of 20s. per day if the quantities required are not delivered in accordance with contract. Quotations to be at per ton. Tenders are also invited for the hire of a 10-ton steam road roller, with water cart, for the year 1906-7. Quotations at per hour for actual work done. This tender must include a quotation for road scarifying at per yard super, particulars as to working hours, etc., to be stated. Tenders for macadam to be accompanied with samples, endorsed "Stones," steam road rolling endorsed "Roller," to be sent to Mr. W. C. Shier, Town Surveyor, Highbridge, on or before May 31.

May 31.—**South Stoneham.**—**FLINTS.**—South Stoneham R.D.C. invite tenders for the supply of flints to the several stations in the district. Persons tendering should state whether the flints will be surface picked or dug and samples should accompany the tender. Any further particulars may be obtained of Mr. W. J. Potter, District Surveyor, Clenny Portland, Tenders and samples must be delivered to Mr. E. T. Westlake, Clerk, 20 Portland-street, Southampton, not later than 1 o'clock on May 31 marked "Tender for Flints."

May 31.—**Stockbridge.**—**ROAD MATERIAL.**—Stockbridge U.D.C. invite tenders for the supply of road

material, as below, viz:—Granite or whinstone, about 300 tons; dress (or ender), about 600 tons; screenings, about 200 tons. Particulars, with forms of tender, to be had from Mr. J. Marsden, Clerk to the Council, Council Offices, Stockbridge, to whom samples, tenders, endorsed "Material," must be sent before May 31.

JUNE 1.—**Brighton.**—**PORTLAND CEMENT.**—The Brighton Corporation invite tenders for the supply of Portland cement for the year ending June 30, 1907, the same to be delivered at any of the Brighton railway stations as ordered in quantities of from 6 to 20 tons at one time. The specification and form of tender may be obtained on application to the Borough Surveyor at the Town Hall, Brighton. Sealed tenders, addressed to Mr. Hugo Talbot, Town Clerk, Town Hall, Brighton, and endorsed "Tender for Portland Cement," must be at the Town Hall before 10 o'clock in the forenoon on June 1.

JUNE 2.—**North Berwick.**—**LIAM.**—North Berwick Town Council invite tenders for the supply of 50 tons of yarding lime. Offers to be lodged with Mr. A. D. Wallace, Town Clerk, on or before June 2.

JUNE 5.—**Fallsworth.**—**MATERIALS.**—Fallsworth U.D.C. invite tenders for the supply of the under-mentioned materials and stores during the period of twelve months ending June 11, 1907, namely:—Paving sets, curbs, flags, Portland cement, earthenware pipes, bends, junctions and gullies, Buxton lime, green crystal concrete, disinfectants, and galvanized sanitary pans. Forms of tender and further particulars may be obtained at the office of Mr. G. F. Gray, Surveyor, Council Offices, Fallsworth. Sealed tenders, on forms supplied, and endorsed "Tender for..." must be delivered to Mr. H. C. Broome, Clerk to the Council, Fallsworth, not later than 12 o'clock noon on June 5.

JUNE 5.—**Romney Marsh.**—**GRAVEL.**—Romney Marsh R.D.C. invite tenders for the supply and delivery of 300 yds. of quartzite of 2 in. gauge

to the parishes and roads hereunder stated, viz.—100 yds. Gullford-road, Brookland; 100 yds. Straight-road, Brookland; 100 yds. Snake-road, Brenzett. The above material to be delivered before September 15, 1906, and yarded at the expense of the contractor in such a manner and in such quantities as the surveyor may direct, and subject to his measurement. Tenders, endorsed "Quartzite," to be delivered to Mr. William B. Smith, District Surveyor, New Romney, not later than June 6.

JUNE 11.—**Cleethorpes.**—**GRANITE.**—Cleethorpes U.D.C. invite tenders for 1,500 to 2,000 tons of Quebec Belgian granite, machine broken, as to pass in any direction through a 2 in. ring, delivered in quantities of not less than 100 tons, carriage paid, to Cleethorpes Station, or at some convenient depot in Grimsby, for the year ending March 31, 1907. A sample of granite is to accompany each tender and to state rate per ton of the material. Sealed tenders, addressed to the Surveyor to the Council, and endorsed "Tenders for Granite," to be delivered at the offices of the Council not later than 12 o'clock noon on June 11.

JUNE 15.—**Radcliffe.**—**TRAMWAY MATERIALS.**—Radcliffe U.D.C. invite tenders for the supply of the following materials, viz.:—(1) Granite sets; (2) steel girder tram rails, fishplates, bolts, nuts, points and crossings, and other special track work. Specifications and forms of tender may be obtained on application to Mr. W. L. Rothwell, Engineer to the Council, on payment of a fee of 2s. Tenders, endorsed "Tramway Materials," to be sent to Mr. S. Mills, Clerk, Council Offices, Radcliffe, on or before June 15.

NO DATE.—**Thurstone.**—**ROAD MATERIAL.**—Thurstone U.D.C. invite tenders for supply of dress, granite, and screenings for road repairs. For further particulars and form of tender apply to Mr. R. Longden, surveyor, Thurstone, near Penistone.

PATENTS.—Continued from page 597.

with plaster or cement, and supported on the ground, on the walls of the staircase and on the landing, by a strip of metal reinforcing the brickwork, which strip is fixed to the arch by fastenings and connected to the walls by a suitable number of tie bars embedded in the brickwork, and holds the bars of the flight by bolts, this belt, which helps to give the stairs great solidity, being, if required, concealed by a covering of plaster or the like.

9,248 of 1905.—J. F. STEPHENSON: Device for Cleaning Flues or Pipes.

This relates to a device for cleaning flues or pipes comprising a series of spring-pressed scrapers mounted on a central shaft, and consists in pivotally mounting the scrapers in a slotted collar fixed on the shaft in such manner that the scrapers bear against the collar and act as the device is drawn through the tube, and providing a flexible connexion to the operating handle.

18,131 of 1905.—J. S. BURN: Lavatory Apparatus.

This relates to a lavatory apparatus comprising a tray with fluted or channelled sides, and a hollow channelled cone or upright tapered body placed on the centre of the tray to form a holder for brush stems, and also to form a sloping back and inclined base with channelled surfaces for the reception of soap, etc.

20,338 of 1905.—C. H. ADAMS: Road Gullies and the like.

This relates to a road gully and the like in which the grating is formed with a corrugated surface preferably in its length, so that a series of grooves results in which depressions the gully grate openings are formed, usually as a gully slot. Water will flow naturally into these grooves or

corrugations, and thus find its way into the gully, and by not making the slots of great width, leaves and obstructions will not enter so readily. The gully body is formed with a trapped outlet provided with screw or other inspection device. A tipping bucket or siphonic discharge is placed in the gully so that it may serve to flush the sewer, and a wire or other screen or guard is placed within the gully so that the leaves which are collected therein may be readily removed.

4,630 of 1906.—E. A. GREEN: Inlets or Junction Pipes Used for Drainage, Sewerage, and the like purposes.

This relates to inlets or junction pipes used for drainage and the like, and consists in forming a portion of the roof over the drop opening at an inclination of 45° or thereabouts to the horizontal instead of as a curve or rounded bend, and in providing each side of the horizontal or approximately horizontal portion at the top, the roof with a gradually increasing width from the entering towards the drop end.

The Care of Ancient Monuments.

HE perception that ancient monuments are of value to the modern world is almost entirely a growth of comparatively recent years. There is no evidence of

the existence of any such feeling in the Roman world; on the contrary, the Romans cut and carved, and swept away ancient buildings, wherever they went, to erect their own structures on the sites. Both with Greeks and Romans there were certain temples or altars which were sacred for religious reasons, but not on historic grounds. There was no trace in the Middle Ages of any feeling as to the vestiges of a historic past, for practically there was no history; and the architect of the XVth century would pull down the much finer work of the XIIth or XIIIth, to make way for his own, without the slightest compunction. The Italian Renaissance seemed the dawn of an interest in ancient monuments, but it was an interest for the sake of their art, not for the sake of their historic significance. It is only well within the century just past that the perception has grown up that the relics of the past condition of a country, embodied in ancient monuments, were very important historic evidences, to be preserved with religious care, as things which, once destroyed, can in no possible sense be replaced. And in this

country we are still very backward in this respect. The average Englishman is almost entirely concerned with the present; it has been exceedingly difficult to get our Parliament to pass even inadequate and half-hearted legislation for the preservation of ancient monuments; anything like compulsory interference is regarded as an invasion of the sacred rights of individual property; and a perception of the historical value of ancient relics has to be thrust upon our community, as it were, at the point of the sword.

The important subject of the preservation of ancient monuments by State care and legislation has been treated systematically in a small book recently brought out by Professor Baldwin Brown,* in which the subject is considered under two heads—the first division dealing with the Principles and Practice of Monument Administration, and the second with the actual facts as to such administration in the various European Countries. In this country the question which will be most debated is the right of Government to interfere in regard to monuments which are legally private property. Our public and our legislators are abnormally sensitive as to private rights, and very indifferent, for the most part, in regard to the historic and national value of monuments which are unique, and which, once destroyed

or seriously impaired, can never be replaced. Railway companies may easily get permission to take private property, or to injure its amenities, for the carrying out of a new line, provided that they can show that there is, or is likely to be, a travelling clientele for the line. But those who wish to preserve historic monuments from possible injury or destruction at the hands of private possessors are at once met by the cry of interference with the hereditary rights of private ownership, which, it is argued, are to be sacrificed merely to gratify the fancies of archæological faddists. The "mild and unpretentious Monument Act of 1882," as Professor Brown characterises it, originally contained a clause under which a private owner who possessed an ancient monument and wished to destroy it, was bound to offer it first for purchase at a valuation by the Treasury.

"This limitation on the freedom of an owner to destroy what might be a unique work of genius and a priceless national possession the British Parliament refused to accept, and the Act carried contains no compulsory provisions at all. Yet this innocuous measure, with all its teeth drawn, was protested against to the last in the House of Commons as 'an invasion of the rights of property' in order to gratify the antiquarian tastes of the few at the public expense!"

We should be disposed to go further than even the original Bill proposed, and to rule that the owner of such a monument should be obliged to maintain it with care and either to report periodically to the Government as to its condition, or to accept the periodical visit of a Government Inspector of historic monuments to see to their condition. But how different is the view of the

* "The Care of Ancient Monuments": an account of the legislative and other measures adopted in European countries for protecting ancient monuments and objects and scenes of natural beauty, and for preserving the aspect of historical cities. By G. Baldwin Brown, M.A., Watson Gordon Professor of Fine Art in the University of Edinburgh. Cambridge University Press; 1905.

subject taken in some other countries will be evident from the following summary by the author of the effect of the Italian Act of 1902:—

"No proprietor may demolish or alter monumental remains existing on his estate unless he can convince the authorities that they are not worth preservation (Act, 11), nor without express leave do any work upon any part of them that is exposed to public view (Act, 10). If the officials responsible for the care of monuments become aware that works of repair or protection are necessary on a monument in private hands, they can call on the proprietor to carry these out within a certain time, and if he fail to do this they can step in and execute the work required, charging the proprietor with the economic value of the improvement (Act, 12; Reg., 127-8). If the private proprietor desire to sell a monument or object of art of special value, or have entered into a contract for such a sale with another party, he must give timely notice to the proper authorities, and must also make the proposed purchaser aware that the object is one on which the authorities have a lien."

In his chapter on France Professor Brown gives the history of the formation of the "Commission des Monuments Historiques," the status of which received legal sanction as late as 1887, though the work of the Commission had been going on for fifty years previously. The duties of the Commission were more especially defined in a decree of January 3, 1889. It was to establish a list of monuments possessing historical and artistic interest, to point out those which ought to be restored, to examine schemes presented for their restoration, and to lay before the Minister of Fine Arts proposals for the application of the funds voted for the preservation of the classified monuments. Up to 1887 the Commission had no legal power of safeguarding the monuments they had "classed"; they could advise and exhort, but could not enforce their views on owners, private or public, of monuments. And it appears that at this time a monument in the hands of a private owner might be "classé" without the owner being informed of the fact, which naturally led to much discontent when the owner was going to make some alteration on what he regarded as his own property, and found himself confronted by an Inspector of the Commission. The law of 1887 was to empower the Minister of Fine Art, after consultation with the Commission, to act in regard to monuments of any national interest, not only architectural monuments, but dolmens, menhirs, and even movable objects, such, we presume, as ancient church plate and other objects of artistic value. Professor Brown rightly criticises the wording of the phrase in the Act, "historical and artistic interest," which should evidently have been "historical or artistic," since the two conditions are not always found combined, and an object may be worth classifying and preserving for its historical value though it has no artistic interest; and we gather that practically this is the principle acted upon. The State may carry out compulsory purchase of an object when the owner is unable to maintain it: and in the case of a recalcitrant proprietor who refuses to allow a monument of national interest to be placed under the operation of the law, the Act authorises the Minister to set in motion the machinery for securing a compulsory purchase of the property in question; but it is admitted that the machinery moves slowly, and it appears that a mischievous or indifferent prop-

rietor may be able to injure a monument irreparably during the interim in which the "machinery" is being set in motion. He would in that case be liable to an action for damages on the part of the State, but there are no penal provisions; so that it would seem that some further legislation is needed for the entire protection of national monuments.

This careful and elaborate organisation for the preservation of national monuments in France has had also its serious drawback, to English feeling at all events, in the too great thoroughness with which the reparation of architectural monuments has been carried out. The French are nothing if not systematic; and, once an architectural monument being reported to be in a dangerous condition, nothing seems to have satisfied the Commission but a thorough restoration—in many cases so thorough that the architectural and historical value of a great building has been nearly scoured out, and the Commission might have been regarded in some instances as a worse enemy to the architectural preservation of a building, in the true sense of the words, than Time or an indifferent and ignorant proprietor. The French restoring architects, in fact, who are the agents and to a certain extent the advisers of the Commission, know too much, and are too anxious to leave all the traces of their knowledge on an ancient building. If they could have been content with repair instead of restoration the case would have been better. This view of the matter, it is almost needless to say, is fully recognised by the author of the book under notice.

We will turn now for a moment to the first division of the book, dealing with principles and practice—with what might or should be done. The chapter on the meaning and scope of the term "monument" proposes as wide an extension as possible, including all objects which have historic interest, whether erections or movable objects; and also great scenes and sites in nature—Niagara Falls for example, which indeed seem very much in need of some Commission of protection to prevent their being by little and little destroyed, or disfigured so as to lose all their impressiveness. In regard to erections, it is pleaded that, in addition to great architectural monuments whose value all would admit, there are the humbler domestic relics of older days—country cottages, street fountains, signboards, etc., which would not, as things are at present, find a place in any State inventory, but nevertheless have their value as relics of the past; and the author quotes the convenient German expression "das Stadtbild," meaning the general characteristic aspect of a city, as a possession not to be lightly broken into and destroyed. There are cases, in the growth of towns, in which the "Stadtbild" must almost inevitably give way to the practical demands of the present; there are others in which it is so unique and completely a part of the character of a city, that it ought to be preserved even at the cost of a little inconvenience to the modern generation. As a typical instance Venice is cited: "Venice is still Venice though the most conspicuous of its monuments has been overthrown; but it would cease to be Venice were all

the smaller canals, the network of which gives the place its *cachet*, filled in and macadamised!" Yet this is what the Venetian authorities, at one time at all events, were recommending; whether this bad dream has been definitely renoué we know not. But (as we have before suggested) it would seem almost worth while for the kingdoms of the world to combine to purchase Venice as a possession for ever, just to keep it being so absolutely unique a city in its ancient form.

In considering the question "Why should monuments be preserved?" Professor Brown gives what is, we think, a necessary warning against the too "perfidious zeal" of some archaeologists who will turn their back upon all practical considerations, and by this want of discrimination assist in raising a barrier of prejudice against the conservation of monuments. The tendency of the average English mind is to regard archaeological considerations as merely fanciful and to be necessarily and rightly postponed to practical requirements; and it is a point of wisdom not to strain matters too hard in opposition to this national tendency. Archaeologists who are moderate in their demands and show themselves willing to consider both sides of the subject, will be likely to do more with the practical Englishman than those who profess to regard him as a mere Philistine to be pushed on one side with contempt. As an example of what patience and goodwill may achieve in preserving public monuments, the author cites the case of the two churches in the Strand, for the demolition of which there was a popular clamour some years ago, on the ground that they were in the way of the traffic. They were, as he says, resolutely and successfully defended by the lovers of amenity, and "the result has been that in the extensive scheme now being carried out by the London County Council they are not only preserved but become foci of a large architectural composition. They have now not only ceased to be obstructions but have become ornaments, and the same time serve to point a warning against hasty demolition of the older features of our cities." In the chapter on "Restoration and anti-Restoration" Professor Brown also steers that middle course which so few people who deal with this subject know how to keep, and we are glad to see that he defends the restoration of Dunblane Cathedral, which was unreasonably opposed by the Society for the Protection of Ancient Buildings, and he expresses generally the view that there should be a distinction drawn between ancient buildings which are still in use for the purpose for which they were intended, and those which are ruins and out of use—between, as we may say, living and dead structures of the past.

Altogether, this is both a wise and a useful book, giving a summary of the existing state of the provisions for the preservation of monuments, and a reasonable theory as to what may be or ought to be done. There are two points to which we would put notes of interrogation. On page 8 the author quotes, in a footnote, from the *Journal* of the Institute of Architects, a passage commencing with the statement that though foreign countries are often supposed to rejoice

Ministers of the Fine Arts, "as a fact no Minister of Fine Arts pure and simple exists anywhere." This statement seems another example of what we have often noticed, that the Institute of Architects does not seem sufficiently awake to what goes on in France. If France has no Minister of Fine Arts, what, we may ask, is M. Dujardin-Beaumetz, who was appointed some two or three years ago Under-Secretary of State for Art, and who has been a very active and energetic official? And on page 95 there is the remark that the prohibition of some alterations to houses in the Place Vendôme was not, "as was supposed in Britain," due to the outraged taste of the artistic Parisians, or to the intervention of a despotic Minister of Fine Arts, but turned on the question of the building servitudes which the proposed alterations contravened. This seems an odd remark, for what were those building servitudes enacted for at all, except for the express purpose of providing against the disfiguration of architecturally designed squares and streets? And that there was public interest in and discussion of the subject in Paris at the time, we have the best reason to know.

THE OPENING OF THE GREENWICH ELECTRICITY GENERATING STATION.

THE new generating station for the power required by the London County Council tramways was opened on Saturday by Mr. Evan Spicer, the Chairman of the Council. It was naturally made the opportunity for a good deal of self-congratulation on the part of the Council. All those who saw for the first time a station for generating electric power "in bulk" must have been considerably impressed with the magnitude of the machinery. They must also have been impressed with the familiar way the councillors talked of tens of thousands of horse-power. What struck us most after hearing the speeches and seeing the station was the enormous importance of the "antiquation factor" in electrical work. We understand that the generators for the half of the station which is not yet completed will be low-speed turbo-generator sets, and not low-speed reciprocating engine generator sets like those which have been installed in the first half. This would meet with the almost universal approval of power engineers at the present day.

When the station is completed, therefore, the people of London will have on one side of their Greenwich Power House enormous low-speed reciprocating engines and generators, and on the other high-speed turbo-generator sets of the same power, occupying very much less floor space, and probably requiring a very much smaller amount of attention.

The question naturally arises whether the engineers responsible for the work were rash in fixing on the low-speed type of generating plant at a time when steam turbines and turbo-generators had passed out of the experimental stage, and had been running for two or three years at several stations in this country and abroad. For instance, two Parsons turbo-alternators of 1,500 horse-power each had been supplied to the city

of Elberfeld in Germany in 1900, and were tested most carefully by a committee of German experts with most satisfactory results. It has to be remembered, however, that even intelligent anticipation of future practice is always more or less in the nature of an experiment, and involves risk. The unfortunate experiences of the London Electric Supply Corporation with their power station at Deptford in 1889 is a case in point. Those who are responsible for the spending of the ratepayers' money are rightly chary of doing anything in the nature of pioneer work. It is possible also that in the immediate future the question of gas turbines will have to be considered, and if they prove successful the present practice of using steam turbines will have to be abandoned. There is no reason why the gases produced by continuous explosions should not be passed through suitable turbines, and in this way, judging from the theoretical standpoint, great economy would follow. Luckily the saving effected by steam turbines and high-speed machinery over a thoroughly well-designed low-speed system is not very great, and so the machinery installed will probably run for many years.

The site of the station is on the bank of the river close to Greenwich Hospital, and it has been well chosen so far as facilities for obtaining coal economically and for obtaining water for condenser purposes are concerned. At present about 25,000 horse-power is available for working the tramways, half the station being practically finished. The four large engines, which form the most important links in the chain connecting the heat developed in the furnaces with the mechanical power generated in the tramway motors, are of the "vertical-horizontal" type. They work at a steam pressure of 180 lb., and run at the low speed of ninety-four revolutions per minute. Only a high-pressure and a low-pressure cylinder are used, but in passing from one to the other the steam passes through a receiver, where it is heated by live steam direct from the boiler. Each engine consists of two complete "half-engines," one on each side of the generator, so as to secure a proper balance of the shaft and an even turning movement. The exhaust steam passes from the low-pressure cylinder to a condenser in the basement. The normal output of the engines is about 5,000 horse-power.

The electric generators are coupled directly to the engines, and generate current at 6,600 volts. Being slow speed their size is enormous compared with generators of equal power in other power stations. We noticed that in accordance with modern practice the field magnet coils were wound with bare copper strip tape placed edgewise. As these coils are whirled through the air at a high speed the copper is effectively kept cool. The magnets are built up of laminated steel stampings, and hence the eddy currents which often cause serious loss in large alternators are avoided.

The armatures are star-wound with the centre connected to earth. This limits the maximum possible pressure between any point of the machines,

or the networks linked with them, and earth. We suppose that the corresponding windings of the motor-generators at the sub-stations are also connected with earth in the same way as in other power distribution systems. Any want of balance in the windings, therefore, or in the load, will send a current of triple frequency through the earth *via* the water and gas pipes. It would be interesting to know if power engineers take any records of this current.

The main switch gear is simple and is admirably adapted for its purpose: The high-tension switches are operated by means of low-tension motors. The operator can see the instruments on the switchboard, and faces the engine-room when at work. The main cables leave the station by two groups; one group, passing through the Blackwall Tunnel, will supply the tramways on the North of London, and the other the tramways on the South. The factor of safety of the cables has been made extremely high, so that no special precautions need be taken when switching them on or off. This is a step in the right direction.

NOTES.

The Building Trade. The labour returns published for April showed for the first time some improvement in the building trade. It has hitherto not benefited with the activity apparent in other classes of employment. In reply to a question asked in the House on May 23 the President of the Local Government Board asserted that the condition of the building trade was improving rapidly, and that everything pointed to the building trade joining in the increased prosperity of other trades. Let us hope that the next labour returns will confirm the optimism of the right honourable gentleman.

The Channel Tunnel Again. WITH the advent of a new administration, the hopes of those who would construct a tunnel between England and France have so far revived that an early opportunity will be taken of submitting a resolution to the House of Commons in favour of the project, which has been dormant for nearly a quarter of a century. With the object of preparing the public for discussion of the subject a pamphlet has been issued in which are presented some favourable evidence given before the Joint Parliamentary Committee in 1883, and other information bearing upon the advantages expected to follow the execution of the work. Considering the wonderful improvement that has been effected in the speed and comfort of vessels engaged in the cross Channel service—so that the journey between Dover and Calais is now accomplished in about one hour—and the popularity of other and longer routes between England and the Continent, we are doubtful whether the increase of passenger traffic would be sufficient to justify the cost of constructing a tunnel, and still more dubious as to the utility of a sub-aqueous route for goods traffic, except perhaps to those engaged in one or two special branches of import trade. If nervous people dread the much-advertised terrors

of *mal de mer*, we believe they would fear still more the serious risks inseparable from the journey through a thirty-mile railway tunnel. Moreover, it is by no means certain that the execution of such a work would be possible. The opinion of independent engineers is that serious faults may exist in the bed of chalk upon whose assumed continuity the practicability of the scheme absolutely depends. If in this layer there is a single fault such as would permit the penetration of water to the workings, then tunnelling would clearly be impossible, because the necessary depth below sea level is so great as to forbid the conduct of operations under the heavy air-pressure by which alone water could be excluded.

San Francisco. THE American technical journals last to hand contain full particulars and numerous photographic views of buildings in San Francisco taken after the earthquake and fire. These accounts confirm the somewhat scanty technical details that had previously reached this country, and justify the conclusions we have already expressed. They make still more clear the facts that for lofty buildings the steel frame is an admirable safeguard against shock, and that for buildings of moderate height good solid stone and brick masonry and substantial timber framework are little liable to damage by earthquake. But the additional point is now demonstrated that buildings standing upon foundations carried down to solid rock, or upon piles driven into well compacted strata, suffer far less than those founded upon made ground and alluvial soil. The most recent evidence from San Francisco shows conclusively that the temporary shaking of rock well below the surface, while not causing serious effects upon the best types of construction, was sufficient to throw the less stable surface ground into wavelike undulations of most destructive character. A little reflection suggests that it is far less trying for any building to be shaken by tremors transmitted from a distance than to be violently tossed up and down on the surface of land reproducing in some measure the characteristics of a storm at sea.

Powers of Local Authorities. THE case of Attorney-General *v.* Pontypridd Urban District Council (reported in the *Builder*, May 26, 1906), noted in these columns August 26, 1905, has been carried to the Court of Appeal, but the decision of the Court below has been affirmed. It will be remembered that the defendant Council had purchased certain land from the relators under powers conferred upon them by the Electric Lighting Acts for carrying out a system of electric lighting. The Council then wished to erect a dust destructor on the land, intending to generate the electric light by the heat so produced. The relators objected to this use of the land, and Mr. Justice Farwell held it was outside the powers conferred upon them. The Court of Appeal have upheld this judgment upon the ground that the erection and use of the dust destructor was not within the meaning of the Acts "necessary and incidental to" the supply of electric light. The

Local Government Board had advised the Council that they could not sanction the use of the land for this purpose, but had suggested that the relators might purchase back the land and then resell it to the Council for the special purpose under the Public Health Acts. The relators, the original vendors, however, would not do this, and then the Council had endeavoured to get over the difficulty by a friendly sale and repurchase to and from a third person. This legal fiction seems to have been of no effect, and serious injustice would be done were land to be sold for a specific purpose, and then its use converted to some other purpose by any such fictitious sale without the concurrence of the vendor. The Council acted *bona fide*, and in the interest of the ratepayers, and Lord Justice Romer expressed some regret that he had had to come to the conclusion involved in the judgment. All the same, local authorities who are seeking to extend their operations in so many directions may well be reminded of the limits of their powers as conferred by statute.

Drainage Authorities. THE complications involved by the system of Local Government in London is illustrated by the case of Mayor, etc., of Westminster *v.* London County Council. In about the year 1849 the Commissioners of Sewers consented to the drainage of three houses, now known as 102 to 104, Grosvenor-road, into the Thames. This drain, the special case stated, was at the passing of the Metropolis Management Act, 1855, a combined drain under sect. 74. In 1870 the Church of All Saints, with or without the consent of the vestry, was also drained into this drain, thereby we presume the drain was converted into a "sewer." The vestry ensured the proper working of a tidal flap controlling the flow of sewage, and in 1899 their successors, the Westminster City Council, undertook the same duty. The Thames Conservancy Act of 1894 prohibited drainage into the Thames, and then the only practical method of draining these houses was to carry the sewage to the metropolitan main sewer in Lupus-street, but it was decided that the London County Council had no power to order the Westminster Council to connect the houses with the low level sewer of the London County Council in Lupus-street. The Westminster Corporation have connected the houses with the Rutland-street sewer, and now were claiming the cost from the London County Council, the question being whether the London County Council were bound to provide means to prevent the sewage passing into the Thames. The result of the judgment appears to be that sect. 135 of the Metropolis Management Act, 1855, gave the Metropolitan Board of Works, the predecessors of the London County Council, a discretion as to what main sewers should be necessary to prevent the flow of sewage into the Thames, that in their opinion the low level sewer in Lupus-street sufficed, and that under sect. 69 it was for the vestries to drain their own districts, which would include the sewer in Rutland-street, and that the amending Act of 1858 carried the matter no further. With the changes in jurisdiction effected

in recent years, and the creation of new authorities, it seems absurd that reference should still have to be made to the old Metropolitan Acts of 1855 and onwards, and a codification of this branch of the statute law is certainly urgently needed.

Houses "Unit for Habitation." IN the case of Slight *v.* Portsmouth Corporation, at present very shortly reported, a curious point seems to have been taken. Some old houses in Portsmouth, having fallen into disrepair, were ordered to be closed as unfit for habitation on April 12, 1904, under a by-law then in force, but since repealed and replaced by another. From the date of this order the houses had remained uninhabited and had not been let or used. Proceedings having been taken under the Housing of the Working Classes Acts, 1890 and 1903, for a closing order, it was contended that by virtue of the previous order these houses had ceased to be "dwelling houses" within the meaning of those Acts, and that no power existed to make a further order under the above Acts in respect of them. This contention was, however, negatived by the Divisional Court.

Colour Photometry. THE paper on "Colour Phenomena in Photometry," by Mr. J. S. Dow, which was read to the Physical Society last week, is one of considerable importance at the present time. We have always considered that the "candle-power" of a source of illumination depends very considerably on the colour of the light it emits, and Mr. Dow quoted results and showed experiments which proved this conclusively. He showed, for example, the Purkinje phenomenon. A sheet of blue and a sheet of red paper were placed on the screen. In a bright light both appeared equally distinct. In a dim light, however, the blue appeared to be much the more distinct. The author's explanation of this phenomenon and of several others which occur when comparing lights of different colours was physiological, depending on the distribution of the rods and cones in the retina of the eye. Whatever theory we adopt as to the difference between the functions of these rods and cones, the effect produced must vary with their relative numbers on the part of the retina covered with the image of the illuminated disc of the photometer. The cones are more numerous than the rods near the centre of the retina, but are less numerous near its circumference. This irregular distribution explains how the relative brightness of different colours varies as the eye looks at them from different distances. In the discussion, Mr. A. P. Trotter pointed out the commercial importance of being able to rate lamps emitting differently coloured rays in candle-power, and stated that there was little difficulty in comparing the intensity of colours which came near to one another on the spectrum. Mr. A. Russell mentioned that there were only cones on the yellow spot on the retina, and so if care were taken that the image of the photometer disc always fell on this spot consistent results would be obtained. He also pointed out that the old-fashioned

grease-spot photometer was the best for heterochromic photometry, as the light transmitted through the spot made the colours on both sides more nearly the same and so made the obtaining of a "balance" an easy matter.

MR. NIGEL BOND, secretary to the National Trust, makes an appeal for a sum of 500*l.* to enable the trust to complete the purchase of this fine old Tudor mansion, with 220 acres of land, towards which an anonymous donor contributes 10,000*l.* upon certain conditions. A further amount of 1,000*l.* should be forthcoming in order that the fabric may be rendered weather-tight, and that the façade may be repaired. Barrington Court, about four miles distant from Iminster, was built of Hamhill stone in the middle of the XVIIth century, by, it is believed, Henry Daubeney, second Baron and first Earl of Bridgewater, who died in 1548; the manor had vested during a long period previously in his family. In 1605 Sir Thomas Philips, Bart., bought the property, which has of late years been occupied as a farmhouse. Some eighty years ago a fire greatly damaged half of the interior; some wainscoting has been wantonly stripped away, and the great hall is converted for the storage of eider. The house is E-shaped on plan, having two end-wings and a central porch. The general design presents but little of the classic influence so prevalent in similar houses of the period we indicate; there is not much ornamental detail, but the twisted finials of the gables and the twisted chimneys are notable elements of the composition. The Duke of Monmouth sojourned at Barrington Court when making his progress in the West Country.

A Remarkable House. In the fine avenue of Addison-road a dwelling-house is in progress, and is now finished externally, which has excited a great deal of notice from passers-by, and is worth the attention of architects as an experiment in structural polychromy of a kind quite new, as far as we are aware, in this country. A coloured elevation of this house, of which Mr. Ricardo is the architect, was exhibited at the Royal Academy a year or two ago; we did not feel very much drawn to it at the time, but in execution it is much more effective than it appeared in the drawing. The whole exterior of the house is in glazed material; Messrs. Doulton's white "Carrara" material for the pilasters and capitals and cornices, and other features which in a brick and stone house would be described as "stone dressings"; the wall-faces between are in Burmantofts bricks, giving large masses of light blue, interspersed with bands of other colours; nothing very strong; the whole effect is harmonious when you consider it in itself and apart from the rather startling contrast which it makes with the sober every-day tones of the other houses along the road. There is a very bold modillion cornice carried round great part of the exterior, with another and a subordinate modillion cornice above; the roof is covered with a special glazed roofing tile, semi-circular in section, obtained

from Spain, which keeps up the glazed surface effect, while its ridged appearance gives texture and scale to the whole. The treatment of part of the wall in a series of three large arches springing from pilasters, with the windows grouped beneath them, is to our thinking not quite domestic enough in appearance, and gives a kind of suggestion of its being a small public building rather than a private residence; but opinions may differ on that point. The house is at all events a most interesting architectural experiment, and we may congratulate Mr. Ricardo on having had an opportunity of carrying out his predilection for coloured architecture in so complete a manner.

Paddington Technical Institute.

THE Exhibition of students' work at the Paddington Technical Institute was opened on Friday, the 25th ult. The Institute was first opened in 1904 by the London County Council as a technical school, and the number of pupils entered this session is 970, a large and increasing proportion of whom are engaged in technical industries. The school is particularly suitable for engineering students, and contains a fine engineering laboratory in the basement, well-fitted with machine latnes, planing and shaping machines, etc. There is also a motor-car class, with an M.C.C. car for experimental purposes. A large amount of student work done in the various classes was on view. In the stone-carving room some good clean-cut alphabets of beautiful design were to be seen. Another large class-room was filled with drawings of building construction, chiefly elementary, also a few interesting measured drawings of St. Saviour's, Southwark, and one or two designs for houses, the latter, however, apparently executed by the class teachers, and not by the students themselves. We notice that there is a small land-surveying class. It seems a pity that more students do not take advantage of this useful and profitable branch. In the adjoining room some really good specimens of embroidery work were shown. The other art classes, however, would appear to be in a somewhat languishing condition if one is to judge by the number and quality of the exhibits.

The German Exhibition at Knightsbridge.

WE hope we may conclude that the "Exhibition of Modern German Art" in the Prince's Hall at Knightsbridge does not really afford a fair representation of that art; if so, the less said about German art the better; but we have rather a suspicion that it gives Londoners the same kind of impression of German art which might be afforded of English art by an exhibition of the New English Art Club in Berlin. A few good things are lent by the Berlin National Gallery, such as Herr Liehermann's "Flax-Cleaning in Holland" and Herr Olde's "Winter Sun," a very powerful piece of winter landscape effect; but even the Berlin National Gallery contributes one terrible picture in the shape of Herr Böcklin's "Elysian Fields," a fantasy in hard texture and horrible colour which we imagine would be crossed at the back at once by a Royal Academy hanging

Committee. Herr Exter's "A Barber" is a fine and powerful nude study, good in colour and effect; and among other works which relieve the general medley of the ugly and the vulgar in painting are Herr Dettmann's landscape "In the Park"; Herr von Keller's "Lady in Black," a small portrait study very interesting in character and expression; Herr Kraus's "Hopless Attempt"; and Herr Lepsins's "Portrait of Professor Dilthey." But of a great proportion of the pictures it is only a question whether they excite anger at their ugliness and vulgarity or laughter at their absurdity; As already observed, however, we cannot believe that this is in any true sense a representative collection of modern German art.

Mr. D. Farquharson's Exhibition.

IN the upper room at Messrs. Tooth & Son's new gallery in Boud-street is a collection of nearly thirty small landscapes by Mr. D. Farquharson, who, since his comparatively recent appearance in the Royal Academy exhibitions, has taken almost immediately and by common consent a very high place, if not the highest, among contemporary English landscape-painters. This exhibition is of interest as showing that Mr. Farquharson, who has been known at the Academy chiefly by paintings on a large scale, loses none of his power when working on a small scale; we go from one picture to another, and all are fine in composition and colour. If we were to select some for mention as especially good, we should name "A Valley by the Sea" (53); "Hedgerows in May" (57); "Golden Autumn" (58); "In Athol Woods" (64); and "Up Among the Grouse" (71); the last a quite perfect little landscape.

The Handel Festival.

WE may draw the attention of our (probably) numerous readers who are interested in music to the fact that this is again the Handel Festival year, the three performances of which are to be held on the 26th, 28th, and 30th of June. On the 26th the *Messiah* will be given; the second day, the 28th, will be devoted as usual to a selection, to include some things which are seldom heard, and to include also a selection from *Israel in Egypt*, instead of making this, as usual, the subject of the third day's performance. This alteration may be regretted by some, but we presume that the intention is to give those portions of *Israel* which are undoubtedly Handel's, and omit the considerable number of borrowed movements from older composers. *Israel* has got to be regarded as a complete work, but (as is well known to musicians) it is really a patchwork, in which a good many pieces are adapted or adopted from one or two older Italian composers of church music, in order to fill up an entertainment for which Handel apparently had not time to compose the whole music.* The third day, June 30, is to be devoted to *Judas Maccabeus*.

* At the time of the last Festival but one the *Pall Mall Gazette* published, the day before the *Israel* performance, a complete analysis of these borrowings, by the Editor of this Journal (who has made a special study of the subject), showing exactly what portions of the oratorio are really Handel's and what are not. The genuine portions, it should be added, are immeasurably superior to the rest.

one of Handel's finest and most effective oratorios, which has not hitherto been given as a whole at any of the Festivals. We call our readers' attention to the subject more especially because the fashionable musical opinion of London (if it can be dignified by the name of opinion) has recently taken the turn of a resolute depreciation of Handel, and the shallow musical criticism of the daily press is occupied in sneering at the Handel Festivals as a kind of entertainment only suitable for country cousins. This is a mere piece of foolish cant; the Handel Festival is one of the finest things we do in England, and ought to be supported by all those who take their intellectual pleasures seriously.

ARCHITECTURE AT THE ROYAL ACADEMY.—II.

THE model of a monument to the late Lord Dufferin, to be erected at Belfast (1615), is a conspicuous object in the Architectural Room; the sculpture by Mr. Pomeroy, the architectural portion by Mr. A. B. Thomas. This is an architectural canopy, oblong on plan, supported at the angles on Ionic columns carrying slices of entablature on them in the rather awkward manner which long architectural custom has sanctioned. It is arched over the long way, by a semi-circular arch which carries a pedestal on which is a figure; on the short sides the opening is bridged by low-pitched segmental arches which abut rather awkwardly against the pulvinate frieze; but as a whole it is a good and effective architectural design of the kind, and the plan of the pedestal and steps, with their curved lines, is well contrived. Beneath the canopy is a portrait statue, and on either side of the pedestal are seated figures representing respectively India and Canada. Gilded festoons of bronze are drooped as decorations across the front and back of the arch. The only remaining model in the room, Mr. Creswick's "Proposed House at Buenos Ayres" (1614), may be noticed here, though it comes under the head of domestic architecture, which we are not specially considering in this article. It looks, perhaps, with its central dome, a little too much like a public building, but it is designed to have a character suitable to a sunny climate, with loggias with coupled columns running round a considerable portion of the house, carrying lean-to tiled roofs. The dome is not very well connected with the four square flat-topped piers from which it springs, and the flat-topped blocks on the lower level seem rather to want something on them, though this may be more evident in the model than it would be in the building itself seen from the ground level. As a whole, though it seems to want "pulling together" rather in detail, it is a good architectural conception, shown in a well-executed model.

Among designs for public buildings some for the Wesleyan Hall are conspicuous. Mr. J. A. Swan exhibits what we take to be his perspective sketch in the first competition (1401), which is not so satisfactory as the completed design published in our issue of July 22 last year; as shown in this sketch, the flat finish of the centre portion between the towers looks awkward and has no connexion in its cornice line with anything else in the design; in the second competition this was rectified and the line of cornice carried round the towers; but in any case there is an awkward gap between the towers, which seems to want filling up. The author is to be commended for showing plans in connexion with the view, though on a very small scale. Messrs. Runtz & Ford exhibit their sketch design (1406; no plan), in a very pretty washed drawing. They treat the building with a solid rusticated base of two stories, with an Ionic order above; the general effect is decidedly pleasing, though the design of the dome is rather weak. Messrs. Lanchester & Rickards exhibit the fine perspective view of their design (1393; no plan), which we published on June 24 of last year; and Mr. E. Vincent Harris exhibits both his preliminary and final designs (1407, 1408; no plan), the latter of which

was published in our issue of August 5 of last year. These we need only refer to; they were noticed fully at the time of the competition. Messrs. Malloys & Cross exhibit their sketch design (1409), a small perspective drawing showing some originality of treatment in the principal block. We notice in this and in one or two other designs with domes a practice of placing a lantern on a dome with its line tucked-in, so to speak, at the base, leaving a crevice between the base of the lantern and the dome, which to our eyes has a very bad effect; the lantern should grow out of the dome, not look as if perched upon it with a spreading base of its own quite independent of the surface of the dome.

Two drawings by Mr. Norman Shaw remained unnoticed in our first article; and though they belong strictly perhaps to street architecture rather than to public buildings, they are two of the most important designs in the room. One of these, the new offices of the Alliance Assurance Company in St. James's-street, has been published, since the Academy opened, in our issue of May 19, and was previously the subject of a very appreciative notice in our columns under the head of "Notes on New Buildings in London" (February 3, pages 111-112), so that we need not return to it further at present. The other is Mr. Shaw's design for the front of the Piccadilly Hotel, "now building from designs prepared for H.M. Office of Woods" (1439); the fact that there is no plan to this may be excused on the ground that this is confessedly only a design, prepared at the request of the Office of Woods, for the street face of the building, and that the plan was not Mr. Shaw's concern. This front has a certain relation, *via* Air-street, to the new front of the Quadrant, and accordingly the character of the strongly-rusticated lower story of the Quadrant, with its arches and mezzanine windows, is continued here; above that the character of the design is entirely different from that of the Quadrant. A nearly unbroken row of small windows, running across above the arcade, binds the whole composition together; above this the centre portion is recessed, with an open colonnade across it, which will have an admirable effect; the ends are treated as gabled pavilions, with a picturesque arrangement of windows. The corbelled-out turrets perched on the centre of each semi-circular gable-head may be open to criticism, not as to their appearance, for they form very pretty features, but as being too much of the nature of constructed ornament; for in spite of the little windows in them, it is difficult to understand of what possible utility they can be, and yet they are rather too large to be justified for show only. But as a whole, this will be a very fine addition to the architecture of Piccadilly, superior to anything at present to be seen in this eastern portion of the thoroughfare, in spite of Burlington House and the Ritz Hotel, both of which are very commonplace pieces of architecture in comparison.

Messrs. Newman & Newman's "Design for Municipal Buildings, Burnley" (1417; no plan) is a suitable and municipal-looking building, composed of architectural materials which are pretty well worn. There is more originality in Messrs. Blomfield & Spiller's "Competitive Design for Library at Wakefield" (1416; no plan), a one-storied building with large windows divided into small panes, running right up to a widely-projecting cornice; over the central portion, over a slight break in the wall line, a wide curved pediment is carried, including some sculptured ornament beneath it; there is a low glazed dome behind. It would look like a library were there not a suspicion that, with the large windows, there is not enough wall-space for books; a plan would have shown how it was managed in this respect. The absence of plans is a crying evil in the architectural room, and there seems to be no improvement in this respect. This is still more felt in the case of Mr. A. Blomfield's "Council Offices, Woodford" (1440), a building on a triangular site which must have presented rather a difficulty in planning, and which may be very well planned, but we are left entirely to conjecture on this point; and the exterior, irrespective of the planning, is not of very much architectural interest.

Mr. J. J. Stevenson exhibits a drawing with some descriptive notes, of his restoration of the Mausoleum at Halicarnassus, "in accordance with the contemporary descriptions and measurements and the remains in the British Museum" (1436). It is rather to be bad that the drawing is hung so high that the descriptive notes cannot be read; a serious attempt at a reconstruction of the Mausoleum is an important exhibit, and ought to have been hung where the author's intentions and reasoning could have been understood. Mr. Stevenson's theory as to the Mausoleum has been noticed and (if we remember right) illustrated in our columns a good many years ago. The outline of the stepped *pteros* spreading out in a curve at the foot and rising afterwards in a steeper line, does not commend itself to us as very probable—it certainly looks very bad; but we admit that it has some support from the fragments of steps in the British Museum, some of them with wide and some with very narrow treads. The argument *per contra* is that no Greek architect would have been likely to build anything so awkward-looking to the eye. However, in the absence of the possibility of reading the notes on the drawing we cannot go into the subject from Mr. Stevenson's point of view; and if the Academy hangers could not see that a design of this kind was hung so that it could be intelligible to those who wished to study it, it might as well not have been hung at all.

Messrs. Warwick & Hall's design for the Hackney Central Library (1433; no plan) is a rather good Renaissance design, with canted angles emphasised by stone bands in the brickwork; the front features are coupled columns in three groups at regular intervals, one of them in centre of the front, above which a clock-beam stands out over the road; but in a design so generally symmetrical the position of the door between the centre and left-hand groups of columns, with nothing to balance it, looks rather awkward. Mr. Vincent Harris's "Proposed Town Hall, Dartmouth" (1474; no plan), is just the thing for a town hall for a small town; a quiet long low building with a row of circular-headed windows in a rusticated ground story, rectangular windows above, and a pediment and turret in the middle; a design recalling the style and feeling of some of our county-town municipal buildings. Mr. Brierley's "Interior of Council Chambers, County Hall, Northallerton" (1477), is a clean pen-line drawing of a Greek cross room with a dome and a large coffered arch over each face of the plan; adequate, but like many other council rooms. Mr. F. E. D. Edwards's "Bradford Town Hall—Proposed Extension" (1478), shows an important piece of work of considerable interest. The new portion of the plan, shown in black, is on a site coming down to a narrow end, where the dining-hall is placed, with a polygonal recess at each outer angle, the windows of which make a feature in the external architecture. The Council Room is placed as an internal room in the centre of the new building, with circular vestibules formed in the diverging corridors in order to get over the angle made by the Council Room entrance and the corridors. The architect has not carried on Lockwood & Mawson's Gothic exactly in the exterior treatment, except to reproduce their corbelled-out turret with gargoyles; otherwise he has made a more modern Gothic of his own, which serves to mark the added portion as new work. Altogether this is a very good addition scheme, both in plan and in exterior treatment.

Mr. Bradshaw's "Central Tower, Leysian Mission Buildings" (1436) is a remarkably effective and well-executed brush drawing in monochrome, showing a picturesque but very rambling and uncertain piece of design. Mr. Littler's "County Sessions House, Preston" (1487; no plan) is respectable municipal architecture, but not more, as Mr. Skipper's interior of the "Norwich Union Life Assurance Society's New Head Office" (1516) is respectable office architecture, owing its position chiefly, perhaps, to a very well-executed coloured perspective drawing in which marble columns play an important part. Messrs. Ernest George & Yeates's "Royal Exchange Buildings" (1522) were published in our issue of May 19, and need not be further described here; a plan was provided for our publication, but there is none in connexion

with the Academy drawing. Messrs. Eden & Mount's "Eton War Memorial—Second Preliminary Design" (1521: no plan) is a rather heavy Classic block with stone pavilions at the angles with an order of pilasters, and a stone columnar order on the brick face of the intervening wall; heavy obelisk finials appear above the pilasters of the angle pavilions, and statues above the columns; the whole is dignified but, as observed, rather heavy. Mr. Stokes has a pretty little water-colour drawing of "St. Mary's Training College, Newcastle—Showing Refectory" (1531: no plan); we presume the refectory is the low building joining the wings, with plain circular-headed stone-dressed windows, and intermediate little pilaster-like strips of stone starting from the string on the springing-line of the window-heads to finish under the eaves, a feature which seems to have no particular meaning or function except to make a little variety. Mr. Warren's exterior of the "New Dining-hall, Wellington College" (1535) is furnished with a plain, an outer columned loggia (which is a feature in this; there is a kind of general picturesque quality about it, but the architectural treatment is rather rambling and seems to lack a controlling motive. Mr. E. W. Twining exhibits in a very good perspective drawing his picturesque but perfectly unpractical design for "Proposed County Hall and Bridge over the Thames" (1541: no plan); this is a municipal hall in Gothic style built on a bridge, after the manner of one or two well-known French châteaux; a perfectly possible scheme in an architectural sense, but totally unpractical, for the reason that it necessarily presupposes a long and narrow building in which concentration of departments and offices would be impossible; there must be long communication corridors which would mean waste of time and energy in internal traffic, as any plan would be certain to have shown, so that in this case the author may be said to have acted wisely in not disclosing the inherent weakness of the scheme by a plan, but leaving it to produce its effect solely as a picturesque architectural combination, in which sense it is effective and deserving of praise.

Mr. Corlette's competition design for the University of Capetown (1552), to which plans are added, but hung too high to be seen, is architecturally an interesting attempt to give to this class of building an architectural character suited to a tropical climate, though the design seems a little too scattered and irregular. Mr. R. G. Kirkby's "Design for New Law Courts, Capetown" (1557: no plan), is well treated architecturally, the columned and pedimented pavilions at ends and centre contrasting effectively with the very simple treatment of the intervening portions. Mr. Caröe exhibits a large perspective drawing of his block of buildings in connexion with the Westminster improvement scheme (1563: small block plan only). Messrs. Scott & Hudson's "New Town Hall and Municipal Offices, Durban" (1593: no plan), is a dignified building with a good treatment of the angle pavilions; the cupola with its two stages is too high and too telescopic-looking in its design, and the rather heavy lantern shows again that awkward feature of the spreading base unconnected with the surface of the dome, to which we have alluded in another instance. No attempt has been made at any special treatment of the architecture suggested by the climate; it is a Northern classical building transported to Southern soil. Mr. Paul Waterhouse's "Refuge Assurance Company, Manchester: tower and additional wing" (1594) is a striking drawing showing the front in sharp perspective with a high sight-line—almost a bird's eye view; the tower stands nearly separate in a break in the frontage line, running up with a plain stalk carrying a lantern stage of unusual and effective design, with concave faces and free columns at the angles; the finishing stage seems rather too heavy in outline for its position; there is a plan, but too high to be studied. Mr. Mountford's "Lancaster Town Hall" (1601: no plan) is a Town Hall which, whether intentionally or not, represents what one may call Lancashire municipal style; a solid and dignified but rather heavy brown stone building (according to the colouring), with a columned portico on the entrance side, and a small wall portico with engaged

columns in the centre of the long side, the further portion of which shows a plain mass of wall with an immense blocking stage above the cornice line. This is a building with character in it, though of a somewhat ponderous type. Messrs. Pearson & Millburn's "Municipal Offices, Cheltenham" (1599: no plan), shown in a small and very well-executed water colour drawing, is one of the most original and pleasing public building designs in the room; there is a slight curve on plan in the front wall, flanked by a stone pavilion at each end, the intermediate portion being of brick walling with a small order of engaged stone columns in the upper story; a canted angle, with a small tower rising in the centre, is flanked by another stone pavilion which serves to connect it with the return face of the building; the effect of the whole is very pleasing. Messrs. Warwick & Hall's selected design for the Lambeth Municipal Buildings (1610: no plan) is inadequately shown in a rather rough pen sketch which does not do it justice; another design, by Mr. W. J. Hardcastle, for the same building (1612: no plan) is much more attractive as a drawing and is a pleasing design, but rather wanting concentration of motive, and the device of spreading out the angle rustication of the tower in a curve each way at the base is a very unhappy idea, involving almost a contradiction of conditions of structure.

LETTER FROM PARIS.

ACCORDING to the terms of the street regulation of Paris, the proprietors of the houses over the arcades of the Rue de Rivoli, from the Place de la Concorde to the Rue du Louvre, cannot modify the architectural lines of the composition nor alter the height of the buildings. Some of the proprietors, however, have shown themselves very refractory in respect of this rule, and the Administration has, to the surprise of most people, treated certain of them with a quite unexpected laxity. Thus the Automobile Club have been permitted to establish a terrace garden on the top of their building, and the proprietors of the Hôtel Menrice to add another story, to the great indignation of the "Vieux Paris" Committee. But in the present case the Municipality can do nothing, since the building concerned is on ground belonging to the State, and, as it appears, the Department of Fine Art will take no steps in the matter; apparently for the same motives that led them some years ago, on the commencement of the Rue Etienne Marcel, to accept the building of two lofty houses which destroy the harmony of the Place des Victoires.

The "Vieux Paris" Committee, whose efforts unfortunately are seldom successful, is also much moved by the scheme, presented by MM. Némot and Buquet, for the enlargement of the Chamber of Deputies. This scheme will involve the substitution for the existing façade, which makes a kind of pendant to the façade of the Madeleine at the other end of the same axis, of a completely new façade on an advanced frontage line and with an increased extension to right and left.

It is probable that the protest of the Committee will have no effect, for the Government is concerned with the question of finding space rather than with that of architectural effect, and the scheme in question will at all events secure a much larger and better ventilated Salle des Séances; and as an architectural scheme it does not merit the severe criticisms passed on it. It comprises a central peristyle, to which access is gained, as at present, by a great flight of steps occupying the whole width of the portico. In the latter, eight columns of the Corinthian order will support an entablature, the frieze of which is to be decorated with eight statues; above the main cornice is to be a balustraded attic ornamented in the centre by a large cartouche with seated supporting figures, and groups of emblematic decoration at the angles. Two wings, with pilasters of the same order as the columns, connect the portico with the two angle pavilions, which are to carry groups of sculpture. The general aspect is imposing, but it involves the suppression of the large pediment over the central portico built by Poyet at the beginning of the last century,

and which actually leads to nothing; whereas the large *perizon* of M. Némot's design will lead directly to the new Hall and will serve as the entrance for the Deputies. This is a manifest improvement, and therefore the criticisms of the "Vieux Paris" Committee will not count for anything. It is possible that the Committee may be more fortunate in another effort they are making, in regard to the Pont Notre Dame. This has to be rebuilt, and the Committee demand that this reconstruction should not involve the substitution of steel for masonry, and that the architectural character of the bridge should be preserved in the new structure. Unhappily the vestiges of old Paris are disappearing successively in consequence of the demands of modern life. Traffic circulation becomes more and more intense, and the requirements of hygiene are too often the enemies of the picturesque. Thus we shall soon see the disappearance of the Hôpital Andral, a picturesque but insanitary old building in the Rue des Tournelles, no longer of any utility. It is a former convent, dating from 1625, once belonging to the Hospitalières de la Charité, and which will now be delivered over to the "démolisseurs."

On the other hand, commemorative monuments and statues of celebrities more or less consecrated by time continue to encumber the public streets. We may make an exception, however, in regard to the fine monument to Cornélie inaugurated last Sunday, a rather tardy homage to a great Frenchman. As already noticed, the monument, erected on the Place du Panthéon, is the work of M. Allouard (sculptor) and M. Latour (architect). M. St. Marcoux will shortly have completed the monument to Dumás *filz* which he is carrying out for a site on the Place Malesherbes. We may mention also a monument to M. Gustave Larroumet, the former Secretary of the Académie des Beaux-Arts, which M. Roussel is executing on the lateral façade of the Théâtre Français, at the entry from the Palais Royal. At Neuilly will shortly be erected M. Pierre Gramet's statue of Alfred de Musset, to stand on a red marble pedestal in the round-point of the Porte Maillot, not far from Bartholdi's extravagant monument to the aeronauts of the Siege. M. Fremiet has just completed a monument to Rude, the great sculptor, which will find place in the Jardin de l'Infante of the Louvre, near the monuments to Boucher, Raffet, and Meissonier.

The exhibition of the works of Fantin-Latour at the Ecole des Beaux-Arts has attracted much interest, also that of the works of Gustave Moreau at the Georges Petit Gallery; among them especially "The Young Man and Death," "Jacob and the Angel," "Jason and Medea," "Helen on the Walls of Troy," etc., as well as some water-colour illustrations to La Fontaine's fables which are almost unknown to the public. There is talk of setting apart a special room at the Petit Palais for the works of Courbet, whose sister has just presented to the Municipality a remarkable picture by him, "Les Demeiselles de la Seine," and others of whose pictures can be collected by her aid. The scheme is regarded with some interest in view of the fact that Courbet might be considered to have been really the first Impressionist, and the precursor of Manet.

We have to record the death, at the age of 76, of M. Charles Lecœur, architect, of Paris, a pupil of Labrousse and of the Ecole des Beaux-Arts. He had been appointed, in 1860, architect to the Municipality of Compiègne, where he built the Hôtel of the Sous-Préfecture, as well as schools and other buildings; he built also the Mairie of Pierrefont. He had made a special study of school buildings, and was architect for a number of Lycées. He built also the thermal establishment of Bourbon l'Archambault, and the new establishment of the same kind at Vichy, with its theatre and casino. In spite of his large practice, M. Lecœur also carried out most efficiently the duties of architecte-expert to the Civil Tribunal at Paris, and his advice was very much valued in regard to many important technical questions, especially in regard to schools and colleges, which had to be considered and decided in the Department of Public Instruction. M. Lecœur was Chevalier of the Legion of Honour.

THE SEVENTH INTERNATIONAL CONGRESS OF ARCHITECTS.

The arrangements for this Congress, to be held in London from July 16 to 23, are rapidly approaching completion. The following are some extracts, published in the *Journal* of the Royal Institute of British Architects, from the provisional programme which will shortly be sent to members of the Congress:—

The headquarters of the Congress will be the Grafton Galleries, Grafton-street, W.

The inaugural meeting will take place at the Guildhall, E.C.

Meetings will be held both at the Grafton Galleries and the premises of the Royal Institute of British Architects, 9, Conduit-street, W., for the discussion of the subjects of the programme.

The Grafton Galleries will be open at ten o'clock on the morning of Monday, July 16, when the President will hold an informal reception.

Badges, tickets for visits, etc., cards of invitation, will be obtainable at the Congress Bureau, Grafton Galleries.

At 11.30 there will be a meeting of the Permanent International Committee.

At three o'clock the inaugural meeting of the Congress will take place at the Guildhall, E.C., kindly placed at the disposal of the Congress by the Corporation of the City of London.

The Royal Academy of Fine Arts will entertain the Congress at a soirée at Burlington House.

The Right Hon. the Lord Mayor of London will entertain the Congress at a conversation at the Mansion House on the evening of Tuesday, July 17 (limited to 1,000 invitations).

The Royal Institute of British Architects will entertain the Congress at a garden fête at the Royal Botanic Society's Gardens on the evening of Thursday, July 19.

The Art Workers' Guild will entertain a small party of members on the evening of Friday, July 20.

The Chairman and Directors of the London Exhibitions, Ltd., have put 500 invitations to visit the Imperial Royal Austrian Exhibition at Earl's Court at the disposal of the Executive Committee. Application for tickets must be made at the Congress Bureau, Grafton Galleries.

The Zoological Society of London have kindly offered admission, to foreign members, to their gardens on Sundays, July 15 and 22—days when they are closed to the general public—on presentation of their cards of identity.

The Royal Botanic Society have kindly offered members free admission to their gardens during the Congress week on presentation of their cards of identity.

The Lyceum Club (for ladies) will constitute lady members of the Congress visiting London hon. members of the Club.

The Lyceum Club also kindly offers a reception to the Congress on the afternoon of Wednesday, July 18.

The Ladies' Committee are arranging for the comfort and convenience of ladies. They will be recognisable by the committee badge.

The following are some of the visits arranged for:—

A. *Hatfield*.—The seat of the Marquis of Salisbury. Tuesday, 2.30.

B. *Hampton Court Palace*.—Tuesday, 2.30. A and B are alternative visits, and will take place simultaneously.

C. *Buckingham Palace Gardens*.—By the gracious consent of His Majesty King Edward VII.; and *Westminster Abbey*. Wednesday, 2.30. Later

D. The works of Messrs. Holloway Brothers, and

E. The potteries of Messrs. Doulton & Co. These visits D and E will take place simultaneously.

F. *Windsor Castle*.—By the gracious consent of His Majesty King Edward VII. Thursday, 2.30.

G. St. Paul's; The Temple; The Institute of Chartered Accountants; St. Bartholomew's Church, Smithfield. Thursday, 2.30. This London visit is arranged for those who do not go to Windsor; as also alternative visits:

H. Kensington Palace; Dorchester House, by the kind consent of His Excellency the American Ambassador.

J. *Oxford*.—All-day visit on Friday.

Lunch in the halls of Exeter College and Balliol College.

K. *Cambridge*.—All-day visit on Friday, alternative with Oxford. The Congress party will be received in the Senate House by the Master of Trinity as Deputy Vice-Chancellor. Lunch in the halls of King's College and Clare College.

L. *Tower of London*.—Friday morning, for those who do not join the Oxford and Cambridge visit.

M. Victoria and Albert Museum and Royal College of Science: Sir Aston Webb's new buildings. Friday afternoon, for those who do not join the Oxford and Cambridge visit.

N. Bridgewater House, by the kind consent of the Right Hon. the Earl of Ellesmere. Saturday morning.

O. Greenwich Hospital. Saturday afternoon.

P. Houses of Parliament; The new Westminster Cathedral. Saturday afternoon, for those who do not join the Greenwich visit.

The farewell banquet will take place on the evening of Saturday, July 21, at the Hotel Cecil, at 7.30. Price of ticket (wines included), 21s. It is hoped that many distinguished persons in London will be present.

Sir Lawrence Alma-Tadema, R.A., has kindly consented to design the menu card.

There will be the following exhibitions in the Congress premises, Grafton Galleries:—
An exhibition of photographs of buildings executed by living British architects.

A chronological exhibition of British architecture from the Norman Conquest (1066) to the death of Sir Charles Barry (1860).

Oil paintings and water-colour drawings of English architecture.

A few choice specimens of British furniture and silver work.

At the premises of the Architectural Association, 18, Tufton-street, Westminster, S.W., will be exhibited a selection of Viennese students' drawings arranged by Professor Otto Wagner (Vienna).

The Executive Committee have received the following communications on the questions of the programme:—

1. *The Execution of Important Government and Municipal Architectural Work by Salaried Officials.*

M. F. Blondel (France).
Society of Austrian Architects.
Gaston Trélat (France).

Oscar Simon (Société Centrale d'Architecture de Belgique).

2. *Architectural Copyright and the Ownership of Drawings.*

George Harmand (France).
H. H. Statham.
Gaston Trélat (France).

3. *Steel and Reinforced-Concrete Construction.*

(a) The general aspect of the subject.
(b) With special reference to aesthetic and hygienic considerations in the case of very high buildings.

The Joint Committee on Reinforced Concrete (England).

Herr Wilemanns (Austria).
Professor Henry Adams (England).
E. P. Goodrich (America).
Louis Cloquet (Société Centrale d'Architecture de Belgique).
Joaquim Bassegada (Spain).
Gaston Trélat (France).

4. *The Education of the Public in Architecture.*

John Belcher, A.R.A.
T. G. Jackson, R.A.
Arthur Hill.
Othmar von Leixner (Vienna).
Herr Mthusius (Berlin).
Banister F. Fletcher.
Francisco del Villar y Carmona, Manuel Vega y March, Eduardo Mercader y Saccanella (Spain).
Society of Austrian Architects.
Gaston Trélat (France).
Gaston Ancaux (Société Centrale d'Architecture de Belgique).

5. *A Statutory Qualification for Architects.*

Robert Walker.
John S. Archibald (Canada).
L. Bonnier (France).
Society of Austrian Architects.
Gaston Trélat (France).

6. *The Architect Craftsman: How Far Should the Architect Receive the Theoretical and Practical Training of a Craftsman?*

Reginald Blomfield, A.R.A.
Professor W. R. Lethaby.
J. M. Poupinel (France).
Fr. van Gobbelschroy (Société Centrale d'Architecture de Belgique).
Society of Austrian Architects.
Gaston Trélat (France).

7. *The Planning and Laying-out of Streets and Open Spaces in Cities.*

Raymond Unwin.
Herr Stübben (Germany).
E. Hénard (France).
B. Polles y Pivo, J. Majo y Ribos, M. Bertran de Quintana (Spain).
C. H. Buls (Société Centrale d'Architecture de Belgique).
Gaston Trélat (France).

8. *To What Extent and in What Sense Should the Architect Have Control over Other Artists or Craftsmen in the Completion of a National or Public Building?*

Sir W. B. Richardson, K.C.B., R.A.
H. P. Nénot (France).
C. B. Müller (Germany).
Association of the Architects of Catalonia (Spain).
Society of Austrian Architects.
Gaston Trélat (France).

9. *The Responsibilities of a Government in the Conservation of National Monuments.*

Professor G. Baldwin Brown.
A. Bessard (France).
Gaston Trélat (France).
Joseph Artegas y Ramoneda (Spain).

10. *The Organisation of Public International Architectural Competitions.*

J. Guadet.
Society "Architectura et Amicitia" (Holland).
Gaston Trélat (France).

The Executive Committee have also arranged for Professor Meydenhauer, of Berlin, to read a paper on "Messbildverfahren" or "Photometry." A communication on this subject has also been received from M. Marcel le Tourneau, of Paris.

M. Honoré Daumet (Paris) will read a communication on the Château de Saint-Germain.

Mr. Cecil Smith (Keeper of Greek and Roman Antiquities, British Museum) will read a paper on "The Tomb of Agamemnon."

Abstracts of the papers and communications will, if possible, be sent to members of the Congress some time before the opening day.

THE SOCIETY OF ARTS.

On Monday evening Mr. George W. Eve gave his final lecture on "Heraldry in Relation to the Applied Arts." He began by describing the development of the helm. At first these were light, and rested on the head without touching the shoulders, but with the introduction of plate armour came the later type, firmly supported at its base and capable of carrying a heavy crest. The great helm was always shown in profile until the middle of the XVIIIth century, when it fell out of use with the cessation of the tournament, and its place was taken by the helmet, which indicated rank by its pose and detail.

The helm usually faces left, but this is not absolutely necessary, and if a number are placed together in a frieze they should all face to a central point, such as a fireplace. The mantling, at first quite short and used as a protection against the sun, soon became long and elaborate; it is valuable as a means of filling up and binding together decorative compositions. It may take the form of any kind of flowing ornament, and so is very useful for connecting up the heraldic group with its surroundings; its colour, however, is fixed by rule. In England it must be of the first colour and the first metal mentioned in the blazon, but exceptions are found in the Royal arms and in Scottish practice.

A general guide to the proportion of a heraldic group is that the shield may be about two-fifths of the height, and the helm and crest the remainder. The shield should, however, be larger if it carries much detail.

CRICKET PAVILION
MERTON COLLEGE
OXFORD
Herbert Quinton
Architect Oxford

Supporters first appeared as badges used to fill up the corners below the shield, and were always relatively small in medieval work. Later they attracted the attention of carvers, and became very large and out of all proportion to their importance. A good deal of freedom is allowable as regards their position and pose, but they should always emphasise the shield, which is the principal object of the group.

The British Imperial crown was then described in detail, and hints were given as to the treatment of the Insignia of Orders.

On banners and horse-clothing all animals, etc., should face to the staff or front. The development of the Union Jack from the banners of St. George, St. Andrew, and St. Patrick was shown with the aid of diagrams, and the lecturer concluded with a warning against the narrowness of view, which results in mannerism, and the repetition always of certain quaint forms.

A vote of thanks to Mr. Eve was proposed by Sir H. Traeman Wood, who emphasised the importance of accuracy in work of this kind.

CRICKET PAVILION, MERTON COLLEGE, OXFORD.

The cricket pavilion here illustrated was built for Merton College, at a cost of 900*l.*, in 1904. The walls externally are red brick and rough-cast, woodwork finished green, and the roof covered with Broseley tiles. The hot water for shower-bath and lavatory-basins was obtained by means of Fletcher's stoves.

Mr. Herbert Quinton, of Oxford, was the architect, and Messrs. Symm & Co. the contractors.

WATERFALLS IN NORWAY.—Pending further and probably more stringent legislation upon the matter, an Act has just been passed which prohibits the sale of waterfalls to other than Norwegian subjects, whilst foreigners are inhibited from having more than a leasehold interest in the properties concerned.

THE SURVEYORS' INSTITUTION: CONFERENCE IN BIRMINGHAM.

A PARTY of the members of the Surveyors' Institution visited Birmingham last week, as mentioned in our issue for the 26th ult. The Corporation placed the Council House at the disposal of the visitors, and before the formal proceedings of the conference were entered upon the members were cordially welcomed to the city by the Lord Mayor (Councillor A. J. Reynolds). The chair was occupied by the President (Mr. Charles Bidwell).

The Lord Mayor, in welcoming the Institution to Birmingham, said he recognised the fact that they were a large and important body of gentlemen, whose profession was one requiring expert knowledge of a high order, combined with those other qualifications which went to make the man and the gentleman. He was glad to see that their ideals were high, and that they were endeavouring to attain them. Like the guilds established in London and elsewhere in the Middle Ages they sought in the first place to attain a high technical efficiency with which they endeavoured to incorporate those wider interests which could only be properly obtained by a liberal education in other respects. With this object in view, and to connect their members with the highest educational institutions, they offered facilities for scholarships at the Universities of Cambridge and North Wales, and at Armstrong's College, Newcastle, so as to give their coming members that university and higher education which was rightly considered so valuable an adjunct to the learned professions. While their membership was large, he was glad to see that they did not put their trust in numbers only, but in the qualifications possessed by those who wished to belong to their body, for he found that out of 530 who entered for membership in March the percentage of passes was 64, showing that the examination was framed with the view to maintaining the status of the profession. An important part of the work of the Institution was the

study and discussion of contemplated or actual legislation. He felt it was for the public benefit that an Institution like theirs was able and willing to take up difficult subjects and to discuss them apart from political prejudice.

The President, in acknowledging the welcome, expressed the pleasure it gave the members to visit the metropolis of the Midlands.

History and Development of Birmingham.

Regret was expressed that indisposition prevented Sir Oliver Lodge addressing the Institution on "Afforestation," as had been announced. The first paper read was by Mr. H. A. Pritchard (Deputy Town Clerk) on "The History and Development of Birmingham," in which he gave an interesting account of the growth of Birmingham from a humble hamlet to a world-famed industrial centre. From the hamlet to the village community, concluded Mr. Pritchard, from the village community to the country town, and from the country town to the populous city, they found Birmingham in the early years of the twentieth century the metropolis of the Midlands, and one of four of England's greatest provincial towns. The centre of a large and populous district, she embraced within her own boundaries a population of 545,000 inhabitants, the results of whose industry found a market throughout the world. A glance at her local history, however, illustrated that the records of her principal citizens formed the chief factor in her success and development. A Birmingham man had been described as "of strong individuality, independence of character, facility of resource, and with an enduring love for the old town." The city had not attained her present wealth, dignity, and importance except by the efforts of her leading men. Each in his different sphere had influenced her progress—from Boulton, the resourceful manufacturer, Watt, the inventor, Baskerville, Priestley, Scholefield, Attwood, the reformer, and many others, to the present senior member for the city, whose early

public life and administrative genius were devoted to her welfare with such marked success and fruitful results.

Mr. Pritchard was heartily thanked for his paper.

Professor C. Lapworth followed with a paper, from which it appeared that had it not been for certain geological movements the Birmingham of to-day would have been a very different place from that described by Mr. Pritchard. In the course of his address on "The Economic Geology of the Birmingham Country," Professor Lapworth said the solid floor of the district, like that of every other extended area in Britain, was formed by the edges of the massive rock-sheets that constituted the so-called geological formations. Omitting the complicated little area of the Lickey Hills, there were seven of these formations. If these seven rock-sheets had remained horizontal, as they were originally deposited, the strata of the highest formation, those of the Keuper marl, would to-day have formed a gently undulating lowland like that of Central Warwickshire. The mineral riches of the coal and iron beds of the South Staffordshire coalfield would have remained undiscovered, buried half a mile deep below the surface of the ground. The Birmingham country, instead of being what it was at present, a land remarkably varied in its scenery and productions, inhabited by a teeming manufacturing and mining population, collected in great towns and in the van of industry and progress, might have been a monotonous agricultural region, with a scanty population gathered here and there into quiet little villages—a country peaceful and picturesque it might be, but without progress and almost without a history. But, providentially, the great rock-sheets had not remained horizontal. They had been bent up in the western parts of the district into the dome-like form which was termed the Staffordshire arch, and warped down in the eastern parts into the basin-like form called the Warwickshire trough. They had been broken across and dislocated by the two great crust fractures, which they knew as the western and eastern boundary faults of the South Staffordshire coalfield, and also by a third great fracture, the Birmingham fault, which ran through the city itself. Professor Lapworth described in detail the various geological formations.

Mr. Vernon, in proposing a vote of thanks to Professor Lapworth, referred to the geological advice to surveyors contained in his paper. He said the whole world had had a terrible lesson in geology, and they wanted to know more of the interior of the earth if they were to avoid the dangers of Naples and San Francisco.

Mr. Gilpin Brown (Chairman of the Warwick and Worcester Provincial Committee) seconded the resolution, and it was carried.

Professor Lapworth, acknowledging the resolution, said geology was regarded as a mysterious science, but the riches of Birmingham and the Black Country were questions of geology; in fact, they might say in a general way that geology was at the base of everything.

Overcrowding in Towns.

Mr. John Willmot read a paper on "Proposed Legislation Affecting Real Estate," in which he gave a short epitome of the following Bills:—The Land Valuation (Scotland) Bill, the Public Health Acts Amendment Bill, the Housing of the Working Classes Act Amendment Bill, and the Land Tenure Bill. Dealing with the second named Bill, Mr. Willmot said that in considering the revision of by-laws they would agree with him that due provision should be made to ensure that only such houses were erected as would provide sanitary and wholesome dwellings. This would still be possible even if by-laws were relaxed so as to permit of the use of various kinds of materials in the erection of buildings. He believed that the by-laws should prescribe a minimum size and height for rooms, and the proportion which the area of the window should bear to the floor space. The revision of by-laws on the above lines would admit of the erection of cheaper houses, which would naturally tend to an increase in the building of cottages, and in some rural districts would be of great assistance in keeping the agricultural population upon the land. The remedy for overcrowding in urban districts was, he believed,

to a great extent within the power of the local authorities themselves, and the difficulty could be met by relaxing the by-laws as to the construction of new streets. In agreeing to the construction of less expensive roads, the local authorities might reasonably stipulate for a certain area of land to be allotted to each house. If this were done he felt sure a great step would be taken towards the provision of healthy and wholesome houses for working men at a reasonable cost on the outskirts of the great centres of population where they were often at the present time to urgently required. But so long as the existing cast-iron rules were applied to the construction of all roads, so long would the difficulty of providing cheap and healthy houses for working-men continue. The whole question of building by-laws and by-laws relating to the construction of new streets was a matter which might with advantage be dealt with in a Bill, to be introduced by the Government, the provisions to apply to both urban and rural districts. Dealing with the third mentioned Bill, to enable rural district councils to adopt Part I. of the Act without first obtaining the leave of the county council, the speaker said he was strongly of opinion that local authorities should not be permitted to speculate with the ratepayers' money in carrying out building schemes which would probably result in a loss and a consequent taxation of the ratepayers, some of whom might be erecting cottages to compete with them. There was at the present time plenty of private capital available to erect all the houses required, providing a reasonable return on the capital could be assured. There was no demand or necessity for the Land Tenure Bill, which was likely to interfere with the present pleasant relations between landlord and tenant.

A vote of thanks was accorded Mr. Willmot for his paper. In the short discussion that followed the paper the Land Tenure Bill was strongly condemned, while one speaker described the legislation as "most mischievous and socialistic."

After luncheon, which was served at the Grand Hotel, parties of members visited the Birmingham Sewage Farm, Messrs. Cadburys' model village at Bournville, the Wolseley Motor-car Company's Works at Saltley, Messrs. Elkington's electro-plate works, Messrs. Osler's glass works, the Generating Station of the City Electric Supply Department in Summer-lane, and the new University buildings at Bournbrook.

The Dinner.

In the evening the members dined at the Grand Hotel, under the presidency of Mr. Bidwell. In proposing "The City of Birmingham," Mr. Howard Martin (Vice-President) expressed appreciation of the kind welcome and the generous hospitality they had received in Birmingham.

Mr. H. A. Pritchard (Deputy Town Clerk) responded. He said reference had been made to the efficiency of Birmingham's municipal government, and the proposer of the toast was perfectly right when he said that the men of Birmingham came forward to do their duty to the community to which they belonged.

Mr. William Fraser proposed "Kindred Societies," coupled with the name of Mr. Thomas Cooper (President of the Architects' Society), remarking that Birmingham, so far as architecture was concerned, abounded in good works.

"The Surveyors' Institution" was proposed by Mr. E. Anthony Lees, who said it helped to promote efficiency in the discharge of the duties which were cast upon the members, and anything which tended to efficiency in any branch of human activity must be a source of satisfaction to all who wished for the well-being of their kind.

The President, in replying to the toast, referred to the founding of scholarships by the Institution, and said their object was to educate intending members of the profession and maintain its status.

Other toasts were "The Warwick and Worcester Provincial Committee," proposed by Mr. G. Langridge (Vice-President), and replied to by Mr. W. D. Gilpin Browne, and "The Visitors," proposed by Mr. Arthur Vernon, and acknowledged by the Mayor of Worcester (Mr. H. A. Leicester).

[The preceding Report has been taken from the *Birmingham Post*.]

The annual general meeting of the Institution was held on Monday at No. 12, Great George-street, S.W., Mr. C. Bidwell, President in the chair, when the thirty-eighth annual report of the Council was read by Mr. Alexander Goddard, the Secretary.

The Report stated that the twelve months showed an activity and growth which indicated the continued prosperity of the Institution. The total membership is now 3,876, as compared with 3,719 last year, and 3,560 in 1904. The Council noticed with regret some falling-off in the number of students during the past two years. Having regard to the importance of young men, at the beginning of their business career, being imbued with that spirit which should arise from connexion with an important professional body, they have made the following alterations in the regulations to students, in order that the advantages of enrolment in this class may be made more obvious:—

1. Students to be allowed to make use of the loan library.

2. Students to be allowed to enter for the Preliminary Examination, provided that they have attained the age of 16 years, and make a written statement that it is their intention to follow the profession of a surveyor.

3. Students to be allowed to take the Intermediate Examination between the ages of 21 and 25 (subject to the disabilities mentioned in rule 11 as to competing for students' prizes if over 21½ years), retaining their advantages as to proportion of pass-marks and fees, but ceasing, in accordance with the by-laws, to be students after the age of 2½ years.

4. In case of failure to pass the examination, students' examination fees for subsequent entries, up to the age of 25 years, to be reduced from three to two guineas.

An opportunity having occurred of acquiring the head lease of No. 11, Great George-street, it was thought advisable to take advantage of it, in view of the possibility of the building being needed at some future date for the extension of the Institution premises.

The necessary funds for the purchase were therefore provided from the accumulated account, and the transaction was thus arranged without loss of income.

As to the Preliminary and Professional Examinations, in the Preliminary Examination 106 of the 190 candidates passed, and the percentage was 55.78, against an average of 71.45, and in the Professional Examinations the candidates numbered 535, of whom 349 passed, the percentage being 65.23, against the average of 69.19.

Included among the 535 candidates who sat for the Professional Examinations were thirty-eight who were re-examined in their respective typical subjects. Of these, six were Land Agency candidates, who were all successful; twenty-two Valuation candidates, of whom fifteen were successful; and ten Building and Quantity Surveyor candidates, of whom five passed. Of the 497 new candidates, 323 were successful, while twenty-four Valuation and twenty-nine Building and Quantity candidates failed only in their respective typical subjects, and were referred back for re-examination in those subjects on a future occasion. Included among the 497 new candidates were seven Scottish candidates, examined in Glasgow, of whom six passed, and four Irish candidates, examined in Dublin, all of whom satisfied the examiners.

The prizes in connexion with the examinations of 1906 were awarded as follows:—

The Institution Prize, value 15 guineas, to William Henry Baines, a student candidate in the Building subdivision, who passed at the head of the list with 797 marks, and who also gained

The Penfold Silver Medal, awarded annually for the best marks in the two sections (Student and Non-Student) of the Intermediate Examination, calculated on the basis of their respective pass marks.

The Special Prize, value 10 guineas, to Frederick William Lord, the student candidate next on the list, who obtained 763 marks in the Valuation subdivision of the Intermediate Examination.

The Penfold Gold Medal, to Sidney James Murrell, for the highest total of marks in the Final Examination. This candidate in the Valuation subdivision gained 820 marks out of a possible 1,000.

The Driver Prize, value 15*l.*, to Harry John Venning, who passed at the head of the list of non-student candidates with 808 marks out of 1,000 in the Building subdivision of the Intermediate Examination.

The Beadel Prize, to Gilbert George Symons, a non-student candidate, for the best work (77 per cent. of the maximum marks) in the subject "Agriculture" in the Intermediate Examination.

The Craxter Prize, to Henry Norman Savill, for the highest marks (86 per cent. of maximum) in the subject "Principles and Practice of Valuation" in connexion with the Final Examination.

The Galsworthy Prize, to Herbert Ivie Wykes, a Valuation candidate in the Final Examination. This prize is given annually to the candidate whose marks in the Final Examination, and those gained in the Intermediate Examination for which he entered as a student candidate, combine to form the highest total. The prize-winner's marks were 784 in the Final, and 783 in the previous Intermediate Examination, a total of 1,567 out of a possible 2,000, or 78 per cent.

The Scottish Committee Prize of 10 guineas, to William Rose Young for the best work in connexion with Professional Examinations in Scotland (76 per cent. of full marks).

The Preliminary Prize, to John Batstone, who passed this year at the head of the list of candidates in the Preliminary Examination.

The Council record their sense of deep obligation to those gentlemen who had undertaken the task of setting the work and awarding the marks in the various subjects in connexion with the examinations of 1906. They specially mention the work done, in a purely honorary capacity, by Mr. J. W. Willis Bond, Mr. E. J. Castle, K.C., Mr. R. E. Colann, Mr. J. E. Drower, Mr. H. A. Rigg, and His Honour Judge F. A. Philbrick, K.C., in setting the legal papers; and by Mr. W. Eve, Mr. E. J. Harper, Mr. F. Lee, Mr. F. J. C. May, Mr. C. John Mann, Mr. J. Douglas Mathews, Mr. J. H. Oakley, Mr. J. W. Tyler, and Mr. J. D. Wallis, in the more essentially professional subjects. Among the members of the Council, the following again acted as honorary examiners:—Mr. Daniel Watney, Mr. T. M. Rickman, Mr. A. Vernon, and Mr. H. T. Steward, Past Presidents; Mr. G. Langridge and Mr. J. W. Penfold, Vice-Presidents; and Mr. H. Chatefield Clarke, Mr. E. P. L'Anson, Mr. H. W. D. Theobald, and Mr. J. Henry Sabin. Mr. Percivall Currey again undertook an important professional subject. The cordial thanks of the Council were also due for the valuable co-operation of those provincial members who have rendered such efficient services as examiners and moderators in connexion with the Branch Preliminary and Professional Examinations in Glasgow, Dublin, and Manchester.

The Council reminded members that the first examinations in connexion with the Institution scholarships, tenable at the Universities of Cambridge and North Wales, Bangor, and at the Armstrong College, Newcastle-on-Tyne, will be held about July next at those centres.

The gold medal for the best paper read during the session 1904-5 was awarded to Mr. E. Morten, Barrister-at-Law, for his address on "Surveyors' Reports and Certificates." The winner of the medal the previous year was Mr. J. Smith Hill, Associate, who read a paper on "Agriculture in Cumberland, 1850-1900," at the country meeting held at Newcastle-on-Tyne.

The library had been enriched by the addition of a number of useful works, and an attempt had been made to bring the editions of the many works of reference which it contains up to date. The Council refer to the obligation imposed upon members by by-law 32 to make some contribution to the library within short time of their election to the membership. They would remind those who had not fulfilled this obligation that, on election, they signed a declaration pledging themselves to comply with the by-laws and specifically promising to make some contribution or donation to the library.

The provincial committees have again proved their value to the Institution in advising as to the eligibility of candidates for examination and transfer, and the Council wish to lay special stress upon the importance of their assistance in this respect. It was obvious that in many cases the eligibility of a

candidate could best be judged by members on the spot, who had the means of investigating his professional antecedents and ascertaining his qualifications. It being of the greatest importance to the Institution that only qualified men should be admitted, the Council wished to impress upon all concerned the necessity for special care being taken in examining these applications, to insure that no candidate shall be accepted who does not come fairly within the definition of surveyors laid down in sect. 1 of the by-laws. It was now eighteen years since the provincial committees were first organised, and their existence had been abundantly justified, not only by the assistance they had so willingly rendered in the direction above indicated, but by the opportunity they had afforded of bringing country members and country opinions into closer touch with the central body. As a further means of enabling the Council to come into more direct relations with country members, who, owing to distance from town or other causes, might be unable to attend the meetings or take a direct part in the business of the Institution, they had nominated the provincial chairmen to act with them on one or other of the standing committees.

Another considerable change had been made. Up to the present Professional Associates had no *locus standi* on the provincial committees. With the object, however, of interesting them in the business of their local branches, and thus indirectly in that of the Institution itself, and helping them to realise the responsibilities as well as the advantages of membership, they had been made members of the provincial committees, with full rights of attending meetings and taking part in the discussions. It was hoped that this new departure might have the double effect of increasing the interest in the discussions and business of the committees, and in making the Institution a more intimate factor in the professional life of the younger members.

The Council's scheme of providing, at the expense of the Institution, lecturers of established repute to open discussions at meetings of provincial committees, on subjects of professional interest, had now been in operation for upwards of twelve months, and had been taken advantage of with satisfactory results on four occasions. From inquiries on the subject, which had been received from provincial chairmen, it was evident that a more general response to the Council's offer would have resulted, had it not been for the introduction of the Land Tenure Bill in the House of Commons, which had provided an ample topic for discussion at the local meetings held during the present year. The four lectures which had been given had been valuable in themselves, and had had the effect of stimulating both attendance and discussion at the meetings. The experiment had, during the comparatively short period it had been under trial, proved sufficiently successful to justify its continuance, and the Council would be glad to consider further applications for lecturers on special subjects.

As mentioned in the last annual Report, the London Building Act (Amendment) Bill of 1905, as introduced, aroused such opposition that its promoters decided to abandon all but the clauses dealing with the prevention of fire. The provisions contained in this portion of the Bill were very carefully considered by the Council, and with a view to putting the experience of practical surveyors at the disposal of the Legislature, a number of amendments were drawn up, and the Institution was represented by counsel and witnesses before Committee in both Houses of Parliament. The result of this action was that when the measure received the Royal Assent, it had lost many of the more objectionable provisions which it at first contained, and might, in its present form, be reasonably expected to fulfil the purpose for which it was passed.

The opposition which led to the abandonment of the remainder of the Bill caused its promoters to recognise that, if further amendment of the London Building Acts were to be attempted, it would be necessary to give the matter fresh consideration. To assist them in deciding how practical improvement might best be effected, the Building Committee of the London County Council requested the Surveyors' Institution and kindred professional bodies to give them the advantage of their experience. A special committee was accord-

ingly appointed by the Council, which gave a considerable amount of time and labour to the subject, with the result that a memorandum, pointing out not only the reason for objection to the various proposals in the 1905 Bill, but the manner in which the existing Acts might with advantage be amended, was drawn up and submitted to the County Council.

Although a private member's Bill, the fortune of the ballot enabled the Land Tenure Bill to come up for second reading early in the session, when it was passed by a large majority and, receiving the approval of the Government, was referred to the Grand Committee on Trade. The Council recognised at once that the adoption of the provisions of the Bill would mean a long step in the direction of dual ownership, with its attendant dangers to the agricultural interest, and immediate action was therefore decided upon. The provincial committees were asked to discuss the measure, and to place their views before the Council, while a committee of the Council was set up to consider the Bill clause by clause, and to determine how best it could be amended. A comprehensive memorandum was drawn up by this committee, and the dangers to be anticipated from the measure, together with a number of suggested amendments, were laid before the President of the Board of Agriculture and Fisheries by a strong deputation. Steps were also taken to make Members of Parliament for agricultural constituencies conversant with the opinions held by members of the Institution on the subject. The Bill has been considered by the Grand Committee, and has now been reported to the House, with amendments, for third reading. The Council are pleased to note that many of the objectionable proposals, which at first characterised the Bill, have been eliminated, and in its present form it embodies, with one important exception, the suggestions for improvement which were submitted to the Government in the memorandum drawn up by the Council. The exception referred to is the compensation for disturbance allowed under clause 5, which it is still hoped may be modified before the Bill becomes law.

Another measure which, although confined to Scotland, embraces a principle which, if adopted, would inevitably be extended to the rest of Great Britain, was the Land Values Taxation (Scotland) Bill. After being read a second time in the House of Commons, it had been referred to a Select Committee, and steps were being taken to insure that the Institution should be represented among the witnesses called to give evidence before the Committee. The subject was one of interest to every member of the profession, and the Council felt that the Majority Report of the Royal Commission on Local Taxation, adverse to the proposals for the separate rating of land values, should not be lightly set aside without the Legislature being made thoroughly conversant with the views of those who would, to a great extent, be responsible for carrying out such proposals in practice.

The services of the Institution have also been called upon in connexion with the Royal Commission on Motor-cars, and the Departmental Committee on Small Holdings.

In the case of the former, two members were nominated to give evidence before the Commission. In the latter, the President of the Institution was chosen by the late Minister for Agriculture to form one of the Committee, while other members have given evidence before it. Valuable information was also provided through the provincial committees, replies to a number of questions relative to small holdings being obtained through them from members having experience on this subject.

In response to the appeal for subscriptions towards the presentation of his portrait to Mr. Julian C. Rogers, as some acknowledgment of his many years of arduous work for the Institution as Secretary, the sum of 317*l.* was contributed. Mr. Stanhope A. Forbes, A.R.A., was commissioned to carry out the work, and the portrait, at present on exhibition at the Royal Academy, would be presented to Mr. Rogers at the opening meeting of next session.

The Council are glad to be able to report that the value of the employment register, as to means of securing qualified assistants, has been more fully recognised by senior members during the past year. At the same time, they feel that full advantage is not yet taken of

the facilities offered under this head, and they would strongly urge all members having vacancies for assistants or improvers to apply, in the first place, to the Secretary for particulars of any suitable men whose names appear in the register, and thus to lend a helping hand to fellow-members at the outset of their career.

On the motion of Mr. E. W. Hudson, seconded by Mr. King, the Report was adopted.

A vote of thanks having been accorded to the auditors,

Mr. Mann moved, and Mr. Fowler seconded, a vote of thanks to the President, Vice-President, and other members and Associates of the Council for the able manner in which they had administered the affairs of the Institution during the past year.

The motion was heartily agreed to, and Mr. Bidwell replied on behalf of the Council.

On the motion of the Chairman, seconded by Mr. Martin, the Hon. Secretary, Mr. Percivall Currey, and the Secretary, Mr. Goddard (including the other officers of the Institution), were thanked for their services, and these gentlemen having replied, a vote of thanks was accorded to the scrutineers.

The President then distributed the prizes to the successful candidates in the recent examinations, and on the motion of Mr. Woolley, seconded by Mr. H. Chatfield Clarke, a hearty vote of thanks was accorded to the President.

Mr. Bidwell thanked the members, and then vacated the chair, which was taken by his successor, Mr. Langridge, who thanked the members for electing him.

The meeting then terminated.

THE ARCHITECTURAL ASSOCIATION SUMMER VISITS.

II.—MARSH COURT, STOCKBRIDGE.

On Saturday, the 26th ult., a large party of members of the Architectural Association journeyed to Stockbridge, in Hampshire, to look over an important modern house, Marsh Court, recently completed from designs by Mr. E. L. Lutyens. In the absence of the author, the visitors were directed by Mr. Donovan, representing the contractors, to the different parts of the buildings, and were informed by him upon matters of general concern.

The site is a beautiful one, situated upon the verge of an escarpment of the chalk Downs which characterise the locality. Fine views of a pleasantly-wooded and watered valley are obtained on the south and west borders, and the immediate ground built on falls slightly in the same direction. Full use has been made of the occasion by grasping the natural features of the country and blending them with the design of the house.

Local material is almost entirely used with the exception of certain varieties of stone in external pavings and balustrades. The main part of the house has a plan suggesting an **U** type, with the wings and central entrance facing a large courtyard on the north. This courtyard is paved with stone sets of varying sizes, laid on edge, to an interesting design radiating from a geometric grass parterre. Stone balustrades and steps enclosing small sunk gardens are introduced upon the margins of this courtyard, while on the west side access is provided to a long, wide terrace by large flights of steps possessing considerable architectural character.

A sunk Italian garden is sited on the south front of the house, having high retaining walls of brick, steps, terraces, and pavings in stone and brick, small water basins, fountains, and lead cisterns. The design is skilful, but suggests a garden upon a larger scale, and is in reality the only feature in which a sense of confusion and restlessness obtains. Other garden-work in lawns, pergola, and terraces are charming in effect, and gain much from a broader treatment. Oak seats of a most pleasing design are scattered about the gardens in effective positions.

The walls of the house, although built "hollow," are faced in solid chalk quarried in the locality. The blocks are somewhat small in size, and, as the joints do not readily reveal themselves, there is a strong white glare in the sunny places of the fronts.

Small inlays of roofing tiles and black snapped flints are inserted at distant intervals, and lead up to the brickwork of a chimney, the tiling of a roof, or other feature. Chalk is used in piers, arches, mullions, and transoms; the facing is devoid of texture, but appears to harden well, although on the rainy fronts considerable discoloration has set in, which, it is anticipated, will disappear with age. Local tiles are used upon the roofs, the lines of which are kept very broad and simple. Various devices in the nature of lead flats are resorted to in order to keep down the height and yet maintain the long, low character of the buildings. Great attention is given to the detail of the chimneys, which are varied in form, and built in red brick. Chimneys rising from a chalk-faced projection have elaborate stepping and recessing in small features of brick and roofing-tiles, which produce an idea of gradation from the material of the base to that of the stack.

A simpler manner is seen in the office or east wing; the small inner court in particular is a delightful piece of brick design.

The accommodation provides for a comparatively small number of rooms, especially bedrooms, but the apartments are large, and are arranged at varying levels to suit their respective heights and to conform to the levels of the site. A long gallery on the north side affords access to the principal rooms on the two floors, at the west end of which is the principal staircase. Some rooms are placed in the basement and overlook the Italian garden. The billiard-room is in the west wing, and its chief feature, apart from all the fittings and apparatuses designed by Mr. Lutyens, is the base of the table built up solid in chalk.

The hall, drawing-room, and dining-room face south, and are all admirably fitted up with oak panelling, interspersed with features moulded and carved in chalk. Entrances from the gardens are placed at convenient intervals, and loggias, with brick tile vaulting, provide shelter from the elements.

Almost every structural and decorative detail in the house and offices has been designed by the architect. The greater part of the furniture and fittings are also his work, and the splendid result of his efforts is seen in the fine character and strong personality which pervades the entire work, from a floor-ventilator to a bell-indicator.

Space prevents reference to matters of detail or to the charming detached buildings, such as the electric generating station, stables, farm buildings, and cottages, in all of which the strong sense of a great artistic individuality is always present. Messrs. Cubitt & Co., the builders, are to be congratulated upon the excellence of their work.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Alderman Spicer, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Brompton Borough Council 15,427*l.* for electric lighting purposes; Hammersmith Borough Council 15,000*l.* for street improvement; Islington Borough Council 22,503*l.* for electric lighting purposes; Lambeth Borough Council 10,000*l.* for erection of town hall; and Poplar Borough Council 2,650*l.* for electric lighting purposes. Sanction was also given to Lambeth Borough Council to borrowing 4,088*l.* for paving works.

Bills of Quantities and the Erection of Cottages.—The General Purposes Committee recommended:—

"That paragraph No. A 3 of the order of reference to the Housing of the Working Classes Committee be amended by the addition of the following words:—'And provided that no contract be entered into without the sanction of the Council, the Committee shall, notwithstanding the provisions of standing orders Nos. A 22 and A 23, be authorised, as regards any cottages that the Council may determine to have erected, to obtain from builders tenders for the erection of such cottages without bills of quantities being supplied, and further, to arrange that the contract for such cottages shall provide that payments shall be made fortnightly upon the architect's certificate to the extent of 80 per cent. of the value of the work done; that 15 per cent. shall be paid on the completion of each cottage, and that the remaining 5 per cent. shall be paid within three months after

the completion thereof, subject to the obligation resting upon the contractor in respect of the maintenance of the cottages."

The recommendation was carried after discussion.

By-laws for the Good Rule and Government of the County of London.—The Local Government, Records, and Museums Committee recommended:—

(a) That the following by-laws for the good rule and government of the County of London be made by the Council in pursuance of the provisions of sect. 23 of the Municipal Corporations Act, 1882, and sect. 16 of the Local Government Act, 1883; that the seal of the Council be affixed to three copies of the by-laws; and that, in accordance with the statute, a sealed copy be sent to the Secretary of State for the Home Department:—

"No person shall (1) sweep or otherwise remove from any shop, house, or vehicle into any street any waste-paper, shavings, or other refuse, or being a costermonger, news-vendor, or other street trader, throw down and leave in any street any waste-paper, shavings, or other refuse; (2) throw down and leave in any street, for the purpose of advertising, any bill, placard, or other substance; (3) throw down and leave in any street any bill, placard, or other paper which shall have been torn off or removed from any bill-posting station.

No person shall deposit in any street or public place any refuse, glass, or any other sharp or dangerous article, or any fruit or the leaves or refuse of any vegetable.

No person shall throw, place, or leave any bottle or any broken glass, nail, or other sharp substance (not being road material), on or in any street or public place in such a position as to be likely to cause injury to passengers or animals or damage to property.

In these by-laws the expression 'street' includes any highway, and any road, bridge, lane, path, footway, meadow, square, court, alley, or passage to which the public have a right of way.

Any person who shall offend against any of these by-laws shall be liable for each offence to a fine not exceeding 40*s.*

(b) That the by-laws made by the Council on May 12, 1905, relative to the throwing down in streets of waste-paper, refuse, advertising bills, broken glass, etc., be repealed as from the date on which the above by-laws come into force.

The recommendations were agreed to.
Main Drainage Extension.—The following recommendations of the Main Drainage Committee were agreed to:—

"That the estimate of expenditure on capital account of 146,000*l.*, submitted by the Finance Committee for the construction of the portion of the middle level sewer No. 2 from Old Ford to Queens-road, Shoreditch, and a branch sewer across London-fields connecting this sewer with the existing high-level sewer, such estimate including the cost of supervision, general incidentals, etc., be approved.

That expenditure on capital account not exceeding 140,100*l.* be sanctioned for the construction of the portion of the middle level sewer No. 2 from Old Ford to Queens-road, Shoreditch, and of a branch sewer therefrom to the high-level sewer; that the work be done without the intervention of a contractor, and that the drawings, specifications, quantities, and estimate of 140,100*l.* be referred to the Works Committee for that purpose."

Schools.—The Education Committee recommended:—

"(a) That, whilst placing on record its opinion, that on educational grounds, the average number of children per adult teacher should, on no account be raised, the Council in view of the urgent necessity of increasing school accommodation in various parts of London, do accept the effective accommodation calculated on the basis set forth in the foregoing report as the accommodation for school provision purposes.

(b) That the necessary steps prescribed by sect. 8 (1) and (2) of the Education Act, 1902, be taken with a view to giving public notice, and informing the Board of Education, of the Council's intention:—

(i) To provide a new public elementary school for 800 children for subdivisions Q and X of the Hackney (School Board) division (Bethnal Green, N.E., and Haggerston).

(ii) To provide 500 additional public elementary school places for subdivisions P, Q, R, and S of the East Lambeth (School Board) division by the enlargement of the "Oliver Goldsmith" London County Council school (Camberwell, N.).

(iii) To provide a new public elementary school for 600 children, with power to enlarge for 800, upon the Hortensia-road site (Chelsea).

(iv) To provide a public elementary school for 1,600 children on the Barnsbury Park site (Islington, S.), or, alternatively, a school for 600 children on that site, and a school for 800 children in the north-eastern corner of subdivision AH of the Finsbury (School Board) division (Islington, S.).

(v) To provide 1,200 additional public elementary school places in subdivision A of the Marylebone (School Board) division (St. Pancras, S.).

(vi) To provide additional accommodation for 500 children by the enlargement of the Addison-gardens London County Council school (Finsbury).

(vii) To provide a public elementary school for 600 children, with power to enlarge to 800 on the Sherington-road site (Greenwich).

(viii) To provide a public elementary school for 1,200 children in subdivision Z of the Hackney (School Board) division (Hoxton).

(ix) To erect a public elementary school for 600 children in subdivision T of the Marylebone (School Board) division (St. Pancras, S.).

(x) To erect a public elementary school for 1,000 children in subdivision U of the Marylebone (School Board) division (St. Pancras, S.).

(xi) To enlarge Rhyll-street, London County Council

school (St. Pancras, N.) by the addition of 300 public elementary school places.

(xiii) To provide 600 public elementary school places in the neighbourhood of King's Cross (Holborn).

(xiv) To provide 500 additional public elementary school places in subdivision B43 of the Finsbury (School Board) division (Islington, N.).

(xv) To enlarge the Hungerford-road London County Council school (Islington, W.) by 414 places.

(xvi) To erect a public elementary school with accommodation for 800 children in the neighbourhood of Hopes-road, Lambeth (Kensington).

(xvii) To provide 1,000 additional public elementary school places for subdivision Z of the Chelsea (School Board) division (Kensington, N.).

(xviii) To erect a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xix) To provide 500 additional public elementary school places in subdivision X of the Marylebone (School Board) division (Marylebone, W.).

(xx) To erect a public elementary school for 900 children in the north-eastern part of subdivision O of the Marylebone (School Board) division (Marylebone, W.).

(xxi) To provide a public elementary school for 1,100 children in subdivision F of the Marylebone (School Board) division (Marylebone, W.).

(xxii) To provide a public elementary school with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division (Kensington, N.).

(xxiii) To provide 500 additional public elementary school places by the enlargement of the Fancestrade London County Council school (Newington, W.).

(xxiv) To provide a public elementary school for 500 children in subdivision G of the Marylebone (School Board) division (Paddington, N. and S.).

(xxv) To provide 600 additional public elementary school places for subdivisions A1, A2, A3, A4, A5, A6, A7, A8, A9, B1, B2, B3, B4, B5, B6, B7, B8, B9, B10, B11, B12, B13, B14, B15, B16, B17, B18, B19, B20, B21, B22, B23, B24, B25, B26, B27, B28, B29, B30, B31, B32, B33, B34, B35, B36, B37, B38, B39, B40, B41, B42, B43, B44, B45, B46, B47, B48, B49, B50, B51, B52, B53, B54, B55, B56, B57, B58, B59, B60, B61, B62, B63, B64, B65, B66, B67, B68, B69, B70, B71, B72, B73, B74, B75, B76, B77, B78, B79, B80, B81, B82, B83, B84, B85, B86, B87, B88, B89, B90, B91, B92, B93, B94, B95, B96, B97, B98, B99, B100, B101, B102, B103, B104, B105, B106, B107, B108, B109, B110, B111, B112, B113, B114, B115, B116, B117, B118, B119, B120, B121, B122, B123, B124, B125, B126, B127, B128, B129, B130, B131, B132, B133, B134, B135, B136, B137, B138, B139, B140, B141, B142, B143, B144, B145, B146, B147, B148, B149, B150, B151, B152, B153, B154, B155, B156, B157, B158, B159, B160, B161, B162, B163, B164, B165, B166, B167, B168, B169, B170, B171, B172, B173, B174, B175, B176, B177, B178, B179, B180, B181, B182, B183, B184, B185, B186, B187, B188, B189, B190, B191, B192, B193, B194, B195, B196, B197, B198, B199, B200, B201, B202, B203, B204, B205, B206, B207, B208, B209, B210, B211, B212, B213, B214, B215, B216, B217, B218, B219, B220, B221, B222, B223, B224, B225, B226, B227, B228, B229, B230, B231, B232, B233, B234, B235, B236, B237, B238, B239, B240, B241, B242, B243, B244, B245, B246, B247, B248, B249, B250, B251, B252, B253, B254, B255, B256, B257, B258, B259, B260, B261, B262, B263, B264, B265, B266, B267, B268, B269, B270, B271, B272, B273, B274, B275, B276, B277, B278, B279, B280, B281, B282, B283, B284, B285, B286, B287, B288, B289, B290, B291, B292, B293, B294, B295, B296, B297, B298, B299, B300, B301, B302, B303, B304, B305, B306, B307, B308, B309, B310, B311, B312, B313, B314, B315, B316, B317, B318, B319, B320, B321, B322, B323, B324, B325, B326, B327, B328, B329, B330, B331, B332, B333, B334, B335, B336, B337, B338, B339, B340, B341, B342, B343, B344, B345, B346, B347, B348, B349, B350, B351, B352, B353, B354, B355, B356, B357, B358, B359, B360, B361, B362, B363, B364, B365, B366, B367, B368, B369, B370, B371, B372, B373, B374, B375, B376, B377, B378, B379, B380, B381, B382, B383, B384, B385, B386, B387, B388, B389, B390, B391, B392, B393, B394, B395, B462, B463, B464, B465, B466, B467, B468, B469, B470, B471, B472, B473, B474, B475, B476, B477, B478, B479, B480, B481, B482, B483, B484, B485, B486, B487, B488, B489, B490, B491, B492, B493, B494, B495, B496, B497, B498, B499, B500, B501, B502, B503, B504, B505, B506, B507, B508, B509, B510, B511, B512, B513, B514, B515, B516, B517, B518, B519, B520, B521, B522, B523, B524, B525, B526, B527, B528, B529, B530, B531, B532, B533, B534, B535, B536, B537, B538, B539, B540, B541, B542, B543, B544, B545, B546, B547, B548, B549, B550, B551, B552, B553, B554, B555, B556, B557, B558, B559, B560, B561, B562, B563, B564, B565, B566, B567, B568, B569, B570, B571, B572, B573, B574, B575, B576, B577, B578, B579, B580, B581, B582, B583, B584, B585, B586, B587, B588, B589, B590, B591, B592, B593, B594, B595, B596, B597, B598, B599, B600, B601, B602, B603, B604, B605, B606, B607, B608, B609, B610, B611, B612, B613, B614, B615, B616, B617, B618, B619, B620, B621, B622, B623, B624, B625, B626, B627, B628, B629, B630, B631, B632, B633, B634, B635, B636, B637, B638, B639, B640, B641, B642, B643, B644, B645, B646, B647, B648, B649, B650, B651, B652, B653, B654, B655, B656, B657, B658, B659, B660, B661, B662, B663, B664, B665, B666, B667, B668, B669, B670, B671, B672, B673, B674, B675, B676, B677, B678, B679, B680, B681, B682, B683, B684, B685, B686, B687, B688, B689, B690, B691, B692, B693, B694, B695, B696, B697, B698, B699, B700, B701, B702, B703, B704, B705, B706, B707, B708, B709, B710, B711, B712, B713, B714, B715, B716, B717, B718, B719, B720, B721, B722, B723, B724, B725, B726, B727, B728, B729, B730, B731, B732, B733, B734, B735, B736, B737, B738, B739, B740, B741, B742, B743, B744, B745, B746, B747, B748, B749, B750, B751, B752, B753, B754, B755, B756, B757, B758, B759, B760, B761, B762, B763, B764, B765, B766, B767, B768, B769, B770, B771, B772, B773, B774, B775, B776, B777, B778, B779, B780, B781, B782, B783, B784, B785, B786, B787, B788, B789, B790, B791, B792, B793, B794, B795, B796, B797, B798, B799, B800, B801, B802, B803, B804, B805, B806, B807, B808, B809, B810, B811, B812, B813, B814, B815, B816, B817, B818, B819, B820, B821, B822, B823, B824, B825, B826, B827, B828, B829, B830, B831, B832, B833, B834, B835, B836, B837, B838, B839, B840, B841, B842, B843, B844, B845, B846, B847, B848, B849, B850, B851, B852, B853, B854, B855, B856, B857, B858, B859, B860, B861, B862, B863, B864, B865, B866, B867, B868, B869, B870, B871, B872, B873, B874, B875, B876, B877, B878, B879, B880, B881, B882, B883, B884, B885, B886, B887, B888, B889, B890, B891, B892, B893, B894, B895, B896, B897, B898, B899, B900, B901, B902, B903, B904, B905, B906, B907, B908, B909, B910, B911, B912, B913, B914, B915, B916, B917, B918, B919, B920, B921, B922, B923, B924, B925, B926, B927, B928, B929, B930, B931, B932, B933, B934, B935, B936, B937, B938, B939, B940, B941, B942, B943, B944, B945, B946, B947, B948, B949, B950, B951, B952, B953, B954, B955, B956, B957, B958, B959, B960, B961, B962, B963, B964, B965, B966, B967, B968, B969, B970, B971, B972, B973, B974, B975, B976, B977, B978, B979, B980, B981, B982, B983, B984, B985, B986, B987, B988, B989, B990, B991, B992, B993, B994, B995, B996, B997, B998, B999, B1000.

(xxviii) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xxix) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xxx) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xxxi) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xxxii) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xxxiii) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xxxiv) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xxxv) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xxxvi) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xxxvii) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xxxviii) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xxxix) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xl) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xli) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xlii) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xliiii) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xliv) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xlv) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xlvi) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xlvii) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xlviii) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(xlvix) To provide a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division.

(cl) That the Board of Education be informed of the views contained in the foregoing report relating to the erection of a school for subdivision C of the Tower Hamlets (School Board) division, and T1, T2, and U of the Hackney (School Board) division (Whitechapel), and that they be requested to sanction the erection of a permanent public elementary school for about 600 children on the Buxton-street site (Whitechapel).

The consideration of the recommendations was adjourned.

Tramways.—The Highways Committee recommended as follows:—

"That, subject to a settlement being arrived at with the Islington Metropolitan Borough Council as to the division of the cost for the tramway tracks and margins, and to the approval of the Board of Trade under the London County Tramways (Electrical Power) Act, 1900, being obtained to the system of erection and of reconstruction proposed to be adopted on the tramways, the tender of Robert W. Blackwell & Co., Ltd. amounting to £258,185, 15s. 11d., for the execution of the roadway and the underground conduit system of electric traction, of the tramways from the Angel, Islington, to a point near Highbury (N.L.R.) Station, *via* High Street and Upper-street, be accepted.

That Robert W. Blackwell & Co., Ltd. be allowed to sublet to the undermentioned firms (or to such other persons or firms as may be approved by the chief engineer under the contract) the following portions of the work in connexion with the reconstruction of the tramways between the Angel, Islington, and Highbury (N.L.R.) Station:—(i) to the Anderson Foundry Company, Ltd., of Middlesbrough, the manufacture of the rakes and castings; (ii) to Messrs. Bayliss, Jones, & Baylis, Ltd., of Wolverhampton, the manufacture of the tie-bars, etc.; and (iii) to the Associated Portland Cement Manufacturers, Ltd., the supply of cement; that the said tender be preferred in preference to any other tender standing order No. A 247 relative to sub-letting.

That the manufacture and the fitting of car-paintwork referred to in the contract entered into with the British Westinghouse Electric and Manufacturing Company, Ltd., in pursuance of the resolution of March 6, 1905, for the supply of 150 electrically equipped cars, be executed by staff of the tramways department under the direction of the chief officer of tramways, for a sum not exceeding £500.

That the seven electrical equipments referred to in the contract entered into with Jessop & Appleby Bros. (Leicester and London), Ltd., in pursuance of the resolution of April 10, 1905, for the supply of seven electrical equipments, be obtained from the British Westinghouse Electric and Manufacturing Company, Ltd., as an extension of the contracts entered into with that firm in pursuance of the resolutions of July 25, 1905, and March 6, 1906, at a cost not exceeding £379½."

The recommendations were agreed to.

List of Rates of Wages and Hours of

Labour.—The Works Committee reported as follows, the recommendation being agreed to:—"A working rule agreement has been arrived at between the London Master Builders' Association and the National Association of Operative Plasterers (London District), and it is necessary that the hours of labour of plasterers inserted in the Council's list of rates of wages and hours of labour should be amended in accordance with the agreement. We recommend that the Council's list of rates of wages and hours of labour be amended so as to provide that the hours of labour of plasterers, during thirteen weeks after the second Monday in November, shall be forty-four a week."

The Council adjourned at nine o'clock for the Whitsun recess.

APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

St. George, Hanover-square.—A projecting porch and four projecting balconies in front of No. 17, Hill-street, Berkeley-square (Messrs. Hindley & Wilkinson for Mr. C. Rube).—Consent.

Westminster.—A building at the corner of Horseferry-road and Elverton-street, Westminster (Mr. D. B. Helderwick for the Board of Officers of the Westminster Dragoons).—Consent.

Marylebone, West.—An open portico in front of No. 76, Upper Berkeley-street, St. Marylebone (Mr. T. Henwood, jun., for Mrs. B. Cohen).—Consent.

Clapham.—That the application of Mr. H. G. Hills for the Wandsworth Metropolitan Borough Council, for an extension of the periods within which the erection of buildings on a site abutting upon the south side of Clapham Park-road, and the east side of Park-hill, Clapham, was required to be commenced and completed, be granted.—Consent.

Norwood.—Porches to Nos. 57 to 75 (odd numbers only) inclusive, Frankfort-road, Herne-hill (Mr. F. L. Goldard).—Consent.

St. George, Hanover-square.—Three houses on the site of Nos. 11, 12, 13, and 14, Hubart-place, St. George, Hanover-square (Messrs. Bochmer & Gibbs for Messrs. G. Trollope & Sons and Colls & Sons, Ltd.).—Consent.

Peckham.—A osteo-therapy shop in front of No. 134, Queen's-road, Peckham (Mr. J. E. Murch).—Refused.

Chelsea.—Buildings on the south-eastern side of Fulham-road, Chelsea, to abut also upon College-street and Kimbolton-row (Messrs. Elms & Jupp for Mr. E. Bingham and Messrs. T. Crapper & Co., Ltd.).—Refused.

Width of Way.

Camberwell, North.—Two houses on a site on the east side of Elmington-road, Camberwell, with the forecourt fences at less than the prescribed distance from the centre of the roadway of the street (Mr. W. M. Proudfoot for Mr. S. F. Cope).—Consent.

Kensington, North.—A working-class dwelling on the southern side of Thomas-place, Kensington (Mr. W. C. Leste for the Kensington Royal Borough Council).—Consent.

Kensington, South.—The retention of an iron forecourt railing in front of No. 22, Aubrey-walk, Kensington, at less than the prescribed distance from the centre of the roadway of the street (Mr. F. Selby for Mr. A. Withers).—Consent.

Width of Way and Lines of Frontage.

Dulwich.—Four houses with porches on the southern side of Love-walk, Camberwell, westward of No. 1 (Mr. A. E. Mallins for Mr. J. Ham).—Consent.

Woolwich.—Buildings on the eastern side of Blendon-road, Plumstead, northward of Wernbrook-street (Mr. J. Wernham).—Consent.

Width of Way and Space at Rear.

Whitechapel.—The re-erection of Nos. 21, 22, and 23, Great Pearl-street, Spitalfields, at less than the prescribed distance from the centre of the roadway of Great Pearl-street, and with an irregular open space at the rear of No. 23 (Mr. W. Gilbert for Mr. A. Wearing).—Consent.

Width of Way, Frontage, and Construction.

Kensington, North.—The retention of a building at the rear of No. 124, Holland Park-avenue, Kensington, abutting upon Princess-road (Mr. S. J. B. Stanton for the Holland Park Motor Company).—Refused.

Formation of Streets.

Woolwich.—(a) A deviation from the plans approved on November 7, 1899, for the formation of new streets on the Suffolk-place farm and Bostal farm, Abbey-wood, Plumstead, so far as relates to an alteration in the position of Conference-road (Mr. W. B. Sheppard for the Royal Arsenal Co-operative Society, Ltd.).—(b) That the Council do consent to the application of Mr. T. G. Arnold for the Royal Arsenal Co-operative Society, Ltd., for an extension of the time within which the formation or laying out of new streets on the Suffolk-place farm and Bostal farm, Abbey-wood, Plumstead, was to have been completed.—Consent.

Hampstead.—That an order be issued to Messrs. Farbrother, Pills & Co., sanctioning the formation or laying out of a new street for carriage traffic to lead from Frogland-lane to Barby-avenue, Hampstead (for Sir Spencer P. M. Maryon-Wilson, Bnt.).—Consent.

Fulham.—That an order be issued to Messrs. Dalgrave & Co., sanctioning the formation or laying out of a street, to be used for the formation of foot traffic only, on the site of Nos. 619 to 631, Fulham-road, Fulham, and in connexion therewith the erection of buildings).—Consent.

Buildings for the Supply of Electricity.

St. Pancras, East.—The construction of an ash hopper, dust screen to ash hopper, exhaust steam pipe from turbines and dust screen to the coal conveyors at the Peat-street generating station, Camden Town (Mr. S. W. Baynes for St. Pancras Metropolitan Borough Council).—Consent.

Paddington, North.—A sub-station on the southern side of Rendolph-mews, Portofolow-road, Paddington (the Metropolitan Electric Supply Company, Ltd.).—Consent.

The applications marked † are contrary to the views of the local authorities.

THE LONDON SANITARY INSTITUTE: MEETING AT BOURNEMOUTH.

A PROVINCIAL sessional meeting of the Royal Sanitary Institute was held at Bournemouth on Saturday last week. The Chairman of the Council of the Institute (Colonel J. Lane Nutter) presided over a fair attendance of members. The Mayor of Bournemouth (Alderman J. A. Parsons) extended a hearty welcome to the members.

Dr. Philip W. G. Nunn (Medical Officer of Health for Bournemouth) read a paper on "Sanitary Administration in a Health Resort," which dealt mainly with the sanitary conditions prevailing under the municipality at Bournemouth. In the course of a discussion which followed, Dr. Groves (Isle of Wight) insisted that every man residing in a district governed by a local authority had the right to demand the sanitary conditions which the law afforded him, but in a health resort they had to do more than that, they had to recognise the sentiment of hospitality, that visitors were their guests, and if Christianity did not prompt them at least their sense of honour ought to make them see that people were not put to any disadvantage in the places which they visited. Dr. W. B. Barclay (Weymouth) argued that the social and moral welfare of the people was as important as the sanitary administration of a town. He consequently favoured Sunday being made a day of rational amusement. Hygiene and sanitary administration should, he said, be taught in a practical as well as a theoretical manner in all their schools. Dealing with the dust problem, he attributed the spread of diseases largely to the insanitary evils created by motor-cars on the roads. He had been struck by the absolute overcrowding which occurred in health resorts. He advocated compulsory inspection of every lodging-house by the sanitary authorities. The Chairman said that every municipality should have an abattoir, and argued that the same remarks with reference to milk supply applied to the sale of meat. At the conclusion of the discussion the members adjourned to the Royal Bath Hotel for luncheon, and during the afternoon, at the invitation of the Mayor and Corporation, they proceeded for a drive to the principal parts of the town, visiting the Sanitary Hospital and Royal Boscombe and West Hants Hospital.

MOUNT ZION BAPTIST CHAPEL, RAMSGATE.—This chapel has just been reopened after having been renovated. Mr. Stanley H. Page has been the architect, and the contractors have been Messrs. Jannin Brothers.

Spac at Rear.

Paddington, South.—Buildings on the eastern side of Richmond-road, Paddington, on the space at the rear of No. 112, Westbourne-grove (Mr. J. A. L. Gimblette).—Refused.

Archaeological Societies.

SUSSEX ARCHÆOLOGICAL SOCIETY.—A special meeting of the Sussex Archaeological Society was held at Lewes Town Hall on the 25th ult. It was convened to "discuss the plans and estimated cost of building the proposed new library and museum in the 'Gun Garden' adjoining Lewes Castle." The Chairman was the Rev. Canon J. H. Cooper, who prefaced the discussion with a few details, which were supplemented by Mr. Reginald Blaker, in regard to the history of the problem to date. Briefly it may be stated that in 1903 the Society learned that the house at Lewes Castle, occupied for nearly twenty years, had been sold without any intimation being given to them, and the fact necessitated the provision of suitable premises elsewhere. In December of that year a committee was formed, and, to secure for the Society access to the castle, what is now known as the "Gun Garden" was acquired. It was upon this site that a proposal to erect a museum and library gained favour in some quarters. Plans were prepared for a "simple two-storied building," containing a museum and a strong room for valuable MSS., etc., on the ground floor, and a well-lighted library and study above, with a convenient residence for a caretaker. The cost of this building, with necessary furniture, it was estimated would probably reach, if not exceed, 3,000*l.* It was apparent to all who attended a general meeting of the Society last March that there was no unanimity of opinion on the subject, several of the members being averse to the erection of a building on the "Garden" site. On the question of expense, the Chairman mentioned that the Society now had a membership of several hundreds, and the subscriptions towards the estimated cost of the new project, given for two years, would not average more than 3*l.* or 4*l.* He emphasised the essentiality of securing access to the castle, supporting his contention, from a monetary point of view, by mentioning that something like 150*l.* per annum was derived from fees for admission paid by visitors, though last year, he added, he believed there were 200 less visitors than the year before, in consequence of the museum's removal, and they only took 115*l.* The Society, he added, had a valuable museum, but it was housed very badly.—Pro forma, as he explained, the Rev. W. Hudson then moved, "That the plans and estimates now submitted be approved, and that the Council be requested to proceed with the work." This was seconded by Mr. Salzmann, and a lengthy discussion ensued. Mr. C. E. Clayton described the proposal to erect a building on the "Gun Garden" site as "an act of vandalism of a monstrous and extraordinary nature." He asked the members to record in the most unmistakable manner their opinion that to erect any building whatever, even if it were to be only the height of a chair, in the "Gun Garden" was a distinct error, not only of judgment, but one of those things that no Archaeological Society should countenance. He did not think as many as fifty members would offer a subscription to defray the cost if that scheme were carried into effect.—After a good deal of discussion, the Chairman asked for a show of hands on the motion. No one supported the proposal, and it was rejected by what appeared to be an almost unanimous vote. Subsequently Mr. Griffith proposed the following resolution:—"That the Council be requested to make inquiries into the best method of making the library and collection of prints and collections belonging to the Society conveniently available for the members, without undue expense to the Society, and report to the first general meeting to be held next year. Mr. Somers Clarke seconded, whereupon Mr. Aubrey Hillman moved, as an amendment, the insertion of the words "at a site in Lewes" in the resolution to follow the phrase "conveniently available." He maintained that they should keep the library at Lewes and prevent it going to Brighton. Alderman Wightman, who seconded the amendment, impressed upon the meeting that Lewes was more suitable than Brighton for the library of the Society. The amendment was carried, and the resolution, as altered, adopted.—Abstracted from a report in the *Sussex Daily News*.

Fifty Years Ago.

FROM THE *Builder* OF MAY 31, 1856.

If London were built throughout in the so-so character of the larger portion of its vast extent; if there were no fine squares, no gardens and lawns, no commanding buildings and places (or piazzas), then we should not have so much to deplore the original laying-out of the streets, ranging, as they do, in all directions but the rectangular. The central quarters even are nearly all obnoxious to the same objection; the nearer the Temple or the Royal Court, the worse the lanes, the greater the "bizarreness" of both buildings and arrangements, and the more contemptible the public! Near Gray's-inn, Leather-lane, Baldwin's gardens, with other familiar places, are too well-known; near the Temple, Essex-street is the most respectable avenue; near St. Paul's, Paternoster-row, Ave Maria-lane, Amen-corner, etc., etc., keep up at a respectful distance the invariable characteristic of the ancient cathedral, viz., a plea "ad misericordiam," for mundane externals; near St. Mary's-le-Strand, and close upon St. Clement's Dunes, *Holywell-street* marks again the sanctuary—the place formerly resorted to for its living waters, is no longer the fountain of health or of piety; but near Lincoln's-inn-fields—how shall we describe the sinuosities, the complexity, and the filth which block up and degrade the very heart of the metropolis? Here is the largest and best situated of our squares (offering a causeway leading direct between the two great arteries of Oxford-street and the Strand) comparatively useless and deserted; it runs nearly half-way between both, and yet there is no advantage taken of the easement it offers for a grand traverse street.

A line drawn southward from it, on the west side, would cut the dens of Clare market and street, Vere-street, Duke-street, and other *deles*, and issue out not far from the front of Somerset House, by Newcastle-street eastward of St. Mary's-le-Strand.

A little violence might be done to the end of the venerable stack of Holywell-street, one house at the end of which block should come down, to make an appropriate opening; and in continuation large clearances should be made through Clare-market and the vicinal heaps of dingy houses, which seem to have been accidentally ranged as a sort of maze to amuse the special pleaders who formerly occupied New-inn, Lyon's-inn, and all the other ins as well as outs of the region.

LONDON BUILDING ACT TRIBUNAL OF APPEAL.

MARWOOD v. LONDON COUNTY COUNCIL.

ON Monday the Tribunal of Appeal continued the hearing of the appeal by Mr. Francis P. Marwood against the certificate of the Superintending Architect of Metropolitan Buildings defining the general line of buildings on the east side of Gliddon-road, Fulham, between Edith-road and the Metropolitan District Railway, and further defining the general line of buildings on the south side of Talgarth-road, Fulham, between the building known as No. 83 in that road, and Gliddon-road. Mr. Schiller appeared for the appellant, and Mr. A. Moresby White for the respondents. The facts of the case, briefly stated, are as follows. Over twenty years ago a building estate was developed which was bounded on one side by the Metropolitan District Railway, and the Talgarth-road, which runs parallel with the railway, was constructed. Gliddon-road was subsequently constructed, and ran at right angles with the Talgarth-road. For a time Gliddon-road was a *cul de sac*, as a wall along one side of Talgarth-road blocked it. Subsequently it was decided to develop the land on the other side of the Metropolitan District Railway, and to do this a bridge was built over the railway, just opposite the Gliddon-road, and the wall which blocked the mouth of Gliddon-road was removed, so that apparently the bridge became a continuation of Gliddon-road. The appellant has erected a block of flats on the approach to the bridge, so that the buildings front the bridge approach on one side and Talgarth-road on the other, and he contended that the bridge and approach formed no part of Gliddon-road, and was never intended to be a continuation of it, and that in fact it was called St. Paul's Bridge until it was renamed Gliddon-road Bridge by the London County Council. The Superintending Architect, however, in fixing the building line took the line of the existing houses in Gliddon-road, and continued it across Talgarth-road, and

applied it to the bridge approach (on which the flats are built) as being part of Gliddon-road, with the result that if the line was adhered to the appellant would have to set back his buildings several feet.

After hearing a considerable amount of evidence, the Tribunal decided to vary the certificate of the Superintending Architect, and found that there was no general line of buildings on the east side of the road between Talgarth-road and the Metropolitan Railway, and that the building marked A on the plan attached to the certificate was situated in Talgarth-road.

The effect of this decision is that the bridge is found not to be a continuation of Gliddon-road, and consequently the appellant will not have to pull down his building. Fronting Talgarth-road, however, there are several bay windows going up three stories, which project over the building line, and these will have to be removed unless the consent of the London County Council is obtained for their retention.

Illustrations.

DESIGN FOR THE PROPOSED PEACE PALACE.

WE devote our illustration plates this week to the fine design for the proposed Peace Palace at The Hague which was sent in by Mr. H. T. Hare, which we venture to think will not be found to be surpassed, in combined architectural and practical character, by any of the designs which have been submitted.

The plan unites the two portions of the programme, the Palace and the Library, in one architectural composition. The interior services are, however, entirely independent and distinct, and can be used separately.

The plans given on one of the sheets, though to a small scale, sufficiently explain the general arrangement of the building. The book-storage department has been arranged on a curved line, which suits well with its requirements, and at the same time makes an effective feature in the rear elevation of the building.

In regard to materials, it was intended to build the whole of the exterior façades in stone to be afterwards selected; the floors to be all of fireproof construction, and the roofs and cornices covered with asphalt, except the dome, which would be roofed with lead. The interior of the grand vestibule was to be finished in marble on the walls and floors; the floors of other apartments, as well as all other woodwork in them, to be of oak; the ceilings of the large rooms in decorative plaster-work, with spaces prepared for ceiling paintings.

The heating was intended to be by hot-water radiators in the principal apartments, to which fresh and partially-warmed air would be introduced by electrically-driven fans, the same method being used for extraction.

The author's estimate for the cost of the building, independently of the laying-out of the land and of some of the more important sculptural decorations, is 1,520,000 forins (about 150,000*l.* in English currency).

The drawings were got up and finished by Mr. Fulton, whose valuable assistance in this respect Mr. Hare is glad to acknowledge.

MISSION CHURCH, GATESHEAD.—The foundation-stone of St. Cuthbert's Mission Church and Parochial Hall, which is to be erected in Rawlins-road, Bensham, in connexion with the St. Cuthbert's Parish Church, Gateshead, was laid on the 18th ult. The buildings, which comprise a mission church, 40 ft. 9 in. by 31 ft. 3 in., and a parish hall, 48 ft. 6 in. by 40 ft. 9 in., are situated at Rawlins-road, Bensham. Adjoining the hall at the back are two class-rooms and a kitchen. The main hall of the church is separated by a movable partition, so that the two can be readily thrown together to form one large hall 79 ft. 7 in. long and 40 ft. 9 in. wide. The vestry is placed at the west end of the church, and adjoins the main entrance porch, which is so arranged as to be the principal approach to both church and hall. The walls are of brick, with red pressed facings and red terra-cotta dressings, and the roofs, which are open inside, will be covered with slates. Extra lighting and ventilation in the roof of the hall is obtained by large dormer windows. The contractor for the whole of the work is Mr. Wm. Hall, of Gateshead; and the architects are Messrs. J. W. Frazer & Corking, of Newcastle and Gateshead.

Correspondence.

"ARCHITECTS AND DECORATION."

Sir,—The interesting extract from the *Builder* of May 24, 1896, which you publish in your last week's issue under the above heading, shows that even so far back as, and in such a generally artless and tasteless age as, the "fifties," the "decorator" had fastened with his octopus-like tentacles upon the legitimate preserves and province of the architect, but certainly not to the extent which obtains to-day.

History repeats itself, and practically the whole of the article could with truth be applied to present-time conditions, with the exception that there are scores of architects who are capable of devising schemes for decoration, while there were comparatively very few able to do so in an equally satisfactory manner fifty years ago.

Competition is not confined nowadays to one's own profession, but the architect's province is invaded on all sides by provision, drapery, furnishing, building, and other firms who undertake every branch of an architect's duties, and being able to keep up large and attractive establishments, and having the great advantage of advertising, attract a large amount of architectural business. These firms frequently do their best to oust any architect who may have been previously called in, and the client is tempted by the plausible title of the "universal supply" decorator that he has an architectural and decorative staff who can undertake all the work required, and thus there is really no need to employ an architect, whose fees can thus be saved!

The estate agent with an "architectural" branch is another source of unfair competition, as he can and does advertise extensively. Surveyors, also, to municipal and educational authorities deprive (not, of course, willfully) their professional brethren of work which should legitimately be allocated to the latter.

All these sources of competition are undoubtedly having a disastrous effect upon our profession, as is evidenced by your advertisement columns of "situations vacant and wanted." They are a very good index of the state of the architectural labour market.

I should be glad if somebody could suggest even a partial remedy.

ARTHUR R. MAYSTON.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XXI.

THE SLIDE-RULE IN TECHNICAL CALCULATIONS.

IN preceding articles we explained the manner in which the slide-rule is applied to the operations of multiplication and division, and we also pointed out in general terms the manner in which the instrument is applied to the processes of involution and evolution.

We now illustrate the various methods of using the slide-rule, and indicate some devices by whose aid results can be obtained with a minimum expenditure of time and to the maximum possible degree of accuracy. As in previous chapters, attention is confined to the ordinary 10-in. rule, of which Fig. 16 may be taken as a typical illustration.

Proportion.

Rule (1).—Set the first term on B or C opposite to the second term on A or D, and opposite the third term on B or C read the fourth term on A or D.

Example (1): Find the value of x in the proportion $20 : 17 :: 8.825 : x$.

Using scales C and D, move C to the left so that 2 comes over 17, and below 8825 on C read 75 on D. Inserting the decimal point at the proper place, we have $x = 7.5$.

Using scales A and B and regarding them as indicating numbers from 1 to 100, the same result is obtained by moving B to the left and reading the result on the right-hand portion of A, or regarding each of them as containing two scales from 1 to 10 by moving B to the left or the right, and reading the result on the left-hand or right-hand portion of A, as the case may be.

By simple modifications of Rule (1) any unknown term can be obtained from the three other terms of a proportion.

Rule (1a).—To find the first term of a proportion, set the third term on B or C opposite the fourth term on A or D, and opposite the second term on A or D read the first term on B or C.

Rule (1b).—To find the second term of a proportion, proceed as in Rule (1a), and opposite the first term on B or C read the second term on A or D.

Rule (1c).—To find the third term of a proportion, set the first term on B or C opposite the second term on A or D, and opposite the fourth term on A or D read the third term on B or C.

As a result of the constant relations obtaining between the values on each pair of scales, the value of the ratio $20 : 17$ in Example (1) is shown, when the slide is moved to the left, at the right-hand index of the slide as 0.85, the reciprocal being given at the left-hand index of the body as 1.176+. If the slide is moved to the right, the value of the ratio and of its reciprocal will be found at the converse indices.

This property of the slide-rule can be utilised in obtaining equivalents for any ratios required in practice, and for converting vulgar to decimal fractions, or *vice versa*.

Example (2): Arrange the rule so as to constitute a table giving all decimal equivalents of a foot.

Set 12 on C over the L.H. index of D. We can now read directly on D the decimal equivalent of any part of a foot expressed on C in inches, or in inches and parts of an inch which can be easily converted to decimals, such as $1\frac{1}{2}$ in., $1\frac{1}{4}$ in., $1\frac{3}{8}$ in., and so on.

The slide-rule finds one of its most valuable applications in the conversion of various measurements from one system to another, and it is really astonishing that so many architects and engineers still deny themselves the advantages of the wonderful facilities it offers in this way.

To enable the operator to utilise to the fullest extent the valuable property of the rule as a conversion scale, tables of constants are necessary, such as those contained in Tables IV. to VII. and in all pocket-books of data for architects and engineers.

Some frequently-employed constants are indicated on the scales of the rule, but the positions of all others have to be found. As most conversion factors comprise three, and some four, significant figures, it is not always easy to determine the correct place on the scale chosen.

For example, no one could determine correctly the value of a radian = 57.2957796° , or even the approximate value 57.3° . Therefore the ratio $1 : 57.3$ is difficult to set exactly on the scale. But if we take $\frac{1 \times 3}{57.3 \times 3} = \frac{3}{171.9}$ there is no trouble in setting the slide with a very close approach to exactitude, for setting 3 on C over 171.9 on D is equivalent to setting 1 on C over 57.3 on D.

Similar treatment can be applied to all other factors where it seems to be desirable, not only to conversion factors, but to those used in ordinary calculations. In the particular case cited above, however, the constant ρ , marked on scales C and D affords ready means of obtaining what is practically the exact value, for $0.63662 \times 90 = 57.2958$.

Hence the latter can be obtained by setting the R.H. index of C opposite ρ , and placing the cursor on 57.2958 opposite 9 on D. It does not matter in the least that the value cannot be correctly read, because the time for reading only comes when the final result of any calculation has been found.

If scales A and B are used for conversions, all required results from any given constant can be read without further adjustment. The only drawback to the employment of

these scales is the impossibility of obtaining exact readings to more than two or three significant figures, according to position on the scale where the results occur.

In using scales C and D for conversions, it always happens that part of scale C projects beyond one end or the other of scale D. To obtain readings from such portions of C, the cursor must be placed so that the hair-line is over that index which is within the length of Scale D; the slide must next be moved until its other index comes below the hair-line, and the required values can then be read.

Multiplication.

Scales C and D.—In Article XIX. the method of performing multiplication by means of scales C and D was explained sufficiently to make further reference unnecessary with regard to this particular application of the slide-rule.

Scales A and B.—When scales A and B are employed for which is within the length of the product is as follows:—

Rule (2).—Moving the slide towards the right, if the product is read on the left-hand portion of scale A, the number of digits is one fewer than the number of digits in the two factors. If the product is read on the right-hand portion of scale A, the number of digits in the product is equal to the number of digits in the two factors.

This rule is applicable to decimal fractions as well as to whole numbers by bearing in mind that in any factor which is a decimal fraction the number of digits must be taken as 0 or a minus quantity, according to the number of ciphers immediately following the decimal point.

Thus: the number of digits in $1 = 0$, in $.01 = -1$, in $.001 = -2$, and so on.

In other respects the process of multiplication is performed exactly as if scales C and D were employed. The use of scales A and B carries the advantage that all results can be read on scale A without the necessity for any adjustment of the slide after it has once been set in the proper position, for if one end projects so as to throw some of the figures on scale D beyond one end of scale A the result can be read on the other half of the same scale.

The only disadvantage of the upper scales is that the smaller intervals of graduation do not give results so accurately as the more extended graduation of scale C and D. Consequently, when saving of time is a more important factor than minute accuracy, scales A and B should be employed. Under converse conditions scales C and D are certainly preferable.

Inverted Slide.—In Article XIX. we explained briefly the effect of inverting one of the two scales then under consideration.

When the slide of a slide-rule is inverted, as shown in Fig. 19, the scale C adjoins scale A, and scale B adjoins scale D. In this inverted position the two scales of the slide can be conveniently designated as B' and C' to facilitate reference.

At first it is somewhat confusing to read figures upside down, but a little practice soon gives facility, and the cursor enables the operator to make exact reference of the figures on one scale to those on the other.

Examination of Fig. 19 shows that the product of every number on D by the number opposite to it on C' has the constant value 10, and the same condition is found when scales A and B' are examined.

Therefore if the values of all the figures on scales B' and C' are considered to be divided by 10, they are the reciprocals of the figures opposite to them on scales A and D, and *vice versa*.

For instance, on each pair of scales, reading in order A to B' and D to C', 2 is opposite 0.5, 3 to 0.33, 4 to 0.25, 5 to 0.2, and so on.

As pointed out in Article XIX., the inverted slide can be used for multiplication, but in that case unless the process is conducted like division the results will be equivalent to quotients, because the reciprocals of all numbers are necessarily employed as factors.

To obtain the product of any two numbers, we must proceed, as in division, by setting the multiplier opposite the multiplicand, and the product will be read opposite one index of the slide.

FIG. 19

Illustration to Student's Column.

The rule for the number of digits in the product is as follows:—

Rule (3).—If the product is read on the left-hand portion of scale A, the number of digits is equal to the number of digits in the two factors. If the product is read on the right-hand portion of scale A, the number of digits is one fewer than the number of digits in the two factors.

Example (3).—Multiply 48 by 3.

Set 3 on B' opposite 48 on A, and read 144 on A over L.H. index of B'. The number of digits in the product by Rule (3) is $(1+2) = 3$. Therefore the product = 144.

Before disturbing the rule as adjusted for Example (3) the relations of all coincident figures on scales A and B' should be examined. It will be found that every value on A multiplied by the value opposite to it on B' gives the constant product 144.

The property of the slide-rule thus revealed can be most usefully applied to the determination of different factors for any number. Example (4) illustrates one out of many directions in which this property can be employed to save time in practical work.

Example (4).—Find alternative dimensions of width and length for a tank to hold 900 gals. of water, $900 \div 6.23 = 144$ cubic ft., the depth of the tank to be 3 ft.

Set L.H. index of B' to 144 on A; opposite 3 on B' read 48 on A; set L.H. index of B' opposite 48 on A; then opposite various widths on B' read corresponding lengths on A.

This:

Width 3 ft. 3.5 ft. 4 ft. 5 ft. 6 ft. 6.23 ft. Length 16 ft. 13.7 ft. 12 ft. 9.6 ft. 8 ft. 6.93 ft.

Successive Multiplication.—When processes of multiplication have to be performed one after another no intermediate readings are necessary, as each product can be marked by the hair-line of the cursor as a basis for the next following multiplication.

The only matter requiring special attention is to settle the number of digits, or to adjust the position of the decimal point in the product at the end of the calculation.

Scales C and D are generally used for successive multiplications, because the rule for settling the number of figures in the product is more simple than that necessary for a similar purpose if scales A and B are employed.

To obtain the correct number of digits in the final product we have merely to take the sum of the digits in the factors and to deduct one digit for every time the slide is used projecting to the right hand.

Example (5).—Find the value of $3.6 \times 43 \times 0.075 \times 55 \times 190$.

(1) Set the R.H. index of C to 56 on D, and bring the cursor to 45 on C; (2) set the R.H. index of C to the cursor, and bring the cursor to 75 on C; (3) set the L.H. index of C to the cursor, and bring the cursor to 55 on C; (4) set the R.H. index of C to the cursor, and below 19 on C read 1215.

There are $(1+2-1+2+3) = 7$ digits in the factors, and as the slide only projected to the right in setting (3), the number of digits in the product is $7-1 = 6$. Therefore the required value is 121,500, which is very near to the exact product 121,524.5 obtained by arithmetic.

BANK PREMISES, BUSHEY.—New premises have been erected in High-street, Bushey, by Messrs. Brighton, Watford, for the London and South Western Bank, Ltd., to the plans by Mr. C. L. Morgan, London. The building is three stories high, and the front elevation is faced with a dark polished granite.

Obituary.

ALDERMAN JAMES TUNSTALL.—Alderman James Tunstall died on the 24th ult. at his residence, Wilton Lodge, Palatine-road, Withington, Manchester. The deceased erected a large number of working-class dwellings, including more than fifteen hundred houses in Beswick alone, and groups of others in Longsight, Plymouth-grove, Greenheys, and other localities.

General Building News.

CHURCH, SOUTH TWERTON.—The foundation-stone has just been laid of a new church which is being erected at South Twerton. The work is being carried out from the plans of Mr. H. O. Buckle, the Diocesan Architect.

CONGREGATIONAL CHURCH, IPSWICH.—The foundation-stone of a new Congregational Church in St. John's, Ipswich, was laid recently by Mr. D. Ford Goddard, M.P. The architect is Mr. Edward H. Collier, of Ipswich, and his design is for a structure in the Gothic style, to be erected in red brick with stone dressings.

CONGREGATIONAL CHURCH, HOYLAKE.—The new Congregational Church at Hoylake was opened a short time ago. The building will accommodate a congregation of about 450. The architects were Messrs. Douglas & Minshull, and the contractor was Mr. James Merritt, of Birkenhead.

PRIMITIVE METHODIST SUNDAY-SCHOOL, WALKER.—A new Sunday-school is being erected in Welbeck-road, Walker, in connexion with the Walker Primitive Methodist Church. The new building will be built of brick, with stone facings, and will have an assembly hall 53 ft. long by 31 ft. wide, with four class-rooms running down the side. In this hall there will be a platform and organ. Behind this will be a lecture-room, class-room, kitchen, lavatory, etc., with heating chamber below the garden. The building has been designed by Messrs. Davidson & Phillipson, Newcastle, and the contractor for the work is Mr. John Hutchinson, Newcastle. The probable cost of the building, including the furniture, will be 1,800.

FREE METHODIST CHURCH, WALLSEND.—The new United Methodist Free Church in Buddle-street, Wallsend, has just been opened. The principal entrances are on the south front in Biddle-street, giving access also to the vestibules with cloak-rooms. East and west of the vestibules are the staircases to the galleries. The western staircase being carried up as a tower. The organ chamber and choir gallery are placed at the north end of the church immediately behind the pulpit. On the ground floor there are vestries for minister and stewards, parlour and class-room, and on the first floor at the rear of the church are rooms for the special work of a social centre. The design of the church is in Early English Gothic, and it has been built of red brick with stone dressings. All the interior work is of pitch pine, and the windows are glazed with cathedral glass with tinted margins and lead frames. The heating is by low-pressure hot water system, and there is an installation of electric light. The church has been erected by Mr. James MacHarg, contractor, Wallsend, from plans prepared by Messrs. Badenoch & Bruce, architects, Newcastle.

CHURCH ENLARGEMENT, SOUTHCHURCH, ESSEX.—Holy Trinity Church, Southchurch, is now being enlarged at a cost of 3,000. The work, which is from plans prepared by Mr. J. A. Couper, is being carried out by Councillor W. C. Leaney. It provides for a nave and aisle, and, when finished, the old church will form the south aisle. The accommodation will be increased from 170 to 370.

RESTORATION OF TERRINGTON CHURCH, NORFOLK.—The work of restoring this church has just been completed. The greater part of the rebuilding has been done by Mr. W. H. L. Brown, of Lynn, but the earlier portions of the work were by Mr. J. Thompson, of Peterborough; and Mr. E. J. Case, of Lynn, is responsible for the work in the porch. The operations have been superintended at various times by Messrs. Hicks & Charlgrove, of Newcastle, and Mr. Lacey, Diocesan

Architect. The total cost of the work has been about 7,000.

CHURCH INSTITUTE, PENARTH.—On the 26th ult. the foundation-stone was laid of the new institute which is being built in Albert-road, Penarth, in connexion with St. Augustine's Church. The part in course of erection is at the rear, consisting of the parish hall, a billiard-room, and general reading-room. The estimated cost is 2,000, whilst another 2,000 will be required for the front part, in which part will be various rooms for the use of young people. The builder is Mr. John Jones, Penarth, Mr. H. Snell is the architect.

FIRE STATION, CROYDON.—The foundation-stone of the new central fire station in Park-lane, Croydon, was laid a short time ago. The building stands at the corner of Park-lane and Park-street, the site being 62 ft. by 168 ft. in depth. On the ground floor is the engine-room, with stabling for four horses in the rear, and from Park-lane this is approached by three doors, the fourth, of similar design, giving access to the duty room. The superintendent's-room, workshop, stores, etc., are on the same level. In the first floor is a recreation-room, reading-room, and the superintendent's quarters. On the second and third floor and over the workshop in the rear there will be accommodation for seven married and six single firemen. Externally the building will be faced with Wrotham red fancy brick (from Messrs. Pascall's, South Norwood), with buff-coloured sandstone dressings for the windows and doorways, while the plinth will be of Irish limestone. The firemen's quarters will be approached through a tower having the entrance in Park-street, the space in the centre of the tower being utilised for drying the hose. The total cost of the building when complete will have been about 10,000. The building contract is for 8,750. This is in the hands of Messrs. Hudson & Co., of Westminster. The electric lighting is being installed by Messrs. Casperd & Co., of Croydon, and the heating by Messrs. Wenham & Waters, also of Croydon. The plans of the building have been prepared in the Borough Engineer's office with the assistance of Mr. Helder.

PUBLIC LIBRARY, MALVERN.—A new public library has just been opened at Malvern. The new building was designed by Mr. Henry A. Crouch, of London, the architect, and Mr. James Herbert, of Wolverhampton, was the contractor. The building is faced with Hereford red bricks, with Monk's Park stone dressings, the roof being of Coalbrookdale tiles. It is fronted by a stone loggia, which gives approach to the vestibule. The floor here is of concrete, the floors of the rooms are of wood blocks. The whole of the screens, doors, fittings, etc., are of English walnut. There is a lecture hall, which will seat 200 people, and also on the ground floor a reading library, centrally situated and well appointed, with the news and reference rooms on its right and left respectively. Double doors shut off the lecture-hall from the library. Upon the same floor is a students'-room. Among the rooms on the first floor is one which will be devoted to ladies. In the basement a room will be devoted to the children.

URBAN COUNCIL OFFICES, HAYES.—The new Council offices, which have been erected at Hayes by Lord Hillingdon, were opened recently. The offices are situated in Grange-road, and are of local stocks with picked stocks for the front, and red brick dressings to doorway. The window heads and aprons are of red rubbers, and the heavy door pediment being of hard stone. The heating is by gas fires throughout. The furnishing has been done by Messrs. Maw, Till, Kirke, & Co., of Hull. The Surveyor to the Council, Mr. C. Curtis Gray, prepared the plans; and Mr. E. Plaistow, of South-road, Southall, was the contractor for the work.

PARKS HALL, TREDEGAR.—The foundation-stone of a new hall and Sunday-school for the Parish of St. James, Tredegar, was laid recently. The hall, which is to cost 1,200, provides accommodation for 520, and is being erected by Mr. J. Newcombe, contractor, Tredegar, from plans prepared by Messrs. James & Morgan, architects, Cardiff. The walls are the local stone, the front faced with dressed shoddes, having red pressed brick and Forest stone dressings.

INFIRMARY EXTENSION, KEYNSHAM.—The new wing of Keynsham Workhouse Infirmary was opened on the 19th ult. by Mr. W. H. Bateman Hope, M.P. The building consists chiefly of two

wards, one above the other, each containing three beds, and also an isolation ward and a lying-in ward. The cost of the work was £1,422, apart from furniture, and Mr. H. M. Bennett was the architect.

PROPOSED EXCHANGE, CARDIFF.—Plans are being prepared by Mr. W. M. Corbett for a new exchange, which it is proposed to erect on a site adjoining the Custom House, Cardiff. The building is to cost from 30,000l. to 40,000l.

PROPOSED IMPROVEMENTS TO THE TOWN HALL, ABERGAVENNY.—The subject of how best to improve the present hall or to build a new Assembly Hall has been under continuous discussions at meetings of the Town Council. The Council advertised for plans to alter the present buildings and received plans from M. Baldwin, 1,750l.; Mr. S. A. Johnson, 2,200l.; Mr. E. Foster, 800l.; and Mr. Francis, 2,500l. for a new hall. It was then decided that a circular should be prepared embodying all the four schemes with a guarantee of the cost signed by each architect, that the plans should be on view one month, and that a poll of the town should be taken as to the best course to adopt. In the meantime a public meeting was called so that the various schemes could be laid before the town and the town could be taken into consideration. A lengthy discussion ensued, and it was eventually decided that the whole question should be referred back to the Council.

BUSINESS PREMISES, CRIEFF, N.B.—At last week's meeting of the Dean of Guild Court plans were passed for a new block of buildings to be erected at the corner of King-street and Com-missioner-street, Crieff. The buildings will extend along King-street 72 ft., and along Commissioner-street 20 ft., where they abut on a building belonging to the same proprietor. The ground floor is occupied by shops and a small dwelling-house, while the first floor contains large function and tea rooms. The top floor is arranged as a dwelling-house. The architect is Mr. Gordon L. Wright, of Edinburgh.

Stained Glass & Decoration.

REVERENDS, HERFORD.—A reredos has been erected behind the altar in All Saints' Church, Herford. It is of carved oak, and consists of three panels—a central panel and two side panels with canopies above. The subject of the panels is the Ascension, which is painted on tiles, and the background is of old mosaic. At some future date it is intended to add two more panels at the top of the existing reredos panels. The tiles were painted by Messrs. Simpson & Sons, London, and the remainder of the work was carried out by Mr. Robert Clarke, of Herford, who designed the reredos somewhat upon the lines previously suggested by Mr. Oldrid Scott.

REVERENDS, HERFORD.—The new reredos to the altar at Corpus Christi Church, Gladys-avenue, North End, which has been in progress for some months past, has been completed. The work is in the late Gothic style. It was executed by Mr. A. B. Wall, sculptor, of Cheltenham, from the design of the architect, Mr. C. W. Bevis, of Southsea.

Foreign.

SAN FRANCISCO.—The first all-steel building to be erected in the world is slowly rearing its unhandsome bulk from the ash-heaps of one of San Francisco's main arteries of traffic. It is the "George Whittell Building," and the architect, Mr. Frank Shea, had planned that it should be the most up-to-date "fire-resister" that iron and stone could produce. After the earthquake had passed and the fire had devoured the business section, Mr. Shea found that the gaunt begrimed girders and framework of the partly-built Whittell building had defied shock and flame. The thought struck him, "Why not sheath it in metal like a battleship?" He suggested to the owner that such a structure would answer every requirement as to comfort and convenience; would be more commodious and at the same time both fire and earthquake proof. Mr. Whittell assented, and the framework is being rapidly walled in with steel plates riveted on steel-ribs. It is to be ready for completion within six months, and will cost, when finished, 150,000l. There are to be fifteen stories, a mezzanine floor, and a deep basement. The different floors are not to be partitioned, and the tenants have already selected the areas requisite to their needs. American architects are watching the progress of the building with interest, as it is predicted that this type of structure will create a revolution in methods now being employed in the building world. Mr. Shea is confident that the projectors of hundreds of buildings of this class will follow his idea. After a careful inspection by experts, the "Call," "Crocker," "St. Francis

Hotel," "Shreve," "Flood," "Mutual Savings Bank," and "Merchants' Exchange" buildings have been passed as sound, and will be ready for occupancy within a few days. The above-named are all of structural steel construction, and comprise most of the highest buildings in the West. Up to the 15th inst. it had not transpired that any large orders for steel had been placed in the hands of American steel mills. The Steel Trust has given absolute instructions to the mills under their control, that orders from the devastated city are to be given precedence over all others. This will militate seriously against the chances of English mills securing an appreciable fraction of the business. The San Francisco Reconstruction Committee, including among its membership representative men of financial, engineering, and business reputation, has subdivided into twenty-four committees, one of these being the "Committee on Securing Structural Materials for the use of the City and its People."

GERMANY.—In the competition for designs for a tower in memory of Prince Bismarck to be erected in Diiren, the first premium was awarded to Herr Berns, and the second premium to Herr Hans Schell.

SWITZERLAND.—The plans for the new Casino to be erected at Berne have been completed by MM. Lindt and Hoffmann, and the work of building will shortly be commenced. A new asylum is to be built at Herisau from plans by MM. Rittmeyer and Furrer, at a cost of about 1,722,000 francs, not including the purchase of the site. A new theatre is to be built at Basle in place of the old one which was burned down in October, 1904.

Miscellaneous.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. William Atkinson has retired from the firm of Welch & Atkinson, Surveyors, of 10, Lancaster-place, Strand; and the practice will be carried on at the same address and under the same title by Mr. George Stephenson, who has for several years been a member of the firm.—Mr. H. T. Neil, Quantity Surveyor, has removed his offices from Chancery-lane, Darlington, to Queen-square, Leeds.

THE BOROUGH POLYTECHNIC.—This institution announces a course of six lectures on "Elementary Principles of Electric Lighting, in Relation to Buildings," to be given by Mr. John Henderson, D.Sc., on Thursday evenings, 8 to 9 p.m., commencing May 31. This course is intended specially for students employed in the building trades, architects' offices, and insurance companies.

NEW HIGH-LEVEL BRIDGE AND QUAY EXTENSION, NEWCASTLE.—It is anticipated that the new high-level bridge will be finished in about two months' time. It carries four railway lines laid for a total length of rather more than a half-mile, from the Newcastle Central Station to meet the main line on the other side of the river, to London, and stands about 300 yds. below Redhough-road bridge. The total length, 1,150 ft., of the bridge is divided into four spans of steel construction supported by piers of granite. The middle two spans are 300 ft. each, the other two are 191 ft. (south), and 231 ft. (north). The girders are 82 ft. in the clear above high-water, their ends rise from centre to centre of the girders being 48 ft. 6 in., with a 50 ft. breadth over all, of steel work weighing in the aggregate nearly 5,800 tons. The masonry for the piers is carried down to 69 ft. below high water, the foundations are built upon caissons, and the three river piers have an extreme width of 103 ft. 6 in. at the cut-waters; for the middle pier 195,000 cubic ft. of granite have been used. The designs were prepared for the North-Eastern Railway Company by Mr. Charles A. Harrison, M.Inst.C.E., their chief-engineer, northern division, whom Mr. A. Cameron represented upon the works. The Cleveland Bridge and Engineering Company, of Darlington, are the contractors, and one of their directors, Mr. F. W. Davis, directed the foundation and other constructive work, with the aid of Mr. J. H. Walker, A.M.Inst.C.E., and of Mr. C. S. R. Kirkpatrick, under his appointment as City Engineer. Mr. Kirkpatrick, we may mention, has recently framed an initial scheme for the construction, at an estimated cost of some 50,000l., of additional quay accommodation, having a frontage of 350 ft. to the river Tyne, and a frontage of 115 ft. to the Ouseburn, and with depths of 20 ft. and 10 ft. respectively at low tides.

WAR OFFICE, WHITEHALL.—The new building will be heated by apparatus patented and supplied by the Brightside Foundry and Engineering Company, of Sheffield, arranged upon the duplicated system, and so that the whole, or any part, may be used at any time. Water for the rooms, lavatories, etc., will be heated by exhaust steam from the engine-plant, a feature of the invention is the use of vacuum-pumps for drawing steam, at a low pressure, into the radiators.

VICTORIA TO CRICKLEWOOD TUBE RAILWAY.—The House of Commons Committee, of which Mr. Rickett is Chairman, have found proved the preamble of a Bill for the construction of a tube railway line from Victoria to Marble Arch, and an extension of time for the similar line thence to Cricklewood already authorised by an Act of 1899. The Committee, however, required the insertion of clauses in the Bill for the compulsory provision of exchange-stations with existing railways at Victoria, Hyde Park-corner, and Marble Arch, before the line is opened for public traffic, instead of giving powers to the Board of Trade to suspend that obligation. The Committee also imposed a time limit of four years from the passing of the Act for the completion of the line, and of two years for the acquisition of the necessary lands.

SLATES AND TILING.—We have received from Mr. C. B. Atkinson (325, Wightman-road, Hornsey), a folding card giving tables of sizes, gauge, weight, etc., of various slates, the number of each required to cover a certain space, and rules for measurement of each. The card folds and is slipped into a small case, and is convenient for reference.

SLAVERY PROPERTY AND DRAINAGE.—A conference of Metropolitan Borough Councils to consider the question of the exemption of Crown property from the provisions of the Public Health (London) Act, 1891, and the by-laws made thereunder is to be held in the Islington Town Hall on June 21.

DRAINAGE WORKS JURISDICTION.—The General Purposes Committee of Paddington Borough Council reported on Monday that twelve months ago the following rules relating to the procedure in regard to the jurisdiction as to repairing drains in existing buildings were experimentally adopted up to March 31, 1906:—(1) That all notices and plans relating to drainage work in existing buildings be sent to the surveyor by the builders (or other persons). (2) That, upon the receipt of any such notices and (or) plans, the surveyor shall forthwith forward the same to the Medical Officer of Health, together with a memorandum of the amendments which he considers necessary to bring the plans and specifications into conformity with the by-laws. (3) That the Medical Officer of Health do carry out all negotiations with the builders (or other persons), serve such notices as are required to bring the said plans and specifications into conformity with the by-laws, and return one copy of the completed plans to the surveyor. (4) That, where any material deviation from the plans and specifications is first submitted to the surveyor (or as corrected by him to conform with the by-laws) be proposed, such deviation shall be submitted to the surveyor for his approval before being carried out. (5) That the Medical Officer of Health do supervise the execution of the work. (6) That all notices and plans be returned to the surveyor on the completion of the work set out therein." The Borough Surveyor and Medical Officer of Health reported that the division of jurisdiction had worked well, and the Committee had, therefore, decided that the rules should continue in operation until the Council would otherwise order.

LECTURES ON DOMED BUILDINGS.—At the London County Council School of Building (Ferdale-road, Brixton) a course of lectures on "Domed Buildings," illustrated by lantern photographs, is being given by Professor Beresford Pitt. The next lecture, on "The dome of St. Peter's, Rome," having been treated on the previous Thursday. The lecture on June 14 will deal with Les Invalides and the Pantheon, Paris.

COMBINED DRAINAGE.—At a conference of delegates from Metropolitan Borough Councils, convened by the Fulham Borough Council, and held in the Fulham Town Hall last week to consider the subject of combined drainage, the following resolutions were adopted:—(a) That this conference of London Borough Councils do respectfully urge the Right Honourable the President of the Local Government Board to give the subject of the unsatisfactory state of the law relating to combined drainage in London his serious consideration, with the view of a Bill to amend the law being introduced into Parliament at an early date. (b) That a deputation be formed to wait upon the President of the Local Government Board in order to present the foregoing resolution to him in person, and to urge the view of the conference on the subject-matter. (c) That the whole of the delegates appointed to this conference form the proposed deputation, and that the Councils of the City of Westminster and Metropolitan Boroughs of Battersea, Chelsea, Greenwich, Stepney, and Wandsworth be invited to appoint representatives thereon. (d) That the resolution passed by this conference be embodied in the form of a joint memorial to the Local Government Board setting out the facts of the case, and that the several Metropolitan Borough Councils represented by the deputation be asked to affix their seals thereto when ready. (e) That the terms of the proposed memorial be referred to the Mayor and Town Clerk of Fulham to settle.

Legal.

ALLEGED OBSTRUCTION OF LIGHT OF ST. GEORGE'S CHURCH, HANOVER-SQUARE.

In the Chancery Division, on the 25th ult., Mr. Justice Swinfen Eady had before him the case of Anderson and others v. Francis & Adams, on a motion by the plaintiffs, the Rector and Churchwardens of St. George's, Hanover-square, for an interim injunction restraining, until the trial or further order, the defendants, a firm of builders, from building in Maddox-street so as to obstruct the light coming to the windows on the north side of the church.

It was arranged that the motion should stand over till the first motion day next sittings, the defendants undertaking in the meantime not to further proceed with the work.

Mr. Evg. K.C., and Mr. Cann appeared for the plaintiffs; and Mr. P. Stokes for the defendants.

ACTION AGAINST THE LONDON COUNTY COUNCIL.

On the 25th ult., Mr. Justice Bray, in the King's Bench Division, delivered a considered judgment in the case of the Mayor, etc., of the City of Westminster v. the London County Council.

The case came before his lordship in the form of a special case, which had been stated in the action, the question for decision being whether the London County Council was under a legal liability to provide means of preventing the sewage of certain houses in Grosvenor-road and All Saints' Church from passing into the River Thames. The action was brought by the plaintiffs for a declaration that the defendants were liable to commence and complete the necessary sewers and works to prevent the sewage from passing into the river, and also to recover 6277. odd as money paid by the plaintiffs for and at the request of the defendants.

It appeared from the special case that Grosvenor-road, with the embankment on one side thereof abutting on the river, was constructed by the Commissioners of Woods and Forests, and in May, 1849, the Commissioners of Sewers, on the application of a builder on behalf of the then owner of Nos. 102, 103, and 104, Grosvenor-road, consented to the construction of a drain from the houses into the river, and this being done the sewage from the houses was discharged into the Thames. All Saints' Church was built about 1870, and some time afterwards a drain from the church was connected with the drain from the houses by means of which the sewage from the church was also discharged into the river. It could not be stated whether the drain from the church and its connexion with the pipe leading from the manhole into the river was constructed with or without the knowledge or consent of the Vestry of St. George, Hanover-square. The houses in question and the church are in the parish of St. George, Hanover-square, and under the London Government Act, 1839, the powers and duties of the elective vestry of that parish became vested in the Westminster City Council. The sewage from the houses and church passed into the river through a flap which opened at low tide, but at high tide was closed by the pressure of the water. Before 1899 the Vestry of St. George, and after 1899 the Westminster City Council, took steps to insure the proper working of the flap, but with that exception the Westminster Council exercised no acts of interference with or control over the drainage of the houses. Having regard to the Thames Conservancy Act, 1894, the only efficient mode of disposing of the sewage from the houses and the church was to bring it into the Metropolitan main drainage system at the Lupus-street sewer. In July, 1895, it was decided that the London County Council had no power to order the Vestry of St. George, Hanover-square, to construct a sewer to commence opposite No. 102, Grosvenor-road, and terminate in Lupus-street at the low-level sewer belonging to the County Council. In October, 1903, the Conservators of the Thames called upon the Westminster City Council to discontinue within three months the passage of sewage into the Thames from the sewer taking the drainage of the Grosvenor-road houses, and in consequence the City Council ceased to see to the effectual working of the flap opening into the Thames. In June, 1904, during proceedings by the owners of the houses against the City Council for ceasing to maintain the proper working of the flap, both parties agreed that a sewer must be constructed for carrying off the drainage, and it was also agreed that the proceedings should stand over to give the Westminster City Council an opportunity of arranging with the London County Council for the immediate construction of such a sewer, leaving the question of the cost of such sewer to be determined between these bodies. In furtherance of the suggestion the Westminster City Council had a sewer constructed carrying the sewage from the houses and church into the Rutland-street sewer, for which works they paid

6277. 4s., the sum claimed in the action. The case for the London County Council was that they were under no obligation to provide means for carrying the drainage of the houses or of the church into one of the City of Westminster sewers communicating with the Metropolitan main drainage system, and that in any case they had a discretion in the matter.

Mr. Justice Bray, in his judgment, said the plaintiffs alleged that the liability of the London County Council to provide means of preventing the sewage in question from passing into the river was created by sect. 135 of the Metropolitan Management Act, 1855, or by sect. 1 of the Amendment Act of 1858. Previous to the passing of the Act of 1855 the Commissioners of Sewers of the City of London and the Metropolitan Commissioners of Sewers had constructed certain main sewers, the sewage from many of which passed directly into the Thames. The Metropolitan Board of Works was created by sect. 135 of the Act of 1855, and by that section the main sewers became vested in them. At the time of the passing of the Act the sewage from the houses in question was passing directly into the Thames by a drain made with the consent of the Commissioners of Sewers, and the contention was that the Metropolitan Board of Works should have constructed a main or intercepting sewer to take this sewage, and as they did not do so, but carried their intercepting sewer along Lupus-street instead of the Grosvenor-road, that they or their successors, the London County Council, could be compelled to construct a main sewer to prevent this sewage from passing into the Thames. In his opinion sect. 135 did not compel the Board to lay a main sewer to intercept this sewage. They did in 1869 lay in Lupus-street a sewer sufficiently low to take the sewage through a sewer along Rutland-street, and, they might, in their discretion, have thought that such a sewer as the low-level Lupus-street sewer was all that was necessary. It was for the vestries and district boards under sect. 69 to make the necessary sewers for effectually draining their parishes or districts, and in his opinion the Metropolitan Board of Works was not bound to lay a main sewer so as to intercept the drain of every house that drained into the Thames. Sect. 1 of the Act of 1858 did not, in his opinion, take away from the Board the discretion they formerly had. He accordingly entered judgment for the defendants with costs.

Mr. Macmorran, K.C., and Mr. Colam appeared for the plaintiffs; and Mr. English Harrison, K.C., and Mr. Daldy for the defendants.

SEQUEL TO THE CHARING-CROSS STATION ACCIDENT.

In the Court of Appeal, composed of Lords Justices Vaughan Williams, Scolding, and Moulton, on the 29th ult., judgment was delivered in the cases of Lennox v. Curzon and Scott v. Lennox, on two separate appeals by the respective defendants from decisions of Mr. Justice Lawrence in the King's Bench Division.

The actions, which were brought for rent, arose out of the accident which occurred at the Charing-cross Station on December 5 last year, when the Avenue Theatre was practically destroyed.

It appeared that Mrs. Scott was the lessee of the freehold of the theatre, and Mr. Lennox the assignee of the lease, which had been granted to the Theatrical Syndicate, Ltd., Mr. Curzon being a sub-lessee, who had granted a further sub-lease to Mr. Cyril Maude. The question in the cases was whether the respective defendants were excused in the events which had happened from paying the rent of the theatre, the point for determination turning on the construction of a covenant in the superior lease. This ran as follows:—"If and whenever during the said term the said theatre and premises shall be closed by order of any superior authority or be destroyed by fire or so damaged by fire that the same cannot be continued to be used as a theatre, the rent shall as from the date of such closure, or from the day following such fire, if any, be suspended." By the lease the cost of structural alterations ordered by the County Council were to be borne by the lessors. In Mr. Curzon's sub-lease the words of the covenant were slightly different, as the words "by fire" were omitted. Mr. Justice Lawrence held that the rent was payable in both cases, and gave judgment for Mrs. Scott as against Mr. Lennox for 750. and costs, and for Mr. Lennox as against Mr. Curzon for 2,100. and costs. Hence the present appeals.

Their lordships held that in the circumstances the theatre had been closed by the order of a superior authority, and that, therefore, the payment of rent by the defendants was suspended. The appeals were therefore allowed.

POINT UNDER THE PUBLIC HEALTH ACT, 1875.

The case of the Mayor of Ludlow v. Prosser came before a Divisional Court of the King's Bench Division, composed of Justices Ridley and Darling, on the 25th ult., on a motion by the defendant to set aside an award.

It appeared from the statement of Mr. Randolph, who appeared for the defendant in support of the application, that by reason of the plaintiffs exercising their powers under the Public Health Act, 1875, damage had been caused to the defendant, and the matter went to arbitration under the provisions of the Act. The arbitrators, before proceeding with the arbitration, appointed an umpire. The arbitrators failing to agree on the amount of compensation to be given to the defendant, the matter was referred to the umpire, who subsequently published his award, but the award had not annexed to it the declaration required by sect. 180, sub-sect. 10, of the Act of 1875. As soon as the defendant became aware of the omission he took proceedings to set the award aside.

The local authority were not represented by counsel, and, in the result, their lordships set the award aside.

Patents of the Week.

APPLICATIONS PUBLISHED.*

9,902 of 1905.—A. P. McALISTER: *Grates for Open Fireplaces.*

This relates to fireplaces, and consists in providing a combined fret, ash-pan, and draught regulator in one piece, so as to enable the draught to be controlled when moving the fret. The fireplace is formed of fire-brick to stand on the floor level on to separate holes or cheeks supporting a loose firegrate, which thus stands entirely clear of the hearth. The said combined fret and ash-pan is movable, and is provided with a bit-and-nut regulating grating or the like, and is placed in front to fit closely to the bottom firegrate and separate hobs or cheeks aforesaid. A space or hot chamber is formed next the fire-brick, through which air from an adjoining apartment may be drawn, and, after being warmed, returned to the said apartment.

9,549 of 1905.—P. KESTNER: *A Process for Laying Smoke Issuing from Smoke Funnel, Chimneys, and the like.*

This relates to a process for laying smoke carried by combustion gases, consisting in introducing or injecting into said gases water or steam according to the temperature of said gases, so that after the steam or water and gases have been thoroughly mixed by being passed through a fan a sufficient quantity of steam remains in admixture with said gases to cause the steam on being condensed by the cooling of the atmosphere to be deposited on the soot particles, and render these so heavy that they will be laid almost immediately after their escape from the funnel.

11,133 of 1905.—P. F. WILLIAMS: *Cooking-Stoves Heated by Gas or Oil.*

This relates to a domestic cooking-stove, the oven of which is heated by means of a chamber underneath, but outside the said oven, the heat being distributed by a shield and flues equally to either side of the oven, and to the back of the oven, from all of which flues the heat arises to the top flue of the said oven and escapes therefrom to the outer air.

12,617 of 1905.—S. NAYLOR: *Radiators for Hot Water Heating.*

This relates to radiators for hot water heating, and has for its object to introduce a hollow plug in the lower end section of the radiator or where the flow pipe is usually connected; the hollow plug has a hole in the upper part to cause the water to ascend the first loop or section, the plug prevents the water circulating into the other loops or sections until it has passed up the first; the water then passes along the upper part of the other sections, and circulates by downward currents and out at the opposite end of the radiator. By this process of circulation a more thorough and positive heating of the radiator is ensured, which yields an increased temperature and consequently adds to the efficiency of the radiator.

13,494 of 1905.—W. J. THOMAS: *Fasteners for Window-Sashes and the like.*

This relates to fasteners for window-sashes and the like, and consists in the use of a bolt, connected by a radius arm to a fulcrum or spindle, and controlled by a strong elastic spring retained or withheld in an "unsash" position when the window is open, by a "gravit" catch suspended and held at its inner end to the bolt, or near its end, by a pin passing through the catch with a projection in the side of the catch, which engages with a fixed erection or stop on the bottom plate. The outer end of the catch extends to the edge of the meeting rail and over a slot in the lower sash, to which the bolt is attached. On the meeting rail of the upper sash is a fixed projection or "tripper," fixed in such manner that in closing the window it rises through the slot and lifts the catch, thus releasing the bolt and fastening the

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

PATENTS.—Continued on page 629.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this list, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, —, Contracts, iv, vi, viii, x.; Public Appointments, xviii.; Auction Sales, xxx. Certain conditions, beyond those given in the following information, are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

Contracts.

BUILDING.

JUNE 4.—Abergavenny.—ALTERATIONS, ETC.—Making certain alterations and additions to Pant-y-noon, near Abergavenny, situated about 2 miles on the road to Crickhowell, for Mr. J. G. Jones. Names to Mr. B. J. Francis, architect, Abergavenny, not later than June 4.

JUNE 4.—Crawcrook.—CLUB PREMISES.—The West Ryton, Crawcrook and District Social Club, Ltd., invite tenders for extension of club premises at Poplar House, Crawcrook. Plans and specifications may be seen on application to the steward, between the hours of 10 a.m. and 6 p.m. Separate tenders to be sent for each trade as specified, and endorsed "Tenders for alterations," which should be delivered to Mr. Fred W. Lishman, Secretary, before noon on June 4.

JUNE 4.—Dundalk.—WALL, ETC.—For building an enclosing wall round St. Nicholas' Church, Dundalk; erecting a wrought-iron railing and gates to same; for painting walls, and for sealing new transept and south aisle. The plans and specifications may be seen at office of Mr. W. H. Byrne & Son, architects, Dublin; or at St. Patrick's Presbytery, Dundalk. The estimates are to be sent separately for walls, railing, seats, and painting. The estimates to be sent in a sealed envelope to the Rev. M. J. Quinn, Adm., St. Patrick's, Dundalk, endorsed "Estimate for St. Nicholas' Church, Dundalk," not later than June 4.

JUNE 5.—East Ardsley.—HOSPITAL.—For the erection of the proposed small-pox isolation hospital in Stone-Lane, East Ardsley. Names to Mr. Frank M. East, J.P., Tisbury House, Wakefield, on or before June 5, stating for which contracts contractor wishes to tender, after which date the necessary particulars will be supplied. The work will be divided into the following contracts:—(a) Fencing, rivet oak, corrugated iron, or crosscot wood; (b) access road formation, and main outfall sewer construction, and the laying of gas and water mains; (c) foundations for buildings and certain portions of the super-structures, internal drainage, and formation of necessary roads on site; (d) provision of cast-iron water mains; (e) provision of cast-iron tank, including fixing; (f) provision of cast-iron gas mains and wrought-iron service mains; (g) provision of steeling of structures. Plans and specifications may be seen at office of Mr. H. H. Beaumont, Clerk to Wakefield and District Small-pox Isolation Hospital, Chancery-lane, Wakefield.

JUNE 5.—Nantyglo.—ALTERATIONS TO CHAPEL.—Alterations to Heron Chapel, Nantyglo. Plans and specification may be seen at office of Mr. William Thomas, architect and surveyor, 7, Queen's-street, Nantyglo. Bills of quantities supplied on payment of 2s. 2s. Sealed and endorsed tenders to be sent in not later than June 5.

Such application must be accompanied by a deposit of the sum of 2l. 2s.

STONE, MATERIALS, AND STORES.

JUNE 4.—East Stonehouse.—STONE.—East Stonehouse U.D.C. invite tenders for the supply of broken and other stone, to be delivered at their works in Stonehouse, East of Stonehouse, specification and form of tender may be obtained at the surveyor's office. Sealed tenders, endorsed "Road Materials," together with samples, must be delivered free of charge, to the office of Mr. B. Townshend, Surveyor, Surveyor's Office, Town Hall, Stonehouse, on or before June 4.

JUNE 4.—Winterton.—GRANITE.—The U.D.C. of Winterton invite tenders for the supply of 600 tons of granite, broken to 1½ in. or 1½-in. gauge, delivered at Winterton Haven, either into carts or stored as may be required. Tenders and samples to be sent to Mr. A. Spencer, Clerk of the Council, Council Offices, Queen-street, not later than June 4. Also tenders and samples for the supply of 200 tons of well-broken slag and 50 tons of screenings, by 8 a.m. on June 4. Also tenders, by June 4, for carting the granite and slag, and screenings, either by carts or traction, and deposited in such quantities and where as the surveyor shall direct.

JUNE 4.—Gosforth.—Whinstone.—Gosforth T.D.C. invite tenders for the supply of broken whinstone, etc., for a period of twelve months. Particulars may be obtained on application to the Surveyor, Mr. George W. Woods, end of Rd., "Supply of Road Material," must be sent so as to reach Mr. R. Sherion Holmes, solicitor, Clerk to the Council, Council Chambers, Gosforth, not later than 5 o'clock p.m. on June 4.

JUNE 6.—Raunds.—ROAD MATERIAL.—Raunds T.D.C. invite tenders for the supply of 260 tons of broken granite and 450 tons of slag to be delivered free at Raunds Station not later than December 31, 1906, in such quantities and at such times as shall be directed in writing by the Surveyor of the Council. Sealed tenders, endorsed "Road Material," quoting per ton, to be delivered to Mr. F. W. Corby, Clerk, Raunds, not later than June 6. Forms of tender may be obtained from Mr. Thomas Yeake, Clerk, Raunds, Surveyor's Office, to whom samples, of not less than 14lb., should be sent.

JUNE 6.—Setton.—MATERIALS.—Setton R.D.C. invite tenders for the supply of materials, etc., for the proposed making up and breaking up of the following townships—Aintree, Ince Blundell, Kirkby Lunt, Newthorpe, and West of Ince Blundell, West of Garsley Rural. Tenders will not be considered unless sent in the printed forms, to be obtained from the Highway Surveyor, Mr. James Roscoe, Kirkby, near Thelwall, on or before June 6 at noon. Sealed tenders to be sent to the Council, Brougham-terrace, West Derby-road, Liverpool. Tenders, sealed, to be marked on the envelope "Tender for June 6," to be sent to a Clerk by 4 o'clock on June 6.

JUNE 11.—Blything.—GRANITE.—Blything Guardians invite tenders (per ton), for the supply and delivery by July 1 next, at Westhaston Station, Southport, of 100 tons of granite, broken to 1½ in. for breaking up in the labour yard. Tenders, sealed, and endorsed "Tender for Granite," to be delivered at the Board-room, Billcamp, not later than 10 a.m. on June 11. Mr. Harold W. Wallis, Clerk to the Guardians, Billcamp, Billcamp, Hellesworth.

JUNE 12.—Baldon.—LIMESTONE.—Baldon U.D.C. invite tenders for the supply of 500 tons of 23-in. broken limestone, to be delivered at Baldon Station. Tenders, endorsed "Limestone," to be sent to Mr. J. Ben, Clerk to the Council, Baldon, on or before June 12.

JUNE 12.—Hetton.—ROAD MATERIALS.—The U.D.C. of Hetton invite tenders for supplying the under-mentioned road materials, namely—200 tons of rough slag; 200 of 2½-in. machine broken slag; 100 tons of 1-in. machine broken slag; and 100 tons of ½-in. slag ravel. Further particulars, together with form of tender, to be obtained from the Surveyor of the Council, Mr. John Harding, Hetton-le-Hole, R.S.O., to whom samples of slag proposed to be supplied are to be sent by 10 a.m. on June 12. Sealed tenders, addressed to Mr. John George Baty, Clerk to the Council, Houghton-le-Springs, R.S.O., endorsed "Tender for Road Material," to be sent not later than 10 o'clock on June 12.

JUNE 13.—Northfleet.—ROAD MATERIAL, ETC.—The U.D.C. of Northfleet invite tenders for the following items, from July 1, 1906, to June 30, 1907, both inclusive:—(1) The supply of 700 tons of Guernsey granite, as per Guernsey State weightbridge certificate weight, broken to gauges of 1½ in. and 2 in., for metalling roads. (2) The supply of such quantity of cement as per ton from time to time as may be required by the Council. (3) The supply of 1,600 yds. of surface-picked flints for metalling roads. (4) The supply, within five days after notice, free of all cartage, river, and other dues and charges (except wharfage), on to such wharf within the district as may be directed, barge freights of clean Thames ballast, 100 tons of cubic yards of ballast, and 500 tons of five days after notice, free of charges except cartage to a railway station on the South Eastern and Chatham Railway, to be named by the said surveyor. (5) The supply of 100 tons of clean district of Northfleet, free of all canal, river, and other dues and charges, as may be directed, such quantity or quantities of selected, best quality, hard blue finely-crushed (½ in. gauge) whinstone, broken to a 2½-in. gauge, for metalling the roads. (6) The supply of 60 tons of granite sets, 4 in. by 4 in. by 8 in., to 10 in. longest, delivered free of all canal, river, and other dues and charges (except wharfage), on to such wharf within the district within twenty-eight days after notice from the said surveyor. (7) The supply, within five days after notice, of a 12-ft-long steam roller, with scraper, and, if required, a 10-ton steam roller without scraper. No forms of tender or conditions can be supplied. Tenders are to be sent to the Council Office in the High Northfleet, not later than 4 p.m. June 13, marked "Tender for—"

JUNE 13.—Bristol.—SPRINGS.—Bristol Guardians invite tenders for the supply of the following articles, to be delivered, cartage free, in such quantities as the Guardians shall order, at their workhouses at Stapleton, Eastville, and Southmead.

or at any of the homes for children, or at St. Peter's Hospital, for one year to June 30, 1907.—Brushes and mops, etc.; bricks and sanitary pipes, etc.; earthenware and glass; timber; oils and colours; ironmongery; furniture; chairs and heavy articles; taps (hot and cold water, etc.); tinware, etc. Patterns of brushes and mops, earthenware and glass, ironmongery, cutlery, taps, etc., may be seen at St. Peter's Hospital, Bristol, and tenders, in forms to be obtained at office of Mr. J. J. Simpson, Clerk, must be delivered not later than 12 o'clock noon on June 14.

JUNE 14.—OSWESTRY.—SUPPLIES.—Cambridgian Railways Company Directors invite tenders for supplies of the undermentioned stores, to be delivered in such quantities and at such times as may be required, during the twelve months ending June 30, 1907.—(1) Oils and tallow; (2) cotton waste; (3) clothing; (4) brushes; (5) bricks, drain pipes, and lime; (6) galvanised wire; (7) carriage trimmings and horse hair; (8) copper, black tin, etc.; (9) canvas; (10) coke; (11) iron tubes and fittings; (12) fencing, wire, files, springs, spring steel and buffer plungers; (16) glass; (17) iron and steel, bar and sheet; (18) pig-iron; (19) india rubber; (20) cement; (21) bolts, nuts, and chair spikes; (22) lead, white and red; (23) lead sheet and piping; (24) nails and crane chains; (25) paints, turpentine, etc.; (26) varnish and cold lead; (27) ropes; (28) printing and stationery (three years); (29) soap; (30) screws and washers; (31) timber, English; (32) timber, foreign; (33) timber, foreign (supplementary); (34) leather. Specifications and forms of tender may be obtained at the Stores Office, Cambridgian Works, Oswestry, and specimens, patterns, and samples may be seen there daily, except on Saturdays, from 9 a.m. to 4 p.m. Sealed tenders should be sent to and reach Mr. C. S. Dennis, Secretary, Oswestry, not later than 9 a.m. on June 14, marked "Tender for No."

JUNE 15.—ELY.—GRANITE.—Ely U.D.C. invite tenders for supply and delivery at Ely Railway Station

of 400 tons (more or less) of 1½-in. Clee Hill, blue Guernsey, or Leicestershire granite (separate prices for machine and hand broken to be quoted), and 100 tons (more or less) of best 3½-in. Hill, blue Guernsey, or Leicestershire granite 7-in. clean screenings; 20 tons of 1½-in. similar granite to Black Bank Railway Station, G.E.R.; also 150 tons of 1½-in. similar granite (separate prices for machine and hand broken to be quoted), to be delivered by water and unloaded on the river bank in heaps at the under-mentioned places, viz.:—50 tons to Adelaide Bridge; 50 tons to Prickwillow Bridge; 10 tons to Burnt Fen Bank, between Prickwillow Bridge and Mr. John Sindall's house; 40 tons for Miles End Drive, to be delivered on Burnt Fen Bank and tipped into carts near Mr. John Sindall's house. Samples of each should be sent to Mr. William McKelvie at the City Surveyor's office in Ely (carriage paid), previous to delivery of tender. Sealed tenders, endorsed "Tenders for Granite," to be delivered or sent by post so as to reach Mr. Geo. Martin Hill, Clerk, Market-square, Ely, on June 18, July 3.—**DARTFORD.—SUPPLIES.**—U.D.C. of Dartford invite tenders for the supply and delivery of the undermentioned goods during the year ending June 30, 1907:—(a) Lubricating and other oils; (b) disinfectants; (c) broken granite; (d) electric meters; (e) house cut-outs; (f) house service cable, isolating material, and accessories for electric lighting department; (g) general stores for electric lighting department; (h) coal. Particulars and forms of tenders will be sent to any applicant on receipt of a stamped addressed look-up envelope, or may be obtained on application to Mr. W. Kay, Clerk to the Council, Council Offices, Dartford. No tender will be considered unless it be upon the prescribed form. Sealed tenders, in envelopes addressed "The Clerk, U.D.C. of Dartford, Council Offices, Dartford," and endorsed "Tender for No." as the case may be, must be sent in not later than 4 p.m. on June 15.—**WATFORD.—GRANITE.**—Watford U.D.C.

invite tenders for 3,000 tons of granite (or such less quantity as the Council may require, machine broken, so as to pass in any direction through a 2-in. ring; also an alternative tender for similar granite broken so as to pass in any direction through a 1½-in. ring, delivered in quantities as required, at Watford or Bushey stations. A sample of granite is to accompany each tender, and the tender is to state the rate per ton of the material. Sealed tenders, addressed to the Clerk to the Council, and endorsed "Tenders for Granite," to be delivered at the offices of the Council not later than noon on June 20.

★ JUNE 21.—ISLINGTON.—ANNUAL CONTRACTS.—The Council of the Metropolitan Borough of Islington invite tenders for contracts for eight months, from August 1, 1906 (except as regards item No. 10, which will be for eight months, one year and eight months, or two years and eight months, at the option of the Council, and as regards items Nos. 11 and 12, which will be for nine months, or two years and nine months at the option of the Council from July 1, 1906), as under:—(1) Horses, harness, and man for van for watering roads; (2) cartage and horse hire; (3) masons' and paviors work; (4) supply of broken granite and chippings; (5) ballast, single, hoazin, hard core, and flints; (6) timber, etc.; (7) wheels and tyres; (8) manhole and other covers, gully grates, guard posts, castings, and other ironwork; (9) iron, steel, and tools; (10) sewers and drains. Forms of tender and contract, and other particulars on application at Town Hall, Upper-street, N., on and after June 11, between 9 a.m. and 5 p.m. Tenders, properly endorsed, to Town Clerk, before noon, June 21.

No DATE.—FOREHOE.—MATERIALS, ETC.—Forehoe R.D.C. invite tenders for the supply of materials and team labour. Particulars and forms of tender may be obtained from Mr. Wm. Partridge Smith, Clerk, Vicar-street, Wyomondham.

PATENTS.—Continued from page 624.
 window. On drawing back the bolt the catch sets automatically ready for the next closing of the window. The catch being attached to the bolt travels with it, supported on a platform which is an upward extension of the tripper. The inside of the end of the bolt is so shaped that when it engages with the standard it gradually draws the meeting rail together, holding them securely. To control and limit the range of the bolt fixed studs are placed on the plate.
 13,868 of 1905.—J. Mason: *Stair Treads, Manhole Plates, and the like.*
 This relates to treads for stairs and the like, and consists in the employment in conjunction with plates of hard metal of a filling for the recesses, containing corundum and cement.
 15,549 of 1905.—H. E. KAYE: *Ash Bins.*
 This relates to an ash-bin, comprising a gridded tray in its upper part, with a gridded bottom, having a sliding cover, and supported on its sides within the bin, and adapted to be moved in and out from the wall of the bin.
 15,926 of 1905.—C. R. BARKER: *Radiators for Heating Buildings and the like.*
 This relates to a radiator for heating buildings and the like, and has for its object to provide a hood or cover for the purpose of protecting the adjacent wall surface, and preventing its disfigurement or discoloration by the more or less impure air issuing from the radiator. This hood or cover is attached to the radiator by any convenient means, preferably by set screws at each end, and a felt or other pad is interposed between the hood and the wall to prevent the passage of air behind the hood; the top of the hood is curved outward, and is fitted in front with a screen of gauze or like material, which arrests any particles of soot or other impurities, and thereby acts as an air filter. The said screen is detachable for cleaning purposes, and is secured in position, preferably in vertical guides by set screws, or

other convenient means. The screen is provided along its lower edge with a suitable channel or dust-box.
 17,266 of 1905.—F. W. HEAPE (H. HEAPE): *Window Adjusting Appliances.*
 This relates to a window adjusting appliance, and consists in means for opening the upper sash of a double-sash window, consisting of catches on the lower sash adapted to engage parts on the upper sash when the lower sash is moved up, whereby when the lower sash is pulled down after raising the upper sash will be pulled down.
 1,966 of 1906.—R. WHITEHEAD: *Hinges for Window Casements, and the like.*
 This relates to a casement hinge taking the form of a cranked rod having pivoted ends and brackets, upon which casements and the like can swing or turn near the hanging side of the window-frame.
 9,355 of 1905.—P. AALTON: *Method of Joining Cast-Iron Waste Pipes and Lead Pipes.*
 This relates to a method of joining cast-iron waste pipes or exhauling pipes belonging thereto with lead pipes, consisting in casting in the cast-iron pipe a wrought-iron pipe having a non-corrosive lining or covering for the purpose of enabling the lead pipe to be conveniently and impermanently joined to the cast-iron pipe.
 8,497 of 1906.—W. HOUGHTON: *Means for Supporting Pipes, and the like.*
 This relates to a pipe-hanger, comprising a yoke having its arms provided with flanges adapted to engage the rib of a beam and flanges on the opposite side adapted to engage a key, a clamping block having a flange adapted to engage the beam extended between the arms, and having the flange adapted to engage the key, and a key for locking the parts together and causing the block and arms to clamp the beam between them, and means connected with the arms for supporting a pipe or cable.

PRICES CURRENT OF MATERIALS.

* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

TO CORRESPONDENTS. NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for media or samples sent to or left at this office, unless he has specially asked for them. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. All communications must be authenticated by the name and address of the sender whether for publication or not. No notice can be taken of anonymous communications. We are compelled to decline pointing out books and giving addresses. Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. The Editor cannot undertake to read and ascertain articles offered for acceptance unless they are type-written. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS. Communications for insertion under this heading should be addressed to "The Editor," and must reach not later than 10 a.m. on Thursdays. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100, unless in some exceptional cases and for special reasons.] * Denotes accepted. † Denotes provisionally accepted. The Church of Steyning.

STEYNING lies twelve miles north-west from Brighton and is the remarkably picturesque small town of Steyning, of ancient origin, and still retaining various domestic buildings of XVth, XVIth, and XVIIth century dates.

Its history, which might well form the subject of a monograph, is diverse and interesting. From the time of Edward I. up to 1832 the borough of Steyning, which gives its name to a hundred in the mid-division of Sussex, returned two members to Parliament. But its story is far more remote than even the dawn of parliamentary days.

The origin and growth of the place goes back to the VIIIth century, when St. Cuthman, an early Christian missionary of much local celebrity, founded a church on this site. Here, according to Leland and other authorities, the saint's relics were enshrined. This interment, and the miracles associated with his tomb, speedily brought about a large concourse of pilgrims, thus forming the nucleus of the future important town. According to Asser, King Ethelwulf, the father of Alfred the Great, was buried at Steyning in the year 858. Alfred bequeathed his estate here, together with his property at Guildford and Godalming, to his nephew Ethelwold, son of his elder brother, Ethelbert. On the rebellion and death of Ethelwold,

Steyning reverted to the Crown, and Edward the Confessor, early in his reign, granted the lands of Steyning, with all their appurtenances, to the famed Benedictine Abbey of Fécamp, in Normandy.

Steyning was a thriving place of considerable importance at the time of the Domesday Survey, when there were 123 dwellings in the town, an increase of five from the time of the Confessor. The Survey names two churches at Steyning; the one was doubtless on the site of the original church of St. Cuthman, where the present church stands, just outside the town, and the other within the town itself, the site of which is still traditionally known. The latter was probably a chapel of ease for the convenience of the townfolk, and would be the same that is mentioned in the Valor of Pope Nicholas, in 1291, as the chapel of the parish church.

The Conqueror made a full confirmation to the Abbey of Fécamp of all their rights here and elsewhere. The Benedictines of Fécamp retained the manor and rectory and advowson of the vicarage of Steyning, save for temporary forfeitures during wars with France, until 1415, when the possessions of the alien priories were generally forfeited to the Crown. In 1461 the church was conferred by Edward IV. on the newly-founded Abbey of Sion, Middlesex. The important possessions of Fécamp at this place were looked after by a prior and several monks, who had a priory of their own on the north side of the large parish church. There seems no reason

to suppose that this church, as is often assumed, ever served as the conventual church of this small establishment of Benedictine monks. At all events, such a supposition is most improbable, and if it was the case would only apply to the choir, for the nave was always parochial. It is far more likely that the monks had their own small church or chapel, forming part of their conventual buildings. There is no evidence of any buildings actually abutting on the north side of the fabric, which must have been the case had this been the monastic church. During the latter part of the Confessor's reign the Fécamp monks lost their Steyning possessions; on their re-establishment there by the Conqueror six of their number were sent over to again form this priory.

One or two more facts in connexion with the history of the church of Steyning and of the Abbey of Fécamp must be very briefly stated, as they directly bear on the date and development of the church fabric. The alien abbey held an important position in this part of Sussex. The rectory tithes of Steyning were valued at 20*l.* a year in the XIIIth century, and this in addition to the vicarage, which was worth an additional 8*l.* The manor of Steyning, of the annual value of 5*l.* 1*s.* 1*d.*, also pertained to Fécamp, whilst other temporalities brought up the abbey's income from property in the archdeaconry of Chichester to 20*l.* 1*s.* 11*d.* Moreover, the church of Steyning with its clergy, in addition to the priory and its monks, successfully claimed exemption from

the episcopal jurisdiction of the Bishop of Chichester. Ralph de Nevill, Bishop of Chichester, vainly endeavoured in 1230 to get their freedom cancelled, with the result that their exemption was confirmed by the Pope. Moreover, the abbot held the right to hold two weekly markets at Steyning, namely on Wednesdays and Saturdays, as well as two annual fairs, each of two days' duration.

The present church (dedicated to St. Andrew) consists of chancel with side chapels, clearstoried nave with north and south aisles, south porch and western tower. The fabric at one time extended further both at the east and west ends, as is known from foundations that have been uncovered when digging graves. Foundations have also been found on the south side, in the place where an early transept might naturally be expected to stand. In its general features the church is obviously Norman, and to the practised eye the Norman work is equally obviously of two different dates, the one early and of simple workmanship, the other considerably later, and not a little elaborate.

The original front of Steyning "to the holy minster at Feckamp" by the Confessor came into operation about 1045. The grant of this important property was for a time revoked about 1052, when Edward, under the sway of Earl Godwin and his connexions, was obliged to expel his favourite Normans from the kingdom. It will be recollected that Edward began the building of the great Abbey of Westminster on Norman lines in the year 1050. It is natural,

therefore, to suppose that the powerful Abbey of Fécamp, so soon as it got so substantial a foothold as this on the English coastline, would begin not only to build a small priory for a colony of their monks, but an imposing church for the townsmen assigned to them.

In the present fabric it is, therefore, reasonable to look for early Norman work extending over the years 1045-1052, for, although this is some time before the Norman conquest, it would be somewhat ridiculous to call such work Saxon, as it would be executed by Norman masons or, at all events, after a Norman design. In the same way no careful ecclesiologist would think of terming the considerable parts of the Confessor's Abbey at Westminster that still remain "Saxon."

A close examination of the building as it now stands, notwithstanding much clumsy repairs of the "churchwarden" era and two restorations of last century, shows that it incorporates a very great deal of masonry of a period earlier than the elaborately enriched Norman work. The first Norman church on this site in the XIth century (in all probability between 1045 and 1052) was on a larger scale than the present fabric. The nave extended westward by at least two bays more; the choir also extended further to the east, and there can be no reasonable doubt that it had a crossing for a low central tower (possibly never completed), as well as two transepts. We take it that the main part of the nave walls, or rather of the outer walls of the nave aisles, are beyond doubt

of a good deal earlier date than the ashlar stone of the clearstory, and the late Norman buttress on the south side with shafted angles. On the north side of the nave is one of the original small semicircular headed lights of the first Norman church, over a much later doorway. This window is only 9 in. in breadth and 3 ft. 6 in. in height. Faint traces of the position of others of like dimensions can be noticed. It would be idle to pretend that these small plain openings have anything in common with the elaborate clearstory windows above.

On entering the church the enriched arches and capitals of the nave arcades speak at once of the second half of the XIIth century; but it is quite possible that the circular piers, which have a diameter of 3½ ft., as well as the plainly-moulded bases, are more than a century older. In connexion with this surmise, it is interesting to note that we found (after our own conjecture had been formed) that that careful observer, the late Mr. Matthew Bloxam, spoke positively when describing the church in 1863. He said:—"The pier arches on either side of the nave bear evident marks of having been originally constructed of plain block masonry, and subsequently, and at different periods, worked out and enriched with Norman mouldings, and some detail of early English character." ("Sussex Archæological Collections," Vol. XVI., 237.)

When the monks of Fécamp regained their temporarily-forfeited rights over this church and town and manor, they

Steyning Church, Sussex.

appear to have been content with the original Norman church for over 100 years; but as the fashion of a much richer and more ornamental treatment began to prevail in the immediate neighbourhood, it was decided that the importance of the flourishing town of Steyning demanded a more ornate style in their great house of worship. Hence it came to pass, about the third quarter of the XIIth century, that the old arcades of the nave were enriched as Bloxam suggests, and a fine lofty clearstory was substituted for one of lower and more primitive proportions. At this period it seems probable that there was some settlement of the central tower or crossing, and that its removal, together with the two shallow transepts, necessitated a decided change in plan. It was then, we believe, that the chancel or choir chapels, separated from the central portion on each side by a double arcade, assumed their present form, the presbytery itself being extended further east. A tower was considered requisite, and one was erected within the western bays of the nave, thereby shortening its original proportions, which had possibly not been completed when the monks were temporarily dispossessed.

It is usual to describe this heavy western tower as of the XVIth century period, chiefly from a misreading of a date on its west side. But we have no doubt, after careful examination, that the core of this tower is of the late Norman period. Over the present west window there is not only the outline of a semicircular arch, but some of the voussoirs still remain bearing chevron mouldings. And above this, in the second stage of the tower, is the outline of another former rounded light.

The present nave consists of four bays. The capitals of the piers are much diversified, those on the north side being the more elaborate. The arches have three orders of mouldings, which are chiefly of zig-zag and lozenge pattern, with a hood-mould or fourth order of rosettes or floriated roundels. Above the arcade runs a string of nebuly moulding, and from that rise the shafts of the deeply-recessed and large clearstory windows. The exterior treatment of the clearstory on the south or principal side of the church, facing the town, is much superior to that on the north. In the former case the windows have double shafts in the jambs, and a well-defined alternate billet moulding as a hood over them, which is also continued as a string between the lights. On the north side the hood and string is a plain moulding, and there are no outer jamb shafts. On each side there is a Norman corbel-table under the parapet, chiefly of masks. The lofty archway into the chancel is finely moulded; it is 38 ft. high. The length of the nave (without the tower) is about 60 ft., and the width with the aisles 48 ft. The chancel is now about half the length of the nave.

The capitals of the arches at the east ends of the aisles opening into the chapels are beautifully carved, and are nearly as rich as those of St. Peter's, Northampton. A curious bit of figure carving should be noticed in the south jamb of the east arch of the south aisle; it is some little distance below the

capital in a unique position. It is somewhat obscured by the galleries which so unfortunately spoil each side of the nave, and also by the organ which now occupies the south chapel.

The peculiar richness of the late Norman work of the interior of the nave, and the dignity of this lofty early clearstory, have naturally attracted the attention of genuine lovers of church architecture both of the past and present. John Carter, F.S.A., made elaborate drawings and plans of parts of this church in 1807, which were afterwards engraved by H. Le Keux, and appeared in Vol. V. of Britton's "Architectural Antiquities," published in 1826. Britton gives three plates to this church; they include an elevation of one compartment of the north side, both exterior and interior, details of all the capitals of the nave piers and of the south door and of the clearstory, together with a small ground plan. It is clear from these drawings that there were, a hundred years ago, three instead of one of the small lights of the first church remaining in the north wall of the north aisle.

The exceptional beauty and variety of the capitals of the nave piers also excited the attention of Mr. Bond, who has given us several plates of these piers, and of other parts of Steyning Church, from his camera, in his recent great work on Gothic architecture.

The most noteworthy of these capitals is the second one from the west of the north arcade; where the scallops are repeated with great frequency on a small scale, thus producing, as Mr. Bond says, "a very rich and beautiful capital elaborated out of the heavy, unsightly cushion." The next most interesting capital, also figured and described by Mr. Bond, is one of the south arcade, which is a remarkable instance of the rarely occurring semi-naturalistic carving of the late Norman period; on this capital fern leaves may be noted, separated by incurved cones.

The font is a fine example of later Norman work. The great stone of the bowl, which is 3½ in. square, is of Purbeck marble, and has its four faces now plainly channelled with worn triangular ridges, whilst the angles on the top formed by the circle of the basin are also moulded. The base, which has been much renewed, consists of a central shaft and four smaller shafts at the corners. The whole style of the font is similar to the better formed and more enriched one at New Shoreham, and to the remarkable group of seven fonts of like shape and design, but of dark Belgian marble, of which those of the cathedral churches of Winchester and Lincoln are the best known.

There was evidently but very little done to the fabric of this church either in the XIIIth or XIVth centuries save repairs. The east end now possesses three large lancet lights, enriched with tooth moulding, but these are of last century "restoration" date. It is stated in Vol. II. of Horsfield's "Sussex" (1835), where there is a good interior view of the nave taken by Grimm in 1780, that "the eastern part of the chancel was rebuilt by Charles, late Duke of Norfolk; it is of squared flints, and has a fine pointed window divided into three lights, surmounted

with tracery." This in its turn gave way to the present east end, and it is mere guesswork to conjecture its original appearance.

The west window of the north aisle and one of the north windows of the same aisle appear to be about 1400, or a little later. They very possibly indicate some repairs undertaken when the rights of the alien Abbey of Fécamp were finally extinguished in 1415, and the church handed over to the Crown.

Considerable alterations were effected in this church in the second half of the XVth century; as is plainly shown in the fabric. When written history tells us that this church—after perhaps a considerable period of neglect, when the Crown, owing to the French wars, kept seizing its revenues—was transferred to the newly and generously established Abbey of Sion in 1461, it may fairly be assumed that it was put in order shortly after that event. Several windows and minor alterations are of that period, or of the last quarter of that century, as well as the porch and the refacing and alteration of the tower.

The south porch is of unusually large size, but of no particular merit. Over the entrance is the date 1766 on a small slab, giving the year of certain churchwarden repairs.

The west tower, which, as we have said, contains a Norman core, and a few outward traces of that style, was refaced and heavily buttressed at the western angles, in a costly and not ineffective style. The whole surface, including a plain parapet, is chequered with small squared stones and faced flints. There are fairly numerous examples of this kind of work in East Anglian churches, several of which are known to be of late XVth century workmanship. Some of the lights of the tower, as is also the case with windows of the chancel aisles, have been altered in debased times. Over the west window is the date and name of one of these repairs—"1684-7, Dapp." It should be remarked that the present great tower arch into the nave is of recent restoration date.

The church underwent very extensive restoration about 1870, and again in 1888.

Eighteenth century views of the exterior of this church shows that it was then roofed throughout with the thick grey stone that used to be commonly used in the old buildings of this district, and which has a special charm. The roofs now present a curious patchwork effect, which is rather irritating in connexion with an old building. The old grey stone still covers the chancel and its aisles, as well as the south porch; but the south aisle is leaded, whilst the nave, north aisle and tower are roofed with bright red tiles.

There is a remarkable dearth in this church of monuments of any particular age or interest. So far as pre-Reformation days are concerned, this is to be accounted for by both manor and rectory being held by religious houses, which precluded the residence of notable civilians. Priors or monks dying here would be interred in their own church or cemetery. Kelly's "Post Office Directory for the County of Sussex," as well as one or two handbooks, make mention of a "brass" in the

From Photograph by A. H. Fry.

Interior of Steyning Church.

chancel, to the memory of Elizabeth, wife of James Michael Clarke, and daughter and heiress of John Edwards, who died in 1613. This, however, is a mistake; the short inscription is not on a brass, but on a stone tablet in a simple but effective alabaster frame, surmounted by the impaled arms of Clarke (a chevron between three escallops) and Edwards (ermine, a lion rampant). It is placed against the south wall of the chancel, between the two arches that open into the south chapel. The remarkable feature of the inscription is the twofold Christian name of the husband, as more than one baptismal name was a great rarity at that date.

The royal arms of Queen Anne are now to be seen under the tower against the south wall. They have been well painted on panel, but are now somewhat dilapidated. The arms are flanked with the initials 'A. R.'; the date 1703 is above them, and the motto *Semper Eadem* below.

In the vestry formed in the north chapel is a well-carved, early Jacobean altar-table, which has unfortunately been discarded from use in favour of a clumsy and inferior successor. Here, too, is a small, well-made chest, bearing the date 1638; also a hatchment, with the name of Joseph Prowd.

There is very little old woodwork remaining in this fabric, but the two doors that form the south entrance to the church should be noted. Many an old porch lacks any trace of having been closed by a door in olden times; but in this case the heavy massive door is undoubtedly of pre-Reformation

construction, and probably coeval with the building of the porch on its present lines. It is, however, much shattered by the reiterated nailing up of parish notices. The inner door, fitting into the Norman doorway, is in better condition and of greater age; it has a good pair of well-wrought iron hinges extending right across the timbers, and is probably of the period at the beginning of the XVth century, when various alterations were made.

There is a well-proportioned and picturesque lych-gate from the highway in the south-west wall of the churchyard. It is of timber, and roofed with the local heavy stone slate. The use of these slates, and the weathered condition of the woodwork gives it an appearance of age, though only of XIXth century date.

The parish registers begin in 1565, but there is an older and most interesting volume of churchwarden accounts which opens in the year 1519. It includes a variety of entries as to the profits made towards church expenses by the "King's play," and by church ales, which were usual features of the parish church's economy in pre-Reformation days, when such a thing as a compulsory church-rate was unknown. A later notable entry in this book is the list of signatures to the Solemn League and Covenant of the early days of the Commonwealth struggle. Seventy of the inhabitants sign their names to the Covenant, whilst sixty-six make their marks. A good paper on this old parish book appeared in 1855, in Vol. VIII. of the Collections of the Sussex Archaeological Society.

NOTES.

Greenwich
Observatory

In the annual report of the Astronomer Royal, published last week, attention is drawn to the grave dangers with which Greenwich Observatory is threatened by the new generating-station of the London County Council, situated in the Greenwich meridian, and only about half a mile from the Observatory. The establishment at present possesses four chimneys, two of which rise to a higher level than the domes of the Observatory, and it is certain that the smoke and heated gases emitted cannot be useful accompaniments to astronomical work. Inconvenience and inaccuracy are chiefly anticipated in observations of the lower north stars and readings from the obelisk in Epping Forest which denotes the astronomical north from Greenwich, but it is clear that huge boiler chimneys anywhere near an observatory are calculated to interfere with the conduct of all operations in which the maximum possible accuracy is essential. Atmospheric disturbance is bad enough, but vibration of the earth is still worse, and unfortunately there is evidence to show that the reciprocating engines of the generating-station actually have the effect of shaking the Observatory, causing sensible tremors in the mercury trough used for delicate observations of the nadir and of stars. We do not for a moment suppose that the engineers of the County Council anticipated such results as these when developing their tramway scheme,

and it is scarcely reasonable to blame the Council for what has happened. But it really is a most astonishing thing that the Astronomer Royal and the Admiralty should have allowed the project to be realised before raising a word of objection. The capacity of boiler-chimneys to emit smoke and heated gases is well known, and it is common knowledge that vibration from heavy machinery is transmissible for long distances, and sometimes with unexpected intensity. Now that the authorities have awakened, they are said to be deeply concerned at the threatened danger, but what they are going to do we cannot say. If the atmospheric disturbance proves to be of little or no practical detriment, the problem may perhaps be solved by isolating the engine foundations, or by substituting turbines for the present motors. If such remedies are shown to be of doubtful efficacy, either the generating-station will have to be shut down or the observatory removed to some more secluded site. In any event, the rate-payers of London or the taxpayers of the country will suffer heavily for the blunder which has been made.

The Canal Commission. IF no evidence of particularly striking character has been taken so far by the Canals and Waterways Commission, the witnesses examined have brought forward facts and expressed views that fully deserve careful consideration. Mr. de Salis, on behalf of the carrying interest of the Midlands, testified to the vitality remaining in the waterways of England, and stated that it would be hard to find any other industry which had managed to survive for so long a period as the water carriers trade almost in its original state. Mr. Bartholomew, M.Inst.C.E., who has executed numerous improvements on the Aire and Calder Navigation during the past fifty years, referring to the well-known fact that the closing of canals by railway companies had been detrimental to the public interest, pointed out that there would be much difficulty in making good the mischief done in the past. He believed that if selected routes were improved they would prove remunerative and be of great public service. We may add that the experience of the Aire and Calder Navigation shows this to be by no means unlikely. Mr. Waddy, of the Gloucester and Birmingham Navigation Company, suggested that railways and canals could work together with advantage instead of regarding each other as antagonists. This view was distinctly supported by the evidence of Sir Cecil Hertslet, who showed that the Belgian Government, as proprietors of the national railways and canals, have proved that each means of transport has its own appropriate sphere, and that, quite apart from any question of profit, an enormous benefit has been secured by the industrial and mercantile classes by the excellent canal system of that country.

The Shipdon Tunnel. EXPERIENCE gained during the execution of the Shipdon Tunnel, which really comprises two distinct tunnels separated by a distance of about 50 ft., should be

most useful for the future guidance of engineers. Apart from the unprecedented magnitude of the operations, the methods adopted for dealing with the problem of ventilation and for removing the large volumes of cold and hot water encountered, the rapidity with which the work was performed, and the wonderful accuracy attained in driving the tunnels, all constitute valuable object lessons. In 1901 a spring was tapped, causing an outflow of water at the rate of 16,000 gallons a minute, the difficulties and dangers which then arose being so great that independent engineers felt certain the works would have to be abandoned. In 1903 greater difficulties were caused by the tapping of hot springs flooding the workings with water at temperatures ranging from 114 deg. to 130 deg. Fahrenheit, and once more it was feared that the tunnel would never be completed. However, by impounding the hot water behind steel bulkheads, and by cooling the atmosphere, the resumption of work was rendered possible, and in February, 1905, the headings were finally connected. Electric trains now perform the passage in about twenty-three minutes, and the efficiency of the ventilation apparatus is such that the maximum interior temperature is only 83 deg. Fahrenheit, or little more than 4 deg. above that of the external air in summer-time. Cooling sprays will be brought into operation before long, and from experiments recently made it is believed that the temperature in the warmest parts of the tunnel will be reduced to about 66 deg. Fahrenheit. The spray apparatus has already been in use, but cannot be regularly employed until the electric cables and motors have been adequately protected.

A New German Canal. AN admirable example is set by the district council of Teltow, in Prussia, to some similar bodies in this country who are too fond of inaugurating works of glorification and works intended to benefit one class at the expense of others, in preference to undertakings which are of advantage to all sections of the community. The example to which we refer is the Teltow Canal, built at a cost of 2,000,000*l.*, establishing a valuable connexion between the eastern and western canal systems of Prussia. The canal is about 24 miles long, and in addition to effecting a material decrease in the length of the barge route between the east and the west, will have the effect of relieving the existing congestion of river traffic through Berlin. No fewer than fifty road and railway bridges had to be built over the new waterway, and five harbour basins have been constructed at points convenient for the transhipment of merchandise to the capital by railway. In the central part of the channel the canal has a minimum width of 65 ft., and permits the passage of vessels of 600 tons register, with a draught of 5 ft. 9 in. One lock has been provided to adjust the difference of about 9 ft. between the levels of the Upper Spree and the Havel. This work is a double lock, having a system of sluices arranged so that when two vessels are passing through the chambers in opposite directions, only half the usual quantity of water is

required for locking. Haulage is effected by means of electric locomotives running on tracks laid along the banks and drawing current from overhead cables. It is estimated that the initial traffic will not be less than 1,400,000 metric tons per annum, and as towage will be conducted exclusively by the district council, the rates charged will insure a satisfactory return for the capital outlay.

Paving Passages not Thoroughfares. A POINT of some interest has been decided in the case of *Harrison v. The Owner of New-street Mews* ("Current Law Reports"). The appellant was proceeding on behalf of the Council of the Borough of Southwark for penalties under the Metropolitan Management Act, 1855, against the freeholder of the mews for failing to pave with asphalt a passage through the same, not being a thoroughfare to the satisfaction of the Council. The respondent's predecessor in title had in 1892 paved the mews with macadam on the requisition of the Vestry, the predecessors of the Council, and the surface had twice since been repaired by the freeholder. The Court held that under sects. 99 and 100 of the Metropolitan Management Act, 1855, the owner was not liable to pave a second time with different material. The decision, however, only covers proceedings under this Act for penalties, a question upon which the Divisional Court is a final tribunal, and the Court left the question open whether under sect. 81 of the Amending Act of 1862, the Council could not have done the work themselves and recovered the expenses from the owner. The decision, therefore, does not carry the question very far, as the Council in future will adopt the latter course.

Standard Templates for Pipe Flanges. HAVING already settled standard dimensions for pipe flanges by the Report issued in December, 1904, the Engineering Standards Committee have now introduced standard templates for the purpose of enabling pipe-makers and contractors to comply with their recommendations. Engineers and architects are aware of the difficulties experienced in consequence of the fact that flanges, purporting to be drilled to given dimensions, frequently refuse to go together, either because the bolt circles differ slightly, or because the spacing is not quite uniform. Troubles of the kind are not necessarily obviated by the establishment and adoption of standard dimensions, for variations are almost inevitable in the workshops of different firms. With the object of insuring the requisite accuracy in the templates for issue to manufacturers and contractors, the committee caused a complete set of male templates to be made for all sizes and drillings specified in the standard tables for pipe flanges. These templates were produced with extreme care, and having been measured and certified at the National Physical Laboratory were preserved as official standards. The commercial sets of templates are being manufactured by a firm having special machinery for stamping core discs for electrical machinery, and who are accustomed to work of great accuracy. As no sets are issued unless

they have been found correct after comparison with the verified standards, there is every reason for confidence in the exactitude of the templates now offered by the committee. In the interests of the architectural and engineering professions it is desirable that the existence of these templates should be widely known, as without their use the full benefits of standardisation cannot possibly be secured.

A New Use for Oxygen. SERIOUS inconvenience is often experienced in blast furnace practice by the closing of tapholes by solid iron so that they cannot be opened without delay by means of ordinary appliances. The trouble is even more pronounced if the blast tuyeres become closed. Hitherto, the opening of closed tapholes and tuyeres has been effected by driving a steel bar through the metal or by applying heat furnished by coke, petroleum, or furnace gas, or generated by a strong current of electricity. These methods are open to objections which do not apply to the oxygen process recently described by the Chevalier de Schwarz to the members of the Iron and Steel Institute. By the application of compressed oxygen it is found that a closed taphole or tuyere can be cleared in a few minutes. The gas is employed in such a way that the iron commences to burn, and a degree of heat is developed which is said to be about 5,000 times that produced by burning an equal volume of hydrogen. The efficiency of the process is shown by the fact that a solid block of cold iron 16 in. thick has been pierced within two minutes. Several blast furnaces in England, France, Germany, and Belgium have already adopted the oxygen process, the application of which has been extended in Belgium to the cutting of boiler plates and tubes. The apparatus is simple and inexpensive, and the quantity of gas used is very small in proportion to the work performed.

Fatal Electric Accidents. ALTHOUGH the Board of Trade rules for the protection of the employees in electrical works are generally considered quite satisfactory, yet the number of fatalities due to electric shock in this country has been steadily increasing since 1899. In that year a foreman joiner was killed when disconnecting a transformer, but in 1904 eight and in 1905 eleven persons were killed by electric shock. It is important, therefore, to consider the causes contributing to these accidents. Some of them were due simply to foolhardiness, which no rules on the part of employers can prevent. In one case the plugs of a 2,000-volt rectifier were adjusted without using the rubber gloves always provided for the purpose, and in another case the electrician crawled among bare high-tension wires in order to search for a leak. Other accidents were due to pure absence of mind. A particularly sad case occurred last year when a perfectly competent electrician accidentally touched a terminal at 500 volts when warning workmen not to touch it. What impressed us most, however, in reading the list, is the large number which are due to comparatively speaking low voltages. Most electricians would

not hesitate for a moment to cut a wire with pliers when the current is flowing, provided that they knew that the pressure was not more than 200 volts. A master electrician, however, was killed in Kennington last year by doing this. The special circumstances were that he was standing on damp earth with nails in his boots, and his hands were moist. Another case was that of the clockwinder to the Leeds Market Hall clock, the gong of which is operated by an alternating current at 200 volts. It was given on evidence that he had a weak heart. The most inexplicable case of all is that of the sub-station employee of the Scarborough Electric Light Works, who was dusting switches with gloves on, and yet was found dead with his head three inches from the nearest live terminal, the pressure being only 130 volts. It is highly probable that owing to physiological reasons there are a few people who are extremely susceptible to electric shocks.

Westminster County Court. It is stated that the County Court on the west side, upper end of St. Martin's-lane, is to be shortly rebuilt. The Westminster County Court was established in 1846, and for a short while the business of the Court was conducted in the old Court of Requests, formerly a Baptist Chapel, on the east side of Castle-street, Leicester-square—see a plan of St. Martin-in-the-Fields Parish, 1799, in the *Builder*, July 2, 1904. The Court House in St. Martin's-lane was erected, in part, on the site of No. 82, which had been "Young Slaughter's" (or "New Slaughter's") coffee-house since about 1760, when the original house took the name of "Old Slaughter's." The latter was at No. 75, pulled down in the winter of 1843-4 for the laying out of Cranbourne-street. The jurisdiction of the County Court extended over a very wide area bounded by the City between the river-side and Holborn Bars; High Holborn, Oxford-street, and Bayswater-road; a winding line from the north end of the Serpentine to Chelsea railway-bridge; and the Thames on the south-east and south. Those limits are fairly coterminous with the older confines, since reduced, of the parish of St. Margaret. A few years ago proposals were made for removing the Court to the Town Hall in Caxton-street, vacated by the Corporation of the City of Westminster.

The Gateway, Viciars' Close, Wells. AN appeal is made for contributions to a sum of 1,000*l.*, the estimated cost of the repair of the Common Hall, over the gateway leading into Viciars' Close, Wells Cathedral, which is found to be in a dangerous condition of decay. The gateway, of which an illustration, after a drawing by Mr. Roland W. Paul, is published in the *Builder* of August 18, 1894, is one of the two giving access to the Close, which, together with that of the Bishop's Palace, were built by Bishop Beckington, who was consecrated in October, 1443; the three gateways bear his rebus, a flaming beacon and tun, illustrated in our number of February 18, 1888, which appears also on his buildings at Lincoln College, Oxford.

The Viciars' Close was originally built by Walter de Hull, Canon of Wells, and improved in 1348 by Bishop Ralph de Salopia, who rebuilt the college for the residence of the vicars and choristers. Bishop Beckington enlarged the college, and augmented its endowment. The revenues, computed to be 72*l.* 10*s.* 9*d.* per annum in 26 Henry VIII., escaped from forfeiture at the time of the Dissolution, and Queen Elizabeth refunded the college for from fourteen to twenty vicars. Pugin brought out an illustrated volume upon the buildings which constitute one of our most precious and charming examples of domestic architecture of the time. The "Chain Gate" across the Bath-road (see our view of February 18, 1888) communicates, by means of a gallery, with the staircase of the Chapter House, on the north side of the Cathedral. The college has its own hall, with buttery, etc., chapel, and library; the houses occupy two sides of the Close; the chapel, on the north side, was refitted and decorated with sgraffito work by J. D. Sedding and Mr. Heywood Sumner.

FURTHER NOTES ON PICTURES AT THE ROYAL ACADEMY.

We have spoken in our first article, in the week of the opening of the Royal Academy, of the leading pictures of the year. There are, however, many works which, if not of the first importance, are well worth notice, and we may proceed to draw attention to some of these, taking them mainly in the order of numbering.

In the Gallery I. Mr. Albert Goodwin's "Venice" (3) is a fine kind of vision of the beauty of Venice, only a little spoiled by the treatment of the sea, which conveys the idea of colour only without having the appearance of water; there is little or no light reflected from it. In a somewhat similar manner Mr. Wetherbee's beautifully composed little pastoral, "A Sleeping Shepherd" (5), loses a little of its effect from the too solid treatment of the sky—too solid, that is, for the key of the rest of the picture; the sky presses on the foreground too much. The centre of the south wall is occupied by Mr. H. W. B. Davis's "Ceriggwynion, Radnorshire" (13), one of his extended landscape views with cattle in the foreground; the animals are painted with more force than is usual with him, and are thus of great value in throwing back the middle distance. Mr. Briton Riviere surprises us agreeably by a piece of pure landscape, "The Day After the Storm" (9), in which there is no study of animal life except some seagulls which are quite subordinate; the picture is a fine broadly painted study of a cliff coast sloping down to the shore, and among the smaller landscapes of the year is quite one of the best; there is a power of style about it which we miss in Sir E. Waterlow's "Antibes" (17), which forms a pendant to it; a charmingly composed picture, as his always are, but weak in style of execution compared with Mr. Riviere's. Mr. Harold Speed has got hold of rather a new subject in "The Temple at Tivoli by Moonlight" (21); as a piece of general effect it is successful, though one does not quite see why there should be a shimmer of light on the entablature and none on the columns. Mr. Parsons's "Calm Before a Storm" (44) is a true bit of country landscape effect, especially in the appearance one often sees of the harsh green of distant trees as compared with the storm cloud behind them. Mr. Padday, who has established himself as the painter of shipwrecked people, makes a good dramatic effect out of "Sinbad the Sailor" (45) flourishing his turban to catch the attention of an approaching ship, only one is puzzled to know why he did not get out to the rocks on the left, as he evidently might easily have done, instead of remaining ensconced between two cliffs where his figure would be much less conspicuous; the position may be better for the picture, but it gives an impression of

unreality to it. Mr. Sargent's Presentation Portrait of Lord Roberts (41) is rather marred as a picture by the inevitable emphasis given to the uniform and the eminent soldier's numerous decorations; such portraits must be painted on occasion, no doubt, but they are of value as likenesses rather than as works of art. The most satisfactory portrait in the first room is Mr. Cope's half-length of "Viscount St. Aldwyn" (16), a very good example of frank and unpretending portraiture, in which, though likeness is evidently the principal object, all hardness of texture is avoided.

In Gallery II. Mrs. Normand's nude "Echo" (57) is not up to her usual standard, and could hardly have claimed a better position than has been given to it. There seems to be a turn for painting rainbows this year—there are several about, but Mrs. Hunter's "The Bow in the Cloud" (60) suggests a coloured ribbon rather than a rainbow, and is the weakest point in an otherwise clever little picture. Miss Wood's "Spring in Worcestershire" (62) and Mr. MacBride's "Sheep Dipping, Kirkcudbright" (68), are examples of a particular manner of painting landscape which has a good many followers at present, whereby a kind of woolly texture is imparted to the whole, foreground and distance alike, which escapes certainly all charge of realism and makes landscape the art of giving an impression through pigment and not of producing illusion; but somehow it is not satisfactory; one wants to know what has become of the atmosphere and of aerial effect. Mrs. Forbes's "The Winter's Tale" (83) belongs also, in another way, to the region of a rather forced convention; the effect may be called "vigorous" or by such other adjectives, but the result is that it is flat in effect; the patches of sunlight on the bank at some distance behind the three figures are put in so strong that they look at first sight as if they belonged to the figures—parts of their garments fluttering out; it is impossible in nature that lights on the ground could ever have so positive an effect in relation to foreground figures; it is a coarse way of painting, giving the facts but ignoring their relation to each other, which defeats its own end. Mr. Clausen is in the opposite but better extreme in "The Green Fields" (109), which is almost mystical in its evanescent indications of gleams of light and shadow over the landscape; but this is a beautiful and poetic little picture. The Academy must have been rather put to it for a central work for the west wall of Gallery II. (commonly the situation chosen for one of the strongest works of the year), when they filled the place with Mr. Sant's picture of the pathetic event (as the painter seems to have considered it) of the admission of the first Lady Fellow to the Linnean Society. Mr. Sargent's portrait of Mrs. Frederick Guest (116) shows a finely painted and expressive head relieved against a background of dark foliage; Mr. Ralph Peacock shows fine colour and a sweet child's face in his portrait called "Mary" (119); Mr. Swan exhibits his diploma work, "Tigers Drinking" (129), in which more particularly should be noticed the manner in which the framework of the stooping animal is indicated; and Mr. W. G. Simmonds, an artist whose name does not seem familiar to us, has a very pretty work under the title "Sweethearts and Wives" (123), women coming along a cliff among the trees fluttering signals to the first of a line of "King's ships," as they were called in those days, sailing parallel with the shore, but the ships are surely older in date than the dress of the ladies would suggest; there is good colour and landscape effect in the small picture.

In Gallery III. Mr. Ayrer Ingram, in "The End of the Voyage" (133), has tried a new effect of sea about which we are sceptical; the colours the sea takes are endless, no doubt, and we have seen it that brown colour in bad weather, but not, as here shown, under a clear sky. Mr. Gow's "Elijah" (132), running before Ahah's chariot is a terrible sample of what may be called the Family Bible class of picture, as Mr. Penrose's "Queen Philippa" (176) suggests a school history book. In Mr. Ludby's "The Cloud" (136) we come upon another rainbow, and this one does look like an aerial effect and not like solid colour. Mr. Arnesby Brown's "Midsummer" (162) is a very real picture of sunlight coming through

the trees; and painted in a broad, free style. The same artist has tried a new line of subject (for him) in "The Pier" (217), a harbour scene somewhat in the manner of Mr. Forbes, one of whose works it certainly recalls. Among sea pictures Mr. Somerscales paints the rescue of the crew of a Russian barque by a Clyde steam trawler (175); a good sea, but not one of his best; and Mr. A. W. Burgess, in "Hopeless—the Morning After the Gale" (164), gives a rather powerful representation of a water-logged steamer with the surf all over her deck. Mr. Clayton Adams's "Flowers of the Field" (178) is at least a very pretty landscape. Mr. Leslie's "Deserted Mill" (179) is a scene of calm and silence painted in that curious and totally conventional brown tone in which he has seen all landscape for the last few years; there is a unity in the work, no doubt, but it is obtained by the entire sacrifice of the real colour of nature; and if, as we understand, this picture has been purchased with the Chantry bequest, we should say, all things considered, that it is an indefensible purchase, and is just a return to the old abuse of buying in the works of their own members. Mr. Dick Peddie makes a very pretty picture, under the title "Penelope" (182), of a young girl unpicking some work by the light (apparently) of a moonlit window. "Nightfall" (229), a twilight scene with cattle, is perhaps Mr. Davis's best work of the year. We ought not, however, to have passed over Mr. Parsons's "The Road to the Shore" (206), a study of a flat barren sea coast landscape which is excellent in truth and finish.

A good deal has been made of Osman Hamdy's curious picture "Jeune Ennir à l'étude" (237), which appears to us to be hardly good enough for what it intends to be; it is a kind of picture to which very high finish would give a value, but the high finish is not there. Mr. W. R. Symonds's "Sheltering from the Storm" (247) is a very charming picture of a rustic maiden seated under a tree, the face is one of the prettiest to be seen in the galleries. Mr. C. W. Wylie's "The Nymph's Pool" (251) is a clever work, but unsatisfying through want of composition and *motif*, the whole thing looks ragged. Mr. Stoll's "Washing-day" (244), on the other hand, is composition and nothing else; figure and subject are totally uninteresting in themselves, but it has what may be called the pictorial element. Mr. Tuke has a very spirited sketch rather than picture of "Sailors Yarning" (264), in which there is a great deal of character; Mr. Mount Loudan's "Mrs. MacGeorge" (269) is a portrait with a great charm of colour and style; and Mr. Hughes-Stanton's "The Lighthouse, Etaples" (276) and Mr. Davis's "Ben Eay, Ross-shire" (279) are two good landscapes, the distant hills in the latter especially true in effect.

The best thing in Gallery V., among those not before noticed, is Mr. Wirgman's fine seated figure, practically a portrait, entitled "Margaret" (334), very fine both in colour and in its broad sweeping style of execution; one of the best things Mr. Wirgman has ever done. Mr. Solomon's large picture of "St. George" (295) carrying off the smirking princess on his shoulder is clever enough as a painting, and as a conception of the subject about as hopelessly vulgar as anything could be.

In Gallery VI. is Miss Kemp-Welch's principal work "The Joy of Life" (356), a set of horses careering in a field; not one of the most interesting of her works. Below it hangs Mr. Adrian Stokes's fine, calm, and bright landscape, "Islands of the Adriatic" (358). Among some smaller landscapes in this room should be noticed Miss Grace Elliott's "Evening on the Marshes, Lynton" (366); Mr. Inglis's "A May Morning—The Gulls' Chapel, Sark" (396) for an admirable bit of foreground; and Mr. Basil Woodhouse's "The Top of the Hill" (403) as a powerful and suggestive bit of composition in landscape.

In Gallery VII. Mr. Fulleyleve gives a well-painted view of "The Acropolis, from the Pnyx, Athens" (432). Mr. Wylie's large picture, "L'Entente Cordiale" (442), illustrates the arrival of the French fleet in Cowes Roads, one of a class of pictures of which he has painted several; but though of course very ably and learnedly carried out, it is more interesting as a record than as a

picture. The modern battleship, notwithstanding that it has a grandeur of its own, certainly does not lend itself as well to the painter's art as the old sailing three-decker. The same painter's little upright picture, "Low Water, Berc-sur-Mer" (499), should be looked at, it gives so truly the impression of a low tide scene. Mr. Compton's "Saleznaz Glacier" (460) is a rather remarkable and powerful painting of a kind of scene not often treated in landscape-painting; and Mr. J. Farquharson's "Evening's Last and Sweetest Hour" (473) is a good example, as good in its way as could well be, of the art of highly finished realism in landscape-painting, which is not however the true end of landscape-painting, though it is the one that appeals most to the public, who like a picture that looks, as people say, as if you could walk into it.

Gallery VIII. contains two small but excellent sea-pieces, Mr. Wylie's "England's Frontier" (509), a study of pure sea and nothing else, and Mr. Henry's "The Squall" (522), with a boat coming up in the foreground shown with remarkable truth of effect. Mr. Board's crowded scene of "The Departure of John and Sebastian Cabot from Bristol" (533) is a good specimen of the typical "historical picture," well executed and perfectly uninteresting. And near this hangs obscurely in a corner a little upright picture, Mr. John Shapland's "Eve" (538), which will be noticed by few of the ordinary sightseers, but which is one of the best things in the whole Academy. Eve stands with her back to the spectator, a figure most graceful in line, half leaning against a tree on which the iridescent coils of the serpent are wound; both in colour and composition this is an admirable and original little work, a real picture in the best artistic sense of the word. We do not remember the artist's name in the past, but we shall certainly look for it in the future.

In the room of Cabinet pictures, Gallery IX., Mr. Val Havers exhibits a picture, rather larger than most in this room, but with a minuteness of execution which renders it suitable to its position, under the title "Ballad of Dead Ladies" (588); a rather remarkable work both in colour and in conception; it is a kind of procession across the picture of some ladies great in story or legend; the separate figures (one of them a nude) are very carefully studied and the effect of the whole is fine; but the insertion of the legend on a gold strip or ribbon in the upper portion of the canvas is rather a blemish and would have been better omitted, or made part of the frame; it catches the eye too persistently and clashes with the rest of the painting. Among other things to be noticed in this room are Mr. Walter West's tragically suggestive interior with a figure, under the title "The Shadow" (602); Miss Catherine Wood's Still Life study, "Opals" (618); Mr. Val Davis's little figure in a rich costume, "The Answer" (621); and Mr. T. Maybank's perfectly charming picture of nude children dancing on the seashore—"Come Unto These Yellow Sands" (661).

Mr. Corbet's "Presepio" (683) in Gallery X. seems rather like a kind of translation of the story of the Nativity into actual life; it is rather scattered in composition and uncertain in intent, but has a great deal of good work in it, and the figure of the mother with her infant reclining in the stall is very charming. In "The Ebb-tide" (692) we have a very good landscape by Miss Walford; a stretch of flat marshy land round an ebbing river, and a foreground very carefully studied. Mr. Albert Goodwin exhibits a study of the effect of "The Tropic Night—Jamaica" (706), which is singular in effect but may be true for all we know to the contrary. Then we have Miss Fortescue Brickdale's powerfully treated allegory, "The Uninvited Guest" (707), which seems to be a great puzzle to many of the visitors. The scene is a wedding, and the uninvited guest is Love, who sits among thorns and briars looking with a nobly-expressed indignation after the bride, going off with her husband, but wholly occupied with her dress. The work is not so satisfying in colour as some of Miss Brickdale's, but it is finely composed and expressed. Higher up on the same wall is another and much larger allegorical picture of which the same cannot be said—Mr. Goetze's "The Ever-Open Door" (710), a religious allegory in bad colour and bad

composition, but perfectly intelligible to the average spectator, to whom it is a kind of godsend. Mr. Lorner has a pretty nursery picture, "Hush!" (712), the scene of which is the same room with the same open window which he used some years ago for a picture of an unhappy bride summoned to the wedding by her child bridesmaids. Mr. Frank Bramley's portrait of Earl Cairns (713), in a dark uniform of some kind, is a fine work of its class. Mr. Farquharson presents us with another realistic landscape, a snow scene (720), also exceedingly complete and illusory. What does Mr. Waugh mean by calling his sea-piece "Mid-Atlantic—the Roaring Forties" (737)? The foreground water has all the effect of shoal water; anything less suggestive of the mid-Atlantic we can hardly imagine.

In Gallery XI. is a sea-painting of another order, in Mr. Hemy's principal work, "Lower Away" (609), another episode in that cruise of a small yacht of which we have seen two others already, the first being the ever-memorable "Youth"; and we have again the splendid painting of the sea and the rush of the boat through the water; the artist has not quite equalled "Youth," but it is the same hand, the same knowledge of the sea and of craft. There is nothing else in the room equal to this; but Mr. Arnesby Brown's "September" (763), with its two hayricks standing up against the sky, is a good landscape made out of very simple materials; and Mr. T. C. Gotch's "The Culprit—A Comedy" (766) is a clever and bright piece of humour in the representation of children.

THE MANCHESTER ROYAL EXCHANGE.

FROM A CORRESPONDENT.

THE erection of a new Exchange, or an additional wing to the present one, is now under consideration in Manchester.

The building is one of the most important commercial marts in existence; and difficulties have gradually arisen as the building has become overcrowded. When it was erected, during the years 1866-9, accommodation was provided to meet the estimated requirements of at least a century in advance, so far as the experienced Board of Directors could foresee; but business has grown so rapidly in Lancashire during recent years that the Exchange, though a large building, 210 ft. long by 195 ft. in width, is now too small for the requirements of the day.

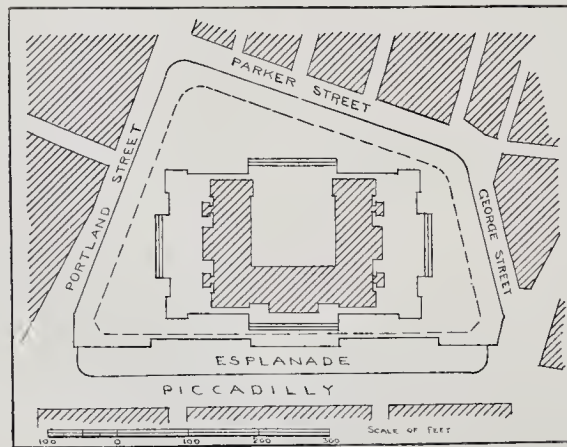

Fig. 1.

The annexed plan (Fig. 1) represents one of the suggestions which have been made. The largest open space in the centre of Manchester was bought some few years ago by the Corporation for 400,000. At present it is occupied by the Royal Infirmary. The Trustees, to provide funds for a new one, which is now being erected by a London

architect, sold it to the Corporation. The sketch plan shows the present infirmary buildings opened in the centre, with a considerable open area around, enclosed by Piccadilly, Portland-street, George-street, and Parker-street, and overlooked by warehouses and hotels. Portions of this site, now, as stated above, municipal property, have been utilised to widen the surrounding streets, as indicated by the dotted lines. The suggested new Exchange is also shown. It will be noticed that it would be considerably larger than the present infirmary buildings, supposing it were made half as large again as the present Exchange; nothing less would suffice. In order that such a building should be erected by the Corporation the Exchange would have to become public property, instead of being owned as at present by a private company; and this preliminary is now being hotly discussed by the ratepayers, by the City Council, and by the frequenters of the Exchange from different points of view. The latter are a most important body, about 8,000 strong, and, as they pay a three-guinea annual subscription each, they probably form the controlling factor. The essential point is that of finance, as the amounts involved run into more than a million, and there is a strong local feeling against increasing the municipal debt, which is already the largest in the country.

When the infirmary site was purchased it was proposed to utilise it for the erection of a Reference Library and an Art Gallery, which would have formed a group of buildings corresponding to the well-known Walker's Art Gallery and Picton Reading-room in Liverpool. The estimated expenditure would be approximately as follows:—For the purchase of the present Exchange, about 800,000l.; for the erection of a new one, as shown on the sketch, at least 250,000l. Both these amounts would be in addition to the cost of the site given above. The sketch plan shows that there would not be space left on the site for a Library and Art Gallery, and no combination is conceivable by which the three buildings could be united into one, as all three would require top light, and could not be above the first-floor level. Additional central sites would have to be purchased for the Library and Art Gallery. A most important and interesting competition would take place should the ratepayers during the next few months decide in favour of such a vast expenditure

ably object to what would after all only be a makeshift, as it would be quite impossible to transform an Exchange into a good library. The former is a building consisting essentially of one large room, in this case with a floor area more than an acre in extent, whilst the requirements and subdivisions of a large library are much more complicated.

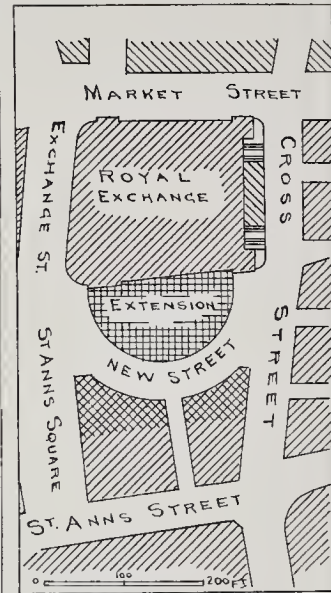

Fig. 2.

The alternative scheme is shown in the sketch plan (Fig. 2). The Exchange would be retained by the present owners, and Corporation aid and funds would not be required. The sketch shows the Exchange as it was rebuilt forty years ago, surrounded on all sides by streets, of which three are important ones—Market-street, Cross-street, and Exchange-street. On the south side a semi-circular addition, or wing, would be added, extending over the site of the less important of the four streets, which would be set back as shown, following the curve of the new building; it is named on the sketch plan "new street." On the concave-side of the new street a new block of shops and offices would be erected, the elevations of which would take their keynote from the present Exchange. The narrow street running into St. Ann's-street could be modified into an ornamental-covered arcade of shops; but that is not essential. There can be little doubt that this suggestion, made by a Manchester architect, is the only possible solution of a difficult problem.

The Board of Directors of the Exchange, owing a building bounded on all sides by streets, found themselves compelled by the persistent increase of members to provide additional floor space, but they were quite unable to suggest any means of enlarging their building; they, therefore, a few weeks ago formally suggested to the Corporation the erection of a larger Exchange on the infirmary site, as already described.

The scheme shown on Sketch No. 2 was then worked out and submitted to them, and one of the two now described and sketched, probably the latter, will be carried out with as little delay as possible so as to relieve the overcrowding on market days. The rentals which would be earned by the second scheme would make it pay for itself, and it would add an important street improvement to the centre of the city just where good shops and offices are in demand.

The present Exchange was designed by Messrs. Mills & Murgatroyd, two well-known Manchester architects of the last generation, several of whose buildings

have been illustrated in the *Builder* during the last fifty years. The commission was obtained in an open competition, which was discussed in the *Builder* at the time and could be readily referred to. The erection of the building was a task of considerable difficulty; it had to be built in two sections, as the site included that of the old Exchange, which continued in use whilst the first half of the present building was being erected. It is in the Corinthian style, with massive columns and pilasters, and the semi-circular addition shown on the sketch plan is so sited as to maintain the architectural dignity and importance of the present elevations, to which it would be subordinated.

A clumsy addition, either in plan or elevation, would ruin the present elevation. An oblong or square addition would throw the present elevations out of the centre, but the extension proposed would leave them intact, as it grows naturally out of the present building. Several other suggestions have been made, but they are so evidently the work of amateurs, and are open to so many objections, that they need not be seriously discussed.

PROVINCIAL FIRE-STATIONS.

The means of dealing with outbreaks of fire in many of our large towns are far from complete or effective, and in rural districts matters are even worse. Under sect. 12 of the Local Government Act, 1894, any parish council may obtain power to borrow money for such purpose. The amount that may be borrowed must not exceed one-half of the assessable value of the parish, and the annual repayment of the principal and interest must be included in the sixpenny rate to which the council is limited. Money borrowed for the general purposes of the Lighting and Watching Act of 1855 must be determined annually by a parish meeting, and raised by special rate, in which land is assessed at one-third only of its full value.

Under the provisions of the Local Government Act, 1894 (sect. 6), there are transferred to the parish council the powers, duties, and liabilities of the vestries and of the overseers, so far as regards the provisions of fire appliances and their maintenance. These powers are stated in sect. 29 of the Poor Law Amendment Act, 1867, as follows:—

"If the vestry of any parish where there is no town council, local board, or other authority competent to provide the same, after due notice, shall resolve that the overseers shall provide any fire-engine, ladders, or fire-escape for general use in the neighbourhood, the overseers shall provide the same, and pay out of the poor rate the cost thereof, and of procuring a proper place wherein to keep the same, and of maintaining it, as well as such engine, ladder, or escape acquired by the parish in any manner for such use, in a fit state of repair, and the charges of such persons as may be necessary for the use thereof, and the cost of suitable implements and accoutrements."

Other Acts relating to the subject of fire-protection have been passed from time to time, including:— Fire-prevention (Metropolis) Act, 1774; Fire-prevention (Metropolis) Act, 1785; Fire-prevention (Metropolis) Act, 1838; False Alarm of Fires Act, 1895.

The Local Government Act of 1894 provides for the grouping of small parishes, which might be taken advantage of in matters of fire-protection.

The planning of a fire-station must obviously depend upon the number of men and the quantity of appliances to be housed therein. All the structural and other arrangements should be directed to the provision of means for the prompt discharge of the engines, apparatus, and men to the locality of the fire. The engine-room walls should be preferably of glazed brick. The doors should be set back from the footway for the safety of the public, and provided with some kind of quick-opening automatic gear, working in conjunction with the ringing of the fire alarm, and should automatically switch on the lights of the engine-room, stables, firemen's bedrooms, etc., and also communicate the alarm to the stables if situated any distance.

A fire-station usually comprises engine-house, recreation-room, workshop, watch-room, stables, and the necessary bedrooms, etc., for the housing of the staff. In the case of small towns, where the firemen give their services voluntary or otherwise, they are communicated with by a system of call bells or housed in cottages near the fire-station.

The site of a fire-station should occupy a central position in the business part of the town, with easy access for the purpose of making a quick exit from the station. Sites situated in a narrow street or lane or at the foot of steep inclines should be avoided, and also those where great congestion of traffic is possible. In small towns the fire-station is usually incorporated with municipal buildings, or may be incorporated with the public baths and wash-houses.

In a fire-station of any pretension stables should be provided communicating direct with the engine-room, the harness being hung in position overhead or over the engines. Horses are, however, frequently hired for the purpose by payment of an annual sum as retaining fee, which varies according to circumstances, plus an agreed sum per horse for every turn out. The stables should be located as near as possible to the fire-station, and in electrical communication with it or a police station, or otherwise according to arrangement. As the majority of fires occur during the evening or night it is often possible to requisition the horses of the authorities employed for other purposes. In any case, stabling should be provided either at or near the fire-station, so that the horses are immediately available in case of an alarm of fire. An enclosed yard for drilling and engine-cleaning purposes should be provided in a fire-station of any size.

Formerly watch-towers were provided as a means to locate outbreaks of fire. It is not a little curious, perhaps, that it was in the Barbican, which has recently been the scene of so disastrous a fire, that the Romans kept watch in a certain tower, the remains of which still existed to the north of that thoroughfare until early in the XVIIth century, in order to give notice of conflagrations or the approach of an invading army. Watch-towers are now superseded by alarm-posts, etc. Towers are, however, frequently erected for architectural effect, and for the purpose of drying the hose after its use, as it retains moisture which, if not attended to, is a serious matter, the life of fire-hose depending almost entirely upon the treatment it receives; that is, of course, assuming that it is of satisfactory quality.

The well of the staircase is also sometimes used for the purpose of drying the hose, which is usually in 50 ft. or 100 ft. lengths. Provision should be made for the hoisting-tackle necessary and drainage of the drip-pings from the hose. The process of drying and draining should be as short as possible. A hose, properly cleaned and dried and stored in a dry and well ventilated place when not in use, has its life considerably lengthened.

The staircase of fire-stations should either be central or placed so that every man has an equal chance of reaching the engine-room as quickly as possible from his sleeping apartments. Short, wide flights and wide landings should be provided. Winders must not be used under any circumstances, being fatal to the quick assemblage of men in case of an alarm. Sliding-poles, or slides, communicating direct from the sleeping floor to the engine-room are frequently provided so that the men may quickly and easily reach it.

When the firemen are housed on the premises slipper baths, supplied with hot and cold water, should be provided for the use of the men after a long attendance at a fire, the grease, oil, and smoky dirt accumulated being difficult to remove with cold water.

Mains for fire-extinguishing purposes should not be less than 4 in. internal diameter under any circumstances; 6 in. is considered a satisfactory minimum.

It would be very difficult, if not impossible, to state any exact rules that should govern the fire-protection of towns, as scarcely two towns are alike in the matter of danger from fire. The equipment of provincial fire brigades is rapidly approxim-

ing that of the Metropolitan Fire Brigade. Liverpool, it is said, possesses the two biggest fire-engines in the world. These are further said to be the most powerful known, capable of throwing 1,800 gals. of water per minute and a jet 140 ft. high. The force of the jet is estimated as able to kill a man at a distance of 50 ft. The new motor fire-engines used in Paris weigh 2½ tons each, and travel twenty-five miles an hour. The pumps deliver 2,000 gals. a minute. The first fire-engine sent from America was sent to England in 1731.

In the equipment of a fire-station the selection and size of a steam fire-engine depends chiefly upon the characteristics of the locality. For a fairly flat district an engine with a pumping capacity of 350 gals. per minute is desirable, whilst for a hilly district an engine with a pumping capacity of 250 gals. per minute is preferable, and one possessing lightness with strength. It should be of simple design, and of a type affording the greatest facilities for actual working. The steam fire-engine does not, as a rule, turn out to every alarm of fire. It is somewhat of a reserve appliance—undoubtedly an important one—for use when a hydrant stream of water is not sufficient either on account of the extent of the fire, or the distance from the hydrants, or where the nearest available water supply takes the shape of a river, canal, or pond. The principal of the smaller appliances are the hose and hand escapes, hose-carriage, hand pumps, stand-pipes, etc.

After years of experience the fact still holds good that open pails and buckets filled with water and kept in suitable places in case of fire have not yet been surpassed in efficiency as "first aids" in fire-extinguishing, and that more fires are annually put out by such pails and buckets than by all the other appliances put together. The chief difficulty found in their use is that the water is apt to be found wanting at a critical time, either because of evaporation or its use by some borrower and failure to replenish the supply. To obviate this an inventor has adopted the following means to prevent this occurring. The hooks by which the pails, or buckets, are suspended are fitted up with pieces of spring steel strong enough to lift the pail when nearly empty, but not sufficiently so as to lift a full pail of water. Just over each spring, in such a position as to be out of the way of the handle of the pail, is set a metal point connected with a wire from an open circuit electric battery. So long as the pails are full their weight when hung on their hooks keeps the spring down, but, as soon as the water is removed, or the pail loses a considerable portion of its contents by evaporation or otherwise, the spring of its hook rises and comes in contact with the metal point, and thus closes the battery circuit and rings a bell, at the same time showing an annunciator where the trouble is; the bell continues to ring until the weight of the delinquent pail is restored by being filled with water.

The great fires that have occurred in London during the last few years have brought into prominence the desirability of being able to readily concentrate a large body of men with greater promptitude than had been formerly practicable with the provision of more men and appliances. It has been proposed that large fire-stations should be built, to be supplemented by the provision of a number of small street stations in the immediate neighbourhood of those central stations; an alternative scheme being to include a smaller station in a given district, with a substation in addition, which should be supplied with horses, engines, etc., and in that way the brigade would be scattered rather than concentrated, it being much easier in the event of a large fire to concentrate from the suburbs than it would be if there was a number of stations in a central district.

The risk of damage to property by fire is never absent. The carelessness of workmen, servants, friends, or neighbours, or the explosion of gas, etc., may frustrate the most vigilant precautions of the owner. There are now in most Government buildings, hospitals, museums, etc., independent organisations for watching and for immediately getting hydrants, etc., to work

pending the arrival of the brigade. Several large firms also take the precaution of having some of their employees instructed to this end. At many theatres one man, at least, is employed to act as fireman if required, though these men are not all trained and skilled firemen; it is important that they should be, and kept for fire duty only. Not only abroad, but in many provincial towns, men from the fire brigade attend at theatres during the performances, and in case of an outbreak of fire a message of a proper character can be relied on. The importance of properly qualified firemen being employed in theatres is that they are men who have often seen panic, and have been accustomed to work in a crowd, and, besides knowing how to extinguish fire, appreciate the importance of promptly calling the brigade.

But while the brigade should undoubtedly receive the earliest possible intimation of a fire, this intimation must be a reliable one, otherwise not only is the effort of the brigade wasted, but it may happen that an outbreak during the interval, whilst men and appliances are out in response to a false alarm, may not be promptly attended to with adequate assistance. An important fact which cannot be too widely known is that the firemen are not on the look-out for fires, and cannot act until they receive information of an outbreak of fire. The best method, therefore, of calling the brigade is to pull the nearest fire-alarm or to telephone if the outbreak is at some distance from the station. It may, however, be pointed out that it is a very serious matter to run the risk of giving false calls to the brigade.

The following prices of outfits may be useful to councils and committees and others about to establish a fire brigade:—A captain's outfit can be purchased for 9l. 18s. 6d.; superintendent's, 7l. 11s.; foreman and engineer, 6l. 10s.; foreman, 5l. 12s. The cost of appliances obviously varies with the requirements; a hand fire-pump, with three buckets and 10 ft. of hose, suitable for theatres, music-halls, lodging-houses, and factories may be purchased for about 4l. 10s.; for about 47l. a hand-carriage fire-engine may be purchased, capable of drawing water from well 28 ft. deep from ground surface to water-line. It is capable of being drawn from place to place by one man, and of pumping 55 gals. per minute and 60 ft. high when worked by eight men, or can be used by two men when needed for irrigation purposes, etc. The more general use of motor fire-engines will affect the planning of future fire-stations and necessitate alterations to existing ones. A. C. PASSMORE.

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A YORKSHIRE district meeting of the Association of Municipal and County Engineers was held in the Council Chamber of the Town Hall, Scarborough, on Friday, June 1. Mr. A. E. Collins (Norwich), President, was in the chair, supported by Messrs. W. Weaver (Kensington), H. A. Giles (Westminster, Assistant Secretary), J. P. Norrington (London), J. S. Brodie (Blackpool), T. C. Beaumont (Driffield), A. Beaumont (Beverley), F. Baker (Middlesbrough), H. Bottomley (Bingley), B. Ball (Bexhill-on-Sea), S. Dyer (Bridlington), T. Henry (Retford), A. M. Kerr (Warrington), W. Loveday (Stoke Newington), E. R. Matthews (Bridlington), F. W. Spurr (York), E. J. Silcock (Leeds), T. H. Tarfit (Lofthouse), and others.

The Mayor, in receiving the President and members, said there was no body of officials that a Mayor and Corporation could more fully welcome than a body of borough and county engineers, because all local authorities owed very much to their engineers.

The President, having taken the chair, thanked the Mayor for the kind welcome he had extended to the Association.

The President then stated that they had to deplore the loss of the Yorkshire Secretary, Mr. W. H. Hopkinson, of Keigley, who rendered very valuable service indeed to the Association, and who died in April after a very short illness.

Mr. Beaumont (Driffield) moved the election of Mr. H. W. Smith, of Scarborough,

as District Secretary for Yorkshire, which was seconded by Mr. Baker (Middlesbrough), and carried unanimously.

Mr. H. W. Smith thanked the members for his election.

Municipal Work, Scarborough.

Mr. H. W. Smith, A.M.Inst.C.E., Borough Engineer, read a paper on "Municipal Work in Scarborough." He said Scarborough had for many years enjoyed a reputation for the excellence of its tar-paved roadways, being one of the pioneer towns in respect of this particular class of work. Much of the success attained was largely due to the care and attention of the late Mr. J. Peitch. The author felt that this class of roadway might be more generally adopted in many boroughs where the traffic was light, as it possessed the advantage of being dustless, sanitary, and economical, the cost of the upkeep being reduced to practically a minimum.

There were many forms of tar-paving now on the market known by various names; but he only proposed to give a short description of the methods adopted in Scarborough which differed from these.

The subsoil of the borough was boulder clay, and, as one of the chief factors in the life of a tar-paved roadway was an absolutely dry foundation, the foundation of a roadway of this class consisted of 3 in. of sand, upon which were laid 7 in. of local sandstone or broken bricks, hand-paved, all interstices being filled in with a layer of gravel 3 in. thick (obtained from the beach).

This formation was consolidated and shaped with either a heavy horse-roller or light 8-ton steam-roller when it was ready to receive the tar-paving, which consisted of three coats as follows:—

The first coat was composed of local limestone gathered from the beach along the coast and broken to a 1½-in. gauge, then placed on the hot plates or drying kiln about 8 in. thick, and left till thoroughly dry. After all moisture had been driven off the stone was turned off on to a platform and mixed, whilst hot, with cold gas-tar direct from the works, about ½ cwt. to 1 ton of stone. It was then deposited in heaps ready for use, and was better for being kept two or three months, which remark applied to all classes of tarred stone.

The second coat was composed of water-worn gravel from the beach, screened to 1½-in. gauge, and was prepared as follows:—A layer of gravel, about 5 in. thick, was put on to the hot plates, and was covered by 1½ in. screened gas-works cinders about 1 in. thick, then another 5 in. of gravel, covered with a thin layer of cinders, the whole making about 12 in. thick. When the material was thoroughly dry it was turned over, mixed, and tarred as above—about ½ cwt. of tar to 1 ton of material. The finishing coat was a mixture of fine gravel and ashes, both screened to ½ in. About 5 in. of gravel were first put on to the hot plates, covered with 3 in. of ashes, then another layer of 5 in. of gravel, and a further covering of 3 in. of ashes—in all 16 in. thick. When dry it was turned over and thoroughly mixed, and then incorporated with tar in the proportion of 2 cwt. of tar to 1 ton of material.

Each coat was well rolled in with an 8-ton roller as it was laid on, and the finished surface was sprinkled with local limestone chippings, which considerably brightened the appearance of the road. The total finished thickness when rolled averaged about 4½ in. After an interval of about twelve months, or sooner if required, in about the months of May and June, in fine weather when the road surface had absorbed the heat of the sun, the surface was painted over with cold tar, and sprinkled with fine gravel and limestone chips, and rolled with steam-roller.

This process was repeated every two or three years as necessary, and was the main factor in extending the life of the road. The cost per yard superficial of a roadway of this class, without foundation, was about 2s. 6d. The cost of tarring and dusting (including such light repairs as might be necessary) was about 13d. per superficial yard. The author had experienced some difficulty latterly in obtaining tar of an equal quality to that supplied some years ago before the attention of gas companies was directed to the extraction of the by-products. Never-

theless, by care and rejection of inferior samples, it was still possible to obtain satisfactory results from the tar now obtained without the addition of other ingredients.

The author did not claim for the above form of tar-paved roadway that it was a superior form to a similar roadway constructed of properly tarred limestone broken to a gauge, but ventured to draw the attention of members to it on account of its low cost, and as showing that it was possible to produce a satisfactory roadway from material which could not be described as "ideal" for the purpose.

The footpaths of the borough consisted of York flags and Limer asphalt in the main thoroughfares, the remainder being of tar-paving.

The tar-paving footways were laid on a foundation of sand and 4 in. broken brick, and consisted of a coat of water-worn beach gravel broken to a 1½-in. gauge, with a finishing coat of fine cinders and gravel similar to that described for tar-paved roadways; this was well rolled with a 5-cwt. hand-roller, and a sprinkling of Derby spar or West Riding chips added to brighten the surface. These footpaths were tarred and dusted in a similar fashion to the roads, with the exception that the materials used were of a finer nature.

The cost of the footways, exclusive of foundations, was 1s. 3d. per yard super. A number of important street-improvement works in the nature of widening and improving streets had been carried out, involving an expenditure, including the purchase of property, of 50,789l.

The sewers of the town were divided into two systems discharging direct into the sea, the southern system having its outlet near the east pier, and the northern at Scalby Nab, about a mile north of the borough.

The new marine drive, now in course of construction, formed the connecting-link between the promenades on the South Fore-shore-road, in the south bay, and the Royal Albert-drive, in the north bay, and would, when completed, form one of the finest marine drives possessed by any watering-place in the United Kingdom, it having a total sea-frontage of about 2½ miles. The drive encircled the base of the bold headland known as Castle Hill, and served the twofold object of providing a magnificent and unrivalled marine carriage drive and promenade, and protecting an historic landmark from the erosive action of the sea. Its length of 4,100 ft. from the end of the Albert-drive, in the north bay, to the junction with the east pier, in the south, did not convey any idea of the magnitude of the work. To realise this one must needs first have viewed the beach at the foot of the Castle Hill before the commencement of the work. This beach was strewn with titanic boulders which had fallen from the cliffs above as the result of centuries of buffetings from north-east gales and the action of the wind and weather. Before a single foundation block of the wall could be laid these had to be removed by blasting and steam cranes. The sea-wall, which was built upon the Oxford clay (or shale) forming the base of the cliff, varied in thickness from 17 ft. 6 in. to 33 ft. 8 in. at its base to 6 ft. and 10 ft. at the top, and in heights from 32 ft. to 38 ft. according to its varying degree of exposure to the forces of the north-easterly gales; it presented a concave face to the sea, and was constructed of cement-concrete blocks, backed up by concrete in mass, the blocks varying in weight from 9 tons in the toe blocks to 14 tons as the top of the wall was reached. Over 71,000 cubic yds. or 113,000 tons, of concrete had been used in the construction of the wall. The level of the top of the sea-wall was 19 ft. above high-water mark at O.S.T., whilst its toe for the greater portion of its length was slightly below low-water mark, a circumstance which had added considerably to the difficulty of the work. The space at the back of the wall had been filled in by material taken from the cliff, over 237,000 cubic yds. of material being required for the purpose. Upon this filling was formed a carriage road and footpath 60 ft. in width. The footpath was 20 ft. in width, and was on the sea side of the road. The space between the roadway and the base of the cliff was fenced in by a stone

dyke wall, and protected the roadway from any boulders or loose stones which might fall from the cliff. The work was commenced in the spring of 1897, and the time of completion expiring in 1899. Owing to the exceptional difficulties which were met with in the laying of the foundations and the loss of the gantry erected for the purpose of the works by gales, it was September, 1904, before the two ends of the wall (which were proceeded with simultaneously) were joined up, the last block being laid on October 1, 1904. There yet remained to finish the paving of the surface of the drive, at an estimated cost of 8,000*l.*, and the erection of toll-houses, at an estimated cost of 1,200*l.*, and the reinstatement of certain proportions of the wall which were damaged during construction by gales. Previous to the commencement of the work and during its progress the Corporation had the benefit of the advice of several eminent engineers skilled in sea defence works, whilst the actual superintendence of the work had been carried out under the direction of Mr. J. B. Everett, Assoc. M. Inst. C.E.E., Mr. E. T. Beard, M. Inst. C.E.E., and latterly by the author, who was completing the work. The estimated cost of the work was approximately 110,000*l.* A system of electric tramways will traverse the drive from end to end connected with the tramway system in other parts of the borough.

In order to form an approach road to the marine drive at its southern end and connect it with the South Foreshore-road, the Corporation had cleared away a number of old warehouses and cottages abutting on the harbour, and had constructed a roadway with a minimum width of 60 ft. This work had been carried out by the author, in conjunction with the late resident engineer of the marine drive, at a cost of about 15,000*l.*

The question of sea-defence works was one of great importance, and in this respect Scarborough differed little from other towns on the east coast which were suffering severely from the erosion of the cliffs by the action of the sea.

A sum approaching 150,000*l.* had already been expended on the construction of sea-walls, and the author was strongly of opinion that the time had arrived when steps should be taken to obtain some aid, either by a grant from the National Exchequer or by sanctioning loans at a low rate of interest and the extension of the period for the repayment of same.

The construction of the sea-walls had created additional scour, and it had been necessary from time to time to construct and extend aprons in front of the same. These remarks particularly applied to the Royal Albert drive, in the north bay, where the bed of the sea consisting of shale had been eroded to a depth of 7 ft. since the construction of the wall in 1888.

The author was now constructing four experimental wooden groynes, and already an improvement in the state of the beach was observable.

Considerable attention had been paid by the Council to the provision of lavatory accommodation in the borough, and he had constructed a number of lavatories for both sexes, both under and above ground, at a total cost of over 4,920*l.*

Attendants (male and female) during the season were provided at such of the lavatories as were fitted with washing accommodation, etc.; the remainder had automatic locks fitted to the water-closets, and were visited periodically by an attendant. A revenue of 565*l.* was obtained from this source during the past year.

Scarborough was very happily situated in respect of public parks and pleasure-grounds, there being no less than eleven of these distributed over the borough. Whilst none of them were of any great extent, they present many unusual and interesting features, owing in the main to their being constructed upon the sides of cliffs in both bays.

The author had laid out the St. Nicholas Gardens (which adjoined the Town Hall), the Esplanade, and extension of Holbeck Gardens, Falsgrave Park, Manor-road Recreation Ground and Bowling Green, in addition to the establishment of a nursery garden, in which plants and shrubs for the above were reared.

The Corporation had been from time immemorial the owners of an estate known as

the Weaponness Estate, comprising 557 acres. The estate comprised agricultural land and farm-buildings, woods and plantations (which were open for the enjoyment of the public), and building land.

The author had laid out and developed a large area of this estate in building sites, which should in years to come afford a considerable relief to the rates.

Mr. W. Weaver (London) proposed a vote of thanks to Mr. Smith for his paper. He remarked that intelligent appreciation had been taken of the natural advantages of Scarborough to turn them by artificial means to the very best account. The marine drive was a work of considerable magnitude, which was being carried out in the face of very strong opposing forces of Nature, and it called for considerable skill and ingenuity on the part of the engineer to combat those forces. The tar-paved roadways of Scarborough had always been referred to at their meetings with admiration. At present traffic was in a transition state, and, with the displacement of horses in favor of motor traffic, they would have to go still further in the way of amendment of the highways to do away with the plague of dust and noise.

Mr. Brodie (Blackpool), who seconded, remarked that Scarborough had always been regarded as the Mecca of the tar-paving surveyor. He also referred at some length to the work in connexion with the marine drive, and said they would be more than human if they could guarantee against all the attacks of the forces of Nature.

The vote of thanks was accorded. The marine drive was then inspected; after which the members were entertained to luncheon at the Grand Hotel by Mr. H. W. Smith and Mr. Rowntree, a member of the Council. In the afternoon the depot was visited and the tar-paved roads inspected.

The Mayor and Mayoress entertained the members to tea at the Town Hall.

On Saturday there was a visit to the water-works.

THE QUANTITY SURVEYORS' ASSOCIATION (INCORPORATED).

The annual general meeting of this Association was held on Wednesday, May 30, at the Holborn Restaurant, the President (Mr. Walter Lawrence, F.S.I.) in the chair.

The minutes of the previous meeting were duly read and confirmed, and the result of the election for members of Council for the ensuing year declared, showing the following elected as London members—Messrs. A. J. Gate, F.S.I., A. G. Cross, F.S.I., W. R. Hood, F.S.I., H. England, R. L. Curtis, jun., H. W. Crickmay, W. W. Barber, and S. Chatfield Clarke, F.S.I.; as provincial members—Messrs. H. Curtis-Card, F.S.I., R. J. Tollit, Arnold Harris, F.S.I., and W. Hoffman Wood.

The President, reviewing the work done by the Council during the past year, congratulated the Association upon the steady increase of membership the total number on the roll being 155 members and four students, and also upon its eminently satisfactory financial position. Out of fifteen candidates who entered for the examinations, which, by the courtesy of the Governors, were held this year at King's College, the following passed the final examination—Messrs. G. Sylvester Taylor, E. G. Huggins, W. G. Walder, L. C. Veale, A. Stratton, and F. M. Gilbert; while in the preliminary examination qualifying for admission as students the following satisfied the examiners—Messrs. D. A. Roberts, E. T. Parr, and Donald Hewitt. An examination was held simultaneously in Pretoria, the results of which had not yet been received. A rather important departure had been made in the professional examination this year by the elimination of papers on abstracting and billing, an additional day being devoted to the subject of "taking-off."

After alluding to the useful work done by the Committee on Professional Practice, which had dealt with a considerable number of questions raised by members, and to the formation of the Belfast Quantity Surveyors' Society of which body the original members are also members of this Association, the President stated that, in order to redeem the promise made to the members a year ago, the Council had recently issued a scale

of fees, which, however, is intended to apply to works undertaken for public bodies only. This scale of fees had been sent to upwards of 1,800 public authorities in England and Wales, and, from the numerous replies and letters on the subject the Council had received, it was hoped it would be generally adopted, and so to a great extent that undesirable practice of a public body inviting men to tender for the supply of their professional services would cease, although the Council admitted that its failure to secure the co-operation of the Surveyors' Institution towards mitigating this evil was a matter for regret.

The President next referred to the "Standardisation of Quantities," saying that this question had been under consideration by the Council practically since the formation of the Association, and had been fully discussed after a paper on the subject had been read by Mr. A. G. Cross. Subsequently a paper by the late John Leaning was read at the Surveyors' Institution, and letters on the same subject had appeared in the professional papers. The Council recognised that, except with the co-operation of the other bodies interested, it was impossible to move in the matter, and had, therefore, approached some of the leading institutions or societies to whom this question should appeal, with a view to the holding a conference on the subject. Pending the receipt of definite replies the matter must remain in abeyance.

In conclusion, the President expressed his own personal regret, and the regret of the Council generally, at the resignation of Mr. F. B. Hollis, the late Honorary Secretary and Treasurer, and his thanks to the members and to the Council for their courtesy during the two years in which he had occupied the chair.

Mr. H. T. A. Chidgey, in moving the adoption of the Council's Report and balance-sheet, congratulated the Council upon its year of office and the work accomplished. He associated himself with the President in his expression of regret at Mr. F. B. Hollis' resignation, and referred to the great service Mr. Hollis had rendered to the Association from its inception. Although very glad that the Council had issued a scale of fees intended to be used by public bodies, the Council was, in his opinion, very wise in not publishing one to apply to private work.

Mr. W. R. Hood, F.S.I., seconded the motion.

Mr. C. W. Ball (Southsea) expressed the fear that the Council's action in issuing the scale of fees broadcast among public bodies would prove to be inimical to the interests of some of the members. His work lay almost exclusively among public bodies, and the fees he received were very considerably in excess of those laid down in the scale.

The President, in reply, stated that if Mr. Ball practised in London he would very soon learn that the majority of London authorities pay ridiculously inadequate fees to their quantity surveyors, and instanced a recent experience of his in which he was asked to quote for preparing the quantities for some building for a London Borough Council. The building was to cost 3,000*l.*, the quantity surveyor was expected to correct the specification, and his charge was to include the supply of fifty copies of the bills. The lowest tenderer (happily not a member of this Association) was appointed to do the work at an inclusive fee of 28*l.*

Mr. R. J. Tollit, as a provincial member of Council, wished to assure Mr. Ball that the interests of the provincial members were not neglected by the Council. He personally heartily agreed with Mr. Ball in his statement that the scale of fees which had been issued was a very low one, and that, as the outcome of its publication, some of the provincial members would suffer, and for this reason he had opposed its issue. From some of the statements made by members of Council while the matter was under discussion, and also from the President's remarks that afternoon, he had arrived at the conclusion that London quantity surveyors accepted very small fees indeed.

Mr. T. Woodbridge Biggs, who supported the motion for the adoption of the Report, stated, as his opinion, that if the newly-issued scale of fees were thoroughly established as a recognised scale in London (which would be a very difficult matter to achieve), and

the provincial surveyors would support it and get similar fees for themselves, the provincial members would be in an infinitely better position than the London members, as the cost of preparing the work (always done at high pressure in London) was lower in the provinces.

The motion was then carried unanimously.

A vote of thanks to the Auditors (Messrs. E. D. Nixon and H. J. West, F.S.I.) was then passed on the motion of Mr. W. R. Hood, F.S.I., seconded by Mr. C. A. Kennett, P.A.S.I.

Mr. England moved a vote of thanks to the Scrutineers, which was seconded by Mr. E. A. Wylie, and carried unanimously, to which Mr. C. A. Kennett replied.

Mr. A. J. Gate, F.S.I. (Vice-President), in proposing a hearty vote of thanks to the President, referred to the arduous duties Mr. Lawrence had performed on behalf of the Association during the last two years and to the difficulties and the opposition with which the Association had to contend at the outset of its career. But for the tact and skill the President had displayed the Association would not have been carried through some of its earlier troubles.

Mr. A. G. Cross, F.S.I. (Hon. Secretary), in seconding the vote of thanks, remarked that future generations of quantity surveyors would recognise what a debt of gratitude they owed to Mr. Lawrence, the first President of the Association, the existence of which Association was, in his opinion, essential (he felt almost justified in saying) to the continued existence of the quantity surveyor.

The President, in replying, thanked all those with whom he had been associated during the time he had had the honour of being President, and hoped that the members would adhere to the scale of fees the Association had issued, whatever self-sacrifice that course might entail.

The meeting then terminated.

A Council meeting was subsequently held, at which, we learn, Mr. A. J. Gate, F.S.I., was elected President, and Mr. H. Curtis-Card, F.S.I., and Mr. W. R. Hood, F.S.I., Vice-Presidents for the ensuing year. Mr. H. T. A. Chidgey was elected to the vacant seat on the Council caused by the resignation of Mr. A. G. Cross, F.S.I., who was elected Honorary Secretary.

BOOKS.

The Model Village and its Cottages: Bournville, Illustrated. By W. ALEXANDER HARVEY, Architect, London. (B. T. Batsford, 94, High Holborn, 1906.)

MR. HARVEY has made into a book a paper read before the Architectural Association in 1904 on Bournville and the model village. The subject is a very large one, interesting from whatever point of view it is approached; most interesting when the full significance of the foundation of such communities is understood in all their bearings. The foundation of a model village on proper lines depends very much on the unselfish efforts of the thinking section of society; their success must needs be left to the judgment of future generations. At a time like the present, when, architecturally, each man does what seems right in his own eyes, a little beneficent tyranny would be a good thing. Our suburbs spring up with alarming rapidity, and the wretched character of the houses, combined with the smallness of the gardens, cannot but be detrimental to the moral and physical health of the class that live in them.

The evil of the existing state of things is realised, there is no need to enlarge upon it here. The author of the book before us has been able, in company with the founder of Bournville, to give a great deal of time and thought to the production of a model village suitable to the requirements of the case. The housing problem is equally pressing both in the town and in the country. In town districts the artisan should be near his work and yet live in suitable surroundings; in rural districts cottages for the labourer should be obtainable to prevent the rural exodus. Bournville is an attempt to solve the problem on the fringe of a great city. It has enjoyed, what in the present state of things we believe to be an advantage, a beneficent dictatorship in the person of its founder. Mr. Harvey, the

architect of the village, is, to a certain extent, at least in sympathy with the problem before him (we speak, of course, entirely from the witness of the book before us). He realises what many educated people do not, including, we fear, many architects, that the beauty of a house does not depend upon the amount of ornament crammed into it, but rather upon its fitness, both in its shape and in the materials of which it is composed, for the purpose for which it is intended. We must get back to that; the picturesqueness and quaint beauty of the old work which we all so much admire, was not a self-conscious effort, it was the result of doing the thing in the right way with the materials at hand, the outcome of generations of consecutive work and thought.

This country is rich in cottage architecture of the past; nearly every county shows its local tradition of the way the work was done; therefore, wherever a model village is founded the methods and materials of the old cottages of the neighbourhood should be studied for the lessons they have to teach. If this rule were conscientiously carried out by the wish of architect and client alike, how greatly would the appearance of acres of modern buildings be improved?

Mr. Harvey's cottages at Bournville, in the majority of instances, show the sound characteristics of the old work; the well-pitched shapely roof giving the feeling of homeliness and protection; windows of adequate but not too great an area, properly placed; and chimneys well grouped in large stacks. The cottages are in pairs or groups of three or four, each pair or group differing from the next. Attractive as are the larger groups, the pairs are the best from the practical point of view. Gardens are more easily divided up with semi-detached cottages than with rows, and in the model village the garden is of the first importance; moreover, in groups of cottages, the centre ones are much more difficult to plan successfully. There is much useful information in the book, though the tables of cost of the executed work are likely to fill fellow-architects with despair, so low are they compared with the cost of building in the south. Here and there the senseless and ugly sloping buttress and battered chimney is allowed to creep in, and in some examples the plans show unfortunate lapses into slovenliness, but these faults occur only in a small minority of the examples shown.

Chinese Art. By S. W. BUSHELL, C.M.G., B.Sc., M.D. Vol. II. (London: Board of Education, South Kensington, 1906.)

MR. BUSHELL'S second volume on Chinese Art is perhaps not of so special an interest to architects as was his first; yet the six chapters on Pottery, Glass, Enamels, Jewellery, Textiles, and Pictorial Art, which go to make it up, cannot fail to please the lover of beautiful things. Perhaps the keynote of the success of Chinese artists, both past and present, may be found in the following passage which occurs in the chapter upon glass:—"A snuff-bottle of plain glass," says the author, "is occasionally painted by hand with the picture pencilled in sepia or filled in with colours. In this case the colours are painted on inside to preserve them from friction; the execution of the brushwork through the narrow opening of the bottle on the inner surface of the glass being a perfect marvel of skill and patience tripping over self-imposed restrictions, such as only a Chinese artist could delight in and bring to a successful result." It is, indeed, this tripping over self-imposed restrictions which seems to have invested all Chinese *objets d'art* with a subtle charm; and what is true of their work upon glass is equally true with regard to porcelain or enamel.

In the small space at his disposal Mr. Bushell has managed to write a fairly-detailed historical description of the various branches of art under consideration. In the opening chapter one learns that Chinese ceramic art "is, in all probability, an indigenous culture, and has been developed continuously from the rudest origin in Chinese soil." Porcelain, its "highest achievement," Mr. Bushell would assert, was unquestionably a Chinese invention. He traces in no dull fashion the progress of the art through the various dynasties. He points out that "pottery has always been an important adjunct to Chinese architecture." A

common practice for many years has been the use of moulded antefixal ornaments of terra-cotta, and the roofing of buildings "with enamelled tiles coloured in obedience to strict sumptuary laws." The method of application is compared to that of the fixing of salt-glazed ware in Europe. Porcelain itself is divided into five classes arranged chronologically. The numerous illustrations with which this chapter is enriched enables the reader to understand upon what broad lines this most interesting branch of art has progressed. One could only wish that the author had been able to give coloured plates. It is occasionally a little difficult to realise correctly the true magnificence of a particular vase or bowl from a photograph. In an exceedingly useful appendix to this essay Mr. Bushell gives lists of the various marks to be found on Chinese ceramic work.

The two succeeding chapters on glass and the various sorts of enamels are considerably shorter, but fully illustrated. Enamelling itself seems to have been introduced into China at a comparatively late period from Western Asia. Some very fine enamelled vases are shown, so fine, indeed, as to make a visit to the museum seem almost a matter of necessity. Jewellery is given a separate chapter, though not of very great importance; but, as the author remarks, "in the art of filigree-work the Chinese jeweller has attained such proficiency as to make it in some degree distinctive of the country." Silk has always been an important material in China, and some of the work on silk is of extraordinary beauty.

The last chapter on pictorial art makes an important finish to an interesting book. Mr. Bushell calls attention to the graphic quality of Chinese painting, remarking that the artists are "first of all draughtsmen and calligraphists." Their colour, too, is no less remarkable than their composition. The introduction of Buddhism into the country had an enormous influence upon its art, though the author does not consider, as some have maintained, that it absolutely brought it into being. The volume is an admirable exposition of a difficult subject, and the illustrations, which number 135, are thoroughly representative. The book is correctly printed.

The Old Stone Crosses of Dorset. By ALFRED POPE. (London: Chiswick Press, 1906.)

THE extant remains of old crosses are not nearly so numerous in Dorsetshire as in other western counties. Much diligence has apparently been expended in gathering together information as to the crosses of this shire, with the result that the total, including a variety of mere stumps or bases, is somewhat under sixty. All the more interesting of these are well illustrated in a series of photogravure plates which give the chief value to the volume. Mr. Pope, in his preface, says:—"I am an architect"; he might have added, "nor am I an archaeologist." These two facts are quite apparent throughout the letterpress. For instance, the very first plate in the book depicts the "Cross and Hand" stone on Batcombe Down, which appears to be a highly-interesting example of a Saxon filleted pillar stone; but it is assigned by Mr. Pope to the XIVth century. The somewhat slipshod character of the descriptions may be gathered from a brief sentence as to this pillar:—"It is said to be of Purbeck marble, but this seems doubtful. If a Dorsetshire gentleman is not capable of recognising Purbeck marble, it is scarcely wise of him to write about the stone crosses of his county. And if he did not possess that faculty, he might surely have appealed to someone better informed ere writing such a sentence."

There is a good plate of the fine old cross standing in the High-street, Stalbridge, and another of the beautiful restoration of the cross at Shillingstone, effected by Mr. C. E. Ponting.

Dorchester (Dorset). By F. R. and SIDNEY HEATH. London: The Homeland Association, 1905-6.

THIS guide, being No. 46 of the Homeland Series, gives a very full and well-written description of this most interesting west-country town. As its name implies, it was an important place in Roman times, and in

the County Museum will be found many evidences of the fact. In the immediate neighbourhood are the earthworks of Poundbury and the great British work at Maiden Castle, and a large number of valuable examples of mediæval work, both churches and houses. Among the latter are the fine houses at Athelhampton, Wolfeton, and Melcombe's Bingham, the first and last showing in some of their detail and ornament a strong resemblance to work of a similar kind in South Somerset. Not far north are the remains of the Abbey of Cerne, while within a few miles south is the charming chapel at Abbotsbury and the picturesque, though scanty, traces of the abbey. The page illustrations are chiefly from photographs; the illustrations in the text are not, however, up to the standard of excellence reached in many of the volumes of the series; that of the gateway of Cerne Abbey is particularly poor. To the majority of visitors the picturesque neighbourhood will recall the works of Mr. Thomas Hardy, whose early training as an architect doubtless has had no slight influence on his vivid descriptions of the buildings and places in his "Wessex" novels. He has written a "foreword" to this guide, and has revised a list of places of interest mentioned in his works.

Dorking and Leatherhead. By JOSEPH E. MORRIS. B.A. London: The Homeland Association; 1906.

THIS is one of the Homeland Handbooks, in this case constituting a guide for the cyclist or pedestrian (if there are any of the latter tribe left—we know of one at all events) through one of the most beautiful districts with easy reach of London; a part of Surrey where one finds beauties wherever one turns. Mr. Morris has done his work very well, giving a fund of information about local history and associations which serve to add to the interest of the district, and the book is accompanied by a detailed map reprinted by permission from the inch-to-a-mile Ordnance map, and which gives of course the by-roads and lanes as well as the main roads. Dorking is taken as the centre point of the map, which includes the country for six or seven miles east and west of it.

A History of Westmoreland. By R. S. FERGUSON. (Cheap Edition.) London: Elliot Stock, 1905.

WE are glad to welcome a second and cheap edition of the late Chancellor Ferguson's popular history of Westmoreland. We considered it one of the best of Mr. Stock's series when first issued, and it is pleasant to think that there is sufficient demand for so accurate and interesting a work to justify its republication. One of the most interesting sections is that which deals with the Jacobite outbreaks of 1715 and 1745. In the concluding chapter there are many admirable observations on the domestic architecture of Westmoreland, which was so largely influenced by the circumstances under which the inhabitants lived, for they were continually exposed to raids and forays from the North. The kernel of many an old farmhouse, both in Westmoreland and Cumberland, is the lower story of a "peel tower," round which the rest of the buildings gradually gathered.

BOOKS RECEIVED.

BRITISH CANALS: IS THEIR RESUSCITATION PRACTICABLE? By Edwin A. Pratt. (John Murray. 2s. 6d.)

CONCRETE-BLOCK MANUFACTURE. By Harmon Howard Rice. (Chapman & Hall.)

CLASS ILLUSTRATIONS FOR THE STUDY OF ARCHITECTURAL HISTORY. (FOUR SERIES OF PLATES.) By Banister F. Fletcher. (B. T. Batsford. 15s. 6d.)

CORRECTION.—In our last issue, on page 623, under the heading "Miscellaneous," we printed a paragraph stating that the new War Office building, Whitehall, is heated by apparatus patented and supplied by the Brightside Foundry and Engineering Company, Ltd., Sheffield. It appears that this is incorrect, and that the system which has been carried out is that of the Atmospheric Steam Heating Company, Ltd., Gray's Inn-road, London, W.C. The Brightside Foundry and Engineering Company, Ltd., installed the system under the Atmospheric Steam Heating Company's licence.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XXII.

THE SLIDE-RULE IN TECHNICAL CALCULATIONS (continued).

Division.

IN Article XIX, the method of performing division by means of scales C and D was explained sufficiently, but no reference was then made to the upper scales of the slide-rule.

Scales A and B.—When scales A and B are employed for division, the rule for finding the number of digits in the quotient is different from that to be observed in connexion with scales C and D.

Rule (1).—Moving the slide towards the right, if the process of division can be completely performed on the left-hand portion of scale A, the quotient read on the same scale above the left-hand index of B will contain one more digit than the difference between the number of digits in the dividend and divisor respectively. But if the process involves the use of both portions of scale A, the number of digits in the quotient is the same as the difference between the number of digits in the dividend and the divisor respectively.

This rule can be applied to decimal fractions as well as to whole numbers by taking the number of digits in any decimal fraction as 0, or a minus quantity, according to the number of ciphers immediately following the decimal point.

Inverted Slide.—As in the case of multiplication, the inversion of the slide makes it necessary to reverse the ordinary method of procedure. Consequently the process of division must be conducted like multiplication, otherwise the results would be products instead of quotients, because—as explained in Article XXI—the factors on scales B and C of the slide are automatically converted into the reciprocals of the numbers represented by the values on scales when the slide is used in normal position.

The rules for the number of digits in the quotient are the converse of those adopted with the slide in normal position (see Rules (7) and (8), Article XIX.).

Example (1): Divide 48 by 3.

Set the R.H. index of C¹ opposite 48 on D, and read 16 on D below 3 on C¹.

The difference between the number of digits in the dividend and divisor is (2-1) = 1, and as the slide projects to the left, the number of digits in the quotient, by the converse of Rule (8), Article XIX., is (1+1) = 2. So the required quotient reads 16.

Successive Multiplication and Division.

Many of the calculations necessary in architectural and engineering practice involve the resolution of expressions stated in fractional form, the numerator and denominator each having several terms.

Example (2): Find the value of *x* in the equation

$$x = \frac{2.5 \times 48 \times 15 \times 180}{3.15 \times 1.1 \times 7.8 \times 32}$$

Here we do not multiply together all the terms of the numerator and all the terms of the denominator, and then divide the latter into the former. This would waste time and lead to inaccuracy, as two unnecessary readings and one unnecessary setting would be required, each offering an opening for error.

The proper method is to proceed by alternate division and multiplication, taking the terms in order from beginning to end of the expression as follows:—

(1) Set 315 on C to 2.5 on D, bring the cursor to 48 on C; (2) set 12 on C to the cursor, bring the cursor to 15 on C; (3) set 7.8 on C to the cursor, bring the cursor to 180 on C; (4) set 32 on C to the cursor and read the result 343 on D below the R.H. index of C.

The number of digits in the numerator, less the number of digits in the denominator, by Rules (5) to (8), Article XIX., is (1 + 2 + 2 + 3) - (1 + 2 + 1 + 2) = 2, and as the slide only projects to the right once in multiplication (2), and once in division (3), the deduction of one digit for the former and the addition of one digit for the latter leaves two digits in the result.

Therefore, the value of *x* = 34.3, which is very close to the exact value 34.3406, and as the entire computation can be performed by the slide-rule in less than sixty seconds, the practical utility of the instrument is very clearly demonstrated.

A very convenient way of registering the effect of division with the slide projecting to the right, is to make the sign | (= plus) every time this happens, and to make the sign — (= minus) every time multiplication is performed with the slide to the right, superimposing one sign over another when signs of opposite signification are necessary.

Thus, if we have three operations of division with the slide projecting to the right and two of multiplication with the slide in the same position, the signs || | — — would be written — + +, the first two pairs being regarded as cancelled and | sign as remaining to indicate that one digit must be added to the difference between the number of digits in the numerator and denominator respectively.

Involution and Evolution.

Squares.—As explained in Article XIX., the square of any number on scale D can be found immediately above it on scale A, the cursor being used to assist the eye in reading the value.

In dealing with squares it must be remembered that, if the left-hand portion of scale A is considered as representing numbers commencing at 1, the right-hand portion really represents numbers commencing at 10, and the two portions must not be regarded as two separate and equivalent scales.

Reference to Fig. 16 will make clear the reason for this reminder. If the two portions of scale A were equivalent, we should have 2² = 4 on the left-hand part of A, and 6.325² = 4 on the right-hand part. But, reading the right-hand half of scale A as the continuation of the left-hand half, the first 4 stands for 4 units and the second 4 for 40 units.

It should now be noted (1) that the square of every whole or mixed number from 1 up to, but not including, √10, comprises one digit only, or one digit fewer than twice the number of digits in the number itself; and (2) that the square of every whole or mixed number from √10 up to, but not including, √100, contains twice the number of digits in the original number.

As √10 = 3.162 occurs in the middle of scale D, we are able to deduce the following rule:—

Rule (2).—Every square of a whole number or mixed number read on the left-hand portion of scale A contains, to the left of the decimal point, one digit fewer than twice the number of digits in the number itself, and every square read on the right-hand portion of scale A contains twice the number of digits in the number itself.

This rule applies equally when, for the purposes of computation, the figures and divisions on the two parts of the scale are regarded as having been multiplied by any positive power of 10, but, as shown in the subjoined table, *even* powers must be applied to the left-hand portion, and *odd* powers to the right-hand portion.

TABLE XVII.—POSITION OF THE MULTIPLES OF NUMBERS ON UPPER SCALES OF SLIDE-RULE.

Power.	L. H. Portion Reads.	Power.	R. H. Portion Reads.
10 ⁰	1 to 9	10 ¹	10 to 99
10 ²	100 to 999	10 ²	1,000 to 9,999
10 ³	10,000 to 99,999	10 ³	100,000 to 999,999
10 ⁴	1,000,000 to 9,999,999	10 ⁴	10,000,000 to 99,999,999

In dealing with decimals, Rule (2) requires modification as follows:—

Rule (3).—Every square of a decimal fraction read on the left-hand portion of scale A contains, to the right of the decimal point, one cipher more than twice the number of ciphers to the right of the decimal point in the fraction itself, and every square of a decimal fraction read on the right-hand portion of scale A contains twice the number of ciphers to the right of the decimal point in the fraction itself.

This rule applies equally when the figures and divisions on scale A are regarded as having been multiplied by any negative power of

10 as shown below, *even* powers being applied to the left-hand portion, and *odd* powers to the right-hand portion, as before.

TABLE XVIII.—POSITION OF SUB-MULTIPLES OF NUMBERS ON UPPER SCALES OF SLIDE-RULE.

Power.	L. H. Portion Reads.		Power.	R. H. Portion Reads.	
	to 9+	to 9+		to 9+	to 9+
10 ⁰	1	to 9+	10 ¹	10	to 99+
10 ¹	10	to 99+	10 ²	100	to 999+
10 ²	100	to 999+	10 ³	1000	to 9999+
10 ³	1000	to 9999+	10 ⁴	10000	to 99999+

Example (3): Find the square of 245.

Set the cursor to 245 on D, and as the coincident number 6 is found on the left-hand portion of A, the number of digits in the square by Rule (2) is $(3 \times 2) - 1 = 5$, and the result is taken at 60,000. The exact square = 60,025 will be obtained if we add the square of the last figure.

Example (4): Find the square of 775.

Set the cursor to 775 on D, and as the coincident number 6 is found on the right-hand portion of A, the number of figures in the square by Rule (2) is $(3 \times 2) = 6$, and the result may be taken at 600,000, which is very near 600,625 the exact square.

Example (5): Find the square of 0.01845.

Set the cursor to 1845 on D and read 34 on A. As the reading is made on the left-hand portion of A, the number of ciphers by Rule (3) is $(1 \times 2) + 1 = 3$, and the square is taken at 0.00034. This is very close to 0.0003404025, the exact square.

Example (6): Find the square of 0.00583.

Set the cursor to 583 on D, and read 34 on A. As the reading is made on the right-hand portion of A, the number of ciphers by Rule (3) is $(2 \times 2) = 4$ and the square may be taken at 0.000034, the exact square being 0.0000339889.

The squares of numbers can be found by multiplication in the ordinary manner, a method by which results may be obtained on scale D somewhat more accurately than by direct reference to scale A, as described above.

Square Root.—The operation of extracting a square root is simply a reversal of the process adopted in finding the square of a number.

Consequently, we have the following rules for whole or mixed numbers and decimal fractions.

Rule (4).—For a given whole number or mixed number on the left-hand portion of scale A, the number of digits to the left of the decimal point in the square root equals half the number of digits contained in the given number plus one, and for a given number on the right-hand portion of scale A the square root contains, to the left of the decimal point, half the number of digits contained in the given number.

Rule (5).—For a given decimal fraction on the left-hand portion of scale A the number of ciphers before the first significant figure equals one fewer than half the number of ciphers to the right of the decimal point contained in the given fraction minus one, and for a given decimal fraction on the right-hand portion of scale A the square root contains half the number of ciphers before the first significant figure to the right of the decimal point contained in the given fraction.

The next thing wanted is a rule showing whether any given number whose square root is required must be read in the first instance on the left-hand portion or the right-hand portion of scale A.

Reference to Tables XVII. and XVIII. above shows (1) that numbers and fractions on the left-hand portion of scale A must contain an *odd* number of digits, or an *odd* number of ciphers to the right of the decimal point, and (2) that numbers and fractions on the right-hand portion of scale A must contain an *even* number of digits, or an *even* number of ciphers to the right of the decimal point.

Example (7): Find the square root of 625.

As the integer of this number contains an odd number of digits, it must be taken on the left-hand portion of A; the significant figures of the square root being indicated by the cursor as 25. Then, by Rule (4), the number of digits is $(1 + 1) \div 2 = 1$, and the square root reads 25, which is the exact root.

Example (8): Find the square root of 62.5.

As the integer of this number contains an even number of digits, it must be taken on the right-hand portion of A, the significant figures of its square root being indicated by the cursor as 7.9. Then, by Rule (4), the number of digits is $(2 \div 2) = 1$, and the square root reads 7.9, the exact value being 7.90569415.

Example (9): Find the square root of 0.0001696.

As this fraction has an odd number of ciphers immediately after the decimal point, it must be taken on the left-hand portion of A, the significant figures of the square root being 13. Then, by Rule (5), the number of ciphers is $(3 - 1) \div 2 = 1$ cipher, and the square root reads 0.013, the value to nine places of decimals being 0.013023056.

Example (10): Find the square root of 0.00006649.

Setting the cursor to 6649 on the right-hand portion of A, we find 815 on D, and, by Rule (5), the number of ciphers is $(4 - 2) = 2$. Hence the required square root reads 0.00815, which is correct as far as it goes.

Example (11): Find the value of the expression

$$\sqrt{\frac{1660 \times 75}{154}} = 90$$

This example shows the importance attaching to the rule that numbers containing an *odd* number of digits are to be taken on the left-hand, and numbers containing an *even* number of digits on the right-hand of scale A. Following this rule we set 154 on B, opposite to 1660 on A, and bring the cursor to 75 on B, reading 810 on A, and $\sqrt{8100} = 90$ on D.

If the left-hand and right-hand portions of A and B were used haphazardly, we might have got results equivalent to

$$\sqrt{\frac{1660 \times 75}{154}} = 28.4$$

or

$$\sqrt{\frac{166 \times 75}{154}} = 2.84$$

A more accurate method of finding square roots is to use scales C' and D.

It must be noted, however, that for numbers containing an *odd* number of digits, the right-hand index of C', and for numbers containing an *even* number of digits, the left-hand index of C' is to be employed.

The mode of procedure is:—Set the proper index of C' opposite the number on D whose square root is required, and by the aid of the cursor find two numbers on scales C' and D which are opposite each other. The value so indicated represents the significant figures of the required root.

Example (12): Find the square root of 62.5.

Set the left-hand index of C' to 62.5 on D, and it will be seen that the coincident numbers on C' and D are about 7.905, the correct value being 7.90569415.

Fifty Years Ago.

FROM THE *Builder* OF JUNE 7, 1856.

PUTNEY BRIDGES.

THE conservance of the Thames is supposed to be in the Corporation of London, which enjoys an arbitrary rule from Gravesend to Staines. Its conservance concerns every citizen, since on free navigation and proper regulation depends much of our commercial prosperity, as well as the health of the inhabitants. Some wants may be difficult to supply; there is, however, one very simple matter that comes under their jurisdiction, and that is the due allocation of bridges—first, that the design is a good one; next, that the position is right; and lastly, that it obstructs no way: yet it would seem that little, if any, attention has ever been paid to these things, much as they concern the free intercourse both on the land and water.

Old Putney Bridge has long been the standing reproach of our *pontifical* corporation: it is a sort of mole to obstruct navigation, a relique of antiquity little adapted to vessels and boats such as now navigate the Thames: being about 700 ft. long, it has no fewer than twenty-five pile buttresses, between most of which there is but 15 ft. of space. Scarce a beam of its structure but has been drawn

and replaced so often, that it is all at jars: still, being the property of a private company, the patchwork is kept together so as to pay a dividend, the directory making it a point to discourage traffic on the Lord's day by charging *double tolls!* That is, however, their affair. Railways find that it pays better to encourage the multitude by charging *less on Sunday.*

Another bridge has been lately constructed close to the old one, but diverging from it at an angle of 10 deg.: it is built on the new principle of the tube, with buttresses of concrete compacted in iron cylinders, having four columns on each pier: the design might have been handsome, and, at a comparatively small increased expense, it would have served the purpose of an aqueduct, a footway, and also a carriage-way; yet this bridge *obscures the view of the river, and the aspect of the hamlets of both Fulham and Putney, is dedicated solely to the object of an aqueduct!* The steamers plying up or down had formerly difficulty enough to steer clear of the buttress beams: they have now another breaker ahead in the aqueduct piers. Having cleared Scylla, Charybdis is at hand: there is scarce room in the old bridge waterway for a Richmond boat—our little skiff, on steaming up, hugged close on the timber: then stopped and sidled through.

What on earth were the corporation about when they tolerated the erection of a second bridge alongside the old one? What were the proprietors of crank shares in Old Putney Bridge dreaming of, when they omitted, or forgot, or refused to agree with the water company, to erect a more solid and more permanent structure, that *might have served for all purposes?*

Illustrations.

FRONT OF THE PICCADILLY HOTEL.

THIS is a reproduction from the drawing exhibited in the Royal Academy and described at some length in our last notice of "Architecture at the Royal Academy."

The full title on the plate, which is as written out by Mr. Norman Shaw, explains the position. The plan and construction of the hotel are being carried out by Mr. W. Woodward and Mr. Walter Emden, but the Office of Woods, the ground landlords, required that the exterior architectural design should be furnished by Mr. Norman Shaw, as in the case also of the new elevation to Regent's Quadrant. We should, however, have given the plan of the hotel, but there were difficulties in the way of getting a plan prepared in time, the one first sent by the architects not having been in a form which could be suitably reproduced.

The set back of the building above the second story, with the open colonnade across it, which is the finest feature in the design, is a fortunate substitution, by Mr. Shaw's desire, for a lofty street front with a well behind which was, we understand, first intended.

The line of frontage next Piccadilly will be set back so as to give a width of 80 ft. to Piccadilly. The building internally consists of a sub-basement, with Turkish baths, etc.; a basement; a mezzanine between the basement and the ground floor, and the various stories above shown on Mr. Norman Shaw's elevation.

The shape of the site has made it an awkward one to deal with, but the difficulties have, as far as possible, been overcome. The exterior result will be, as we have already said, an exceedingly fine addition to the architectural ensemble of Piccadilly.

DESIGN FOR THE PEACE PALACE AT THE HAGUE.

The illustration shows the principal elevation and two plans of the design for the Peace Palace sent by Mr. John Belcher, A.R.A.

The object kept in view in the design was to produce a dignified effect by uniting the two parts of the building, which were to be kept entirely distinct in their functions, by means of a large central ball and dome.

The administrative offices are on the first floor next the façade, and the large and small Courts of Justice, with their corridors, etc., balance the library on the other side.

CAPE TOWN.

TEMP. PHOTO'S PRINCE & CO. LONDON 4 & 5 EAST HARRING STREET, FETTER LANE, E.C.

HOUSE NEAR CAPE TOWN, SOUTH AFRICA.—MESSRS. MILNE & SLADDIN, ARCHITECTS.

HOUSE NEAR CAPE TOWN.

This is an illustration of a house in South Africa built by English architects, Messrs. Milne & Sladdin, practising in Cape Town.

As far as general character is concerned the house might be English, but the influence of climatic conditions will be seen in the plan, where the drawing-room, with its comparatively small windows, faces north and east, instead of south and west as it probably would be placed in a house on English soil.

Some consideration has been given to the laying out and arrangement of the garden, but the photograph was evidently taken before the garden had been cleaned off and finished.

MOSAIC FLOOR, POMPEII.

This floor, which is illustrated from measured drawings by Mr. Lionel U. Grace, is in the Fauces of the house at Pompeii now called, in consequence of this floor, the "Casa del Cignale" ("House of the Boar").

The mosaic is executed in slate-coloured marble on a cream-coloured ground. The figure of the boar is given to larger scale, in addition to the general design.

Trade Catalogues.

MESSRS. A. RANSOME & Co., of Newark-on-Trent and London, send us a copy of their 1906 general catalogue of wood-working machinery, which includes detailed particulars and numerous photographic blocks and woodcuts illustrating an immense variety of machinery and auxiliary appliances, not only for the forestry, sawmill, and general wood-working industries, but also for railway carriage and wagon builders, shipbuilders, wheelwrights, box and packing-case makers, and others. Owing to the dimensions attained by the general catalogue, particulars and illustrations of coeprage machinery and sawmill accessories are issued in separate form. In this brief paragraph we cannot attempt to mention even the chief types of machinery illustrated, and must content ourselves by referring readers to the volume itself for particulars.

We have received from "Vulcanite, Ltd.," a pamphlet containing views of many large buildings which have been roofed with their material, showing that it is coming into extensive use among architects. The illustrations of some roof gardens, and of two or three large buildings which hold tanks or ponds of water on roofs waterproofed with vulcanite, are striking proofs of its reliability in this respect.

We have received from "Simbury Decorations" a large book of illustrations of Lin-crusta Walton decorative ceilings and wall coverings, which can be made in almost any colour, and afford an opportunity for a rich decorative covering. Some of the designs we have seen before; their general character in regard to design is exceedingly good, and there is nothing that is in bad taste. "Cameoid," which forms another feature in the book, appears to be an application of the same type of design for friezes and ceilings in high relief, the Lin-crusta-Walton work being in low relief. Among these there are some very fine floral designs for friezes; we may mention especially those named "Italian," "Glenalmond," "Romola," and the two scroll designs under. There are some effective ceilings also in Cameoid.

Mr. Percy Pitman, of Ledbury, sends us some circulars relative to his specialties. One of these is a form of Pelton waterwheel having a new pattern variable discharging nozzle which is said to effect a great saving in the quantity of water consumed, and when the apparatus is fitted with a governor it is claimed that the speed variation under sudden changes of load does not exceed two per cent. The Hector water-motor, for duties

from 4th h.p. to 24 h.p., is described on another sheet, this being a neat and serviceable-looking machine for domestic purposes. The Hector water-motor and dynamo constitutes a compact direct-coupled generating set for charging accumulators. It can be operated with water from the ordinary domestic supply or from hydraulic power mains, and is made in a standard stock size measuring only 12 in. long by 9½ in. wide by 7 in. high, with an output of 50 watts.

Correspondence.

"LIVE AND LET LIVE."

Sir,—The subject matter in Mr. Mayston's letter in the *Builder* of June 2 touches many architects nowadays very forcibly and unpleasantly; indeed, there are few of us who are not in one way or another deprived of the means of reasonable existence by methods that seem very far removed from the opening precept of these remarks. Let the trade element by all means adhere to its own business, but let it free itself from the guilt of encroaching on the domain of other people; it is pretty well known that the brains that produce the "art" fostered by such firms are, even if fairly remunerated, rarely given the credit, which goes to the "firm" only.

It appears from the daily papers still to be immoral to rob from the person, but quite reasonable to rob a railway or a bank, or to absorb the profits made by brains which one strives to live. Our good name seems to be of no importance whatever. I noticed a case recently where, after competition, the work of the winner was used as a medium for the personal profit and gratulation of an official who may have improved, or otherwise, on the work of the competitor, but who probably thinks himself worthy of the credit to himself. In our intense love of our art we seem too ready to give away our talents to those whose only appreciation of them is a financial one to their own benefit.

We are told that the non-employment of the "working classes" is a serious matter. Why not of the "professional classes" also? They bear at least an equal share in the burdens of the State, and are certainly not idlers.

The only remedies for such untoward conditions are to pray for a public with some greater sense of the proportion of things in giving honourable employment to those who deserve it; and to apply the laws of copyright to ourselves, as musical composers and publishers are urged to do. With unity of our forces this should not be an impossibility. If these remedies fail there seems nothing left for us but to follow the example of the proverbial rat, who is said to "leave the sinking ship." May we all be spared from such a *pis aller!*

E. SWINFEN HARRIS, F.R.I.B.A.

COURT OF COMMON COUNCIL.

A MEETING of the Court of Common Council was held at the Guildhall on Thursday last week, Alderman Sir Alfred James Newton presiding, in the absence of the Lord Mayor.

Renovation of Artisans' Dwellings.—The Improvements and Finance Committee recommended that the Artisans' Dwellings in Stone-lane, Houndsditch, should be repaired and repainted at an estimated cost of 2,200l.—The Court agreed.

Proposed Enlargement of the Cleansing Depot.—The Streets Committee reported on the question of providing accommodation at the depot in Upper Thames-street for the Superintendent and Assistant Superintendent of Cleansing, and submitted for approval sketch plans for providing house accommodation above the Gravel Store No. 80, Upper Thames-street, at an estimated cost of 1,050l., including the cost of alterations and repairs necessary to the rooms over the Depot No. 82, Upper Thames-street.

Paving Works.—In consequence of the alterations recently made to the pavements of Cater-street, Houndsditch, the same committee recommended that the existing contracts with the Limer Asphalt Company for maintaining the cartway, and the French Asphalt Company for maintaining the footways of this thoroughfare, should be cancelled, and that fresh tenders should be obtained for paving the widened thoroughfare, at an estimated cost of about 460l., exclusive of the cost of altering any mains, etc., that it may be found necessary to divert.—This was agreed to.

Delegates for the Sanitary Institute Congress.—Mr. H. F. Hepburn, Chairman of the Sanitary Committee, Mr. R. W. Edwards, and the Medical Officer of Health (Dr. Wm. Collingridge), were appointed delegates to represent the Corporation as the sanitary authority for the City of London at the Congress of the Royal Sanitary Institute, to be held at Bristol in July next.

City of London School for Girls.—The City of London Schools Committee were authorised to

expend on structural alterations to the school building and improved equipment of this school, the balance in hand on the construction account, viz., 869l. 16s. 6d., and to draw on the interest funds a sum not exceeding 358l.; and further to expend, out of the City's cash, a sum not exceeding 100l. on repairs to the interior.

WESTMINSTER CITY COUNCIL.

The usual fortnightly meeting of this Council was held on Thursday last week at the City Hall, Charing Cross-road, W.C.

Ebury Bridge Depot and Grosvenor Canal Property.—The Highways Committee submitted a report dealing with the acquisition of this property, stating that they had received a letter from Messrs. Boodle, Hatfield, & Co., to the effect that the Duke of Westminster had accepted the Council's offer of 95,000l. for the purchase of the Grosvenor Canal and the land adjoining; that the withdrawal of the restrictions on the use of the mortuary at Ebury Bridge forms no part of the provisional agreement, but could be arranged, provided a covenant was given not to erect a mortuary or use any existing building for that purpose on the frontage of the land proposed to be sold facing Buckingham Palace-road or Commercial-road in any position facing directly the property of the Duke of Westminster on the opposite side of Buckingham Palace-road or Commercial-road, and provided that the Council transferred to the Duke all their interest (if any) in the areas at the rear of Nos. 104 to 111, Mount-street, Grosvenor-square. The Committee considered the requirements reasonable, and recommended that the terms should be accepted. This was agreed to.

Government Property, Exemption of, from Provisions of the Public Health Act.—On the recommendation of the Public Health Committee it was agreed to appoint Councillors J. Owin Evans and Col. G. B. B. Hobart to represent the Council at a proposed conference of Borough Councils on this matter.

Lighting of Parliament-street and Whitehall.—A lengthy report by the Works Committee dealing with the lighting of these thoroughfares, was referred back.

Charing Cross Subway.—Messrs. Fowler & Hugman were appointed to take out the quantities in connexion with the work of reconstructing the Charing Cross underground conveniences consequent upon the formation of a subway by the Baker-street and Waterloo Railway Company.

General Building News.

CHURCH, SLEEKBURN.—The new church of St. John's, Sleekburn, situated within one or two hundred yards of Bedlington Station, has just been consecrated. The church and fittings are designed in early Perpendicular style by the diocesan architect, Mr. Arthur B. Plummer; Mr. J. Goulding, of Messrs. J. Goulding & Son, of Blyth, being the contractor. The church and boundary enclosures are built with Bedlington Colliery Company's bricks with best stone dressings and tracery. The two aisles are divided from the nave by seven arched arcades. The west window is a seven-light and the east window is a three-light traceried window. The vestries and aisles have cusped triplet windows of slight and varied designs. The whole of the roofing is open timbered and moulded. There are main entrance doors with inner wood porches at the south-west and north-west corners of two aisles. The nave and aisles combined measure 46 ft. across, and the length is 75 ft. The chancel is 35 ft. by 21 ft., with organ chamber in addition, and with clergy and choir vestries in connexion. The church will seat 500 people; the nave is seated with pews and the aisles at present with chairs. The bell is in a turret or fleche over the west end of the nave. The interior piers and all aisle and other arches and door window arches, mullions, buttresses, weatherings, water tables, quoins, and gable crosses are of stone. Miss Easton has given carved oak chancel fittings, viz., choir and clergy seats, Communion-table and rails, and reredos and pulpit; also organ and organ case and screen and mosaic pavement, with marble steps to chancel, and a painted east window by Messrs. Clayton & Bell, of London. The heating apparatus has been carried out by Messrs. Henry Walker & Son; the mosaic pavement by Messrs. Emley & Sons, of Newcastle; the oak carving by Mr. Ralph Holley; and the font by Mr. Robt. Beall; the glazing by Messrs. Atkinson Bros., all of Newcastle. The boundary railings and gates were undertaken by the Star Foundry, of Blyth.

CHRIST CHURCH, EALING.—At a sitting of the Consistory Court of London on May 29, Dr. Tristram, K.C., Chancellor of the Diocese, agreed to issue a faculty authorising some alterations and decorations in the church at the charges of the parishioners. The alterations include the removal of the organ from the north chapel, the erection of a screen or grille between that chapel and the north aisle, the placing of a new organ in a gallery

* We had the drawing printed with Mr. Grace's decorative lettering, and did not notice till too late that the word "Cignale" was spelt wrong. There is no such word as "Cignale" in Italian. Mr. Grace need not feel specially troubled about such a mistake; he has plenty of fellow-sinners to keep him in countenance; it is only one of many instances in our experience of the indifference as to architectural draughtsmen as to the spelling of foreign words which they may have to introduce in a drawing or a description. It would surely be worth while to look in a dictionary and see that a word is right before putting it into print or printed lettering.—En.

at the west end, etc., under Mr. G. F. Bodley's directions and superintendence. Mr. Bodley has prepared a scheme for the decoration of the north chapel, which embodies a standing figure (under life-size) of Our Lord in the act of blessing, and the painting of the roof in the same style as that of the rest of the fabric. Christ Church was built in 1851-2, after Sir G. G. Scott's plans and designs, for the foundress, Miss Lewis.

PRIMITIVE METHODIST CHURCH, DIPTON.—On the 26th ult. the foundation-stones of a new church and Sunday-schools for the Primitive Methodists of Dipton were laid. The church will accommodate 500 worshippers, while the schools will hold 300 children. The building will be of stone, with ornamental frontage to the street. The school is at the rear, and embraces several class-rooms, hall, kitchen, etc. The internal woodwork will be of pitch pine; and the windows will have lead glazing. The architects are Messrs. Davidson & Philipson, of Newcastle, while the contractor is Mr. T. Reynoldson, of Dipton. The total cost of the scheme is about 1,800l.

BAPTIST CHURCH AND SCHOOLS, CONSETT.—The foundation-stones of this church were laid on Wednesday last week. The buildings, which are designed in a late period of Gothic, are faced externally with red brickwork, with white dressings. The present contract for the church, including tower and vestries complete, amounts to 2,619l., and the building will accommodate 448 persons. Messrs. J. Guthrie & Son, of Darlington, are the contractors; and Messrs. George Baines & Son, London, are the architects.

WESLEYAN CHURCH AND SCHOOL, DEANBANK.—It is intended to erect a new Wesleyan Church and school at Deanbank, at an estimated cost of 2,000l. Plans have been prepared by Mr. J. Walton Taylor, architect, of Newcastle-on-Tyne, and the trustees have decided to proceed with the school to seat 300, and afterwards undertake the erection of the church and vestries. The contract for the building of the school and classrooms has been let to Messrs. R. Blackett & Son, of Darlington, and Mr. J. J. Taylor, of Newcastle, is the clerk of the works.

NEW CHANCEL, HECKMONDWIKE CHURCH.—On the 26th ult. the Bishop of Wakefield consecrated a new chancel and side chapel added to the Heckmondwike Parish Church. The new portion is the first instalment in the carrying out of a scheme for the entire rebuilding of the church. It has been built to designs by Mr. C. Hodgson Fowler, of Durham. By extending the new chancel further eastward than the old one a portion of the site of the previous chancel has been utilised for lengthening the nave, and that, in turn, has permitted the making of other improvements. Advantage has also been taken of the opportunity to provide new vestries, and two have been built on the north side of the church, one for the clergy and another for the choir. All the new parts are lighted by electricity. At a cost of nearly 300l., the organ has been rebuilt, and some new steps put in, besides provision being made for it to be electrically blown. From the old portion of the church, built in 1839 out of the money provided by the "Million Act," two side galleries have been removed, and the whole of the interior has been renovated. The cost of the whole of the new work is about 3,000l.

CHURCH EXTENSION, HIRST.—The parish church of St. John's, Seaton Hirst, has been enlarged by the extension of the nave, the addition of an aisle on the south side, and a parish room, at a cost of about 2,000l. The architects were Messrs. Hicks & Charleswood; the builders being Messrs. R. & G. Brown (Amble).

RESTORATION OF WALTON CHURCH.—The dedication of St. Leonard's Church, Walton, after restoration at a cost of about 10,000l., took place on the 28th ult., by the Bishop of Manchester. The new nave has been erected practically on the same site as the old one. There are only two pillars, placed in the transept opening. The architect was the late Mr. J. P. Seddon, who died before the completion of the building.

SCHOOL, DUNDEE.—The contract has been let for the work of erecting a new school in the east end of Dundee. Mr. James H. Langlands is the School Board architect, by whom the plans were prepared. The site has a narrow frontage, but widens out at the back, and has a backyard full of about 9 ft., advantage being taken of this fall to secure an extensive basement. The ground is divided into two parts, and the school placed exactly in the centre, so that the boys' playground is on the south and the girls' on the north. The school is oblong in plan, the end being turned towards Eliza-street, where the main entrance is situated. The basement contains caretaker's house ranged along the frontage facing Eliza-street, two large manual instruction classrooms and drawing classroom, with lavatory and teachers' accommodation running along the south wall. Behind the corridor are stores. Above the north wall are placed staircases, with entrances from the playground, while to the north is the boiler-house and switchboard-room. Along the centre of the basement runs the main air duct, 6 ft. wide, which throws out air from the towers on the west front. The air is propelled along this duct to each apartment by an electric

fan. The main floor has two entrances from the street, an inquiry room on one side and a janitor's room on the other, just outside the glass door. In the main central hall are placed twelve class-rooms, each to accommodate from forty-five to fifty pupils, and cloak-rooms. On the north side of the second floor are the museum cases and art classrooms, which can be made into three separate rooms or one large room as desired. In the north-west corner is the art master's room. On the south side are the cookery rooms, which, like the art classrooms, can be made three separate rooms or one large room. Along the end next Eliza-street is placed the library wall. At the other end are two rooms, which can be converted into one. In the north-west corner is the housewife department, which is as near as possible a replica of a small villa. It comprises an entrance hall, bath-room, kitchen, scullery, parlour, on first floor, and two bedrooms on the upper flat. In the mezzanine are placed teachers' rooms, four in all, for headmaster, headmistress, and assistant teachers. The heating is by low-pressure steam, and the air is heated as it enters the class-rooms. The foul air is carried off by shafts leading to exhausts in the roof. The staircases are all to be constructed of reinforced concrete, covered with tank. The building will be lighted with electric light, but gas will be carried into each kitchen range, so that gas cooking may be taught the pupils if desired. A system of telephones will also be introduced to enable the headmaster to transmit his orders direct to each teacher, and as a precaution against panic in case of fire. The school has classrooms for 1,110 pupils, and subsidiary accommodation in addition. The list of accepted tenders will be found in our Tenders column.

SCHOOLS, WOLVERTON.—New elementary schools for girls and infants, with cookery centre, are now in course of erection at Wolverton, under the Bucks County Education Committee. The principal front of the schools faces Aylesbury-street. The schools will be two stories high, built with heather facing bricks and Bath stone dressings. The basement dimensions are 27 ft. 8 in. by 24 ft., with heating chamber for low-pressure heating apparatus, and coal, coke, etc., stores. The ground floor (infants) consists of eight classrooms, providing accommodation for 402 children, and has a hall 41 ft. 5 in. by 31 ft., with entrance hall 7 ft. to 10 ft. wide, and commodious cloak-room and lavatories. The mezzanine plan consists of teachers' room and store-room, with lavatories for the staff of both girls and infants. The girls' school on first floor consists of eight classrooms, giving accommodation for 418; also with 10 ft. entrance hall and large hall 41 ft. 5 in. by 31 ft., and cloak-rooms, etc. The infants' entrance is on the ground floor from Aylesbury-street, and the girls enter by two staircases from playground, and there is also an infants' exit to playground. There are two playgrounds, also cooking centre, with scullery, coal and coke store, cloak-room, porch, lavatories, etc. The floors are of concrete, and the sanitary arrangements are being superintended by Mr. Alfred E. Abbott (Surveyor to the Stony Stratford and Wolverton Rural District Council). The principal glazed bricks are used. The work is being done under the superintendence of Mr. H. Waterhouse, foreman for Mr. E. Archer, contractor, Northampton, in Old English bond. The contract is about 9,000l.

HOSPITAL, BAGNALL.—The new North Staffordshire Joint Small-pox Hospital, which has just been opened at Bagnall, is designed for thirty-nine beds. This includes the temporary corrugated iron buildings erected some time ago, but not the two concrete sites, which are prepared to receive, at any time in case of a severe epidemic, a sixteen-bed pavilion on each. The present permanent scheme includes an administration block, consisting of doctor's sitting and bed rooms, dispensary, nurses' and matron's rooms, kitchen, scullery, stores, etc., and eleven bedrooms, with an iron fire-escape staircase outside; a discharging block, consisting of undressing, dressing, bath rooms, etc.; the isolation pavilion, comprising four wards, entirely separate from each other, two double and two single-bedded, with clothes and food stores and nurses' duty rooms; a laundry, stables, harness-room, ambulance-shed, disinfecting rooms, and boiler-house. The two concrete sites provided are each suitable for immediately erecting a sixteen-bed pavilion in case of serious epidemic, and each is provided with the necessary drains, roads, etc. In addition there is an incinerator, refuse receptacle, a mortuary block and a water storage tank; a rubble stone wall, about 6 ft. 6 in. high, and built to an average thickness of 2 ft., forms the boundary to the road sides of site, the two remaining sides being enclosed by a close wood fence, 6 ft. 6 in. high. The new buildings are constructed of brick work with red-pressed brick arches, stone on the walls and tiled roofs. The whole of the ground floors to the buildings, with the exception of the living-rooms to the administration block, are constructed with concrete, with a smooth granolithic finish, the upper floors and living-rooms in the administration block being boarded. The whole of the work has been carried

out from the designs and the direct supervision of Mr. Elijah Jones, Architect to the Board, Hanley. The buildings and concrete sets are the work of Mr. James Moss (Milton); drainage, roads, paths, etc., Messrs. J. Horobin & Son (Cobridge); and the sewage disposal works were carried out by Mr. J. Bagnall (Fenton); the whole of the plastering, Messrs. Hill (Hanley); plumbing and painting, Mr. W. Fradley (Hanley); the ironmongery, Mr. G. Hollins (Newcastle); the wrought-iron lamp brackets were carried out by Mr. W. Durose (Tunstall); the baths and lavatories supplied by Messrs. F. Winkle & Co. The cost of the buildings, including boundary walls, fencing, roads, paths, drainage, and sewage works, is about 7,050l.

HOSPITAL EXTENSION, HARROW.—The new block at the Harrow Isolation Hospital in Pinner-lane was opened a short time ago. The block consists of two wards, male and female, the female ward being 36 ft. by 26 ft., with six beds. The male ward was 24 ft. by 26 ft., with four beds. There is a nurse's duty-room, 16 ft. square, bath-room, discharging-room, and to each ward a sanitary annexe; in the hall are provided linen cupboards. The block faces the south, and has a verandah to each ward. The plans were prepared by Mr. J. P. Bennett, Surveyor to the Council, and the contractor was Mr. Simmonds.

FIRE STATION, WESTMINSTER.—The new Fire Station erected in Greycoat-place, Westminster, by the London County Council, was opened recently by Mr. Lewen Sharp, the Chairman of the Fire Brigade Committee of the Council. The work of erecting the station was commenced by the Works Committee in January, 1905. The architect's estimate of the cost of the building was 12,250l. Mr. W. E. Riley, the Superintending Architect of the Council, was the architect of the building. On the ground floor are two appliance rooms; the larger, at the western end of the site, is 38 ft. 9 in. by 35 ft., with accommodation for a steam fire-engine and a long ladder, and stalls for four horses; the smaller, at the eastern end, is about 28 ft. by 35 ft., with accommodation for a horse escape and stalls for two horses. The walls of the rooms are lined with white-glazed bricks, the floors paved with ironstone tiles, having panels of blue stable bricks in same to assist the horses to start. The stalls are drained into covered enamelled iron guttering which is flushed automatically. The watch room, 14 ft. by 10 ft., is placed centrally in the building, and commands (a) appliance rooms; (b) the separate entrance, and approach to the staircase to the quarters on the upper floors; and (c) the yards and offices. Writing-room, lavatory, etc. A small writing-room, a lavatory and dressing space at the foot of the sliding pole are entered from the western end of the larger appliance room. The laundry, 24 ft. by 14 ft., is lined with white glazed bricks and paved with granitic concrete, with hot closet and stoker's adjoining, is entered from the yard, and is approached from the quarters by a secondary staircase from the first floor level. From the yard, which is paved with ironstone tiles, are approached the hose drying tower, the openings of which have been protected for drill purposes; a rest-house for two horses, with fodder store adjoining; workshop stores for coal in bulk, coal in sacks, coke, oil, and wood, and for general purposes, and a coal store to each set of quarters. On the first floor, the western side of the central staircase is occupied by single men's quarters, consisting of a mess-room, 11 ft. by 12 ft. (the planning of which is arranged for a contemplated future addition to the number of quarters), a lavatory and two bath-rooms, and six cubicles about 9 ft. 6 in. Two sliding poles lead to the larger appliance room below. On the eastern side of the staircase is one set of married men's quarters, and the recreation-room, 27 ft. by 18 ft., capable of containing a full-sized billiard table. Two sliding poles lead from this room to the smaller appliance room. On the second floor are two sets of three-room quarters (four rooms), one set of three-room quarters, and two sets of three-room quarters and two common bath-rooms. On the third floor are three sets of three-room quarters, and one set of two-room quarters, and two common bath-rooms. On the fourth floor are two sets of three-room quarters, two spare rooms, and one common bath-room. The building is lighted by electricity. The elevation to Greycoat-place and the short return to same are of Portland stone to a height of 18 ft., and above that of red brick with cut and rubbed brick pilasters and cornice. The appliance room and the single men's corridor, from which the water cubicles are entered, are heated by hot water. A subsidiary boiler is provided for this purpose in the stoker's.

PUBLIC LIBRARY, TIPTON.—A new central public library at Tipton was opened on the 30th ult. The site of the new library is at the corner of the park in the Victoria-road. The contract was given to Mr. E. Secker, erected from plans prepared by Mr. George H. Wynn, architect, Tipton. The exterior of the building is of buff terra-cotta and red bricks. Above the

public entrance to the library is a tower, 66 ft. high, in which it is intended eventually to place a clock tower and a set of chimneys. The library is all arranged on the ground floor, and the whole of the public apartments are entered through folding doors from a large central hall which is approached through an open porch. It is divided into five departments, namely, the lending library, newsroom, magazine-room, juvenile reading-room, and reference library. In the lending library shelves are provided for over 7,000 volumes, and there is accommodation for about 12,000. The magazine-rooms is divided into two by an oak screen, one portion being for the sole use of ladies, the total accommodation being for forty readers. The juvenile reading-room is not yet erected, but is planned as a future extension. The reference library is temporarily provided for in a part of the lending library, but provision has been made for an extension of the building to give increased accommodation for this department when required.

HOTEL, INXIELEAV, N.B.—On the site of the old Royal Hotel, Inxellav, which was destroyed by fire two years ago, a new hotel has been erected. Designed in the Scotch Baronial style, it has been built from plans prepared by Mr. Higgins, of Glasgow.

NURSES' HOME, WEST KIRBY.—An addition to the West Kirby Convalescent Home for Children, in the shape of a nurses' home, was opened on the 26th ult. The new building, erected in three stories, comprises nineteen bedrooms and three furnished sitting-rooms, one on each floor. Altogether the building has cost 2,600*l.*, and has been erected by Mr. W. H. Forde (Birkenhead) to the designs of Mr. Edmund Ware.

BATHS, SUNDERLAND.—The new Hendon-road Baths and Washhouses, which have been rebuilt by the Corporation, were opened on the 29th ult. The building, which was designed by the Borough Engineer (Mr. J. W. Moneur), was erected by the Corporation.

SPA HYDRO, RIPON.—A new spa hydro is to be erected at Ripon from plans prepared by Mr. Sydney D. Kitson, M.A., of Leeds. The principal contract is that of Messrs. W. Wilson & Sons, builders, of Leeds, for a total amount of 25,281*l.* The sub-contractors are:—For joiners' work, Mr. J. H. Coldbeck; painters' work, Mr. J. S. Lowley; and slating, Messrs. Baynes & Beck, all of Ripon. There were altogether eleven tenders for the principal contract, and a number of sub-contractors.

RAILWAY OFFICES, YORK.—The new central offices of the North Eastern Railway Company at York are now nearly completed. The building covers 2,750 yds., and has a frontage of 275 ft. and a depth of 100 ft. In it is provided accommodation for the headquarters and divisional stations—183 rooms in all. The design won the silver medal at the French Exposition two years ago, and is the result of the co-operation of two architects, Mr. W. Bell, chief architect of the North Eastern Railway, and Mr. Horace Field, of London.

Stained Glass & Decoration.

MEMORIAL WINDOW.—ST. MARY'S COLLEGIATE CHURCH, WARWICK.—A painted window has just been dedicated to the memory of Mr. C. E. John William Margets in this church. Mr. C. E. Kempe is the artist. The four lights are filled with the figures of St. Peter, St. James the Great, St. John the Baptist, and St. Martin.

Sanitary and Engineering News.

FISHGARD HARBOUR.—A work of considerable engineering importance now virtually completed on the coast of Pembrokeshire is the harbour in Fishguard Bay, constructed by the Great Western Railway Company. The new port has been established on a somewhat unpromising site, at a place where only a few years ago the sea was bounded by precipitous hills rising more than 300 ft. above water level. By blasting away the rock for a distance of 150 ft. and a height of 200 ft., some two million tons of material have been obtained for the construction of a quay 1,120 ft. long and a breakwater 2,500 ft. long, providing a sheltered water area of about 700 acres. On the land rendered available by blasting operations and reclamation works, the company have erected a large passenger station, and other buildings for dealing with goods traffic, as well as a generating station to provide current for electric light and power. The primary object of the new harbour was the opening of the Fishguard and Rosslare route to Ireland, but the hope is that Fishguard will eventually become a port of call in St. George's Channel for ocean liners plying between Liverpool and Glasgow on one hand and Canada, the United States, South America, Australia, and the East on the other. Considering the remarkable success which—in spite of the half-hearted

co-operation extended by the South-Eastern and Chatham Railway—has attended the efforts of the Harbour Board to convert Dover into a port of call for ocean liners, there is every reason for believing that Fishguard has a great future in the same direction, particularly as it was built and equipped by a railway company whose special objects are to popularise the port and to encourage traffic.

HIGH-LEVEL BRIDGE OVER THE TYNE.—The new high-level bridge which has been built across the Tyne, connecting Gateshead and Newcastle, is to be opened in July. The viaduct is of four spans. The girders are of steel, resting on three river piers and on granite abutments on the north and south banks. The span on each side of the centre pier is 300 ft. long, that from the north pier to the abutment is 232 ft., and from the south pier to the abutment on the Redheugh bank is 191 ft.; while a series of arches form the approaches on each side of the river, those on the southern bank being in two series to the east and the west, so as to give access to the main line south and to Gateshead Station in the north. The sides of the bridge are of plain lattice work, 27 ft. deep, with the usual bracing and struts. The parapets are of steel. The under side of the bridge gives a clear height of 87 ft. above high-water level, and this is sufficient to admit of the passage of the largest sea-going vessels. The span on each side of the centre pier is 300 ft. long, that from the north pier to the abutment is 232 ft., and from the south pier to the abutment on the Redheugh bank is 191 ft.; while a series of arches form the approaches on each side of the river, those on the southern bank being in two series to the east and the west, so as to give access to the main line south and to Gateshead Station in the north. The sides of the bridge are of plain lattice work, 27 ft. deep, with the usual bracing and struts. The parapets are of steel. The under side of the bridge gives a clear height of 87 ft. above high-water level, and this is sufficient to admit of the passage of the largest sea-going vessels. The span on each side of the centre pier is 300 ft. long, that from the north pier to the abutment is 232 ft., and from the south pier to the abutment on the Redheugh bank is 191 ft.; while a series of arches form the approaches on each side of the river, those on the southern bank being in two series to the east and the west, so as to give access to the main line south and to Gateshead Station in the north. The sides of the bridge are of plain lattice work, 27 ft. deep, with the usual bracing and struts. The parapets are of steel. The under side of the bridge gives a clear height of 87 ft. above high-water level, and this is sufficient to admit of the passage of the largest sea-going vessels.

COMBINED DRAINS IN EAST HAM.—The report of the Chief Sanitary Inspector of East Ham, which has just been issued, contains the following passages with regard to combined drains:—"As nearly the whole of the drains which have been reconstructed are old properties, the cost of carrying out the work would have fallen upon the district but for the passing of the East Ham Improvement Act, which directs a drain to be laid to include all combined drains within its meaning. It will be seen that this section is a great financial boon to the borough, for considerably over 1,000*l.* worth of work of this character has been executed during the past year. In the event of stoppage the Council send two men who are wholly employed for this special work of drain clearing, and are intimately acquainted with the construction of the drains, knowing exactly the position of the inspection chambers, and in the event of the drains becoming stopped they know where to open to clear, while strangers usually commence by breaking pipes to unstop a drain. In the absence of public health the Council's system of clearing drains is to be highly commended, for if the work is left to the individual owner to do he usually calls in a person whom he thinks to be a 'cheap man,' with the result that permanent damage is done and covered up, and not until perhaps disease arises does the drains being tested is the work of the jobber disclosed. During the year 2,703 house drains have been cleared by the Council's men, and it is essential to all concerned that stoppages should be cleared speedily and efficiently."

MAIDENS AND DUNURE LIGHT RAILWAY, SCOTLAND.—The Glasgow and South Western Railway Company have just completed the construction of a light railway, twenty miles long, from near Ayr to Girvan, with a hotel at Turnberry. At present the line has but a single track, except at the stations of Alloway, Dunure, and Maidens, which form the only passing places, and at the end junctions and the more important covered ways and bridges. The sixty-five bridges vary from 10 ft. to 70 ft. in span, and there are two viaducts having spans of 100 ft. and 118 ft. respectively. The bridge across the Doon is constructed of masonry, with brick arches; the copes, string course, and ring-heads being of concrete. Concrete or masonry was used for the abutments of the bridges over public roads, the superstructures being of arch plates and cast-iron girders. The steepest incline has a gradient-rate of 1 in 66, and about one million cubic yards of material were removed in the course of the work.

Foreign.

FRANCE.—The project for the forming of a deep-water harbour in the front of the town at Cherbourg has been abandoned. On the other hand, a decree authorising the building of a cement quay on the south side of the commercial basin will shortly be issued. The total cost of the work is estimated at 10,800*l.*—The Medal of Honour in the architectural section of the Salon has been awarded to Mr. Godefroy, pupil of M. Laboux, and architect of the new Prefecture at Limoges, the drawings of which were noticed at some length in our article on "Architecture at the Paris Salon." The medal in painting, we record with regret, has been awarded to M. Rochegrosse for his brutal picture "La Jolie Rouge." In sculpture the

jury have divided the honours between M. Antonin Carlès, sculptor of the Hériot monument, and M. Georges Bareau, sculptor of the "Vision du Poète," which belongs to the Paris Municipality.—The marble altar of the Church of St. Pierre, at Martinique, which was destroyed in the eruption of Mont Pelée, is now being reconstructed in the square of the Church. The architect is M. Marquette, sculptor, and M. Rives, architect, have together completed the model for the monument which a subscription committee propose to erect to the memory of M. Waldeck-Rousseau. The monument consists of a portico under which is a stole carrying a portrait bust, and accompanied by a winged figure. The pedestal is decorated with bas-reliefs. The monument is intended for the Tuileries Gardens, but the Government has not as yet sanctioned its erection.—A school of arts and crafts is to be built on the site of the former abattoirs of Villejuif.—At the Museum of Versailles two new rooms have been opened, devoted to works of art connected with the period of the Revolution, the First Empire, and the Restoration.—The Société des Amis des Arts de Calais are organising an exhibition to be held in that town from September 2 to October 2.—A new Mairie, of graceful architectural design, has been built at Villiers-le-Bel, from the designs of M. G. G. M. Glasquin, architect, of Epinal, has been elected president for the year of the Société des Architectes de l'Est de France.—The picturesque old bridge at Cahors, dating from 1250, is to be rebuilt, as it has fallen into a dangerous condition of dilapidation.—A monument has been erected at Chalon-sur-Saône to the memory of the Duc de Rochefoucauld-Liancourt, founder of the school of arts and crafts in that town. M. Max Blondel is the sculptor.—The municipality of Ancenis have commissioned M. Michel, engineer, of Nantes, to establish a sewerage system in the town, at an estimated cost of 900,000 francs.—The Municipality of Nice have had a bridge built over the Paillon for the accommodation of the inhabitants of the village of Ariane.—The death is announced, at the age of 82, of M. Aubert, the painter, whose *genre* pictures, representing for the most part scenes of ancient Roman life, had a certain success under the Second Empire. He obtained, in 1844, the Prix de Rome in the section of engraving, and received several awards of medals and the cross of the Legion of Honour. He studied painting in the atelier of Delacroix.

SOUTH AFRICA.—The Municipality of Umata are now having drawn up complete plans for a new town hall, at an estimated cost of 16,000*l.* According to a local correspondent there is an unprecedented activity in the building trade in Umata.—The buildings in Cape Town have received a notable addition by the erection of the new premises for the South African Mutual Life Assurance Society, the architects of which are Messrs. W. H. Stucke and W. E. Bannister. The building was begun in 1903, Mr. William Eyre acting as clerk of works.—The new town is to be erected in Cape Town to the order of Mr. J. D. Logan, M.L.C. It will be known as the "Selborne," and the estimated outlay on the building is 120,000*l.* The hotel will have two frontages, one of 87 ft., and one of 150 ft., and a depth of 145 ft. Steel will be largely used in its construction.

THE WALLS OF CADIZ.—Mr. Keyser, the British Consul, in his annual report to the Foreign Office, writes:—Cadiz is almost an island, a fortress surrounded on all sides by a wall, through which there is a gateway into the town. Beyond this entrance stretches a long, narrow belt of sand, dividing the Atlantic from the bay. As circumstances now are it is impossible, within town limits, to extend the available building area. It has been, to quote an oft-written local expression, "a long cherished dream" of the people of Cadiz to demolish a certain portion of these picturesque but now useless walls, in order to obtain space for erecting factories and developing the business portion of the town. This "dream" is not without interest to the foreign traveller, since it includes the laying out of gardens and building of modern hotels. It is proposed to utilise the material obtained in lengthening existing piers and reclaiming land from the sea, thus enabling vessels to load and discharge cargo alongside of wharves instead of, as at present, by means of lighters in the bay. In the prevailing distress through lack of employment local authorities and influential merchants have found opportunity to forward their scheme, and with such energy have they pushed it that at the time of writing (May) the walls are being demolished, and all who desire work can obtain it as they wish wage. It is probable, however, that ultimately the work in all its branches will be handed over to the contractors of the harbour works, for which the material obtained from the walls is intended to be used.

ROSARIO (ARGENTINE REPUBLIC).—The Municipality have recently called for tenders to pave sixty squares or blocks of the more important streets of the town with alga-roba hardwood, to be laid

on a foundation of Portland cement. The stones which comprise the present street pavement will be removed and used in paving sixty blocks of the town further out, hitherto unpaved. A large quantity of cement will be required for this work.

The new central market, a fine building, has been completed and opened to the public. The provincial Government have also completed and opened a public school for girls. Owing to the increasing population and demand for houses, capitalists are investing largely in building, and some fine houses are being put up. It is estimated that buildings to the value of 1,000,000, are now under construction.

ASPHALT FROM SICILY.—According to an official report the quantity of asphalt rock exported from Sicily during last year was 85,497 tons, of which 11,308 tons were sent to the United Kingdom.

PUBLIC WORKS IN NEW SOUTH WALES.

From the Report of the Under-Secretary for Public Works to the Government of New South Wales it appears that of the total expenditure for the year 1905 the amount of 849,922, was laid out on roads, bridges, harbour works, dredging, and other items considered as not giving a direct return on the expenditure, although such works are very necessary for the settlement and prosperity of the country. On railways, water supplies, ferries, sewerage, river, and wharfe works, which yield actual or immediate revenue, the outlay amounted to 1,010,618, and work on public buildings was executed to the extent of 132,933, an expenditure which, if not deducting actual revenue, saves a direct outgo of rent.

Dredging, wharfe, and harbour works have been undertaken on a somewhat extensive scale in the coastal districts, being absolutely necessary to enable produce to be sent to Sydney by sea; and in the absence of railway communication the keeping open of the water highway is really the pivot on which the prosperity of this part of the country turns.

Among water supply works the most important in progress is the Cataract Dam, near Sydney, intended to hold up water to the height of 150 ft., and to create a reservoir with the capacity of 21,000,000 gallons. Satisfactory progress is being made with the dam, and it is hoped that this valuable addition to the Sydney water supply system will be completed about the middle of 1907.

During last year works to the value of over 160,000, were executed on the Central Railway Station, Sydney, designed by Mr. W. L. Vernon, Government architect. The total expenditure upon the station to June 30, 1905, amounted to more than 458,983, excluding the value of surplus lands, and at the time when the Report was written it was hoped that the new premises would be available for the Railway Commissioners by the present month.

So far as the general public are concerned, interest centres largely upon the Roads and Bridges Department, and, although the expenditure last year was more than usually restricted, existing works were well maintained, and the construction of various new roads was commenced, one of the most noteworthy being a highway giving access to the sea at Coff's Harbour, by which a very large tract of Crown land will be opened up between Coramba and Dorrigo. Here, as elsewhere in the State, the timber industry finds employment for many hands, especially on the Dorrigo, where pine and other soft woods are being cut at the rate of millions of feet per annum. Between Maitland and Cessnock increased expenditure has been incurred in opening up roads to and through the new coalfield, and in the neighbourhood of Cobar the expansion in mining has necessitated outlay on similar work. The public are said to be growing rather exacting in the matter of road surfaces, for grades and tracks that a few years ago were considered good are now held to be almost unfitted for traffic requirements.

The State appears to be well supplied with bridges, there being not less than 3,508 in existence, the bulk of which are to be found in the coastal and central districts, and generally it may be said that provision has been made for reasonable means of access at all times along the more important arteries of traffic. These important works, the Pymont and Glebe Island bridges, which cost 145,189, and 107,000, respectively, continue to fulfil their purpose in a satisfactory manner. The traffic over Pymont Bridge last year included 4,000,000 pedestrians and 1,909,315 vehicles, while 10,576 vessels passed through the swing span. The Glebe Island Bridge the traffic included more than 1,000,000 persons and 948,270 vehicles, while 9,369 vessels passed through the opening span.

Further consideration has been given to the great scheme by which it is intended to irrigate an immense area of country adjacent to the Murrumbidgee River, across which a dam, 200 ft. high, will be erected to impound 33,880,864,000 cubic feet of water. Surveys, plans, and estimates, have been prepared, and the whole proposal is now under the consideration of the Public Works Committee.

Taking the Report as a whole, it is evident that, in spite of the restricted funds at the disposal of the Public Works Ministry, a large amount of useful work was performed during 1905, and, so far as we are able to judge, all money available has been expended in a thoroughly judicious manner.

THE CEMENT TRADE ABROAD.

In the consular reports now coming to hand from British representatives in foreign countries there are numerous references to the cement trade. Some of the more important and interesting of these references we subjoin:—

AUSTRIA-HUNGARY (TRIESTE).—The consumption of Portland cement in Austria during 1905 has been a large one. All Austrian cement manufacturers supplied important quantities for the new Austrian railways. The combine of Austrian Portland cement manufacturers and the convention with those of Hungary, caused prices to rule high. The Austrian cement export to foreign countries has been very limited, as, although freights were low, prices offered abroad were not such as to invite special attention to this market.

ITALY (CIVITAVECCHIA).—Cement continues to be one of the principal industries of the district, and the two local factories are yearly increasing their output. So far the cement manufactured at Civitavecchia, which is generally recognised to be of a very superior quality, has never been exported outside of Italy, but some attempts have been lately made to place it on foreign markets.

CALIFORNIA.—Mr. Consul Bennett writing from San Francisco shortly before the earthquake disaster, remarked:—Commenting on the cement trade, my correspondents point to the figures given below of imports of cement into California from 1890 to 1905. There were also certain imports of cement from Japan, but they have now practically ceased, and may be left out of the account:—

Year.	Quantity in Pounds.		
	Belgium.	Germany.	United Kingdom.
1890.....	17,472,800	24,370,000	132,865,400
1891.....	50,827,600	30,157,600	146,148,800
1892.....	19,100,800	1,838,000	58,256,800
1893.....	15,407,200	5,055,400	83,582,000
1894.....	21,540,000	9,258,800	94,880,000
1895.....	31,951,600	22,133,600	61,764,800
1896.....	28,858,400	37,689,200	61,296,200
1897.....	40,015,610	17,694,800	30,191,658
1898.....	55,890,714	23,515,200	37,416,000
1899.....	55,234,000	27,005,200	37,541,000
1900.....	122,182,290	73,412,251	68,432,000
1901.....	63,105,982	42,198,477	22,800
1902.....	81,651,782	75,073,005	4,395,999
1903.....	77,520,507	85,499,154	11,353,200
1904.....	36,162,358	35,101,734	96,774
1905.....	23,626,846	27,596,558	28,180

It will be seen that, as a general rule, as British imports decreased Belgian and German increased, and that since 1894, after various fluctuations, the British trade has consistently shrunk, whilst Belgian and German imports consistently expanded. In the meantime large cement plants have been laid down locally at Suisun and Napa, and can to-day turn out cement practically as good as that imported. During the whole period under review the plants have been gradually growing in capacity of output, and the local price has been kept just a little lower than that of imported cement, on which the duty at present is 8 c. per 100 lbs. The imports for the current year, however, are expected to be heavier than those of 1905, as the local manufacturers, owing to the enormous demands made upon them, sold their product without waiting for it to become seasoned, the result being that it caused great dissatisfaction to the users. This has caused heavy orders to be sent to Europe. The cement works at Suisun and Napa are both running at full time, and a new plant is being established at Santa Cruz, which is expected to come into operation this year. Several other cement plants are projected in different parts of the State.

FRANCE (BOULOGNE).—Cement exports were low, but 780 tons were shipped to the United Kingdom; this seems a somewhat abnormal direction for the traffic, even although the quality of the local product is undoubtedly good. In local building considerable use is made of "cement arm" (steel and concrete) for flat roofs and warehouse floors, which, at a relatively low cost, bear heavy weights and are fireproof; piles constructed of these materials are now being used in consolidating foundations of quay walls, and seem to be driven very easily. Fibro cement, a mixture of cement and asbestos, is manufactured locally. It is used for roofing, as being lighter and better able to resist wind than tiles or slates; strips used to enclose electric wires minimise the dangers of short circuits; it is also moulded in imitation of wood panels for use in fireproof buildings; the material is easily cut to shape and nailed, and takes paint readily.

FINLAND.—The ever-increasing cement imports amount for 1905 to 30,077 metric tons, against 25,136 metric tons in 1904. Nearly 22,000 tons came from Germany, the rest from Sweden, Denmark, Russia, and Belgium. As in 1904, the United Kingdom was completely unrepresented.

MOSCOW.—In the Moscow district there are ten cement works, of which only one is a large concern. I should doubt (writes Mr. Consul Grove) their having done much last year, owing to the disturbed course of events. I understand also that there are hardly any building projects for the present year. The import has been:—

Total import.....	Value in roubles.		
	1901	1902	1903
United Kingdom.....	121,000	175,000	137,000
Germany.....	16,500	31,000	3,000
China.....	91,000	120,000	78,000
			41,000

Total import.....	OTHER CEMENTS.		
	1901	1902	1903
United Kingdom.....	278,000	330,000	297,000
Germany.....	81,000	49,000	84,000
	119,000	101,000	146,000

The balance comes from Sweden and Japan.

BILBAO.—The importation of Portland cement has further diminished. It is true that no new works of importance were undertaken during 1905, requiring the British product, but as the building of new quays is in contemplation, tenders for it will most probably be called for in the near future. The importation of cement from France and Belgium fell last year some 2,700 tons, but this may be put down to the fact that fewer building operations were undertaken, as well as to the introduction here of the native article from surrounding districts, of which, however, there was only an increase of 600 tons to be noted. The price of native cement in Guipuzcoa for quantities of some importance is about 53 pesetas per ton (11. 15s. 4d., at 30 pesetas per 11.) f.o.b., Bilbao. The most important works are situated in the province of Guipuzcoa, and in view of their success others are being opened for the production of large quantities in Navarre, as well as in other places in Spain.

PORTLAND, U.S.A.—The demand for cement increased as the year progressed, and stocks held at the beginning of the year were rapidly depleted. The supplies in sight are not nearly sufficient. This trade, however, does not appear to be cultivated by the British maker, as not one cask was received from the United Kingdom during the year. Prices have advanced, and the article is being used much more in buildings, streets, etc., and there is an extraordinary demand for railway purposes and irrigation works throughout the district. At this time there is practically none in the market, with prospects of a scarcity for some time to come. Prices have temporarily advanced to 13s. per cask. Market prices during the year ranged from 8s. 4d. to 10s. Receipts from California were about 35,000 bags; quality of this is reported irregular, and the capacities of factories is not equal to the demand. Japanese cement will be received more largely in future. There seems to be some probability of cement works being started at Bellingham on Puget Sound, where very satisfactory working tests have been made of raw material found there.

Miscellaneous.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. Hubbard & Moore, architects, are removing their offices from 85, Gresham-street to 112, Fenchurch-street, E.C.—Mr. H. T. Neilson, quantity surveyor, has removed his offices from Chancery-lane, Burlington, to Queen's-square, Leeds. (In last week's notice the name was incorrectly given as "Neil.")

A REVOLVING TOWER DERRICK.—A novel type of steel frame derrick now being used in the construction of the new municipal buildings, Washington, consists of a four-sided pyramidal steel tower, about 30 ft. high, with bearings at the top and bottom for a vertical mast, the lower end of which is pivoted at the bottom upon a fixed base-plate, and projects for a considerable portion of its length above the top of the tower. A horizontal boom, with unequal arms, is rigidly attached to the mast and gayed by steel ropes. The long arm of the boom carries the track for a hoist suspended from a trolley, which can be moved in either direction by means of the hoisting cable and other ropes extending to the outer end. The short arm of the boom is fitted with a platform, upon which are placed counterweights for balancing the loads hoisted. At the four corners of the tower there are long vertical screwed rods so arranged that the tower can be raised from story to story of the building as the work progresses. Each end of the mast has a steel cap, the lower one being provided with an annular groove revolving on the fixed base. The top of the tower consists of a fixed horizontal plate, provided with a large bearing ring, which keeps the mast in alignment and transmits the horizontal thrust to the tower. The mast and boom can be revolved through a complete horizontal circle by ropes engaging a bull-wheel attached to the mast just above the top of the tower, and led together with the hoisting tackle, to the foot of the mast, whence they are taken in the usual way to the drum of the hoisting engine. The derrick is

essentially a balanced cantilever crane, with traversing motion for the load, and capable of being revolved through a complete horizontal circle. Therefore materials can be collected from and deposited upon any point within the circular area described by the boom, except in the space occupied by the base of the supporting tower. The apparatus was originally designed by Mr. James L. Parsons, of Washington, for the demolition of a six-story building in that city. The structure was so dilapidated that great care was necessary to prevent its collapse, and it was considered essential to remove it by an independent derrick, by which materials from the upper part of the building could be lowered to the ground without risk of developing any stresses in the old work. The apparatus proved so satisfactory that it was afterwards employed for the erection of the new building on the same site, and similar derricks have since been employed in the execution of several important building contracts in Washington, including the new War College, Marlborough and Stoneleigh Court apartment houses, and the municipal buildings already mentioned.

MEMORIAL TO ARCHBISHOP TEMPLE.—At St. Paul's Cathedral on the 31st ult. a memorial was unveiled to the late Archbishop Temple. The memorial, which takes the form of a bronze panel and tablet and is the design of Mr. F. W. Pomeroy, has been placed in the first bay of the south aisle. It shows, in high relief, the figure of Dr. Temple kneeling in the attitude of prayer, and is in pose and composition a replica of the monument erected in Canterbury Cathedral. On the right are the arms of the See of Canterbury, and underneath a processional cross.

PUMPS AND SAND.—The Pulsometer Engineering Company forwards a letter received by them from the North Antrim Mining Syndicate, who have been using two of the Pulsometer pumps in sinking operations at their Ballycastle mines, which is of some interest in regard to the general difficulty of dealing with sand. They were about four months pumping water and sand; "the Pulsometers kept men constantly shovelling thousands of tons of sand from the drain into which the sand and water was deposited."

PHOTOGRAPHS OF TREE STRUCTURE.—The Country Press, from whom we have before received some useful photographs of the detail of British ferns in the form of picture postcards, have now issued a set of twelve photographs in similar form, six of them showing the ramification of the beech, chestnut, horn-chestnut, maple, oak and walnut (photographed in winter when the trees were bare), and six of the detail of trunks of the same trees. These are very useful in promoting a true knowledge of the forms of trees. The photographs are taken by Mr. F. G. Heald. It is proposed to issue similar illustrations of other trees.

THROUGH HOUSES AND BACK-TO-BACK HOUSES.—At Leeds City Council recently, in bringing forward the minutes of the Plans Committee, Mr. Baxter, the Chairman, referred to the statement showing the number of buildings completed during the past six years, as compared with the previous six years. He called attention to the fact that during the first period—1895 to 1900—the number of through houses built was 8,859, while in the second period—1901 to 1906—the number was 5,634, an increase of 1,784. On the other hand, there was a decrease in the number of back-to-back houses built—from 9,569 to 8,642. These figures, he said, would be an encouragement to those who favoured through houses as against back-to-back houses. He added that the Committee had had before them plans for five or six large estates which would ultimately be used for building purposes. The building trade was beginning to revive, and the Committee were very hopeful for the future.

CAYTHORPE CROSS.—The remains of the very beautiful XIV. century churchyard cross at Caythorpe, Lincolnshire, have been erected on the old foundation, and the upper part of the shaft and the canopy restored. The cross stands upon three steps, each 1 ft. high. The base to the shaft is an octagon, and from this springs the delicate shaft, crowned by a four-sided canopy, with pinnacles and spirelet. In the base and in the lower part of the shaft are some holes, plugged with lead. Mr. W. Samuel Weatherley, architect, of London, had charge of the work. The carving was done by Mr. W. Hearn, of Kensington, and the masonry mouldings and tracery for the canopy work by Mr. W. Cragg, builder, of Caythorpe.—*Standard.*

A CENSUS OF PRODUCTION.—The text of the Bill introduced by the President of the Board of Trade some days ago has just been issued. The schedule contains "a list of persons required to make returns," namely—(a) The occupier of every factory or workshop within the meaning of the Factory and Workshop Act, 1901; (b) the owner, agent, or manager of every mine and quarry; (c) every builder, that is to say, a person who by way of trade or business undertakes the construction, alteration, repair, or decoration of a

building or any part thereof; (d) every person who by way of trade or business executes works of construction, alteration, or repair of railroads, tramroads, harbours, docks, canals, sewers, roads, embankments, reservoirs, or wells, or of laying, altering, or repairing gas or water pipes, or telegraphic, telephonic or electric lines or works, or any other prescribed works; (e) every person who by way of trade or business gives out work to be done elsewhere than on his own premises; and (f) every person carrying on any other trade or business which may be prescribed.

MIDDLESEX COUNTY COUNCIL AND GIPSIES.—The Police and Sanitary Committee of the House of Commons, of which Mr. J. W. Wilson is Chairman, have agreed to accept modifications of a clause affecting gipsy encampments in the General Powers Bill promoted by the Middlesex County Council. As amended by the Committee the clause will provide that no gipsy shall use a dwelling-place within 50 yds. from any street or dwelling-house for more than twenty-four hours so as to cause injury to residents in the neighbourhood or to cause a nuisance or danger or injury to health; and that no owner of land shall cause or suffer such land within 50 yds. from any street or dwelling-house to be occupied by gipsies, tents or vans, for more than twenty-four hours, so as to cause injury to the residents or to be a nuisance or a danger or injury to health. Applications are to be made to a Court of Summary Jurisdiction for orders against offenders; and in the case of disobedient fines may be inflicted and the use of the land for encampment purposes also to be prohibited during such period as the Court shall determine.

CITY AND GUILDS OF LONDON INSTITUTE.—The annual meeting was held last week at Mercers' Hall, Lord Haldry presiding. In the report, which was adopted, the Council announce that the fees will be raised from 30l. to 36l. a session for all students admitted after the close of the previous session. Last session more than 41,000 students attended classes in technology throughout the country and in the Colonies. The number of students in the Central Technical College during the winter term was 431, including fifty-nine from the Royal College of Science and School of Mines; a total increase over that of any previous year. With the aid of contributions and of 10,000l. assigned from the general funds the new wing of Finsbury Technical College has been completed. The Corporation of the City have renewed their former contribution of 500l. for the next five years, the Mercers' Company have renewed also to their original contribution of 2,000l., and the Vintners' Company have raised their subscription from 100l. to 150l. The total income for the twelve months is 56,443l. A special committee has been appointed to confer with the President of the Board of Education in the matter of the re-organisation of subsisting or proposed institutions for instruction at South Kensington. At a recent interview of the Executive Committee of the Institute (of which Sir J. Wolfe Barry is Chairman) with the Departmental Committee upon the Science Schools at South Kensington, the former expressed their desire to continue to be identified with, and to be largely concerned in, the conduct and control of the Central Technical College, whilst they are quite willing to join in an arrangement which would bring all branches of physical science into correlation and effect an interchange of students at various stages in their careers.

IMPROVEMENTS, BEXHILL.—Major C. E. Norton, R.E., of the Local Government Board, held an inquiry at the Bexhill Town Hall on the 29th ult. into the application of the Town Council for sanction to borrow 1,350l. for the purpose of making up the Marina with tar macadam, and 1,850l. for public lavatories on the Marina. The Clerk (Mr. T. E. Rodgers), in regard to the tar mac, said about eighteen months ago the Surveyor reported that it was necessary for the road to be properly made up. A committee visited Brighton, and after inspecting Madeira-road, expressed approval of what they had seen. They recommended to the Council that tar slag macadam, prepared in this way, would make a better road than ordinary macadam, and the report was approved by the Council. The Surveyor (Mr. G. Bell), questioned by Major Norton as to utility, said that at Scarborough a road thus treated had worn well. Major Norton: Can you explain to me why you are making up this road with a new surface, after the present surface has only been in use for five and a half years?—The Surveyor replied that the wear was due to the excessive amount of traffic and the development of the Marina. The road was much worn, and he recommended to the Council that it would be an economy to repair it with three inches of tar macadam.—Respecting the second application the Clerk supplied the necessary information to the inspector, pointing out that it was the intention of the Council to purchase and improve certain lavatory buildings.—Councillor Jesty spoke in support of the application, and the inquiry was closed.

MEMORIAL FONT, GAMBERLEY.—The font which has been erected in St. Michael's Church as part

of the memorial to the Rev. F. M. Middleton, was recently dedicated. It is constructed of Mansfield stone, and is supported on pillars of Devonshire marble. The leaden basin belonging to the old font has been embedded in the new bowl, and the cover is constructed of oak. The designer of the font is Mr. A. H. Hoole, of London.

Legal.

SUCCESSFUL APPEAL BY BRICK-MAKERS.

Is the Court of Appeal, before the Master of the Rolls and Lord Justices Koser and Cozens-Hardy last week, the case of Bold v. Crompton and Company (Croston), Ltd., was heard on the appeal of the respondents from the award of the County Court judge of Chorley, sitting as the arbitrator under the Workmen's Compensation Act, 1897, in favour of the applicants, the representatives of a man killed while at work for the respondents.

The short facts of the case were these:—The respondents owned certain brick-works where they carried on the business of brick-making. About 700 yds. away from the brick-works they had a field in which they had a clay pit, and in which the deceased man was employed in excavating clay. Whilst so engaged some clay fell upon him, and he was fatally injured. The brick-making yard was constituted a factory within the meaning of the Act by reason of there being machinery worked by steam, and the learned County Court judge held that in the circumstances of the case the deceased man was employed "on, in or about a factory" within the provisions of the Act, and made an award in favour of the applicants.

Mr. C. A. Russell, K.C., on behalf of the employers, contended that the learned County Court judge had misdirected himself, and that the award was erroneous and ought not to be allowed to stand.

Mr. Lord having supported the award of the County Court judge, their lordships in the result allowed the appeal with costs, holding that the deceased man could not be said in the circumstances of the case to have been working at the time of the accident "on, in or about a factory" within the meaning of the Act.

Patents of the Week.

APPLICATIONS PUBLISHED.*

14,298 of 1905.—E. J. PROPPER and F. BACH-SCHMID: *Artificial Building Stone Blocks.*

This relates to an artificial stone building block, in the form of a rectangular cross, in which the angles or inner corners of the arms are formed with rib-shaped lugs or projections, and the outer corners or edges of the end faces of the arms are formed with corresponding grooves.

14,628 of 1905.—H. JOHNS: *A Gate Fastening.*
This relates to a gate fastening, consisting of a straight pivoting part passing through the head of the gate and cranked parts continued therefrom to form respectively the handle portion and the catch of the fastening, the catch being adapted to engage a hook on the gate post, and the handle portion being formed either with or without curve parts for gripping with a whip and loop for enabling the fastening to be locked.

14,956 of 1905.—J. G. WALKER: *Means for Opening and Closing Ventilators, Sashes, Doors, Shutters, or the Like.*

This relates to an apparatus for opening and closing doors, sashes, shutters, and the like by means of fluid pressure and suction, and consists in the combination of a fluid pump and operating mechanism, which may be situated at a distance from the sash or the like, to be manipulated and connected by means of a pipe or passage with a cylinder and piston in close proximity to the sash, the said piston being connected to the said sash or the like.

15,763 of 1905.—S. KEELLET and F. W. RICHARDSON and BUTTERMERE GREEN SLATE COMPANY, LTD.: *Manufacture of or Ornamentation of Slates.*

This relates to the manufacture or ornamentation of slates, and consists in the application of the slates of salts of iron or of other metals, such as chromium, having coloured oxides, or forming with the material of the slates suitable colours with heat, and then roasting to produce the various shades of red, green, purple, yellow, and the like. For example, iron or oxide of iron is dissolved in acids, such as nitric, hydrochloric, sulphuric, hydrofluoric, acetic, and formic acid, or the iron salts of these acids obtained as waste

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, xvi.; Auction Sales, xxvi. Certain conditions, beyond those given in the following information, are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

Contracts.

Tenders should be delivered at the Committee's Offices, Town Hall, Portsmouth, not later than 10 a.m. on June 13.

JUNE 13.—Bolton.—PAINTING.—Bolton Corporation invite tenders for painting, etc., at the Fever Hospitals, Hillon-lane, Bolton. A copy of the specification may be obtained at the office of the Borough Engineer, Town Hall, Bolton, under seal, and endorsed "Tender for Painting Hospitals," to be delivered to Mr. Samuel Parker, Town Clerk, Town Hall, Bolton, addressed to the Chairman of the Sanitary Committee, not later than 10 a.m. on June 13.

JUNE 13.—London.—PAINTING, ETC.—Chelsea Guardians invite tenders for painting, whitewashing, cleaning, etc., at their infirmary in Grosvenor-street, Chelsea, S.W. Persons desirous of tendering may obtain a specification of the work from Mr. Joshua Dowling, Clerk to the Guardians, during the hours of office, at their infirmary, and send in a sealed envelope and endorsed "Tenders for Painting and Cleaning, etc., at the Infirmary," and be sent to the Guardians' Offices, 253, King's-road, Chelsea, not later than noon on June 13.

JUNE 13.—Paddington.—W.—PAINTING, ETC.—Tenders are invited for painting and other works at the Infirmary in Harrow-road, for the Paddington Guardians. Specifications and form of tender may be obtained from the architect, Mr. E. Howley Simpson, 14, Norfolk-street, Strand, on deposit of 1s. (cheque). Tenders, enclosed in envelopes for "Painting the Infirmary," to be delivered at the Guardians' Office before 5 o'clock on June 13.

JUNE 25.—Lepton.—PAINTING, ETC.—The Lepton Education Committee invite tenders for the cleaning, painting, repairs and alterations to schools to be executed during the summer vacation. Specifications, conditions, and form of tenders may be obtained on application to Mr. William Jacques, architect, 2, Pen-crest, E.C., on depositing 1s. Sealed tenders, in endorsed envelopes provided, must be delivered at the meeting of the Council at 7 p.m., June 25.

NO DATE.—Gateshead.—CLEANING AND PAINTING.—Gateshead Education Committee invite tenders for the cleaning and painting of various schools during the summer vacation (August). Specification and other particulars may be had on application at the Education Offices—By order, Mr. E. J. Harding, Secretary.

ROADS, SANITARY, AND WATER WORKS.

JUNE 9.—Leeds.—PAVING.—Leeds Highways Committee invite tenders for the paving and flagging of the following streets—Argyle-road, Barborough-street, Raincliffe-grove, Raincliffe-street, Everleigh-street, Temple View-terrace, Parkside-place, Everleigh-grove, Chantrell-grove, and Chantrell-place. Plans and specifications may be seen at the City Engineer's Office, Municipal Buildings. Tenders on printed forms, enclosed in envelopes for the purpose, must be sent to the Town Clerk's Office on or before June 9, addressed to the Highways Committee, and endorsed "Tender for Private Street Works."

JUNE 9.—Penistone.—SEWERAGE SCHEME.—D.C. invite tenders for taking up and relaying about 9½ in. yds. of 9 in. earthenware pipes and the construction of two lamp eyes. Plan, section, and specification may be inspected at the Council Offices, Penistone, during office hours. Quantities and forms of tender and other information to be obtained from the engineers, Messrs. Winks, Pilling, 39, Park-road, Leeds, on payment of 1s. Specifications and forms of tenders enclosed in envelopes for "Penistone Sewerage," to be delivered at the Council Offices not later than Saturday, June 9.

JUNE 14.—Guildford.—PAVING.—Guildford Education Committee invite tenders for preparing and laying down Kentish grass tar-paving therein. A specification may be seen on application to Mr. Edward L. Lunn, surveyor, at the Education Committee's Office, Guildford. Sealed and endorsed tenders are to be sent in to Mr. F. S. Miller, Clerk to the Education Committee, Bridge-street, Guildford, not later than 12 o'clock noon on June 11.

JUNE 11.—Northampton.—PAVING.—The Corporation of Northampton invite tenders from experienced paving contractors for the paving of a certain granite-paved concrete paving in the cattle pens at the Cattle Market. Plans and specifications may be seen, and bills of quantities and forms of tender enclosed in envelopes, to Mr. Alfred Egan, Borough M.Inst.C.E., Borough Engineer, Guildhall, Northampton, on and after Thursday, May 31, on deposit on a cheque for 2s. 2s. Sealed tenders, endorsed "Paving of Cattle Market," and addressed to Mr. Herbert Hankinson, Town Clerk, Guildhall, Northampton, must be delivered at the Town Clerk's Office, Guildhall, Northampton, on or before 12 o'clock noon on June 11.

JUNE 12.—Gosforth.—SEWER.—The Gosforth U.D.C. invite tenders for the construction of a sewer in Gosforth-grove and Moor-road, Gosforth. The work consists of laying about 400 yds. of 12 in. pipe sewers, with the necessary manholes. Plans and conditions of contract may be seen, and specification, quantities, and form of tender obtained on payment of 1s. as, on application to the Engineer, Mr. Harry W. Taylor, A.M.Inst.C.E., St. Nicholas-churchyard, Newcastle-upon-Tyne. Sealed tenders, enclosed in envelopes for "Grove Sewer," are to be sent to Mr. R. Sheridon Holmes, Clerk to the Council, Council Offices, Gosforth, Northumberland, on or before 12 o'clock noon on June 12.

JUNE 12.—Tottenham.—ROADS.—Tottenham U.D.C. invite tenders for making up Donzola-road (second section), Frinton-road, Hale-road, Hampden-road (remainder), Merton-road, and Highgate-road (first section), Holmdale-road (remainder), Marden-road, Stainby-road, The Avenue (third section), and Thorpe-road. The plans can be seen, and general conditions, specifications, bills of quantities, schedule of prices, and forms of tender, can be obtained on application to Mr. W. H. Prescott, A.M.Inst.C.E., Engineer, to the Council, at their offices, Council Buildings, The Grove, Tottenham. The sum of 10s. 6d. will be charged for each set of quantities. Persons tendering will be required to deposit with the tender a sum of 10s. 6d. in Bank of England notes, or cash, the sum of 1s. for each road, which will be forfeited by the person whose tender is accepted if the contract be not executed within seven days from the date he is informed it is ready for signature. Sealed tenders, on the form supplied, endorsed "Tender for —," (as the case may be), to be delivered to Mr. Edward Crowne, Clerk to the Council, Tottenham, by 12 o'clock noon on June 12.

JUNE 13.—Farnworth.—ROAD IMPROVEMENTS.—Farnworth U.D.C. invite tenders for the widening, draining, and reconstructing of a portion of Bladder-lane. Plans and specifications may be inspected at the offices of the Surveyor, Mr. W. J. Lumax, 11, Bold-street, Farnworth. Tenders, under cover, endorsed "Bladder-lane Improvement," to be received by Mr. W. Tyldesley, Clerk, Council Offices, Farnworth, S.O., not later than noon on June 13.

JUNE 13.—Rawtenstall.—ROAD WORKS.—Rawtenstall Corporation invite tenders for the manual and team labour and materials required in excavating, widening, forming, and relaying of footpaths, and in several streets situate at Crawshaw-wood, Cough-ford, and Waterloo, within the borough. Plans, specifications, and conditions may be seen, and forms of tender obtained, on application to Mr. James Johnson, C.E., Borough Surveyor, Municipal Offices, Rawtenstall, on payment of the sum of 10s. 6d. in Bank of England notes, or cash, to be addressed "The Town Clerk, Rawtenstall," sealed and endorsed "Tender for Private Street Works," to be left at his office at, on, or before noon on June 13.

JUNE 13.—Saltwood.—SEWER.—Elham R.D.C. invite tenders for the construction of about 475 in. yds. of 9 in. earthenware pipe sewer, with two manholes and three manholes on the line of Sandring-road, Saltwood. The plans and specification may be seen between the hours of 10 a.m. and 4 p.m. at office of Mr. R. C. G. C. Clerk, 21, Clifton-place, Falmouth, and tenders, endorsed "Tender for Sewer, Saltwood," must be delivered not later than 12 at noon on June 13.

JUNE 14.—Aberdeen.—SEWER.—Aberdeen City Parish Council invite tenders for constructing an outfall sewer from the Aberdeen Poorhouse, to join the existing City Sewerage System in Queen's-road, near Hollybank. Plans may be seen in the office of Messrs. Jenkins and Marr, 16, Bridge-street, who will supply schedules of quantities to intending offerers. Sealed tenders, endorsed "Sewer," to be lodged in proper form with Mr. C. B. Williams, Inspector of Pools, 20, Union-terrace, Aberdeen, on or before June 14, at 6 o'clock p.m.

JUNE 14.—Covepen.—ROAD WORKS.—Covepen U.D.C. invite tenders for making up Newsham-road, back Harper-street, and other back streets (representing a total area of about 3,700 sq. yds.) within their municipal district. Plans, sections, and specifications may be seen, and forms of tender obtained, at the office of Mr. Robert Grievie, Surveyor to the Council, Seaforth-street, Blyth. Sealed tenders, endorsed "Tender for Street Works," must be delivered not later than 4 p.m. on June 14.

JUNE 14.—Hackney.—ROAD-MAKING.—Hackney Borough Council invite tenders for the kerbing, channelling, paving, making-up, etc., of (a) Aberdeen, Crescent, Upper Clapton; (b) Lee Conservancy-road, Tottenham; and general conditions of contract and specifications and plans and sections may be inspected, and copies of the bills of quantities and forms of tender obtained, on application to Mr. Norman Sawyer, M.C.E., Borough Engineer and Surveyor, and on payment of 1s. Sealed tenders, endorsed "New Street Works," must be delivered at the Town Hall, Hackney, N.E., not later than 12 o'clock noon on June 14.

JUNE 14.—Warrminster.—DRAINING.—Warrminster U.D.C. invite tenders for under-draining the Sewage Farm at the Marsh, Warrminster, which consists of an area of 200 acres. Plans and specifications may be seen, and further particulars obtained, at the surveyor's office, High-street, Warrminster, and sealed tenders, endorsed "Under-draining," must be delivered to Mr. Herbert J. Wakeman, Clerk to the Council, Council Offices, Warrminster, not later than 12 o'clock on June 14.

JUNE 16.—Liversedge.—SEWAGE WORKS.—Liversedge U.D.C. invite tenders for alterations to the existing septic tank, graise chamber, and receiving channels, and the construction of additional precipitation tanks, bacteria beds, and land filters, with channels, wells, culverts, and other appurtenant works, for the improvement of the Liversedge Disposal Works at Liversedge. Drawings and specification may be seen, and bills of quantities and form of tender obtained, at the offices of Messrs. Chas. Gait & Sons, M.Inst.C.E., Engineers, to the Council, 8, Charles-street, Bradford, on deposit of the sum of 2s. 2s. Sealed tenders, endorsed "Liversedge Sewage Works—Tender," are to be delivered to Mr. Thomas Mickleton, the Clerk of the Council, at the Public Offices, Liversedge, not later than 12 o'clock noon on June 16.

JUNE 16.—Newton.—BACTERIA BEDS.—U.D.C. of Newton-in-Makerfield invite tenders for the construction of two bacteria beds at the Central Sewage Works. Plans can be seen, and bills of quantities obtained, on application to the surveyor, Town Hall, Earlestown. Tenders are to be sent in to Mr. C. Cole, Clerk to the Council, Town Hall, Earlestown, not later than 10 a.m. on June 16.

JUNE 18.—Canberwell.—NEW SEWERS, ETC.—Tenders are invited for the following works in Rotherfield, New-road:—(a) New 12 in. pipe sewer, with manholes, gullies, etc.; (b) underdrain, channelling, and making up road. Specifications and forms of tender can be obtained from the Borough Engineer, and tenders must be delivered to Town Hall, Peckham-road, S.E., not later than 10 a.m. on June 19, addressed to Public Health Committee; for (b), addressed to Works and General Purposes Committee, before 5.30 p.m., June 19, 1906.

JUNE 18.—Finchley.—SEWAGE WORKS.—Finchley U.D.C. invite tenders for the construction of sewage filter beds and storm water beds, open, septic, and under tanks, together with channels, culverts, valves, and other works. Drawings may be seen, and copies of bills of quantities, specification, and form of tender obtained, on application to the offices of the engineer and surveyor, Mr. C. H. Fryer, N. 1, on payment of 3s. 3s. Sealed tenders, endorsed "Sewage Purification Works," and addressed to Mr. E. H. Lester, Clerk to the Council, Council Offices, Church End, Finchley, N., to be sent in by not later than noon on June 18.

JUNE 25.—Balham.—UNDERGROUND CONVEYERS.—The Wandsworth Borough Council invite tenders for underground sanitary conveniences, Station-road, Balham. The specification, drawings, form of contract, etc., may be seen, and form of tender and copy bills of quantities obtained, at the Surveyor's office, 215, Balham High-road, S.W., on payment of 1s. 1s. Tenders, sealed, and endorsed "Tender for Conveniences, Station-road, Balham," to be sent to the Council House, Wandsworth, S.W., not later than June 25.

JUNE 25.—Bromley.—ROAD MATERIALS.—The Town Council of Bromley invite tenders for supply of various road materials. Samples of each description tendered for must accompany the tender. Tenders must be made on printed forms, to be obtained at the office of the Borough Engineer, Municipal Offices, Bromley, and must be delivered, addressed to Mr. Fred H. Norman, Town Clerk, Municipal Offices, Bromley, Kent, before 5 p.m. on June 25.

JUNE 25.—West Ham.—ROAD-MAKING.—The County Borough of West Ham invite tenders for relaying on various streets, etc. Bills of quantities can be seen, and specification, form of tender, etc., obtained of Mr. John G. Morley, Borough Engineer, Town Hall, West Ham, on or before 11 a.m. Tenders, endorsed "Tender for Private Street Works," to Mr. Eric J. Hillyard, Town Clerk, Town Hall, West Ham, E., before 4 p.m. on June 25.

NO DATE.—Child's Hill.—ROAD.—Tenders are invited for construction of a new road, to be laid under the superintendence of Mr. Frank Selby, 44, Chancery-lane, W.C. Bills of quantities can be obtained by applying to Messrs. Northcott, Nicholson & Nicholson, 9, Regent-street, London, W.C., between 10 and 5 from June 14 to 18 inclusive.

STONE, MATERIALS, AND STORES.

JUNE 11.—Aylesbury.—COKE BREZZE.—Aylesbury U.D.C. invite tenders for supplying about 60 tons of coke breeze (4 in. to 3 in.) on rail. Tenders must be delivered to Mr. Percy A. Wright, Clerk to the Council, Town Hall, Aylesbury, marked "Coke Brezze," not later than 12 o'clock on June 11. Further particulars can be obtained from Mr. W. H. Taylor, Surveyor to the Council.

JUNE 12.—Ashton.—MATERIALS.—The U.D.C. of Ashton-in-Makerfield invite tenders for the supply of the following materials between July 1, 1906, and June 30, 1907:—Salt glazed stoneware sanitary pipes, junctions, etc.; slag, macadam, flags, kerbs, channels, disinfectants, sanitary pans, socket and wooden cast-iron pipes and specials, galvanised tubes and fittings, galvanised steam tubes and fittings, gasnettes (ordinary and pre-painted), cast-iron lamp columns, gratings, and copper lanterns. Tenders are invited for the purchase of all surplus tar and ammoniac liquor made at the Gasworks between the dates before mentioned. Tenders must be upon forms which may be had from Mr. A. G. G. Surveyor, Clerk to the Council, Council Offices, Ashton-in-Makerfield, upon application, and further information may be obtained from the Council's Surveyor, the Gas Engineer, or the Sanitary Inspector so far as concerns their respective departments. Sealed tenders for supplies, endorsed "Tenders," to be delivered at the Council's Office, Council Offices, Ashton-in-Makerfield, not later than June 12.

JUNE 12.—Cormsby.—MATERIALS.—The supply of materials required at Cormsby Colliery for the twelve months ending June 30, 1907, comprising pit timber, iron, steel, and metal castings, wire ropes, nails, and grease. Forms of tender may be had on application to Messrs. Ferriss & Low, Market-place, Durham. No tender will be received except on the printed forms, not later than June 12.

JUNE 13.—Elham.—GRAVITY.—Elham R.D.C. invite tenders for the supply and delivery of granite, hand broken to 2 in. gauge, and 3 in. chips, as follows—100 tons of 2 in. to Lynton Railway Station (South-Eastern and Chatham Railway), 20 tons of 3 in. to Lynton Railway Station (South-Eastern and Chatham Railway), 300 tons of

2 in. to Westenhanger Station, 20 tons of 3 in. to Westenhanger Station, 350 tons of 2 in. to Sandling Station, 50 tons of 3 in. to Sandling Station, 20 tons of 3 in. to Elham Station. Forms of tender may be obtained from the Secretary, Lymington, Kent, and samples of granite must be sent to same address by June 11, carriage paid. Sealed tenders to be sent to the Clerk to the Council, 11, Chertton-place, Folkestone, by June 13, marked "Granite."

JUNE 13.—London.—STEEL FENCING, PICKS, ETC.—The East Indian Railway Company invite tenders for the supply and delivery of (1) steel palisade fencing for platforms; (2) picks, kholas, shovels, etc.; (3) files; (4) hammer handles, mallets, etc., as per specifications to be seen at the company's offices. Tenders are to be sent to Mr. C. W. Young, Secretary, Nicholas-lane, London, E.C., marked "Tender for Fencing," or as the case may be, not later than 12 o'clock noon on June 13. Fees, which cannot under any circumstances be returned, are charged for the specifications as under, viz., for Nos. 1, 2, and 3, 21s. each; and for No. 4, 10s. 6d.

JUNE 13.—Madras.—CEMENT—2,000 tons of Portland cement, delivered in barrels at Madras. Specifications may be obtained (by manufacturers only) on application to Messrs. Rendel & Robertson, 8, Great George-street, Westminster, at whose offices tenders must be delivered not later than noon on June 13.

JUNE 13.—Royston.—MATERIALS—Royston U.D.C. solicit tenders for the supply of the following materials etc., during year ending May 31 next:—(1) kerbs, flags, and setts (solid rock); (2) earthenware drain pipes and other sanitary goods; (3) Portland cement; (4) pitch and creosote oil; (5) sewage precipitant; (6) scavenging brooms. Specifications and forms of tender in respect of the first two classes of materials may be obtained on application to Mr. Thomas Bleasdale, Clerk to the Council, Town Hall, Royston, near Oldham, on or before noon, June 11. Sealed tenders (on the forms supplied in the case of stone and pipes), stating description and particulars of goods tendered for, endorsed "Tender for —," must reach the Clerk not later than 10 a.m. on June 13.

JUNE 13.—Aberdeen.—STORES—The Directors of the Powell Duffryn Steam Coal Company, Ltd., invite tenders for the supply of the undermentioned stores from July 1, 1906:—(1) Bar and other iron; (2) bolts, nuts, rivets, etc.; (3) brass fittings; (6) indiarubber and asbestos; (7) collars' tools, etc.; (8) leather goods, etc.; (9) ironmongery; (10) girders, channels, and rails; (11) nails; (12) oilskins; (13) steel; (14) steam tubes and fittings; (15) waste and brattice cloth; (17) chains; (19) lumber, deals, etc.; (20) printing; (22) horse feed; (24) French pitwood; (24a) Swedish pitwood; (25) Cement and lime; (26) electrical fittings. Forms of tender and all particulars can be obtained on application to the Stores Manager, Aberdeen Office, near Aberdeen. Tenders to be addressed to the Directors of the Powell Duffryn Steam Coal Company, Ltd., 101, Leadenhall-street, London, E.C., and posted so as to be received not later than 10 a.m. on June 13.

JUNE 13.—London.—STORES—Great Western Railway Directors invite tenders for the supply of the undermentioned stores from July 2, 1905, to June 29, 1907:—(1) Laminated timbers, and volute springs, (3) tyres, (4) straight axles, (5) steel crank axles and forgings for built-up cranks, (6) iron bars, (7) steel plates and sheets, (8) steel bars and blooms, (9) steel castings, (10) iron forgings, (11) chain and special iron for chain manufacture, (12) tubes and fittings, (13) cast-iron socket pipes, (14) tool steel. Specifications and forms of tender (upon which alone tenders will be received) may be obtained on application to Mr. G. K. Mills, Secretary, Paddington Station, London, or to the Stores Superintendent at Swindon. Tenders, addressed to the Secretary, and marked outside "Tenders for Stores," will be received on or before June 13.

JUNE 13.—Macclesfield.—MATERIALS—Macclesfield Gas Committee invite tenders for the undermentioned materials required for twelve months commencing on July 1 next, viz.:—(1) The best hand-picked Buxton lime, delivered fresh at Macclesfield free from dirt and ash, in such quantities as may be ordered; (2) wrought-iron lap-welded steam tubes and fittings; (3) cast-iron mains and irregulars; (4) oils, white lead, and other druggists' sundries. The committee are also prepared to receive tenders from local painters for the painting of their two gasholders in Tythingington; and towers, scrubbers, etc., at the Gasworks. Forms of tender and all other information can be obtained on application to the Engineer, Gasworks, Macclesfield. Sealed tenders to be sent in not later than June 13, addressed to the Chairman, Gas Committee, Town Hall, Macclesfield, and marked outside "Tender for —."

JUNE 13.—Thornhill.—SAG—U.D.C. of Thornhill invite tenders for the supply for the year ending March 31, 1907, of the following materials:—Best hand-picked furnace slag, best hand and machine broken furnace slag, slag clippings. To be delivered at such stations within the district of Thornhill, and in such quantities as the Council shall during the above period from time to time order. Forms of tender and specification may be obtained on application to Mr. A. Robson, engineer and surveyor. Tenders, on the form supplied, and accompanied by a sample of each of the materials quoted for, must be delivered to the Clerk to the Council not later than 5 p.m. on June 13, marked "Tender for Sag."

JUNE 13.—Walton.—GRANITE—Walton-on-Thames U.D.C. invite tenders for the supply of 1,200 tons of 4-in. broken granite, delivered as required during the period ending March 31 next. Specification and form of tender may be obtained on application to Mr. R. Wilds, Surveyor, Council Offices, Walton-on-Thames, to whom tenders, sealed, and endorsed "Tender for Granite," must be delivered not later than mid-day on June 13.

JUNE 20.—Enfield.—GRANITE—U.D.C. of Enfield invite tenders for the supply of 2,500 tons (more or less) of broken Cleve Hill Dhu or best blue Gurnsey granite, and 1,150 tons (more or less) of broken Leicestershire or other approved granite, to be

delivered free in such quantities and at such times prior to March 31, 1907, as may be ordered by the Council's Surveyor at the several railway stations in the district. Tenders (on forms to be obtained only of Mr. Richard Collins, the Council's Surveyor), endorsed "Tender for Granite," together with samples as to size and quality of the granite proposed to be supplied (no tender will be considered unless accompanied by samples), to be sent in to Mr. T. W. Scott, Clerk to the Council, Public Offices, Enfield, not later than noon on June 20.

JUNE 21.—North Walsham.—GRANITE—North Walsham U.D.C. invite tenders for 350 tons of granite (broken to a 13-in. ring gauge), and 30 tons of granite chips, the whole thereof to be delivered free to either of the North Walsham Railway Stations in September or October next as required by the Council's surveyor. Sealed tenders, endorsed "Tender for Granite," to be sent on contractor's North own form, with samples, to Mr. E. J. Simpson, North Walsham, Surveyor to the Council, on or before June 21.

JUNE 27.—Middlesbrough.—STORES—Middlesbrough Streets Committee invite tenders for the supply of sanitary pipes, timber, plate bricks, common bricks, concrete flags and kerbs, Portland cement, annealed scoria blocks, Whinstone setts, broken Whinstone, broken slag, manhole covers and frames, gully grates, flushing boxes, etc., delivered during the ensuing twelve months. Specifications may be seen, and quantities obtained, on application at the Borough Engineer's Office, on payment of 10s. 6d. Tenders, sealed, and accompanied by a sample, addressed to Mr. Alfred Sackett, Town Clerk, Municipal Buildings, Middlesbrough, not later than 10 a.m., June 27. Mr. Frank Baker, C.E., F.G.S., Borough Engineer, Borough Engineer's Office, Municipal Buildings, Middlesbrough.

JULY 2.—Bedford.—GRANITE—Bedford Corporation invite tenders for the supply of about 2,100 tons of broken granite for road-making, to be delivered at the railway station at Bedford in such quantities as the surveyor shall from time to time order during the year ending September 3, 1907. Forms of tender and further particulars as to gauge, etc., may be obtained on application. Tenders, endorsed "Tender for Granite," to be sent to Mr. Hedley Baxter, Town Clerk, Town Hall, Bedford, on or before July 2.

JULY 2.—Sunbury.—GRANITE AND FLINT—Sunbury-on-Thames U.D.C. invite tenders for the supply and free delivery at Sunbury Railway Station for the coming season of not less than 400 tons of Bardon Hill (Leicestershire) granite, broken as was through a 12 in. ring. Also for the supply and delivery of not less than 500 cubic yds. of Kentish brown pit flints, delivered at Clark's Riverside Wharf, Sunbury-on-Thames. Further particulars may be obtained of Mr. Harold F. Coates, the Surveyor to the Council. Sealed tenders, endorsed "Granite" and "Flints" respectively, to be delivered to Mr. Charles E. Goddard, Clerk to the Council Offices, Sunbury-on-Thames, before 4 p.m. on July 2.

PATENTS.—Continued from page 653.
and by-products from chemical works, and the aqueous solutions of these with or without free acid are applied directly to the slates. The slates thus impregnated are placed on end, or otherwise loosely piled in gas, coke, or other ovens or furnaces, in which every part of the load can be substantially evenly heated, and are heated to various temperatures, according to the salt acid, with or without the addition of free air, from a nearly black heat to bright red or yellow, and are then gradually cooled or annealed. In some cases they may be heated with the products of combustion to the maximum point, and then hot air allowed to play round them so as to thoroughly oxidise the salts.

17,901 of 1905.—R. BROWN: *Chills or Moulds for Casting Sash Weights.*
This relates to an apparatus for casting sash weights constructed with a chill or mould in two parts, one part fixed to the frame and stationary, the other part mounted on the frame and capable of movement to and fro thereon, and internal

projections thereon, by which the slots and hole in the end of the sash weight are formed.

18,529 of 1905.—G. BATTY: *Sliding Sash and Hinge Opening Window.*
This relates to a combined sliding and hinged sash or the like, the said sash or the like having a rounded stile to run in a groove in the adjacent stile of the sash frame, and also a crooved stile carrying two semi-rollers which run in the opposite grooved stile of the sash frame, lift-off hinges being provided for enabling the sash to swing when freed by bringing the flat faces of the semi-rollers into the same plane as the inner face of the adjacent stile of the frame, a groove in which partly contains the said semi-rollers.

18,959 of 1905.—J. THOMAS: *Saddles or Supports for Domestic Ovens.*
This relates to a combined saddle or support and end piece for domestic ovens, in which the saddle is reversible, and is provided with a readily-attachable and detachable end piece, which will engage the saddle, the said end piece being also reversible.

19,128 of 1905.—J. BOARD & Co., LTD., and W. S. AKERMAN: *Roofing Tiles.*
This relates to a roofing tile having two T-shaped flanges along the upper edge of its top surface, and a square projecting ridge along the top edge of the under surface, which is also provided with two T-shaped flanges.

20,976 of 1905.—R. M. HAHN: *Sash Fasteners.*
This relates to a sash fastener, and consists in the combination with a non-rotatable sliding barrel or stem provided with a head adapted to engage one of the sashes of a barrel-box secured to the other sash, within which the said barrel is adapted to slide, a screw journaled in the barrel-box and engaging the sliding barrel and means for rotating said screw to cause the barrel to slide into or out of engagement with the cooperating sash.

23,021 of 1905.—E. RUCKGAUER: *Means and Method of Elevating Houses and Similar Structures.*
This relates to a method of elevating entire buildings or the like or the upper parts of same

which consists in mounting under the part to be lifted an upper grating adapted to support the same, a lower grating, a suitable distance below the upper grating, together with screw jacks placed at suitable distances apart so as to support the upper grating and the superincumbent load, either directly or through the intermediary of loose struts, and along the walls of the building a steady guide frame is arranged to guide the building vertically during the process of lifting. The operation consists in working the lifting jacks simultaneously to the end of their stroke, then working the said jacks backward one after the other, and replacing their struts by longer ones, then lifting the upper grating a further distance by the simultaneous working of the jacks, and so on until the desired height has been reached.

26,148 of 1905.—T. H. WATSON & T. EISLEY, Ltd.: *Means for Securing and Opening Emergency Exit Doors or Windows.*

This relates to means for securing and opening emergency exit doors or windows, and consists in the combination of counter levers or weighted levers movable on centres affixed to plates secured to the side of the rafter or framing, one part of lever being cranked and having at its end a small wheel, or a short arm or lever.

26,184 of 1905.—S. BUDER: *Apparatus for Cleaning Chimneys.*

This relates to an apparatus for pneumatically cleaning chimneys, comprising a hollow vessel with a tight joint between it and the chimney walls, which is connected to a compressed air or suction pipe, so that the soot falling into the hollow vessel is pneumatically removed from the same.

502 of 1906.—F. SHUMAN: *Concrete Piles and Method of Making the same.*

This relates to the formation of a concrete pile by sinking or driving a preparatory pile which is either open at the bottom, or is provided with a movable or removable lower end, so as to form an opening in the ground for the reception of the concrete to form the pile, providing the said preparatory pile with an inner tube or casing which surrounds the concrete of the pile throughout any desired portion of its length, and withdrawing the preparatory pile at any desired stage in the formation of the pile, but leaving the inner tube in position.

1,177 of 1906.—F. J. CHEREH and F. W. W. BRAMBLE: *Door Springs or Checks.*

This relates to door springs or checks in which a plunger adjustably connected to the door is adapted to reciprocate in a tubular member under the control of a spring or two springs acting on opposite sides of the plunger piston, and consists in the arrangement between the two springs carried in the tubular member of a collar or plate adjustably carried upon the plunger.

1,485 of 1906.—E. H. McLEOD: *Folding Fire-resisting Shutters or Screens.*

This relates to a flexible fire-resisting shutter or screen composed of sections, the lower edge of each section forming in part a cylindrical surface terminating in an inward bend, the upper edge forming a reverse curve, the lower and portion acting as a fulcrum on the horizontal plane of the inward bend of the adjoining section.

2,187 of 1906.—W. FAIRWEATHER (H. L. JUDD COMPANY): *Curtain Rod Supporters.*

This relates to a curtain rod support, comprising in combination a sheet metal body, an outwardly and upwardly struck up hook integral therewith, and a spring tongue or arm integral with said body and struck up adjacent thereto, and having a free end relatively to the rear of said hook.

2,503 of 1906.—L. SEPULCHRE: *Caps or Tops for Lamp and Other Chimneys, Ventilating Shafts, and the like.*

This relates to an exhaustor for chimneys, ventilating shafts, and the like, comprising a plate or horizontal collar supported by the chimney or shaft, and a horizontal plate of like dimensions, and is characterised by the fact that the plate has upturned edges, and that a ring is arranged to surround the chamber formed by the base plate and the superimposed plate, said ring to provide around the said chamber an annular and vertical passage having at top and bottom two entirely free outlets.

5,355 of 1906.—A. FIBZAMER: *Construction of Wrought-Iron Windows.*

This relates to the construction of wrought-iron windows, and is characterised by the fact that a sash bar of H-section is passed through a sash bar of the usual shape in such manner as not materially to weaken the latter sash bar, the bridge of which is perforated only in the central portion of its breadth and has its rigidity maintained by the considerable breadth of material which remains between the edges of the aperture, and those of the bridges, and that the positions of these apertures are so chosen as to bring one

of the faces of the grooves formed between the flanges of the bars to the other set.

7,438 of 1906.—A. C. MORTENSON: *Doors.*
This relates to doors, and consists of a door supporting frame comprising in its construction metal braces, said braces formed of angular sheet metal, the flanges of which are set into the bars, and bridge the joints between them, the said braces being provided with corner plates adapted to bridge the angles between the top bar and the side bars of the door supporting frame.

8,171 of 1906.—BAUGESCHAFT and CHALET-FABRIK DAVOS ATKLENGESELSCHAFT: *Operating Apparatus for Fanlights of Double Windows.*

This relates to operating apparatus for fanlights of double windows, comprising a rotatable cross bar mounted on the window frame and carrying a lever connected to a link pivoted to the inner fanlight.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

7,438 of 1906.—A. C. MORTENSON: *Doors.*
This relates to doors, and consists of a door supporting frame comprising in its construction metal braces, said braces formed of angular sheet metal, the flanges of which are set into the bars, and bridge the joints between them, the said braces being provided with corner plates adapted to bridge the angles between the top bar and the side bars of the door supporting frame.

8,171 of 1906.—BAUGESCHAFT and CHALET-FABRIK DAVOS ATKLENGESELSCHAFT: *Operating Apparatus for Fanlights of Double Windows.*
This relates to operating apparatus for fanlights of double windows, comprising a rotatable cross bar mounted on the window frame and carrying a lever connected to a link pivoted to the inner fanlight.

MEETINGS.

Junior Institution of Engineers.—Visit to Messrs. James Brown's Brick works at Uppminster. Train leaves Fenchurch-street (Tilbury line) at 1.48 p.m.

Society of Engineers.—Mr. Gerald Odey Case on "Submarine Groyning." 7.30 p.m.

Royal Institute of British Architects.—The Fifteenth General Meeting (Business) of the Session (1) to receive the reports of the committees appointed to direct the election of the council, standing committees, etc., for the year of office 1906-1907; (2) to proceed with the election of candidates for membership under by-laws 7, 8, and 9; (3) Mr. G. A. T. Middleton has given notice of his intention to move "That the council be instructed to consider the practicability of including all architects practising in the United Kingdom within the scope of the Institute;" (4) adjourned debate on Mr. Paul Waterhouse's paper on "The London Traffic Commission Report." 8 p.m.

Wednesday, June 13. Institute of Sanitary Engineers.—Half-yearly Ordinary General Meeting.

Friday and Saturday, June 15 and 16. Incorporated Association of Municipal and County Engineers.—Scottish District Meeting to be held at Berwick-upon-Tweed.

Saturday, June 16. Northern Architectural Association.—Annual excursion, Beverley.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. The Editor cannot undertake to read and consider articles offered for acceptance unless they are type-written.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from our office to residents in any part of the United Kingdom at the rate of 18s. per annum (24 numbers) PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Japan, etc., per annum.

Remittances payable to J. MORGAN should be addressed to The Publishers of "THE BUILDER," Cassinette-street, W.C. SUBSCRIBERS IN LONDON AND THE SUBURBS, by prepaying at the Publishing Office 18s. per annum (24 numbers) or 4s. 9d. per quarter (13 numbers), can ensure receiving "The Builder" by Friday Morning's Post.

PRICES CURRENT OF MATERIALS.

*. Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table with columns for material names (Hard Stocks, Grizles, Pickled Stocks, Facings, etc.), units, and prices. Includes sections for GLAZED BRICKS, PORTLAND CEMENT, and STONE.

NOTE.—The cement or lime is exclusive of the ordinary charge for sacks.

Table with columns for material names (BATH STONE, PORTLAND STONE, YORK STONE, etc.), units, and prices. Includes sections for STONE and HARD YORK.

STONE (continued).

Table listing stone types (Hoyton Wood, etc.) and their prices per cubic foot or per 1000.

SLATES.

Table listing slate types (In. In., 20x10 best blue Bangor, etc.) and their prices per 1000 or per 1000 at r. d.

TILES.

Table listing various tile types (Best plain red roofing tiles, etc.) and their prices per 1000 or per doz.

WOOD.

Table listing wood types (BUILDING WOOD, Fir timber, etc.) and their prices per standard or per load.

The Peace Palace Designs at the Hague.

WE very much doubt whether the Peace Palace at the Hague will ever really be built, and we feel quite sure that if it is built on the plot of land at present proposed, at a turn of the Old Road to Scheveningen and practically outside the town, it will be a failure, if not a laughing-stock. To propose that at the Hague, the city *par excellence* of long vistas of water and trees, a building which is intended to be a kind of European centre of reference and arbitration, should be built outside the town and away from its political centre, on a side plot facing nothing and with nothing to lead up to it, is absurd both in an architectural and an official sense. If it is so placed it will be a failure, as the Imperial Institute here has been a failure, from being relegated to a site too far removed from the Government centre, and it will be in an architectural sense completely misplaced and wasted, as there will be no point from which the building could be properly seen, and no axis of approach connected with it. A building on such a scale and with such a purpose ought to be a central object at the end of a dignified approach on its axial line, the more so in a city which, as observed, is full of straight vistas. If it were not for the old building called the

Gevangen-poort, which is of historical and archeological value, we should have said, get possession of the house property at the west end of the Vyver, the large rectangular piece of water along the south of which stands the old palace of the Binnenhof; at the end of this the Peace Palace would stand splendidly, reflected in the water, and in the midst of the historic centre of the town. But the Gevangen-poort, though not right on the bank of the Vyver, is too close to it to allow much space for building between it and the water, and we admit that to demolish this bit of ancient building would be a vandalism; but it is to be regretted, for the site would otherwise have been an ideal one for the Peace Palace, in an architectural sense at all events. If it is argued that the Peace Palace has no special relation to the Government of the Hague, and therefore need not be connected with its official centre (which is perhaps true), why could not possession be obtained of part of the large open space called Alexander's Veld (which seems to be a kind of parade ground), on the north side of the town, and the Palace be built there on the axis of Park-sstraat and Alexander-sstraat (running north and south) and of the most important public monument, the National Monument of Dutch Independence (1813), which stands centrally in the open space between the two streets? The building would then at least occupy a position of monumental dignity, with an important axial approach to it. To erect such a building on a corner

plot at the turn of a road would be nothing less than an absurd anti-climax to the competition. And, to return to our first idea about the Vyver site, it would be perfectly possible, after getting rid of the unimportant houses at the west end of this piece of water, to extend the ground by building a concrete pier at the west end of the Vyver, which would only cut off a comparatively small part of this large piece of water, and would form a perfectly ideal site for the Peace Palace, at the end of a broad vista of water in which it would be reflected, and in the neighbourhood of the most historic buildings of the town. Surely that is worth thinking of. It would be likely to be a success there; it will not be so if placed where it is at present proposed to place it.

The building was to contain two separate sections; A, the Court-House Section; B, the Library Section. The latter was to be built so as to form a separate part of the Peace Palace, with its own separate entrances from the Park, but to have an interior communication with the Court-House on the principal floor. The Court-House Section, which would form the principal and front portion of the building, was to contain two courts, a larger and a smaller one, and a Council Room in connexion with each court, each Council Room to have its own separate exit to the Park, unless the two were close together, in which case one exit and one set of retiring rooms would serve for both. The upper story was to contain, as its principal apartment, a room for the "Conseil Administratif" of

the Permanent Court of Arbitration; some of the competitors have however placed this Permanent Council Room on the principal floor. With this department there were of course to be various secretaries' rooms, rooms for clerks, messengers, etc. The Library Department was to contain a large storage library for books, two reading-rooms, librarians' rooms, a room for geographical maps, a cataloguing room, etc.; and to this it was added that on the upper story there must be room for the Board of Directors of the Carnegie Foundation; but in this case, as in that of the Permanent Council Room, some of the competitors have included it in the principal floor.

In regard to the arrangement of the plan, therefore, it will be seen that the most important point of distinction between different plans would be in regard to the manner in which the two main portions were related to each other architecturally and on plan; whether they should be treated as two separate blocks of building with merely a corridor of communication, or whether the whole should be combined into one architectural design, only with an internal separation in plan. In regard to the Court section also, as there were two courts to be provided, but one of them larger than the other, it would be a question whether the accesses to the two courts should be made similar and symmetrical, only making one of them smaller internally than the other; or whether the larger court should be given a more important and central position and the smaller one relegated to a side or angle position. There is something to be said for either principle. A good many of the competitors, we observed, have taken a very illogical way of reconciling symmetry of approach with difference of size in the courts, by simply making one court smaller than the other by cutting off portions of the interior for accessory rooms in connexion with the court, which, if they were required in one court, were required in the other.

The designs, 221 in number, are arranged mostly on the ground floor, and also in six rooms on the upper floor, of a rambling old palace entered from The Paleis Straat, the first block of which looks like a brick church, but appears really to have been some kind of assembly-room or banqueting-hall, with an open timber roof. The plan of the ground floor rooms occupied by the drawings is given in the accompanying cut. The upstairs rooms occupied being those over K, I, H, E and D. Room A is the open-timber roof one just mentioned. F is a rather fine-looking room in classical style, with a row of columns down each side, grained to imitate marble, carrying an entablature from which springs a segmental-arch coffered ceiling, leaving narrow aisles between the colonnade and the windows, ceiled in square coffered compartments. The staircase is a poor affair as far as the stairs are concerned, though there is an ill-judged attempt at architectural effect at the top, where there is an open clear-story colonnade formed by pretty substantial-looking columns which stand on the outer edge of a large overhanging cove cornice, with very singular effect:

What should be the style of a Peace Palace in which all the civilised nations of the world are supposed to be equally concerned? In view of its being a Peace Palace, one would say that the expression of repose should above all things be sought for; and in view of its supposed universality of interest (which it is to be feared is more imaginary than real), we should say that it ought to take one of those classic forms of architecture which, since the Renaissance, may be said to belong to no single country but to be the property of the civilised world. M. Cordonnier, to whose design (No. 213—motto "S'G.") the first prize of 12,000 guilders has been awarded, apparently thinks otherwise; and we gather from the published Report of the Jury that he considered that as the Hague has been chosen as the permanent seat of the Court of Arbitration, "the building should in style follow the local traditions of XVIIth century architecture." As the architects' own reports are not attached to their designs, we can only gather the intention of each, at second hand, from the brief remarks in the Jurors' Report. If this design is supposed to represent local XVIIth century tradition, it is that tradition as seen through French spectacles. The

Plan of Exhibition Galleries.

design reminds one very much of a Paris Mairie of the more exuberant type of detail, with a tower added at each end. The centre of the front, in the ground story, shows the three large round-headed doorways which are almost a religious observance in a French Mairie of the approved type. Above these there is a row of large mullioned windows in pairs, divided by piers with terminal figures, each couple of windows being again divided by a wall space with a decorative niche. These windows light the Permanent Council Room in the centre, and the secretaries' rooms and ante-rooms at each end; but these receive just the same fenestration design as the Permanent Council Room, whereas the latter ought certainly to have been emphasised in the exterior design. The centre block

terminates with the usual expanse of high-pitched slated roof with a flèche in the middle, also like the orthodox type of Mairie. The towers, carried to a great height, are fearfully restless and cut up in detail, in the upper portion especially. Anything less suggestive of a "Peace Palace" it would be difficult to imagine; there is no repose anywhere; the whole thing is *cinquant*, though most elaborately and beautifully drawn in every part; and as far as the architecture is concerned we should regard its erection as the representation of the Peace Palace as an absolute misfortune. It is different with the plan; the plan is an admirable one, and we should have supposed that it was to this that the author owed his position in the competition, but for the fact that the Jurors speak rather coldly of it, implying that it emphasises too much the distinction between the two departments of the building, connecting them only by one corridor on the axis line; and we gather that the selection of this design for the first premium was mainly due to its adoption of local architectural traditions. If so, we can only conclude that they are doubly in the wrong; first, in selecting a design for such a building on grounds of local tradition; secondly, in accepting this as local tradition: it is only local tradition Frenchified—very much Frenchified. In regard to the plan, M. Cordonnier treats the plan in two longitudinal blocks,* connected, as before observed, by a single short corridor on the vertical axis of the plan. The store library is in the centre of the Library block, the public entrance at one end of it, and the administrative entrance at the other end. In the front block the entrance-doors give access to a large vestibule running nearly across the front, the two courts placed symmetrically one at each end of it. The internal difference of size between the courts is made by cutting off from the right-hand court, as an ante-room, the amount of space occupied in the other court by the bench. This is a clumsy contrivance, for, as has already been suggested, if an ante-room is wanted in the one court it is wanted in the other. But it is the only fault we see in the plan, unless it is considered a mistake to treat the two departments as separate architectural blocks; the Jurors appear to have thought so, but there is much to be said for either view in this respect. The drawings, which occupy the whole of Room D to themselves, are no doubt a splendid set, and do M. Cordonnier in one sense the greatest credit: we can only regret that we cannot feel more sympathy with the result in an architectural sense.

The other five premiated designs are all on the right side of Room C as one goes from Room A.† The design to which the second premium is awarded (No. 194; "Pax"), by M. Marcel, of Paris, is shown in a magnificent set of drawings, incomparably the finest set exhibited, and which one can hardly speak of

* We are using "longitudinal," throughout this article, to mean blocks or corridors parallel with the line of the principal front, and "vertical" to mean those which are at right angles to it.

† The letter B is assigned to the gallery at one end of A, reached by the staircase in the corner; but none of the designs put up there are of any consequence.

without enthusiasm. It is "Ecole des Beaux-Arts" in *excelsis*, as well in its merits as in its defects, and is a typical example of French draughtsmanship and design in its most monumental aspect. In spite of having given this design the second premium, the Jury Report dismisses it coolly enough, with the remark that "it is only the plan that has at all commended itself," and that "both in the plan and the elevation the lines of the composition notably depart from the noble simplicity which should characterise a building devoted to the serious and dignified purposes of the Peace Palace." It should seem therefore that they have discovered this "noble simplicity" in the first premiated design, in which we can only say that their ideas of "noble simplicity" in architecture must be very different from ours. But why, after this criticism, did they give this design the second place? Were they so human as to be seduced by the mere drawing? There is certainly a good deal of exuberance in the design, but taken altogether it is much finer and more scholarly work than the First Premiated design. The outlines of the plan tend to run rather into curved lines; in other words, it is very much "modelled" in plan as well as in elevation; but we do not know that it is the worse for that. The entrance-hall is on a plan with a segmental curve at front and back, and a smaller semicircular curve at each side, with massive piers at the meeting of the curves. To the left of this is the small court, to the right the grand staircase. The large court occupies (vertically) the central axis of the plan, the council-room connected with it being an oval apartment adjoining the upper end of the court, one-half of it forming a projecting bay on the further margin of the Court House block. Beyond this is a formal garden round which the Library department is built, the book-store making a separate longitudinal block beyond this, and connected with it (or disconnected from it) by two corridors of communication. This is the principal practical defect of the plan, as the book-store is removed to far too great a distance from the reading-rooms to be convenient. The corridors round the Library court or garden are connected on each side with the corridor of the Court block by an open columned vestibule of three bays which would make a good architectural feature; indeed, the whole plan is full of possibilities of interior effect. The architectural treatment of the principal front is a good deal suggested by that of the Petit Palais, including the employment of a large semicircular *fronton* over the central entrance; but the dome is much larger, and consists of a steel-framed dome showing externally, and a built dome underneath it. The design is certainly, as already observed, very exuberant, but there is great force and vigour in it, and the detail is at all events much better than that of the First Premiated design.

The third premium, for the design No. 132—"Concordiâ Parvâ Res Crescunt: Discordiâ Maximâ Dilabuntur"—goes to a German architect, Herr F. Wendt, of Charlottenburg, for a design which is as intensely German as the other two are

French; German in its solid dignity, and also in a certain clumsiness and heaviness of character—qualities both recognised in the Jury Report. The plan, with a large octagonal central hall reached through a vestibule running across the front between the wings, is well laid out for internal effect, but somewhat scattered for practical working. The Library section forms a three-armed block at the upper side of the site, connected only at one point with the main block. The architectural treatment is a sober and rather ponderous classic, with a large Corinthian order and strong cornice carried all round the principal block of building. The ends of the principal front are brought out as boldly projecting wings, the recessed portion being occupied in almost its entire width by what would be a hexastyle portico only that the columns nearest the centre are doubled, and the centre intercolumniation much wider than the others, marking the approach to the great central doorway. Over the cornice is a plain heavy-pannelled attic surmounted by statues; and over the octagon hall a dome raised on a high circular drum very plainly treated; the dome is pannelled in gores in the orthodox manner, and has a large eye at the top, surrounded by what can only be called a *wall*, which makes one of the heaviest and ugliest finishes imaginable. There is not a touch of fancy or originality in the whole thing; it is absolutely academic architecture, and not of the most fascinating kind as such; and yet we cannot but think that it fulfils the architectural ideal of a Peace Palace better than either of the two already named, because it has at all events repose and dignity, and is cosmopolitan rather than local in character and associations.

From the prose of Herr Wendt we pass to the poetry of Herr O. Wagner, of Vienna (No. 17—"L'Art de l'Époque"), who receives the fourth premium for a design which also may be said to be neither local nor national in style, since it certainly does not represent the recognised architecture of any special time or place. From the Report we learn that "in the written memorandum which accompanies this design the author explains that a Palace of Peace, being something new, seems to him to require novel methods of artistic treatment." We should be more inclined to say that a Palace of Peace merited the repose which arises from traditional treatment; an architect who proposes a new style for it surely is of those who "come not to send peace but a sword"; yet we agree with the Jurors that "the result is interesting and not without originality," indeed we should say that it has a great deal of originality, though we do not see exactly how it illustrates "L'Art de l'Époque." His plan shows an immense square forecourt with a columned cloister on each side returned across the front to the central gateway. The columns, however, do not carry an entablature and roof, but only treillage and twining plants. Up the centre of the forecourt is a broad straight drive, at the end of which a monumental column with a statue of Peace stands in front of the entrance to the building. The two Council Chambers occupy the positions

at each end of the front block; the two courts are vertical on the plan, with an ante-room separating them from the council chambers. The side cloisters on each side of the forecourt lead up on each side to a small columned terrace which forms the outer vestibule to the courts. Beyond the ends of the courts a wide gallery runs across the whole building, on the further side of which the grand staircase is projected as an apse. From either end of this wide gallery run corridors connecting the Court block with the Library block; the book-store is across the top of the plan. The communication galleries, however, lead only to what is called a "pièce de reserve" in the Library plan, which would apparently have to become a passage-room on occasion, so that this part of the corridor connexion is rather clumsily managed. The architectural style is difficult to describe. The impression conveyed is that the exterior is intended to be revêted with marble slabs, or slabs of some kind; there are practically no mouldings, except a shallow and wide-spreading cornice with modillions. The windows are square-headed with visible steel lintels, or what look like such. Before the main entrance there is no covered portico, but four columns which carry gilt winged figures. Below the cornice is a series of gilt festoons and a row of the coloured armorial shields of all nations; above the cornice is a blocking with a square pedestal over each pier, carrying a seated gilt statue. The pavilions at each end of the main front, though projecting slightly on plan, are lower than the centre portion and roofed with segmental gilt domes, behind which, a little further, rises on each side a stepped erection reminding one of the outlines of buildings in Assyrian bas-reliefs, carrying two tiers of gilt angels blowing trumpets, and on the apex a gilt figure seated in an archaic chair, flanked by a gilt lion at each side; the figure presumably represents Justice, as this portion of the exterior is immediately over the entrance to the courts. Altogether, it is a strange architectural idea, unlike anything we have seen before; but it is not ugly, and it must be added that the whole thing is harmonious and in keeping, and there is nothing unpractical about it, in spite of its singular appearance.

The fifth premium goes to an American firm (No. 79, with a geometrical device as motto), Messrs. Greenley & Olin, of New York. This, the most quiet and unpretentious of the six premiated designs, is in regard to architectural expression the most refined and most suitable of all, only it is to architectural appearance a one-story building, whereas the Instructions contemplate a two-story one (in addition to the Basement). On the side elevation there are two stories of windows shown, between the columns of the order; the front is entirely a one-story treatment. An order of Ionic pilasters carries an entablature and cornice; the large windows between the pilasters are crowned with a secondary cornice which stops against the pilasters, the spaces between that and the main entablature being occupied by panels filled with decorative design. This wing design is stopped by a higher projecting

block of building in the centre, from which again projects a columned portico with a pediment over and a large deep-set arched portal beneath it; the architrave of the portico order ranges with the cornice of the order on the wings. The centre block is crowned, *more Americano*, with a low stone dome. The whole is most refined and scholarly in treatment, and groups admirably. The Jury Report objects somewhat captiously to what they call "the round ends of the principal façade," which they say injure the effect; they are not "round ends," they are apses projected from the square end, which is quite a different matter. We do not wonder that a jury which gave the first premium to M. Cordonnier's restless design should speak rather coldly of this; but it is a much better and purer style of architecture. The plan has a great deal of merit. The entrance is into a square hall under the dome, the two courts opening right and left, each ending in that apse which the Jury do not like, but which is quite suitable for this sort; the entrances to the two courts are symmetrical as seen from the hall, but the smaller court is reduced by being reached through a short corridor with minor rooms on each side of it. The two departments form one building, the corridor communication running completely round, only interrupted by shutting-off doors between the Court and the Library departments. All the provisions as to special entrances are carried out. The book-store of the Library department occupies a considerable part of the centre of the plan, backing up against the wall of the grand staircase of the Court department. The provision for the side-lighting of the book-store between the bookshelves is cleverly provided for, so as to be as effective and occupy as little wall space as possible. The plan is very compact and covers less ground than the other premiated designs; and altogether this is a most meritorious design and had a right to a higher place in the awards.

The sixth premium is awarded to the design (No. 130—"Eüene") of Herr F. Schweeten, of Berlin. The plan is rather naïve and square-cut, and in spite of the strict symmetry of the exterior the plan is not symmetrical at all, and the corridor plan contains two or three "dead ends," always the mark of inferior planning. In fact the plan is manifestly inferior to any others of the six, and far inferior to that by Mr. Hare which we published in our issue of June 2. That a design like this should have received a premium and that by Mr. Hare have been left out of consideration does not say much for the judgment of the Jury. The fact is that the Jury were five Continental architects to one American and one Englishman, and Continental taste in architecture is radically different from English, which is too sober to suit Continental judges; and we are very much inclined to think that the winners of the two first premiums owed their position as much to the striking character and size and number of their drawings as to more important considerations. Herr Schweeten's design is not unpleasing, but it is weak in points; there is a boldly projected central tetrastyle portico with a Roman Doric order

and a sculptured pediment, in the centre of a block of building pierced with separate windows in the Italian style, which *ordonnance* is simply carried round the corner at each end, with nothing to strengthen the angle or to make any balance to the central portico; and this weakness at the angle is the more noticeable because this part of the building is finished with a visible sloping roof with no balustrade, which makes a receding hip line at the angle. The portico and the wings, in fact do not seem to belong to each other. The square central hall has a double walling, the outer walls carrying a square mass of blocking rising above the roofs and decorated by panelling and angle finials, the inner walls carrying a circular dome of graceful design in itself, but which is badly and clumsily connected with the structure immediately below it.

In another article we will notice some of the best of the non-premiated designs.

NOTES.

No sooner has Mr. Norman Shaw's grand design for Regent's Quadrant become public property, than the bootmakers and drapers and their compeers are up in arms to try to prevent the erection of a design which will deprive them of their beloved plate glass fronts, and give London at least one street of monumental design. We do not believe that their objections will have any effect; but it is impossible to pass without comment the preposterous idea that the improvement of London street architecture is to be stopped because tradesmen imagine it to be necessary that the whole front of their shops should be one sheet of plate glass. If it were of any use to argue with selfishness and stupidity, one might point out to them that a fine class of architecture in shops may turn out eventually, if they could only understand it, to be a better advertisement than the rinning of all architectural character by mounting buildings on sheets of plate glass. But no such considerations can be expected to reach the shopkeeping intellect. It was the shopkeepers of the Strand, it may be remembered, who did all they could, some years ago, to pull down the church of St. Mary-le-Strand, and who would have gladly seen the destruction of a fine architectural monument in order that there might be more room for carriages to draw up at their shops. If they had been listened to, what would people be thinking of the transaction now? This is an agitation on just the same lines; an attempt to stop a great architectural improvement because it does not suit the ideas of shopkeepers. We hope the authorities will remain firm, and let these people see that "trade interests" are not to rule everything.

RESIDENTS in the northern half of London have reason to be satisfied with the decision of two Parliamentary Committees in favour of the North-East London and the North-West London railways. The former of these undertakings will provide a much-needed

line of communication, partly underground and partly in the open, along the main road to the north as far as Waltham Abbey. The latter will furnish similar facilities between Victoria and Cricklewood, with the great advantage of stations for the transfer of traffic to and from the systems of the Metropolitan, London and North-Western, Central London, Brompton Piccadilly and Great Northern, London Brighton and South Coast, and South-Eastern and Chatham railways. These exchange stations will be established at Victoria, Hyde Park Corner, the Marble Arch, Chapel-street, and probably at Edgware-road, and we fully agree with the opinion expressed by Sir Douglas Fox that the scheme, as amended by the extension to Victoria, promises the most valuable north and south connexion not already authorised which could be proposed for the metropolis.

An important point has been decided by the Court of Appeal in the case of *Lowe v. Myers & Son*. They have decided that a "claim" under the Workmen's Compensation Act need not be in writing. This is an important point, as under the new Bill the change in the language, although it would seem to imply that the claim should be made in writing, since it speaks of its "delivery," is not so explicit in its terms as to overrule the above decision. The Departmental Committee advised that the claim should be made in writing, and it seems reasonable that the employer should be given this security; and since it has been decided by the House of Lords in *Powell v. Main Colliery Company* that the claim need not be formal in its form, it would seem that no hardship to the workman would ensue; although in view of the fact that the Bill is to embrace industrial diseases which may be some time in declaring themselves, possibly the present limit of time (six months) within which the claim must be made should be extended. It certainly seems very undesirable that employers should be rendered liable to have a verbal claim for compensation set up months after the accident, which possibly, if given at all, may have been made to some agent.

THE partial opening of the new station of the London Brighton and South Coast Railway will, no doubt, do something to relieve the congestion from which regular passengers have suffered for years past, largely in consequence of the fact that all main line and suburban trains were compelled to enter and leave the terminus on two tracks only, one for up and one for down traffic. The widening of Grosvenor Bridge and the provision of a fan-like extension of tracks outside the enlarged station will save many tedious delays, and the additional platform accommodation will make access far more easy. Until the work of reconstruction has been completed, in about two years' time, local trains will continue to use the west and main line trains the east of the terminus, an arrangement that will ultimately be reversed. One of the most striking features of the new station is the admirable

system of high-pressure incandescent gas-lighting, which is described on another page, and which has been found more satisfactory and more economical than the arc-lighting previously employed. Some difficulties and annoying delays were experienced during the early part of the week owing to the unsatisfactory behaviour of the electrical signalling apparatus, which appears to have been affected by the stiffness of the new points. This, however, was a purely temporary trouble, which has now been practically overcome.

Automobilism. THE *Times* of last Saturday, under this heading, published a Reuter telegram containing an account of the Herkomer motor race. The telegram contained this passage:—"The only accident reported happened to a Berlin car, which ran over and killed a peasant near Melk. The weather was fine but the roads were heavy. The cars will remain here on exhibition to-morrow." A lady took part in the race, and the telegram also speaks of the ovation she received. The extraordinary callousness of motorists as to the lives and safety of others is now a matter of common knowledge, but surely such an account of a fatal accident as this, even in a telegram, is unjustifiable. If the man killed had been a dog or a chicken hardly less could have been made of his death. What would be thought of an account at a cricket match where an onlooker was killed by a ball and his death announced in such terms? Moreover, what would become of cricket if such occurrences were frequent? This breach of decency and humanity serves one good object, and therefore we do not regret its appearance in the Press: it shows the real attitude of the motorist, when he is not on his guard affecting studied moderation to safeguard the enjoyment of his sport.

A Concrete-Steel Failure in America. THE collapse of a concrete-steel building during construction in Atlantic City, N.J., should serve to emphasise the extreme importance of sound design and workmanship in all cases where the new material is employed. The failure to which we refer shows clearly that these essentials were lacking to a lamentable extent. An engineer who has examined the ruins reports that the surfaces of the fallen beams and columns were badly split and broken, and the concrete was so much affected by frost that large portions could be broken off and crushed by a slight effort of the hand. Another circumstance, for which no excuse can be made, was that no satisfactory bond existed between the concrete of the beams and the floor slabs. That the necessity for such union had not been recognised by the contractor was evidenced by the fact that in several instances the beams were formed of trap concrete, while the slabs were of concrete with limestone aggregate. As the designer has evidently included the thickness of the floor slab in the effective depth of the beams, the lack of cohesion between the two classes of members necessarily involved a serious departure from the calculated resistance of the construction, and might in itself be sufficient to account for the failure.

Another defect was demonstrated by the shearing of two beams at the supports, indicating that the reinforcement had not been carried to the points of bearing. Faults such as these may easily occur in reinforced concrete work, even when properly designed, if executed by inexperienced contractors under inefficient superintendence, and the lessons conveyed by this failure are so obvious that comment is unnecessary.

The Palace, Southwell. THE Bishopies Act of 1878 made provision for reforming the "peculiar" of Southwell, and an Order in Council of February 2, 1884, revived and set up the present independent See. For the uses of the new diocese the bishop suffragan of Nottingham bought the remains of the old palace, together with its gardens and part of the park—some 4½ acres in all. The palace, standing about 100 ft. distant, southwards, from the Minster, was formerly a residence of the Archbishops of York, and had been a favourite home of Cardinal Wolsey. It was originally built by John Kempe, Archbishop of York, 1421-52, and was completed by his successors, William Booth and other prelates. It formed a large quadrangular edifice, having a chapel, and on the north side a fine banquet-hall of *temp.* Henry VI. It will be replaced with the new buildings now being erected after Mr. W. B. Caröe's designs for the Bishop of Southwell. The association of Southwell, with the See of York, the most ancient in England, begins with the history of Mercia. Paulinus, consecrated archbishop in A.D. 627, founded at Pinga Ceaster, in the Trent valley, one of the earliest Christian churches in those parts, which afterwards became the collegiate church of St. Mary, Southwell. The site lay in the midst of the Marches, which Penda, having slain in battle Eadwin and Oswald, Kings of Deira, established as the kingdom of Mercia. Archbishops Thomas, Grey, Romaine, and Kempe rebuilt and enlarged the church in the course of the XIth-XVth centuries; they possessed four parks within a radius of 5 miles, at Norwood, Little Park, Hockerwood, and Hexgrave.

Messrs. Waring & Gillois's New Premises. THE new building that Messrs. Waring & Gillois have built for themselves in Oxford-street, from the designs of Mr. Frank Atkinson, their architect, was open to the public on Monday. Apart from the interest attaching to the commercial enterprise displayed in the size and completeness of the undertaking, an interest attaches to the building itself. The pernicious expanse of plate glass is in evidence on the ground floor, though the piers of granite are heavier than those which generally mask the steel stanchions carrying the superstructure. Fortunately the ground floor is the only floor marred in this respect. It is the unbroken stretch of plate glass windows, such as the Regent-street shopkeepers are now agitating for, which is such a blight on the appearance and character of our towns; if the large firms and respectable shopkeepers would set their faces against this unsightliness improvements could

gradually be made—improvements which Messrs. Waring & Gillois's building faintly suggests; or we might get back to the dainty shop fronts of the Georgian period. The new block of buildings is on a fine plan, with a central Rotunda having galleries around it on each floor; there are eight floors, and some idea of the size of the building is gained from the fact that these floors provide about 8 acres of floor space for showrooms. Some of the showrooms are treated in a fine architectural manner, their proportion and design very effectively set off by the fine examples of antique furniture, pictures and hangings; they have ceilings very richly moulded and carved or cast in wood and plaster. Many other showrooms were fitted up as complete flats, showing ranges of furniture at different costs, while there are separate departments for each branch of household requisites.

The Pastel Society. THE eighth exhibition of the Pastel Society is open at the gallery of the Royal Institute of Painters in Piccadilly. It is on the whole a better exhibition than last year, partly because it is not so disfigured with some of the ugly and scarcely decent figure scrawls by one or two French artists which were to be seen last year. Pictures at a Pastel exhibition may mostly be divided, as in this case, into two classes—works which illustrate what can best be done in pastel, and works in which the endeavour is made to simulate the effect of paintings in oil or water-colour. The latter are a mistake, as they only serve to show the limitations of the material. Among those who understand what Pastel is meant for is Miss Marion Gemmill, whose portraits in a free line treatment (Nos. 1, 2, 3, and 119) are very good. In landscape Pastel will do to indicate broad effects of light and colour and composition, as in Mr. Baldry's "Storm Clouds" (20) and "At the Edge of the Marsh" (21), but it does not do to carry landscape too much into detail in this material. Among the very best things are M. Le Gout-Gérard's four marine and shipping scenes, 101 to 104, the first-named especially, Chevalier Formilli treats effectively "The Harbour, Capri," and "The Field of the Angels, Barbizon" (139, 140). Mr. Melton Fisher's "The Poem" (175), among the more highly finished works, is a very pretty figure of a girl reading, though a little too much of an imitation of painting. In the opposite class of work, Mr. Clausen illustrates very well the use of Pastel for rapid sketches of effect (178 to 182), especially in the two sketches "The Rickyard" and "A Willow Tree." Mr. Tuke has made a charming nude study, "Early Morning" (167), which may have been a study for a picture he is exhibiting at the New Gallery, or may be a replica of it in another medium. M. Legraud and Mr. Charles Conder supply the element of vulgarity in figure subjects which unfortunately is seldom absent from an exhibition of sketches and studies; the figure by the latter artist of a low and odious-looking woman listening at "The Keyhole" (77) is a remarkable example of the taste for the ugly and repulsive which is unfortunately so prevalent nowadays with some artists,

and which seems only to arouse the sympathy of the "art critics" of the day. As a contrast we may draw attention to Mr. Bruckman's beautiful little composition, "An Idyll" (147), which, except that the figures are clothed in everyday dress, reminds one of the feeling and style of some of Fantin-Latour's monochrome studies in combination of figures and landscape.

The Goupil Gallery. THE summer exhibition of the Goupil Gallery includes one or two first-rate examples of the art of Mauve (3 and 11), and a fine picture by Herr Israels, "The End of the Day" (15), a dark undulating moor with the western light beyond, across which two weary peasants trudge. Mr. Robert Fowler's "The Rainbow, Conway" (31), is an effect, no doubt, but it hardly makes us forget the paint-pot—perhaps it is not intended to do so. Mr. Weiss's "February on the Seine" (38) is a good landscape; and there is a little Corot sketch (8) with a white house in the middle distance, and a fine sky by J. Maris in the picture called "Entrance to a River" (7). Among the black-and-white works in the outer room some sketches by Mr. Paul Heury, especially "The Top of the Hill," are worth note; and there are architectural subjects by Mr. Hanslip Fletcher and Mr. John Finleylove. Among the small sculpture works by Herr Arosen are some pretty ideal heads in marble, but his colossal head called "Beethoven" is one of several sculptural libels on the great composer which we have come across lately. It may be said that it is an ideal or symbolic head and not a portrait; but why represent Beethoven (as an English sculptor also did in last year's Academy) as a kind of inspired washerwoman?

The Leicester Galleries. A COLLECTION of water-colours by Mr. Arthur Severn which occupies the principal room at the Leicester Galleries consists largely of studies of special and rather brilliant effects of light, which seen altogether give the exhibition rather a sensational appearance at first sight. Perhaps one or two of the effects are rather overdone, but in the main these drawings have the aspect of truth. "The Indian Ocean" (11), a dark cold sea beneath the last glow of sunset, is a fine work; also "Looking towards the Sierra Nevada from a P. and O. Steamer" (15). "Westminster by Moonlight" (4) is a real moonlight effect. Architecture is well treated in "The Salute, Venice" (34), and some other drawings. Of the landscapes, "Coast of Spain, near Gibraltar" (31), and "Lancaster Sands" (43), are among the best things in a very interesting collection. In the other room "Paintings of Dutch Life and Landscape," by Mr. and Mrs. Harold Knight, are very clever, the figure studies (which predominate) especially so. The two artists paint in a very similar style; the lady's work is distinguished by asterisks in the catalogue, otherwise it would be difficult to separate them by any distinction of style. Among the best are "Gossip" (1), in which the figure with the back to the spectator is remarkably expressive; "The Little Brother" (14); "Knitting the Stocking" (18); "The

Mirror" (27); "The Baby's Cot" (28); and "The Window Curtains" (46). Mr. Gwelo Goodman's small "Water-colours in India," which occupy the front room, seem a little inspired, at least as far as the manner of putting in the figures is concerned, by the work of the late Mr. Melville. They are not important work, but they are good water-colour sketches. "The Taj" (32) is one of the best slight views we have seen of this often-painted building; and the drawings give a general impression of truth of colour.

The Fine Art Society. At the Fine Art Society there is a quadruple exhibition going on, of which however the portion contributed by Count Seckendorff. "At Home and Abroad," is the only one of artistic importance. Count Seckendorff's water-colours are well known at the Institute of Painters in Water-Colours, of which he is a member; they are characterised by freedom of style and effectiveness rather than by higher qualities of water-colour art, and a good many of the drawings now exhibited are of rather a topographical character; but he paints architectural groups well, and he is specially successful in some subjects of châteaux rising from among trees on a hilly site—see Nos. 21 and 34. "The Forum, Rome" (59), is a very good representation; and also the foreshortened Rialto in "Venice" (73), and the view of "Camogli" (84) with its tall narrow strips of houses, and the "Porto Venere" (90) with its mass of red-brick building on the opposite side of the canal. But the best thing in the collection is "An Old Oak Tree, Weidelsburg" (19), which seems to have been done under some special influence, as there is a higher style about it than in the others. The other three collections are a set of water-colours of "Veldt and Kopje in Five Colonies," by Miss Agnes Goodall, which are chiefly interesting in a topographical sense, and we imagine chiefly intended so, though they are good drawings; a series of chalk portraits drawn from life by Mr. C. E. Ritchie—good drawings, whether good likenesses we cannot judge; and Mr. George Roller's sketches under the title "Soldiering and Sport," which are hardly things for an art gallery.

Some Pictorial Decorations. MESSRS. CARFAX & Co. have taken the large room of the Alpine Club for the arrangement of a series of decorative views in Italian cities by Mr. Kerr-Lawson, intended for panels in the drawing-room of a private mansion. They are arranged here much as they will be arranged in their ultimate position, each painting in an upright panel, the lower portion of which is occupied by a low-relief floral decoration in plaster, the picture occupying the upright space above. The paintings are kept in a low key of colour and treated with a certain severity of style which is proper to decorative painting, and we should think that in their position in the room they are intended for they will have a very good effect.

Illustration of Egyptian Temples. THE series of water-colour drawings and oil-pictures by Mr. Frederick F. Ogilvie, exhibited under this title at the Modern

Gallery, do not quite answer to the title, as the fact is that the best things among them are the water-colour drawings of various old houses and picturesque corners in Cairo, which are excellent examples of architectural subjects treated in water-colour. The larger illustrations of the temples are less impressive than these, and do not seem to get all out of the subjects that might be got from them. The little view of a corner in the Hall of Columns of the temple of Isis at Philæ (46), with light coming in through the opening, is very good, as also is the larger drawing of "The Main Door of the Mosque of Sultan Hassan, before the Restorations" (64), an admirable piece of architectural illustration. The exhibition includes some special illustrations of the most recent discoveries at the temple of Mentuhetep III. at Der-el-Bahri (which seems to be the latest spelling adopted—we first knew it as "Deir-el-Bahari"), and of the Hathor cow image discovered by Mr. Naville, which are exhibited by the permission of the Egypt Exploration Fund.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The usual fortnightly meeting of the Royal Institute of British Architects was held on Monday at No. 9, Conduit-street, Sir John Taylor presiding.

At a private meeting which preceded the resumed discussion on the London Traffic Commission Report, Mr. G. A. T. Middleton moved:—"That the Council be instructed to consider the practicability of including all architects practising in the United Kingdom within the scope of the Institute."

Mr. Cross seconded the motion, and it was carried.

The Annual Elections.

The results of the elections were announced. The Council and Standing Committees were declared duly elected as follows:—

The Council.—President—T. E. Colcutt. Vice-Presidents—J. S. Gibson, E. T. Hall, H. T. Hare, Leonard Stokes, Hon. Secretary—Alexander Graham, F.S.A., Members of Council—Reginald Blomfield, A.R.A., M.A.Oxon., W. D. Carge, M.A.Cantab., (Glasgow), W. D. Carge, M.A.Cantab., F.S.A., W. S. Cross, M.A.Cantab., E. Guy Dawber, W. Flockhart, Ernest George (Past Vice-President), J. A. Gotch, F.S.A. (Kettering), E. A. Gruning (Past Vice-President), E. L. Lutyens, C. E. Mallows, E. W. Mountford, Ernest Newton, W. A. Pite, A. N. Prentice, G. H. Fellowes Pryme, J. Slater, B.A.Lond. (Past Vice-President), Paul Waterhouse, M.A.Oxon. Associate Members of Council—H. A. Crouch, W. A. Forsyth, S. K. Greenslade, H. V. Lancaster. Representatives of Allied Societies.—H. Dare Bryan (Bristol Society of Architects), H. Sutton Chorley, M.A.Oxon. (Leeds and Yorkshire Architectural Society), E. Kirby (Liverpool Architectural Society), W. M. Mitchell, R.H.A. (Royal Institute of the Architects of Ireland), J. M. Monro (Glasgow Institute of Architects), Harbottle Reed (Devon and Exeter Architectural Society), H. O. Tarbolton (Edinburgh Architectural Association), H. H. Thomson (Leicester and Leicestershire Society of Architects), J. H. Woodhouse (Manchester Society of Architects). Representative of the Architectural Association (London)—R. S. Balfour.

Standing Committees.—Art.—Fellows: R. Blomfield, A.R.A., M.A.Oxon., F.S.A., W. D. Carge, M.A.Cantab., F.S.A., E. Guy Dawber, E. George, J. S. Gibson, H. T. Hare, Professor W. R. Lethaby, Ernest Newton, E. S. Prior, M.A.Cantab., F.S.A., Paul Waterhouse, M.A.Oxon. Associates: J. Anderson, R. S. Balfour, A. T. Bolton, W. A. Forsyth, S. K. Greenslade, H. V. Lancaster.

Literature.—Fellows: Reginald Blomfield, A.R.A., M.A.Oxon., F.S.A., A. W. S. Cross, M.A.Cantab., Professor W. R. Lethaby.

E. S. Prior, M.A. Cantab., F.S.A., Halsey R. Ricardo, Professor F. M. Simpson, Professor R. Elsey Smith, R. Phené Spiers, F.S.A., H. Stannus, A.R.C.A., Paul Waterhouse, M.A. Oxon. Associates: W. A. Forsyth, F. Lishman, W. H. Ward, M.A. Cantab., P. L. Waterhouse, M.A. Cantab., A. M. Watson, B.A. Lond., P. S. Worthington, M.A. Oxon.

Practice.—Fellows: W. H. Atkin Berry, H. Brodie, Max Clarke, G. Hubbard, F.S.A., J. D. Mathews, J. Murray, S. Perks, A. Saxton Snell, T. H. Watson, W. H. White. Associates: E. Greenop, E. R. Hewitt, H. Hardwicke Langston, T. E. Pryce, A. W. Tanner, R. Stark Wilkinson. Science.—Fellows: T. W. Aldwinckle, Max Clarke, B. J. Dicksee, Matt Garbutt, E. Hooper, C. S. Peach, S. Perks, H. D. Seales-Wood, A. Saxton Snell, L. Solomon. Associates: R. J. Angel, H. W. Burrows, F.G.S., E. R. Hewitt, G. Pearson, A. W. Tanner, E. A. Young.

The Hon. Auditors are Messrs. Sydney Perks and William Arthur Webb.

New Members.

The following candidates for membership were elected to the various classes by show of hands under By-law 9:—

As Fellows:

- C. H. Ashworth, Dublin.
- T. Baird, Jun., Glasgow.
- A. Balfour, Glasgow.
- R. Sheiketon Balfour, London.
- A. Back, Glasgow.
- G. Bland, Harrogate.
- P. Bown, Harrogate.

Traffic Facilities for London.

At the conclusion of the private business the discussion on Mr. Paul Waterhouse's paper, reported in the *Builder* of May 26, was resumed.

Professor Beresford Pile said that the paper which had been read was perhaps the most important that they as Londoners had had for many years. He ventured to think that new thoroughfares were of great importance to architects, and certainly to them more than to engineers. No doubt it was a matter which had attracted the attention of engineers, and had been dealt with in an engineering manner, but he suggested that it was primarily a matter of building. It was not merely a matter of through traffic. With regard to the matter on which the question had been brought before them, he would only refer in general terms to the extraordinary gift which Mr. Waterhouse possessed of providing that suggestive flavour of humour in his paper which characterised the work of the onion in the salad. Mr. Waterhouse had altogether adopted the directions of the roads proposed by the Traffic Commission, and he would start with the suggestion that the configuration of London was governed by the configuration of the river and the hills. He thought it would be useless to attempt to throw a new line of traffic communication through London irrespective of the weight of buildings adjacent to that line, and that weight of buildings was practically created by the line of the river, and therefore the wide new thoroughfare should be about equidistant from the river. Then with regard to the hills. There was Ludgate-hill, which

was London, and there was Pentonville-hill, with the "Angel" on it, and then the general slope going westwards which lay between Piccadilly and the river. The suggested thoroughfares of the Traffic Commission neglected that configuration of the river, and practically neglected the configuration of London in vertical sections created by the hills. It passed up Pentonville-hill as if the traffic would like to get up it. Taking the great west and east road, they would notice that it terminated practically on the side of the park, and there was no logic in taking a huge thoroughfare to receive the greater part of London's traffic and throwing it upon the edge of Lancaster-gate. The only possible direction suggested by that line was, of course, the immersion of the traffic in the water in Kensington-gardens. Surely the western road ought to reach some focussing point. If it lead to the Marble Arch, it would receive relief in various directions, but leading as it did near the foot of Queen's-road, it seemed to be practically futile for its purpose, and Bayswater-road for at least a mile did exactly the work which it was proposed to be done by the west and east road. With regard to its general direction, it discarded the tendency of all the east and west roads on the north side of the river. If they noticed these roads they would see that they all converged on the City—that they all had practically a due easterly direction. The proposed road, however, had a north-easterly direction, and he could not imagine what section of the population would wish to hurry at electric tramway speed in a north-easterly direction, away from Oxford-street and the shops, and right away from the City to some point near St. Luke's. It seemed to him that the direction of the suggested road was contrary to the tendency of the traffic of London. If they looked to the road eastwards, the same truth applied, though his proposition with regard to the configuration of the river would appear to have had some bearing upon the eastern arm. All the easterly roads of London had a northern tendency, but the proposed great road from east to west would have the effect of driving the traffic from the east not to the City, but in the direction of Old-street and St. Luke's. In the same way, the north and south thoroughfare did not seem to him satisfactory, because it also neglected the tendency to the City. It created a wide road by the side of the great inclosure created by the railways on the north, but did nothing, and could not do anything, to receive and to relieve the north-western access to London. It was unfortunate, of course, that the railway-stations formed, as they did, a great wedge driven into London from the north and preventing freedom of access from the north-west into the centre, but this great north road did nothing but emphasise the existing difficulty, and only created an expensive thoroughfare. When they came southwards, the road in the same way avoided the City, and everyone who came down that road and wished to arrive at the heart of London would have to leave the road to itself and turn into some of the already existing thoroughfares. Generally speaking, the western districts of London at present had an ample number of good thoroughfares. If they took Oxford-street, they found parallel streets to relieve it to the north, such as Wigmore-street and the Euston-road. The Euston-road was a road created by Act of Parliament to be no less than 160 ft. wide, and the buildings were 50 ft. from the road, and it was a fact that when Marylebone Church was erected by Hardwicke it was found that the portico came over the line, and a special Act of Parliament had to be obtained to allow it to remain. But in the past Londoners had been very lax, and this road had become blocked by buildings at different points. It was to be hoped that when the leases fell in London would come into the reversion of the valuable inheritance of an east and west thoroughfare already existing. South of Oxford-street there were not the same facilities. Then they had to recognise the position of the Park. If they took the position of Hyde Park, they would find that the traffic of the north-west went on the north side of Hyde Park and the traffic on the south-west took the Piccadilly line. It would be obvious that any improvement of

the means of access to London should follow the existing tendencies, and should rather take a similar direction to the great Oxford-street in the north and the Piccadilly line in the south. The scheme which had been proposed was very large and drastic. It was, he thought, too large to be possible, and one could imagine such a scheme only being carried out by the creation of an enormous trust to acquire a vast amount of property and hold it for a public improvement, and he hardly thought it was likely that such a trust would be brought into existence. As to Mr. Waterhouse's paper, if one rejoined to hear of the Hotel Russell being under sentence of death, Mr. Waterhouse was absolutely impartial, because the Langham Hotel would also go. He expected that in his anxiety for All Souls' Church Mr. Waterhouse had forgotten that it had a back side as well as a portico, and that did not leave the delicious impression which his circular place had at first sight. Lastly, he would like to suggest that London possessed a very large number of beautiful buildings, and that if they had the chance of really clearing a space and taking the buildings they had in London and grouping them, there would be no capital in Europe which could compete. If, for instance, they took and grouped the Greek buildings they had in Bloomsbury—the British Museum, University College, St. Pancras Church, the entrance to Euston Station—or if they took the great City halls and grouped them, how wonderful they would be! Then they had a wonderful series of Gothic churches of the last half-century, and if these were put into a park, how nice they would be! He would really like to have all the Gothic residences of the last half century put into South Kensington to give the public something to look at. Still, if they had the chance to arrange, what a fine city they could make of London, and he suggested that the proper method was to improve their line of access between these buildings. If they projected the line of Waterloo Bridge northwards, they came into the centre of the British Museum, and if the lines of new streets led to and from great buildings they would do something practical, and which would be more satisfactory to them as architects than the mere driving of a huge new thoroughfare right through the heart of London they knew and loved so well. Then, with regard to the configuration of the river, he would point out that the river was a sort of "S." The upper curve had St. Paul's sitting upon it, and it had for its centre Bethlehem Hospital on the south. The traffic of London was practically on that radius, because it crossed by several lines to the "Elephant and Castle." The lower curve had Westminster upon its shore and at its true centre, from which it struck Hyde Park-corner, and that was a part of London which wanted some relief, and probably the new Vauxhall Bridge would assist radiation from it. If they recognised that configuration it would help them to bring their buildings together. One point was probably the most important, as it was the most practical. Was it possible to have an authority in London which would with steady tradition and with architectural advice proceed to consistently harmonise their street widenings and street improvements so as to give them the means of obtaining relief when it could be done most cheaply and when most needed? They all wanted such a body as that. He ventured to think—and he said it quite prepared for criticism—that he thought they had that body in the London County Council. He could not help thinking that a body sitting with a permanent architectural staff, with the permanent supervision of public buildings, with statutory power with regard to the making of new roads, and with certain control over existing roads, was the body which ought to be strengthened and which ought to be supported, and which should work towards the attainment of the things which London most desired. He was quite sure that the improvement of the London County Council was very necessary, but he would suggest to the Institute that the improvement of the London County Council in architectural matters was wholly in their own hands, and if they were to take up a sympathetic attitude with the Council and seek to assist them on architectural matters in promoting new legislation, they

would be able to do much more good than by merely maintaining a critical attitude. In the last year the London County Council withdrew the greater part of a Bill which would have given them power to make streets up to 100 ft. in width throughout London, and to link together streets which wanted linking together, and which in many ways, and at a small expense, would have given relief to traffic. He ventured to warn them against the falling into existence of a Frankenstein monster without architectural tradition, and with regard to which they might have no control, to drive great boulevards through London and interfere with the existing architecture. He could not help thinking that there must be an improvement in the public in architecture before they ventured to call a new body into existence. He ventured to say that they, as architects, were not in a fit state of mind, or intellect, or art, to design buildings of such streets as were proposed. They did their best, but could produce nothing much better than Shaftesbury-avenue on a large scale, and he must say he was a little pessimistic as to Aldwych. It was the absence of real public interest in architecture which was to blame for this. However, if they were given another half a generation he thought they might be more fit for these new streets.

Mr. E. W. Hudson said that Mr. Waterhouse had on the whole dealt gently with the Royal Commission, but he had given them one telling hit when he referred to them as being tramway mad, and they would all agree with that. The disease had also been caught by the gentleman at the head of the Local Government Board. Mr. Waterhouse had not given them a comprehensive scheme, but had confined himself to offering an alternative line to the proposals put forward in a half-hearted way in the Report, and they would agree that the proposals of the reader of the paper were far more thoughtful. He, however, did not think that east to west or north to south thoroughfares were altogether what were required for London. His idea was that they did not require more such straight streets, but an elliptical line. The road might start from the east, take a curved direction, go over one bridge and pass along the south side of the river, and link up over another, as in some of the best-regulated Continental cities. He suggested that an elliptical line from Regent-street, passing north-east, then east, and then south-east again and over Tower Bridge through Bermondsey, and coming again over Westminster Bridge, would form one of the best elliptical lines which could be suggested. London lost its fortifications so early that it had not the advantage of pulling down the walls and filling up the ditch and of making a magnificent street, but that was what had occurred in Continental cities. The belt system was what he advised as the *ne plus ultra* for London. Looking at cities in America and in their own colonies they found they were all laid down on grid-iron lines, and belt lines were conspicuous by their absence. Besides the avenues in Continental cities there were also belt lines of railway. They had that in the Underground Railway in London, and what a benefit the despised railway had been! That had been copied in Paris. They did not want four lines of tramway anywhere, as had been foreshadowed. The motor-bus had not had a fair chance, and he believed that when improved it would be one of the great reliefs for the traffic of London. Objection had been raised to the newness of London's aspect if the schemes were carried out; but there was no objection surely to newness *per se*. They had seen the design for buildings along Regent-street, and, although the shopkeepers held up their hands in horror, they must admit that their architects could design something of which they might be proud. As to the Advisory Board, Mr. John Burns said one already existed at Spring-gardens, and in that he agreed with Professor Pite, who feared the creation of a new Frankenstein monster, but the public had already created one, and it was to that it was now proposed to grant extra duties. He thought the present duties of the London County Council were quite as much as they could properly carry out. Then it was proposed that there should be a new bridge to the west

of Blackfriars. Could they imagine anything more dreadful than that? It would ruin the finest curve of the finest embankment the country possessed. It was perfectly unnecessary, for Blackfriars Bridge was to be widened, Waterloo Bridge could be widened, and by the addition of two wings to Charing Cross Bridge to carry carriage traffic they would be provided with all the accommodation that was necessary to relieve the Strand and Fleet-street. As to the width of roads, he considered it would be most extravagant to exceed 100 ft. Mr. Waterhouse suggested that it would be better to take the two frontages than only one, but it would be a much more expensive thing. Gray's-inn-road had only just been widened, and he did not think it would be agreed to widen that further. He felt that the fear of trespassing on the precincts of the Temple had been carried a little too far, and that if King's-bench-walk was thrown open it would form a splendid cut from the Strand to the Embankment, and so make Blackfriars Bridge more valuable. Then Mr. Waterhouse had been generous with the Duke of Devonshire in not desiring to interfere with his mansion, but he had not been so kind to the Duke of Bedford, and he (the speaker) suggested that in passing in front, instead of behind, the new St. Pancras Church he would do just as well, and, by widening Seymour-street, take away a lot of poor property and make a fine avenue leading to Camden Town.

Mr. W. Woodward said he could not follow Professor Beresford Pite's reference to the configuration of the Thames, and what that had to do with the traffic and the thoroughfares of London he could not imagine. There was a great deal in the learned Professor's speech he could not understand. With regard to the Euston-road, he knew the history of that thoroughfare, and spent a great deal of energy in preventing the Samaritan Hospital encroaching, of which he believed Professor Pite was the architect.

Professor Pite: No, I was not. Mr. Woodward said that, dealing with the matter in a practical way, they must arrive at the conclusion that there was no possibility of getting new thoroughfares in London now. The present Government would not give them the money, and the London County Council had spent all the money it had, and they could not look forward to them to help them with new thoroughfares. What they must do to make the matter practical was to take advantage of the existing thoroughfares more than they did. If, for instance, the police would drive more of the traffic on to the Thames Embankment and do the same thing in Gower-street and relieve Tottenham-court-road and take advantage of the parallel roads, they would be able to get very considerable relief. He felt that the two lines suggested were quite as good for the relief of traffic as it was possible to design, and he was certainly not one of those who thought that if they got those thoroughfares there were no architects living who could design buildings for them. He felt that they could not adopt a better plan than that referred to in Regent-street, where they had blocks between streets and symmetrical, which was all they could expect, and it was far better than what they saw in Paris, Vienna, Brussels, and Budapest. As regarded tramways, they knew it was proposed that they should run along the Embankment, and he thought they would simply spoil that thoroughfare. As to the width of thoroughfares, Mr. Waterhouse agreed that they should not be too wide, and they knew that Northumberland-avenue was 90 ft. wide, Portland-place 120 ft., and the new Piccadilly near the Circus was to be 80 ft. in width, building to building. Whatever they did in clearances he thought they should preserve as much as possible of old London. He was reading of the wonderful effect of Temple Bar, which now formed the entrance of Theobald's Park, and he hoped that Sir Aston Webb had preserved the beautiful piers which originally stood at Christ's Hospital. If they had to destroy thoroughfares the least they could do was to preserve some remains in a museum. With regard to a Board of Architectural Control, he would be very sorry to see such control resting at Spring-gardens. The London County Council

officials had quite enough to do as it was. Professor Pite contradicted himself by first suggesting that the Board should be at Spring-gardens and then finding fault with Aldwych, which was the child of Spring-gardens. Reference had been made to the education of the public, and he would like to read them an extract from the *Times* by their art critic with regard to the designs of Mr. Norman Shaw for the new Regent-street Quadrant. The critic said:—"It might be made less heavy by abolishing the square blocks that are to interrupt the columns and by greater simplicity of detail generally. Let the architect beware of a recent shocking example—the new Palace of Justice in Rome. It has cost millions, and its decoration, because it is heavy and over-elaborate, is universally condemned. The staidness of the new Quadrant would be improved, not diminished, if the distinguished architect would retrench a few of his details and simplify some of the lines." Well, he thought the buildings would make a magnificent addition to the architecture of London. It was lamentable that the art critic of the *Times* should not make suitable inquiry into the matter on which he wrote. If he had he would have found that the design was one of the most simple in lines and details that it was possible to have. There was certainly no elaboration, and it was a regrettable thing that such an influential journal should not take the trouble to ascertain the facts. He would only add, with regard to the opening of the Mall, that one of the suggestions made in that Institute thirty years ago was now being carried out by Sir Aston Webb. They could trust Sir Aston Webb to do what was right with regard to that, but there was an instance of the want of public spirit. The entry into the road could not be perfect unless Drummond's Bank was removed. It was to be retained, and it would prevent the widening of Whitehall, and they would spoil one of the finest things done in the early part of this century by not pulling down the bank.

Sir Aston Webb said he would not like the occasion to go by without adding his small congratulation, and especially to express the pleasure that he and they all had that one who bore so honoured a name in that Institute should have revived the interest which his father took, and should have read such an excellent paper before them. It was one of the most important subjects that they had ever had before the Institute. Architects, he thought, had spent a good deal of time in discussing the arts and crafts, and while they had been, if he might say so, fiddling over chairs and tables the greater interests of architecture had been apt to slip out of their fingers, and now they found that nearly all their municipal authorities had borough engineers or surveyors, and that the architects had little consideration given them. He thought that Mr. Waterhouse's paper and scheme showed how essential it was that when streets were laid out they should be laid out not only by engineers and surveyors, but in conjunction with architects, and that the very direction of the streets themselves were influenced in many cases by the architectural problems which arose. He was not concerned in saying whether these two streets were or were not on right lines. It was far too great a subject for him to enter into, and Mr. Waterhouse also protected himself by saying that he accepted the recommendations of the Commission as to these being the two best lines, and then he tried to put them into architectural form, and, so far as he (the speaker) was concerned, Mr. Waterhouse appeared to have succeeded. There was one thing he would like to say with reference to straight streets. Mr. Waterhouse was not much in favour of straight streets, but it did depend. At the first discussion Sir Melville Beachcroft gave them an amusing account of how Kingsway was made. They had been told that Mr. Frederick Harrison took up a ruler and drew a straight line upon the map. After all, that was quite right so far as it went, for a street like that ought to be straight. But it could not end there. They might have their straight streets without effect: the matter of importance was the manner they terminated the street. For instance, Harley-street and Wimpole-street had been constantly referred to. Both

streets were straight and wide, but they lacked dignity, and the reason for that was simply because they had no termination. Those streets ran into the Marylebone-road in a mean, poor way, and they had no architectural effect. That was a thing they constantly saw in parks. They perhaps saw a fine avenue leading up to a Georgian house, and the avenue appeared very fine indeed; but if they went into another park and saw a similar avenue, where the house had been removed, the avenue lost half its charm. In his opinion, the great thing in laying out streets was the termination. Mr. Woodward had referred to the Mall, and had urged that Drummond's Bank should be removed. If they stood in the Mall now and looked down towards the Palace they would see that there was a certain dignity. If they turned around and looked in the other direction there was the same road and trees, but a conglomeration of buildings at the end, which took all the effect out of the wide road. If, however, they pulled down Drummond's Bank they would only give a better advertisement to the Grand Hotel and other buildings, and they would not get that dignity which a wide thoroughfare of that kind required. Therefore it was that they were now in the course of erecting a building which would span right across the thoroughfare, and they would then get a wide road, with the Palace at one end and a great building at the other. Professor Pite had told them they would not be able to build on those sites for another half a generation, but it was probable that the sites would not be ready until that time. Then, no doubt, the profession would be ready. The Professor no doubt knew, for he had the young under his tuition, and therefore was speaking as an authority. He thanked Professor Pite for his kind proposal to fill South Kensington Museum with second-hand redwoods, but hoped it would not be carried out. He hardly knew whether the London County Council was the proper authority for great street schemes in London, and he was not sure that some arrangement of that sort with some outside advice attached, and with someone to whom they should be responsible, would not be a good thing. The great thing was that there should be somebody, whether an Imperial authority or a municipal body, who should be the recognised authority responsible for the alterations in their streets, and who should have some scheme. He would like to read to them an extract from a speech delivered by the Bishop of Birmingham, who had put the matter far better than he himself possibly could. The Bishop said: "Again we look through miles and miles of streets in our big cities without open spaces; with nothing except what Dickens called 'an un-interrupted view over the way,' and think of what that means—never to realise or breathe anything of the largeness which comes in open spaces. Then you see lands not built over, not in cultivation, and you ask 'Why?' 'Oh, because they are not ripe for development!' But we say they are ripe for development to-day. They have been ripe for development these years past for the good of the community. We want the whole mass of our cities to be organised, planned, and laid out. Instead of that, the cities grow at the will of the jerry-builder or the property owner—orderless, shapeless, without method, because there is no one to plan and forecast and give the city space and dignity and room and order; something which can make it worthy to be called a city."

Mr. Searles Wood moved:—"That this Council present a memorial to the Government urging that, as the Royal Commission on London Traffic reports it to be necessary to open up new thoroughfares and communications, it is most desirable, in order to preserve the architecture of London, that the profession of architecture should be either represented on that Board or that a professional advisor or advisors should be employed by the Board that will be formed to deal with the laying out of the new thoroughfares."

Mr. Slater seconded the motion, and said that the reason for the present congestion of traffic was that their forefathers had not provided foresight. The congested districts of to-day were the open spaces of a hundred years ago, and what were the open spaces of to-day would be the congested districts of

a hundred years hence unless their municipal authorities looked to it and got powers to protect the public.

Mr. Waterhouse said that he would amplify his remarks for the *Journal*, but there was one thing he would like to say. It was suggested that they were attempting to raise a Frankenstein monster, but they were not raising anything at all. It was the Royal Commission who suggested that a Board should be appointed, and a Bill was actually before Parliament for the formation of the Board. Without wishing to appear to step forward in this matter as the creators of this monster, they might at least make their suggestion that the monster should be assisted by architectural advice.

The Chairman said the more they heard of the enormous work which had been proposed the more they felt themselves indebted to Mr. Waterhouse for having dealt with the subject, and he (the speaker) heartily concurred with many of the views he had expressed, and especially with reference to the utilisation of Kingsway. To create another road and not utilise that would be a great extravagance. He also agreed with the recommendation for the increase of bridge accommodation between north and south in front of the Law Courts. Much of the block which occurred was in the Strand and in Park-street, Westminster, and they were due solely to the want of more bridge accommodation. There was no such accommodation between Westminster and Waterloo Bridges, and what was the result? Thousands of vehicles crossed the existing bridges to get to Charing Cross. They came across Waterloo Bridge and came down the Strand to Charing Cross. If a bridge was across the Thames in a line with St. Martin's Church it would be of enormous service in stopping the congestion of traffic. A great deal might be done by the police in diverting traffic, but they seemed indisposed to be at variance with certain sections of the public. What did they find at Hyde Park Corner? The arch was set back to get rid of the block, but, notwithstanding, the 'busses continued to go straight along Piccadilly and straight by St. George's Hospital. If the police had forced them to go round the way made for them, the block would have been got rid of. The creation of a Traffic Board, he considered, would be a good thing if properly formed. Tramways, he thought, had been overdone, and he did not think the enormous schemes for railways to run out twenty or thirty miles round London were needed just now. There was no difficulty when they once got to the stations, but the difficulty was to get there.

It was announced that the next meeting would be held on June 23, when the Royal gold medal would be presented to Sir Alma-Tadema.

THE SILCHESTER EXCAVATIONS.

The results of the excavations conducted by the Silchester Excavation Fund in 1905, now on view at the Society of Antiquaries, are this time chiefly remarkable for some objects of an architectonic character in stone. These are (a) a fragment of a column in white limestone about 9 in. in diameter and 2 ft. 6 in. high, with a beaded necking broken off, evidently part of a Doric column; (b) a "winged" altar in grey stone, about 2 ft. 6 in. high, roughly square on plan, with a projecting base, top, and two side lugs, or "wings," all worked out of the one stone; and (c) an unfinished couchant lion, also about 2 ft. 6 in. long, and in grey stone.

Neither the altar nor the lion exhibit any detail whatever, and show deep chisel marks, but it can be readily understood that the excavators regard such objects as of much greater importance than the pottery, bones, and various small utensils and ornaments usually found on Roman sites, largely as the latter—and the pottery in particular—bulk at Silchester.

Of other finds, the pottery claims first attention. The most perfect examples were extracted from rubbish-pits discovered from their soft nature in the process of trenching. The results this year excel more in quality than quantity, and include some interesting examples of the British "New Forest" and "Caistor" wares, some complete vases of

various shapes in grey clay, unglazed, and several more or less experimental techniques based on the "so-called" Samian were found wherever Roman remains are known. There are some distinctly fine examples of this ware in the room, particularly some on the central table, exhibiting indented ornamental forms, with remarkably clean-cut edges and listrons glaze.

Perhaps the most interesting pottery fragment of all is an attempt at polychrome design in a grey clay overlaying a red, with a lustrous black glaze, and a thick painted and knobbed decoration in white and orange. This is also on the central table, as are the mortars for pounding meat—flat listron-like bowls about 1 ft. in diameter with draining spouts. In the process of making these mortars had coarse sand thrown on to the surface of the clay when wet, so as to offer a hard, rough ground for the operation of the flint grinder. In process of time the sand got worn off.

The tray of painted plaster fragments, which formed wall-decoration, is an interesting exhibit. It is remarkable how similar ancient paint was in technique, and what precise resemblance these particular fragments have, both in colour and design, to much earlier examples from South Europe.

There are also cases of silver and copper coins, small bronze and bone implements and ornaments, and animal and human bones, including some complete skeletons, but these call for no particular attention here. Notice should be taken, however, of the pane of glass in broken pieces, for all the world like a modern window-pane in cheap green glass.

The excavations are further illustrated by the large general plan hanging on the wall, some detailed plans of particular houses recently excavated, and some photographs.

The exhibition remains open till Tuesday, June 19, when the finds follow the former ones to the Reading Museum.

MAGAZINES AND REVIEWS.

UNDER the head "Some Pressing Questions of the Public Service" the *Burlington Magazine* considers, among other points, the future of the National Gallery and the Tate Gallery under the management of their possible directors. The appointments are now made, and we have much more faith in the appointment to the National Gallery than in that to the Tate Gallery, which we cannot regard as safe in the hands of an art-critic who has shown such a decided leaning towards eccentric and temporary aberrations in modern painting. In regard to the National Gallery we entirely agree that the present policy of its Director ought to be "to make certain of preserving for England the few supreme masterpieces which still remain in our private collections." Mr. Robert Ross's article on "The Place of William Blake in English Art" seems rather to amount to the conclusion that William Blake was himself simply and had no "place," having in fact neither predecessor nor follower; and if that is what is intended, we entirely agree. Blake will never appeal to any but a minority; those who can enter into the extraordinarily imaginative spirit of his designs and his poetry (which at its best is almost as remarkable as his design) will feel that he is not to be classed with anyone else in art, or to be coldly criticised for his faults in technique; you must take him on his own ground of spiritual insight or leave him alone altogether. The attitude of the average citizen towards Blake will always be that which we once heard expressed before the picture of "The Spiritual Figure of Pitt Guiding Behemoth"—"No, upon my word, that is coming it a little too strong!" We think that some of Blake's admirers have done him some harm with the cold outer world by accepting too enthusiastically every strange fancy which he put forth in however strange a garb, and using rather exaggerated language about them. Blake at his best is beyond all exaggeration; but he is not always at his best. Mr. Ross's estimate of him, however, is expressed in perfectly reasonable and well-considered language.

In the *Art Journal* Mr. Rudolf Dircks writes a very good and temperate criticism on the Royal Academy, which is in pleasant

contrast to the sweeping and violent judgments (if they deserve that name) which are too common in contemporary art-criticism. The old subject of the Platin Museum receives some fresh illustration and description from Mr. Edgcombe Stealey.

The *Magazine of Fine Arts* devotes an article to "The Chalk Drawings of William Strang, A.R.A.," all of those illustrated being portrait heads of remarkable force and character. Sir James Linton contributes an article on "The Sketches of Constable," which he characterises as being really "sketches," reference notes for intended pictures; "they are the antipodes," he says, "of most of the so-called sketches of to-day; they are not got up for exhibition purposes." But is not the fact rather that artists do in the present day exhibit, and are encouraged by critics to exhibit, sketches such as in former times would have been considered too rough to be suitable for public exhibition? Among other articles are "Some XVIIIth Century Chairs in Private Collections," by Mr. Stephen Aveling, and "The Portraits of 'Nattier,' by M. Arsène Alexandre.

The *Architectural Record* (New York) contains an interesting account, by the architects, Messrs. Nimmons & Fellows, of "Designing a Great Mercantile Plant," that of Messrs. Sears, Roebuck, & Co.; an immense working warehouse, for what kind of goods is not specified. The account of the construction of a building of this kind, which is stated to have been insured at the lowest rate ever given to a risk of this character, is of considerable practical interest, as also the description of the means employed to facilitate the carrying on of all the different branches of work with the greatest economy of time and labour. Architectural effect in the exterior has not been overlooked, partly from the practical reason that the firm do not want to spoil the amenity of the district in which many of their best customers reside. In relation to the matter of fire-proof construction, we notice that the system of solid wood floors has been adopted; 8 in. by 5 in. yellow pine laid close together, the top of each floor protected by a saturated roofing felt and with maple flooring boards; these floors are so arranged that water used in case of fire will be drained to scuppers in the outside wall or pass down the stairs and elevator shafts. The same issue contains Part I. of a well-written article by Mr. Jean Schöpfer on "Roman Art," a kind of plea for recognising the really great qualities of Roman architecture in spite of its æsthetic defects.

The *Architektonische Rundschau* contains a fine illustration of a noteworthy piece of modern German architecture in a very florid Renaissance style, a portal of a building in the Neue Friedrichstrasse, by MM. Thoemer & Schmalz, which is exceedingly bold and ingenious, though not in a style that we can profess any sympathy with.

The *Berliner Architekturwelt* contains illustrations of a set of buildings erected in connexion with the working of some large sluices on a canal, which are of much interest; they show how a practical erection of this kind can be made really picturesque by a simple and direct treatment and grouping arising out of the requirements of the case, and without any of what are sometimes called architectural features. This is one of the things in which German architects are often specially successful. Herr Friedrich Lahrs is the architect.

The *Nineteenth Century* contains an article by Mr. H. H. Statham on "The Salons and the Royal Academy."

In the *National Review* Professor Milne writes an article "About Earthquakes," a subject which may have a sinister interest for us all even in this country, as is darkly hinted at the close of the article; and Professor Milne's opinions on earthquakes are probably worth more than those of any other person. The following summary as to the movements of the earth's crust will bear quoting separately:—

"From what we can see and measure we know that within the period of a lifetime, and well within the period of reliable history, certain tracts of country have been sinking downwards, whilst others have been bending upwards.

Since 1811 the Sunk Country in the central portion of the United States has still been sinking. Portions of African Turkestan are rising. The southern part of Scandinavia during the last 100 years has

been sinking, while the northern portion has been moving in the opposite direction. Marked indications of corresponding movements are to be found in very many countries upon the globe. These movements imply the bending of rocky strata, evidence of which is met with in almost every mountain range we see. It is even visible in the gentle undulations of our Southern Downs. On a journey from the north-eastern counties towards the Isle of Wight, as we pass by quarries and through railway cuttings, we first see chalk in horizontal bands. From the north of London it dips gently downwards beneath that strata to rise as the North Downs. Still further south the upward fold, the greater portion of which has been effaced by denudation, is again seen to plunge downwards beneath the Solent, to rise steeply in the Isle of Wight. The arrangement is similar to a series of parallel creases or wave-like folds which can be made in a table cloth or in a carpet. In many of these folded districts we see that the strata have been fractured, and that beds on one side of a fracture or fault do not correspond to those on the other side. There have been displacements which may be measured by inches or by thousands of feet. The formation of these faults is assumed to be the result of bending which has exceeded the limits of the elasticity of the bent material. When these displacements are large and take place suddenly elastic relief, together with the jolting and impact of the settling mass, give rise to vibrations and waves which may shake the world."

In the *Century* is an illustrated article on the Elysée Palace, under the heading "Historic Palaces of Paris," and an article by Mrs. Pennell, with some delightful sketches by Mr. Pennell, on "The Lonely Marine from its Source."

In the *Antiquary* Mr. W. J. Fennell, under the general heading "Some Ulster Towns," writes an article on the history and associations of "Bangor, County Down," now a favourite Irish watering-place, but with a long and interesting history behind it. "So great was the reputation of Bangor University that Alfred the Great, Saxon King of England, sent to it to supply professors to Oxford when he founded or restored that University." Mr. A. C. Fryer continues his article on "A Pilgrimage to St. David's Cathedral."

FIRE TESTS OF REINFORCED-CONCRETE FLOORS.

Two Reports issued this week by the British Fire-Prevention Committee afford some interesting and valuable information relative to armoured-concrete floors from the standpoint of fire-protection. In the first of the two tests described the floor was divided by transverse beams into three panels, each of 6 ft. 9 in. clear span; the concrete was made with Portland cement, Thames sand, and furnace clinker, in the proportions of 1, 1, 2½, and the reinforcement was arranged on the Coignet system. Almost immediately after the gas had been lighted the cement plastering on the ceiling began to blow off with slight explosions. After the expiration of about one hour two patches of concrete, each measuring about 3 sq. ft., fell from one panel, exposing the reinforcement, and smaller pieces flew off from the centre of the two other panels; and after about two and a half hours several cracks were to be seen on two of the beams. The application of water had the effect of stripping the concrete from the underside of the same beams, exposing the steel bars for a length of about 6 ft., and showing the metal to be red hot. Considerable erosion was also caused by water on the under surface of the panels, and several of the longitudinal bars of reinforcement were exposed. The maximum deflection of the floor was about 6 in., and the permanent set averaged 5 7/16 in. This test does not show furnace-clinker concrete in a very favourable light, but it is probable that the considerable deflection of the floor beams may account for the large masses of concrete which were detached. The most obvious features demonstrated by the test were the insufficient proportions of the reinforcement and the inadequate protection of the metal against the effects of heat.

In the second test described another Coignet-system floor was tested, but this time the concrete was made with blast-furnace slag, the spans were reduced to 5 ft., the reinforcement was much stronger, and the steel was covered with concrete on the underside to the thickness of 1½ in. in the panels and 1½ in. in the beams. Further, the beams and panels overhung the testing-hut by 3 ft. 4 in. at each side in the direction of the beams, and the panels projected 1 ft. 8 in. at each end. Nevertheless, at the expiration of half an hour, the floor began to deflect,

and continued to do so until the maximum deflection of 4.3 in. was reached, the permanent set being afterwards found to average 1½ in. On the application of water sufficient concrete fell from two of the beams to expose the reinforcement for lengths of 4 in. and 6 ft. respectively, and the steel was seen to be red hot. The under-surface of the panels was also eroded where struck by the jet, and on removal of the load the upper-surface of the floor showed transverse and diagonal cracks. Although this floor was classified as "fully protective," it should be noted that, in spite of the assistance rendered by the overhanging portions of the beams and panels, the reinforcement was not able to resist deflection so fully as could have been desired. No doubt if the steel had been more adequately protected from heat by a greater thickness of concrete the deflection would have been much less, but it is not improbable that some methods of disposing the reinforcement may be better than others for withstanding deflection at high temperatures. This is a point which can only be settled in a satisfactory manner by comparative tests upon different systems of reinforced-concrete floors. In the meantime the important, but by no means new, lesson to be learned from these two tests is the absolute necessity for an ample thickness of concrete to protect embedded steel from the effect of fire.

EXPERIMENTAL SCIENCE AND THE BUILDING TRADES.

On Monday last at the London County Council School of Building, Ferndale-road, Brixton, Mr. Alan E. Mumby, M.A., delivered the first of two lectures on "Experimental Science and what it has done for the Building Trades." In his prefatory remarks Mr. Mumby said that even the antagonist to science nowadays appreciated its applications and the benefit he received from the work of the scientist in the laboratory, but there were very few people who appreciated all that had been involved in making those applications. Those of them who wished to gain information on that point were rather apt to look simply at the harvest without troubling to know anything about the seed-time. Take the case of a man who wanted to rear a house on a very slight foundation. He might object to the cost of putting in deep foundations on the ground that the work would be underground, and that the money would be wasted. The contention might be accurate for a time, but perhaps a little later on the man wanted to add another story. On examination it might be found that the foundations would not permit of that, and that was where they would find themselves if they did not give a little more attention to science in their work. It was particularly curious that so little attention should be given to the claims of science in this country and that so few people appreciated the work done in laboratories. It was the more curious because some of our greatest natural laws had been discovered by Englishmen, and also some of the greatest applications of those laws. The man of science experimented with things that were unknown, and he wanted to learn something more about them. He tried to solve the problem according to some preconceived scheme, he thought out what he was going to do, and then he conducted his experiments with a view of finding out the exact thing. The experiments alone, however, were not the whole of his work. What he did was to make a series of experiments and then to consider in the light of the results whether he could get any general statement from them. It was, however, not enough for the scientist to know that certain things happened—he wanted to find out the cause, and in that respect all workers might emulate the scientist, for it was always a healthy tendency for a man to know in his work why certain things happened. It was by the patient work of the scientist that they had got those two great laws which stood at the basis of all the sciences—the law, for instance, of the indestructibility of matter. That law, which told them that nothing could be destroyed, stood at the very basis of chemistry. Then they had got the great law of the conservation of energy, which told them that energy could not be destroyed, although it

might be transformed. That great law formed the basis of the science of physics. Then they had the law of gravitation, which told them from the way in which two bodies moved how they would act upon one another. If they considered why it was that science had advanced so rapidly during the last century he thought it would be found to be due to those causes. If they looked back one hundred years they would find that science was in a very poor way indeed; there was very little chemistry, physics was a little more advanced, but there were none of the applications of science as they had them at the present day. He did not think the advance in science could be put down to the increase in mechanical skill, to fortuitous circumstances, or to the demands of mankind; they must put it down to those natural laws which had been the basis of all scientific work. By those laws they could predict what would happen under certain circumstances, and at once a whole flood of light was thrown on a thing. They were not at the end of their scientific knowledge or by any means in possession of all the natural laws—in fact, it was not too much to say that we stood at the very threshold of knowledge itself. Vast progress had been made during the last few years, and, therefore, it was very necessary to remember that pure science was not a thing of the past but a thing of the present, and they wanted to develop it just as they wanted to develop their applications. They wanted to take their work into actual research, which would enable them to study new conditions. Work might seem rather tedious, but it would always pay a workman to take up a certain amount of pure science, because it was not as if we were fighting for our hands for a few years ahead; but we were living for the future, and, therefore, it would pay us to make our foundations as broad as was possible. The man who took a real interest in his work would look very much higher than the financial aspect of it, although, of course, that was important. In the national aspect they had got to remember that other countries took very much more interest in science as a rule than we did. The French, the Germans, and the Americans venerated pure science, and it behoved us to take care that we as a nation were doing enough in this direction. It was simply because of their science that Germany had got the large dye trade which was of such great value to them. Let them remember that the work of the laboratory to-day was the work of the workshop to-morrow, and if we did not lay down our work in the laboratory and obtain the help of all these new principles, then we should be left behind in the race. It was the new industries that were the paying industries and which helped to make a country flourish. If they got a nation that was very keen on pure science it would develop it until finally it would yield some direct applications to a new industry, and then that nation would have the whole field for that new industry. Take the cement industry. That, always by its side, had developed on scientific lines of recent years, but at the same time the Germans were going ahead very rapidly with cement, and very valuable public prizes were at the present time being offered there for researches on cement. The result of those prizes probably would be greatly to stimulate research, with the object of finding out the chemical composition of cement in their manufacture and use. There was a great deal yet that we did not know about cement—why it was that it set in a particular way, and what was its exact composition. It seemed likely, therefore, that we should have German cement in the front of the market, because if something was wanted for a particular purpose the relation between its use and its composition would be definitely known. There were three sciences which were particularly applicable to things connected with building work—chemistry, physics, and geology. Physics dealt with energy and matter, so that the suitability of structures, the action of mechanical forces upon things, the expansion of bodies with heat and cold, the question of lighting, hot-water problems, and questions of sound-proof divisions were all based on the science of physics. Chemistry dealt with the ultimate composition of things; its object was to investigate as to what bodies were composed of,

how the particles were put together, and by that means they were able to predict what would happen under certain given conditions. Geology was of value to them because of the enormous number of natural materials which were obtained from the crust of the earth. All our building-stone and timber grew on the earth's shell, and it was very necessary to know something of the way in which that shell was constructed. By the application of chemistry they were able to find out the causes of rusting and decay in materials, and they would find that ordinary decay really consisted of a series of mechanical changes. It was impossible, of course, to prevent decay entirely in building materials, but their object in choosing materials should be that there should be as little decay as possible. The ideal building no doubt would be one built on the principle of the "one-horse shay"—made equally strong in all parts. That would be the ideal building—one in which all the materials were equally strong. Unfortunately, they could not do that; all they could do was to attempt to proportion the strength of their materials to their uses. That was sometimes overlooked, and stronger materials than were really needed were used. They wanted, as far as possible in their building work, to balance the parts and not use herculean materials in one part and very poor materials in another; that was a mere waste of money. The two chief agents in decay were air and water. Rusting would not take place either in air or water; it must be a combination of the two things. In concluding his lecture, which was illustrated by a number of practical experiments, Mr. Munby said that one of the best ways to note the effect of acid gases in the air on sandstone and limestone was to place a small piece of the stone in a bottle and pour on a little diluted sulphuric acid and note the effects.

SAN FRANCISCO.

[FROM A CORRESPONDENT.]

SUFFICIENT time has now elapsed since the devastation of their city in April to enable San Franciscans to look the complex problem of its rebuilding squarely in the face. Some data may be noted in this connection of interest to the British industrial community at large.

A careful canvass of the iron trade in the city reveals the fact that, while many inquiries have been received—one involving 50,000 tons of structural steel is a record—no important orders have been actually placed in this market. Some fairly good orders have been taken within the past thirty days by Belgian rolling-mills. Manufacturers in Belgium understand the physical and chemical requirements as to structural steel for America, and now roll to American standard, at least as far as sections, beams, and channels are concerned. It is stated that these shipments will be largely composed of "longest stock lengths," and such miscellaneous angles, channels, and beams as are used to a limited extent by the riggers of San Francisco. Many persons look upon the placing of orders in European hands as a foolish expedient. They point out that nearly all steel structures erected in their city up to this date have been manufactured and fitted in Pittsburg or Philadelphia, and laid down at their destination complete to the last bolt and ready for building. Everything as regards the up-building of the city depends upon the dispatch with which the insurance companies settle the claims of property-owners. It is safe to say that not more than a score of citizens are ready to proceed with plans until this phase of the question is settled.

Later on, when money is in hand, some business will undoubtedly be done with English manufacturers with specifications for structural steel, punched, fitted, and marked ready for assembling. A serious obstacle may interpose, however, in that the American Labour Union of Riggers may refuse to handle material purchased outside the U.S.A.

The financial aid freely offered by American steel mills will also have a minimising effect on orders to be placed in foreign markets. It is said that a San Franciscan steel importer, who has been rendered practically insolvent by the earthquake, has been offered \$20,000. worth of material "to

be paid for when possible." A banker's letter of credit would have to be in evidence when trading with a foreign supplier.

THE BUILDING TRADES DIRECTORY.

A new edition, the tenth, of their excellent Directory of the Building Trades has been issued by Messrs. Kelly's Directories, Ltd. (182-4, High Holborn, W.C.), which appears to be as carefully compiled as any of its predecessors. The directory is published at intervals of four years, and the first edition appeared in 1870, so that for thirty-six years those connected with the building trade have had within their reach a work which must be as indispensable to them as is the Post Office London Directory to the general public, and which is as well arranged and as accurate as the Post Office Directory. The work is intended to give a complete list of all the trades and occupations connected with the industry, and in addition to a long index of towns and places mentioned in the volume, as well as an index of trades, it includes a list of County and Borough Surveyors in England, Scotland, and Wales; a section devoted to the building trades in the various towns and villages, arranged alphabetically under the various counties of England, Scotland, Wales, and Ireland, the Channel Islands, and the Isle of Man; and a classification of trades in London and suburbs and in the provinces and Scotland and Wales. There are some 2,600 pages to the directory, excluding advertisements, which are wisely kept apart from the letterpress. The work, the price of which is 50s., is a model of what such a book should be.

THE COST OF ERECTION OF SCHOOLS.

The following Report of the Education Committee of the London County Council was submitted at the last meeting of the Council before the Whitsun recess, but its consideration was postponed:—

"On February 20, 1906, we submitted a report with reference to the preliminary plans of new public elementary schools proposed to be erected on sites in (i.) Lawn Lane (Kennington), (ii.) Fountain Road (Wandsworth), and (iii.) Franciscan Road (Wandsworth), and also of a school for special instruction to be erected on the Jan-street site (Poplar). On April 10, 1906, we submitted a further report in reference to the plans of these schools, and it was then decided that certain modifications should be made in the specification with a view to reducing the cost, and that for the purposes of comparison tenders should then be obtained both upon the original and the revised specifications. We have carefully examined the whole question of the cost of erecting schools, and in dealing with the result of our inquiry we think it would be of interest to the Council to prefix our report with a brief statement of the history of the evolution of school planning and the steps taken by the late authority in this matter, to which reference was made by the late chairman of the late School Board (Lord Reay) in his valedictory address at its final meeting on April 23, 1904:—

"We are so used to the sight of the handsome school buildings which are such prominent features in most parts of London, that we are apt to think that the type has been long established. The fact is that, in 1870, a satisfactory plan for a school building was non-existent. The Board had to create it, and the process of evolution was lengthy. It was inevitable that the earlier schools built by the Board should prove defective in the light of accumulated experience, and many of these have had to be altered so as to bring them into harmony with the present standard of efficiency.

From the following remarks it will be seen that the original type of school was erected at a cost per place which could not be maintained when necessary improvements—the result of experience, gradually became adopted.

When the London School Board began its building work, and before it appointed an architect of its own for the purpose, in consequence of the urgent need of more rapid provision of school accommodation, the planning and erection of the first thirty schools were entrusted to various architects. These schools, although handsome in elevation and in some cases built by architects of considerable reputation, were yet ill-adapted for teaching, partly because of the absence of general professional knowledge of the requirements of a good school, and partly because of the very meagre code of the then Education Department, the building of which was of a most elementary description, and such rules and illustrations as existed tending rather to perpetuate error than to stimulate improvement. The classrooms were long, steep, and narrow. Cloakrooms were either insufficient or altogether wanting. Teachers' rooms were practically unknown, as contrasted with the present provision of both head teachers and assistant teachers' rooms. The classrooms were subsequently found to be of unsuitable sizes, and the scholars sat for the most part with their backs to the windows. Most of the rooms were passage rooms one to another, and, in addition, the sites were small and the playgrounds were very insufficient. In respect of these earlier schools the Education Department allowed a building loan of 10s. per child accommodated.

Of necessity, therefore, a great many of these earlier schools, have since had to be improved, halls added, new staircases of a modern type built, and the schools properly equipped with classrooms, lavatories, teachers' rooms, etc.

After the Board appointed its own architect, the earlier schools built by him showed no marked departure in planning from the previous types, but gradually a certain improvement was effected. The dominant idea, however, was still that of a school room holding several classes, supplemented by a moderate number of classrooms. Corridors for reaching the end rooms were introduced, but these were also made too narrow to ensure safety in the event of fire or panic, and the hanging of cloaks in them was inconvenient and dangerous.

In 1883 the School Board began to recognise more especially the importance of light, lighting, and with this object in view planned square classrooms for sixty children, with five rows of dual desks, arranged six deep, as compared with the former size, viz., 29 ft. 4 in. by 22 ft. This arrangement was objected to by the Education Department on the ground that desks should not be more than five deep, but the Board adhered to their plans, which were tacitly accepted. From this time the improvement in school planning has been continuous.

About the year 1898, the late authority, in view of the large and increasing amount expended yearly on maintenance account in pointing the exterior walls, etc., and in painting the internal walls, decided that the brickwork should be built in cement in lieu of lime mortar, and that the internal walls of staircases and corridors and dados of classrooms and halls should be faced with glazed bricks. In considering the use of the increasing use of halls for drill and public meetings, a much heavier and more rigid type of floor construction than had hitherto obtained was adopted. It was not until the year 1901 that the Education Department so far acknowledged the utility of a hall in a school as to grant a special loan for the purpose for every school. Previously the cost of the hall, when provided, had to be included within the before-mentioned loan limit of 50s. per child accommodated unless an allowance was specially made. Consequently the cost was always prohibitive, unless the hall was reckoned in the accommodation, or was of such restricted dimensions as to be more of a corridor than a hall. Since the department allowed a loan of 2s. per foot floor space for the halls, the Board were able to provide them in every new school.

In 1891, the Board, which had for several years neglected the provision of drawing classrooms, determined to provide them, and many spacious and convenient rooms have been built over the halls for this purpose.

Another item in the cost of schools is the amount of decorative detail put into them. The policy of the late authority was almost always to give these structures, as public buildings, some dignity of appearance, and to make them ornaments rather than disfigurements to the neighbourhoods in which they were erected. Where in a few cases, striving after the sternest economy has been observed, plain buildings being erected, as in the case of Trudley's-road (Deptford), Enfield-road (Lickney, C.), Elkeslie-road (Hammersmith), and other of our others, the resentment of those who contrasted the appearance of these with other schools in the neighbourhood led to a reversion to the more ornamental type.

It was found that the difference between the cost of buildings erected on utilitarian lines and those designed with some regard to materials, colour, and style was about 5 per cent. At the same time, this ornamental appearance has been secured either by richness of detail or by a dignified grouping of masses—in some few instances a greater amount of decorative work has been introduced into the buildings than has been permitted to continue after fuller experience of the cost involved.

In recent years, too, the cost of the offices and drainage generally has considerably increased under the stringent requirements of the sanitary authorities. Where the ground is of a treacherous nature, it is customary to use iron soil drains, glazed divisions are provided between each set of latrines, and subject to damage, and requires periodical painting, etc. Further, single pans, with separate water-waste preventers, are provided in lieu of the trough and automatic flusher. The extra cost of these items on a school for 800 children, of the ordinary type of building and site, may be taken approximately as follows:—

- (i.) Building in cement ... £ 350
- (ii.) Glazed brick facings to staircases and corridors, and dados of classrooms and halls ... 930
- (iii.) Additional cost of solid floors of classrooms, and additional strength and rigidity of hall floors ... 545
- (iv.) Additional cost of iron soil drains, single pans and W.W.P., glazed divisions, etc. ... 750

representing about 3s. 5s. per place on these items alone.

It sometimes happens that in consequence of the restricted area of the site a playground has been arranged on the top of the school. This topmost floor comprises playground and science and art rooms (to which latter exception has recently been taken in some cases by the Board of Education) and increases the cost of the building by about 3,400, equal to 4s. per place. Were the playground not so provided a larger area of land would be required on the level, which would probably cost considerably more.

On several occasions the question of the cost of erecting schools was carefully considered by the late authority, the more important investigations being conducted in 1897-8, 1892-3, and the last in 1905. In 1897 a special committee was appointed to investigate and report upon the whole of the existing arrangements relating to the work of the Works Department of the late authority, and as a result of their report the late authority, on February 24, 1899 (i.) adopted a new specification—the joint proposition of Mr. Ewan Christian and Mr. Thomas M. Rickman, the professional advisers called in for the purpose; (ii.) arranged for a more extended

supervision over the construction of buildings; (iii.) introduced a more elaborate and expensive system of heating apparatus; (iv.) arranged for the brickwork to be built entirely in cement in lieu of mortar; and (v.) adopted glazed bricks to a very much larger extent than had formerly been the case. In 1892 the late authority desired to ascertain whether it would be possible to obtain from outside architects any fresh ideas in the planning of its schools, and invited architects to enter into public competition, in accordance with the rules of the Royal Institute of British Architects, for the planning of a school for 1,250 children, capable of being erected on any ordinary site purchased by the Board, the President of the Institute being appointed assessor, and to draw up the terms and conditions of the competition. It was further decided that three premiums, of 150s., 100s., and 50s. respectively, should be awarded, in the discretion of the assessor, to the architects whose plans were most successful.

The site finally selected was a vacant piece of ground in Fulham Palace-road, and the competition, besides being advertised in the daily and trade journals, was specially brought to the personal notice of a large number of architects. One hundred and sixty-one architects applied for the instructions, and sixty-one of them sent in designs, which were afterwards publicly exhibited in the upper hall of the "Hugh Myddelton" school, Clerkenwell. The result of the competition was that the assessor, Mr. Macvicar Anderson, reported that he had not produced a more judicious in respect of plan than had been deemed worthy of approval; and on April 26, 1894, a report was submitted, stating that, as a result of the competition, it was gratifying to find that the schools had not only been erected upon what might be fairly considered the most approved plans, but that the cost appeared to be as moderate as seemed possible, judging from the estimates forwarded by the various competitors of the probable cost of the schools if erected according to the designs submitted by them.

In 1896 the subject was again the matter of careful investigation, and the late authority then decided, as an experiment, in the case of the next six schools to be erected, to revert to the old specification being modified to meet the then requirements of the Board and the Education Department, it being arranged that in the building contracts the quantities should not form part of the contract.

Every detail of the specification was then examined, and, after being tabulated, decisions were arrived at, which became instructions for the description of the building of the schools.

The schools subsequently selected to be built under these special conditions were the following, the accommodation, cost, etc., being as stated in the subjoined table:—

965 places, and cost 29,78s. 4d. a place. The graded portion of both schools consists of a two-story building, the infants being accommodated in a separate one-story building. A comparison was made, item by item, of the various branches of the work done at these schools, and a very full examination was made of materials, quantities, and prices. The sub-committee which then reported arrived at the conclusion that the facts before them showed "that, having regard to the accommodation provided and the character of that accommodation, and the conditions under which the London School Board were required to work, the London Board had their work done quite as cheaply at Invicta-road as the Croydon Board at their Portland-road school." It was ascertained that the cost of the school buildings comprised, excluding offices, works on site, furniture, etc., amounted to 14,800s. for the Invicta-road school, and 14,491s. for the Croydon school.

In the course of the inquiry it was ascertained that it was cheaper to build a school in two separate blocks, consisting of a two-floor building for the graded school and a one-floor building for the infants' department, than in a single block of three or four floors; and in planning new London County Council elementary schools, this practice is adopted wherever the site is of sufficient size for the purpose. This was accounted for by the fact that, although, in the case of a three-story building there is a saving in having to provide only one roof, this saving is more than counterbalanced by the additional cost of the greater thickness of brickwork required for the walls, the extra cost of scaffolding to the upper floors, and the cost of hoisting joists and girders, which is a great height, etc. This fact compelled the Board to scrutinize carefully its system of planning, which, owing to most of the schools being built in the heart of London, has been predominantly one involving three-story structures. It should be stated that it was the practice of the late authority, when securing vacant sites in outlying districts, to acquire sites having a height of 20 ft. or more. The following shows the relative cost of erecting (i.) a three-story building compared with (ii.) three one-story buildings (boys, girls, and infants), and (iii.) two-story building (boys and girls) and a one-story building for infants:—

(i.) Three-story building of ordinary type. Broad-water-road (Wandsworth) (accommodation 520—Total estimated cost, including works to site, offices, etc., but excluding furniture, etc., 20,948s., equivalent to 22s. 15s. 4d. a place.

(ii.) Three one-story buildings. (Woolwich) (accommodation 1,202)—Total estimated cost, including works to site, offices, etc., but excluding furniture, etc., 21,953s., equivalent to 18s. 5d. a place.

(iii.) Two-story building and a one-story building, the "Wandle" (Wandsworth) (accommodation

* This school was subsequently transferred to the Penze education authority.

The last occasion on which this question was considered was in 1903, when the resolutions made by the chairman of the Croydon School Board, at the public opening of the Portland-road school, having accommodation for 1,510 children. To the effect that the cost of building (exclusive of site and furniture) had been 13s. 11s. 8d. a place, as against a cost of 28s. 10s. and 30s. 15s. 4d. in two London schools.

It is to be noted that a comparison might be made between two schools, where the conditions of planning, etc., were as nearly as possible identical, the Invicta-road school, Westcombe Park (Greenwich) was taken as corresponding fairly in general arrangement and size with the Portland-road school, Croydon. The Invicta-road school, which was built in 1893, has

1,140.—Total estimated cost, including works to site, offices, etc., but excluding furniture, etc., 23,537s., equivalent to 22s. 9s. 5d. a place.

We now pass to the result of our investigations into the cost of erecting schools in London, as compared with the cost of schools recently built under the jurisdiction of education authorities whose areas are contiguous to London. In this connexion we have consulted the County Councils of Surrey, Middlesex, and Kent, the Boroughs of Hornsey, Wimbledon, and East Ham, the County Boroughs of Croydon and West Ham, and the Urban District Councils of Witleton and Chiswick, from the information which these authorities were good enough to furnish, we were of opinion that the schools erected under the jurisdiction of the Croydon.

Willson, and Horsey authorities were the most suitable to select for purposes of comparison, and several of our members have visited, in company with some of members of the Council interested in the construction of schools, the latest schools built under the direction of these authorities. The subjoined statement shows the accommodation and cost of the schools that were inspected—

department. Both schools were planned very much on the lines of the majority of the three-story buildings recently erected in London, but in neither school was there any provision for science or drawing, the buildings comprising only the halls, classrooms, rooms for the head and assistant teachers, and cloak-rooms.

The first point that was noticed was the economy

observed in the erection of the playing sheds. These were supported on slender iron columns, the roof being carried by a timber plate and covered with zinc. In the staircases and lobbies there is a glazed brick finish surmounted by plain discoloured brackets. As in the case of some of the London schools, economy was effected by providing no fire-places except in the babies' rooms.

With the exception of the roof principals of the two-story hall in Salisbury-road school, the joinery was of the simplest possible character.

Except, perhaps, in the arrangement by which a store-room was provided in a mezzanine above the ground floor corridor, and in the cheaper construction of the sheds in the playground, it did not appear that the schools exhibited any points which should be imitated in the Council's schools. Generally speaking, they appear to have been carried out on the same lines as the Council's schools with the practice of certain small economies.

The plans and specifications of two schools built under the supervision of the Chiswick and West Ham local authorities were also kindly lent to us, and, after a careful perusal of the specifications and a full examination of the drawings as to plan, etc., we have arrived at the conclusion that very little difference, if any, exists—indeed, in one or two cases the specifications involve work of a more costly nature than that adopted in the Council's schools.

We submit a statement, showing for the last seven years the number of new schools for which tenders were accepted, together with the accommodation, the total amount of the tenders, and the total average cost a place (see below).

We also append particulars relating to the cost of municipal schools, the tenders for which were announced the last accepted by the late authority, and in comparing the cost per place in the foregoing and in the following table with the cost per place in the Croydon and Willson schools, it is very important to notice that the average

	Portland-road	1,310	1901	18,439 0 0	14 1 6	Two-story building for boys and girls; one-story building for infants.
Horsey	Mattison-road	900	1893-4	23,069 5 0 (excluding special instruction school)	25 11 3	Two-story building for mixed children; one-story building for infants.
	Pemberton-road Higher Elementary School	340	1903-4	16,212 12 0	47 14 2	Two-story building for mixed children.
Willson	Chamberlayne Wood-road	1,224	1902-3	19,060 0 0 (excluding centres and special buildings)	15 10 6	Three-story building, including three halls.
	Salisbury-road	1,560	1901-2	19,695 0 0 (excluding centres, etc.)	15 12 8	Three-story building mixed school, central hall through two stories with balcony, and infants' hall.

We found that in the Croydon schools afforded all the requisite accommodation and presented many points in comparison with the Council's schools.

In the Croydon schools the general arrangement of the roofs and gutters was suggestive of a country school rather than a town school, and were correspondingly cheaper; in the staircases and corridors the glazed brickwork was carried only to the height of the dado, while in the Council's schools it is carried the whole height of the wall. The dipped bricks used for the dados in the Croydon schools, though of a specially cheap make, are more expensive than the soft glazed bricks used in the Council's schools, but there was nothing in the kitchen ranges and no fireplace similar to that to be found in an artisan cottage. The swimming bath was about 40 ft. long, which was too short for the requirements, inasmuch as it involved a somewhat generously steep floor. The gallery was provided with dressing boxes.

Throughout the ground floor of the building, comprising the swimming bath and domestic economy centre, there was a profusion of glazed bricks, and the 22 in. walls were unnecessarily heavy. The housewifery department consisted of a well-furnished sitting-room, bedroom, and kitchen with scullery attached.

We are of opinion that the Council would not secure economy by following the example of the Horsey local authority in any particular except, perhaps, that simple tiled roofs with eaves gutters are less expensive than lofty parapets.

The higher elementary school at Pemberton-road, Horsey, was organised as a secondary school for 340 children under sixteen years of age. The accommodation included a good room for the headmaster, classrooms, a hall about half the size necessary for a secondary school, and unaccommodated by a row of iron columns, a chemical laboratory for twenty-four, an experimental science laboratory for twenty-four, a balance room, a preparation room, a demonstration theatre, and a good art-room, with special wall fittings made to the design of the headmaster. There was, however, no dining room, kitchen, common room, library, or gymnasium, so that the building fell considerably short of the accommodation generally provided in a secondary school.

The brickwork was carried out in lime mortar, with a profusion of glazed bricks, and in particular two 14-in. longitudinal walls were carried right through the building on both upper floors, one on each side of the corridor, the weight of one of these walls on the first floor necessitating the columns in the hall above referred to.

As regards the two schools we visited at Willson, the Salisbury-road school comprises an infants' department and a mixed department. The Chamberlayne Wood-road school is organised as infants, girls, and boys. The former school has an infants' hall on the ground floor and a hall for the mixed department, extending through two stories with a gallery. The latter school has a hall for each

accommodation in the London schools is much lower than that in schools under the Croydon and the Willesden authorities.

The average number of children accommodated in each of these schools is 1,027, the average cost per place of main school buildings only is 15s. 9s. 2d., and the average total cost per place calculated on the total amount of tenders is 21s. 18s. 2d.

It should be noted that in none of the cases referred to in the above statement did the cost exceed

The true test of the cost of a building is its cost per foot cube on the main building, and we venture to assert that no buildings of a public character have been built in the manner in which schools have been erected at a smaller comparative cost. The architectural features of an expensive nature have been reduced to a minimum, and effect obtained by carefully studied proportions and grouping. By way of illustration, three types of schools built within the last three years are given below:—

Electoral area & name of school.	Story.	Accommodation.	Cost per foot cube (main buildings complete and ready for occupation).	d.
Wandsworth.				
Broadwater-road.....	Three stories.....	920	7-90	
Fulham.				
New King's-road.....	Do.....	1,148	8-31	
Dulwich.				
Denmark-hill.....	Two stories (graded departments), one story (infants).....	996	7-83	
Wandsworth.				
"Wandle," The.....	Do.....	1,140	8-85	
Southfields.....	One-story buildings.....	1,126	6-70	
Fulham.				
Townmead-road.....	Do.....	1,124	7-14	

the amount of the loan allowed by the Board of Education on the capital cost. This is the more noteworthy in that the loan for the main building was still only 10s. per child, with certain special allowances which were added from time to time.

When the question of reducing the cost of buildings to be erected for a certain purpose and of an accepted type is under consideration, there are only two ways in which it can be effected:—(i.) by reducing the requirements or being content with a smaller or simpler building, and (ii.) by lowering the standard of the building. With regard to (i.) the required accommodation has to be provided in classrooms, graduated in size according to the numbers for which the school has to be built. These classrooms have to satisfy the code with regard to the number of superficial feet for each child, and the heights are also stipulated for proper ventilation and exits, cloakrooms, containing a peg for each child, adequate lavatories, stock-rooms, teachers' rooms, and offices have to be provided according to a scale laid down in the code, and, no such classroom has to be approached separately, it is evident that corridors or halls have to be provided for the purpose. If the school is planned with proper regard to its use for teaching purposes, the central hall plan is the best and most economical, by reason of the fact that, if properly arranged, the hall supplies the place of corridors, and as the head teacher's desk is placed therein, proper supervision of the whole department is secured. The value of the central hall for school work has been so thoroughly appreciated that it has been decided to spend a yearly sum in providing these and other modern adjuncts to the schools built in the earlier years of the late authority and not provided with them.

As regards the provision of rooms for special purposes, such as art, science, manual, and domestic work, it would appear that an art or drawing classroom is not now considered a necessary adjunct to every elementary school, but that a room for general science is desirable. As regards manual training rooms, it is a question whether such rooms should be built for forty or twenty boys, or should be in the nature of centres for groups of schools or adjuncts to each school. As regards housewifery centres, we can consider an ordinary domestic house suitable therefor, and certainly their construction is never such as to fulfil the requirements of the Building Acts for a public building, which they undoubtedly become as soon as they are used for teaching purposes.

With regard to (ii.) when the alternative tenders, which are about to be obtained for three new schools sanctioned by the Council, are received, there will be an opportunity of ascertaining what the savings under the various heads of the revised specification will amount to. The principal suggestion is for building the brickwork in lime mortar instead of cement. Whatever the saving may show under this head, the late authority and the Council has had experience of the cost and inconvenience involved in retaining buildings, inevitable after a certain time when built with lime mortar; the cost in the case of a school of the ordinary size and type is about 350s., while the nuisance from the dust caused by the raking out of the joints and the erection of scaffolding and the presence of workmen on the premises during school hours, with the consequent risk of accidents to children, pierce, carrying entries and heavy weights must be built of a larger size if not in cement; so that, taking all these matters into consideration, we cannot consider the saving to be desirable, especially considering that the after expenses would fall on the rates of the year.

For a proper comparison to be made of the cost per place, the cost should be based not on total cost, including the site, but on the main buildings complete and ready for occupation. The site difficulty affects the total cost so much that the whole calculation is vitiated by having to be accommodated in sites like Plum-tree (Woolwich), Invel-road (Greenwich), New End (Hammersmith), and others, whereas level rectangular sites like Townmead-road (Fulham) and similar ones present no unusual or costly difficulties. Further, taking the maximum size of a department as for, say, 300 children, and building originally for, perhaps, 250, the hall is built of the requisite size for the full number to be accommodated in the completed school. Generally the cloakrooms, teachers' rooms, lavatories, etc., are also built complete, and this provision for future requirements, while it adds to the initial cost, is really a considerable saving to the Council, as when the additional classrooms are erected the further cost is about 7s. 10s. per place.

We feel confident that, upon a comparison being made between school buildings and buildings erected by the Council for other purposes, the result will be favourable to the schools.

With regard to the planning of the schools and their fitness for teaching purposes, it may be stated that the architect to the Board of Education has published, with permission, plans of some of the modern schools of the Council, as types of what such buildings should be. In this connexion we think it would be of interest to the Council to have before it when considering this report a sheet of diagrams (which will be laid upon the table) showing various types of schools, of which we present the subjoined explanations:—

A and B represent elevation and plan of the Tradesmen's road school (Deptford), a building designed with an effort to reduce cost by erecting a school without any architectural features—simply of plain stock bricks, slate roofs, and without architectural embellishments of any kind, at the same time obtaining the standard of building and the completeness of plan by which a satisfactory school building, apart from its external appearance, is secured.

C and D represent the elevation and plan of a type of school in which the architectural adornment was carried beyond the general standard of the late authority, the walls being faced with red brick, and terra-cotta being introduced to a considerable extent.

E and F is a type of school similar in plan to D, and designed in a similar manner, the walls being faced with stock bricks with red arches and dressings to the windows, terra-cotta being introduced sparingly, and the roofs covered with red tiles. The cost of a school of this design as compared with A works out at about an additional 5 per cent. on account of the architectural features, and is a type which was rejected by the late authority in preference to the bare and barrack-like appearance of A.

G is a plan of a school which was worked out to embrace the minimum of the requirements of the Board of Education for a school of that number. It has been a type adopted with more or less important modifications in classrooms, such as Southfields (Wandsworth), Deansfield-road (Woolwich), Timbercroft-road (Woolwich), and other sites where the area was sufficiently large to admit of the erection of a two-story building.

This is a plan which the architect to the Board of Education has illustrated as the type of an ideal school, and it will be observed that corridors giving access to the classrooms are eliminated altogether, the central hall answering the purpose, giving complete control and supervision over every classroom. It is also a type which is mentioned as costing 6-70s. per foot cube, being, in our opinion, about the cheapest type of school which can be erected.

Conclusions.

There are so many special features to be taken into consideration in regard to the area, the shape and adaptability of each site and the situation of the school thereon, the accommodation required for each department, and the need for future enlargement, that it is not possible to estimate closely the cost which will be incurred in respect of any school proposed to be erected until the plans have been prepared and the quantities taken. There is no doubt that in many cases the elevation of the school and the architectural features in connexion therewith have not been designed with so strict a regard to economy as to the pleasing and dignified appearance which has enabled a school to adorn the neighbourhood in which it has been placed. In this connexion the "Oliver" schools tend to be a notable exception, and here it appears to be a general impression that these could be of a considerably less costly description, approximating more closely to one of the standards in use in the erection of dwellings for the working class. We venture to point out that this impression is hardly borne out by facts, and that such a standard would scarcely suffice in view of the rough usage to which the school fittings are liable to be subjected. Further, the comparison hardly applies, inasmuch as in the case of the dwellings one closet only is required to each and the number of closets in the lodging houses is small as compared with the liberal

supply in the schools (provided in blocks and required by the code of the Board of Education). When it is remembered that the total number of square feet of floor is about 6,000, the great importance of having a substantial and durable type of fitting, pan, etc., in the first instance provided out of loan will be readily appreciated, especially when it is recollected that the cost of all subsequent repairs—thus reduced to a minimum—comes out of the rates of the year. The use of iron drains, instead of the abandoned, except where the drains pass through made up ground or under buildings.

As regards wood block flooring, we propose to effect a saving under this head by substituting in the classrooms flooring consisting of 6-in. concrete, thus limiting the use of wood block flooring to the halls and corridors only. It is also proposed to reduce somewhat the cost of the glazed bricks by providing these dado high only in the corridors with plastered walls above.

The playsheds will, without material disadvantage, be simplified in construction and reduced in cost by the use of iron columns, 200 ft. long, and the standard pattern of sashes and fittings, together with substitution of cords, pulleys, and quadrant stays for the present metal window gearing will be provided.

We do not advise that the specification should be altered in regard to the requirements for "picketed" stocks, the saving in cost being so trivial. The same applies also to the cisterns, in view of the material sanitary advantages gained as compared with the use of ordinary cisterns in lead or galvanized iron, to say nothing of the saving in labour in cleaning.

The instruction to obtain from warming engineers competitive schemes for providing systems of warming by low-pressure hot-water apparatus is already being followed in the case of the new schools in course of erection on the sites in Scnarb-street (Stepney), and Sellincourt-road (Wandsworth). It will then be possible to submit a further report with the present systems, and, should a saving result, the usual provision now included for warming can be reduced. We propose to look carefully into the matter, and to submit a further report thereon at a later date.

We have instructed the architect (Education) in all future cases to lay down in a report the cost of the estimated cost of all portions of the proposed buildings above the floors actually occupied for ordinary teaching purposes. We also propose to consider carefully the cost of the extra cost of the extra cost reduced by the omission of rooms for art classes, and ordinary drawing classrooms in the roof. By the omission of this story there will be a saving of about 10 per cent. on the total cost of a school, while by making reductions in the cost of carving and general architectural embellishments in all suitable cases, by excluding as far as possible the use of special articles, and by making the other reductions already alluded to, we hope to effect a further saving. It must, however, be borne in mind that while the cost of a school is reduced, the cost of the extra cost of the school, it is only arranged in those cases where the site is small and the cost of additional land is prohibitive, and to most extent the extra cost of building is the result of a saving in the expenditure on the site.

We have also decided to throw the tenders open to public competition, and, consequently, though there are manifest advantages in confining the competition to a large selected list of contractors who are acquainted with the special requirements of this class of work.

We think that the experience gained on many points while engaged in this investigation will result in a decrease in the future cost of erection of public elementary schools, without detracting from the necessarily high standard of quality and efficiency which the Council should maintain. We have had submitted to us plans of a typical school of 176 pupils, consisting of three elementary buildings to be erected on a perfectly level and large site to be selected, requiring no retaining walls or terracing, nor extra deep foundations, the boundaries being of oak fencing instead of a brick wall, and the specification providing for the reductions already agreed to by the Council and the further modifications suggested in this report. The boundaries being of oak fencing instead of a brick wall, and the specification providing for the reductions already agreed to by the Council and the further modifications suggested in this report. The boundaries being of oak fencing instead of a brick wall, and the specification providing for the reductions already agreed to by the Council and the further modifications suggested in this report.

Main school buildings complete, 13,664, equivalent to 11s. 12s. 4d. a place.

Main school buildings, including inclosing and draining site, etc., 17,834.

Total cost, including possible extras, lithography, furniture, supervision charges, etc., 19,659s., equivalent to 16s. 14s. 4d. a place.

The cost per foot cube is 6-14d.

We desire, in conclusion, strongly to represent to the Council that it is a very extravagant proceeding to plan schools for subsequent enlargement in growing neighbourhoods, instead of building the complete school at once, where it is known that the area of accommodation is limited. There is no doubt that in many cases the elevation of the school and the architectural features in connexion therewith have not been designed with so strict a regard to economy as to the pleasing and dignified appearance which has enabled a school to adorn the neighbourhood in which it has been placed. In this connexion the "Oliver" schools tend to be a notable exception, and here it appears to be a general impression that these could be of a considerably less costly description, approximating more closely to one of the standards in use in the erection of dwellings for the working class. We venture to point out that this impression is hardly borne out by facts, and that such a standard would scarcely suffice in view of the rough usage to which the school fittings are liable to be subjected. Further, the comparison hardly applies, inasmuch as in the case of the dwellings one closet only is required to each and the number of closets in the lodging houses is small as compared with the liberal

THE LETCHWORTH GARDEN CITY.—Mr. J. M. Dent, the publisher, has decided, it is stated, to remove his works, with over 200 employees and their families, from the City of London to the Garden City at Letchworth, and to erect new works communicating directly with the Great Northern Railway. About 110 "London unemployed" are at work at Letchworth excavating land for the new goods yard of Garden City. An area of 13 acres has been acquired by the Great Northern Railway Company for this purpose, and the levelling involves the removal of over 30,000 cubic yards of earth. The unemployed is now about 1s. per cubic yard for the work, and this pays about half the expense of keeping the men and their wives, and running the colony financed by the London Unemployed Fund.

Engineering Societies.

SOCIETY OF ENGINEERS.—At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday, the 11th inst., Mr. Maurice Wilson, President, in the chair, a paper was read on "Submarine Groyning" by Mr. Gerald Otley Case. The author said that erosion was not confined to the visible shore between high and low water marks, but took place to some extent also in considerable depths of water. He summarised the chief forces at work below low water mark tending to cause erosion as being (1) unbroken or true waves of oscillation; (2) waves during or after breaking; (3) tidal or other currents. He thought the greatest depth of appreciable wave disturbance was about 100 to 150 fathoms. The transporting and eroding power of waves decreased as the depth of water increased. Referring to current action, he stated that the velocity of tidal currents was not as a rule sufficient to enable them to erode coarse material, but that they transported material stirred into suspension by the waves. Currents due to the flow and ebb of the tide were oscillating currents. The conformation of the coast had a most important influence on the action of both waves and currents. He then dealt with the generally-accepted theory of deep sea erosion, which was that in many places erosion of the coast was caused by erosion going on in deep water, which, by undermining the foundation of the shore, caused the shore between high and low water mark to slide into the hollow thus created. That theory was a fallacy; the power of waves and currents to erode decreased as the depth of water increased, and little erosion was going on in deep water. On the contrary, as a whole, the oceans must be slowly filling up, owing to material eroded from the coast and brought down by rivers being gradually spread over the ocean floor. Referring to littoral drift, the author observed that material, in moving round the coast, was gradually worn away by attrition, the smaller particles being slowly carried seaward, fresh material eroded from the land keeping the supply fairly constant. He concluded that waves were the chief cause of littoral drift, and were aided by currents. Adequate protection could generally be obtained by the application of a properly-designed system of groyning, but he insisted on the importance of extending groynes below low water mark. He did not, however, think it necessary or advisable to extend them beyond a depth of about 5 ft. of water. It was most important to build groynes low at first, and raise them as accumulation took place, there being no advantages, but many disadvantages, in building them high in the first instance. After pointing out the disadvantages of using wood and exposed from submerged groynes, the author expressed the opinion that ferro-concrete was the material of the future for marine works. The merits of any system of groynes could not be judged by the accumulation brought about in a short time, but by their ability to hold the accumulated material for a considerable period, and by the cost incurred in maintenance.

Books.

The Slide-Rule: A Practical Manual. By CHARLES N. PICKWORTH. Tenth edition. (Manchester: Emmott & Co., Ltd.)

AMONG the various treatises published on the slide-rule, none is more popular than that written by Mr. Pickworth, a fact which is sufficiently proved by the frequent demand for fresh editions. In the present issue no noteworthy changes are to be found in the earlier portion of the work, although this has been carefully revised. It would be still further improved by the inclusion of a table setting out the various special marks, or constants, engraved on slide-rules by different makers, together with full explanations of their exact values and uses. Towards the end of the book more adequate description than formerly is made of rules provided with *log-log* scales, and several recent types of slide-rules are described and illustrated. We find no mention, however, of Col. Anderson's slide-rule, an instrument of great precision

clearly deserving notice. The block on p. 100 ought to be replaced by one better drawn and more correctly representing Fuller's calculating rule, which, by the way, is supplied by all instrument-makers and not solely by Mr. Stanley, as implied on p. 101. The section entitled "Slide-rules for Special Calculations" is one which could be amplified with advantage, as, apart from a few words relative to two varieties of calculating wheel, it makes reference to only one slide-rule among the various types now available for specific computations. Owing to successive additions, the category of slide-rules described in the last twenty pages of Mr. Pickworth's treatise has so overgrown the classification originally adopted as to suggest the desirability of entire rearrangement in the next edition, which we hope will be provided with an index as well as the table of contents. In making these hints we are merely accepting the invitation extended by the author, and do not for a moment wish it to be thought that we fail to appreciate the useful character of this treatise, or the successful efforts made by Mr. Pickworth to popularise the slide-rule in the office and workshop.

Practical Pattern-making. By F. W. BARROWS. (London: Crosby Lockwood & Son; 1906.)

IF we omit from consideration some American and one or two English papers, it may safely be said that the technical press of the world is conducted on serious lines, and is fairly free from the writings of misguided people who try to make science and art interesting by treating technical subjects in a way that is meant to be funny. Judging from his colloquial style and the statement that some of the subjects discussed in this treatise have appeared in the *American Machinist* and the *Pattern-Maker*, we assume Mr. Barrows to be either an American, or an Englishman who has lived for some time in the United States. His attempts to make the material in his book "as interesting as possible" are not conspicuously successful. References to "the sty for Farmer Jones' pig," "Johnny's picture of the cow," "the pattern-maker in the role of Sherlock Holmes," and various other irrelevant allusions, are more calculated to induce the reader to lay the book aside than the "dry reading" which Mr. Barrows looks upon as an objection to technical books as a class. We are glad to find that, as the author gets deeper into the subject, he gradually becomes interested, and, writing sensibly on work he evidently understands, becomes really interesting. The book contains much useful information on pattern-making in general, a detailed description of the materials and tools used by the pattern-maker, and a section devoted to typical patterns in wood and metal. As the examples selected and the general treatment appeal more particularly to mechanical engineers than to architects and builders, the treatise is less suitable for the bulk of our readers than others that could be named. The illustrations are all good, having been prepared exclusively from sectional and other drawings, and, except in places where the author tries to be "interesting," the language used has the merit of being plain, intelligible, and to the point.

National Engineering and Trade Lectures. Vol. II.: "British Progress in Pumps and Pumping Engines." By PHILIP R. BJÖRLING. Vol. III.: "British Progress in Gas Works' Plant and Machinery." By C. E. BRACKENBURY, A.M.Inst.C.E., M.Inst.Gas.E. London: Archibald Constable & Co., Ltd. 1905.

IN Vol. II. of this work Mr. Björling describes and illustrates several different kinds of pumps and pumping engines made by some of the best-known makers in Great Britain. While containing information which may be useful to Colonial and foreign buyers, this "lecture" has no technical interest, and, in our opinion, is of far less practical value than a well-assorted collection of trade catalogues.

Vol. III., written in a very different style, constitutes an intelligent and interesting review of the plant and machinery employed in gasworks. Commencing with machinery for the reception and handling of raw material, Mr. Brackenbury demonstrates the superior character of the coal and coke storing equipment made in this country and its greater diversity and adaptability than

Continental plant for the same purpose. He instances the unique constructional ability displayed by British engineers in the manufacture of stoking machinery, gas-holders, and practically all apparatus incidental to the production of coal and water gas. The concluding chapters on "Gas Appliances" and "By-Products" quite deserve perusal, and the book as a whole is a readable, instructive, and welcome addition to the literature of gas engineering.

Electro-Wiring, Diagrams, and Switchboards. By NEWTON HARRISON, E.E. (London: Crosby Lockwood & Son. 1906.)

THIS book is well printed, many of the diagrams are excellent, and it is notably free from misprints. The author discusses the question with a vigour which often takes the reader by surprise. In the introduction we are told that electric-wiring has now "assumed an importance in the building arts second to none," and, in the preface, that "the pages of this volume will prove of the utmost value to the student, wireman, or contractor." The book deals mainly with American practice, and so the sizes of the wires are given in B and S gauge. Where an English writer would say "earth," or "earthen," the author says "ground" or "grounded." On the other hand, where an American would say "cross," he uses the English "short-circuit." Although the reviewer has had considerable experience in testing three-wire circuits, he is not able to understand the working of the "ground detector" described on p. 211. In his opinion the indications of this detector would be entirely misleading. The descriptions and diagrams of alternating current systems are simple and clear. Young electricians will find some of their difficulties clearly explained, and will appreciate the diagrams explaining the various methods of wiring.

The Encyclopedia of Practical Engineering and Allied Trades. Edited by JOSEPH G. HORNER, A.M.I.Mech.E. Vol. III. London: Virtue & Co.

THIS volume commences with "Boiler Plate" and ends with "Civil Engineering," and, in accordance with the standard set by the compiler, is directed mainly to the instruction of practical men. Most of the articles and paragraphs refer to the various branches of mechanical work, and with the exception of one on Book-keeping—which cannot be considered an engineering subject, and is not discussed in a way helpful to anybody—they are well selected and judiciously treated. Among the articles more particularly interesting to our readers we may mention those entitled "Bore Holes," "Bridge," "Caisson," "Canals," "Carpentry," and "Cement." There is, however, a good deal of information scattered about the volume which may often be drawn upon with advantage in connexion with work performed under architectural specifications, and the present issue quite sustains the favourable opinion we have already expressed concerning the first two volumes of the encyclopedia.

Joiners' Machines and How to Work Them. By T. R. GROOM. (London: William Rider & Son, Ltd.)

IN this small volume the author deals chiefly with some of the machines commonly used in joinery and cabinet-making, his object being to give serviceable information to those engaged in such branches of work rather than to the experienced mill-owner or operative. The author writes from experience gained as a practical sawyer and machinist, and his book contains a good many useful hints as to the management of various simple types of wood-working machines.

Society of Engineers: Transactions for 1905. Edited by PERRY F. NURSEY, Secretary. (London: E. & F. N. Spon, Ltd. 1906.)

MOST of the papers printed in this volume of *Transactions* have already been noticed in our columns. The subjects discussed are of more than ordinary interest, a circumstance which may be responsible for the fact that two at least of the authors have read very similar papers before other engineering societies, or have availed themselves of other means of making known their views and experience. "The Transport Possibilities of

our Inland Navigable Waterways," by Mr. B. H. Thwaite; "The Parade Extension Works at Bridlington," by Mr. E. R. Matthews; "The Improvement of London Traffic," by Messrs. Meik and Beer; and "The Metallic Preservation and Ornamentation of Iron and Steel Surfaces," by Mr. S. Cowper-Coles, are the most noteworthy contributions in the volume, and their value is considerably increased by the numerous drawings and diagrams reproduced as illustrations.

BOOK RECEIVED.

ELECTRICITY IN HOUSES AND WORKSHOPS. By Sydney F. Walker. Fourth Edition. (Whittaker & Co. 5s.)

Fifty Years Ago.

FROM THE *Builder* OF JUNE 14, 1856.

INSUFFICIENT SCAFFOLDING: TARRANT v. WEBB.

In the Court of Common Pleas, at Westminster, on the 3rd inst., this case was tried. The defendant is a house decorator and painter, and in October last he was employed to do some work in the interior of the Carlton Clubhouse. For the purpose of performing his contract, a scaffold was erected (according to the case of the plaintiff) under the defendant's directions, in the hall of that building. The plaintiff, who was employed on the same work with several other men, mounted this scaffold on October 4 last: a portion of it gave way, and he was precipitated to the ground, and seriously injured, and he now sought to recover damages from the defendant, who, as he alleged, had built the scaffold in an unsafe and insufficient manner.

The defence was, that even if Mr. Webb had erected the scaffold, he was not liable for any accident which might happen to the plaintiff, who, if he saw that the structure was faulty, need not have gone on it.

The jury eventually found a verdict for the plaintiff—damages, 25*l.*

Illustrations.

SCULPTURE FROM THE PARIS SALON.

THE two groups of sculpture here illustrated were among the most prominent exhibits in the sculpture hall of the Paris Salon this year, and were referred to in our article on the Salon some weeks since.

The "Nouvelle Muse," by M. Guilloux, appears to represent the Muse of music, or he may merely mean to represent the modern spirit of poetry; it would lend itself to either interpretation. It will be observed how finely the two figures are grouped so as to make a pyramidal composition.

M. Peyre's "Offrande à Venus" sufficiently explains itself.

NEW CHAPEL FOR THE COMMUNITY OF THE RESURRECTION, MIRFIELD, YORKS.

ON the top of a commanding eminence, which on one side slopes away down into the valley below, the site offers great opportunities for effective treatment.

The chapel is to be built of the local stone, and a quarry exists in the grounds of the community. The external bands are formed by the employment of alternate ashlar and rubble work.

Internally the local stone will be used, also various other kinds, the roof being formed with stone ribs and coke breeze concrete coloured on the under face. The height to the apex of the vaulting is 64 ft., and to the top of the columns 50 ft. The columns which support the lantern tower are so arranged as to form a sort of baldachino over the high altar.

The screen is of marble and metal.

Two stairways on either side of the nave with two flights of twelve steps each lead on to the vestries' level, and a further flight of twelve steps leads to the crypt. This is a spacious, vaulted chamber about 18 ft. in height, 98 ft. in length, and an average width of 45 ft.

Over the walls of the crypt on the external face and leading round the lady chapel from each of the octagon chapels is an outside passage. The west end will be connected to the house on the one side and to the college on the other by a low cloister in crescent form. The architect is Mr. A. H. Skipworth.

SOME SAN FRANCISCO BUILDINGS BEFORE THE FIRE.

THE first of these four illustrations is of what may be called a tragic practical interest, for it forms an illustration of the danger of wooden buildings in a city liable to earthquakes and fires. It was the rapid conflagration of these wooden buildings which led the fire up to the higher-class residential quarter of the city, which might otherwise have escaped.

The effects of earthquake and fire on the City Hall and Leland Stanford University

gateway are shown in the subjoined reproductions from photographs taken after the fire. The Mint is the building previously mentioned in a letter in our columns, which withstood the earthquake without damage; but we cannot help thinking that there must have been some especial cause for this immunity other than the mere thickness and solidity of the walls.

METROPOLITAN ASYLUMS BOARD.

THE usual fortnightly meeting of the Metropolitan Asylums Board was held on Saturday last week at the offices, Victoria-embankment.

Darveth Asylum.—The Asylums Committee submitted a report dealing with the proposal to construct new workshops and a fire-station at this Institution. The Local Government Board having asked for further information in regard to the fire-station, the Committee recommended that the report of the Engineer-in-Chief should be forwarded to that authority. The Committee's recommendation was agreed to. The total cost of the scheme is estimated at 3,500*l.*

East Cliff House.—The same Committee submitted a report on the proposal to erect a new building for the laundry staff at this Institution. The Works Committee were instructed to obtain tenders for the work. The cost is estimated at 690*l.*, but the Local Government Board have suggested that the work could be carried out for 500*l.*

Small Pox Hospitals.—On the recommendation of the Hospitals Committee the question of providing additional accommodation for cuttle at the Board's small-pox hospitals was referred to the Works Committee to be dealt with.

Bacteriological Laboratories.—The plans prepared by Messrs. T. W. Aldwinckle & Son for the provision of diphtheria antitoxin and bacteriological laboratories on the Board's property at Peckham Rye were adopted, and ordered to be forwarded to the Local Government Board.

WHITEFRIARGATE BRIDGE, HULL.—At a recent meeting of the Hull Corporation Works Committee the Whitefriargate Bridge Sub-Committee reported that the Mayor had seen Mr. Newell, with the City Engineer, with reference to the suggestion that a spare shaft should be provided for Whitefriargate Bridge, and that Mr. Newell stated that he could not advise the North-Eastern Railway Company to provide one. The City Engineer also informed the sub-committee that he had written to the engineer in charge of the Tower Bridge inquiring whether any spare main shaft for the bridge was provided, and that he had received a negative reply. In the opinion of the City Engineer it would be unreasonable to expect a spare shaft to be provided for the new Whitefriargate Bridge. The sub-committee thereupon resolved that in their opinion it was no part of the duty of the Corporation to provide a spare shaft for the Whitefriargate Bridge, and that there is no sufficient reason for asking the North-Eastern Railway Company to do so.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XXIII.
THE SLIDE-RULE IN TECHNICAL CALCULATIONS (continued).

SOME other modes of applying the slide rule to technical calculations still remain to be mentioned, and, as before, the reader is referred to the rule illustrated in Fig. 16.

Cubes.—To find the cube of any number by the slide-rule it is quite feasible to proceed by successive multiplications on one pair of scales, but a more expeditious method is to bring into play the automatic squaring process effected by the shorter graduations of scales A and B.

Rule (1).—To find the cube of any number from $\sqrt[3]{1}$ up to $\sqrt[3]{100}$ ($= 4.6415$) on D, set the left-hand index of C to the number on D, and opposite the given number on the left-hand half of scale B read the required cube on scale A.

To find the cube of any number from $\sqrt[3]{100}$ up to $\sqrt[3]{1000}$ ($= 10$) on D, set the right-hand index of C to the number on D, and opposite the given number on the left-hand half of scale B read the required cube on scale A.

The employment of the right-hand index is necessary for numbers above $\sqrt[3]{100}$, because the movement of the left-hand index beyond 4.6415 on D causes the numbers of scale B corresponding to the remaining values on scale D to pass beyond the limit of scale A. Therefore, as explained in Article XIX., we continue the process by using the right-hand index of scale C, regarding the values marked on the left-hand half of scale A as having been multiplied by 100, so that 1 represents 100, 2 represents 200, and so on.

In this way we are enabled to find the cubes of all numbers up to 10, and by considering the figures and marks on the scales to have been multiplied by positive and negative powers of 10 as required, all numbers, mixed numbers, and decimal fractions can be cubed. For the correct positions of multiples and sub-multiples of numbers on the upper scales, see tables XVII. and XVIII.

The number of digits to the left of the decimal place in the cube of any whole or mixed number is determined as stated below, where N = number of digits in the cube, and n = the number of digits in the given number.

- Rule (2).**—
- (a) For cubes read on L.H. half of A, slide projecting to the right hand: $N = 3n - 2$.
 - (b) For cubes read on R.H. half of A, slide projecting to the right hand: $N = 3n - 1$.
 - (c) For cubes read on L.H. half of A, slide projecting to the left hand: $N = 3n$.

The number of ciphers immediately to the right of the decimal point in the cube of any decimal fraction is determined as stated below, where C = the number of ciphers in the cube and c = the number of ciphers in the given decimal fraction.

- Rule (3).**—
- (a) For cubes read on L.H. half of A, slide projecting to the right hand: $C = 3c + 2$.
 - (b) For cubes read on R.H. half of A, slide projecting to the right hand: $C = 3c + 1$.
 - (c) For cubes read on L.H. half of A, slide projecting to the left hand: $C = 3c$.

Example (1). Find the cube of 21.
Set L.H. index of C to 21 on D, and over 21 on L.H. of B read 926 on the L.H. half of A. As the slide projects to the right the number of figures in the cube by Rule (2) a is $(3 \times 1) - 2 = 1$. Therefore, the cube is taken at 9.26, the exact value being 9.261.

Example (2). Find the cube of 39.6.
Set L.H. index of C to 39.6 on D, and over 39.6 on L.H. of B read 621 on the R.H. half of A. As the slide projects to the right the number of figures by Rule (2) b is $(3 \times 2) - 1 = 5$. Therefore, the cube is taken at 62.100, the exact value being 62.999-136.

Example (3). Find the cube of 8.2.
Set R.H. index of C to 8.2 on D, and over 8.2 on L.H. of B read 551 on the L.H. half of A. As the slide projects to the left the number of figures by Rule (2) c is $(3 \times 1) = 3$. Therefore, the cube is taken at 551, the exact value being 551.368.

Example (4). Find the cube of 0.082.

The required figures being the same as found in Example (3), we have only to settle the number of ciphers following the decimal point in accordance with Rule (3) c thus: $(3 \times 1) = 3$, and the cube is 0.006551.

Cube Root.—Two methods are available for finding cube roots by the aid of the slide-rule.

Rule (4).—Set the cursor to the given number on scale A, and move the slide to the right hand or the left hand, until the number found on the left-hand half of scale B under the cursor is equivalent to the number simultaneously found on scale D under the L.H. or R.H. index of scale C. The value thus concurrently ascertained represents the cube root, or the significant figures of the cube root, of the given number.

In applying this rule to numbers containing one, two, and three figures respectively, it is necessary to take the numbers on the appropriate parts of scale A, to move the slide in the proper direction, and always to use the left-hand half of scale B in conjunction with scale A. Thus:

- Take 1-figure numbers on L.H. of A, move slide to R.H.**
 " 2 " " R.H. " A, " to R.H.
 " 3 " " L.H. " A, " to L.H.
- Example (5).** Find the cube roots of (1)8, (2)80, and (3)800.
- (1) Set cursor to 8 on L.H. of A, move slide to R.H. and find $\sqrt[3]{8} = 2$.
 - (2) Set cursor to 8 on R.H. of A, move slide to R.H. and find $\sqrt[3]{80} = 4.3$.
 - (3) Set cursor to 8 on L.H. of A, move slide to L.H. and find $\sqrt[3]{800} = 9.28$.

In dealing with numbers containing more than three figures the numbers must be pointed off into groups of three as in evolution by arithmetic (see Article XI., page 325). Having done this, the number of figures in the first group indicates the part of scale A on which any given number is to be taken, and the direction in which the slide is to be moved.

Rule (5).—In any cube root there is one digit for each group of three figures into which the given number has been pointed off, and one digit for the first group, whether this includes one, two, or three figures.

In applying Rule (4) to decimal fractions having two, one, and no ciphers immediately after the decimal point, the procedure is as follows:—

Take 0-cipher fractions on L.H. of A, move slide to L.H.
 " 1-cipher " R.H. " A, " R.H.
 " 2-cipher " L.H. " A, " R.H.

- Example (6).** Find the cube roots of (1)0.008, (2)0.08, and (3)0.8. These numbers must be written as 0.008, 0.080, and 0.800.
- (1) Set cursor to 8 on L.H. of A, move slide to R.H. and find $\sqrt[3]{0.008} = 0.2$.
 - (2) Set cursor to 8 on R.H. of A, move slide to R.H. and find $\sqrt[3]{0.08} = 0.43$.
 - (3) Set cursor to 8 on L.H. of A, move slide to L.H. and find $\sqrt[3]{0.8} = 0.928$.

To deal with decimal fractions having more than two ciphers immediately after the decimal point, point off the fraction towards the right into groups of three figures, and add any ciphers necessary at the end of the last period, as in arithmetic (see Article XI., page 325). Then the position of the first significant figure in its group indicates which part of scale A must be used, and the direction in which the slide is to be moved.

Rule (6).—In the cube root of any decimal fraction there is one cipher immediately after the decimal point for every group consisting entirely of ciphers into which the given fraction has been pointed off.

Example (7). Find the cube roots of (1)0.0008 and (2)0.000008.

Pointing off the numbers and appending the necessary ciphers we have 0.000,800 and 0.000,000,080.

- (1) Set cursor to 8 on L.H. of A, move slide to L.H. and find $\sqrt[3]{0.0008} = 0.0008$.
- (2) Set cursor to 8 on R.H. of A, move slide to R.H. and find $\sqrt[3]{0.000008} = 0.000008$.

Cube roots can also be found by the use of the inverted slide and scale B, i.e., scale B inverted. When the operator has learned to read figures upside down with facility this method will be found more convenient than that discussed above.

Rule 7.—Set the left-hand or the right-hand index of the inverted slide to the given number on scale A, and look along scales B' and D for two coincident numbers. When found, these represent the required cube root or the

significant figures of the root of the given number.

As in the previously described method, it is necessary to take the given number on the proper part of scale A, to use the proper index of the slide, and always to use the right-hand half of scale B' (that is the left-hand half of scale B) in conjunction with scale D as follows:

Take 1-figure numbers on L.H. of A, use R.H. index.
 " 2 " " R.H. " A, " R.H. "
 " 3 " " L.H. " A, " L.H. "

The method of pointing off the digits of numbers whose cube roots are required, and the methods of determining the number of digits or ciphers in the cube roots found are the same as those already explained in Rules (4) to (6).

Example (8). Find the cube root of (1)6,000, (2)60,000, and (3)600,000.

- (1) Set R.H. index of slide to 6 on L.H. of A, and find 1817 on R.H. of B' coincident with 1817 on D. Then $18.17 = \sqrt[3]{6,000}$.
- (2) Set R.H. index of slide to 6 on R.H. of A, and find 391 on R.H. of B' coincident with 391 on D. Then $39.1 = \sqrt[3]{60,000}$.
- (3) Set L.H. index of slide to 6 on L.H. of A, and find 843 on R.H. of B' coincident with 843 on D. Then $84.3 = \sqrt[3]{600,000}$.

In applying Rule (7) to decimal fractions having two, one, or no ciphers immediately after the decimal point, the procedure is as follows:—

Take 0-cipher fractions on L.H. of A, use L.H. index.
 " 1-cipher " R.H. " A, " R.H. "
 " 2-cipher " L.H. " A, " R.H. "

The same procedure is also applicable, after a decimal fraction has been pointed off, to the group containing the first significant figure.

Example (9). Find the cube roots of (1)0.00006, (2)0.00036, and (3)0.0006.

- These numbers must be pointed off thus: 0.000,006, 0.000,036, and 0.000,600.
- (1) Set L.H. index of slide to 6 on L.H. of A, and find 1817 as before. Then $0.1817 = \sqrt[3]{0.00006}$.
 - (2) Set R.H. index of slide to 6 on R.H. of A, and find 391 as before. Then $0.391 = \sqrt[3]{0.00036}$.
 - (3) Set L.H. index of slide to 6 on L.H. of A, and find 843 as before. Then $0.843 = \sqrt[3]{0.0006}$.

Higher Powers and Roots.

Fourth Powers.—

Rule (8).—Set the right-hand or the left-hand index of scale C to the given number on scale D, and opposite the given number on scale C read the fourth power on scale A.

It should be observed that only one half of scale D can be used with the L.H. index of the slide, and that to use the other half the R.H. index must be employed.

Rule (9).—Let N = the number of digits in any fourth power, and n = the number of digits in the given number. Then calculate the number of digits as below:—

Power Read on	Index.	Number of Figures in Power.
L.H. half	L.H.	$N = 4n - 3$
R.H. "	L.H.	$N = 4n - 2$
L.H. "	R.H.	$N = 4n - 1$
R.H. "	R.H.	$N = 4n$

With suitable modification this rule is also applicable to decimal fractions.

Example (10). Find the fourth powers of (1)19, (2)21.15, (3)376.5, and (4)6.69.

- (1) Set the L.H. index of C to 19 on D, and over 19 on C read 2 on L.H. of A. The number of figures = $(4 \times 1) - 3 = 1$. $\therefore 19^4 = 130321$.
- (2) Set the L.H. index of C to 21.15 on D, and over 21.15 on C read 2 on R.H. of A. The number of figures = $(4 \times 2) - 2 = 6$. $\therefore 21.15^4 = 200,000$.
- (3) Set the R.H. index of C to 376.5 on D, and over 376.5 on C read 2 on L.H. of A. The number of figures = $(4 \times 3) - 1 = 11$. $\therefore 376.5^4 = 20,000,000$.
- (4) Set the R.H. index of C to 6.69 on D, and over 6.69 on C read 2 on R.H. of A. The number of figures = $(4 \times 1) = 4$. $\therefore 6.69^4 = 2,000$.

Fourth Roots.—Fourth roots may be extracted by a reversal of the process described above.

Rule (10).—Set the cursor to the given number on scale A, and move the slide to the right hand or the left hand until the number found under the cursor on scale C is equivalent to the number simultaneously found on scale D under the L.H. or R.H. index of scale C. The

value thus concurrently ascertained represents the fourth root, or the significant figures of the fourth root of the given number.

It is necessary to take the numbers at the proper part of scale A, and to use the proper index of the slide. When the given number has been pointed off into groups of four figures, the first group in the case of a whole number, and the group containing the first significant figure in the case of a decimal fraction, read in connexion with the subjoined table, indicates at once which half of scale A and which index of the slide are to be used.

Number taken on A. on C.		Index		Readings on A.	
L.H.	R.H.	1 to 10	10 to 100	Whole Numbers.	Decimal Fractions.
L.H.	R.H.	1 to 10	10 to 100	0.0001 to 0.0099	0.0001 to 0.0099
L.H.	R.H.	100 to 999	100 to 999	0.01 to 0.99	0.01 to 0.99
R.H.	R.H.	1000 to 9999	1000 to 9999	0.1 to 0.9	0.1 to 0.9

Rule (11).—The number of digits in the fourth root of any whole number corresponds with the number of groups obtained by pointing off the digits in fours, and the number of ciphers immediately after the decimal point in the fourth root of any decimal fraction corresponds with the number of groups, which, after pointing off, are seen to consist wholly of ciphers.

Example (11).—Find the fourth roots of (1) 835, (2) 83.5, (3) 835, (4) 8350.

(1) Set the cursor to 835 on L.H. of A, and using L.H. index of slide, find 17 on C under cursor and 17 on D below the index of C. Then, as the given number contains part of only one group of four digits, $1.7 = \sqrt[4]{835}$.

(2) Set cursor to 835 on R.H. half of A, and using L.H. index of slide, find 302 on C under cursor and 302 on D below the index of C. Then, as the given number contains part of only one group of four digits, $3.02 = \sqrt[4]{83.5}$.

(3) Set cursor to 835 on L.H. half of A, and using R.H. index of slide, find 5375 on C under cursor and 5375 on D below the index of C. Then, as the given number contains part of only one group of four digits, $5.375 = \sqrt[4]{835}$.

(4) Set cursor to 8350 on R.H. half of A, and using R.H. index of slide, find 956 on C under cursor, and 956 on scale D below the index of C. Then, as the given number contains only one group of four digits, $9.56 = \sqrt[4]{8350}$.

Example (12).—Find the fourth roots of (1) 0.000000835, (2) 0.0000835, (3) 0.0000835, and (4) 0.0000835.

These numbers must be pointed off thus: 0.0000008350, 0.00083500, 0.00008350, and 0.00083500.

(1) Find 17, as before. Then, as the given number contains one group entirely of ciphers, $0.017 = \sqrt[4]{0.000000835}$.

(2) Find 302, as before. Then, as the given number contains no group entirely of ciphers, $0.302 = \sqrt[4]{0.0000835}$.

(3) Find 5375, as before. Then, as the given number contains one group entirely of ciphers, $0.5375 = \sqrt[4]{0.000000835}$.

(4) Find 956, as before. Then, as the given number contains one group entirely of ciphers, $0.956 = \sqrt[4]{0.0000835}$.

By noticing exactly what happens when operating the slide rule in the foregoing calculations, the reader will find that after the proper position of any given number has been settled on scale A, the quickest way of finding the fourth root is to extract the square root of the square root as follows:

Rule (12).—Set the cursor to the given number on scale A, read the square root on scale D, set the index of B to the value of the square root on scale A and read the fourth root on scale D below the index of scale C.

WORKSHIP-STREET POLICE-COURT.—Under an order in Council the police-court in Workshop-street has been closed, and the business of the court is transferred to new buildings in Old-street, St. Luke's, which will serve for the locality by name of the Old-street Police-court. In Rocque's map of about 1755 the east end of the present Workshop-street appears as Hog-lane, where lived the actor, Gabriel Spencer, whom Ben Jonson killed in a duel in the fields at Hoxton.

Obituary.

MR. SCRIVENER.—The death, at his residence, The Cedars, Newcastle-under-Lyme, is announced of Mr. Edward Elvine Scrivener, in his sixty-eighth year. Mr. Scrivener was senior member of the firm of Messrs. R. Scrivener & Sons, of Howard-place, Hanley, architects, surveyors, and valuers. His partners were Mr. A. Scrivener and Mr. E. D. M. Scrivener; in May last the firm dissolved partnership in so far as regards Mr. E. D. M. Scrivener. Of the more principal architectural works carried out by Mr. Scrivener and his firm we may mention the enlargement of the schools at Atherstone; school buildings for Highley School Board, Salop; the new schools in Queen-street, Fenton, for the Stoke-upon-Trent Urban District School Board, for 660 boys and girls, 1897, and in 1902 more school buildings at Fenton; a mixed school for 470 children in Princes-road, and one for the deaf and dumb at Penkull, Staffs, the new church for St. Jude's parish, Hanley, for a congregation of 850 persons, at a cost, with the site, of some 10,000, in 1897-8; the Roman Catholic Church and schools for 20 children, Hall-street, Burnley, 1897-8; the laying-out of Fenton Park estate, and Dix's brewery, Hanley; new premises in Foundry-street, Hanley, for the proprietors of the *Staffordshire Sentinel*, comprising offices, a publishing-room, and a large printing press room to accommodate six electrically driven machines; and, in Lamb-street, premises for Messrs. Huntbach & Co., the restoration, six years ago, of the parish church of St. Lawrence, Anley, near Atherstone, in Warwickshire; the infirmary and sick wards at Deunstone College, Hanley, 1901; extension of mill works at Hanley, for Messrs. C. Leese & Sons; premises at Burnley, and enlargement of Dalehall Manufactory, Hanley, for Messrs. Keating & Co.; shops and warehouse in High-street, Stoke-upon-Trent, for Mr. J. H. Irwin, and, for Messrs. W. Kirkham & Sons, a slip-house and workshops, Stoke-upon-Trent; schools for 548 children at Tunstall; St. James's rectory-house, Longton, Staffs. (a very recent work of the firm); and schools in Shelton, Newbold, and in Leek, Leek classrooms, etc., at Harfield, for the School Board of Stoke-upon-Trent. Mr. Scrivener was architect to the School Board for Hanley and their successors, the Hanley Education Committee; in that capacity he and his firm made the plans and designs for many board schools, amongst them being those in Caudon-road, 1896; Great York-street; Northwood Schools; a junior mixed school; the New Grove Schools for 1,000 children; and, in 1905, the extensions of the Municipal Secondary School. Mr. Scrivener was valued to the Board of Guardians for Stoke-upon-Trent, and five years ago was appointed a Justice of the Peace for the borough of Hanley.

MR. W. PARRISON.—Mr. William Pattinson, head of the firm of Messrs. W. Pattinson & Sons, contractors, Ruskington, near Sleaford, has just died in his seventy-third year. He was the first chairman of the Ruskington Urban Council.

General Building News.

ST. AUGUSTINE'S CHURCH, DERBY.—A further advance towards the completion of this church has been made by the erection of a south aisle, which will provide about 200 additional sittings. The work has been carried out under the direction of Messrs. Naylor & Sale, architects, of Derby, who prepared the original design, and the builder was Mr. Henry Chattle.

CHURCH, GARRISTOWN, IRELAND.—The new church at Garristown has just been dedicated by his Grace the Archbishop of Dublin. The new church is built in the Gothic style. It consists of a nave 90 ft. by 30 ft., with a diagonal apse 20 ft. by 18 ft. The walls are built of local limestones from Mr. Mangan's quarries, lined on the inside with brick. The chancel dressings to windows, doors, plinths, buttresses, weatherings, etc., are from the Milverton quarries, Skerries. The chancel floor is laid in mosaic; the nave passages and floors of porches are tiled. The roof, which is of open timber construction, is panelled with pitch-pine. The chancel arch is supported on polished granite shafts with carved capitals and moulded bases. The edifice was erected by Mr. James M'Adory, builder, Dundalk, from the designs and under the superintendence of Mr. George L. O'Connor, Dublin. The statues in the niches at each side of the altar were presented by Mrs. Aungier. The gates of the altar rails were supplied by Messrs. McGloughlin.

CHRIST CHURCH, NORTHAMPTON.—The erection of this church has just been completed. The main structure is of local stone from Lady Robinson's Kingshorpe pits, but both east and west ends are temporarily built of brick. The floors under the seats are of wood blocks, and the passages are paved with quarries. The carving to the exterior and to fittings has been executed by Mr. S. L. Reynolds, Northampton. Mr. Robert G. Costford, Northampton, was the general contractor; the architect being Mr.

M. H. Holding, also of Northampton. The artificial lighting is by electricity, the installation having been carried out by Mr. W. C. Mansell, of Northampton. The heating is by means of hot water. The seating at present is for about 600 people, but to complete the scheme the chancel, chancel aisle, vestry, western tower, and western porches have to be added. The amount of the contract was 5,800.

WESLEYAN CHURCH, GATESHEAD.—On the 6th inst. the opening ceremony took place of the new Wesleyan Methodist church in Durham-road, Gateshead. The building is in the early Gothic style, and is surmounted by an octagonal turret, about 90 ft. in height. The church is seated for 671. The architect for the work is Mr. W. Stanley Ellison, of Liverpool; and Mr. Alexander Pringle, Gateshead, is the contractor. The stone has been supplied from Mr. Pringle's quarry at Beacon Lough, near Wreckenton.

WESLEYAN SCHOOLS, KETTERING.—The foundation-stones of the new Wesleyan Methodist Sunday Schools in Regent-street, Kettering, were formally laid on the 4th inst. The schools are being erected to plans prepared by Messrs. Gotch & Saunders, and the estimate for the building is 1,588, 10s., the contract having been secured by Messrs. E. & F. Henson, of Kettering.

BAPTIST SUNDAY SCHOOL, BROMLEY.—The picked stock of the new Sunday School, which is being erected on the land at the rear of the Bromley Baptist Church, were laid recently. The building is designed upon one floor only, and will have a main assembly-hall, 42 ft. 6 in. long and 34 ft. wide, with classrooms on all sides, being lighted from the clearstory rising above the flat roof over the classroom. The hall will have an average pitch of about 20 ft. On the east and west sides there will be small classrooms divided from one another by "Climax" folding partitions, which when required will be thrown back and increase the width of the hall to 50 ft. These rooms will be seven in number, each about 1 ft. square. On the northern side of the building a reading room has been provided for the secretary and librarian, a Bible classroom for seniors, the kitchen and the boys' lavatories. On the southern side is another seniors' classroom and the infants' classroom, also the lavatories for girls. The front elevation will be faced with red Kentish bricks, and all other elevations with picked stock. The stone dressings are to be of Bath stone from the Monks Park quarries. Welsh slates will be used in covering the main roof and lead on the flats. The whole of the joinery will be in pitch-pine. It is proposed to light the building with gas and warm it by a system of low-pressure heating, the plan of which has been designed by Mr. Percy Coad, Bromley, and the builder is Mr. T. D. Grady, also of Bromley.

NEW COUNCIL SCHOOL, PRESTON.—The cornerstone of the Roebuck-street School, Preston, was laid a short time since. The site of the school is nearly an acre in extent, and the school, which is of the central hall type, will be erected according to the designs of Mr. architect of Morecambe, whose plans were selected in competition. In addition to the ordinary elementary curriculum, provision will be made for training the boys in manual work and imparting a knowledge of cookery to the girls. Though not included in the original scheme, sanction may be sought for an additional grant of 500 £ for a caretaker's room, and it is proposed to utilise the caretaker's house, which will stand in one part of the playground, for training in housewifery. The two central halls, each 1,060 sq. ft. in dimensions, not only act as lungs to the apartments adjoining, but may be used for marching and drill during wet days or on any occasion when it is desired to group the scholars. The school will be divided into two departments—the infants and the mixed. In the latter there will be six rooms, five of which will accommodate 60 children each and one 50. For infants there are four classrooms, one to hold nearly 60 and three to accommodate 54, thus giving a total accommodation of 570. The cookery-room will have an area of 752 sq. ft., the manual instruction room 700, and the two teachers' rooms each 128 sq. ft. The contract was let to Mr. T. Cottam, Preston, for 6,350.

PUBLIC LIBRARIES IN ST. PANCRAS.—The Public Libraries Committee of St. Pancras Borough Council has provisionally arranged to purchase for 4,400 £ a site of 3,834 sq. ft. in Mableton-place for the purpose of erecting thereon the proposed second largest library in the borough. The principal façade of the new library is to be in a new road now being constructed by the Borough Council, situated between the Gray's Inn-road and the Tottenham Court-road districts. The Borough Engineer estimates that the cost of the Highgate district library will be 3,860.

SCHOOL, BALSAGRAY, GOVAN, GLASGOW.—Mr. James Caldwell, M.P., opened the Balsagray Public School on the 5th inst. The building consists of three stories, with a front to Dumbarton-road, and is built of Corncockle stone in the Roman classic style. There is accommodation for 1,415 scholars. In connexion with the school there is a swimming pond 75 ft. long by 30 ft.

broad, with dressing boxes and galleries on three sides. There is also a workshop for manual instruction, a cook's kitchen, and the usual author's house. The buildings are from designs by Messrs. Bruce & Hay, architects, Glasgow, and the cost is estimated at 29,000.

COUNCIL SCHOOLS, BIRMINGHAM.—The secondary and elementary schools erected by the Education Committee of the City Council in Guyton have just been opened. The area of the site, including playgrounds, etc., is 10,280 square yards and the length of the buildings is 450 ft. The schools are built of brinded Black Country bricks, with dressings of mottled Hollington stone. The roofs are of Hartall tiles, and the construction throughout is fire-resisting. The architects are Messrs. Buckland & Farmer. A feature of the building is the tower, which serves the double purpose of ornament and ventilation. The secondary school affords accommodation for 600 pupils, 300 boys and the same number of girls. The main teaching rooms for their use are on the ground floor, and the special rooms, chemical laboratories, gymnasium, and art rooms are upstairs. Two central halls are provided, each 74 ft. long and 32 ft. wide, one for the boys and the other for the girls. In the sixteen classrooms provision is made for teaching the boys wood and metal work, and the girls cookery and laundry work; while the pupils of both sexes will be instructed in chemistry and physics, and they will be allowed the use of the gymnasium. In the basement dining-rooms have been fitted up for the convenience of the scholars. The elementary school is distinct from the secondary, although it is part of the main block. Accommodation is provided for 600 children—400 in the mixed rooms, and 200 infants. There are two halls, one for the mixed children and the other for the infants, each 48 ft. long by 23 ft. wide, and twelve classrooms have been arranged. The heating of the building is by means of low-pressure steam, and the ventilation is on the exhaust principle, the foul air being extracted by two rotary fans driven by electric motors. The chemical laboratory works are situated in a similar manner, but on a separate system, and the inlets for fresh air are at the back of radiators. The total cost of the buildings, exclusive of the site, will be between 40,000, and 45,000.

POST OFFICE EXTENSIONS, CHELTENHAM.—The additions which have been made to the Cheltenham Post Office have now been completed. The new front has been executed in Bath and Portland stone, and is in harmony with the Grecian style of the rest of the building, with the difference that the details of the former are Doric and those of the latter Ionic. The public offices and sorting-rooms for the postmen are on the ground floor, and are 55 ft. in length. The remainder of the building is taken up by the sorting office and the telegraph messengers' room. On the first floor of the front building are placed the Postmaster's and Chief Clerk's offices, and the sorting-rooms for the postmen. The postmen's office occupies the whole of the first floor of the back building. The telegraph and telephone rooms are on the second floor of the front building, the remainder being occupied as retiring-rooms for the male and female clerks. In the basement accommodation is provided for the telegraph and postal and telegraph stores. Except in the Postmaster's and Chief Clerk's offices, which retain the fire-grate, the heating is by hot-water pipes. The general contractor was Mr. Colborne, of Swindon. The work has been carried out from the designs of Mr. John Rutherford, Architect of the Board of Works.

HOTEL, TURNBERRY, N.B.—A new hotel has been erected at Turnberry by the Glasgow and South-Western Railway Company, in connexion with the new line of railway which runs the entire length of the seaboard from Ayr to Girvan, and which will be officially known as the Maidens and Dunure Railway. The hotel adjoins the railway, and is connected with Turnberry Station by a covered way which leads through a conservatory to the entrance lounge. The building has been designed in the Georgian period of architecture, and has a frontage of 300 ft. The exterior walls are rough cast, coloured a light cream; the woodwork of the windows, verandah cornices, etc., have been relieved with pure white, while the roof is of red tiles. Altogether there are one hundred visitors' bedrooms. The entire building is lit by electric power, produced by a central station which provides two 30-horse-power engines, and electric lifts communicate with various floors. The building was designed by Mr. James Miller, Glasgow.

FREE LIBRARY, LITTLEHAMPTON.—The new Littlehampton Free Library has just been opened. The building is situated on the corner of Malvern-road and Fitzalan-road, and has its main front facing south-east, with an entrance from each road leading up to a central porch, from which the chief public rooms are directly approached through an arched corridor. The building contains a lending library 30 ft. by 20 ft., reference library 17 ft. by 17 ft., news and newspaper-room 33 ft. by 17 ft., on the ground floor, where also are the librarian's private room and workroom, which are entered from the lending library. The back portion contain a

holder-house and usual offices, while over the librarian's room and the workroom are two store-rooms. The rooms on the ground floor are divided by means of glazed lead light screens and doors, and the main portions of the building are heated by low-pressure hot-water apparatus, and radiators. Gas lighting is employed, incandescent burners being used. Pitch-pine has been employed for the roof, which is hoarded and covered with Staffordshire tiles, and the floor is composed of pitch-pine blocks. The building is designed in the Tudor style, plain red kiln Poling bricks being used, with stone bands, sills, millions, lintels, etc. The plans for the work were prepared by Mr. H. Howard, the Surveyor.

THE PALACE, CLACTON.—This building, which has just been opened, occupies a site of four acres, and has cost about 40,000. It is situated on the West Cliff, overlooking the sea. The architects were Messrs. Spencer & Tighe. The theatre, which is the main building, will seat 1,500 persons, and it contains a supper lounge and various alcoves. It is approached by an entrance-hall, which also gives access to a couple of terraces. In the grounds a bandstand is reared in a pool, and there are tea-houses in the Japanese, Indian, and Swiss styles. The structure is built entirely of steel and iron framing, and the whole of the work has been carried out by Messrs. D. Rowell & Co., of London, under the management of Mr. W. W. Pepper. The grounds have been laid out under the supervision of Mr. T. B. Harpham. The artistic continuation scenery is the work of Mr. B. Burris, the electric contracts have been carried out by Messrs. Mayfield & Co., of London, and the superintendent-general has been Mr. Gatfield.

CLUB PREMISES, WHITSBURY, HANTS.—The foundation-stone of a new clubroom has just been laid at Whitsbury. The architect is Mr. Fred Bath, of Salisbury, the builders being Messrs. Frederick Merrick & Son, of Glastonbury, Somerset.

FACTORY, HULL.—New works are being erected by the National Radiator Company on the north of Springhead-road, Hull. The architect is Mr. H. Heathcote, of Messrs. Charles Heathcote & Sons, London; Messrs. Arnold & Sons, Doncaster, are the general contractors; Messrs. Dorran, Long, & Co., Middlesbrough, the contractors for the steel work; Messrs. Bell & Co., Liverpool, for the erection of the steel work, Messrs. Hewitt & Sons the zinc roof; Messrs. Henry Hope & Sons, Birmingham, the windows; and Mr. F. Abbe is executing the plumbing work.

ISOLATION HOSPITAL, READING.—The opening of the new hospital for infectious diseases in Prospect Park, Reading, took place a short time ago. Mr. Charles Smith was the architect of the buildings. The general contractors were Messrs. Collier & Catley, and the engineering work has been carried out by Messrs. Barford & Perkins, of Peterborough. Mr. B. J. E. Webber acted as clerk of the works.

GENERAL POST OFFICE, EDINBURGH, EXTENSIONS.—A scheme of extension of the General Post Office, Edinburgh, is under consideration, and plans for the same, prepared by Mr. Oldrieve, of the Board of Works, have been sanctioned. Working drawings are now in course of preparation. The enlargement scheme is one of considerable magnitude, it being intended to build an extension eastward along the railway to Low Calton, and also to add an additional story to almost the whole of the present building. Nearly every department in the post office will have more accommodation assigned to it, and the administrative offices will be concentrated. It is also intended, for example, to bring into the enlarged building the engineering department and the office of the superintendent engineer of the district, now outside the building. In preparing the elevations, the architect of the Board of Works has kept prominently in view the preservation of the *ensemble* of the group of buildings at the east end of Princes-street, as viewed from the south. To this end the sky-line of the post office block, after extension, as seen from the bridge, will be broken up by three steps, so to speak, leading from the lowest elevation on the east to the highest on the west, to meet the line of the North British Station Hotel. The wall top of the new buildings will be at the present level, and the "steps" will be to the west. Photographs have been taken of the corner, and it is believed that the additional story on the post office to the west, when in combination with the new building in the manner indicated, will restore the architectural scale of the neighbourhood, which was somewhat thrown out of joint by the height of the North British Hotel. The cost of the extension will be over 50,000.

LIBRARY, KING'S HEATH, BIRMINGHAM.—On the 11th inst. the Carnegie Free Library, which has been erected at King's Heath, close to the railway station, was opened. The building, which has cost upwards of 3,000*l.* has been built to the design of Mr. A. G. Latham, of Birmingham. It has been carried out in the classic Renaissance style, and the whole of the front and a portion of the side facing the station have been carried out in white Hollington stone and the other frontages are of red brick with stone dressing. A bold entrance with vestibule, having

wrought-iron gates, is provided facing the main road. From thence swing doors lead to the reading and news-room, and the lending and reference departments. The reading-room has a circular, panelled ceiling, and, in addition to accommodation at the tables for forty-two readers, there is a recess with wall slopes and independent newspaper stands of fumed and polished oak providing for about a score of newspapers. In the centre of the building is the lending department, in which shelves are provided for 11,000 volumes. The borrowers' space, which forms the corridor to the reference room, is 11 ft. wide, and is furnished with a polished oak counter for service of books, and there is a seat for the use of persons waiting. The reference room is at the rear of the building, as far removed as possible from the noise of traffic, and is provided with shelves for over 4,000 volumes.

PROPOSED NEW GUILD HALL, PERTH.—Plans have been prepared by Mr. A. Granger Heiton, architect, Perth, for a new guild hall, which it is proposed to erect in High-street, Perth. The building will be of the XVIIth century style. On the ground floor there are to be one large double bay of wood blocks, while the ceiling will be of concrete fireproof. A low platform with panelled front is to be erected at the east end of the hall. If chairs are used accommodation will be provided for 160 persons, and twenty on the platform. Ventilation is provided by shafts led from the ceiling to the turret ventilator on the roof. A cloak-room, lavatory, and store are provided over the main staircase. The hall will cost about 2,250*l.*

Sanitary and Engineering News.

GLASGOW MAIN DRAINAGE SCHEME.—On the 4th inst. Lord Provost Bilsland out for the first of the works at Shieldhall which form the third and final section of the main-drainage scheme of Glasgow, which was inaugurated fourteen years ago. The whole of the works for taking the drainage of the north side of the city out of the River Clyde are already in operation, and when the works at Shieldhall are completed the drainage of the south side of the city will also be kept out of the river. The third section includes the whole municipal area of Glasgow on the south bank of the river, the burghs of Rutherglen, Pollokshaws, and Govan, as well as various residential and rural districts in the counties of Lanark and Renfrew. The extent of this section is 14 square miles. The works for the disposal of the sewage of this area were originally intended to be situated on the river bank at Braehead, about one mile eastward from Renfrew. It having recently been found that this position would be disadvantageous to the interests of the Clyde Navigation, it has been arranged to place the works at Shieldhall on the ground recently occupied as the timber depot. The daily volume of dry-weather sewage to be treated at Shieldhall will be 47,000,000 gallons, and the works have the advantage of river frontage, with every facility of water carriage for receiving and dispatching materials. Mr. A. B. McDonald is the City Engineer.

WIGTON WATER SCHEME.—On the 7th inst. Mr. H. P. Boulnois, Local Government Board Inspector, held an inquiry at the Council Chambers, Wigton, into an application by the Wigton Urban District Council for sanction to borrow 2,000*l.* for works of water supply, viz., the laying of a cast-iron main in the parishes of Bolton and Westward. Mr. J. W. Crookes (clerk) and Mr. Joseph Graham Carlisle (the Council's Water Engineer), appeared in support of the application, and there was no opposition.

BIRMINGHAM SEWAGE FARM.—Mr. R. H. Bicknell, Local Government Board Inspector, held an inquiry at the Birmingham Council House on the 11th inst., respecting the application by the Tame and Rea Drainage Board for sanction to borrow 40,500*l.* for the purpose of constructing four additional bacteria beds at Minworth Graves. Mr. J. D. Watson, the Engineer of the Board, pointed out that at the present time they were able to deal with about a quarter of the dry-weather flow by means of the beds already in existence. The new ones were to be constructed on the same principle, but the Board had gained knowledge from experience, which would lead to a lessening in the cost. The imperative necessity for more beds was shown by the fact that they had 450 persons per acre, which was abnormally high, as it was held that anything above 100 or 150 per acre was excessive. Mr. Watson added that with the additions proposed they would be able to deal with about half of the dry-weather flow. The land would be used for dealing with the remaining part of the sewage on irrigation lines.

SEA DEFENCES, HORNSÉE.—On the 6th inst. Mr. P. M. Crosthwaite, M.Inst.C.E., the Local Government Board Inspector, heard the application of the Urban Council, which has been made to the Local Government Board, for sanction to

borrow a sum of 12,500l. for works of sea defence, or, in other words, to repair the great damage done to the sea front by the recent spring tides, by the erection of a sea wall and groynes. Mr. W. T. Douglass, C.E., of London, the Council's Engineer, said his first report was in November, 1905, with a subsequent one in April of the present year, copies of which had been forwarded to the Local Government Board. The plans showed a sea wall from the north end of the Promenade-gardens to the New-road end with four groynes, but the Council had since decided to limit the length of the sea wall at the south end of the Gardens because of the expense attached. The plans presented embodied the scheme for which the loan was applied for, and included a sea wall with upper and lower decks and a groyne to the south, which was 745 ft. in length, with further ones of 550 ft., 430 ft., and 400 ft. respectively, making a total of 2,125 ft. The groynes were to be constructed 2 ft. 6 in. over the present beach line, and to have a crossing place provided for the Board of Trade rocket life-saving apparatus and the lifeboat. The scheme was estimated to cost 12,500l.

VENTILATION OF SEWERS.—Dr. Orme Duffield, the Medical Officer of Health for Kensington, in his annual report, just issued, goes at considerable detail into the question of the ventilation of sewers, a subject which, he states, has engaged the attention of the local sanitary authority at intervals for thirty-five years to his knowledge. Summing up, Dr. Duffield writes:—"Success has attended such efforts as the Kensington sanitary authority have made to cope with the nuisance from sewer emanations as by abolishing dead ends of sewers or by the ventilation of them; by the erection of pipe ventilators in substitution of offensive gratings at street level, and by the pan siphon trapping of offensive street gullies. Works of this sort carried out in the vicinity of Hurstway-street (in 1898) and in the Notting Dale 'special area'—which does not now possess a single entrapped gully or sewer grating at street level, sewer ventilation being effected by shafts—have proved effectual. I think it correct to say that wherever these means have been adopted, permanent good result, i.e., the prevention of nuisance, has been attained without detriment to the inhabitants of the locality. These means, applied with success locally, should be largely extended, and especially I would recommend an extension of the practice of abolishing dead ends of sewers (of which there are nearly 250 in the Royal Borough), or the effective ventilation of them when abolition would be either too costly or impracticable. This remedy, at a large increase in the number of pipe ventilators, so as to secure free circulation of air in the sewers, would, I believe, go a long way towards effecting the object in view, and thus put an end to the well-founded complaints which now recur during the hot weather every year, with painful regularity."

INTERCEPTING TRAPS.—The Works Committee of Hackney Borough Council reported on Monday having considered, in conjunction with the Public Health Committee, a letter from the London County Council with reference to a suggestion that by-law No. 5 of the series of by-laws (drainage etc.) made by the County Council under section 202 of the Metropolitan Management Act, 1855, should be repealed. It had been resolved by the Joint Committee to inform the London County Council that while the Hackney local authority does not consider that the use of intercepting traps affords perfect protection, their use generally is desirable until the public sewers are efficiently ventilated.

WATERWORKS EXTENSION, LEYLAND.—At Leyland Public Hall, on the 1st inst., a Local Government Board inquiry was held by Mr. A. A. G. Mays, M. Inst. C.E., into the application of the Council to borrow 945l. for the purpose of water supply and 225l. for the construction of a bridge over Mill Brook at Slaters-lane, Leyland. Mr. Wrennall, who is the engineer of the scheme, explained the plans and details.

Foreign.

FRANCE.—The jury of architecture of the Ecole des Beaux-Arts appointed to judge the work of the First Class in Architecture, have awarded a Première Médaille to M. Levard, pupil of M. Pascal. The subject of the competition was "La Grande Salle d'Une Bourgeoisie."—The Académie des Beaux-Arts has awarded to M. André Godard the prize founded by M. Deschamps, the object of which is stated to be "pour encourager de jeunes architectes se distinguant par leur aptitude artistique et par leurs bons sentiments envers leur famille"; so that art and domestic affection are to be jointly encouraged.—M. Rous has been appointed architect to the Administration of the Assistance Publique of Paris, in place of M. Lebrun, who has been superannuated.—The inauguration of the monument to Dumas fils, on the Place Malherbes, took place on Tuesday. It is the work of M. René St. Marcieux, and consists of a marble statue of Dumas, represented seated, in an attitude of

meditation, on a marble pedestal decorated with various female figures representing the principal heroines of his works, notably the "Dame aux Camélias."—The picture executed by M. Gervex and M. Poilpot. The picture by the first-named artist represents Louis XVI. and the celebrated agriculturist Parmentier on the plain of Sablonville: the subject of the other is the fête given by Murat in the Palais Borghese, at Neuilly, in honour of Napoleon and Josephine.—The official inauguration of the monument to Alfred de Musset, at Neuilly, is fixed for the 24th inst. The monument is the work of M. Granet, the sculptor.—The jury of the competition opened by the Conseil-Général of the Seine for the pictorial decoration of the Salle des Fêtes of the Mairie at Fresnes, has selected for execution the work of M. Endors, pupil of M. Cormon.—The municipality of Carasso have instituted a competition for a new asylum hospital ("hôpital-hospice"). The jury have selected for execution the plans by M. Bertrand, of Paris, awarding a second premium to M. Vasson, of Carasso, and a third to M. Carlier, of Montpellier.—The jury in the competition opened by the municipality of Carasso for a municipal theatre, have awarded the first prize to M. Legendre, "architecte diplômé"; the second to M. Tronchet, of Paris, and the third to M. Bourgeois, of Poissy.—M. Tronchet has just carried out in the Bois de Boulogne, at the Pré Catelan, a large restaurant, accompanied by buildings in the style of the Norman farm buildings, and intended for the use of villa and country houses.—The death is announced, at the age of eighty-two, of M. Pierre Joseph Dubel, architect "en retraite" to the Corporation of Paris, and a former pupil of Nicolle.

GERMANY.—The new bridge over the Elbe at Dresden is to be built from plans by Herr Wilhelm Kreis, and the work has commenced this autumn.—The new town hall at Kiel is to be built under the direction of Professor Billing, at a cost of about 3,100,000 francs.

AUSTRIA.—It has been decided to adopt the designs presented by Professor Karl König for the new Industrial House to be erected in Vienna; Professor König will also superintend the carrying out of the building.—Herr Ludwig Baudler, architect, died at Vienna in his sixty-sixth year on May 25.

Miscellaneous.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The District Surveyor's office for the Western Division of the City of London has been removed to 22, Bride-lane, Fleet-street.—After the 24th inst. the offices of the QUANTITY SURVEYORS' Association will be removed from 17, Bedford-row, to Caxton House, Westminster, S.W.—Messrs. Lanchester & Rickards, architects, have removed their offices from 1, Vernon-place to 47, Bedford-square, W.C.

PROPOSED COTTAGE BATHS, BIRMINGHAM.—The Baths and Parks Committee, in their report to the City Council, state that, acting on the authority of the Council, they have inspected various properties in the Floodgate-street area with the view of acquiring some old buildings which might be converted into cottage baths. The committee have come to the conclusion that the better course will be to secure a piece of land and erect a new building thereon. They now submit for consideration an offer by the Rev. W. H. Clarriss, Vicar of St. Gabriel's, Pickford-street, to lease for a term of 999 years, at a ground rent of 27l. 10s., or 6d. per yard, a piece of land 1,100 sq. yds. in area, having a frontage of 17 yds. to Bordesley-street. The committee submit a plan of the land, with sketch plans of the buildings proposed. The cost of the buildings, with all necessary fittings adapting them for use as cottage baths, including boundary wall, leveling and asphaltting the site, is estimated at 2,000l., which the committee propose to defray from revenue account. The proposed buildings will cover about 100 sq. yds., and the remainder of the area will be utilised as a playground for the district. The committee recommend that they be authorised to lease the land, and to proceed with the erection of the buildings.

HOUSING OF THE WORKING-CLASSES.—Before the House of Commons Select Committee on the Housing of the Working Classes, Sir J. Dickson Poynder presiding, Mr. Noel T. Kershaw, Assistant Secretary of the Local Government Board, attributed the reluctance of local authorities compulsorily to acquire land for the erection of workmen's cottages to the fact that it was generally found that such action resulted in a loss to the rates. The cost of a cottage was, as a rule, 200l., and it was seldom possible to get a rent which would represent a fair return on the outlay. This contention, however, the knowledge that rates were rising, made the local authorities hesitate in embarking on an enterprise which was risky. Alderman Thompson, of Richmond, Surrey, Chairman of the National Housing Reform Council, said he had made a structural examination of nearly all the municipal

workmen's dwellings in this country and on the Continent. He produced a return showing that of 578 cottages, the cost of building averaged from 40l. to 70l. a room, and charging 2s. 6d. per week—which was the rule—for each room, expended the rents were greater than a workman could pay. Witness held the opinion emphatically that by standardising the parts of cottages the cost of production could be reduced to 30l., and in rural districts, where labour was cheap, to a figure even considerably lower. Witness lamented the apathy which was displayed with regard to local government, except on the part of men who had a financial interest. These men should at least be kept off the building committees of local authorities. In one town the Chairman of the Building Committee was a builder, and it was, therefore, given to him to pass his own plans. When witness last inquired into the matter every builder on the council was on the Building Committee. There was in a town, and in a country place the difficulties would be greater.

THE DECAY OF GLASGOW MUNICIPAL BUILDINGS.—Mr. Alexander Muir, in a Report to the Glasgow Corporation Municipal Buildings Committee regarding the restoration of the masonry work of the City Hall, which has been in repair since 1901, says his opinion is that the treatment has been quite successful, and his confidence in the Szechely stone liquid as being the best-known stone-preserving preparation is as strong as it ever was. In a building so large as the municipal buildings it is almost too much to expect that every stone will yield so well to the treatment, and in some places, in the cornice of John-street front seem to show decay since being treated. What the extent of this decay is it is difficult to say by examination from the street, as a considerable quantity of soot and dirt is lodging on this cornice, occasioned by the discharge of smoke from the stack of the cold storage building in George-square, which was in part blown direct on to the John-street front. He cannot say whether the discharge from this stack would have a bad effect on the stone forming the cornice; it certainly was not in its favour. John-street front was the first treated, and at the beginning of the work he had an idea that the cost of the work would be kept within as much as possible, consequently he did not cause some stones to be cut out and replaced by new ones, which he now realises has been a mistake. He thought at the time that re-hewing them and coating with the liquid would suffice. It was not long, however, until he realised that it was essential to cut out stones freely and replace them with new ones, and since then he has had this done. Looking over the whole building, he sees nothing even to suggest that the treatment is likely to prove anything but a thorough success.

A NEW MODEL VILLAGE, NEAR BOURNVILLE.—It has been decided at the Cotteridge, King's Norton, to establish a Co-operative Tenants' Society, upon co-partnership principles, for the provision of artisans' dwellings on "model village lines." Mr. George Cadbury, the founder of Bourneville, addressing the co-operative delegates, expressed his conviction that the physique of the nation could only be maintained by those who worked in factories during the day being able to get out to cottages with gardens in the evening. Municipalities had made a stupendous mistake in buying and pulling down slums, and he believed such cottages as he indicated could be provided if in future the municipalities confined themselves to buying up the land around our great towns and cities. If fifty years ago that had been done by Birmingham the city would to-day be surrounded by hundreds of Bournevilles instead of by suburbs miserable, dreary, and desolate. The Bourneville Trust had offered to a local Co-operative Tenants' Society 20 acres of land on lease at a rent of between 5 per cent. and 6 per cent., which he thought a municipality would be perfectly justified in doing. The lease would, after the Scotch fashion, be renewable at the end of ninety-nine years at a valuation, so that the house-owner did not lose his house at the expiry of the lease. The 20 acres offered by the Bourneville Trust has a frontage of 400 yards to Northfield-road and about 270 yds. to Woodlands Park-road, is in close proximity to King's Norton station, and within a quarter-hour's walk from the Pershore-road trams. The ground rent will be at the rate of 11l. 10s. per acre. The society, if formed, will have the option of taking up 5 acres only at a time, which will relieve them of a large amount of expenditure, which they would necessarily incur if the whole of the 20 acres were taken at one time. The number of houses must not exceed eleven per acre. The land will be let on a lease for ninety-nine years, at the end of which time the society would have the option of a further lease or leases at revised terms. For every 10 acres taken by the society, the Bourneville Village Trust grant a acre of land free of cost, so that for 20 acres leased, ground rent will have to be paid on only 18 acres, the remaining 2 acres to be used as permanent open spaces. Mr. George Cadbury has offered to erect an iron hall to be used for public purposes as soon as 100 houses are erected.

EDINBURGH OLD CITY WALL.—At a meeting of the Treasurer's Committee of the Edinburgh Town Council, held on the 7th inst., the question in dispute between the Town Council and the Governors of the Heriot's Hospital as to the ownership of the wall on the north side of the Hospital grounds was under consideration. A report on the question by the town clerk was before the Committee, in which it was shown that the wall in question is part of the old "Blodden wall, and was the property of the Corporation. On the other hand, the Heriot Governors, who desire to use the wall as part of the foundation of their new building for the art department of the school, contended that it was at least a mutual wall, seeing that it was rebuilt in 1888 at the joint expense of the city and the Trust. After discussion, the Committee agreed to recommend to the Council that the wall in question belongs to the Corporation. Further, however, that the magistrates and Council should without giving any conveyance of the ground, or the wall, to the Heriot Governors, allow the Governors to reconstruct the wall as desired; that no compensation or price should be asked, only that the Governors in all time coming should relieve the Corporation from the upkeep of the wall.

URKFIELD NEW BUILDING BY-LAWS.—Mr. E. Walter (Vice-Chairman) presided at the meeting of the Urkfield Rural District Council on the 11th inst. In connection with the carrying out of the Crowborough scheme, intimation was received from Messrs. John Taylor, Sons, and Santo Crisp, the Council's engineers, that they had arranged that their Resident Engineer, A.M. Hart, C.E., should be their resident engineer on the works. Mr. Hart then moved that the draft of the proposed new building by-laws, which had been before the Works Committee for a considerable time, should be submitted to the Local Government Board for their preliminary approval. The district, Major Thornton stated, had been split up into urban and rural areas for the purposes of applying the new by-laws, so that in future persons wishing to build in rural areas would not be tied and bound by the present most unsuitable by-laws, which would never have been passed but for the insistence of the Local Government Board, who thought they knew more about rural parishes than those who lived in them. Practically the only restrictions in future would be in regard to the sanitary arrangements. In the parts defined as urban, the by-laws would be to a certain extent more lenient than at present; where alterations were made they would be in favour of the owner.—The resolution was carried.

PROJECTING SHOP PROPERTIES.—At the St. Pancras Town Hall, on Monday evening, a meeting of property owners, convened by the local branch of the association for the amendment of the projecting shop clauses of the London Building Act, 1905, was held to protest against sections 10 and 12 of the London Building Acts Amendment Act, 1905. Sir W. J. Collins, M.P., presided. Mr. H. D. Wildcombe explained the working of the clauses, which, he said, were calculated to inflict considerable hardship upon property owners and occupiers. Mr. T. B. Westcott proposed a resolution to the effect that the meeting of owners and occupiers of projecting shop properties in the borough of St. Pancras, of which there are not less than 700, representing approximately some 1,400 owners and occupiers, views with alarm, and hereby records its emphatic protest against sections 10 and 12 of the London Building Acts Amendment Act, 1905, requiring the provision of concrete or other fire-resisting roofs to existing projecting shops and means of access to roofs. It also records its protest against sect. 10 as applied to lantern lights in existing projecting roofs, and appeals to the London County Council to take such immediate steps as may be necessary to repeal or amend the sections herein referred to, so far as they apply to existing buildings, having regard to their interference with the principle of security of contract and the arbitrary infliction of loss upon both owners and occupiers, not only by reason of the capital expenditure involved, but also the serious disturbance to peaceful possession and the infliction of damage upon all classes of trades carried on by the occupiers. Mr. Coleing seconded the resolution, which was supported by Mr. Balch. Sir W. J. Collins said the Act was framed with the intention of protecting life from fire, but the County Council had no desire to deal harshly, and he advised owners to take advantage of the exemption clause. Mr. H. C. Lea, M.P., said his sympathies were divided between the tenants and the owners, but he would follow the lead of the chairman. The resolution was carried, and a deputation appointed, which the chairman said he would introduce to the County Council.

SOUTHWOLD HARBOUR.—Proposals are made to form a company for the enlargement and deepening, at an estimated outlay of 50,000*l.*, of the harbour at the mouth of the River Blyth, Southwold, to render it available for the shipping employed in the local and Scottish fishing trade, and in the export trade to Germany and Russia.

PROPERTIES FOR SALE.—Lundy Island, in the mouth of the Bristol Channel, and distant about 14 miles north-west from Clovelly, is about

3 miles long by from one to half a mile broad, and is well-nigh inaccessible, except on the east side. There are ruins of an ancient chancel dedicated to St. Anne, and, near the south-eastern point, of the castle named after Morisco, the pirate, who there suffered death for conspiring against the life of King Henry III. Lord Saye and Sele held the castle for the King in the Civil War, and it was occupied a while by a French force *temp.* William III.—Ware Priory, Hertfordshire, embodying some remains of the religious house founded *temp.* Henry III., by Margaret, Countess of Leicester, as a cell to Ebrali in Normandy, and bestowed by Henry V. upon the Carthusians at Sheen.—Hudson House, near Ware, wherein are portions of the palace built by Henry VIII., which Queen Elizabeth gave to her kinsman, Henry Cary, Lord Hunsdon, whose monument in St. John the Baptist Chapel, Westminster Abbey, was erected by his son, and is the loftiest in the Abbey.—The estates, in three portions, of Lady Mox, extending over an aggregate of 20,000 acres in and near Wootton Bassett, Marlborough, and Dauntsey, North Wiltshire. The Downs estate, being the second portion, includes the West Woods, 700 acres in extent, and adjoins Savanake; the first portion comprises nearly all the town of Wootton Bassett, and the manor house of Vestern, at one time a Benedictine priory, and, it is said, the home of Anne Boleyn. The total rent-roll is computed at 22,660*l.* per annum, and facilities will be given to subsisting tenants of the farms to purchase their holdings.—Stoke Park, Stoke Poges, with a deer park of 300 acres, which once appertained to Windsor Forest, of which the ownership passed from Lord Mollines, *temp.* Edward III., to the Lords Hungerford, and from them to the Earls of Huntingdon (Hastings) (whose badge may be seen in the church), Lord Mansel, and, lastly, to Sir Edward Coke, to whom it was bought by William Penn, for whose descendant John Penn the house was re-built by James Wyatt, with colonnades after the Doric order on the north and south fronts; Repton laid out the park, with its ornamental waters. The old manor house is now a house of Gray's "Long Street" written when it belonged to Viscountess Cobham.—Milton Ernest Hall, near Oakley, Bedfordshire, having a frontage of 600 yards to the river Ouse; the house was built in 1858, after Butterfield's designs in the Gothic style.—High Walls, Gullane, co. Wick, Ireland, a fine Marlfield, well-fitted with all the conveniences, the work of which Mr. E. L. Lutyens was the architect.—The "Tower House," one of those built in Bedford Park, Chiswick, by Mr. R. Norman Shaw, R.A.; and Palace-court House, Palace-court, Bayswater, planned and designed by Mr. Leonard Stokes, with a facade of stone and red brick in the Flemish manner. Of the Willesden Paddocks, a freehold of 165 acres, at Dollis Hill, we may mention that they formed the last resting place for cattle when driven from the north to the market at West Smithfield; and of Ivy House, North End, Hampstead, that it was the house of the late Sir Cockerell, R.A., who modelled the frieze, in the library, from the reliefs, discovered in 1812, of the frieze of the Temple of Apollo.

GAS LIGHTING AT THE NEW VICTORIA STATION.—The new Victoria Station, when complete, will be lighted by 2,000 lamps, varying from 175 to 1,000 candle-power, and giving a total light of about 140,000 candle-power. Gas is supplied at a pressure of 50 in. from two Salco-Onslow compressors, each capable of delivering 5,500 cubic feet per hour, driven by gas engines, the plant being duplicated throughout, and the shafting so arranged that either engine can drive either or both compressors, in order to guard against the possibility of break-down. Two smaller compressors that can be run from the same shafting have been fixed for use when only a small number of lights are in use. The compressors are supplied through two 500-light dry meters (George Glover), inter-connected and by-passed, which are fed by a 6 in. main. The platforms are lighted by Sugg's "Chertsey" pattern lamps of 350 candle-power, except in the case of those on either side of the carriage drive, which are lighted by lamps of 500 candle-power. The lamps are placed one between each pair of columns carrying the roof, so that there is no shadow. The platforms are divided into sections by the Eccleston and Elizabeth Bridges, under which they pass, back-lights being chiefly used for lighting the portions under the bridges. The lamps lighting each of the platform sections are controlled by two taps (especially devised for the purpose by the Gas Light and Coke Company) placed at the end of the section, one tap controlling Nos. 1, 3, 5, etc., lamps, and the other Nos. 2, 4, 6, etc.; so that every alternate lamp can be lighted or extinguished in series from the control point. To enable this to be done, dual services have been run, with a third independent service for the by-pass supply. A special cup-and-ball joint is used for connecting the down-rod of each lamp to one of the two main supplies and to the by-pass service, the one cup-and-ball serving for the two connexions. Each lamp is connected to the down-rod supplying it by a cup-and-ball, so that the effects of vibration on the mantles are reduced to a minimum. A special mercerial seal is fitted to each down-rod to

prevent air getting into the pipes when the gas is shut off at the "distant control" tap. The down-rod is also fitted with taps to enable any lamp to be removed without shutting off the supply to the platform generally. Each section of the by-pass services is fitted with a governor regulating the pressure to 2 in. The by-passes are completely extinguished by the action of lighting the lamps. The station yard beyond the platforms is lighted by four "Bellevue" lamps (each 1,000 candle-power) on welded steel columns, two 25 ft. and two 30 ft. high, the lamps being worked by "distant control" taps, similar to those used on the platforms, placed at the base of the columns, to avoid the necessity of climbing the ladder to light or extinguish the lamps. The signals, both ground and post, are lighted by flat-flame gas burners, supplied from the high-pressure services through double-governors, to save the expense of running special low-pressure supplies. The services for the ground signals and the column lights in the yard have been laid in pitch in wood troughing. The scheme for the lighting of the station, as submitted to and approved by Mr. Charles L. Morgan, Engineer to the railway company, was prepared by the Gas Light and Coke Company; the work of installation was accordingly entrusted to them, and is being carried out by their contractors—Messrs. Sugg & Company—under the direction of the company's chief inspector, Mr. F. W. Goodenough.

THE LATE GALLERY.—Mr. D. S. McCall has been appointed Director of the Tate Gallery.

THE SLATE TRADE.—The mineral statistics for 1905 show a falling off in output of roofing slates of 32,000 tons from open quarries, and 18,000 tons from mines (or underground quarries), together 50,000 tons, about 10 per cent. of the total output. This, with the great falling off in the imports of foreign slates, is bringing down the quarry stocks rapidly.

Legal.

ACTION BY BUILDING OWNER AGAINST BURIAL BOARD.

THE case of Godden v. the Hythe Burial Board came before the Court of Appeal, consisting of Lord Justice Vaughan Williams, Koster, and Moulton, on the 12th inst., on the defendants' appeal from a decision of Mr. Justice Kekewich in the Chancery Division.

The short facts of the case were as follows:—The defendant Board in 1905 found it necessary to provide a new burial-ground, and had chosen a site, called a Vestry Meeting in April of that year, when a resolution was passed, authorising defendants to acquire the land in question, subject to their obtaining the consent of the adjoining owners, if necessary. At this time there was only one house within 100 yds. of the proposed site, and the owner and occupier of such house consented in writing to the use of the land as a burial-ground. The plaintiff owned 7½ acres of land adjoining the proposed new burial-ground, which he meant to develop for building purposes, and in April, 1905, he commenced to build two dwelling-houses on his land, and when the defendants completed their purchase of the land the walls of the plaintiff's houses were some 5 ft., or 6 ft., in height. On April 27, 1905, defendants carried out a burial within 80 yds. of the site of the plaintiff's house and between April and August they caused three other burials to take place, but all of these were outside the 100 yds. limit. In October, 1905, the plaintiff commenced to build two more dwelling-houses, which had been completed. In March last the defendants caused another burial to take place, within about 80 yds. of the first two dwelling-houses erected by the plaintiff. Plaintiff then commenced proceedings to restrain defendants from using any part of their new burial-ground for any burial within a distance of 100 yds. from the plaintiff's houses, in alleged contravention of sect. 9 of the Burial Act, 1855, which provides that no ground not already used as or appropriated for a cemetery shall be used for burials within the distance of 100 yds. from any dwelling-house without the consent of the owner and occupier. The case put forward by the defendants was that, as the ground had been used by them before the erection of any dwelling-house by the plaintiff, the latter could not now complain. Mr. Justice Kekewich, however, held that the plaintiff was entitled to an interim injunction in the terms of the notice of motion, he seeing no reason why the plaintiff should not be protected because he had not a dwelling-house at the date of the acquisition of the cemetery. Hence the present appeal of the defendants.

At the conclusion of the arguments of counsel, the lordship dismissed the appeal with costs, holding that the construction put by Mr. Justice Kekewich on sect. 9 of the Act of 1855 was the correct one.

Mr. Cripps, K.C., Mr. P. O. Lawrence, K.C., and Mr. Gatey appeared for the appellants; and Mr. Levitt, K.C., and Mr. P. Wheeler for the respondent.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, xvi.; Auction Sales, xxviii. Certain conditions, beyond those given in the following information, are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

Contracts.

Railway; 50 tons of screenings to Whitehorse Station, B. and M. Railway; 150 tons of limestone to Aberargoed Station, B. and M. Railway; 250 tons of limestone to Pengam Station, B. and M. Railway; 50 tons of screenings to Pengam Station, B. and M. Railway; 350 tons of limestone to Blackwood Station, L. and N.W. Railway; 30 tons of screenings to Blackwood Station, L. and N.W. Railway; 100 tons of limestone to Argoed Station, L. and N.W. Railway; 20 tons of screenings to Argoed Station, L. and N.W. Railway. Sealed tenders, giving price per ton, and endorsed "Tenders for Limestone," to be sent to Mr. T. J. Thomas, Clerk, Barged, on or before June 23. Samples to be sent, carriage paid, addressed to Mr. J. H. Lewis, Assoc. M.Inst.C.E., Council Offices, New Tredegar, Cardiff.

JUNE 23.—Newcastle-on-Tyne.—MATERIALS.—The Guardians of the Poor of the Newcastle-on-Tyne Union request prices for the following classes of material, which may be required for the work-house during the ensuing twelve months, viz.:—Sanitary pipes, etc.; builders' hardware, timber, etc.; slates, etc.; sheet lead and piping; and engineers' fittings, pipes, etc. Forms will be supplied by Mr. James Atkinson, Clerk to the Guardians, Union Offices, Pilgrim-street, Newcastle-on-Tyne. Schedules of prices will be received at office of clerk up to 12 o'clock at noon on June 23.

JUNE 25.—Leeds.—ARTICLES.—The Gas Committee of the Leeds Corporation invite tenders for supply of the following articles, for twelve months from

date of order—About 25 tons best merchant iron, at per ton; about 2 tons best charcoal annealed double tinned iron, at per cwt; about 10 tons wrought iron bars, at per cwt; about 10 cwt. steel, at per lb.; about 150 gross washers, of various sizes, at per gross; about 5 cwt. wrought nails, at per cwt.; about 10 cwt. rivets, at per cwt.; about 10 cwt. iron pipe hooks, of various sizes, at per cwt.; about 6 tons bolts and nuts, of various sizes; about 15 cwt. iron rivets, at per stone; about 100 boxes tin plates, as per term of tender; about 40 cwt. pure tin ingots, at per lb.; about 90 gross screws, of various sizes, for wood and iron (discount off price list to be stated); about 4 dozen No. 2 square ballast shovels, at per dozen; about 4 dozen No. 7 square coal shovels, at per dozen; about 60 dozen cast steel charging shovels, at per dozen; about 4 dozen cast steel forks, at per dozen; about 3 dozen spades, at per dozen; about 2 dozen sheet shafts, at per dozen; about 6 dozen pick shafts, at per dozen; about 40 dozen hammer shafts, at per dozen; about 2 dozen hammer heads, of various sizes, at per lb.; about 12 dozen rake heads, at per cwt.; about 8 gross files, of various sizes, and re-cutting files (discount off price list to be stated); 72 dozen galvanised iron buckets, at per dozen; about 20 dozen weed brooms, eachaving, at per dozen; about 100 dozen brushes, of various descriptions (net price); indiarubber cords (net price); wood spurs, 3 in. to 2 1/2 in.; about 25 tons best pig iron, at per ton; about 80 cwt. virgin sheet lead, at per ton; about 100 tons lead tube, at per ton; about 5 tons roofing white lead, Walker Parker's; about 15 cwt. genuine red lead; about 5 cwt. red oxide paste, at per cwt.; about 14 cwt. black ash, about 30 gal. best pale copal varnish; about 2 gal. cast iron paint; about 20 gal. black oil, at per gallon; about 80 gal. pure linseed oil; about 1,500 gal. engine oil, at per gallon; about 2,000 gal. gas engine oil; about 300 gal. common oil, at per gallon; about 40 gal. pure boiled linseed oil, at per gallon; about 100 gal. white lead; about 7 tons tarred hemp top gaskin, at per cwt.; about 20 tons Portland cement, at per ton. All articles to be delivered at the stores, Meadow-lands, or at the gas-works, at the price tendered. Samples of the various articles may be seen at the stores office, Meadow-lands, and tenders to be obtained on application to Mr. K. H. Towseley, General Manager, Gas Offices, Leeds. Endorsed tenders, addressed to the Town Clerk, Town Hall, Leeds, to be delivered not later than June 25.

JUNE 25.—Bromley.—ROAD MATERIALS.—Bromley Town Council invite tenders for the supply of the following road materials—3,725 cubic yds. of broken stone, 4 in. Gurnsey's granite, Leicestershire granite, Charbonat quartzite, Penle, Elvan, or Bussat; 250 cubic yds. of broken surface or pit flints; 175 yds. of broken surface or pit flints; 625 cubic yds. of broken surface or pit flints; 740 cubic yds. of broken surface or pit flints; 200 cubic yds. of broken surface of pit flints. Samples of each description tendered for must accompany the tender. Tenders must be made in printed form, to be obtained at the office of the Borough Engineer, Municipal Offices, Bromley, and must be delivered, addressed to Mr. Fred H. Norman, Town Clerk, Municipal Offices, Bromley, and endorsed "Tender for Road Materials," not later than 3 o'clock p.m. on June 25.

JUNE 26.—Keywood.—STORES.—Heywood and Middleton Water Board invite tenders for the supply of stores and materials, including timber, picks, spades, iron steel, oil, wash-water, Portland

cement, lia lime, coal, brass taps and fittings, iron pipes, lead service pipes, sluice valves, fire-pump casings, valve casings, and other stores, for a period of twelve months ending June 30, 1907. Specification, form of tender, and all other information may be obtained on application to Mr. James Diggle, C.E., Water Engineer, Water Board Offices, Heywood. Sealed tenders, endorsed as specified, to be sent in to Messrs. G. G. Bouchier & F. Entwistle, Clerks to the Board, Heywood, not later than June 26.

JUNE 27.—Barnet.—GRAVEL, GRAVEL, and HOOG.—The Barnet U.D.C. invite tenders for 600 tons and upwards of 2 1/2 in. broken granite, 500 tons of gravel, and about 450 tons of Hoogin. The certified crushing strain to be stated, and no form of tender supplied. Tenders, sealed and endorsed "Gravel," "Gravel," or "Hoogin," to Mr. H. W. Poole, Clerk to the U.D.C., 40, High-street, Barnet, on or before June 27.

JUNE 27.—RAMSGATE.—PORTLAND CEMENT.—Rams-gate Corporation invite tenders for the supply of Portland cement from July 1, 1906, to June 30, 1907, inclusive. The contractor may estimate that the quantity required will not be less than 100 tons, and probably not more than 150 tons. Specification, form of tender, and full particulars may be obtained on application to the Borough Engineer, Albion House, Ramsgate, between the hours of 10 a.m. and 4 p.m. Sealed tenders, endorsed "Tender for Cement," are to be addressed to the Chairman of the Works Committee, and delivered under cover to the Borough Engineer, Albion House, Ramsgate, on or before noon on June 27.

JUNE 27.—RAMSGATE.—STONEWARE PIPES.—Rams-gate Corporation invite tenders for the supply and delivery of glazed stoneware pipes, junctions, etc., for the ensuing twelve months. Forms of tender and full particulars can be obtained on application to Mr. F. G. Taylor, Borough Engineer's Office, Albion House, Ramsgate. Tenders, endorsed "Tender for Pipes, etc.," addressed to the Chairman of the Works Committee, are to be delivered at the Borough Engineer's Office, Albion House, before noon on June 27.

JUNE 30.—Rotherham.—STORES.—Rotherham Tramways Department invite tenders for the supply of the following stores and materials required by the Tramways Department during the twelve months ending August 31, 1907.—Oils and greases; tools, hardware, brake blocks; cast-iron brake blocks; paints and varnishes; brass castings; waste cleaning rags; nuts, bolts, and screws; incandescent lamps; river sand, etc. Forms of tender, specification, and further particulars can be obtained upon application to the tramways Manager, Tram Depot, Rotherham. Tenders, endorsed "Tramways Stores," to be sent to Mr. W. J. Board, Town Clerk, Town Hall, Rotherham, not later than June 30.

JUNE 6.—Brighton.—GRANITE SPALLS.—Brighton Corporation invite tenders from such persons as may be willing to enter into a contract for the supply of 1,000 tons of granite spalls. The specification and form of tender may be obtained on application at the office of the Borough Surveyor, from Depon, Brighton. Sealed tenders, addressed to Mr. Hugo Talbot, Town Clerk, Town Hall, Brighton, and endorsed "Tender for Granite Spalls," must be left at the Town Hall before 10 o'clock in the forenoon on July 6.

NO DATE.—Dublin.—ROAD MATERIALS.—Dublin Daving Committee require supplies of broken Whinstone, Fresh-water rubble, and Fresh-water sand. Full particulars regarding price and specification can be obtained on application at the office of the City Engineer, City Hall, Dublin, during office hours.

Patents of the Week.

APPLICATIONS PUBLISHED.* 9,909 of 1905.—J. BEWICK: Kitchen Ranges. This relates to means for adjusting and supporting a rising and falling grate for a kitchen range, and consists of a loose top bar with pivoted front... * All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

part, this latter having extensions forming pawls, and said top bar carrying the grate front and being at each end formed with a groove, plates by which the top bar and grate front are guided and lugs by which and by the extensions the top bar and front grate are supported at various elevations. 10,255 of 1905.—C. WILSON and W. W. SEER: Water Heater for Baths and the like. This relates to a water heater for baths and the like, and consists of a hollow sheet iron vessel

in the form of a Wellington boot which is put in the bath with the narrow or leg part projecting above the surface of the water, the narrow or leg part being open at the top. A suitable gas burner is placed inside the sheet iron vessel which will heat it and the water will thus be heated externally. 10,449 of 1905.—J. H. BRINDLE and S. BONSOR: Appliance Applicable for use as a Fire Lighter or Stove. This relates to a fire lighter or appliance with a chamber or channel—to contain a non-combustible

wick and oil or spirit—between two walls and a central passage to admit air to the centre of the flame, and consists in constructing a number of projections upon the edges of the walls or partitions between which air is admitted and the flame allowed to spread.

12,321 of 1905.—E. GOOLD: Heating Apparatus for Domestic or Warming Purposes.

This relates to a heating apparatus for domestic or warming purposes especially such as are arranged in separate systems either by a tank or coil within an outer tank, the boiler with circulating pipes and the tank or coil forming the primary system for giving up its heat to the water in the secondary or service system, and has for its object the minimising of the deposit of solids in the boiler. According to this invention both systems are supplied in the first instance from the same cistern. The water in the primary system for heating is used in continual circulation and therefore after it has deposited the solids it originally contained no further deposit can take place, as the make up water for replacing that which may be evaporated is taken from the upper part of the secondary or service tank which has already deposited its solids.

13,797 of 1905.—A. MIETZ: Steps or Stairs.

This relates to the construction of steps or stairs from a composition, and consists in fitting at the front of the step a detachable and replaceable facing strip of metal extending the whole length of the step and forming the nose thereof, said strip being secured or carried upon a supporting plate or upon metal brackets or blocks resting upon the top or foundation of the step, the said composition being run over the whole surface of the step and extending to the top of the said facing strip.

17,229 of 1905.—E. PRICE: Chimney Cowl.

This consists of a chimney cowl for the prevention of down draught constructed with notched side plates or wings and a loose shield carried by the wings having side extensions resting on the bottom of the notches which form a fulcrum allowing the shield to turn to either side and close either side of the cowl.

18,006 of 1905.—R. P. WILSON and A. G. MARSHALL: Ventilating Fans, Blowers, and the like.

This relates to a fan or blower, so constructed and mounted that its rotation, a gyroscopic precessional movement, occurs, whereby the stream of air delivered automatically varies its direction as the fan or blower rotates.

19,297 of 1905.—A. E. BISHOP: Glass Plates or Tiles, and Means for Attaching the Same to Walls, Ceilings, and Other Structures.

This relates to means for attaching plates or tiles to walls, ceilings, and other structures, and consists in the use in combination and application to the back of said glass plates, tiles, or the like, of a mixture of seven parts of finest ground calcined magnesite, four parts of concentrated sodium silicate solution, three parts pure precipitated silica, and three parts of manganese dioxide. These materials are mixed until a tacky or elastic substance is produced, and then applied to the back of the tile, and while the coating is soft, pottery chips or some such material is sprinkled over the coating, and is pressed into the coating thus forming a key by which the tile can be fixed either with the same mixture that provides the coating or with cements.

20,475 of 1905.—C. JOYNER & Co., LTD., and E. ISCHLEY: Gas Brackets or Fittings.

This relates to gas brackets or fittings, and consists essentially in the employment of a cut-off plug secured to carry the burner, this plug being located in an upwardly expanded sealing in the front or end connexion piece and of means for rotating the said plug.

26,382 of 1905.—W. SELTNER: Jiggers for Separating and Grading materials.

This relates to a jigger having fixed screens and is characterised by the separation or grading being simultaneously effected on two or more screens arranged one above the other in the same chamber of the jigger.

214 of 1906.—C. H. RICHARDSON and C. HUNTER: Window Sash Suspenders.

This relates to a window sash suspender and consists of a metal casting shaped and cast in one piece and having a hole in its top end for the passage of the sash cord, and a parting bend with a recess to enable the cord to be secured to the sash stile from the face of the sash without removing the sash or beads from the window frame.

10,230 of 1905.—W. T. BUCHLEY: Drains or like Conduits for Arresting the Passage of Solid Matter in Suspension.

This relates to drains or like conduits, and consists in the provision of an internal chamber provided with a flat or conical outlet in said base provided with louvred openings, an upstanding flange arranged in the interior of the chamber having perforated or louvred openings, a second flange at the base or lower bottom having depending flanges to form a water seal an open topped receptacle adapted to fit into or onto or to rest upon

the flange and having louvred openings in its sides level with or arranged at different heights to each other and a grid or cover at the top of the receptacle with or without a fixed flange extending below it all.

13,491 of 1905.—H. J. HASKINS: Machinery or Apparatus for Scoring, Cutting, Polishing, and Finishing Sanitary Clay Pipes.

This relates to a valve for finishing clay pipes in which the pipe sockets are when the pipes are in the drum open to access, thereby enabling a scoring tool to be introduced for scoring the interior of the sockets or enabling a cutter or tool to be introduced.

17,465 of 1905.—T. E. DEVONSHIRE and H. STEPHENS: Pipes more especially intended for use for Conducting Water, or other Fluid under Pressure.

This relates to pipes used for adjusting water or other fluid under pressure, and consists of a tube made of perforated metal and of such a form that in cross section it presents a series of dovetails, corrugations or equivalent formations. These may be formed in any suitable way such as by rolling or pressing in thin metal sheet and forming this into the required tube. The cement, mortar, concrete, or the like when moulded inside and outside the metal tube so formed is retained or keyed owing to the formation of the said tube and there is no need to embed any metal rods or rings or expanded metal or the like in the cement, mortar, concrete, and the like within the said metal tube and owing to the longitudinal strength of the said tube when formed there is no necessity to use longitudinal rods embedded in the cement or the like outside the said metal tube, laterally or circumferentially disposed metal rings or spiral metal windings being sufficient to resist the pressure.

16,086 of 1915.—H. J. YATES and D. R. McNEILL: Radiator and like Heating Appliances.

This relates to radiators and like heating appliances, and consists in the combination with a radiator plates or air deflector of a rotatable and resilient clamping device adapted to be inserted and secured in position from the front of the baffle plate.

5,955 of 1905.—H. KLEE: Method of Manufacturing Artificial Stone Plates or Fibrous Materials and Hydraulic Binding Substances.

This relates to a method of manufacturing plates from fibrous material and hydraulic binding substances in which a paper, cardboard, or like machine is employed and is characterised by the hydraulic binding substance being supplied to the fibrous material by means of a suitable device, while the fibrous material is still on the perforated drum or on the longitudinal sieve or band of the machine.

9,179 of 1906.—C. SCHMIDT: Boiler Furnaces for Heating Apparatus and the like.

This relates to a boiler composed of elements having a feed shaft furnace and consists of an arrangement of louvre-like bars between the boiler elements on the sides of the feed shaft, which bars form one side of inwardly leading passages into which the gases of combustion may enter laterally at various heights.

22,624 of 1905.—A. ABZCO: Combined Hinges and Fastenings for Doors.

This relates to a combined hinge and fastening for doors, and consists of a door, opening to right or left, and provided with a cross bar which connects the right and left side rods or hinge pins together, the distinguishing feature being that the cross bar is moved by levers which are so connected with door latches that after the proper side rod has been drawn back the latch can be moved by the upper lever without the cross bar being further influenced.

SOME RECENT SALES OF PROPERTY:

Table listing property sales including Estate Exchange Regent, May 31, By Haslam & Son (at Reading), Reading, Berks.—Various enclosures, 62 a. 2 r. 6 p., £3,245; 2 cottages and 7 a. 2 r. 3 p., £1,440; 2 cottages and 6 a. 1 r., 230; June 2, By Elworthy & Son (at Wisbech), Upwell, Cambs.—The Well Fen Farm, 439 a. 2 r. 37 p., £11,000; June 6, By Drexdale, Nere & Co., Stamford Hill—57, Cranwiche Rd., ut. 84 yrs., gr. 7 1/2 lbs., yr. 4d., 455; Clapton—25, Norfolk rd., ut. 74 yrs., gr. 0l., yr. 34d., 350; By Rodd & Slipper, Peckham—28, Camden-gr., l., ct. 40l., 530; By Rosworth & Stevens, Caledonian road—Byron Rd., "Bryan Mews" (coach-houses), ut. 37 1/2 yrs., gr. 6l., ct. 31l., 210; By Wyer, Adams, & Glover, Lee—Grove-pk., "Olovelly," and 1 1/2 acres, l., p., 2,970; June 7, By G. F. Harrington, Beckenham—Stanley-av., two building sites, 0 a. 3 r. 10 p., 480; Geverby-av., two building sites, 0 a. 2 n. 25 p., 525.

Table listing various property sales and building contracts. Includes entries for By W. F. LAING, By Godfrey C. Lambere, By Stimson & Sons, By T. B. Westaoot, By Stanley Parkes & Brown, By Weston, Bull, & Cooper, and various building contracts with details of land area and terms.

MEETINGS.

Table listing meetings for Friday and Saturday, June 16 and 17, 1906. Includes Northern Architectural Association, Builders' Foremen and Clerks of Works' Institution, and Northern Architectural Association—Students' Sketching Club excursion.

PRICES CURRENT OF MATERIALS.

* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table listing prices current of materials. Columns include material names (Hard Stocks, Rough Stocks, Picked Stocks, etc.), quantities, and prices per 1000 or per unit. Includes sub-sections for GLAZED BRICKS and various types of bricks and headers.

BRICKS, &c. (continued).

Table listing various types of bricks and their prices, including glazed bricks, Thames and Pitt Sand, and Portland Cement.

NOTE.—The cement or lime is exclusive of the ordinary charge for sacks.

STONE.

Table listing various types of stone and their prices, including Bath Stone, Portland Stone, and Ancaster in blocks.

Table listing various types of stone and their prices, including York Stone, Scapplied random blocks, and Hopton Wood (Hard Bed).

Table listing various types of stone and their prices, including Hopton Wood (Hard Bed) in blocks, slates, and tiles.

Table listing various types of stone and their prices, including slates and tiles.

Table listing various types of stone and their prices, including tiles.

Table listing various types of stone and their prices, including wood.

WOOD (continued).

Table listing various types of wood and their prices, including building wood, battens, and deals.

Table listing various types of wood and their prices, including joiners' wood.

Table listing various types of wood and their prices, including white sea and yellow deals.

Table listing various types of wood and their prices, including kauri pine and teak.

Table listing various types of wood and their prices, including teak and American whitewood planks.

Table listing various types of wood and their prices, including joists, girders, and sheet iron.

Table listing various types of wood and their prices, including sheet iron.

METALS (continued).

Table listing various types of metals and their prices, including iron, galvanized corrugated sheets, and steel sheets.

Table listing various types of metals and their prices, including lead, zinc, and copper.

Table listing various types of metals and their prices, including English sheet glass in crates of stock sizes.

Table listing various types of metals and their prices, including English rolled plate in crates of stock sizes.

Table listing various types of metals and their prices, including oils and varnishes.

Table listing various types of metals and their prices, including varnishes.

Table listing various types of metals and their prices, including varnishes.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

The Peace Palace Designs at the Hague.—II.

HAVING noticed in our last issue the six premiated designs for the Peace Palace, it seems only right to give a little space to some of the best of those which

have received no imprimatur from the Jury; and it may also be entertaining to say a word on some of the more extraordinary and eccentric architectural fancies which are illustrated. Taken altogether, the collection forms indeed rather an amusing architectural comedy, illustrating the various ways in which it is possible to regard a programme of this kind. Several competitors seem to have thought there could be nothing so suitable and emblematic as to construct a model of the globe on the top of the building. Thus the author of No. 47, in Gallery B, has got an immense representation of the earth, with all the countries duly drawn out on it—all that can be visible in one hemisphere at least, and a crowd of bronze figures of men and horses at the base, as if crushed or about to be crushed under the monstrous globe which takes the place of a dome. No. 18, in Room A, is a truly wonderful specimen of the modern German mystical architecture, looking as if it came out of the world before the Flood; the author, however, is so little afraid of ridicule that he has

taken the trouble to attend and place his card on it—"Walter Solbach, Elberfeld." * If we could publish Herr Solbach's perspective view, it would afford an interesting example of what the modern German architect of the mystical school is capable; but it will very likely appear in due time in the *Berliner Architekturwelt*, where we have before come across similar nightmare visions. The plan, it may be added, is as preposterous as the architectural treatment. In Room H, No. 142, with the ambitious motto "Athene—Roma—La Haye," illustrates this by an enormous pagoda in terraces, like an idea for the tower of Babel, the whole practical part of the plan being sacrificed to the base of this wonderful erection. The puzzle about it is, what was the connexion in the author's mind between his motto and his design? It would be interesting to know from what quarter of the world came No. 157, with the motto "Skibo"; a building with green roofs, drawn on rough grocery paper, and with a blue pond in front. On the table in Room E a great deal of amusement may be found; here have been placed, flat, some of the designs which were apparently thought too absurd to hang up. One of them, a triangle on plan, rises into three great brick towers one on each face, pyramidal in line, and holding between them at the top an enormous crystal globe, how made and supported is not apparent. Another on the table looks

like a scene for some romantic opera—say "Die Zauberflöte." But, as Bacon says, "enough of these toys."

On the right side of Room A, No. 195 ("Adrinastéphe") is a noteworthy conception of the exuberant French type of detail, showing in a bird's-eye view a pyramidal composition with three pavilions grouped around a centre one rising above them; there is nothing especially to recommend it in plan, but it has the merit of unity of architectural conception. Also, on the same side of the room, No. 144 ("Vogue la Galère") shows a noteworthy scheme, the Court block a Greek cross on plan with a large dome in the centre; the dome buttressed by the square masses of building has a fine effect. The Library department is joined on to this on the plan of an inverted T; the plan, however, does not fulfil the requirements. On the left side of the same room No. 10 ("Cedant arua toga") is an orthodox classic design shown in a fine set of drawings, but correct rather than impressive. No. 29 ("Palladio"), on the same wall, occupies an immense amount of ground with his garden courts, but it is a fine dignified design, laid out on the principle of having a dominant block running up the axis of the plan, rising above the rest, and marked by a portico and pediment in front; the plan is well arranged though spaced rather widely; in the large open court on part of the central axis rises an immense Corinthian column carrying a globe on the top. This employment of a column as a central feature is a suitable way of advertising,

* All the other designs except the six premiated ones were anonymous at the time of our visit. If there are any names on them now, they have been appended since.

Plan of Exhibition Galleries.

as it were, the position of the Palace; we find it employed again in No. 72 ("Templum Pacis") on the screen at the top of the room, which we think we recognise as that of Mr. A. W. S. Cross. This is a very fine architectural conception, one of the best in the collection in fact; the two departments are placed vertically on the site in two parallel symmetrical blocks, recessed in the centre; into these recesses a square colonnaded court is worked between the two blocks of building, with a great column in the centre of the square; on the outer side of each block there is a similar recess in the plan with a colonnade, forming a kind of echo to the colonnaded court between. This, with its front porticos, works out, as might be expected, into a very fine composition in perspective, but we cannot see that the plan would work very well, the two departments are too much separated; and as a matter of architectural expression it does not seem right to treat the two departments side by side as of equal value; the Court department is the more important one, and therefore should naturally appear as the front block, with the Library block in the rear. On the lower or entrance wall of Room A, to left of the entrance, is a very nice low-proportioned classic design of which we omitted to note the number, but which is in excellent taste, and is very well suited (evidently intentionally so) to the architectural *genius loci*; far more so than the first pre-niated design, for the Hague is a city of quiet and not of florid architecture. Among the designs on the cross screens No. 60 ("Paix du Monde") impresses one as a production of native Dutch talent; a brick tower and lofty green-slated roofs, and a general suggestion about it of being a new Casino for Scheveningen. We may pass over two or three which look well at first sight but will not bear investigation. One or two remind one usefully how an otherwise good design may be rendered effete by a bad crowning feature. No. 143 ("Honneur et Patrie"), for instance, is a most ambitious classic design lost by the employment of a large glass dome, a feature fatal to monumental

architecture; and No. 112 is a very good piece of rusticated masonry design spoiled by a glazed cupola in a still worse form—square on plan with convex hipped angles; we should have thought this was "made in Germany" but for the motto, "Fluctuat nec Mergitur," the armorial motto of the City of Paris. No. 134 ("Sol"), quite obviously French, is a very clever design perfectly unpractical in the plan, in which everything is sacrificed to a great three-aisled vestibule running across the front; the very clever perspective sketch shows an architecturally one-storied front with three great entrances with segmental frontons, flanked by a columned order, each entrance approached by a large flight of steps convex on plan; there is great spirit and style about this sketch, though perhaps it suggests a royal hunting pavilion rather than a Palace of Peace.

On the left hand side of Room C are one or two fine designs. No. 100 ("Pax Humanitati"), a French (?) classic design, shows a very well arranged plan, in which the Library department is separated from the Court by a garden, the corridors of communication enclosing the garden right and left, the centres of these communication corridors developing into vestibules for the entrances from the Park at each side of the site. The corridor plan is unbroken all round, the rooms well arranged and the architectural design dignified. No. 82 ("Pax Vobiscum") is also a rather fine design, differing from most in showing a large hall running not across but vertically up the axis of the plan, ending in the large court, which ends in an apse projecting from the further margin of the plan. The principal stairs rise in flights to right and left outside the door of the large court, too far from the main entrance of the building; one would have to traverse the whole length of the hall before arriving at the staircase. The central hall divides the two departments, the Court section (except the large court) on the left, the Library section on the right, but both sides are treated the same in the symmetrical elevation; an obvious aesthetic mistake. No. 147 ("L'Homme"), on the left side of the centre screen in Room C, is one of the Utopian architectural dreams which this competition has evoked; though a building that no one would think of carrying out, it is not without power as an abstract architectural conception. The style is a kind of mixture of Persian and Egyptian suggestions; the main feature is an immense octagonal tower built with a considerable entasis and ending in a small dome; internally the treatment of this tower reminds one of Blake. Above the arches and pendentives is a band of massive sculptured wreaths enclosing shields; above this a band of colossal figures of angels between columns, and then the lofty tower interior with long narrow slits of windows, and a domed ceiling. What becomes of the great space between the inner and outer dome is wisely left a blank. But it is a rather remarkable architectural dream, and the plan is a great deal better than one generally finds in a Utopian design of this kind. The perspective view, one must admit, suggests rather

a funeral monument to Peace than a palace for her entertainment.

In the right hand recess in Room E No. 140 ("Ecco") is worth note, a scholarly and severe classic design with a sensible plan. In Room L No. 103 ("L'Ange de la Paix") is also worth something; the plan shows a very clever combination of practical arrangement with possibilities of interior architectural effect; the access to the two courts is very cleverly managed so that the entrances to them from the vestibule appear symmetrical, without any "dodging" being employed to produce different-sized courts internally. The architectural treatment is a light and graceful Renaissance, but the cupola, of high proportions and pleasing in outline, is unfortunately only a glass affair, detracting from the effect of an otherwise good design.

Among the number of drawings in the large room marked F there are only two or three that are worth particular notice. No. 55 ("Red Dragon") shows a very nice elevation, but rather too suggestive of almshouses or an agricultural college. The author of No. 215 ("Arx Pacis") has had the idea of producing a Peace Palace in a kind of rural cottage style—white stone walls and mullioned windows, a roof garden with trees on the top, and climbing plants all over the walls. The idea is pretty and idyllic, but the plan is childish. No. 39 ("Pax") is a design of much merit; the plan is in this shape, the centre block containing a vestibule and a large square hall with a low stone dome over it; the left-hand block is the Court section and the right-hand the Library section; in front of the centre block is a tetrastyle portico, and a strong cornice is carried all round the building. In perspective these three blocks group exceedingly well, though in the elevation the detail looks rather naive; of course, in this as in one or two other cases mentioned, the symmetrical treatment of the Court and the Library sections is a mistake. No. 81 ("Ædes Pacis") has a good plan, except that the bookstore has an entrance only at one end, which does not facilitate despatch in procuring books for readers. The grey-toned perspective, showing a front with a centre recessed behind a colonnade of coupled Ionic columns, and a low dome behind, has a good effect of dignity and repose. The design is probably French.

The upstairs rooms contain mostly a collection of curiosities. No. 75 ("S. P. Q. R.") is not without architectural merit; the loftier portion of the building is arranged in four great square blocks coming to the centre of each face, and connected by lower buildings in the angle spaces; the bigger blocks are crowned with sculpture. Unfortunately the lower portions are roofed with visible glass roofs, which gives the whole the appearance of an exhibition building. Among these designs in the upstairs rooms, mostly curiosities, the Jury, or whoever was concerned in the hanging, have placed that by Mr. Hare, No. 117 ("Red Cross"). So much for their judgment and attention to their task. After looking through the best of the other plans, we should hardly

hesitate to say that Mr. Hare's, in point of arrangement and concentration, and symmetry of interior effect, is actually the best plan that has been submitted, and has a completeness about it which we find in no other plan; while in architectural treatment it takes its place among the best. But it is a compact and rather small plan, very economical of space, and exhibited therefore in drawings which are smaller than many others and more quiet in style of execution, and the fact that it has been passed over in the awards and almost overlooked in the hanging is one among other indications that the Jury have simply given their attention to the largest and most showy sets of drawings, and that they have fallen into the very pitfall which professional adjudicators are supposed to be warranted to elude—viz., that of mistaking drawing for design. It has been a badly-judged competition. As we are giving the illustrations of the premiated designs this week, we have printed under the head of "Illustrations" the remarks on each design in the Jurors' Report; only those who have examined the drawings themselves can fully appreciate how vague and weak these remarks are, and how completely they fail to discriminate the real points in each design.

Whether the mere exhibition of the designs, to those who already know the town, is worth a visit, may be a question; but those of our professional readers who may not before have visited S'Gravenhage (as it is properly called) would find it worth while to make this an opportunity at once of looking over the designs for the Peace Palace and making the acquaintance of a small city which has a peculiar attraction of its own. Architecturally the Hague has not very much to show; there is the well-known Grootte Kerke, with its hexagonal brick tower and traecried stone spire; and there is the bold and picturesque ancient Hall of The Knights in the courtyard of the Binnenhof; that is all that is of the first interest, and the street architecture is of little interest *per se*. The charm of the Hague is in the combination of water and trees with streets; the continual vistas of canals, often lined by avenues of trees; the large open lake of the Vyver at the centre of the town, with the exterior walls of the Binnenhof rising straight out of the water; while a five minutes' walk from the Vieux Doelen hotel—a hotel with a history of two centuries behind it, and looking out on the Tournooiveld, the ancient tilting field, now a tree-planted square—takes one across the canal at the eastern boundary of the town into a tract of woodland large enough to furnish an afternoon's walk. Take the electric tram from the Tournooiveld to Scheveningen, and as soon as the tram is clear of the town it is running nearly the whole way under an avenue of trees. As for Scheveningen, however, it is a riot of casinos and kurhaus's, each one more vulgar and blatant in style than the last; it is like the Paris exhibition taken down to the seaside, only that the buildings are much worse. It is only a good way from the watering-place establishment that painters find the picturesque craft and the rather uncouth figures which are familiar to us in a

hundred exhibitions under the title "On the Beach at Scheveningen." The celebrated picture-gallery in the Mauritshuis at the Hague is also rather a disenchancement. It contains no doubt two very famous pictures, Rembrandt's "Tulp and his Pupils" and Paul Potter's "The Young Bull" (an over-rated work by an over-rated painter); one or two good Metzus, two admirable Gerard Dowz, and one or two good Jan Steens; but the main body of the collection consists of second-rate Dutch pictures; and we do not know any form of entertainment more depressing to the mind than second-rate Dutch pictures. The best thing in the Mauritshuis next to Rembrandt's "Tulp" is the carved stair balustrade. But there is another art-gallery, known apparently to few, the Mesdag Museum, in an out-of-the-way street in the north-west quarter of the town. This was founded by Herr Mesdag, the well-known marine painter, and dowered with his private collection. It is admirably arranged in three stories of rooms, and contains a number of interesting pictures of the modern French and Dutch schools, besides a considerable amount of bric-à-brac and other artistic curiosities. It is one of the best minor art-museums we have seen anywhere, and no visitor to the Hague should miss it.

NOTES.

The Workmen's Compensation Bill. THE so-called Government measure to amend the Workmen's Compensation Acts will soon be hardly recognisable by its originators. Already the Government have been compelled to give way on two points—viz., the limit they inserted in the Bill to exempt small employers by exempting those employing not more than five workmen, and the date from which compensation is to commence; but now they have been further over-ruled in Committee. Owing to pressure the Home Secretary introduced a clause which would include shop assistants, provided the salary paid did not exceed 200*l.* and the employer did not employ less than three shop assistants. The "followers" of the Government, not satisfied with this concession, moved amendments raising the limit of salary to 250*l.* and removing the limitation based on the number employed. The Home Secretary acceded to the first amendment, but stood out against the second, but the Government was defeated on a division, and an adjournment had to be asked for to allow the Government to consider the position. Some members even pressed for the Compensation Acts being extended to soldiers on active service, but we only allude to this to prove the rashness exhibited in Committee in relation to this question of compensation. The fact that all compensation is a charge eventually on the consumer is entirely lost sight of by these ardent reformers, but is one which will make itself severely felt by the industrious industrial classes. The principle of compulsory insurance has also been introduced in Committee and carried against the Government, a clause having been introduced enabling

a Secretary of State to make rules in any industry compelling employers to insure their workmen in any mutual trade insurance scheme confined to that industry.

The Charing Cross Trade, issued Friday last week, Major Pringle discusses

In a Report to the Board of Trade, in a Report to the Board of Trade, issued Friday last week, Major Pringle discusses at length various theories which have been put forward to account for the failure of a portion of Charing Cross station roof in December last. It is satisfactory to find that he sweeps away all suggestions to the effect that the accident may have been due to reduction of strength by corrosion or by fatigue of the metal to excessive wind pressure, to disturbance of the foundations by tunnelling or other causes, or to the absence of buttresses on the west wall of the station. Major Pringle confirms the view that the fall of the roof was brought about by the breaking of the tie-rod in the principal nearest to the wind screen, the fracture having occurred at a defective weld where a flaw, commencing in the heart of the bar, had gradually extended outwards. The facts stated in our article of December 23 last as to the state of the broken bar were so fully corroborated by the evidence given at the Coroner's inquest and at the Board of Trade inquiry, that no other conclusion was possible as to the actual cause of failure. Major Pringle finds further that the weight of the temporary staging was the immediate cause, but as the stress in the total sectional area of the bar did not exceed 513 tons per square inch, no reason existed for anticipating danger. In our "Note" of January 13 last we said, "The most important lesson to be drawn directly from the accident is that a roof like this ought not to depend for safety upon a single tie-rod." That warning is repeated in the present Report, where the particular lessons to be learned from the accident are said to be (1) that in old iron roofs where welded bars have been used there is danger of concealed flaws; (2) that unless main tension members in such roofs be duplicated or strengthened there is possible risk of failure; and (3) that where such risk of failure exists the supporting walls should be strengthened, if not already of adequate strength to resist the thrust caused by failure of the roof ties. In some respects the interest of the Report is diminished by its tardy appearance, but to those who desire a complete record of the facts for study and future reference the document is well worth having.

The Panama Canal. A RECENT vote of the Senate Committee on Inter-oceanic Canals in favour of the

level scheme for Panama has considerably raised the hopes of those who believe that this is far superior to the lock canal project. On the other hand, a telegram received last Saturday from Washington announces that the House of Representatives agreed by a majority of seventy-four votes to the adoption of the lock type of canal. It remains to be seen whether this decision will be confirmed by the Senate. A letter by Mr. W. H. Hunter, printed in the *Engineering Record*, contains a strong statement of

the grave dangers that may attend the operation of the six large locks proposed in the high-level plan. The writer describes the results of five accidents to lock gates on the Manchester Ship Canal between 1895 and 1906, and points out that if similar mishaps were to take place on the Panama Canal there would be no escape from serious disasters. The three locks proposed at Gatun are characterised as presenting "one of the most striking examples of rash and hazardous experiments in the construction of public works ever seriously suggested to the Government of a great nation." Other portions of the proposed works come in for almost equally emphatic condemnation, and as Mr. Hunter's conclusions were generally in agreement with those of the majority of the Board of Consulting Engineers, it is really difficult to understand the preference entertained in some quarters for the high-level canal.

THE case of Godden v. Hythe Burial Board (reported in the *Builder*, June 16), recently decided in the Court of Appeal, has raised a very important point under the Burial Amendment Act, 1855. The Burial Board, having to increase the burial accommodation, resolved to acquire certain land for this object, and with the consent of the Local Government Board entered into negotiations for this purpose. At that time there was only one house within 100 yds. of the site, and the consent of the owner and occupier had been obtained, as the Act requires. The plaintiff in the action owned $7\frac{1}{2}$ acres of land, which he used as a market garden, but intended to develop as a building estate, and on April 17, 1905, he commenced two houses. The purchase by the Board was completed on April 26, and on April 27 a burial took place within 80 yds. of the plaintiff's houses, which were in the course of construction. The plaintiff subsequently erected other houses, but on March 24, 1906, a burial took place within 80 yds. of the houses first erected, and the plaintiff then took action against the Board. Sect. 9 of the Burial Amendment Act, 1855, provides that "no ground not already used as, or appropriated for, a cemetery shall be used for burials within the distance of 100 yds. from any dwelling-house." And the Court of Appeal with great reluctance have been compelled to construe the word "already" as indicating the time when the Act became law, and hence the plaintiff succeeded in his action restraining the Board from burying within 100 yds. of his houses. The Court pointed out the serious result of their decision, which amounts to this, that a margin of 100 yds. must be left round every burial ground acquired since the Act. This is clearly a case which calls for remedial legislation, the wording of the Act being amended so as to indicate the time when the land is acquired.

THE Right to Photographs of Buildings. IN these days photographs of buildings are used for so many purposes that any light which is thrown by legal decisions on the right to reproduce them is important. The case of *Stackemann v.*

Paton, which is reported in the current number of the "Law Reports," is, therefore, worth notice. The right in question depends on the words of the Fine Arts Copyright Act, 1862. The gist of the first section is that the author of every photograph shall have the sole right of reproduction unless the negative shall be sold "or shall be made or executed for any other person for a good or valuable consideration." In the case in question a photographer had taken photographs on his own initiative of a school, the proprietor allowing him to enter to visit rooms, and, as the phrase is, giving him every facility by means of groups of the pupils, and, so forth. It is unnecessary to go into the details as to the way in which the dispute as to the reproduction of these photographs arose; it is sufficient to quote a sentence from the judgment of Lord Justice Farwell:—"There is," he said, "a perfectly good consideration given by the owners of these establishments to the photographers by allowing them to come on to the premises and to take photographs." In other words the permission to come on the premises is equivalent to a payment, and therefore under such circumstances the owner of the house has the right to reproduce the photographs, and to prevent their reproduction by the photographer, unless the latter has by writing expressly reserved the right of reproduction.

PROFESSOR McADIE, of the United States Weather Bureau, has written an interesting article on "Atmospheric Electricity and Trees" in the *New York Electrical World*. He discusses first the use of trees in connexion with wireless telegraphy. It is found that they can be used for the "antenna" of the receiver or transmitter. Trees which have a small amount of leaf surface give poor results, and dead trees act practically like insulators. The variations of the resistance of a large eucalyptus-tree were recorded. They show that rapid changes occur every morning and evening. This is probably due to the disturbing effects produced by sunlight on the electrical condition of the atmosphere. It is suggested that a sunshine recorder might be constructed on this principle. The photographs shown of trees struck by lightning are most interesting. The oak is the most frequently struck, and the beech is seldom if ever struck. When dead trees are struck they are splintered at the top exactly in the same way as flagstaves or the masts of ships. Living trees, however, are sometimes splintered at points on the trunk, above and below which there is little trace of the discharge, but generally there is merely a deep groove made on the trunk. Attention is called to the excellent "earth" made by the roots of trees. In many places in America the end of the lightning-conductor is connected with a large nail driven into the trunk of a tree, and this is found to be more satisfactory than connecting it with an earth plate in the ordinary manner. Records are to be made of the differences of electrical pressure between the tops and the roots of trees during thunderstorms, and this field of research appears to be very promising.

A REPORT, presented to the Rapid Transit Board, explains the conditions which led to the subsidence during construction of the tunnel now being driven under the East River, New York. It appears that no trouble arose until the shield had passed below the river bed, when water was encountered in considerable quantities, and the shield commenced to sink. We learn from the report that this effect was due to the action of the contractor, who, instead of maintaining an adequate air-pressure, preferred pumping as an alternative means of keeping the shield free from water. The result was that in flowing beneath the shield the water washed away the underlying sand in quantities sufficient to form a cavity, into which the forward end of the tunnel subsided. Heavy bending moments were developed, and the resulting strains had the effect of cracking numerous plates of the lining, besides disturbing the gradients for a total length of 2,500 ft. The broken plates are now being replaced, and the gradients corrected by reconstruction of the permanent way. It is stated that the settlement was "immediately detected" by the Rapid Transit engineers, but this is hard to believe, except on the assumption that some 2,500 ft. of tunnelling were performed in the space of a few hours. "Subsequently detected" would be a better phrase. No explanation is given as to why the contractor was allowed to follow his own foolish devices without interference from the responsible engineers. The occurrence does not seem to be a particularly good advertisement for American methods of supervising the execution of important engineering works.

SEEING that steel-framed buildings are becoming general in London and elsewhere in Great Britain, it is well that a clear distinction should be drawn between the three essentially different methods in which steel is applied to construction. The first method, now happily falling into disfavour, is that in which columns and girders are more or less loosely built into brickwork without proper or adequate inter-connexion, and serving purely local purposes, would not be able to stand without the support afforded by the walls. Steelwork of this kind is so bad that it does not deserve a name, and we may therefore pass on to the second method. This may conveniently be termed "skeleton" construction; it consists in the establishment of a steel framework properly and rigidly connected throughout, the object of the skeleton being essentially to carry the floors, and sometimes other details, of a building, while the walls are self-supporting. The new Waring building in Oxford-street is a good example of skeleton construction. The third method, or "cage" construction, embodies the idea of a complete and well-connected framework of steel capable of carrying not only the floors, but the walls, roof, and every other part of a building, all loads being transmitted to the ground through columns at predetermined points. The Ritz Hotel, in Piccadilly, is a genuine cage building, although the stipulations of the existing Building Act made it

necessary for the architect to adopt brick and stone masonry of just the same thickness as if the walls had been required to support their own weight and that of the entire structure and its contents.

DR. COPEMAN'S Report to the Local Government Board on the causes of an epidemic of enteric fever at Fulbourn Asylum.

of enteric fever at Fulbourn Asylum states that at the time of the outbreak the sewage was disposed of by broad irrigation (after a preliminary straining) on land adjoining the asylum. The water supply for the asylum is obtained from a well sunk in the chalk about 60 ft. deep, near the centre of the block of buildings. The water-supply for the town of Cambridge and for the village of Fulbourn is obtained from other wells and springs about one mile from the asylum. The underground water in the neighbourhood is held up in "what is practically an immense basin," and the surface-soil above the chalk is of a loamy nature with a thickness of from 1 ft. to 1 ft. As long ago as October, 1902, the Local Government Board directed the attention of the Town Council of Cambridge "to the danger that exists of possible pollution to the asylum wells and those of the Cambridge Waterworks Company, by the discharge of untreated sewage from the asylum direct on to land having a chalk subsoil and in close proximity to the water supplies." At a later date the asylum authorities were warned, but they declined to "admit the danger," and took no steps to escape it. The Lnuacy Acts require all plans for the "erection, restoration and enlargement of buildings" to be approved by a Secretary of State, but by a curious and unfortunate omission nothing is said about drains, and the Visiting Committee took advantage of the omission and carried out the work on their own lines, and consequently on their own responsibility. Dr. Copeman's tests with fluorescin showed clearly that colouring matter (and therefore in all probability sewage), applied to the irrigation-area, found its way to the underground water and to the springs and wells supplied therefrom, and his conclusion is that "it is not possible to deny the potentiality of danger from this cause [*i.e.*, sewage pollution], through the medium of the water supply." We agree with him, and incidentally may point out the danger of the soak-away cesspools which are so common in many districts having a chalk subsoil; wells more than a mile away may be polluted with the sewage from these convenient but insanitary filth-pits.

Whitton Park, Hounslow.

THE Metropolitan Public Gardens Association have taken steps to advance the acquisition of this finely-timbered estate, extending over 45 acres, at a cost of 15,000*l.*, the sum for which it is stated the vendors are willing to sell the land, conditionally upon its preservation as a public park. The Twickenham District Council have offered to contribute 3,500*l.* towards the purchase money. The freehold property, of 115 acres, was offered for sale, in parcels, for building purposes, twelve years ago; the mansion and pleasure grounds were subsequently

rented by the Whitton Park Club. The grounds were laid out over some cornfields and the waste on the verge of Hounslow Heath by Archibald, third Duke of Argyll. The Duke built the house and laid out the property, making fishponds, a bowling-green, an orange-walk, and so on, and (a rarer thing at that time in this country) planting a large variety of foreign trees and shrubs, with cedar, fir, larch and pine trees—some of the cedars, including the avenue about quarter-mile long; he raised from seeds in 1724-6. He also built a tower for his astronomical observations, and a conservatory for a choice collection of exotics. After the Duke's death, *s.p.*, in 1761, the estate passed through several hands; it was ultimately bought by a Mr. Gostling, who sub-divided it, taking the conservatory for his own residence and selling the house with the greater portion of the grounds to Sir William Chambers. Chambers made some alterations of the house, and occupied it as his country-seat during many years. He built in the grounds a temple of *Æsculapius*, in honour of the Rev. Dr. Willis after the King's recovery, in 1789, together with "ruins," a "Roman bath," etc., somewhat after the mode he adopted at Kew; he restored the observatory, and, *teste the Gentleman's Magazine*, 1812, set up in the garden portions of the screen from the chapel in Denmark (Somerset) House, Strand. In the grounds was Cibber's marble group, afterwards taken to Stowe, of a Highland piper and his dog, commemorating an incident, related by De Foe, of the Great Plague. A bas-relief of Zeus overthrowing the Titans was carved by Dere for the tympanum of the pediment of the principal façade. After Chambers' death the two properties were acquired and again united by Mr. George Gostling.

The New English Art Club.

THE Club are holding their thirty-sixth exhibition at galleries in Dering-yard, off 67A, New Bond-street. It is of no use, of course, expecting to see here pictures in the sense in which one ordinarily understands the word; one must be content to take it as a gallery of experiments in painting, dealing with part of the elements of a scene or subject; the colour without the form, as in the late Mr. Brabazon's shapeless colour-blot of buildings; or colour and form without atmosphere, as in Mr. A. Rothenstein's side elevations of "The Linen Markers" (62), a very interesting composition nevertheless. The desire of some of the members seems to be especially never to let us forget that this is *paint*—paint laid on thickly in the shape of something or some one, but not for a moment to descend to anything so low as simulating life. Professor Brown has rather fallen from the true ideal in two studies of nature effects, "Misty Morning on the Thames" (61) and "Richmond, Yorkshire" (71), an effect of storm; these have something of the force and reality of nature. We are glad to see Miss Alice Fanner at her best again in her really bright and breezy picture "Old Mill at Montreuil" (64). Mrs. McEvoy, in "The Sonata" (7), gives a good study of a very plain girl looking over some music; there is certainly character

in this; and Mr. Tonks's "The Crystal Gazers" (58) is an interesting and very cleverly-drawn figure composition. Beauty of course is sedulously avoided in this gallery as if it were the accursed thing; the point is to find the element of art in low and repulsive subjects—see "Noctes Ambrosianæ" (123), a study of a vulgar audience in the gallery of a music-hall; or if there is possible beauty in the subject, to evade it, as in Mr. von Glehn's so-called "Decorative Panel" (99), in which a nearly colourless nude figure sprawls in the most ungainly and undecorative of attitudes. As a type of the higher ambitions of the Club we may call attention to the crooked sketch of some old buildings at Honfleur (22) by a well-known art-critic who finds the Royal Academy not good enough for him.

The Dowdeswell Gallery.

At the Dowdeswell Gallery there is a second exhibition of water-colours of garden scenes by Miss Beatrice Parsons, whose first exhibition there we noticed some time ago. The collection is entitled "Old Gardens in England and Algiers." We thought Miss Parsons's first exhibition admirable; this second one is even more so. For delicacy, finish, and truth in the painting of garden scenes and flowers it would hardly be possible to surpass these water-colours; we know of nothing of the same kind in contemporary art to equal them. It is hardly worth while to particularise or to select, for all are equally beautiful; the artist has made for herself a first and incontestable place for subjects of this class.

The Baillie Gallery.

At the Baillie Gallery there is a collection of paintings by Mr. Montague Smythe, mainly of Chinese and Japanese scenes and figures; many of them only slight sketches, but all showing his well-known ability. The paintings by a young artist, Mr. Philpot, recently a student at the Slade school, are full of talent and promise, though they are rather studies than pictures; and it is a mistake to tack the name of "Ganymede" to a prosaic nude study of a very ordinary-looking youth; a kind of mistake, however, which older and more experienced painters frequently make. The work of most value in a pictorial sense is the small picture entitled "The Bath of Venus," which is both original and pleasing in composition. The paintings by Mr. Louis A. Sargent, rather mystical in character, show imaginative feeling; the group entitled "Titans," and a landscape "The Hour before Dawn," have a good deal of poetry in them; and there is a powerful design illustrating Blake's "Tiger" poem, which would have been more effective however if the whole tiger had been shown, instead of his head and tail being cut off by the frame.

Old Wimbledon.

AN interesting exhibition has been on view last week at the building at Wimbledon called "The Art College" (though we understand it is no longer put to the use which that name would imply), consisting in part of a loan exhibition of various objects of artistic and

archeological interest lent by residents in the neighbourhood, and in part of a special section illustrating, by old engravings and by water-colours, different features of Old Wimbledon, most of which have now disappeared. The exhibition was got up by the exertions of Mr. Richardson Evans, the Hon. Secretary of the Society for Checking the Misuse of Advertisements, with the co-operation of the members of the local "John Evelyn Club." There was a great deal of interest in the illustrations, some of the old engravings showing buildings which had long since passed away and been forgotten, though their sites can be identified. At the same time there was exhibited in the ground floor rooms the work of Wimbledon Arts and Industries. The Loan Exhibition, especially the Old Wimbledon section, was of so much interest that it is to be regretted that it could not have been kept open longer.

ARCHITECTURE AT THE ROYAL ACADEMY.—III.

The church architecture exhibited this year is neither large in quantity nor particularly striking in quality when compared with the secular work shown, and the annual decline which has shown itself during the last few years in exhibits of this class is thus maintained. Presumably fewer churches are being built, or else architects of ability devote themselves less and less to ecclesiastical work.

In the present exhibition, too, the dividing line is again strongly marked between what one may properly call archeological Gothic and the new Gothic built of arrangements and features by no means traditional. Naturally it is to the latter class that one looks for the least commonplace designs; but even as regards these one must, before attempting criticism, set a different standard and get into quite another atmosphere, so far apart have secular and church work drifted nowadays.

First on the list comes Mr. C. H. M. Mileham's "Design for a Church at Epsom" (1,394), shown by a thin-looking water-colour drawing. This is a quite traditional Norman church with a fine square tower rather on the lines of that at Tewkesbury. The plan is of a church with nave and aisles, the aisles and the crossing under the tower vaulted. The tower piers are curiously planned with arches facing the nave, transepts, and chancel, in three receding planes which are carried down to the floor. Mr. Mileham also has another scheme, presumably for the same church (1,493), which is certainly not so good, and is disappointing as coming from him.

Mr. Frank Freeman's church at Failsforth (1,433), and Messrs. Oliver, Leeson, & Wood's "Proposed Church at Swalwell" (1,455), are both Gothic revival churches of not much interest; the latter has a long row of simple square-headed clearstory windows to the nave, a common and pleasing feature in north-country Gothic, but a little spoilt in this case by a too heavy hood moulding jumping up and down over each opening. Otherwise this is a quiet and meritorious design.

"Baptist Church at Farnworth" (1,471), by Mr. A. J. Hope, is a heavy Renaissance building made up of scraps of "municipal" detail which we suppose must be considered equally applicable to a Baptist meeting-house.

In an entirely different class are the two drawings (1,465 and 1,488) setting out Mr. A. H. Skipworth's "New Chapel at Mirfield for the Community of the Resurrection," interior and exterior views of which are shown by water-colours of a somewhat unrealistic character. The chapel is situated on a steep hillside which falls in an easterly direction, allowing a spacious and well-lighted crypt to be formed under the chancel; access to this crypt is obtained down two flights of steps leading directly out of the nave, with an open well-hole. Possibly there may be some special reason for an arrangement such as this, though one cannot help feeling that, if a direct approach to the crypt from the church was necessary, a scheme like that at

Torcello could have been devised to give a better architectural effect and take up less floor space. Otherwise the interior would no doubt be impressive, but the inexplicable twisting of the fluted polygonal piers must produce a very uneasy effect, while the method of springing the main arched off corbels attached to the twisted portion of the piers, instead of off some kind of cap in the usual way, looks most unstable.

Close by are hung two drawings (1,496 and 1,497) of Mr. G. H. Fellowes Pryne's "New Church of St. Mary, at Jobannesburg"; neither of these drawings is very interesting; so far as the architecture is concerned, perhaps it may be above the level of Jobannesburg, though it is to be regretted that what will evidently be looked upon there as a representative example of English Gothic should fall short of the present English standard.

Mr. Temple Moore has two exhibits, one a quiet and correct little early-Decorated church at Wellhall, in Kent (1,502), but inadequately drawn, and with no plan. Also a large interior view of "All Saints' Church, Tooting Graveney" (1,511), an uninspiring piece of work shown by a commonplace brown-ink and wash drawing, and again no plan. Apparently the interior is faced with yellow brick and stone bands, a combination of materials which is, as a rule, singularly ineffective when applied to this arid kind of Gothic. Altogether this important church is scarcely worthy of Mr. Temple Moore.

"Three Chapels" (1,503) is a large frame with several interior and exterior views, cleverly executed in water-colour, of village chapels in countries as far apart as Italy and Ireland. They are all well "localised," and the painted ceilings and decoration look dainty and well thought out. These are by Sir C. N. Nicholson, as is the important "Steeple, leaded" (1,505), which we illustrated and described in a former issue, and which, therefore, requires no further comment.

Mr. Ernest Newton shows a wash drawing of the "New Spire and Upper Part of Tower, St. George's, Bickley," which has also appeared in a former issue. It is certainly a successful attempt to work down to the level of the existing modern church behind it.

A very large drawing of a "High Bay of the Choir, Liverpool Cathedral," exhibited by Mr. G. G. Scott (1,513), is interesting as showing the detail to a large scale. On the whole it is a splendid piece of building, turned into somewhat unconvincing Gothic by the correct but rather lifeless tracery of the windows.

Sir Charles Nicholson has another drawing, in water-colour, and not quite up to his usual standard, of the exterior of the "New Parish Church at Epsom" (1,515); no plan is given. There is a curious mixture of styles in this design; the chancel, with its rude wall arced and early character generally, is by far the most satisfactory portion, but it is difficult to reconcile it with the rest; the tower is made to look clumsy by the unnecessarily heavy buttressing of the belfry stage.

"Proposed Church, New Somerby, Grantham" (1,517), by Mr. B. H. Tarrant, is a pleasing little interior showing a low church ceiled with a flat segmental paneled roof giving a feeling of breadth. The absence of chancel arch and the general open effect is reminiscent of west-country churches, but the screen would have been better had it run across the aisles as well as the nave. The iron screen itself is unsatisfactory; cusped tracery never looks well in this material.

Mr. C. E. Bateman's "Hill Church, Sutton Coldfield" (1,518), is a good, simple suburban church, rather over-chequered perhaps, but otherwise restrained; the plan is ingeniously arranged so as to throw the space under the tower into use for seating accommodation.

"St. Chad, Longsdon" (1,532) is a pen drawing by Mr. G. C. Horsley, executed in a manner which assuredly cannot do justice to any merits the building may have; some of the fittings look as if they might be interesting.

Mr. H. C. Corlette's design for "A Modern Church" (1,534), which might just as well have been labelled "A Study for a Byzantine Church," is, nevertheless, very interesting, and shown in a good water-colour drawing

in which the foreground and the chancel are extremely well put in. The plan is in three compartments, each of which is domed, the domes springing from four large square piers which are placed so close to the outside wall as only to allow space for a passage aisle. The interior is impressive, and would probably be more so if the whole scheme had been a little less stumpy. Altogether this is an admirable study.

In some respects the most notable church design in the exhibition, though it is not very well hung, is Mr. G. Gilbert Scott's "Design for a New Church at Bourne-mouth" (1,549). In the absence of a plan it is not easy to gather exactly what the scheme is intended to be; the west end, which is good in scale and very quiet, has high-stepped parapets masking the sloping lines of both the aisle and nave roofs. The nave is very low in comparison with the high transept beyond, and the scheme seems to be another development of the idea embodied in the corresponding part of Liverpool Cathedral. Part of a tower appears in the drawing, but it is of far less convincing design than the fine west front already mentioned.

Messrs. Rogers, Bone, & Coles show a design for a wooden chancel screen (1,558), in which the stout upright members, set rather closely together, certainly produce a definite architectural effect, which is very pleasing.

Mr. Ponting's two village churches (1,595 and 1,596) in the old manner are quite quiet and English in effect. Mr. Spooner shows a drawing (1,572) of a lofty church interior, in which a more modern spirit and a greater effort at impressiveness are shown.

On Mr. T. G. Jackson's two designs we have commented in a former article.

PROPOSED NATIONAL COLLECTION OF DRAWINGS OF ARCHITECTURE.

The following letter has been issued by the Committee formed by Mr. R. Phené Spiers to assist him in organising a national collection of drawings of architecture:—

"DEAR SIR,—Owing to the lack of any organised scheme for the collection of architectural drawings, numerous sets of measured drawings of old buildings forming in themselves valuable historical records, have been lost or destroyed, and many others are practically inaccessible to students. Magnificent work has been done during the last fifty years by young architects and others, in making accurate drawings of old buildings, both at home and abroad, and as many of these buildings have since been destroyed or materially altered, these drawings in some cases form the only record of their original design and arrangement.

It has long been felt that drawings of this nature should be carefully collected and housed for future reference, and the Committee charged with arranging a testimonial to Mr. Phené Spiers last year hoped to have been able to initiate such a scheme as part of the testimonial. This was found to be impracticable, but Mr. Spiers has since come forward and, of his own free will, put aside the money balance of the testimonial as the nucleus of a fund for dealing with the matter, and he has invited a small Committee to assist him in organising and arranging a scheme.

As it is felt that such a collection should be as freely accessible as possible to everyone, the authorities of the Victoria and Albert Museum at South Kensington were approached to ascertain if they would be willing to take over and house such a collection in their library under reasonable conditions. We are pleased to say that arrangements have now been completed whereby the collection will be deposited in the Art Library at South Kensington, and any contributors of drawings will be recognised as donors conjointly with Mr. Spiers' Committee, and will be entitled to the donors' privileges of the Museum. While the drawings will be accessible to students for purposes of study, and can be copied under this head, they will not be available for publication by other than the author during his lifetime, without his permission.

The Committee feel sure that architects who possess such drawings only require to be made aware of the existence of a definite scheme for collecting and adequately housing the same in order to present their drawings

to the collection. In most cases such drawings, having served their original purpose, are rolled up and never looked at, being ultimately either lost, destroyed, or forgotten.

The collection will not be confined to drawings of old work, but will include within its scope the following—Records of important public buildings and of works by eminent architects down to the end of the XIXth century; photographs of buildings which no longer exist, or which have been materially altered; and sketch-books of deceased architects of repute.

We venture to hope that you will signify your approval of the scheme by contributing any such suitable material as you possess and by informing us of the existence of similar material in other hands, as well as by using your influence to secure the same for the collection.

We will arrange, if required, for the collection of drawings, etc."

The letter is signed on behalf of the Committee by Professor W. R. Lethaby and Mr. Robt. Weir Schultz.

STUDENTS' DRAWINGS AT THE ARCHITECTURAL ASSOCIATION.

At the Association's premises in Tuffen-street, Westminster, the walls of the central hall and the entire suite of lecture rooms on the first floor are hung with a very large collection of students' drawings, representing the work done for the annual prizes and in the studio.

One cannot but ask oneself in the presence of such a large show what it all means, and if the work exhibits the best kind of promise both in the individual and in the system. But from the nature of the case the part of the work that is really criticisable—that done for the prizes—eludes such questioning. With the exception of the Travelling Studentship the competitions can only by chance be governed by the system of training in vogue at the Architectural Association. The men who compete need not necessarily be day school and studio men, so that we are face to face with an exhibition that defies systematic criticism. The Travelling Studentship is, indeed, somewhat of an exception, though not so much as appears at first sight. By an innovation introduced some years ago this competition was brought into touch with the educational work of the Association, and the prize was awarded for the best three sets done in the Advanced Class of Design, plus a certain number of sketches and measured drawings. Excellent as the Design Classes are in themselves, however, they cannot be said to represent a system of training. The visiting list is made up of men well known in the profession, who give up part of their valuable time to giving much invaluable advice to the student. Results, in such circumstances, must be more accidental than systematic. To come to another matter, it may be questioned if the Association has improved its studentship by bringing in the element of design. Since the innovation the standard of sketching and measuring work submitted has inevitably declined. By offering the prize for draughtsmanship alone, as aforesaid, work of a high quality could be obtained. Now, the appearance of the drawings submitted, for the most part, suggests that they are done in the least possible time.

We might throw out the suggestion that the Studentship, as regards its design work, should no longer attempt to enter into competition with that excellent and popular prize, the Architectural Association silver medal for design, and, by limiting its field, maintain the high standard of its earlier years.

The winner of the Studentship, Mr. A. Winter Rose, appears on the whole to be the strongest competitor. Most successful of his design work is, perhaps, the "Entrance Lodge and Gates to a Public Park." In the "Wayside Inn" perspective he leaves colour for pen and ink, with a result that shows promise. The 3-in. scale drawing to this subject is not improved by the spiritless, not to say meaningless, pencil shadows. The perspective of his third design, the "Specimen House at Kew," is a highly-coloured, rather hot drawing of a design which soars out of "Garden Renaissance" into

very modern Byzantine. The design is otherwise well thought out, particularly as to detail. Two pleasant, but not remarkable, colour sketches of bits at Queens' College, Cambridge, are also submitted, and as measured drawings, three staircases of the Senate House at Cambridge—the small scales in ink-line and the details in pencil and wash; but we fear that Mr. Rose has not always done his best with the draughtsmanship, in the fluting of the columns in the small-scale drawing, for example. Some of the drawings in this winning set are marred by particularly objectionable printing. When will students learn that there is a scale and a fitness in accessories which the strongest drawings cannot ignore?

One can fairly say for Mr. E. Brantwood Muff, who is awarded second prize, that his work is not tainted with the desire of doing everything in the least possible time, which is too apparent in much of the work submitted by the winner. In his draughtsmanship he is not hurried, neither is he exactly laboured, but perhaps he just misses the real living yet careful workmanship, which is the best of all. His drawings of Bolton Abbey seem to suffer from lack of interest on the part of the worker, and one of the scale drawings is obviously unfinished. Yet the impression, confirmed by the Street of Almshouses at Bursall, is a pleasant one, on seeing drawings that for the most part are done cleanly and carefully. Mr. Muff's strong exhibit is unquestionably his design for a village church, which is up to the best traditions of the Class of Design. With another strong design exhibit he would score handsomely. But his oak staircase is not so convincing.

Though not yet of full Studentship calibre, there is much in the work of the third competitor, Mr. W. A. Hodges, that is excellent and full of promise. In his pencil sketches of St. George's, Hanover-square, and the Cloisters at Worcester, he really tries to draw as carefully as he can, a method of getting to work not by any means too common nowadays. His design for Public Park Gates also shows capital feeling for dignity, though the plan of the house is unduly sacrificed. The "Wayside Inn" is also a very fair design, and the "Grammar School"—which avoids meaningless eccentricity—is commonplace more from inexperience than method.

The drawings executed in the two Classes of Design—Elementary and Advanced—and exhibited in a separate room—vary much in excellence, and on the whole, perhaps, are not quite so strong as we have seen them in former years. In the Elementary Class Mr. George L. Alexander's "Three Cottages" should be mentioned, as well as the lot generally showing shop-fronts; and in the Advanced Class the designs for a "Wayside Inn" by Mr. P. M. Stratton and another student, who draws on tracing-paper, but does not sign his name; the charming "Tudor Chimney-piece," by Mr. Stratton, as well as the "Public Park Gates," by Mr. Alan Binning.

The competition for the Architectural Association medal and 10L 10s., unlike the Studentship, does not suffer from lack of competitors. "Heron" (Mr. T. W. Watkins) is unquestionably first in the design for a "Village Library." He exhibits a well-coloured and well-drawn set with a good plan and workmanlike elevations. He is not happy, however, in the arches on each side of the central bay of the first floor in his front elevation. Other creditable sets are submitted by "Nil Desperandum," "Mansard," and "Sacred Beetle." "Mercian" makes an attempt at a condensed plan, but he gets scrappy in his elevations. "Lion" is quite the weakest of the six. It cannot be said that it is a strong year for the Architectural Association medal.

The Banister Fletcher Bursary for Measured Drawings goes to Mr. Cecil Pinsent for a set showing the Mansion House, an interesting piece of work well worth measuring. This set is on the whole the best piece of measured work in the exhibition. Mr. P. Hulbert Keys shows the Stationers' Hall, but, though the thick line he has adopted is perhaps allowable for this class of work, his drawings have not the merit of Mr. Pinsent's.

We cannot understand the Architectural Union Company's Prize, also for measured

drawing, being awarded at all. Only one set seems to have been submitted, representing Pallant House, Chichester, under the motto "Dodo." The house is of the comparatively tame order that has quietness and sobriety as its chief merit—with an occasional piquant smack in the details, as in the dodos carved in stone which adorn the front gate-piers—requiring more than common care in the draughtsmanship. The drawings submitted, however, are poor and commonplace to a degree, and deserve no prize of any kind.

It is with greater pleasure that one turns to the Saxon Snell Prize of value 50l. offered every three years for the best set-design fully worked out in all practical details, including a specification. Two designs are submitted, and that by Mr. Vincent Hooper (Motto "A") is deservedly successful. He is certainly to be congratulated not only on the thorough working out of his subject ("A Home for Aged Soldiers"), but on the very neat way he has condensed his matter on to four small stainers. His elevations are not unpleasing, though somewhat heavy, and his plans are excellent. A taking, if rather slipshod, design is also submitted by "Suspect," which Effer worked out might have gained more recognition. He would do well to study the winner's up-to-dateness in practical matters, such as the disposition of lavatories.

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A SCOTTISH district meeting of the members of the Association of Municipal and County Engineers was held at Berwick-on-Tweed on Friday and Saturday, June 15 and 16. The members assembled at the Town Hall, where they were received and welcomed by the Mayor (Mr. Ralph Thomson, J.P.).

The business meeting was held in the Museum. Mr. F. C. Holmes (Govan) presided, in the unavailing absence of the President (Mr. A. E. Collins, of Norwich), supported by J. Bryce (Partick), Honorary District Secretary, W. F. Curry (Pretoria, South Africa), J. Lee (Paisley), T. Nisbet (Glasgow), and others.

Mr. J. Bryce made a report of the work of the Committee which is engaged in preparing by-laws under the Borough Police Act (Scotland), 1903. The draft Report was complete, and when revised they intended to submit it to the Town Clerks' Association before they went to the Secretary for Scotland.

The Chairman said the Report was satisfactory, as it must be patent to all of them that the preparation of these by-laws involved a good deal of time and trouble.

Mr. J. Bryce, of Partick, was then unanimously re-elected Honorary Secretary for Scotland.

Municipal Works, Berwick-upon-Tweed.

Mr. R. Dickinson, Borough Surveyor, read a paper on the "Municipal Works in Berwick-upon-Tweed." He said that, while the poor rate was levied uniformly over the whole borough, the sanitary rates varied in Berwick, Tweedmouth, and Spittal. Each part of the borough defrayed the cost of its own services. Tweedmouth had neither water or sewage, and, consequently, was not rated for such, while Spittal rate included sewerage expenses but not water, this being paid to the owners of the waterworks. This charge, which varied, might be taken at ls. 6d. in the 1l., so that the total rates in Spittal amounted to over 8s. in the 1l., as against 5s. 6d. in Berwick. Establishment charges, which included salaries, hospital expenses, buildings, etc., could not be debited to each place according to the service rendered, and were divided in proportion to the rateable values.

The authority had been content to levy out of current rates for permanent improvements, rather than borrow for such purposes, and, consequently, no important improvement schemes were in progress. For years Berwick levied 6d. to 8d. in the 1l. for renewing streets, and when the small rate-producing power of each division of the borough was considered, very little could be done even with very high rates. Four causes seemed to explain the hitherto deep-rooted objection to the principle of borrowing, viz. the reckless mismanagement of the old Guild, which ruled down to 1835, the misapplication of the

principle "pay as you go," the idea that hallowing was expensive, and the comparative isolation of Berwick from other large and progressive centres.

At the last meeting, however, the Berwick rate estimate was reduced 3d. in the lb. by striking out two items of permanent improvement, the required sum being ordered to be borrowed. This action might be taken as an indication that a more progressive spirit was beginning to prevail.

The rare old relic of Berwick Bridge was entirely under the jurisdiction of the Corporation, into whose keeping it was handed by Charles II., together with a perpetual annuity of 100l. per annum for its maintenance.

Built during the years 1611-1624, the bridge was carried on fourteen piers of substantial proportions. The arches were formed of two rings of freestone of a total thickness of 3 ft. 2 in. It was 1,000 ft. long, and the carriage-way was 13 ft. 3 in. between the kerbs, with narrow paths on each side. The foundations and arches were sound, but the piers and cut-waters were not in a satisfactory condition.

The action of the river had had the effect of washing out the joints of the cut-waters, while surface water penetrating downwards between the rubble-paving of the old paths and defective channelling had completely disintegrated the lime-concrete with which they had been formed. The Corporation had in view a thorough repair, and instructed Messrs. Read & Waring, of Westminster, to examine and report. The estimated cost of putting the whole bridge into good order was 5,450l. As this work, however, included taking down and rebuilding the cut-waters and part of the piers, the question developed into one of widening the bridge.

Owing to the increase of heavier and speedier traffic, the narrowness of the bridge had become a serious matter, for while a traction engine was crossing all other traffic must be stopped. When it was remembered that this was the main route between England and Scotland, carrying a constant stream of motors, the Corporation did well to raise the question of widening. The engineers were consequently instructed to prepare a scheme.

Their proposal was to take down the piers and cut-waters to the level of the brandeths and rebuild on the same position, reusing the best of the existing old weathered stone for external work, the solid interior to be of Portland cement concrete. When the piers were carried to the necessary heights it was proposed to spring new arches on both sides, this part of the work to be executed in ferro-concrete but faced with old stones; while the existing parapets, which were 13 in. thick, of sound ashlar, would be carefully taken down, and, after being reduced 3 in. in thickness, would be again used. As arranged, the alterations would increase the carriage-way to 19 ft., with a 5-ft. path on each side, and, as the present structure carried both gas and water main, provision was made under the paths for this purpose. The estimated cost was 16,000l. The scheme was designed to avoid destroying the unique character of the bridge, and in this respect it had received a very hearty approval. As soon as the proposed widening was publicly discussed the interest in the bridge, from an antiquarian standpoint, became evident. But, putting that aside, the multiplicity of interests involved was a serious difficulty to overcome.

The bridge was essentially an Imperial one, having been built and maintained out of the National Exchequer; the Corporation was not liable to widen, being simply custodians for the Government; the sanitary authority, though under obligation to provide highway accommodation within the borough, had never had any control over this structure; while the County Council of Northumberland was also involved, as this bridge formed the only highway through this part of the county. Negotiations had been opened with the County Council and also with H.M. Treasury, where they remain for the present.

Only the Berwick division of the borough had a public water supply. Originally this was provided by the Corporation, or Guild, from certain springs on the freemen's estate, and was conveyed to various public "pans" by means of wooden pipes. In addition, almost every property had a private well.

In 1855 the then local Board of Health constructed a storage reservoir of 6½ million gallons capacity on a piece of moorland at New East Farm, about two and a half miles north of the town, at a level of 440 O.D. This supply served the purpose until 1870, when the land and springs at the existing Tower Works at Tweedmouth, were purchased. These springs yielded 250,000 gallons of water, which flowed daily into the river, over the bottom of what had been a freestone quarry. A reservoir was constructed on the quarry bottom, with three open-jointed sides into the bank from which the springs issued. At a lower level a second reservoir was built, which received its supply from the higher reservoir. From the low reservoir the water was pumped to the original Castle Terrace reservoir. For this scheme Messrs Leslie & Reid, of Edinburgh, were the engineers.

This new supply was used in conjunction with the older new East Farm supply, and, on the lowest estimate, formed a daily supply of over 320,000 gallons for a population of 8,000, or 40 gallons per head, and still the demand grew apace.

Before 1890, when the writer was appointed, the supply became totally inadequate, and for some years it was impossible to maintain a constant supply during summer months. So far as water supply was concerned, there was practically no control, no regulations, no meters, no trade charge, no inspection of waste, no required strength of fittings, no application for supplies; in fact, the supply was in the hands of plumbers. To cope with such chaos single-handed was impossible, and the author agitated for a special committee charged solely with water business.

After much opposition a Water Committee was appointed. With a strong man at its head and grasping the situation the Committee soon justified its existence. A Deacon waste-water meter was procured, which told tales that forced the appointment of an inspector. Regulations became imperative; the Waterworks Clauses Acts were put in force, and slowly but surely the Committee gained ground, and past anxieties began to disappear. The old New East Farm supply, in consequence of the gradual cultivation of the watershed, had become of doubtful purity and, owing to the prevention of waste, the Committee were able in time to abandon this supply altogether. A new pump was provided, capable of delivering 28,000 gallons per hour, instead of the original pump, which was only equal to half that duty, and, in order to further reduce waste and destruction of fittings, the town was divided into two districts by utilising a small reservoir as a pressure-reducing tank, so that on no part of the mains does the pressure exceed an equivalent to a head of 100 ft.

Charges of trade supplies, which had long been threatened, did not begin to operate till two years ago. This was vigorously opposed within the authority, as well as without, but there could be no going back. It became a choice between the abolition of meters and an additional supply, and the authority accepted the proper alternative. A charge of 1s. per 1,000 gallons was ordered, and this was shortly afterwards reduced to 8d. per 1,000 gallons. The revenue derived from this source was only about 350l. per annum, partly because no minimum charge had been made for metered supplies. In many cases where supplies were metered the amount paid for water was less than the meter rent. The meter used was Kent's "Standard," and its adoption had been fully justified by experience.

Berwick now rejoiced in a water supply of over 50 gallons per head, well distributed, and provided with 120 hydrants, but with the serious drawback that it did not reach the highest part of the town containing some of the best residences. This district had its own supply, but without "head," and consequently would be at a disadvantage in case of fire.

The supply to Tweedmouth was derived from two sources—a private company and public wells.

After prolonged investigation, the author became satisfied that probabilities were greatly in favour of additional water being found on the ground of the Berwick Waterworks, but, as boring involved considerable risk from two sources, he advised, as a

preliminary, that the advice of an engineer, experienced in work of this nature, should first be obtained. The dangers feared were the possibility of interfering with the existing springs and of sea-water being drawn into the bore-hole in consequence of its close proximity to the tidal waters of the river.

The matter was referred to Messrs. Read & Waring, who were engaged in carrying out a similar scheme in Lancashire, and, after careful inquiry on the ground, they confirmed the opinion already given, and recommended that a trial bore-hole be made to determine the depth of the water-bearing stratum in the first instance, and thereafter to proceed with well-sinking as might be found necessary.

An air-compressor plant was employed for the test. The water was discharged over a weir 12 in. in length, and on the thirteenth and fourteenth days the flow remained steady at a depth of 2 7-16 in., being equal to 175,000 gallons per twenty-four hours. As the surface of the bore-hole was only 10 ft. above high water, samples of water from it were taken at both states of the tide, and the analysis proved it to be in every way satisfactory. The quantity obtained from so small a bore exceeded the most sanguine expectations, while the existing supply had not been affected in the slightest degree.

The result was deemed so satisfactory that the engineers were instructed to prepare a scheme for the supply of the whole borough. The scheme was to combine the existing supply and that from the bore-hole, and, instead of pumping the water to Berwick, to pump it to a reservoir to be constructed in Tweedmouth, where a site could be obtained about 100 ft. higher than the Castle Terrace reservoir, which would provide "head" to gravitate the supply to any part of the borough.

The present pumping main was to be extended and utilised for delivering water from the new reservoir to the existing Castle Terrace reservoir for the supply of Berwick. As the new reservoir was intended to contain three days' supply for the whole borough, and the Castle Terrace reservoir could only hold one day's supply for Berwick alone, Berwick would be safeguarded against the existing risk of the supply being cut off in case of a machinery breakdown. Separate pipes would convey water to Tweedmouth and Spittal, where it would be properly distributed, and this would have provided in one establishment a thoroughly compact and efficient water supply for the whole borough. The authority's instructions were fully complied with, and the estimated cost of the work was 20,000l. In January last, at a meeting of eighteen out of twenty-four members, eight voted for and nine voted against the scheme, and one declined to vote. The position to-day was that, on the recommendation of the Spittal representatives, the authority had decided, subject to the approval of the Local Government Board, to purchase, for the use of Spittal alone, the Spittal Waterworks and the farm on which they were situated at a cost of 8,000l. Tweedmouth remained as before, in urgent need of a supply, with no prospect of its acquisition. Berwick was considering a proposal to provide a pump to raise water from the Castle Terrace reservoir for the supply of Castle Terrace.

Mr. Lee (Paisley) expressed surprise at the decision of Berwick to carry out all street improvements from revenue. The borrowing of money for the carrying out of permanent street improvements was quite a legitimate charge to put upon the rates. He could hardly imagine how it was possible to have a satisfactory administration of the water supply with three different authorities controlling it.

Mr. Wilson (Helensburgh) was also of opinion that there should be one water supply for the whole of the borough and a uniform charge for the water.

Mr. Curry (Pretoria, South Africa) told a story of a Kent meter which failed to register, though they knew water was going into the house in large quantities, and on examination it was found that the workmen had put the supply-pipe on the exhaust, and consequently the meter was not working.

Mr. Goudie (Stirling) considered that three different water supplies must cause a good

deal of trouble to the engineer, and could not in any way be satisfactory.

Mr. J. Bryce (Partick) said it was surprising to find a town with a Corporation one thousand years old which had so old-fashioned a system of rating, with parts of the borough like independent colonies, evidently more or less rebellious, and desiring to be rated according to their own peculiar ideas and views of things.

The Chairman thought if the differential rating could be got rid of many of the difficulties as to water supply and sewerage could be remedied.

Mr. Dickinson having replied, he was heartily thanked for his paper.

Mr. A. H. Goudie (Stirling) presented a paper on the plan and register of streets, as provided for in the Burgh Police (Scotland) Act, 1903. The Act imposes a duty on Town Councils to provide a plan and register of streets, in which certain information has to be given as described in the section.

Mr. Nisbet (Glasgow) said they had prepared a register in Glasgow under a Local Act, with the result that there were now 5,000 or 6,000 actions entered against him as registrar.

The members were entertained to lunch at the King's Arms Hotel, and the afternoon was occupied with a drive to places of interest in the district, including the Waterworks pumping-station and the old bridge.

On Saturday morning Captain Norman, R.N., gave some particulars of the Elizabethan fortifications and walls of Berwick.

EXPERIMENTAL SCIENCE AND THE BUILDING TRADES.

At the London County Council School of Building, Brixton, on Monday, Mr. Alan E. Munby delivered his second lecture on "Experimental Science and what it has done for the Building Trades." Having given a brief summary of the chief points touched upon in the first lecture, Mr. Munby said that all gases had great power of expansion on heat, and, that being so, they would expect considerable expansion if they raised the carbonic dioxide to a moderate temperature, the conclusion being that hot carbonic gas was lighter than cold air. This explained why bad gases rose to the top of a room and were extracted by different systems of ventilation. There were some systems of ventilation which extracted the bad gases from the bottom of the room, but he felt that they were wrong. Dealing next with the principles of combustion, the lecturer said that combustion was nothing more than oxidation. This oxidation might proceed slowly or rapidly. In the case of the rusting of a piece of iron oxidation took place slowly. Burning was simply a form of oxidation, and in all chemical action we get heat. Even in the rusting of iron the iron gets hot, although it was not noticed. The action was so slow that it was impossible to measure the rise of temperature, but if rapid oxidation went on it was very noticeable, and in some cases caused the bodies to take fire. Heaps of oil-rags, for instance, caught fire from spontaneous combustion, as it was called, and they had explosions in coal mines which was due to the rapid oxidation of the coal dust, and occasionally the same thing took place in flour mills. The rate of oxidation was influenced by the size of the particles which were oxidised. If they had an evenly-divided substance, which got plenty of air, the rate of oxidation was very rapid. In the present day attempts were made to protect our buildings from fire, and to leave them in such a state that they were not likely to be burned, and it was very necessary to know something about the principles upon which fire-proof construction was based. Combustion or burning might be described as the chemical action taking place with the evolution of heat and light at the same time, and if they wanted to prevent fire they must remove one of the conditions necessary for combustion. The conditions on which fire took place were:—(1) Something which will burn, (2) something in which it will burn, and (3) sufficient heat to raise the substance up to a point at which it will take fire, which will depend upon what the substance is. Everything required a certain degree of temperature at which it would take fire, and this

was a matter of great importance in the consideration of the choice of materials which would resist fire. If they could get the air away from a substance it would not burn, but the idea in fire-proof construction was to get rid of one of the conditions necessary for burning. Thus they might have a combustible material, but prevent air getting to it; and that idea was carried out in solid-joisted floors, in solid treads for staircases, in teak floors, etc. The use of hard woods, as against soft woods, was based on the same principle, as the hard woods were comparatively non-porous. Proceeding to deal with the question of the physical properties of bodies to show how science could assist building-work in showing how those engaged could by its help better understand the materials with which they were brought in contact, the lecturer touched first on the question of cohesion, and said that, with regard to building materials, cohesion lay at the root of most of them. It was the cohesion of the particles of the bodies of cement, mortar, and other materials which render them so valuable. Matter, to begin with, was not perfectly continuous. Although solids appeared to be perfectly homogeneous, yet they consisted of very minute particles which had inter-spaces between them. Even a thing like a piece of lead consisted of minute particles with spaces between them. These spaces were so minute that it was not possible for them to see between them, but their existence had been established on theoretical grounds which he could not touch upon that night. The small particles were called molecules, and they were minute rings, which had circular sections. They had a certain amount of motion, which was limited in solid bodies, and the amount of motion depended on conditions other than what the substance was. First, however, it was evident that they had this quality of cohesion; there was a certain force which held them together. When these molecules got hot their motion became much more active. With one exception, all bodies expanded on heating. They saw that in the case of steel used in building, and with the use of long lengths of steel it was a thing which had to be reckoned with. It was an ordinary thing to put a 30-ft. girder over a shop front, and the expansion might easily be $\frac{1}{4}$ in. between winter and summer, and, therefore, if the girder was fixed at both ends in the wall serious damage might result from the expansion, and so such things were only fixed at one end. In the case of the Forth Bridge, which was built of steel girders, the bridge was 1 yd. longer in summer than in winter. Then the way in which the molecules behaved was of importance, as on that depended to a large extent the weathering power of the substance. They might have substances of the same chemical composition, and might think they would behave in the same way, but if they used them they would find that one weathered a great deal better than the other. It might be asked if that was so, what was the use of the chemist? but the answer was, that the work of the chemist must be used in conjunction with other sciences. By means of a number of lantern slides Mr. Munby explained how the structure of materials was affected by crystallisation, and showed the difference between crystallised and uncrystallised things. Although they might have the same chemical composition, physical tests, he said, were quite as important. Chalk and marble, for instance, were of the same chemical composition, and the difference between them was due almost entirely to structure. In marble they got an enormous amount of interlocking, but in chalk they had a number of rounded grains, and the power to resist abrasion was not nearly so great. At the same time, he did not want it to be supposed that crystallisation in all cases was advantageous as regards the structure of the bodies, and they had an illustration of that in timber. Then, with regard to the power of bodies to conduct sound, the lecturer pointed out that if solids were homogeneous they were always good conductors of sound, and he demonstrated how sound would travel along a length of good timber. In good timber there was a continuous structure, but in decayed timber that was destroyed. In the case of cement and mortar, they could test it by seeing how it behaved when broken up and when mixed with water, because the ingredients of which

it was composed will settle according to their density, and they could then get a separation which would allow of a certain amount of examination. Mr. Munby concluded his lecture by showing how the water test with mortar could be made.

Mr. H. W. Richards (Principal of the School), in proposing a vote of thanks to the lecturer, said it was gratifying to see the lectures so well attended, and he regarded it as evidence that those present realised that they had to use their brains in their work. He hoped the time would come when those engaged in the building trade would feel generally that there was something more than A B C to learn. The cleverest men rose to the top, and the time would come when the students would realise the value of such lectures.

THE CARPENTERS' COMPANY.

At an examination in carpentry and joinery, held at the Carpenters' Hall on June 6 and 9, silver medals were awarded to the following candidates:—Ernest Kerridge and Geo. Arnall; bronze medals were awarded to P. J. Luxton, T. B. Davis, E. E. Hunt, and C. H. Hancock (equal); first-class certificates to J. F. Dowsett, H. E. Gibbs, Wm. A. Harvey, Robt. F. Ewin, B. Holmes, G. S. Haines, W. Breffit, Jas. Sinclair, and E. Dymock; second class certificates to T. A. Gilbert, Arthur R. Cope, A. McMillan, H. B. Sander, A. Crews, E. G. Hampshire, B. E. Smith, P. Woodward, W. F. Bulgin, W. S. Syson, N. Walls, W. A. Carter, W. G. Udall, F. J. Layzell, J. L. Thomas (equal), C. Burle, Geo. Mould, J. H. Crawford, H. J. Borrett, F. Barsby, H. C. Tweed, W. Bosworth, A. McSwan, F. Garner, A. Stevenson, H. Merryfield, E. J. Beesley, J. W. Isard, H. Forl, J. W. Aitchison, W. Emerson, Hy. Pitkin (equal), W. P. Downer, and F. J. Parr.

The number of candidates entering for the examination this year was a record one, there being no less than sixty-seven entries, nearly half of these coming from the provinces, including candidates from Ireland, Scotland, and all parts of England, thus showing that the value of the Carpenters' Company's certificate is becoming every year more widely known.

THE ARCHITECTURAL ASSOCIATION SUMMER VISITS.

III.—IGHTHAM MOTE AND FAIRLAWN, TONBRIDGE.

The third summer visit was held on Saturday, June 16, at Ightham Mote, Kent. The somewhat large party was driven from Sevenoaks through the enchanting scenery which makes this county justly famous, and, with the exception of some late showers, the excursion was an unqualified success. The house is one of the leading English historical establishments, and, to the architect, is particularly attractive in that it possesses features of all the great building periods from the XIVth century.

The first impression is one of intense interest, which is maintained upon closer investigation; but the charm begins to wane when the hand of the restorer of the Victorian era discloses itself. It is in this latter aspect alone that any disappointment is felt.

To those of our readers who are interested in the subject we refer the series of sketches, together with the detailed, historical description, which appeared in the *Builder* of July 15, 1905, and we now confine our remarks to a few general references. The situation is in a valley, and the surrounding gardens, most fitting of their kind, are set in a scene of great natural beauty. The main buildings are grouped around a quadrangle, and are themselves enclosed by a moat fed by springs and running water in the valley. A forecourt on the western side has ancient timber-framed stable buildings and high brick walls facing the gatehouse tower, entrance, and bridge. The principal apartment is the great hall, a curiously proportioned chamber, with a height of 37½ ft. in relation to a length of 30 ft. A window and other features show that a great establishment was in existence in the XIVth century. An adjoining object of interest is an excellent stone-vaulted chapel, supposed to be the crypt of an ancient chapel.

now transformed into less dignified apartments.

On the upper floor are several important rooms. The second, or Tudor, chapel has a charming interior, with an oak-ribbed vaulted roof, a pleasing arrangement of oak seats, a pulpit with canopy and linen-fold panelling throughout, all of the best work of the period. The withdrawing-room is also of great interest, apart from disclosing the incessant nature of the successive changes from which Ightham Mote has emerged. Windows are both early and late in date. The large Jacobean fireplace at the south end is of splendid design and workmanship, and is schemed with an ornate frieze of the same date, which is continued around the walls.

The house is unique among the remains of the great domestic works of the Middle Ages, and, while possessing the usual accommodation, everything is treated upon a much smaller scale than is generally found in kindred buildings.

Not the least noticeable of the numerous characteristics is the great variety in the building materials used in the structure.

The occasion under notice was extended by a visit to Fairlawn, a neighbouring mansion, of uncertain date, which has recently undergone a process of enlargement. The house virtually belongs to the later Renaissance Period, and is well stocked with valuable pictures and objets d'art. The chief interest is found in the dining-room, a lofty apartment of most satisfying proportions, panelled throughout and richly carved in the manner of Grinling Gibbons. A tour was made of the gardens, which occupy a hilly site, and give rise to a long series of terraced parts, while fine views of the surrounding country are thus obtained.

Architectural Societies.

GLASGOW ARCHITECTURAL ASSOCIATION.—The annual business meeting of the Glasgow Architectural Association was held in the Rooms, 187, Pitt-street. The President, Mr. James Lochhead, A.R.I.B.A., occupied the chair. Reports were read by the Secretary, Treasurer, and Librarian, which showed the working of the past session to have been very satisfactory. The membership has increased by twenty-three during the session, and four gentlemen were nominated for election. Office-bearers for the ensuing session were appointed, with the following results:—Mr. Lochhead was re-elected President. As Vice-presidents, Mr. James McKissack and Mr. Alex. Wingate were re-elected. The Hon. Secretaries, Mr. Stephen Adam, jun., and Mr. Alan G. McNaughtan, were again appointed. Mr. E. D. Smith was re-elected Hon. Librarian, and the new Council consists of Messrs. Whitelaw, Blain, Davie, Dewar, Malcolm, Baxter, and Wyllie.

Archaeological Societies.

EAST HERTS ARCHAEOLOGICAL SOCIETY.—The East Herts Archaeological Society visited Ware and the Thunthridge district recently in connexion with their first excursion this year. The contingent from Hertford started at 9 o'clock and met the other members of the party at Ware Parish Church. The Vicar (the Rev. Canon Appleton) had compiled a paper on the church, but in his necessary absence it was read by the Curate (the Rev. H. M. Rose). Mr. R. T. Andrews informally supplemented the paper with a few notes he had brought with him. A few yards back along the High-street brought the party to the premises occupied by Mr. R. W. Harradence. Remains of ancient buildings had been discovered at the rear of Mr. Harradence's establishment, and were at first believed to be those of an alien Benedictine Priory. Mr. H. P. Pollard had ransacked the records, and obtained copious information concerning this priory, but a few days ago the real site was found to be at Dr. Boyd's house. Several of the party climbed up to the lofts over the stables, and found the traces of blocked-up windows, doorways, and posts; and Mr. Pollard, at the close of his paper, suggested that it may have been the site of a guild. The excursionists then drove to Wadesmill, and arrived at "Chelings"

and "Rennesley Gardens." Here is a moated mound surmounted by trees; the plantation designated "Gardens" is probably the site of the manor-house. The party having assembled on the mound, Mr. G. Aylott read a paper on the subject. The archaeologists then proceeded to Thunthridge Old Church, of which only the tower (decorated) remains. The building ceased to be used for Divine worship about fifty years ago, and the present church superseded the old one, which is at a considerable distance from the village. Part of the building material was used in the erection of Sacombe Church. The fabric was Norman and Early English, and the features of interest comprise a Norman doorway (mutilated) and a curious ornament inserted in the tower wall. The Vicar (the Rev. P. R. Allnut) read a paper in which he discussed the derivation of "Thunthridge." The church was dedicated to St. Mary and All Saints, and consisted of a nave and chancel, separated by a Saxon arch. The embattled tower at the west end was surmounted by a tall spire. The registers date back to 1556. A few yards outside the churchyard stands a curious object, namely, a tall chimney-stack. This is a vestige of a Tudor building, the history of which was told by Mr. W. B. Gerish. The Manor of Thunthridge seems to have been from very early times subordinate to that of Ware. Chauncy traces its various possessors from the time of Edward III., which include members of the Disney, Hamsterly, and Pery families, until it came to the Gardiners (*temp.* Henry VII.), several of whose tombs are still in evidence in the long-neglected churchyard. Thunthridge Bury is stated to have been erected in the reign of Henry VIII., possibly by Henry, the first of the Gardiners. After four generations had in turn possessed the estate, we find it in possession of Edward Gardiner, a contemporary of Sir Henry Chauncy, who refers to him more particularly. The estate continued to be held by the Gardiners, although they had ceased to live at the Bury, until January, 1811, when John Gardiner sold it to Mr. Daniel Giles, who shortly afterwards sold it in lots to be taken down. The last occupants of the old mansion were the Hollingsworths. A writer in the *Gentleman's Magazine* for 1871, who signs himself "P.," gives an interesting description of the house. The fine avenue of elm-trees which formed the carriage-drive to the mansion parallel to the River Rib still exists. The brick wall, about 8 ft. high, which separates the churchyard from the old park still remains fairly perfect, and about 25 yds. distant is a stack of chimneys, the sole remaining fragment of Thunthridge Bury. The stack in question rises to a height of about 45 ft., and is 11 ft. 8 in. wide at the base and 4 ft. 3 in. in depth. It is supported in the centre of the south side by a massive brick buttress, 22 in. thick, which rises almost to the top. Many conjectures have been made as to the reason for thus carefully preserving this relic of the ancient house (which was especially reserved from destruction at the time the rest of the house was sold for its materials), the local tradition being that the rent-charge of 2l. per annum upon the Thunthridge estate would lapse if the sole remnant of the house were allowed to collapse. The correct explanation is, however, that Thunthridge Bury possessed a pew in Thunthridge Church, and when the old house was pulled down, Mr. David Giles left the chimney in order to preserve the right to his seat in the church. The theory that a house is in existence while the chimney-stack stands is not confined to Hertfordshire. Proceeding to Youngsbury, the party inspected the bath-house, and then wended their way to the excavated tumulus. Here Mr. H. C. Andrews read a paper, by Mr. E. E. Squires, principally extracted from Sir John Evans's article in *Archæologia* descriptive of the opening of this barrow in 1899, together with some remarks on another one close by. Mr. Andrews also read a paper, which had been compiled by Mr. F. C. Puller, on the Roman villa at Youngsbury. In the shrubbery at Youngsbury, he said, about 300 yds. W.N.W. of the tumuli, stood a Roman villa. The site of this was opened in 1890. Foundations were discovered, chiefly composed of flints embedded in mortar. The only brickwork that was unearthed was a circular pit about 2 ft. in

diameter and 2 ft. 6 in. deep. It was suggested that this might be part of some kind of heating apparatus. Several tesserae were found, but no trace of the tessellated pavement which is known to have existed, to some extent intact, about 1750. A few oyster shells and a bone pin were found, but very little else. The excavations were afterwards filled in. In 1903, while some levelling was being carried out on the lawn, a rubbish heap was discovered about 75 yds. south-west of the villa. Its area was about 20 ft. by 10 ft., and thickness 9 in. to 12 in.; depth below surface of ground about 15 in. Throughout its extent the ground was blackened by wood ashes. A large number of broken fragments of pottery were found, chiefly of rough brown or black ware of many shapes and sizes; there were also a fair number of buff-coloured and reddish fragments, and a few pieces of glazed red Samian ware. Two other smaller patches containing pottery were found near by, each about 4 ft. diameter. Five hundred yards south of the villa on the north bank of the river is a bath-house containing a small swimming-bath, fed from below by a strong spring. The bath is 10 ft. long, 6 ft. 7 in. wide, and 5 ft. deep. The overlow level 4 ft. 7 in. above the bottom of the bath. It is entered by a flight of six steps outside the bath itself and at one end of it. So far as can be seen, all the work is of comparatively modern date. It is possible, however, that the present bath owes its being to a previously existing Roman bath, and that it is copied from, or even built upon, remains of a Roman structure. The following reasons give some support to this proposition:—(1) the proximity of the villa; (2) the building of a bath on such a spot would be quite in accordance with Roman customs; (3) the shape of the bath is similar to baths of known Roman origin; (4) from the bath-house a path leads some distance up the hill, pointing nearly in the direction of the villa; the line of the path produced passes 20 ft. east of the rubbish heap and 100 ft. west of the discovered foundations of the villa. On the other hand, it is believed that before the present house at Youngsbury was built another house existed more or less in prolongation of the line of the path. It is equally or more probable, therefore, that the path was made long after Roman times. Supposing it to be of Roman origin, it is impossible to say in what state it remained between its abandonment by the Romans and the building of the present structure, but possibly its excellence as a spring caused it to be always maintained in some degree of preservation. At the conclusion of the papers Mr. H. C. Andrews proposed a vote of thanks to Mr. Giles Puller and Miss Puller, who had welcomed the Society and afforded them facilities to visit the features of interest. Before leaving Youngsbury the fragments of pottery, etc., which had been unearthed, were inspected in the house. The party then drove to Standon Lordship. A Tudor mansion was erected here in 1545 for Sir Ralph Sadler, but only a small portion survives in the existing house. The history of the house and its owners was related by the Rev. Edwin Burton, D.D., Vice-President of St. Edmund's College. The excursionists then returned homewards.—[Compiled from the *Hertfordshire Mercury*.]

EAST RIDING ANTIQUARIAN SOCIETY.—The members of the East Riding Antiquarian Society held their first summer excursion on the 13th inst. The place of visitation was Easington, the members proceeding by the morning train from Paragon Station, duly arriving at Withernsea a few minutes before eleven o'clock. Here waggons were brought into requisition for the continuance of the journey. The party proceeded to their rendezvous *via* Holmpton, when they were met by the Rev. E. Maule Cole, F.G.S., who acted as conductor. An inspection was made of the encroachments of the sea between Ten Chain-lane end at Easington and the Kinsea Beacon, where the results of the recent inundations were clearly manifest by the barren and wasted appearance of the land, which had been previously promising fields of corn and meadow. The evils of land drains for wearing away the cliff were shown, and the long trenches washed away by the water drip. At the Beacon the Rev. E. Maule Cole gave a short lecture on the

formation of boulder clay, which is here of a very shaly nature. It is apparently the base of the lower purple clay, the true basement clay having sunk beneath the sea level a short distance south of the Beacon. The formation of the clay was dealt with, and an excellent illustration of the wear during the glacial period was discovered on the surface of a small boulder. A return was made to Easington, where the church was inspected. An old detached piscina was viewed with interest in the church, it being possibly the only one of its kind in the district. The date of this interesting relic was estimated at about 1120, during the period when the chances of the old pre-Reformation churches were composed of wood or mud. The visit to the old church was made doubly interesting by the fact that the north aisle was undergoing restoration. This portion of the building shows great antiquity, having been rebuilt about 1190. A curious discovery had been made, being the use of old stone coffin lids, which had been utilised for the tops of the windows, the floriated crosses being distinctly discernible. A very fine Norman door was viewed at the north side. The party also visited the old Tythe Barn. This building, which is of the aisle type, is about the last of its kind, the date of its erection being put down as 1272. The thatching is in a bad state of repair, and the members passed a resolution asking the authorities to restore this part of the place, for the preservation of such an interesting relic. Easington is one of those villages which appear full of things in which an antiquary takes a delight. Old coins are found here, as well as fragments of Roman pottery, some of which were inspected. Mr. G. Alles, of Withernsea, exhibited a fine specimen of a mediæval signet-ring and an excellent drawing of the Sotteleur tomb slab at Welwick. A good example of the Hylton lustre and transfer pottery was procured in the village. The party proceeded on to Welwick, where the church, which has been recently restored, received the chief share of inspection. The shrine was an object of interest, and a discussion as to whether it had occupied another building arose, this beautiful piece of work being placed in a somewhat outlandish position for a permanency. The pulpit, which had been restored, was inspected. This piece of church furniture is dated 1618. The old screen, which is also being restored, has not yet been placed in the church. An old Bylawman's minute-book of Welwick, Weeton, and Plowland was also scrutinised. It dates from 1651 to 1764, and contains reference to Pensthorpe and Northerne, two of the lost towns of the Humber. The party next proceeded to Patrington, where afternoon tea was served. Subsequently a visit was paid to the fine old rural cathedral of Holderness (St. Patrick's), when its many objects of interest were surveyed. The members returned to the city by the 5.57 train from Patrington.—*Eastern Morning News*.

Competitions.

LIBRARY, HOVE.—A decision has been arrived at concerning plans for the Hove Library. The first competition among architects was abortive. Mr. John Belcher, A.R.A., as assessor, has reported on the ten sealed designs submitted in the second competition, for premiums of 50*l.*, 30*l.*, and 20*l.* He reports that many of them present excellent features, and that all show evidence of having been carefully thought out. After a careful study of their respective merits he places first No. 10A, and believes it will be found to be a most convenient and workable plan. No. 9A, placed second, "possesses many merits, and has also a good plan and elevation." No. 5A is placed third. On the envelopes being opened, it was found that the first three were: (1) Messrs. Percy Robinson & W. Alban Jones, 53, Albion-street, Leeds; (2) Messrs. A. J. Hardwick & Sydney E. Castle, Kingston-on-Thames; (3) Mr. Lionel U. Grace, 30, John-street, Bedford-row, London. The Library Committee have considered the designs, and, agreeing with the decision of the assessor, recommend the Council to approve his award, and that the design No. 10A, placed first, be selected as the design for the building to be erected.

HOSPITAL, STONE.—At a recent meeting of

the Stone Joint Hospital Board, the Acting-Clerk, Mr. W. W. Wynne, read correspondence which he had had with the Local Government Board and the Royal Institute of British Architects on the subject of the appointment of an assessor to consider the plans of the proposed new hospital, and reported that the President of the Institute had nominated Mr. W. A. Pite, of London, as the assessor.

Books.

British Canals: Is Their Resuscitation Practicable? By EDWIN A. PRATT. (London: John Murray, 1906).

Now beginning to end this is a most interesting book, which, although coming from the pen of a writer who appears to be strongly biased in favour of railway as opposed to canal traffic, is by no means an unwelcome contribution on a subject now occupying the attention of a Royal Commission and of the commercial and industrial classes throughout the country. We need not here dwell upon the historical aspects of the canal problem, nor deal at length upon the gradual decline of canal traffic in the face of railway competition. It is admittedly a fact, as the author says, that the canals constructed in the XVIIIth century "played a most important rôle in developing the trade, industries, and commerce of our country," although rates were excessively high, and the railway system was welcomed by traders "as a means of relieving them from what had become the intolerable monopoly of the canals and waterways." At the beginning canals and railways alike were designed to serve purely local purposes, and through traffic was scarcely contemplated. After a time the railway companies began to amalgamate and to co-operate one with another until a general system became available for the whole country. Canal proprietors, on the contrary, made practically no attempt to link up their waterways, and, after a period of rate-cutting, entered upon that down-grade which led to the condition of things known to everyone in the present day. Mr. Pratt vigorously contests the theory that the decline of our canals is due to their having been "captured" and "strangled" by the railway companies, and cites various statements in support of the opinion that, instead of being anxious to kill off moribund competitors, the railway companies were practically driven into the purchase and control of canals against their own will. This is a point upon which there is some difference of opinion, but, in any event, the fact, as stated by the author, is that by the middle of last century "about one-third of the existing canals had been either voluntarily acquired by or forced upon the railway companies." Mr. Pratt does not believe that railway ownership and control has been in any way prejudicial to the British canal system, and he devotes two entire chapters to an account of the efforts made by railway companies for the maintenance of their canals and the encouragement of canal traffic. The author omits to mention the fact that while through tolls are readily arranged by independent canals there is considerable difficulty in obtaining the same facilities upon canals owned by railway companies. That is not the way to encourage traffic. The elaborate defence of railways which occupies nearly one-half of the book does not bear upon the problem of to-day, for however well individual canal sections may be managed they cannot be expected to pay as isolated units. In succeeding chapters the author seeks to show that, even if the canals of the country were revived on a modern basis, no great use would be made of them under existing conditions of trade, and that, owing to difficulties connected with differences of level, water supply, and finance, any general resuscitation is altogether impracticable. In his book Mr. Pratt does not lead up to these conclusions by any judicial weighing of *pros* and *cons*. His method is the far less troublesome one of starting with ready-made conclusions and of supporting them by the selection of corroborative opinions from various sources. We are quite prepared to admit that the questions of levels and water supply constitute serious problems so far as concerns some existing canal routes, which

may possibly have to be abandoned or left in their present condition. But nothing said in this book should discourage further inquiry into the whole subject, and we believe that a judicious scheme for reviving the most important routes along canals and rivers, with new connexions as may be found necessary, should be attended with financial success. It would be quite another matter to attempt the general resuscitation of all the old canals without making allowance for altered conditions, and we may be sure that nothing so foolish will be recommended by the Royal Commission. The author, with iconoclastic zeal, would sweep away canals altogether, and recommends as an alternative to proposals which he regards "as more or less quixotic," the further encouragement of the railway system by the relaxation of Parliamentary regulations, the reduction of local rates payable by railway undertakings, and the co-operation of traders and agriculturists in such a way as to avoid the disadvantages of unremunerative "light loading." Although evidently written in the interest of the railway companies, the book is well worth reading, partly because of the interesting matter it contains, and partly for the reason that in some respects it may act as a corrective to the over-sanguine representations and arguments put forward by some canal enthusiasts, who look only at the question from their own standpoint, and are insufficiently acquainted with the difficulties that have to be faced.

Concrete Block Manufacture: Processes and Machines. By HARMON HOWARD RICE. (New York: John Wiley & Sons; London: Chapman & Hall, Ltd., 1906.)

NO INDUSTRY in modern times has developed with greater rapidity than that represented by the manufacture of concrete blocks for building purposes. In the United States solid and hollow concrete blocks have taken a place among recognised materials of construction, being regularly produced by numerous manufacturers and obtainable in the open market just as readily as ordinary bricks. Up to the present they have scarcely established a footing in our own country, but as machinery is now obtainable for their production in all requisite forms, it is probable that concrete-block building will soon become a feature of British architecture. The subject is one that may well be commended to the attention of architects, whose guiding influence may be usefully directed to the avoidance of those defects which characterised the early stages of the industry in America where, as Mr. Rice says, there was "a lack of recognition on the part of block-makers and machine manufacturers of those principles of symmetry and decorative fitness which can alone result in a building beautiful to one trained to judge of beauty from the viewpoint of the architect." In another respect, architects have an opportunity of performing useful service, for, at the very commencement of the new industry, they can insist upon the adoption of suitable mixtures of concrete, the proper manipulation and testing of blocks during manufacture, and the establishment of standard and generally consistent sizes of blocks for ordinary purposes. These points all receive judicious treatment in Mr. Rice's book, wherein several chapters are devoted to the preparation and use of concrete, and others deal with matters connected with the manufacture and testing of blocks, causes of failure, and the cost of production. In different parts of the book some useful hints will be found as to the best means of securing pleasing tints and surfaces for facing blocks. In respect of colour, the author is quite right in deprecating the employment of pigments which are always liable to fade in process of time, and, if used in sufficient quantity to produce the desired colour and to prevent fading, have the effect of weakening the concrete. The regulation of tint by the careful selection of aggregate is the only unfailing method of obtaining concrete of fixed colour, and of avoiding that plaster-like appearance characterising artificially-coloured material. Two of the most useful chapters in the book are those containing the specification drawn up by the City of Philadelphia for testing hollow concrete blocks, and a review of the building regulations, applying to the same material, adopted by the municipal authorities of Philadelphia, Denver, Minneapolis, and Newark.

A short chapter on "Architecture" deals with the possibility of architectural effect in concrete-block buildings in a very sensible manner. It is pointed out that makers who have put forth what they call ornamental concrete blocks have not realised that such things are not to be used all over a wall, but as an emphasis in certain suitable positions, and that the mere assemblage of blocks with a definitely-marked jointing is an important element in the effect of a wall surface. "In this connexion nothing is more valuable than a careful study of some of the structures of the Italian Renaissance; and the accentuation of mortar-joints in some of the block-stone rustications of that period is of especial interest to the progressive block-maker of to-day." This is good sense and shows a true perception of the problem. We do not see why very good architecture should not be built from concrete blocks, with a type of decoration (where required) suitable for cast detail; though we will not say that we would accept it willingly as a substitute for stone.

A Précis of the English Law Affecting Landlord and Tenant. By LAWRENCE DUCKWORTH, Barrister-at-Law. Second edition, revised and enlarged. (London: Effingham Wilson; 1906.)

THE fact that the first edition of this little handbook was only issued in 1904, and that a second edition has been found necessary in two years, proves that it has been appreciated, and that it meets a felt want. The work has been brought well up to date, and, in the limits of its 148 pages, contains much information most useful to the layman without attempting too great detail, and the author has wisely devoted a further thirty-two pages to what he has justly called "an exhaustive index," which much adds to the value of the book. The statement at the foot of page 108 as to the rights of owners of ancient lights appears to us hardly sufficiently modified by the reference in a note to the decision of the House of Lords in *Colls v. Home and Colonial Stores*, and therefore to be slightly misleading, but this subject of easements is purely incidental to the subject treated of in this volume, which answers the description given it on the title-page, "A précis" of the law affecting landlord and tenant, clearly expressed.

Electricity in Homes and Workshops. By S. F. WALKER, M.I.E.E. Fourth Edition. (London: Whitaker & Co. 1906.)

THE author states in his preface that the book is written for the practical man—that is, "the man who, in some form or other, has to get his living by the aid of electricity." He discusses electric bells, telephonic apparatus, electric lighting, heating, and power transmission. The book is a great improvement on the earlier editions, and contains much that will be helpful to those desiring a practical knowledge of the subject. The first chapter, however, which is headed "A Glossary of Terms," is unsatisfactory. The definitions are not rigorous; there are also several errors and misprints.

Practical Painters' Work. Edited by PAUL N. HASLACK. (Cassell & Co.)

THIS is, as its name implies, mainly a work of practical information as to painters' tools and pigments, and is in that sense a useful little book. The chapter on colour combination may be useful in its two diagrams showing in an outer circle the series of colours and in the effects respectively of mixing them with white, or mixing them with their complementary colour; this will be an aid to beginners as to what to expect in mixing; but the directions for producing harmonious colour effects are not very convincing; and in fact rules and recipes on this point are of no use; the treatment of colour is a natural or acquired artistic perception, not a science.

BOOKS RECEIVED.

REASON IN ARCHITECTURE: Lectures delivered at the Royal Academy of Arts in the year 1906. By T. G. JACKSON, R.A., F.S.A. (John Murray. 10s. 6d.)

ELECTRIC WIRING: A primer for the use of Wiremen and Students. By W. C. CLINTON, B.Sc. (John Murray. 2s.)

Trade Catalogues.

MESSRS. DORMAN, LONG, & CO., of Middlesbrough, send us their newly-published "Pocket Companion," containing useful data and tables pertaining to the use of steel manufactured at their works. The "Companion" takes the form of a neatly-bound volume of 267 pages, and is in every way superior to the handbook formerly issued by the same firm, and which was once the best commercial guide of its kind in Great Britain. During recent years, however, several firms in the steel trade have brought out excellently-arranged books giving useful information relative to structural steel, with the usual stimulating results. The manufacturing establishments of Messrs. Dorman, Long, & Co. now include the Britannia Steel Works and Rolling Mills, the Clarence Steel Works and Rolling Mills (for many years associated with the name of the late Sir Lothian Bell), the Cleveland Wire Works, and the Ayrton Sheet Rolling Mills, all situated in the vicinity of Port Clarence, Middlesbrough. The object of the pocket-book is to furnish a complete account of the various forms in which iron and steel are produced at the works mentioned, and to present technical information in accordance with the best modern practice. We observe with satisfaction that the British Standard Rolled Sections have been adopted by the company, and that, as far as possible, the details of constructional work have been standardised with the object of facilitating deliveries and insuring economy. There is so much interesting matter in the new handbook that we cannot possibly refer to it in detail, and must be content with a general mention of the chief sections into which the work is divided. After a complete catalogue of rolled structural steel sections, the dimensions and properties of simple and compound beams are tabulated, similar treatment being adopted in the case of stanchions and struts, concerning which the data now given are very complete, and for this reason far more satisfactory than the somewhat meagre references in the previous handbook. Then follow details and illustrations of bases, caps, and joints for stanchions and of standard beam connexions. A series of notes on roofs, with diagrams of trusses and typical connexions, and some notes on troughing and its application to bridge design complete the first portion of the book. In the succeeding sections there are detailed particulars of corrugated, curved, and plain steel and iron sheets and fittings of different kinds, of steel wire for fencing, cables, and electrical work, and of the different qualities of steel produced in ingots and other forms at the Clarence Works. Finally we have about seventy pages of general information, formulae, and tables, constituting a really serviceable collection of useful data. The book is provided with a comprehensive index, and will be found of much assistance to architects and those engaged in structural engineering.

We have received from the General Electric Company, of Queen Victoria-street, slips announcing an advance in the price of nearly all electrical supplies. They also send us a list of electric-light fittings and fixtures which, as they are not illustrated in their present catalogue, they are offering for sale at greatly reduced prices. In their "General Progress" sheet for June they show a "security" lamp-guard. There are many cases where it is desirable that no unauthorised person should be able to remove a lamp from its holder. This simple and ingenious appliance effects this object perfectly, and as there is no cap to obstruct the light it ought to prove useful. Improvements have been made in the well-known "link" branch switch. It is now supplied with a roller movement, and its action is therefore more rapid and decided.

Mr. C. D. Monninger sends us his 1906 illustrated catalogue of wood-working machinery and tools. Band-sawing machines and appliances for brazing, setting, and sharpening band saws are described in considerable detail, and the enumeration of other useful auxiliaries occupies nearly half the book. The latter portion contains particulars of circular-saw benches, log-saws, and moulding, mortising, boring, dovetailing, fluting, planing, and sundry machines particularly

adapted to the requirements of cabinet-makers and joiners. Attention should be given to the excellent selection of hand-guards for sawing, planing, and moulding machines illustrated in this catalogue.

We have received from the Caron Company a leaflet containing illustrations and prices of seven varieties of their "Radiant" and "Esto" firegrates. The firelump hacks are of the "Teale" shape, and economisers or frets and adjustable canopies of ordinary types are provided in front of the grates. The two special features are the shape of the bottom gratings and the adjustable trivets. The bottom gratings are concave from front to back, the back being some inches higher than the front, and the trivets are pivoted so that they can be turned up to form front bars or placed horizontally to form front hobs. Ornamentation is carried to excess, particularly in the trivets, but, from a practical point of view the grates will probably be successful. In the "Esto" fire the trivets are omitted.

Mr. F. Wallis Stoddart (Bristol) has sent us some leaflets showing his "New Pattern" distributor for sewage filters, the improvement consisting in the method of fixing the distributors to the sewage channels in order to secure more accurate adjustment.

Bishop's Safety Tread Company manufacture a tread which is applicable to new and old stairs, and which has much to recommend it. The wearing surface is of Limmer Rock asphalt, and this is compressed in a metal frame to which a re-enforcement of expanded metal is attached. The treads are made at the company's works to any size, and can be easily and quickly fixed.

Messrs. John Harper & Co. (Willenhall) have sent us a copy of their new catalogue of ironmongery, including window and door furniture, cistern and gutter brackets, hat and coat seats, etc. It is interesting to note that the dimensions are given in inches and millimetres, and the weights in pounds and kilogrammes. Another catalogue from the same firm shows their "Domestic Hardware Novelties," but it is impossible to speak highly of the quality of the designs.

We have received from Mr. John Jones a copy of his new catalogue of cast-iron drainage fittings, which includes illustrations and prices of some excellent intercepting and other traps, inspection-chamber bottoms (each in one casting), inspection chambers with airtight covers, channel-bends, gullies and rain-water shoes, drain-pipes and soil-pipes, penstocks, manhole covers, air inlets, etc. The catalogue contains 100 pages, and is fully illustrated, and provided with a good index. Altogether it is one of the most useful catalogues of cast-iron drainage fittings which we have received, and cannot fail to be appreciated by architects and sanitary engineers.

Messrs. Morrison, Ingram, & Co. (Swadlincote and Manchester) have sent us a sample and description of their new "Densitas" ware as used for water-closets, sinks, and other sanitary fittings. It is a hard, cream-coloured ware of great strength, and is supplied either cane-glazed or white-enamelled.

Correspondence.

STEYNING CHURCH.

SIR,—Allow me to correct an error in the article on Steyning Church. The arms on the tablet are those of Michell or Michael (a chevron between three escallops), an old Sussex family. Jonas Michael was a "Clerk," i.e. clergyman, and was Vicar of Steyning at the period named (A.D. 1613)—*vide* the old Churchwarden's Book.

W. POWELL BREACH
(Member of Council Sussex A.S.)

WESLEYAN CHAPEL, EYAM.—A new Wesleyan chapel is in course of erection at Eyam. It is being built throughout of Ribley wood stone, and will provide seating accommodation for 180 worshippers. Mr. H. White is the builder, and Mr. Frank W. Chapman the architect of the work. FACTORY, HULL.—Under the heading "General Building News," page 681 of our issue of June 16, under the sub-heading "Factory, Hull," a short description is given of the National Radiator Company's new works, where it is mentioned that the zinc work is being carried out by Messrs. Hewitt & Sons. We understand that the contractors for the zinc work are Messrs. Ewart & Son, Ltd., of London. The mistake was not ours.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XXIV.

THE SLIDE-RULE IN TECHNICAL CALCULATIONS (concluded).

BEFORE leaving Invention and Evolution, it may be useful to point out the manner in which the slide-rule is employed for raising numbers to any required power, and for extracting any required root.

Various Powers and Roots.—For raising numbers to powers and for extracting roots other than those hitherto considered, it is usually necessary to employ the logarithmic method described in Article XIV., pp. 411-12.

As the slide-rule is furnished with a scale by the aid of which the mantissa of the logarithm of any number can be instantaneously obtained, it can be used as a substitute for a table of logarithms.

Rule (1).—To find any given power or root of a number, set the L.H. index of scale C to the given number on scale D; turn over the rule and read the required mantissa above the lower index mark in the right-hand slot at the back of the rule. Prefix the characteristic mentally, set the L.H. index of the slide to the complete logarithm on scale D, multiply or divide it by the index of the given power or root. Then, turning over the rule, bring the mantissa of the product or quotient to the lower index in the slot, and read the result on scale D below the index of scale C. When the decimal point has been adjusted as demanded by the characteristic of the logarithm the value is that of the required power or root.

This explanation takes far longer to read than the operation to perform, as will be found by the following examples.

Example (1): Find the value of $3 \cdot 274^{17}$.
Set L.H. index of C to 3274 on D, read \log = 515 on back of slide. As the complete \log $3 \cdot 274 = 0 \cdot 515$, set L.H. index of C to 515 on D, bring cursor to 17 on C, and read 875 on D. Bring 875 on \log scale at back of slide to the index mark, and read 75 on D below the index of C. As the *char* is still 0 the required power = 75, the value calculated by Tables XIV. and XV. being 7508.

Example (2): Find the value of $\sqrt[3]{1179}$.
Set L.H. index of C to 1179 on D, read at back of slide \log 1179 = 072. As complete \log 1179 = 3 072, set 5 on C to 3072 on D, and read quotient 6148 (= 06148) on D below R.H. index of C. Bring 6148 on \log scale at back of slide to the index mark, and read 412 on D below L.H. index of C. As the *char* of the quotient was 0, the required root = 412, the value by Tables XIV. and XV. being 4114.

Trigonometrical Functions.
We have next to consider the practical application of the trigonometrical scales at the back of the slide. The graduation of these scales has already been described and illustrated in Article XX., and the uses of the scales are stated below.

Sines of Angles.
Rule (2).—To find the value of any natural sine. Withdraw the slide, replace it in the groove so that scale S is coincident with scale A, and over the given angle on S read the value on the sine on A. If found on the left-hand half of the scale, the first significant figure is in the *hundredths* place, and if on the right-hand half in the *tenths* place.

Example (3): Find the values of (1) $\sin 0^\circ 40'$, (2) $\sin 5^\circ 45'$, (3) $\sin 14^\circ 10'$, (4) $\sin 30^\circ 0'$.
Results: (1) 0 0116, (2) 0 10, (3) 0 245, (4) 0 5.

Rule (3).—To find the value of any natural sine. Using the scales in normal position, set the given angle on scale S to the upper index mark on the R.H. slot at the back of the rule, and read the value of the sine on scale B under the right-hand index of scale A. If found on the left-hand half of scale B, the first significant figure is in the *tenths* place, and if on the right-hand half in the *hundredths* place.

Example (4): Find the values of (1) $\sin 1^\circ$, (2) $\sin 2^\circ 50'$, and (3) $40^\circ 20'$.
Results: (1) 0 01745, (2) 0 0495, (3) 0 65.

Owing to the progressive decrease in the length of the graduations towards the end

of scale S, the accuracy of results decreases very much as the values of the angles increase. Consequently it is often desirable, and sometimes necessary, to perform the workings nearer the beginnings of the scales.

For this purpose the required sine is calculated in accordance with the equation:—

$$\sin \theta = 1 - 2 \sin^2 \left(\frac{90 - \theta}{2} \right)$$

Example (5): Find the value of $\sin 80^\circ$.
Using scale S as in Rule (1) we read on scale A, $\sin \left(\frac{90 - 80}{2} \right) = \sin 5^\circ = 0 \cdot 08742$ and find, by scales D and A, $0 \cdot 03742^2 = 0 \cdot 00762$. Then $1 - (0 \cdot 00762 \times 2) = 0 \cdot 98476$. Using scale S as in Rule (2), we find $\sin 5^\circ = 0 \cdot 08742$ on scale A and, without moving the slide, read on scale B, $0 \cdot 08742^2 = 0 \cdot 00762$. Then $1 - (0 \cdot 00762 \times 2) = 0 \cdot 98476$, as before.

The constants ρ and ρ'' on scales C and D (Fig. 16) are used for finding the values of the sines of small angles expressed in minutes and seconds, respectively, as follows:—

Place the constant on one scale opposite the figure representing the number of degrees in the given angle on the other scale of the pair to be used, and read the value of the sine opposite the index of the scale on which the constant is marked.

Example (6): Find the value of $\sin 0^\circ 5'$.
Set ρ on C opposite 5 on D and read 0 001454 below L.H. index of C.

Example (7): Find the value of $\sin 0^\circ 0' 5''$.
Set ρ' on C opposite 5 on D and read 0 0000212 below L.H. index of C, or bring 5 on C opposite ρ'' on D and read 0 0000242 above L.H. index of D.

Rule (4).—To multiply the sines of angles turn over the slide so that scale S is next to scale A, and proceed as in ordinary multiplication.

The following are rules for determining the number of digits to the left (or ciphers to the right) of the decimal point in the product. Let P = number of digits in the product, and n the number of digits in the multiplier. Then

- (a) $P = n - 2$ when the product is found to R.H. of multiplier and in the same half of scale A.
- (b) $P = n - 1$ when the product is found to R.H. of multiplier, but in the other half of scale A.
- (c) $P = n - 1$ when the product is found to L.H. of multiplier, but in the other half of scale A.
- (d) $P = n$ when the product is found to L.H. of multiplier, and in the same scale.

Example (8): Multiply (1) $5 \cdot 2^2$ by 2, (2) $5 \cdot 20^2$ by 2.

(1) Set L.H. index of S to 2 on L.H. of A and over 2 on S read 0 0693 on L.H. of A.
(2) Set L.H. index of S to 2 on L.H. of A and over 20 on S read 0 634 on R.H. of A.

Rule (5).—To divide numbers by the sines of angles, turn over the slide so that scale S is next to scale A, and proceed as in ordinary division.

The following are rules for determining the number of digits in the quotient. Let Q = number of digits to the left (or of ciphers to the right) of the decimal point in the quotient, and n the number of digits in the dividend.

- (a) $Q = n + 2$ when the quotient is found to the L.H. of the dividend, and in the same half of scale A.
- (b) $Q = n + 1$ when the quotient is found to the L.H. of the dividend, but in the other half of scale A.
- (c) $Q = n + 1$ when the quotient is found to the R.H. of the dividend, but in the other half of scale A.
- (d) $Q = n$ when the quotient is found to the R.H. of the dividend, and in the same half of scale A.

Example (9): Divide (1) 3 by $\sin 2^\circ$, (2) 60 by $\sin 20^\circ$.

(1) Set 2 on S to 6 on L.H. of A and over L.H. index of S read 172 0 on L.H. of A.
(2) Set 20 on S to 6 on R.H. of A and over L.H. index of S read 175 0 on L.H. of A.

Rule (6).—To divide the sines of angles by numbers, place the slide so that scale S coincides with scale A. Set the figure representing the number of degrees in the given angle on S opposite to the divisor on A, and

read the quotient on scale B below the index-mark at the back of the rule. If the slide projects to the left-hand, read the square root of the quotient on D, and square this on the front of the rule.

As a general rule more accurate results can be found on S below the R.H. or L.H. index of A, noting the values as obtained, and converting them to numerical equivalents by closing up the rule and reading as in Rule (2).

The number of digits in the quotient can easily be obtained by noting the decimal values of sines as stated in Rule (2).

Example (10): Divide $\sin 4^\circ$ by 20.
Set 4 on S to 2 on R.H. of A, turn over rule and read 0 0693 on B; or read $20^\circ 30'$ below R.H. index of A, close up slide and read $\sin 20^\circ 30' = 0 \cdot 0035$ on A.

Cosines of Angles.
When scale S has been placed in the rule so that it coincides with scale A, the cosine of any angle can be read by taking its complement on scale S in accordance with the relation $\cos \theta = \sin (90 - \theta)$.

The first significant figure of every value read on scale A is in the *hundredths* place if on the L.H. half, and in the *tenths* place if on the R.H. half.

Example (11): Find the value of $\cos 40^\circ$.
 $\cos 40^\circ = \sin (90 - 40) = \sin 50^\circ = 0 \cdot 766$.

Example (12): Find the value of $\cos 4^\circ$.
 $\cos 4^\circ = \sin (90 - 4) = \sin 86^\circ$ and as there is no graduation for this on scale S we proceed in accordance with the equation

$$\sin 0 = 1 - 2 \sin^2 \left(\frac{90 - \theta}{2} \right)$$

$$\cos 4^\circ = 1 - 2 \sin^2 \left(\frac{90 - 80}{2} \right)$$

Scale S gives $\sin \frac{90 - 86}{2} = \sin 2^\circ = 0 \cdot 0348$.

Scales D and A give $0 \cdot 0348^2 = 0 \cdot 00121$.
Then $1 - (0 \cdot 00121 \times 2) = 0 \cdot 9976$.

Tangents of Angles.
Rule (7).—To find the value of any natural tangent from $5^\circ 43'$ (approximately) to 45° .

Withdraw the slide and replace it in the groove so that scale T is coincident with scale D, and over the given angle on T read the value of the tangent on D. The values of the tangents so determined range from 0 1 to 1.

Example (13): Find the values of (1) $\tan 7^\circ 20'$, (2) $\tan 14^\circ 45'$, (3) $29^\circ 30'$, (4) $38^\circ 50'$.
Results: (1) 0 1257, (2) 0 2633, (3) 0 566, (4) 0 805.

Rule (8).—To find the value of any natural tangent from $5^\circ 43'$ (approximately) to 45° .

Using the scales in normal position, set the given angle on scale T to the index-mark on the left-hand slot at the back of the rule, and read the value on scale C over the left-hand index of scale D.

Example (14): Find the values of (1) $\tan 11^\circ 20'$, (2) $25^\circ 10'$, (3) $40^\circ 50'$.
Results: (1) 0 2, (2) 0 47, (3) 0 864.

Rule (9).—To find the value of any natural tangent from 45° to 90° . Withdraw the slide, replace it in the groove so that scale T is coincident with scale D; set (9) - 8) on scale T to the right-hand index of scale D and read the value of $\tan \theta$ below the left-hand index of scale T on D. The first turn of every result ascertain θ is to be taken as an integer.

Example (15): Find the value of $\tan 50^\circ$.
Set $90 - 50 = 40$ on T to R.H. index of D and read 1 192 on D below L.H. index of T.

The tangents of angles less than $5^\circ 43'$ differ very little in value from the sines of the same angles. Hence, for approximate calculations, scale S may be used in conjunction with scale A.

Rule (10).—To find the approximate value of any natural tangent less than $5^\circ 43'$, use scale S, placed next to scale A, and find values on scale A, taking a liberal reading for the last figure.

Example (16): Find the approximate values of (1) $\tan 4^\circ$, (2) $\tan 3^\circ$, (3) $\tan 1^\circ$.
Results by slide-rule: (1) 0 0699, (2) 0 0524, (3) 0 01744.

Values from Tables: (1) 0 0699268, (2) 0 0524078, (3) 0 0174551.

For the reason stated above, the constants ρ and ρ' on scales C and D can be used to find approximate values for the tangents of small angles expressed in minutes and seconds respectively. The procedure is the

same as that illustrated in Examples (6) to (9).

Cotangents of Angles.

Rule (11).—To find the value of any natural cotangent from 5° to 45° (approximately) to 45° , place scale T in the rule so that it is next to scale D, set the given angle on T to the right-hand index of D, and read the cotangent on D below the left-hand index of T. The first figure of every result so ascertained is to be taken as an integer.

Example (17): Find the value of $\cot 38^{\circ} 40'$. Set $38^{\circ} 40'$ on T to R.H. index of D and read 1.23 on D below the L.H. index of T.

Rule (12).—To find the value of any natural cotangent from 45° to $84^{\circ} 17'$ (approximately), place scale T so that it coincides with scale D, and read results on D opposite the complement of the given angles. All values so ascertained are decimal fractions.

Example (18): Find the value of $\cot 53^{\circ}$. The complement of 53° is $(90 - 53) = 37^{\circ}$, below which on T we find 0.733 on D.

Secants of Angles.

Rule (13).—To find the value of any natural secant, place scale S in the rule so that it is next to scale A, set the complement of the given angle on S to the right-hand index of A, and read the value over the left-hand index of S. The first figure of every result found on the left-hand half of scale A is to be taken as an integer, the first two figures of every result found on the right-hand half of scale A are to be taken as integers.

Example (19): Find the values of $\sec 60^{\circ}$. Set $(90 - 60) = 30^{\circ}$ on S to R.H. index of A and read 2 on L.H. half of A over L.H. index of S.

Cosecants of Angles.

Rule (13).—To find the value of any natural cosecant, place scale S in the rule so that it is next to scale A, set the given angle on S to the right-hand index of A, and read the value on A over the left-hand index of S. The first figure of every result found on the left-hand half of scale A is to be taken as an integer, the first two figures of every result found on the right-hand half of scale A are to be taken as integers.

Example (20): Find the values of $\csc 60^{\circ}$. Set 60° on S to R.H. index of A and read 1.15 on L.H. half of A over L.H. index of S.

All the foregoing rules and examples refer to the type of slide-rule illustrated in Fig. 16. In the case of instruments where the arrangement of the scales is different in minor details, some modifications of procedure are necessary, but such variations are so simple that no explanation is necessary.

LONDON FEVER HOSPITAL, LIVERPOOL-ROAD, N.

THE alterations which have just been completed are the first instalment of an entire recasting of the original hospital, as built from the plans of the late Mr. Charles Fowler in 1848.

The main wards, which still exist untouched on the female side, were double wards, that is to say—there were four rows of beds between the opposite windows, an arrangement which though much superior to most hospital work of the period, is now universally condemned. The sanitary offices were of the most meagre description—there was no proper disconnection from the wards, and there were no proper bath-rooms.

Some years ago a scheme was devised for rebuilding the whole hospital on modern lines, and part of the work has been carried out by the erection of a nurses' home, a diphtheria block, and a boiler-house, laundry, etc. The difficulty of getting funds and the necessity of doing something without further delay determined the committee to abandon the larger scheme and do what is possible to improve the existing buildings.

Half of the double ward has been removed, leaving a single ward for sixteen beds.

The windows have been carried up as near the ceiling as possible, without interfering with the existing arches, and have been brought nearer to the floor, thus giving better light and ventilation. A new ceiling has been put in below the old beams, which gives a level ceiling without any projections, and at the same time leaves less unventilated space above the heads of the windows. New Teale grates have been put in place of the old fireplaces, and the ward has been refloored with teak. New sanitary offices, properly disconnected, with a fixed bath and a place for a bath on wheels and all requisite fittings, have been erected, and the cross wards which run at right angles to the main ward have been rebuilt a story higher than at present.

These cross wards have their own sanitary offices and a balcony on the south and west sides is carried round at the levels of both floors, with access from each ward.

The upper floor over the main ward has been refloored, the lighting and ventilation improved, and a ward scullery with proper offices attached. The private wards in the front have been largely improved by lowering the ceilings and raising the windows, a bath-room has been formed between the two rooms, the floors have been relaid with teak, and new fireplaces inserted. A properly disconnected sanitary block has been built for these wards. The floors of all the ward kitchens and the sanitary blocks have been laid with terrazo, a jointless composition which has lately been introduced to this country. The walls are lined with white opalite tiles.

The next piece of work which is now being taken in hand is the erection of a block, partly one story, partly two stories, which will provide a new nurses' dining-room, servants' hall, stores, and rooms for ten servants. When this is completed the reconstruction of the female side will be taken in hand, and when finished the old wing, which was built to cope with an epidemic of fever in the metropolis, will be removed, and a block erected to provide accommodation for measles and German measles, and possibly additional isolation rooms.

The building work has been carried out by Messrs. Howell Williams, Ltd., the plumbing work by Messrs. Dent & Hellyer, the fireproof floors by Messrs. Mark Fawcett & Co., and the steam and hot water work by Messrs. Slater & Co. The grates by the Teale Fireplace Company, and the terrazo floors by Messrs. Bergthel & Young. The architects were Messrs. Keith D. Young and Henry Hall, of Bloomsbury, London, W.C.

Fifty Years Ago.

FROM THE *Builder* OF JUNE 21, 1856.

BRITISH SCULPTORS.

THE vote of 17,500l. agreed to by the Commune in committee of supply, for the Scutari monument, designed and executed by Euron Marochetti, and now on its way to the East, has excited much adverse comment. The Sculptors' Institute, as our readers may have observed, has addressed a memorial to Sir Benjamin Hall on the state of sculptural art in England, in which, guarding themselves against any imputation of illiberal jealousy, they deprecate the unmerited neglect into which native talent seems to have fallen, and submit that public competitions, before a committee so constituted as to give confidence both to artists and to the public, ought to be instituted, so that foreign artists might at least be made to enter into fair competition with those of England, the models of every competitor being publicly exhibited before selection by the committee. The memorial is signed by all the principal sculptors of this country. More than one eminent sculptor has stated that the sum paid for the Scutari monument, which certainly betrays no great stretch of genius, is exorbitant.

Illustrations.

NATIONAL PROVINCIAL BANK OF ENGLAND, GREAT YARMOUTH.

THIS building has been erected on the site of the old bank, and occupies a commanding position on the Hall Quay. It is faced with Ketton stone; the plinth, entrance, and columns to windows are of red Aberdeen granite.

The office, which is 20 ft. 9 in. in height, has a panelled teak dado 8 ft. high, above which the walls are divided into panels by Devonshire marble pilasters. The floors are of teak and marble mosaic, and the ceiling is moulded and decorated in panels. The accompanying plan shows the accommodation on the ground floor. In the basement is a heating chamber, and on the first floor rooms for the caretaker and store for old books.

The architect is Mr. Arthur S. Hewitt, of Great Yarmouth.

The illustration is from a photograph by Mr. F. H. Sayers, of Great Yarmouth.

THE PREMIATED DESIGNS FOR THE PEACE PALACE AT THE HAGUE.

We give this week illustrations of the perspective views of the six designs for the proposed Peace Palace which have been awarded premiums by the jury.

On the architectural character and plans of

these designs we have already commented. We give below the brief comments on each in the Jurors' Report; comments which, as observed in our first article in this issue, seem singularly vague and inconclusive, but represent all that we can gather as to the reasons for the awards and for the order of merit in which the designs are placed:

Design No. 25.

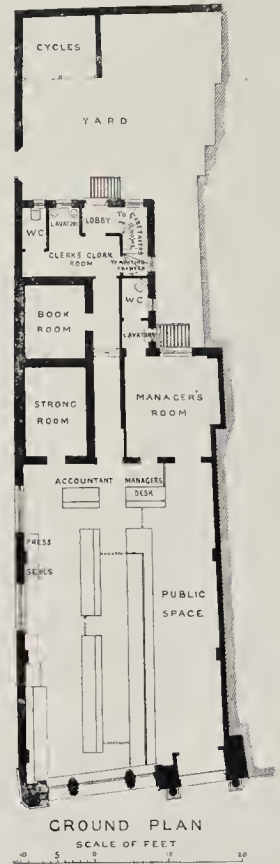

This design is an attractive one. Its author has considered that, inasmuch as the Hague has been chosen as the permanent seat of the Court of Arbitration, the building should in style follow the local traditions of XVIIIth century architecture. These considerations have finally prevailed with the majority of the jury.

This design somewhat emphasises the distinction between the Library and the Court of Arbitration, which is indicated by the programme, connecting them only by a corridor. But it has failed to give a sufficient unity of character to the two different portions of the structure.

Design No. 194.

In this design it is only the plan that has at all commended itself. Its general arrangement is very good, and is eminently that of a building standing in a park; the large rooms are well lighted by side windows, and in the rear part of the library rooms are admirably disposed around a garden, forming a kind of cloister.

But both in the plan and in the elevation the

National Provincial Bank, Great Yarmouth.

lines of the composition noticeably depart from the noble simplicity which should characterise a building devoted to the serious and dignified purposes of the Peace Palace, without at the same time evincing any special originality of treatment.

Design No. 132.

This design meets the requirements of the programme in a simple and straightforward way, though an undesirable amount of space is given to vestibules and corridors.

The exterior, though it exhibits a suitable dignity of character, is somewhat stiff and monotonous.

Design No. 17.

In the written memorandum which accompanies this design the author explains that a Palace of Peace, being something new, seems to him to require novel methods of artistic treatment.

FOURTH PREMATED DESIGN (NO. 17). BY HERR O. WAGNER, OF VIENNA.

PREMATED DESIGNS FOR THE PEACE PALACE AT THE HAGUE.

SIXTH PREMIATED DESIGN (NO. 130). BY HERR F. SCHWECTEN, OF BERLIN.

INK PHOTOGRAPHIC CO. L. 4. 5 EAST HINDING STREET FETTER LANE E.C.

PREMIATED DESIGNS FOR THE PEACE PALACE AT THE HAGUE

SECOND PREMIAED DESIGN (NO. 104). BY M. MARCEL, OF PARIS.

PREMIAED DESIGNS FOR THE PEACE PALACE AT THE HAGUE.

The result is interesting and is not without originality, and, though the plan is not without some particularly interesting or defined, and, while the exterior is greatly to be praised, both for its simplicity and for its lightness of character. But the round ends of the principal facade injure this effect, and the room of the Administrative Council on one side and a series of smaller rooms on the other are laid out only with rough colonnades.

The plan is well studied, and is distinguished from most of the others by a notable economy of space.

Design No. 130.
The exterior of this design is well composed, though not particularly interesting or defined, and, while the noticeably unsymmetrical plan shows some careful study, the small, narrow light-areas seem out of place in a building occupying an open site.

General Building News.

CHURCH, WALTHAMSTOW.—The new St. Columba Presbyterian Church was opened by the Mayress of Kensington on Saturday afternoon last week. Owing to the necessity of providing for the school that the rear for Sunday-school purposes, the problem of accommodating 500 persons with architectural effect on a site with a frontage out of proportion to the depth was not an easy one to solve. The difficulty was met by planning the church in the form of a square, each side measuring 32 ft., with a semi-circular gallery running round two sides, and the pulpit and rostrum in one angle. The seating on the ground floor is octagonal in form, and in the gallery semi-circular, the whole facing the pulpit with the least possible interruption of view by columns. The gallery is supported on columns, but the roofing is in one span formed with four arched lattice girders, and four angle ditto. The ceiling is diagonally boarded. The main flooring, faced with maple wood blocks, is formed with a fall of 15 in. to the rostrum, and the pews, out of Orham wood, are 2 ft. 10 in. apart, and 20 in. deep, and are cast-iron. A large front vestibule has been provided communicating with inner porches so as arranged to prevent cold currents of air from entering the building. The staircase to the gallery is constructed with fireproof material, and the stairs are formed with iron flights. Provision has been made for inlet and outlet ventilation, for heating by hot-water, and for lighting by electricity. The main front is faced with red bricks with Corsham Down stone dressings. The staircase leading to the gallery and the heating chamber is formed within a tower rising to a height of 71 ft. above the ground level. The total cost of the work is 4,500. Messrs. Sands & Burley, of Walthamstow, are the builders; Messrs. Webster & Sons carried out the stone-work; Messrs. John Lawson & Co. the heating and lighting; and the seating was executed by the Bennett Furnishing Company. Mr. W. McDougal was the clerk of works. The whole was carried out from plans and designs and under the general superintendence of the architect, Mr. J. Williams Dunford, of Queen Victoria-street, E.C.

PETERBOROUGH CATHEDRAL.—The Peterborough Cathedral Restoration Committee is about to undertake the repair of the north transept on the advice of their architect, Mr. G. F. Bodley, R.A. The north wall leans a good deal, but Mr. Bodley thinks the settlement took place a considerable time ago, and that the masonry has now got its bearing. The cracks and displacements require to be carefully treated.

PRESBYTERIAN CHURCH, LEEDS.—The foundation-stone of a new Presbyterian church was laid on the 16th inst. at Leeds, at the junction of Avenue-hill and Harchills-avenue. The church is to cost about 6,000. It will consist of a nave, with chancel, transepts, organ chamber, vestry, tower, and vestibule. It will be in the Early English style, and formed of Bramley pitch-faced wallstones and Callington dressings, lined with brick. The roof will be open-timbered in pitch-pine covered with red tiles. The seating accommodation is for 500, with provision for a gallery to be erected at a subsequent date to seat 80 additional. The designs show a tower and spire about 115 ft. high, but at present only the square portion of the tower, up to the springing of the spire, will be built. Mr. W. H. Bevers, of Leeds, is the architect.

FREE METHODIST CHAPEL, HAZLEBERE.—The foundation-stones of a new Free Methodist chapel were laid a short time ago at Hazlebere, High Wycombe. The contractors for the work are Messrs. Nash & Son, the architects being Messrs. E. Hooper and A. W. Nash, of High Wycombe.

WESLEYAN CHAPEL, RYTHYR.—A new Wesleyan Methodist chapel has just been erected at Rythyr. The work has been carried out to plans prepared by Messrs. Hornsey & Monkman, architects, of York. The new building possesses a classroom at the rear. There is also a vestry with heating chamber and other conveniences. The entire place will find accommodation for upwards of 130 people.

WORKMEN'S HALL, CWMAAM.—The opening of

the Cwmaam Workmen's Hall and Institute took place on Monday. The architect for the work was Mr. T. Rodric, Aberdare, and the contractor Mr. F. Willis, Rystrad.

SANATORIUM, MIDHURST, SUSSEX.—The King's Sanatorium, situated at Midhurst, was opened by His Majesty last week. The main block is devoted to the patients, each of whom has a separate room with a balcony on to which the bed can be wheeled if necessary, the upper story being set back in order that the balcony for this floor should not interfere with the light and air of the rooms below. The twelve rooms for the well-to-do are in the centre, the eighty-eight for the others in the wings. Recreation-rooms are provided on the ground floor, while in the basement is a hydrotherapeutic department. The administration block containing the dining-rooms, nurses'-rooms, and kitchen, with its accessories, is separated from the main building by an ornamental garden. The communication between the two is by a corridor permitting of the direct access of nurses and domestic servants to the grand corridor leading to the patients' rooms. Annexed to the administration block are the rooms of the resident medical staff, the consultation-rooms, and the operating theatre, and in a convenient situation, isolated from the other parts of the sanatorium, is the pathological laboratory. A clinical and research laboratory is also provided, as it is intended that scientific work, both preventive and curative, shall be one of the prominent objects of the sanatorium. The laundry is fitted with the latest appliances, and precautions are taken for sterilisation of the linen. Adjoining it is the engine-house, from which is supplied the motor-power for the dynamo that generate the electric light and the steam for heating the buildings. A chapel has been erected at the expense of Sir John Brickwood. It consists of two naves at right angles to each other, meeting in a chancel common to both. The sides enclosing the angle which looks to the south are formed by open arches protected only by a cloister. By this arrangement a divine service will practically be conducted in the open air, warmth being provided by heating the floor. The architect was Mr. H. Percy Adams, Messrs. Longley & Sons being the builder. Mr. E. R. Delby was the engineer.

Foreign.

FRANCE.—The Académie des Beaux-Arts has declined this year to award the Duc prize set on foot for the encouragement of "hautes études architectoniques." The next award of the prize falls due in 1908.—The Government has commissioned M. Henri Martin to execute two large decorative paintings for the vestibule of the "Salles des Autorités" at the Sorbonne.—M. Gaston Latouche, the painter, has been elected a member of the Conseil Supérieur des Beaux-Arts.

—At the Ecole des Beaux-Arts the competition in decorative design organised by the "Société d'Encouragement à l'Art et à l'Industrie" has just been adjudged on. The first prize has been awarded to M. Desroches, a student of the Art-school at Lyons. Of the ten prizes awarded this school has obtained five.—Mme. Octave Feuillet, widow of the eminent author, has presented to the town of St. Lo the collection of pictures formed by her late husband, also a number of miniatures and two marble statues by M. Crauk.—M. Denys Puech, the sculptor, has presented to the town of Rodez a sum of 40,000 francs to contribute towards the foundation of an art-museum, in which, among other things, will be placed the models and casts of his works. In the course of excavations on the site of the ancient Alesia (the scene of the victory of Cæsar over Vercingetorix) the remains of an ancient theatre have been found.—The Lycée for girls at Besançon is to be enlarged, at an estimated cost of 187,500 francs.—The Municipality of Périgueux are about to build a new college at an estimated cost of 215,000 francs.—The Ecole Pratique de Commerce et d'Industrie at Mazamet is to be enlarged, at a cost of 140,000 francs.—The enlargement of the Lycée for girls at Anancy is to be carried out shortly, at a cost of 229,000 francs.—On Tuesday last was inaugurated, in the Luxembourg Garden, a monument to the memory of the political economist Le Play. M. Allar is the sculptor and M. Delaire the architect. In the Square Lamartino at Passy a monument was inaugurated last week to the memory of Benjamin Godard, the composer, designed by M. Champell (sculptor) and M. Jaumin (architect). A medalion in memory of the painter Paul Merwart has been set up in the forest of Fontainebleau; it has been executed by M. Ernest Dubois.

BURGARA.—Mr. Foulman, the British Vice-Consul, reports that the activity of the building trade creates another opening for British cement, window-glass, iron bars, and girders.—The Sofia Municipality has concluded a loan for street paving, the construction of new baths and slaughter-houses, a new drainage system, and other improvements.—A fine theatre, sub-

sidised by the State, is to be opened this autumn in the capital.—Phillipopolis, Varna, and Ruzhuk are also busily engaged in municipal improvements.

SPANISH MARBLE AND STONE.—It is stated in the annual report of the British Consul at Barcelona that of the marble and stone exported from that port by far the largest quantity is sent to the United Kingdom. There was a great increase in the exports of these articles last year, and the United Kingdom took 8,717 tons.

Sanitary and Engineering News.

DRAINAGE AND INFECTON IN LAMBETH.—According to the annual report of the Medical Officer of Health for Lambeth, which has just been issued, of the total number of 1,694 houses in which infectious disease occurred during the year, 117 were found to have defective drains, 541 were found to have defective fittings, and 40 were found to have defective traps, and 34.2 per cent. gave no results with the tests. The test used was the chemical test (Kingzett's), and when a result is obtained the drain (tested) is defective, but when no result is obtained it would be unsafe to say that the drain was sound. Year by year, it is stated, the number of defects found decreases. The percentage of houses showing defective drains had fallen from 22.3 in 1891 to 11.7 in 1905. In connexion with an outbreak of diphtheria in the infants' department of St. Mark's School, Kennington Oval, in September, it was a significant fact that about that time certain works were being carried on within 100 yds. of the school by a ventilating-shaft, and that during the progress of this work, sewer-gas was escaping from the open sewer into the street, off and on, for a period of from two to three weeks. Inquiries showed that all the notified children, with one exception, had to pass the sewer opening going to and from school.

VENTILATION OF SEWERS.—At a Conference of representatives of Metropolitan Borough Councils held at Greenwich, the following resolution was adopted:—"That in the opinion of this Conference the ventilation of the new main sewers in course of construction by the London County Council would be materially improved if the London County Council would abolish By-law No. 5 made on October 30, 1900, and which by-law provides:—

"Every person shall erect a new building shall provide in every main drain or other drain of such building which may immediately communicate with any sewer, a suitable and efficient intercepting-trap at a point as distant as may be practicable from such building, and as near as may be practicable to the point at which such drain may be coming from the sewer." He shall, except in cases where the means of access to be provided in compliance with the preceding by-law shall give adequate means of access to such trap, provide a separate manhole or other separate means of access to such trap for the purpose of cleaning it."

Miscellaneous.

PROFESSIONAL AND BUSINESS ANNOUNCEMENT.—Messrs. Jay, Broll, & Co., of 31, Old Queen-street, Westminster, have been appointed London agents for Messrs. W. Truswell & Son, heating and ventilating engineers, of Newcastle, Staffordshire.

COMMONS AND FOOTPATHS PRESERVATION SOCIETY.—At the annual general meeting, held on June 13, Mr. C. J. Shaw-Lefevre was re-elected President and Sir Robert Hunter a Vice-president of the Society. In moving the adoption of the report, the President stated that the Society had gained the day in every case in which they had instituted legal proceedings in respect of encroachments by railway companies and other private bodies upon common land, more especially in the neighbourhood of London. In the course of his address Mr. Shaw-Lefevre justified the action of the Society in their endeavours to maintain the right of public access to Stonehenge.

STATUE OF SIR WILLIAM VERNON HARCOURT.—A statue, sculptured by Mr. Waldo Story, of Rome, has been set upon one of the four pedestals in the members' lobby of the House of Commons. The statue, which is life-sized, represents Sir William Vernon Harcourt in his robes as Chancellor of the Exchequer, and the stone has been tinged in colour that it may harmonise with the tint of the pedestal from which the paint has been removed; the three other pedestals will be similarly treated during the recess. Mr. Waldo Story's bust of the deceased statesman is in the possession of his son, Mr. Harcourt.

FIRST GARBEES CITY, LTD.—The company, having a nominal share capital of 300,000l., offer for subscription all the remaining 55 shares, amounting to 164,240l., for carrying on, in succession to the Garden City Pioneer Company, the development of the Letchworth estate, which was bought from several owners for 131,568l. 9s. 6d., or about 40l. an acre for an area of some 3,818

acres; the then subsisting buildings being valued, for insurance purposes, at 84,470*l*. Sites for 520 houses, 25 shops, 7 factories, a church, a chapel, a public-hall, schools, etc., have been let or chosen, and up to last March 31 ground rents to an amount of more than 1,500*l*. per annum have been created; some sites for shops have been let for ground rents at rates of from 40*l*. to 60*l*. per acre. Mr. Justice Neville is Chairman of the Company, and Mr. Barry Parker and Mr. Raymond Unwin, of Baldoek, Herts, are appointed as consulting architects.

NEW GOVERNMENT BUILDINGS.—In the House of Commons on the 14th inst., Mr. P. W. Wilson asked the First Commissioner of Works whether he had received any representations respecting the towers which appeared upon the plans of the new Government buildings facing Great George-street, and whether he was prepared to authorise the construction of any or all of those towers. Mr. Harcourt: Yes, sir, I received a strong representation from the Council of the Royal Institute of British Architects in favour of the completion of the towers on the Great George-street front of the new public offices. "I replied to them in the following letter:—"I am much obliged by your letter of the 15th. Though I maintain my own opinion that the proposed very high towers on the Great George-street front of the new public offices are not architecturally or aesthetically desirable, I am not prepared to put my artistic opinions against those of the Council of the Royal Institute of British Architects. I have, therefore, given immediate instructions that the building now in course of construction shall be continued and completed on the lines originally laid down by Mr. John Brydon. I need not say that I shall always greatly value any criticism or assistance that the Institute is good enough to afford me in that part of my duties which is connected with architecture. I may add that I have asked the contractors to see that as far as possible the masons to be engaged on this work shall be those who were discharged on its suspension, and the contractor has promised to meet my wishes.

HOUSING OF THE WORKING CLASSES.—On the 18th inst., the Select Committee of the House of Commons on the Housing of the Working Classes Acts Amendment Bill (Sir J. Dickson-Poynder presiding) heard the evidence of Dr. J. C. Thresh, Medical Officer of Health to the Essex County Council and to the Rural District Councils of Chelmsford and Maldon. He gave the results of his experience of the difficulties he had encountered in attempting to put in force the Housing of the Working Classes Act. His chief reason, in his opinion, of the inadequate supply of cottages in agricultural districts was that the wages paid to the agricultural labourer did not enable him to pay a rent which would adequately remunerate either landowners or speculative builders for the provision of cottages of a satisfactory type. The vicious system of paying a portion of the wages on house rent accentuated this difficulty. The building by-laws had had, in his opinion, little effect in preventing buildings, although they were in many cases too stringent. By the action of the Chelmsford and Maldon Rural District Councils the Local Government Board had been persuaded to allow a relaxation of restrictions which had proved that what was desired, but had had very little effect upon building operations. The stringency of the building by-laws had served as a mere excuse in most cases for people who never intended to build unless actually compelled. The obstacles to the establishment of factories in rural districts and small provincial towns were various. In some cases the land could not be obtained, as the landlord wanted no factory in the neighbourhood. In other cases the landowner increased the price of the land. The greatest difficulty was that of obtaining sufficient labour. Employers complained that they could not get as much or as good work out of the countryman as out of the townsman. These and other obvious disadvantages more than outweighed the advantages of cheaper labour. He thought the Bill before the Committee was a palliative, but would not be a sufficient cure for the evils to be dealt with.—On the 18th inst. the Select Committee of the House of Commons on the Housing of the Working Classes Acts Amendment Bill (Sir J. Dickson-Poynder presiding) heard further suggestions from the Chairman of the National Housing Reform Council (Alderman W. Thompson, Richmond) with regard to the means of stimulating the local authorities to great activity. He considered that the problem of housing the poorest of the poor was insoluble except by a system of subsidies, such as were given in the Irish Labourers Acts, and were now being extended by the Bill before Parliament. The lowering of rent to meet the capacity of the bulk of the badly-housed might be met by a scientific attack on the items which caused the expenditure on housing to mount up, with a view to reducing the capital outlay on land, building, roads, and sewers, and the annual charge for rates and taxes and repairs. One of his suggestions in connexion with repairs was that a tenth of the rent should be separately charged to the occupier as a repairs rental, a proportion of

this amount to be returned to the tenant in the form of a bonus when the actual cost of the repairs is kept below the percentage allowed. He advocated the establishment of a central land housing and transit commission, and the institution over suitable areas of town and village development committees somewhat on the lines of Continental *Comités de Patronage*, whose special functions were to make themselves acquainted with the exact needs and conditions of their districts, and to put them officially before the local authorities or the State authorities when the locality was in default. These bodies acted also as useful intermediaries between public and private enterprise.—Mr. J. H. Diggle gave evidence as to housing difficulties in South Lincolnshire, notwithstanding the thrift of the agricultural labourers. The more land that could be attached to labourers' houses the better from the point of view of return for the capital outlay, and the advantage of the occupier. The rural population was undoubtedly kept low in consequence of the want of houses. It would be an advantage to the farmer that the labourers should have more land. Where there were small holdings it was found that the people remained on the land, and their sons and daughters were available for the farm.

LIVERPOOL CATHEDRAL.—Lord Derby presided at the annual meeting of the Liverpool Cathedral Committee on the 13th inst., when it was announced that the Duke of Connaught would visit Liverpool to lay the foundation-stone of the Lathom Chapter-house on July 17. The report of the committee congratulated the Duke on the completion of the first portion of their work. The foundations of the Cathedral choir, Lady chapel, and Chapter-house were finished by the contractors in the month of April. After 75,000*l*. had been spent on the purchase of the site, legal and general expenses, and construction of foundations, there was 101,000*l*. available for the first portion of the cathedral, which was estimated would cost about 240,000*l*. Thus about 80,000*l*. would be required, and the committee appealed not only for this sum, but for such further funds as would justify them in undertaking a further portion of the great design on which they had embarked. The Chairman, in moving the adoption of the report, said they must try and keep the work going with increasing fervour, and at no distant date they would be able to have services in the Cathedral. The Bishop of Liverpool said that their aim from the beginning had been that the Cathedral should be built by every school of thought among church people in the diocese. The report was adopted. Sir Robert Hampson pointed out that the foundations already finished included also the two towers and the cross transept, so that, if funds permitted, the second portion of the Cathedral could go on contemporaneously with the first. Sir William Forwood, Chairman of the Executive Committee, stated that the money they had in hand would take about five years to expend. They would then want about 39,000*l*. per annum, and also 80,000*l*. to complete the first portion.

HISTORICAL DOCUMENTS.—In the Parliamentary Papers Mr. Boland asks the Secretary to the Treasury whether, in view of the interest caused in Ireland by the publication of the Historical Documents Commission of the MSS. at the Franciscan Monastery in Dublin, he will consider the advisability of securing the publication of similar historical documents bearing on the same period now at the Irish College in Rome. Mr. McKenna replies that inquiry shall be made into the suggestion, but no funds are at present available for the purpose, and he could give no pledge on the subject.

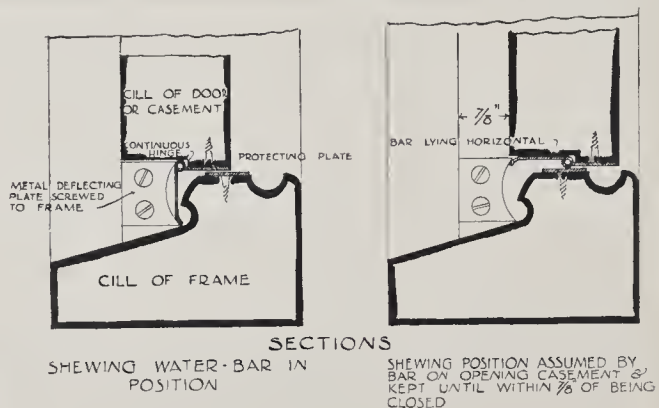

A NEW WATER-BAR FOR CASEMENTS.—Messrs. Johnson & Webber, architects, Torquay, have

designed a water-bar for inward-opening doors and casements, which is now being made by Mr. James Gibbons (Wolverhampton). The peculiarity of the invention is that the water-bar is continuously hinged under the bottom-rail of the casement, and lies in a horizontal position while the casement is open, and is deflected into a vertical position when the casement is closed, thus covering the joint between the bottom-rail and the sill (see illustration).

ELECTRIC LIGHTING, SALFORD.—On the 13th inst., at the Salford Town Hall, Mr. W. R. Harper, on behalf of the Local Government Board, heard an application from the Salford Corporation for permission to borrow 7,720*l*. to extend the Frederick-road Electricity Station. The Deputy Town Clerk, Mr. J. H. Jackson, said that the opening of the station took place in 1901, since when the demand for the supply of current had grown so considerably that additional plant was now required. The total cost of the electricity scheme so far was 550,409*l*., and the outstanding debt 484,289*l*. The undertaking at first was not successful, but recently there had been great improvement.

INTERNATIONAL BUILDING TRADES EXHIBITION.—The Directors of the Crystal Palace Company are considering a scheme for holding an International Exhibition of all trades connected with building, during the spring and summer of 1907. This Exhibition would give those participating in it an opportunity of bringing their specialities before all persons connected with the building interests for a much greater period of time than has been the case at the ordinary Trade Exhibitions, which generally lasted only a few days. An endeavour will be made to bring together manufacturers of building materials and architects, and an International Jury will be appointed, who will make awards according to the merits of the exhibits, and thereby afford the persons participating an opportunity of obtaining a formal recognition of the excellence of their wares.

GLASGOW SCHOOL OF ART.—The Governors of the Glasgow School of Art, authorised by the Scotch Education Department, have granted six maintenance bursaries of 20*l*. each, with free tuition, and seven travelling bursaries of 10*l*. each, and one of 5*l*., competed for during the session now concluding. The judges appointed by the Governors to make the awards were:—For drawing and painting—Sir Francis Powell, LL.D.; Messrs. E. A. Walton, R.S.A. (assessor approved of by the Scotch Education Department); John Henderson, with Professor Jean Deville and the headmaster. For architecture—Messrs. T. L. Watson (convenor); David Barclay, Hippolyte J. Blanc, R.S.A.; Professors Bourdon, B.A., Gourlay, M.Gibson, Mr. James S. Boyd (recorder). For modelling—Messrs. W. Forrest Salmon, John Keppie, John Henderson, with the director and the headmaster. For design and decorative art—Messrs. W. Forrest Salmon, James Morton, Alex. N. Paterson, M.A., Charles R. Mackintosh, Wm. Meikle, with Professor Girdalton and the headmaster. The following are the winners:—Six maintenance scholarships, value 20*l*. each, with free tuition: Drawing and painting—Eleanor Moore, David R. Lockie, John Currie. Architecture—Edw. G. Wylie. Modelling—Mary Buchan. Design and decorative art—James S. Rennie. Seven travelling bursaries of 10*l*. each: Drawing and painting—Wm. M'Arthur, Andrew Watson. Architecture—Wm. A. Robb, Wm. Lindsay. Modelling—John Currie. Design and decorative art—Mary R. Henderson, Wm. Brown. Extra Design bursary of 5*l*.: Robert Hood. Twenty-one governors day-class studentships and thirty governors evening-class studentships were awarded. The Institute of Architects' prize was gained by Thomas C. C. Mackie.

the anatomy printed by Hilda McFarlane (judge, Dr. W. K. Hume), and the prize offered by Messrs. Wm. Meikle & Sons by Isobel Spence. Day and evening bursaries offered by the Haldane Trust, tenable at the Glasgow School of Art for next session, have also been awarded. The judges for these were—Mr. Alex. N. Thomson, R. A., and Mr. John Henderson. Four day-class bursaries, value 15*l.* each, were awarded to John Turnbull, Clara Tucker, Wm. J. Anderson, and Ellison Young. Extra bursary of 5*l.*—A. E. H. Miller. Seventy evening-class studentships were awarded, tenable in the evening classes.

NEW LIBRARIES IN LONDON.—The Libraries Committee of Greenwich Borough Council reported on Tuesday having decided to invite tenders for pulling down Bexley House, London-street, and erecting on the site a branch library, according to the plans prepared by Messrs. Willis & Anderson. Tenders will be invited as soon as the working drawings are completed. On Tuesday the Hackney Public Libraries Committee reported that the specification for the central library having been prepared, and the quantity surveyor having the bills of quantities well in hand, they had decided to invite builders to send in their names to the town clerk by a given date. By this means the number of sets of bills of quantities required will be ascertained, and all builders tendering can be supplied with quantities on the same day. Mr. Carnegie recently offered the Public Libraries Committee of Lewisham 4,500*l.* for the erection of a branch library at Hither Green, conditional on a full site being provided. In September, 1903, Mr. Cameron Corbett offered to give a site if the building was erected in twelve months from then. On Tuesday the Committee reported that Mr. Cameron Corbett had agreed to give the site as previously proposed. Immediate steps are to be taken for the completion of the conveyance.

COMBINED DRAINAGE.—At a conference recently held at the Fulham Town Hall, at which twenty-two of the London Borough Councils were represented, it was resolved to form a committee to enquire into the Local Government Board to urge the views of the conference with regard to the unsatisfactory state of the law relating to combined drainage in the metropolis. On Tuesday the Law and Parliamentary Committee of Fulham Borough Council reported having received a letter from the President of the Local Government Board stating that he would be prepared to consider the representations in the memorial proposed to be submitted by the Borough Councils concerned, but that he does not think it necessary to trouble the delegation to wait upon him with reference to the matter.

WATER SUPPLY TO KENSINGTON HOUSES.—At the meeting of Kensington Borough Council on Tuesday the Public Health Committee reported that their attention had been drawn by the Medical Officer of Health to the provisions of sec. 48 (2) and 48 (3) of the Public Health (London) Act, 1891, which required that prior to the occupation as a dwelling-house of any house erected since the coming into operation of the Act in question, the sanitary authority shall have certified the premises to have a proper and sufficient supply of water, and that any owner who occupies such house or permits the same to be occupied as a dwelling-house without such certificate shall be liable to penalties. The Committee found on referring to the minutes of the late Vestry that an order had been given in April, 1894, as follows:—“(1) That it be instructed to the surveyor to make inspections and grant certificates in all cases when application is made to him under the provisions of the Statute.” Their report concluded as follows:—“We are of opinion that the enforcement of this provision of the Act should be transferred to the Public Health Department, with whom rests the responsibility for seeing that effect is given to the by-laws framed by the sanitary authority under sec. 50 of the Act with respect to the cleansing of cisterns, and we accordingly recommend—(a) That the above-mentioned order of the late Vestry of April 11, 1894, be revoked. (b) That it be an instruction to the Medical Officer of Health to cause inspections to be made of all buildings newly erected or rebuilt, and to report to the Public Health Committee as to there being a proper and sufficient supply of water thereto, with a view to the required certificates being granted before such buildings are occupied, or to such other steps being taken as may be necessary for the enforcement of the provisions of sec. 48 of the Act.” The report was adopted.

BUILDING CONTRACTS.—Mr. John Good, Honorary Secretary of the Master Builders' Association of Dublin, has addressed a letter to the principal Irish newspapers to the effect that on Thursday, June 14, the Association, at a largely-attended meeting, adopted unanimously the following resolution:—“That, although conditions of building contracts have been under consideration for many years, we now regret to learn from the public Press that the members of the Royal Institute of Architects of Ireland have, at a recent meeting, adopted without discussion a set of conditions, without any consultation with the Builders' Association as to their views on a matter so vitally important to their interests,

contrary to the custom and practice adopted in England and Scotland, where this matter was the subject of many conferences between the architects and builders prior to its mutual adoption. While willing and anxious at all times to carefully consider any proposals whereby equitable terms of contract might be agreed upon, we respectfully decline to be forced to accept or sign conditions which are, in our opinion, inequitable and unfair, and which differ very materially from any accepted conditions at present in use in the United Kingdom.” Mr. Good adds that the members of the Master Builders' Association will continue to accept and sign the conditions of contract at present in use in the city of Dublin, and also those agreed on between the Royal Institute of British Architects and the Association of Master Builders' of Great Britain and Ireland.

BUILDING OF IRISH SCHOOLS.—Mr. A. P. Farrell asked the Secretary to the Treasury in the Parliamentary Papers if he will state whether any proposition has been yet made in providing for extended building expenditure under Plan VI, for the erection of National Schools in Ireland. Mr. McKenna replies that no settlement has yet been reached, the Commissioners of National Education having objected to the new plans prepared by the Board of Works at the instance of the Treasury. The Commissioners have now been asked to submit for the consideration of the Irish Government and the Treasury their own suggestions for plans for schools to be built in future years.

GAS-HEATED BOILERS FOR DOMESTIC HOT-WATER SERVICES.—Mr. Thomas Potterton's ingenious “Victor” gas-heated boiler, which was mentioned by us in connexion with the gas exhibition at the Horticultural Society's Hall some months ago, is worthy of a more detailed notice in view of the tests recorded by the inventor in his new catalogue. The boiler has two waterways, the lower being of a flat diamond shape, and on the lower surface of this the flames of the Bunsen burners impinge. The upper waterway is of saddle shape, and receives the heat from the products of combustion on a side to the flue; it thus serves the purpose of a feed-water heater. A dipped pipe outside the boiler connects the two waterways. The flow-pipe to the cylinder or tank is taken from the upper part of the lower waterway, and the return-pipe is connected to the upper waterway, as the water in the latter is always of lower temperature than that in the former. Records are given of a number of tests, but the following may serve as an example:—With a consumption of 36 cubic ft. of gas per hour 8 gallons of water in a storage tank were raised from 46 deg. Fahr. to 130 deg. in half an hour, to 145 deg. in one hour, and to 212 deg. in 2½ hours, and at the end of the test the temperature of the products of combustion entering the flue was only 176 deg.

Capital and Labour.

CONDITION OF THE BUILDING TRADES.—Employment in these trades was quiet generally, except with painters, who were well employed. It was better than a year ago and a year ago. Returns received through the trade correspondent from 41 London employers show that in the last week of May they paid wages to 9,882 work-people of all classes, compared with 9,951 in April, and 11,973 in May, 1905. Employment generally seemed very quiet, except with painters, who continued busy. Returns from Trade Unions in London show little change on the whole in the state of employment as compared with a month ago and a year ago. The percentage of unemployed Trade Union carpenters in London at the end of May was 8.2, compared with 6.5 in April, and 8.3 in May, 1905. With plumbers, the percentages unemployed for the three periods were 13.7 for May, 1906, 13.5 for April, 1906, and 14.2 for May, 1905. In the case of both carpenters and plumbers, the percentage unemployed in May, 1906, was lower in London than in any other district of the Kingdom. Bricklayers and plasterers reported a slight improvement in employment; masons and painters reported a decline. Seventy-four returns were received from Employers' Associations in towns outside of London. On the whole, employment in these towns was quiet.—*Labour Gazette.*

Legal.

THE ALLEGED OBSTRUCTION OF LIGHT TO ST. GEORGE'S CHURCH, HANOVER-SQUARE.

MR. JUSTICE BUCKLEY, in the Chancery Division last week resumed the hearing of the motion by the plaintiff in the case of Anderson v. Francis & Adams for an interim injunction to restrain, until the trial or further order, the obstruction by the defendants of the light to St. George's Church, Hanover-square.

In the result it was arranged that no injunction should be granted, his lordship consenting to try

the case on July 3, the action being set down without pleadings, there being given liberty to each party to inspect the premises and make experiments in the presence of the other as to the degree of obstruction.

Mr. Eve, K.C., and Mr. George Cann appeared for plaintiff; and Mr. Stokes for the defendants.

ANCIENT LIGHT DISPUTE.

THE case of Fear v. Morgan came last week before the Court of Appeal consisting of Lords Justices Vaughan Williams, Romer, and Fletcher Moulton, on the defendant's appeal from a judgment of Mr. Justice Kekewich in the Chancery Division.

The action was brought by Mr. and Mrs. T. F. Fear for an injunction to restrain the defendant, Mrs. Margaret Jane Morgan, her servants and agents, from erecting or permitting to remain erected on her land at Aberystwyth, consisting of the plaintiffs' premises, any wall, building, or structure so as to darken, injure, or obstruct any of the ancient lights of the plaintiffs. The plaintiffs also claimed a mandatory injunction and damages. The plaintiffs were lessees for a term of 21 years from June 30, 1900, of No. 16, North-parade, Aberystwyth, consisting of 10 dwelling houses, wine and spirit vaults, and out-buildings in the rear. In a portion of the plaintiffs' buildings looking towards the east were two windows, faced by land belonging to the defendant, upon which where the same adjoined the plaintiffs' land there formerly stood in front of the defendant a wall about 6 ft. 10 in. high. The plaintiffs alleged that the windows were ancient lights, and that in May, 1903, the defendant began to build upon the wall so as to increase its height. The plaintiffs alleged that this had deprived them of a substantial quantity of light, thus diminishing the value of their premises.

The defendant, by her defence, pleaded that the lease of the premises was originally vested by the Corporation in one Watkins, that Watkins surrendered that lease to the Corporation in view of another lease being granted, which was assigned to the plaintiffs, and that in view of that surrender by Watkins all rights of light, if any, to the plaintiffs' windows over defendant's premises became extinguished. Defendant also said that her lease, one granted originally to Watkins, gave her power to raise her wall as she had done. She further denied that there had been any substantial interference with the plaintiffs' lights. At the trial the claim for a mandatory injunction was not pressed, and, in the result, Mr. Justice Kekewich held that it was immaterial whether the plaintiffs entered into the property by virtue of the prolongation of the old lease or whether they came in under a new lease in 1900. Under the new lease Watkins got the benefit of the uninterrupted enjoyment up to that time of any light that had been acquired by right. That being so, it was competent for him to say that he would not insist upon it. But he had to regard all the surrounding circumstances in order to determine whether, when Watkins took the lease, he was entitled to insist upon his rights of light. In his lordship's opinion, Mr. Watkins was entitled to insist upon his right, and in his judgment the access of light to the windows in question must not be obstructed. He accordingly granted the plaintiffs a declaration in that sense, and judgment was entered accordingly. Hence the present appeal of the defendant.

At the conclusion of the arguments of counsel for the appellant, and without calling upon counsel for the respondent, their lordships affirmed the decision of Mr. Justice Kekewich, and dismissed the appeal with costs.

Patents of the Week.

APPLICATIONS PUBLISHED.*

10,531 of 1905.—A. SMITH: Means for Utilising the Waste Heat of Stoves and Fireplaces for Heating Purposes.

This invention consists in the means of utilising the heat of a fireplace or stove by shutting off direct communication between the source and the chimney, and by interposing in the path of the whole of the said products enter, and from which they pass into the chimney or other uptake, the said cylinder having within it a smaller cylinder water-charged to form part of a hot-water heating apparatus.

12,415 of 1905.—C. H. THOMPSON: Ventilating Water-closets.

This invention relates to a ventilating water-closet, and consists of a casing fastened to the edge of the closed hall, pistons working within cylinder formed in said casing, said pistons having

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, —, Contracts, iv. vi. viii. x.; Public Appointments, xvi.; Auction Sales, xxviii. Certain conditions, beyond those given in the following information, are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

Contracts.

BUILDING.

- JUNE 24.—Ashburton.—ENGINE-HOUSE, ETC.—**The Managers of Stormdown and Owlcombe Mines, near Ashburton, invite tenders until noon of June 24 for (a) erection of engine-house; (b) erection of caliner house, flues, chambers, and chimney stack. Plans, specifications, and conditions of contract can be seen at the office of Mr. Wm. A. Crose, Manager.

PATENTS.—Continued from page 709.

spindles projecting through the top of said casing, lugs projecting from the upper sides of the said casing, an operating hinge plate pivoted to said lugs, a seat and cover pivoted to the front edge of the said operating plate, an inlet into one of the said cylinders, valve ports communicating between the said cylinders, means by which the valve ports open and close, one of the said ports being opened and closed by a ball actuated by a coiled spring supported within one of the said cylinders, the other valve port opened and closed by a regulating tapered screw plug, the shanks of said plug projecting through the side of said casing, an outlet from one of the said cylinders, said outlet adapted to communicate with a spray pipe adapted to enter into a vent pipe communicating with the ball of the closet.

12,776 of 1905.—L. HEINTZ: *Locks and Fastenings.*
This invention consists of a locking bar fitted and displaceable within the thick part of the door casing, and furnished with catches capable of engaging on the lowering of the bar with some projections fixed to the door, the said bar being capable of being added without need of a special lock to any existing door, a projection with which it is furnished being placed in the lower part of the bar beneath the bolt of the lock, so that when the bolt is shot the bar cannot be raised, the said bolt being absolutely independent of the bar.

14,007 of 1905.—W. G. WAKEHAM: *Fittings of Swinging Windows and the like.*
The invention relates to a catch for securing the sashes of casements, doors, and the like, which are hung on pivots. The invention comprises the arrangement of two or more dove-tailed catches arranged in convenient position on each stile, a member of such catch being arranged on the swinging sash, and the other member on the sliding sash.

14,079 of 1905.—THE ELECTRIC AND ORDNANCE ACCESSORIES COMPANY: *Air Heaters for Use in Connection with Certain Systems of Ventilation, and for Analogous Purposes.*
The invention comprises an air heater consisting of a fire flue connected with a fireplace, and an external casing, provided at its opposite ends with air intake and delivery openings, and separated from the said flue by an air passage or passages.

14,395 of 1905.—C. A. PARK: *Apparatus for Heating Water.*
The invention consists of apparatus for heating water by means of steam of the type in which the supply of steam to the water tank is controlled by a thermostatic device, actuated by variations in the temperature of the water in the apparatus, wherein the thermostatic device is located in a chamber formed in the cold water inlet pipe, which pipe terminates some distance above the bottom of the water tank, the lower part of said

tank being connected to the lower part of said chamber, so as to provide for circulation of the water there-through, which circulation may be assisted by discharging steam into the upper part of the inlet pipe.

15,962 of 1905.—L. H. TEALE: *Construction of Domestic Fireplaces.*
The invention consists of a fireplace with cooling air spaces beneath and behind the fire, having air inlets and outlets.

16,855 of 1905.—E. MARQUARDT: *Draught Inducers for Chimneys, Ventilators, and the like.*
This invention relates to a chimney ventilator of the like, having a pipe covered by a perforated plate, and consists in constructing such perforated plate in the form of upward sloping parts meeting at an angle at the middle of the pipe, and in providing an additional lid or cover, the inner cells of which are parallel to the corresponding outer cells of the pipe, and to the perforated plate and which extend down below the lower edge of such perforated plate.

18,617 of 1905.—F. W. MARILLIER: *Locks and Fastenings for Sliding Doors.*
This invention relates to locks or fastenings in which a latch bolt moves vertically between guides, and consists in arranging a spring to draw the latch bolt, and a latch nose exterior to the front of the casing being parallel with the spindle of the pivoted pawl, so as to latch by mere

contact with a striking plate on the endwise movement of the door, said pivoted pawl setting on the bottom of the latch body.

19,392 of 1905.—A. DAVIDSON: Padlocks and similar Locks.

This invention relates to padlocks and the like operated by keys having a wing capable of being protruded from such key, and consists in the provision of a lever or part arranged to automatically move and hold back the bolt or locking part, when unlocking takes place, and capable of being freed to release the part or locking part when the handle is pressed down, so as to make the padlock self-snapping.

24,490 of 1905.—O. DIECKMANN: Grates for Stoves and Fireplaces.

This invention consists of a grate front of adjustable length and width, and is characterised in that the lower parts are exchangeable, all parts being arranged in such a manner as to adjust the length of it as well as the width according to the size of the stove, so that one and the same grate front can be used for different sizes of stoves.

24,970 of 1905.—J. JAARNA: Relating to Stoves.

This invention consists of means for regulating the draught, and comprises a flue, an aperture upon a level with the fire-basket communicating with the said flue, a damper for closing said aperture, a second aperture formed at or near the upper end of the said stove, which also communicates with the flue and the grate to prevent the entry of the fuel to the latter aperture.

27,245 of 1905.—D. WHITEHEAD and H. ADAMS: Ventilating Shaft Top.

This invention consists in the construction and combination of parts consisting of an inverted cone made of metal or glass, an up shaft, and a head with meshed protector, the whole forming an easily detachable air ventilator or skylight.

9,805 of 1906.—T. F. SALING: Flush Hinges.

This invention consists of a flush hinge comprising leaves formed at their ends with inwardly-projecting flanges, having bevelled corners, and upon their inner sides with longitudinally extending recesses, a link disposed between the flanges of said leaves, and having bevelled edges to coact with the recesses in said leaves, and wedge-shaped stops at its ends to coact with the bevelled corners of said flanges, and pivot pins passed through said flanges and into said link.

J. Williams, £201 0 0

SWINDON.—For metalling, sewerage, paving, and channelling portion of Drew-street, on the Even Swindon Estate, for Mr. J. Morrison, J.P., Messrs. Drew & Sons, surveyors, Regent-streets, Swindon:—

Tudman Bros. £501 4 10
W. J. Rogers, Swindon* 423 0 0

TONYREFALL.—For the widening of the Ely River bridge and erection of a masonry drain at Wainwright, Tonyrefail, for Llantrisant and Llantwit Ffandre Rural District Council, Mr. G. S. Morgan, Surveyor, School-street, Pontydund, Glam.:—

S. Morgan £347 12 0
T. Lewis 291 7 0
J. E. Evans 273 0 0
A. G. Collins & Co. 261 12 2
R. Jones, junr., 220 14 2
John & West, 213 11 5
R. Jones, senr., £206 11 10
J. Sutherland, 206 5 0
Barnes, Chaplin, & Co., 189 0 11
G. L. Morgan, 162 19 5
Pontypridd*, 175 17 0

WHITTINGTON (Salop).—For erecting a school at Gohoven, for the Elementary Education Department, Messrs. Shaylor & Ridge, architects, Oswestry:—

W. H. Thomas, Salop-road, Oswestry* £2,992
WORMIT.—For constructing a 9-in. outfall sewer at Serrogside, for the Town Council of Newport, Mr. D. A. Donald, C.E., Burgh Surveyor, Blyth Hall-buildings, Newport:—

J. Fairweather £285 2 0
T. S. Dick 236 6 8
D. Horburgh, 253 8 3
P. Gissitt, 247 16 6
W. Brand & Son, 243 7 2

WREKENTON (Co. Durham).—For erecting new Wesleyan Chapel and school, Mr. J. Orwin, architect and surveyor, 20, Collingwood-street, Newcastle-on-Tyne:—

D. Elliott £1,595 0 0
J. Niles, 1,327 14 0
Glen & Mollitt, 1,519 19 8
W. Hall, 1,455 10 7
Arnell, 1,309 6 2
Belam, 1,375 0 0
J. White, 1,353 0 0
North Durham Stone Co., £1,329 0 9
W. E. Hall, 1,269 0 0
E. Dyson, 1,225 12 6
W. H. Ayton, 1,209 0 0
R. Davidson, 1,196 0 0
Felling, 1,196 0 0

W. H. Lascelles & Co. LIMITED, 121, BUNHILL ROW, LONDON, E.C. Telephone No. 1365 London Wall.

HIGH-CLASS JOINERY, LASCELLES' CONCRETE. Architects' Designs are carried out with the greatest care. CONSERVATORIES, GREENHOUSES, WOODEN BUILDINGS, Bank, Office, and Shop Fittings. CHURCH BENCHES & PULPITS. ESTIMATES GIVEN ON APPLICATION.

The BATH STONE FIRMS, Ltd., BATH. For all the Proved Kinds of BATH STONE. FLUATE, for Hardening, Waterproofing, and Preserving Building Materials. HAM HILL STONE. DOULTING STONE. The Ham Hill and Doulting Stone Co., Limited (Incorporating the Ham Hill Stone Co. and C. Trask & Son, The Doulting Stone Co.). Chief Office:—Norton, Stoke-under-Ham, Somerset. London Agent:—Mr. E. A. Williams, 16, Craven street, St.

GREEK TILES. White and Blue Pentelikon at Low Prices for BUILDING PURPOSES. Beautiful Colours for Interior Decoration. Full Particulars and Samples:—MARMOR, LIMITED, 18, Finsbury-square, E.C. See Advt. p. xiv. Asphalt.—The Seyssel and Metallic Lava Asphalt Company (Mr. H. Glenn), Office, 42, Poultry, E.C.—The best and cheapest materials for damp courses, railway sheds, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. Asphalt Contractors to the Post Office.

SPRAGUE LITHOGRAPHIC PRINTERS. Estate Plans and Particulars of Sale promptly executed. 4 & 5, East Harding-st., Fetter-lane, E.C. QUANTITIES, etc., LITHOGRAPHED accurately and with despatch. Telephone No. 434 Westminster. METCHIM & SON, 18, PRINCES STREET, S.W., and "QUANTITY SURVEYORS' DIARY & TABLES," For 1906, price 6d., post 7d. In leather, 1s., post 1d.

JOINERY Of every description and in any kind of Wood. CHAS. E. ORFEUR, LTD., COLNE BANK WORKS, COLCHESTER. ESTIMATES ON APPLICATION. Telephone: 8205. Telegrams: "Orfeur, Colchester." LONDON OFFICE: 161, COMMERCIAL STREET. PILKINGTON & CO (ESTABLISHED 1838.) MONUMENT CHAMBERS, KING WILLIAM STREET, LONDON, E.C. Telephone No., 6319 Avenue.

Polonceau Asphalte. PATENT ASPHALTE and FELT ROOFING. ACID-RESISTING ASPHALTE. WHITE SILICA PAVING. PYRIMONT SEYSSSEL ASPHALTE.

MOULE'S PATENT EARTH CLOSET CO., LTD. (Established about 40 years.) THE ORIGINAL INVENTORS AND MANUFACTURERS OF SANITARY EARTH CLOSETS. Contain the latest improvements; a new patent granted in 1905. Several Gold and other Medals awarded. Sanctioned by the Public Health Acts. Over 12,000 apparatuses supplied to Government Departments. No drains or cesspools required; no danger of typhoid fever. Not affected by frost. IN CONSTANT USE IN ALL POSITIONS INSIDE AND OUTSIDE MANSIONS, COTTAGES, SCHOOLS, HOSPITALS, AND WORKSHOPS; ALSO IN CAMPS AND ON BOARD SHIP. Can be hired for temporary use. Pamphlets sent post-free. Apparatuses on view at the Company's address: MOULE'S PATENT EARTH CLOSET COMPANY, LIMITED, 5a, GARRICK ST., LONDON, W.C.

The Adhesion of Concrete to Steel.

ONE of the most important assumptions made in all theories of concrete-steel construction is that a perfect bond exists between the constituent materials.

If the bond were readily broken there would always be the liability that the reinforcing bars might become free to slide within the enveloping concrete, thus militating against the combined action which renders concrete-steel capable of behaving as a homogeneous structure.

While there is comparatively little adhesion between concrete and a plane surface of smooth, perfectly clean steel simply pressed upon its surface, it is found that when a round bar of steel has been embedded for a certain distance into a block of concrete, the bond between the concrete and the steel becomes very great. Numerous experiments have been made for the purpose of ascertaining values of the adhesion between concrete and embedded bars of iron and steel. Among those who have conducted investigations of this kind may be mentioned Professor Bauschinger, Professor Ritter, M. de Joly, M. Feret, M. Considère, and Professor Hatt.

The experiments of Professor Bauschinger indicated an adhesive resistance of from 570 lb. to 710 lb. per square inch of metallic surface, those of Professor Ritter

showing the value to be between 568 lb. and 668 lb. per square inch. Very similar conclusions were drawn by M. de Joly, but the following observations made by that engineer are worthy of special notice. His experiments seemed to indicate conclusively that no sliding movement commenced to take place until the elastic limit of the metal had been passed, and that the real cause of failure in the bond was to be accounted for by shearing of the concrete, a view that was supported by the fact that a coating of concrete generally remained on the iron rods after they had been pulled out. This point ought not to be overlooked, and we may add that in the present day it is becoming more and more recognised that failure of the bond is less likely to occur from sliding of the reinforcement inside the concrete than from failure of the concrete by shearing. From the investigations conducted by M. Feret the main conclusions drawn were: That the adhesive resistance varied at different points along the rods used, increasing with the roughness of the metallic surface, the proportion of cement used, the fineness of the cement, the size of the sand particles, the proportion of water used in mixing, and the age of the concrete. Professor Hatt also observed that the adhesion of the concrete varied at different parts of the rods tested, the values of the adhesive resistance ascertained by him being from 636 lb. to 756 lb. per square inch of metallic surface.

The results we have quoted serve to demonstrate the fact that the adhesion between concrete and ordinary round

steel bars may be taken with safety at about 500 lb. per square inch. Applying this value to the case of a round bar $\frac{1}{2}$ in. diameter embedded for a length of 1 ft., the total calculated resistance would be $0.5 \times \pi \times 12 \times 500 = 9,425$ lb., and if the bar were embedded for a length of 10 ft., it would be 94,250 lb., or about seven and a half times the ultimate resistance of the $\frac{1}{2}$ -in. diameter bar of mild steel. As a matter of fact, a $\frac{1}{2}$ -in. diameter bar, embedded for a length of only about 20 in. in a concrete block, can be pulled asunder without perceptibly impairing the hold of the concrete upon the embedded metal, except around the point of entry. In practice, however, the adhesive resistance of the two materials is not taxed beyond a value corresponding with the elastic limit of the metal, and as a general rule the factor of safety keeps down the value to one-third or one-fourth that of the elastic limit. In the case of a $\frac{1}{2}$ -in. diameter steel bar the tensile force with an adequate factor of safety might be anything from, say, 2,000 lb. to 3,000 lb., but could not possibly be within measurable distance of the adhesive resistance offered to the movement of the bar if this were properly embedded in concrete of suitable proportions and consistency. Even assuming the bar were stressed up to the elastic limit, and taking that limit as high as 56,000 lb. per square inch, sufficient adhesive resistance would be afforded by embedding the bar for a length of less than 6 ft. in the concrete.

We have purposely delayed reference to the investigations of M. Considère,

because these were conducted upon specimens tested as beams in which the reinforcement was surrounded by concrete subject to tensile stresses beyond its elastic limit. For this reason the results obtained by M. Considère were not so high as others which we have mentioned. Using air-hardened concrete and ordinary rods of 0.24 in. diameter, Considère found the adhesion between the two materials to be 256 lb. per square inch of metallic surface; and using water-hardened concrete of richer proportions and rods of 0.17 in. diameter the adhesive resistance ranged from 326 lb. to 500 lb. per square inch of surface. Other tests by Considère indicated that the adhesive resistance varied inversely with the proportion of water used in mixing the concrete, the ascertained values in this series ranging from 71 lb. to 171 lb. per square inch of metallic surface.

Applying Considère's results to the case of a $\frac{1}{2}$ -in. diameter rod embedded for a length of 10 ft., as before, we find the adhesive resistance would be from 13,400 lb. for very dry concrete up to 94,250 lb. for semi-fluid concrete of rich proportions. Thus, even the lowest result of 71 lb. per square inch for concrete of manifestly improper consistency gives an adhesive resistance of more than 70 per cent. higher than the elastic limit of a $\frac{1}{2}$ -in. diameter rod of ordinary mild steel, and about 20 per cent. higher than the elastic limit of high carbon steel with an ultimate strength of between 40 and 50 tons per square inch.

Taking into account the figures stated above, it is abundantly evident that the adhesion between concrete and ordinary round bars is ample for all practical purposes, and fully justifies the general employment of such bars in reinforced concrete construction of all kinds.

Some American engineers hold the opinion that a mechanical bond in addition to that existing between concrete and the more or less irregular surface of a round bar is desirable for the purpose of enabling the construction to remain secure even if adhesion has been partially destroyed by concussion or other mechanical agencies. Several kinds of corrugated, twisted, and indented bars of square and circular cross sections have been patented in the United States, and one of them, the "Indented Steel Bar," is now being offered in Great Britain. This bar is of peculiar form, and may be best described by likening it to a bar which, originally of square cross section, has been flattened alternately in horizontal and vertical directions so as to form a series of projections with bevelled edges along all four surfaces. No doubt so long as the concrete remains intact the projecting surfaces would form a mechanical bond even in the total absence of cohesion between the concrete and the metallic surface, but it is also evident that they offer no protection against that shearing of the concrete around the reinforcement, which the most recent experience shows to be the cause of slipping under high stresses.

In a circular issued by the patentees the suggestions are made that the use of plain bars is on the decrease as engineers are beginning to realise the danger

of adhesion being destroyed by vibration and shock, that the adhesion of plain bars is reduced 60 per cent. after continued immersion in water, and that the adhesion of plain material is not sufficient to utilise the full available strength of high elastic limit steel. We do not for a moment think that these suggestions are made otherwise than in good faith, but at the same time we believe the patentees would be well advised in making some inquiry as to the exact extent to which they are supported by practical and scientific evidence before repeating them in another edition of the circular. So far as our own knowledge extends, the use of round bars is certainly not on the decrease, and we hope such bars will never be found unsuitable for the purposes of reinforcement, as it is very desirable that concrete-steel construction should always be possible with materials which are readily obtainable in the open market without the direct or indirect payment of royalties to patentees. As for the other points, the tests of M. Considère upon water-hardened concrete and the examination of concrete-steel piles after long submersion seem quite sufficient to dispose of the second suggestion, while the third is not supported by the experience of the authorities already quoted in this article. Moreover, remembering that high unit stresses, such as are permissible in high carbon steel, involve excessive tension and surface cracks in the concrete, it is not easy to see what advantage is offered by the use of high carbon steel as reinforcement, to counterbalance the serious disadvantage that it is very apt to break if bent cold, or if improperly treated after bending by the aid of heat.

NOTES.

The Highgate Tramway Disaster. By the serious occurrence of last Saturday London has been provided with a sufficiently convincing proof of the extreme importance attaching to the question of tramway brakes. It is true that none of the gradients on the inner system of metropolitan tramways is so long and steep as that of the Archway-road, but there are many where the failure of braking apparatus would entail most alarming consequences, and along some of the newer routes recently opened to electric traction in the outer districts, hills of considerable height and length have to be negotiated. From the evidence heard by the Coroner on Tuesday, it is clear that the hand brake with which the runaway car is fitted was capable of application in such a way as to cause four wheels of the vehicle to lock, and to remain fast even after the brake was taken off, thereby making the emergency magnetic brake perfectly useless. The chief engineer of the tramway company said that the driver ought to have applied the magnetic brake instead of the hand brake. While admitting that if the wheels were skidding the magnetic brake could not be used, this witness expressed the opinion that skidding could only result from bad driving. Even accepting that view, merely for the sake of argument, we must still say that the brake apparatus is not satisfactory because it

offers to drivers two opportunities of causing disaster (1) by applying the wrong brake first; and (2) by using that brake unskillfully. But it has yet to be proved that there was no defect either in the hand brake on the car in question, or in the mechanism of the wheels and axles. Whatever may be the upshot of the Coroner's inquest and the Board of Trade inquiry, it is tolerably certain that this regrettable event will lead to the adoption of safeguards not at present existing for the protection of the public, notwithstanding the fact that the apparatus now employed is said to have received the approval of the Board of Trade. While referring to the subject, we may point out that in addition to the risk of running away downhill in a forward direction, tramcars may run down backwards on steep inclines. Consequently it would be a wise precaution to employ a third brake such as has been fitted, on the recommendation of Colonel Druitt, to cars on the Penrynmequick branch of the Plymouth Corporation Tramways.

The Death of Mr. Stanford White. ALL the architectural world, in this country as well as in the United States, will have received a most painful shock at the news of the murder of Mr. White, the partner in the eminent firm of McKim, Mead, & White, whose names are familiar to all our readers. It is only two or three years since Mr. McKim, the head of the firm, was in this country to receive the Gold Medal of the Institute, and made, it may be safely said, friends in England wherever he went. Whatever he the real history of this terrible affair, all who knew Mr. McKim will sympathise with him in regard to the blow which has fallen upon his firm by the tragical end of one whose name and work had for so many years been linked with his.

A Light Case. THE case of *Fear v. Morgan* (reported in the *Builder*, p. 709) is somewhat complicated, but seems to have decided no new principle of law. Two houses had originally belonged to one common owner, and had been leased under one lease for a term of ninety-nine years. By subsequent assignments and underleases they had come into different hands, and at different times the interest under the original lease had been surrendered to the successors in title of the original owner, who had granted two separate leases for long terms. It was one of the terms of an agreement to renew the lease of one of the houses that the premises at the back of it should be raised, and this erection obscured the light to the other house, and the occupier, who held as underlessee of one of the renewed leases, brought an action to restrain the defendant, the lessee of the other house, from so obstructing the light. The decision appears to be that the fact that the predecessors in title of the plaintiff and defendant claimed from one common landlord did not prevent the acquisition of rights to light by these lessees one against the other, and that, whether the plaintiff held under a prolongation of the original lease or under the further lease granted on its surrender, the lights, being ancient lights

could not be obstructed. This decision is based on authorities of old-standing, and although it seems to have been argued that they had been affected by the decision in *Colls v. Home and Colonial Stores*, the Court of Appeal have held that this is not so, and that they still remain good law. There seems to have been no question as to the amount of obstruction caused by the erection or as to the diminution of the light, which was the ground for decision in *Colls' case*.

Aforestation in England.

THERE is no doubt that the care of woodlands and of timber trees has been surprisingly neglected in England. Some landlords have thought much of the preservation of game, and others of the improvement of agriculture; very few have given a thought to the preservation and improvement of trees. The Company of Carpenters has, therefore, acted wisely in publishing two prize essays on the "Adaptation of Land for Aforestation," by Mr. Leslie Wood and Mr. P. T. Shaw.* While there must always be a large demand for foreign timber these essays show clearly that the home supply can be considerably increased if timber trees were systematically managed. For example, Mr. Wood states that "the ash is, on the whole, the most useful tree grown in England on account of its elasticity, and at the same time its hardness," and while its price is about the same as that of oak, there is a steadier market. Yet to all intents and purposes the ash is a mere hedgerow tree—not one landowner in a hundred troubles to plant young trees or to take care of those which are becoming mature, and when he does realise the older timber he leaves the future to take care of itself. We hope, therefore, that these two essays will have a wide circulation.

Fires in Railway Buildings.

Two of the most destructive fires which have occurred for some years past in premises belonging to railway companies are those at the St. Rollox Works of the Caledonian Railway Company at Glasgow, and at Southampton Docks, where a large shed belonging to the London & South-Western Railway was totally destroyed. At Glasgow the fire broke out in the boiler-house of the carriage works and rapidly spread to the adjoining shops, causing the complete destruction of the buildings and their contents. Probably all the buildings involved by these two fires were erected before fire-resisting construction attained the prominence it occupies in the present day, and we may hope that such of the companies as are concerned will make sure against any repetition of similar disaster. Unfortunately, engineers are not too ready to employ methods and materials of construction affording absolute protection against the spread of fire. For many types of building they still pin their faith to unprotected steelwork and ordinary glass, looking upon reinforced concrete and armoured glazing as things of doubtful character, apparently for no other reason save that of comparative novelty. Perhaps a few more fires may bring councils of wisdom:

* London: Laughton & Co., 3, Wellington-street, W.C.

The Collapse of a New Building at Kingston.

WHILE the severity of some building regulations continues to form a fruitful topic of discussion, it does not seem possible that the rules prevailing in Kingston-on-Thames can be of vexatious character. That is certainly a natural inference to draw from the sudden collapse of a shop and dwelling-house in King's road immediately after completion on Saturday last. We are not in a position to speak definitely as to the precise cause of this surprising *dénouement*, but it is evident that the main portions of the structure must have been in a particularly delicate state of equilibrium. The stable character of brick buildings designed in the good old-fashioned way leaves nothing to be desired. But there is a limit to economy, and people who apply brickwork and other structural material in slender proportions, such as prevail generally in suburban London, would do well to introduce a framework of steel for the purpose of binding together all the essential parts of the buildings they erect. At the same time, it must be remembered that a steel frame, if not properly connected, may in itself prove to be a source of danger, a fact illustrated by the failure of a steel-frame building during construction in New York a year or two ago.

The National Physical Laboratory.

WE are glad that the scope of the work carried out at the National Physical Laboratory is extending rapidly. Last Monday a large new electro-technical building was opened by Mr. Haldane, and Dr. Glazebrook announced that buildings for metrology, metallurgical chemistry and engineering were being erected. The Government grants have been largely supplemented by private donors, and we agree with the director in thinking that the opportunities for research and investigation will be hard to equal elsewhere. The new ampere balance for determining the unit of electric current has now been completed, and readings obtained by means of it agree in the most satisfactory manner. The investigations recently carried out on standard cells and resistance standards will be a great help to electricians. The determinations of the values of the constants of the insulating materials used in the construction of telephone cables which Mr. Campbell communicated in a paper to the Royal Society last week are deserving of high praise. The methods he used in carrying out this research are highly ingenious, and the publication of them will be a help to many. The arrangements for the testing of ammeter shunts struck us as being very complete and satisfactory. In the new building arrangements are made so that currents up to 5,000 amperes can be easily obtained. The thermometers of ordinary range are dealt with at Kew, but the very high or very low range thermometers are tested at Bushy House. Temperatures down to the temperature of liquid air are readily obtained, and the high temperatures are obtained by a series of electric furnaces, one of which can maintain the temperature constant at 2,000 degrees Centigrade. The large Moissau arc furnace was also interesting,

and should prove useful for reducing the so-called "infusible" oxides. It seems to us that by means of these electric furnaces it would be possible to maintain platinum in the molten state and so make determination of the light emitted from it per unit centimetre an easy matter. It would be interesting to know the exact value, in British candles, of this standard which was first proposed by M. Violle twenty-two years ago.

Birkenhead New Water Supply Scheme.

It appears that Birkenhead now intends to follow the example of Liverpool by going to the mountains of North Wales for additional water supplies. The complete scheme formulated provides for the construction of three reservoirs in Denbighshire, and the necessary aqueducts following a course of about 42 miles from the source of supply to a large new service reservoir near Birkenhead. The proposed works comprise three sections, the first of which will be undertaken as soon as practicable, the second will not be necessary for some thirty or forty years, and the third may not be required for eighty or a hundred years, but under the scheme prepared all the sites, including extensive gathering grounds, will be purchased so as to make absolutely sure of future as well as of present supplies. The first reservoir will be formed in the valley of the River Alwen, by the construction of a masonry dam capable of holding up about 2,100 million gallons of water with the surface level of 1,700 ft. above the sea. This reservoir will supply 8,100,000 gallons daily, in addition to 7,000,000 gallons of compensation water. The second section of the works involves the construction of a similar reservoir with the capacity of 1,700 million gallons, on the Brenig, a tributary of the Alwen. This reservoir will supply 5,900,000 gallons daily after due provision for compensation water. The third section of the scheme fore-shadows a reservoir, below the confluence of the Alwen and the Brenig, capable of supplying between 4 and 5 million gallons daily, besides compensation water. Thus the total supply from Wales reaching Birkenhead early next century should be 18 million gallons daily. The project is undoubtedly a good one so far as Birkenhead is concerned, and ought to make the town quite safe against the possibility of water famine for a very long time.

Newport Market Schools.

MR. E. T. HALL has been appointed architect for an extension of the Newport Market Army Training School, in Coburg-row. The refuge and schools were originally established in 1863, through the instrumentality of the late Mr. and Mrs. W. E. Gladstone and Mr. Shaw Stewart and others, in association with the House of Charity, Greek-street, Soho, in the buildings of Newport Market as an industrial school, with a boys' band and a refuge for the homeless poor. The market-house—a curious survival from past times—consisted of an octagonal structure having a glazed upper story, the use of which as a slaughter-house, did not, by some means or other, cease upon the passing of the Public Health Act, 1849. A quaint, old, barn-

like building to the south, erroneously described as the slaughter-house, had been the place wherein the cattle were stabled, the dealers meeting in the "chaffering-floor" over the stalls. During its occupation as the refuge that building with its stalls and large-framed timber work suffered very little change. But in July, 1882, the Newport Market area, extending over some 10,000 sq. ft., was cleared, having been reserved for working-class dwellings under a special clause of the late Metropolitan Board of Works' Act, 1877, for improvements in that quarter, and the site was taken for Sandringham-buildings, erected on the east side of Charing Cross-road by the Improved Industrial Dwellings Company. A temporary home was found in Long-acre for the refuge and schools, which in December, 1884, were removed to No. 76, Coburg-row.

THE New Dudley Gallery is at 169, Piccadilly (as nearly as possible, we believe, on the site of the old one), in the large new block of building which now occupies a frontage of which the Egyptian Hall was a part. The situation is good enough, but unfortunately the room, like another new gallery lately opened in Bond-street, is very insufficiently lighted at one end, and can never therefore be as satisfactory a room for exhibitions as the old Dudley Gallery, which was one of the best-lighted rooms of its class in London. The main feature of the first exhibition held in this room is a collection of sketches in Japan by the late Mr. Charles Wigram, who in 1857, at the age of 23, was commissioned by the *Illustrated London News* to go out and make sketches in connexion with the Chinese war; and finding his way afterwards to Japan, was so well satisfied with the country as to remain there for the rest of his life. The sketches exhibited are chiefly of characteristic figures of Japanese life, very clever, and interesting also because they portray the people of Japan at a time when the country was much less Europeanised than now. There are also a number of sketches and some finished pictures, including one or two important portraits, by his brother Mr. T. Blake Wigram, whom we fortunately still have with us.

THE Society have disposed of their property, consisting of 100 acres, at Park Royal, Willesden, together with the freehold ground-rent of the Plumes tavern, for 28,500l. At their last monthly meeting the Council unanimously agreed to accept an offer made to them for a building lease of Harewood House, No. 13, Hanover-square, and to take steps for securing new premises. In November, 1894, they entered into occupation of Harewood House, which had been offered for sale after the death of Lord Harewood. In, or after, 1766, the brothers Adam decorated the interior for the Duke of Roxburghe, and at the same time remodelled the two fronts, adding pilasters and a rounded bay, on the west side, which had an extended frontage to Harewood-place. After the Duke's decease the house was bought by Edward, first Earl of Harewood. The alterations

and restoration of the house, with some additions on the north side, were carried out for the Society by Messrs. Holland & Hannen, under the directions of Mr. Arthur Vernon. The original drawings state that the fabric was to be coated with "Liardet" stucco; the first elevations are depicted in early views of the square, including those of 1720 (first state) and 1754 by Sutton Nicholls; and one by Overton, 1727. In 1800 T. Malton published a good view in aquatint of the altered west front.

AT the Modern Gallery there are two small exhibitions of water-colours. The first, a set of sketches of Spain, Corsica, and Italy, by Mr. Ernest Thesiger, contains some very good work; the colour is pleasing, and in most of the sketches there is a great feeling of atmosphere and sunlight. "An Olive Yard, Ajaccio" (7), is a very effective painting of dark trees against a light sky. In "The Gesuati, Venice" (37) the colour and the treatment of the water are very satisfactory. The other exhibition, "The Garden of Allah," by Major Englehart, consists of sketches of Biskra, its neighbouring oases, and the surrounding desert. It is an interesting collection in many ways; there are several very characteristic sketches of Arab life, and though the figures are not always perfectly drawn, yet as a whole they are well put in, and full of life and movement. There are also paintings of the desert under many different aspects. "Drying Bricks by the Cemetery" (22) is a beautiful sunset effect; a "Sand Storm" (28) gives a very different idea of the desert. "The Valley of the Biskra River" (1) is one of the most successful of the drawings.

WE may remind our readers that the great historical pageant at Warwick, which has been in preparation for a long time past under the management of Mr. Louis N. Parker (who originated and arranged the Sherbourne pageant), commences on Monday next, to be repeated on each day of the week. We gave some information as to the principal points in the pageant, as well as some historical notes on Warwick and the neighbourhood, in the *Builder* of February 3 (page 113), to which we refer the reader. The pageant will probably be well worth a visit to Warwick.

ARCHITECTURE AT THE ROYAL ACADEMY.—IV.

In the way of domestic architecture there seems less than usual at the Academy of any attempt to produce house design with a distinct and dominating idea. There are various pretty sketches of houses of the irregular picturesque type, and to many persons, no doubt, this kind of treatment represents what is best and most fitting in a country house, rendering it what is called "homelike." To our thinking, this is hardly house architecture in the true sense of the word. In an old house a picturesque irregularity of grouping and outline is often very pleasing from association; whether it arises from additions made at different times and under different tastes, or whether, if built at one time, it is simply the expression of the naïveté of country construction in which each portion of a house has been put up just as materials and construction seemed to sug-

gest at the moment, and without much consideration of its relation to the rest. The plans of such old houses are for the most part as naïve as the exterior architecture, and, if considered from the modern point of view, often very inconvenient and ill-arranged; and in the case of an old house it is easy to pardon this, for the sake, again, of association. The irregularities and inconveniences are, so to speak, historically interesting. To what misunderstandings or accidents of building was it due that half of a long passage had to be boarded on a slope instead of level; or why was one of the bedrooms inconsequently floored with a 3-in. step up from the passage, over which the unsuspecting visitor trips on entering his room? These things do not annoy us in an old house; they are part of its history; but the visitor who tripped over such an unexpected step in a new house would possibly swear at the architect. Irregularity of exterior grouping, without any definite object, does not produce any physical inconvenience, and hence it is accepted as "picturesque"; but is it any more good architecture than irregularities of level are good building? Architecture is not naïveté, it is design; and there is no design in throwing a building into an irregular assemblage of brick or stone walling, timbering and plaster, battering buttresses where they are not constructively required, and gables introduced at random. We are not saying, of course, that houses should always be symmetrical in design; but that a symmetrical design should have an obvious motive, and should be design, and not either accident or with the appearance of accident. Irregularity of arrangement, for the mere sake of irregularity, is one of the easiest things possible, and is worth very little when it is done.

Hence we cannot attach any importance to sketches of houses with no plans, such as Nos. 1,390 and 1,397, showing the same house; the latter really a landscape sketch in ink line, with the house in the foreground. Mr. Langton Dennis's "House at Crowborough" (1,589), to which a plan is attached, is pretty, and the small colonnetted loggia at the top of the projecting bay is a nice feature. Mr. Schultz's "House at How Green, Hexer" (1,411), is an example of a house with an unsymmetrical plan which shows an original treatment. The plan is V-shaped, but with the right leg of the V longer than the other; it is here that the offices are added on. On the front, or the base of the V, there are two recesses, leaving a projecting bay in the centre, and on the first-floor level a balustrade balcony runs right across in a straight line. The dining-room and library form the base of the V; the billiard-room is in the left diagonal and the drawing-room in the right. The whole is both picturesque and well arranged; the perspective, in coloured chalks or pastel, is effective.

Mr. Compton Hall's "New Entrance Front, Dunham Masie" (1,399), shows a fronton attached to the front of the house, with three stories of orders one over the other, Roman Doric in the ground story, forming a framework to the entrance door, and Ionic in the two upper stories, the upper one of all being a dwarf order of low proportions. It is not a bad way of giving architectural emphasis to an entrance.

Mr. Percy Robinson's small "House at Chapel Row" (1,456) shows a nice treatment of a small symmetrical house, white rough-cast with a red-brick arch over the entrance recess and a high red-tiled nipped roof; no plan is given, but there is a pleasing simplicity about the exterior. Simplicity is what is wanting in the group of "Three Houses, Regent's-park" (1,441), by Mr. W. Henry White; there is no distinct motive in the design, and no plan is given. Mr. Prentice's "New House, Eglinton-drive, Glasgow" (1,454), is an example of a design with a definite treatment; this is a symmetrical house with a slightly projecting centre and pilaster projections emphasising the angles; both a plan and north point are shown, from which we see that the dining-room, with an apse, faces north, the drawing-room west—both these are good aspects; the morning-room faces south and east, the principal window south; east would have been better. The ground-floor windows are wide and comparatively low, with round-arched heads, and filled in with small panes; the round heads look very well

outside, but this form of head in a sitting-room sometimes leads to a little difficulty as to how to finish it and arrange the curtains, etc., inside. There is a high tiled hipped roof and a cornice of great projection; the slope of the roof is carried straight down over the centre projection of the wall, which does not look very well. It gives the impression of a bit being snipped out of a roof here, but this is a good exhibit in the main. "Houston Court, Kensington" (1,415), by Mr. J. D. Coleridge, is not exactly domestic architecture, but a block of houses in flats, in E-shape in plan of front, except for a ground-floor block of shops which runs straight along the front street line. The main building is treated with a stone front half-way up, and brick above, and is a simple and suitable design with no florid ornament about it. The same praise may be given to Mr. H. G. Todd's "Proposed House in Wimpoole-street" (1,431), a stone front, also very simply treated with the windows grouped within a series of vertical panels. Mr. Geoffrey Lucas's "Cottages at South Mymsms" (1,452) has the same merit as Mr. Prentice's house above-mentioned, that of showing a distinct and carefully considered treatment and not a mere random picturesque. It is a long block of white rough-cast wall with two stories of windows, stopped at each end by a block of red-brick wall slightly projecting, and with a simple decoration in bricks of a different colour; the entrance to the two centre houses is by a round-arched porch-entrance in the centre, to the two end doors in the brick pavilions; it is a cottage group which would at once be recognised as the work of an architect.

Mr. Arnold Mitchell's "House at Harrow Weald" (1,465) is simply a water-colour sketch of a rather picturesque cottage which might be either old or new—the sketch would suggest that it was an old cottage; and there is no plan to tell us anything about the arrangement or construction. This is a kind of drawing which, for all its reference to architecture, might as well be in the water-colour room. Mr. Hutchinson's "House on Hawkhill, Walmers" (1,482), is a picturesque design properly worked out in plan and elevation; it is very simply treated, with brick walls half-way up and rough-cast above, and a high tiled roof with a strongly-marked eaves cornice; the staircase hall is marked externally by a half-octagon bay with chequers of brick and stone at the top and below the main window; a small carefully-executed drawing of a very pleasing house. Mr. Baggallay's "Shenley Hill, Herts, as Rebuilt" (1,490, no plan), is a perspective view in line of what may be either a stone house or rough-cast walls with stone groins; it is a good example of an unobtrusive country mansion of the symmetrical order, with a projecting columned porch with a heavy broken pediment, and a carved shield and mantling on the wall above; it is very likely more attractive in reality than in the drawing. Mr. Ernest Newton exhibits a pen-line drawing of his "House near Godstone" (1,490, no plan), which was illustrated in our issue of May 12; in an E-plan in the front wall, with a wrought-iron railing round the flat over the centre porch and a large dormer above; a cornice carried all round, and windows with flat brick-arch headings; *simplex munditiis*. Mr. Horace Field's equally simple front of "Nos. 14 and 15, Great College-street" (1,501), is a good specimen of a street front suitable to its surroundings; it is apparently mainly a brick front shown on an elevation rather too much covered with lines which disturb its effect; a nice little point in it is that the two stone-framed doorways, symmetrically placed, have one a curved and the other an angular pediment, a difference in detail which gives a little character to it.

Messrs. Ernest L. George & Yeates's "Busbridge Hall" (1,540) was illustrated in our issue of May 19; it is a quiet domestic-looking building, as usual with them, the main feature of which is the recurrence of three similar projecting bays with balustrades at the top, equally spaced along the front, which the plan shows to represent respectively (on the ground floor) drawing-room, hall, and dining-room, which thus have all the same aspect and the same architectural expression; what the aspect is there is no north point to show. The same aspect cannot be equally good for all three,

and one would think the hall should be distinguished externally from the two rooms; but this is a case in which the expression of the interior is sacrificed to breadth and repose of effect, and there is something to be said for that; at all events, it is a very pleasant, quiet-looking house. Mr. Raffles Davison has a pretty sketch of "An Artist's Cottage" (1,538, no plan); and in Messrs. Cockett & Dick's "New Premises, Pilgrim-street, Newcastle" (1,546), we come on a rather bold and important bit of street architecture. The ground story is shops, with a strongly-marked lintel and cornice carried right through over the windows in two courses (but the stone beam over the wider windows must be clandestinely supported by a girder in the rear); over this a projecting bay, segmental in plan, runs up on each side of the front, ending under the boldly-projecting cornice; the horizontal cornice is stopped in the centre, and a high-pitched raking cornice of the same section springs from the top of it; with the exception of that deceitful stone lintel over the shops, this is a good and bold piece of masonic design. Mr. Voysey's "House at North Luffenham" (1,548, no plan) is another of the pretty sketches which are "merely that and nothing more," and the battered buttresses we are getting tired of; they are no longer a novelty, and we do not know that they have any, other special merit. Mr. W. H. Briery is to be commended for showing a plan of "Burrough Court, Leicestershire" (1,567); but there is not much distinction of style in the exterior. In Mr. C. T. Bathurst's "A Block of Business Premises" (1,569) we come on a good bit of street architecture of some originality; as this is simply the case of the treatment of a street front, a plan is hardly required. This is a plain stone front half-way up, and brick above, but with slightly projecting pilaster-like piers of stone carried up to the top; the windows are arranged so as to give character and variety, and this is a very good example of a plainly-treated street front with a certain individuality. Messrs. Oldrid Scott & Son's "House at Sunningdale" (1,573) is shown in a pretty water-colour drawing in which the effect of the green outside shutters to the windows, showing against the white hall, looks more French than English. Mr. Needham Wilson's "Springfield Dukes, Essex" (1,586), is evidently a pencil sketch of an old farmhouse with a pond in the foreground, and its proper place would be in the Black and White books; as Messrs. Silkock & Reay's "Cottage Homes, Churchhill, Somerset" (1,591, no plan), looks as if it ought to be in the water-colour room; it is a very nice drawing of an effect and a composition evidently suggested by Walker's "Harbour of Refuge"; but then we should like to know how the Cottage Homes are planned. Mr. E. A. Hunt sets a good example in giving both a pretty large plan and north point in connexion with his "Redlands, near Haslemere" (1,597); a picturesque house with low walls and high roof and some character in the arrangement of the windows. We may point out, however, that west is not a good aspect (in summer) for the large kitchen window, and the drawing-room would be rather deficient in light at the inner end. Mr. Figgis's two small water-colour sketches of two aspects of a "House at Bromley" (1,600) are simply sketches which do not tell us anything, except that the one with the high flight of steps makes a good little bit of composition. Mr. Lofthouse's "New Shipping Offices, Middlesbrough" (1,608), is a pleasing bit of street architecture, though the finish of the centre gable is rather heavy and awkward. Mr. E. T. Powell's "Great House Court, East Grinstead" (1,605), has a small plan which implies that it must be a new building, otherwise we should have supposed it to be a piece of curious old patchwork produced by additions at different periods. It is picturesque enough, and, of course, there are people who like this kind of quasi-ancient treatment; but it is not what we should call house architecture.

Among a few drawings of domestic interiors, Mr. Christian Eliot's "Dining-room, Byrkeley Lodge" (1,392), shows a dignified room wainscoted with dark wood, three-quarters of its height, with a portion of it cut off the common arrangement of two wall-

columns and a scuff; the centre part of the ceiling shows a circular moulded panel, decorated with that very high-relief naturalistic plaster foliage the fashion for which has been revived lately, and which we think bad art. The interior of the "Garden Entrance Vestibule" of the same house (1,507) we like better, because the detail of this kind seems less exuberant; it is apparently an oak-panelled apartment which, with its floor in large squares of black and white marble, looks very well. "An Interior" (1,525), by Mr. Thomas Johnson, is a good water-colour drawing of a room with Elizabethan detail. Mr. Charles Strange's small water-colour drawing of "Music-room at Beechwood" (1,448), rather slight and sketchy, gives an impression of a pleasantly-decorated room with white woodwork and a prevalent gold tint on the walls, but there is nothing to enable one to judge of the detail.

There is not much to speak of in the way of decorative work. The large drawing of a "Monstrance for Westminster Cathedral" (1,400) is showy and wanting in refinement, and, in fact, looks too much as if it might have come out of an ecclesiastical furnisher's repository. The drawing entitled "Decorations" (1,426), by Mr. E. J. Lambert, is a good piece of work showing the adaptation of late Renaissance painted detail to the surfaces and groins of a quadrangular vault, with designs of figure subjects in the lunette. Mr. Weatherley's "Font Counterpoise weights, Longborough Parish Church" (1,429), we suppose represents the application of modern wrought-ironwork bracket, chain, and counterpoise weight to an existing font-cover; an elaborate piece of ironwork, perhaps better if it had been a little simpler. Mr. Walter Keith's "Design for Golden Chalice of the XVIII Century Period for the New York Cathedral" looks well at first sight and as to general line and effect, but some of the detail is by no means good; for instance, the lower part of the exterior of the bowl is covered with a miniature representation in relief of a late Gothic screen arcading, buttresses and all; of course distorted in line on a convex surface, and in every sense a total misapplication of detail. Mrs. Ostrahan's two drawings of figures for stained glass, "St. Matthew" and "St. Thomas" (1,463, 1,466)—figures on what may be called a background of square leaded lights, look very well; so does the simple window design for the peristyle of the dome in the City Hall, Belfast (1,443), by Mr. J. C. Bewsey; a window divided into upright panes by thick strongly-marked bars, with a wreath and symbolical device in the centre of the upper portion. Mr. J. J. Stevenson's "Monument in Largs Cemetery, Ayrshire" (1,472), looks very well in the drawing in which it is shown standing in the foreground of an extended landscape. The monument is a classic erection on this plan, with two columns standing free at the two outer ends and solid piers at the re-entering angles; the space between these is partly occupied by a screen and inscription tablet, leaving an open space above it. It is a good and rather novel piece of monument design.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The last ordinary general meeting of the present session of the Royal Institute of British Architects was held on Monday at No. 9, Conduit-street, Regent-street, W., Mr. John Belcher, A.R.A., President, in the chair.

The minutes were taken as read, and the following gentlemen were introduced to the Chairman after their election as Fellows, *i.e.*, Mr. R. Sheekleton Balfour, President of the Architectural Association; Mr. H. P. G. Manle, Master of the Architectural Association Day School; and Mr. W. A. Forsyth.

Deceased Members.

Mr. Alexander Graham (Hon. Secretary) announced the decease of the following gentlemen, *i.e.*, Mr. A. Mossley, aged 94, of Fulham, elected an Associate in 1838, a Fellow in 1850, and who was placed upon the retired list in 1902; and Mr. Philip Wilkinson, London, elected a Fellow in 1890.

Presentation of the Royal Gold Medal.

The Chairman said:—"Ladies and gentlemen,—I count myself peculiarly fortunate in

that it falls to my lot to-night to present the Royal Gold Medal to so great an artist as Sir Lawrence Alma-Tadema. You know how sincerely I have desired, how earnestly I have striven, to effect a close relation between the arts, to bring the painter and the sculptor into association and collaboration with the architect for the achievement of the noblest results—results which shall be a triumph of art in its unity and entirety. It is a very happy occasion for me, therefore, when I am called, on behalf of this Institute, to do honour to a man like Sir Lawrence, who is not only one of the first of living painters, but has also shown so fine an appreciation and so great a knowledge of architecture—both on its artistic and its practical side—that it has been said that if choice or destiny had not determined him an eminent painter, he might have been a still more eminent architect.

The gold medal presented by the King is, as you are aware, conferred annually upon one who is recommended by this Institute and approved of by His Majesty as having designed or executed a building of high merit, or as having produced a work tending to promote or facilitate the knowledge of architecture.

Our distinguished member, Sir Lawrence Alma-Tadema, is qualified on both grounds. Indeed, he has rendered such good service to our art—indirectly for the most part it is true, yet not the less substantially and really—that, though he is known to the world chiefly as a great painter, the Institute has felt no hesitation whatever in presenting his name to the King for the Royal Gold Medal; and His Majesty has, with equal readiness we believe, recognised Sir Lawrence's merit and graciously approved the Institute's choice.

We have all admired the fine architecture which is so beautiful a feature in many of Sir Lawrence's pictures. Before we speak of that, however, let me tell you, what probably some may not know, that Sir Lawrence is an architect. If you have had the privilege of examining the house and studio which he has built himself in St. John's Wood, you will have recognised the hand of a master in every part of it. Not only is it an interesting and delightful building for the ordinary visitor, full of beautiful features which meet you and surprise you at every turn, but it possesses also many details which are worthy of the architect's careful study. The smallest and most insignificant details, in fact, such as would probably escape the layman's attention altogether, have received an amount of thought and care which is both unusual and suggestive. I learnt much that has been useful in Sir Lawrence's house, and its many novel and effective features impressed me greatly. If you ask me what "style" it is—rather an incautious and self-betraving question—I reply, "It is real Alma-Tadema," and that means, at any rate, that it is instinct with life.

"To copy and imitate is death to art" is one of Sir Lawrence's principles, and though his archaeological knowledge and skill are beyond dispute, and in respect of certain periods and countries unrivalled, yet in his own house he has known well how to be original—both in the arrangement of the plan and in the adaptation of forms and materials to his particular purpose. All is fresh and beautiful, and parts of the house possess a character and environment which would make a Roman of the times of the Empire feel quite at home—even in St. John's Wood. I say a Roman advisedly, of course, because, as we all know, ancient Rome has been Sir Lawrence's chief theme as a painter. He has, I believe, saturated himself with the beauties and glories of Italy—as that great country was before its sun went down. He is probably the first living authority on the art work of Greece and Rome, and that not merely on the æsthetic side, but on the practical constructive methods that were then in use.

His research has been of the widest scope. He has not been content with studying the grand structures and remains of ancient buildings. He has ventured amongst the tombs, both Etruscan and Lycian. He has had an eye for Assyrian bas-reliefs, terracotta slabs, and all those miscellaneous relics which are to him who knows how to read them a revelation of the history of the past,

an index of the power and spirit of vanished nations. This is how it is that Sir Lawrence has been able to use his great gifts to portray for us the architecture of the past, particularly of Rome, in all its magnificence. He is never satisfied with a mere suggestion or rough indication of a building. Every single detail, each moulding or other ornament, is most carefully and truthfully set forth. It must be the best of its kind, too—something selected for its beauty, and finished and refined with perfect taste. What a wealth of material, too, he employs, and how he revels in the expressive qualities of each kind! Has anyone else presented, or will anyone ever present, the translucent properties of marble so well as he? Whether it be marble, stone, bronze, or silver, he has studied the forms most suitable to each, and everything may be perfect both in form and colour. And then he portrays the whole for us under the sunny skies of Italy, that the beauty of the artist's work may be lighted up and intensified by the beauty and glory of the world of nature!

As an indication of the interest that Sir Lawrence takes in other forms of art than that which he has made expressly his own, I may cite two well-known pictures of his. "Architecture in Ancient Rome," in which he depicts the architect engaged on his work, and another in which the sculptor Phidias is represented putting the finishing touches to the Parthenon frieze and explaining it (apparently) to his friends and patrons. He has also given us a picture of a sculptor's studio and a corresponding one of a painter's studio.

Architecture figures more or less conspicuously in quite a large proportion of Sir Lawrence's paintings, as you may see by the photographs which he has kindly lent for your inspection this evening. In some it is quite a (if not the) prominent feature, as, for instance, the picture in which he has reconstructed the Roman Colosseum, and another representing the Baths of Caracalla in all their splendour—magnificent paintings, both of them, impressing us with a conviction of the absolute accuracy of every detail, such as only an architect could reproduce.

I must not attempt to speak of all Sir Lawrence's paintings that contain architectural accessories—a bit of an exterior in this one, a bit of an interior in that, and so on—pictures in which the architectural element is naturally and properly limited, and made subservient to the figures in the composition. But this I should like to say, that, however much, or however little, may ultimately find place in the actual canvas, it has all been carefully planned and set up in section first.

There is one of Sir Lawrence's pictures which presents a complete architectural work, filling indeed the major part of the canvas. I refer to the painting known as "Down the River," which contains the whole of a well-designed bridge of five arches, a reconstruction—idealised no doubt—of the celebrated Bridge of Augustus at Rimini. The four piers contain good-proportioned niches occupied by bronze statues, and framed with column, cornice, and pediment. The parapet is perfectly plain, and, like the arches, without moulding. The bold cornice which separates parapet and arches is horizontal. The arches vary in height, and evidently follow the curve of the roadway. Over the centre arch is a raised stone block panelled for lettering, and above that again a recumbent river-god. At one end of the bridge may be seen an arched entrance to the roadway. The whole treatment is simple and dignified, and the effect of the long horizontal line of the cornice is particularly good.

But as a wonderful illustration of Sir Lawrence Alma-Tadema's architectural knowledge, and the clearest proof of the practical value of his archaeological researches, I desire to direct your attention to the series of designs which he made for Sir Henry Irving for the scenery to illustrate Shakespeare's play of "Coriolanus." Here we have whole buildings, and even groups of buildings, exteriors, and interiors presented with a marvellous appearance of solidity, and marked, not only by a wealth of beautiful detail, but also—which is perhaps more wonderful—by complete constructional fidelity.

Mr. Phene Spiers, writing of these scenes in the *Architectural Review*, makes a point of the constructive genius displayed in them, and remarks that Sir Lawrence's "interpreta-

tion, based on the most profound archeological research, of the variety of design in Etruscan architecture comes to us virtually as a revelation." Quite apart from the beauty of the colouring or the picturesqueness of the grouping, the actual designs fill us with admiration. In the Roman Forum scene, for instance, as shown in the original drawings, Sir Lawrence has reconstructed the Forum buildings for us after a manner which we instinctively feel is absolutely true, not only to the general form and spirit of Roman work, but also to the particular period in which the play passes; and as for detail, even the construction and framing of the timbers are carefully shown.

In the widely-projecting timber eaves which constituted a striking feature in the typical Etruscan Temple the artist has treated a somewhat difficult problem. This great projection (over 7 ft.) of the beams which support the boarding of the roof and gutter was intended to protect the wall decorations beneath them.

But these single beams, relatively to the whole, looked thin and weak; so Sir Lawrence added two extra ones underneath, of shorter length, thus dividing the projection into three parts. He also terminated each timber end with a bracket, just as we see in some of those old ceilings where the joists are exposed and the span is great. Mr. Spiers, himself no mean authority, speaks of this treatment as both original and effective. Then there is the house of Tullus Alfidius—a beautiful design with a projecting and overhanging balcony of wood, full of detail, evincing great technical knowledge. The charm of the whole scene in which this is presented will not easily be forgotten. In another scene there is a very striking entrance doorway or projecting portico, the upper part of which, covered in by a semi-circular roof of bronze plates, forms a kind of outlook. The constructive timbers, with their tenons and pins, are all carefully shown in this design. The general form has been probably suggested by some old tomb, but the details are fresh and original.

Amongst the beautiful interiors presented in these designs we may mention the Senate House and Coriolanus's house. In the latter the excellence of the plan, the beauty of the colouring, and the effects of light and shade attract our attention and excite our admiration. The arrangement of the Senate House is simple and without impressive. The beautifully-moulded square Etruscan piers, enclosing the hemicycle of stone seats ranged in tiers above one another, are very fine in scale, their apparent size being increased by their contrast with the small figures of the projecting Etruscan frieze above. Between the piers and the frieze is an architrave marked by a curious and effective square block corbel.

I have indicated a few of the most striking features of this wonderful series of designs, but no words of mine can convey any adequate conception of the amazing wealth both of knowledge and of skill to which they bear witness. When we consider the many and varying elements which go to make up their truth and their beauty, we can only wonder that they all fall within the scope of one man's powers. To one of the rarest of gifts as a painter Sir Lawrence Alma-Tadema adds the powers of a great architect, and endows all his work with a perfection of taste and a fulness of knowledge which in their combination are unrivalled.

The rising generation, who are not too old or too proud to learn, may profit much by Sir Lawrence's example. He has shown to all men the immense importance of accurate and careful detail. He is a living witness to the truth that the ultimate refinement of all work depends upon the amount of thought and study bestowed upon each and every part. Furthermore, all his work is an illustration of the right and true use of archeological knowledge. Though he is well versed in all the forms and details in use amongst the Romans, he has not been content merely to copy and imitate their work—he has advanced it along the old lines, after the traditional manner and in the true spirit of the original. He has not cast aside the experience of the past, but has shown us how it can be rightly used and carried forward. His work has given us a true insight into the methods by which alone our beloved art can be advanced and made to live.

In the presentation of the Royal Gold Medal we recognise and acknowledge Sir Lawrence Alma-Tadema's services to architecture—in promoting a knowledge of and quickening an interest in it—and we are glad to be thus permitted to honour him. He has had many honours conferred upon him. He is the possessor of the Order of Merit. He received his first gold medal at the age of twenty-six; I am not sure how many he has received since. But not one of all the many distinctions that have been conferred upon him has been bestowed with more heartfelt pleasure and more real esteem than the medal I have now the honour of presenting."

The President then conferred the medal upon Sir Lawrence, who was received with great applause.

In acknowledging the gift, Sir Lawrence said—"The sun has often shone upon me in the course of my life, but it has never warmed me more than at this moment, when the apostles of architecture have bestowed upon me that great distinction, the Royal Gold Medal, for services rendered to the well-beloved sister art. Our kind President has honoured me by explaining to you my connection with architecture; and I am proud to think that my services to an art which I love beyond expression have been thought worthy of consideration, although, when I compare my achievements with my love, it seems to me that I have done very little."

The sister arts have always appeared to me indivisible—different parts of a single whole; and I realise that from this point of view I might be regarded as a link of some interest, my own particular art being so closely concerned with architecture that I was myself at times almost tempted to believe I knew something about it! It would no doubt be enlightening if we could point out to one another the causes that lead us each to his peculiar bent in the pursuit of a common ideal; but none of us really knows what impelled him to choose a certain pathway in the kingdom of art.

Art is so manifold in its aims and expressions that it seizes every one of us in a different way, and yet in the same way; it seems to take possession of us, and forces from us different expressions of the same truth. What this truth is no man has yet been able to define; it always seems to me that art is an expression of the human mind which exists merely because it is an expression of beauty; and, to quote Winckelmann's fine definition, "Beauty is one of the great secrets of nature, of which we all behold and receive the influence, but of which a general and clear understanding belongs to the eternally unattainable truths." Indeed art is a thing about which one cannot speak or reason; yet it is a thing that fills one with emotions and expressions which one spends one's life trying to communicate to one's fellow-creatures, in the silent language of one's craft; if once art has a foothold in a man's nature it masters him, and forces him to do this. It convinces him that he is bound to do this. It communicates his impressions, that he may not keep them to himself, and that there is no happiness for him unless he can share with all the world that which possesses him so deeply. Every artist is conscious, therefore, that he has little to say concerning his artistic aims and ideals beyond what can be read in his work.

I have taken the liberty of showing you, by permission of the President and Council, a few reproductions of my pictures, in order to prove to you how greatly my mind has always been pre-occupied by architecture in the execution of my own art. I should, of course, have preferred to show you the pictures themselves, but, with the exception of a few, they are all abroad. You will see that in some I have tried to reconstruct antique buildings; in others I have been concerned with the proportions of figures to architecture—I am even showing you a composition of a Gothic entrance to a cathedral, exhibited as long ago as 1857, to prove to you that my very beginnings were architectural; and a painting of the Church of San Clemente in Rome, dated 1863, will show you that during my first visit to Italy, at a moment when I was steeped in studies of the Merovingian period, I was mainly pre-occupied by the study of Early Christian churches.

I cannot sit down without a sincere expression of gratitude to the President for his

all too kind words of goodwill towards me and my art; and to you, ladies and gentlemen, for the way in which you have sympathised with me in the receipt of this honour, which, I am happy to feel, has met with the approval of His Majesty."

In the Meeting-room there was a large collection of prints and photographs of the artist's work, in some form or other representing architecture, which had been lent by Sir Lawrence Alma-Tadema for exhibition, and some of these, on the invitation of the Chairman, Sir Lawrence said a few words about.

The President.

Sir Aston Webb, R.A., said he desired to propose a vote of thanks to the President for the two years of office that he had served so well. "We are very proud," said Sir Aston, "of having Mr. Belcher as our President—both as President, as an architect, and as a man. We feel that, as our President, he has guided our affairs with discretion—and it has required some discretion to guide us safely through these last two years. He has guided us in such a way that he has made all members of this Institute friends, and therefore he cannot have made one enemy. As an architect we all honour him for his work, and, if I may say so, for the individuality which is shown in his work. He has worked on traditional lines, but in all his buildings there has been the individual character of Belcher himself visible from beginning to end of them. That is the character that we look for in all good work, and that is the main character that I think you will like me to emphasise in our President's work. As a man, I will not venture to say much. He is my friend, and he has always been faithful and just to me, and he has been faithful and just, I know, to everyone with whom he has had dealings. Nothing more can be said, or need be said, about a friend. I will ask you to extend this vote of thanks with the greatest enthusiasm, which I know you all feel to Mr. John Belcher, our President, for the arduous two years he has served us. It is a pleasure to find that he is quite well and fit again and ready to carry on that arduous undertaking of entertaining something like 2,000 foreigners and Englishmen whom we hope to see next month at our Congress."

Mr. John Slater said: "No words are necessary from me to supplement the remarks made by Sir Aston Webb in proposing the vote of thanks to our President, Mr. Belcher; but as, I am sorry to say, I am the oldest member of Council, I should like to second this vote of thanks and to express my appreciation and the appreciation of all the members of Council for the tact and urbanity he has always shown in presiding over our deliberations. We must not forget one of the greatest services Mr. Belcher has rendered to the Institute in bringing back within this fold a large number of architects whom we were always very regretful to have parted with, and whom we welcome here with open arms again. That is one of the greatest services Mr. Belcher has done, and I have the greatest possible pleasure in seconding the vote of thanks."

The vote of thanks was then heartily agreed to.

In reply, Mr. Belcher said he remembered that when Sir Aston Webb spoke to him about following him in the chair that he had so worthily filled, he (Sir Aston) said, "I can assure you I have had a very pleasant time." "I looked at him with immense surprise," said Mr. Belcher. "I could not believe him, and it was with great fear and trembling that I accepted the position; but I am bound to say that I have had a very pleasant time, and I have enjoyed myself very much. But I believe it is more to your good nature and constant support, especially the members of Council, and the way in which our worthy Secretary and the staff have always helped me. I have had no difficulties, and everyone has been most kind and lenient to me. I thank you sincerely, and I beg you to support me in the extension of my time of office through the Congress. I shall have need of your help. I am sure, and I hope the attendances will be good and constant at all the meetings, and that you will do your utmost to make the Congress a pleasant one to our foreign guests."

The meeting then terminated.

SOCIETY FOR THE PROMOTION OF HELLENIC STUDIES.

THE annual general meeting of this Society was held in the Rooms of the Society of Antiquaries, Burlington House, on Tuesday, Professor Percy Gardner presiding.

Mr. Geo. A. Macmillan read the annual Report of the Council for the session, in which reference was made to the death of Sir R. C. Jebb, the President. An important departure in the constitution of the Society by the creation of a class, to be known as Student Associates, was recommended by the Council for adoption. They had long felt that there was a class of younger students specially interested in the objects of the Society, and likely by inclination and training to be useful members, who were debarred by the entrance fee from coming forward as candidates. They had endeavoured to devise a scheme which should confer a boon on the class in question, and inflict no injustice on those who had already assumed the full responsibilities of membership. This could only be done by giving part privileges for a part payment, and in the scheme produced they believed that this intention was achieved in the fairest manner possible to the largest number. The annual grants of 100*l.* to the School of Athens and 15*l.* to the School of Rome had been renewed for a further period of three years. The School at Athens had now transferred its operations from Crete to Laconia, and Mr. Bosanquet was to be congratulated on the success which had already attended the excavations on the site of ancient Sparta. One hundred and sixty-two volumes and 164 pamphlets had been added to the library.

With regard to finance, they were able to report a surplus of 172*l.* The appeal on behalf of the Endowment Fund had resulted in the receipt of 357*l.* 10*s.*, and to this was to be added a bequest of 200*l.* from Canon Adam Farrar, which was the first legacy the Society had received. During the year forty-two new members had been elected, and twenty-four had been lost by death or resignation. The number of members at present on the list was 951, and there were in addition 170 subscribing libraries and forty hon. members. On the whole, the Society could look back on a successful year, but it was hoped that members would bring in new candidates in order that the Society might be in a position to meet the increasing claims made upon its resources for the promotion of Hellenic research in every department.

The Chairman, in moving the adoption of the Report, first made reference to the losses the Society had sustained by death, and said that he considered it better, instead of being impartial and comprehensive, to select for consideration "two or three of the more important recent discoveries which had been made in the branch of Hellenic learning which was concerned with the artistic remains of ancient Greece. As a matter of fact, although excavations had proceeded in many cleared sites—Ephesus, Lindus, Pergamus, and Miletus—striking discoveries this year had been few. Nothing, perhaps had been fresher, or given greater hope for the future, than the discoveries made by Mr. Bosanquet and his colleagues of the British School of Athens at ancient Sparta, a site now handed over to them as a lasting place for research. Of all spots in the world the Athenian Acropolis was dearest to phil-Hellens. During the last year that sacred spot had somewhat changed its appearance through the partial restoration of the Erechtheum. No question had been more earnestly discussed in archeological circles in recent years than the propriety of rebuilding in some measure the partly-surviving temples of Greece. Opinions on the subject had differed widely, but at the Archeological Congress last year it appeared from speeches made by Dörpfeld, Homolle, and others that something like a working agreement had been arrived at to the effect that existing stones should, when their former position in the edifice was known, be restored to the buildings, and modern work, undecorated, should be added only when there was a necessity to support ancient work. Such strict rules were unknown when Ross put together the little temple of Wingless Victory out of the ruins of a Turkish bastion. Yet he thought that most of them felt a debt of gratitude to

Ross. Their modern responsibilities were more burdensome, but M. Homolle had succeeded in reconstructing, at Delphi, the treasures of the Cnidians and of the Athenians, taking but very few liberties, the cella wall of the temple of Apollo, at Bassæ, had been in part rebuilt, at Olympia two columns of the Heræum had been set up, and the venerable lion of Charonea had been re-erected. The Parthenon had only been so far repaired as was necessary to prevent it falling, and, curiously enough, the question of the moment in regard to that most perfect of Greek shrines was not whether more pillars should be set up, but whether some of the sculptured frieze which still remains *in situ* should be removed and placed in the museum since it was visibly perishing by the action of the climate. Such a removal was advocated by most of the European archaeologists, but naturally the Greeks did not want it carried out. He imagined that that put an end to any question of the restitution of the Parthenon sculpture in the British Museum to Athens, because it was quite clear that we should not send them back to be placed in a museum. But the greatest interest attached, as he had suggested, to the recent attempts at the legitimate restoration of the Erechthion. The west wall of it was first set up, and then the east end with its great porch was taken in hand. It was remarkable how practical work on a building sharpened the eyes of those who studied it. For half a century past the Erechthion had been the subject of numerous treatises, but now they seemed to have reached a new level. Dr. Dörpfeld, in one of his astonishingly persuasive papers, had maintained that the original plan of the building was cruciform; in the middle, running from side to side, a corridor flanked on each side by an important shrine—on the one side the temple of Athens and on the other side that of Poseidon. But even Dr. Dörpfeld's study of the remains of the temple did not lead them to the true reconstruction of the east end, which was the discovery of a young architectural member of the American School—Mr. Stevens. In the course of trying to assign to its original place several surviving stones of the edifice Mr. Stevens found certain fragments decorated with a beauty for which the Erechthion was almost unique, which must have been part of two windows opening on either side of the eastern entrance door. This had made the restoration of the east end possible. With characteristic generosity Dr. Dörpfeld had not spared his praise of his young colleague. If one had to select amongst works of classical archaeology published during the year the book most worthy of mention one could not hesitate—it was the great work in which Professor Furtwängler, with his colleagues, Dr. Fiechter and Dr. Thiersch, had published the results of his excavations in Aegina. The previous excavator of the great temple at Aegina was the English architect Cockerell, who had done excellent work, but in archaeology, as in mining, they reaped ample reward by re-examining by the help of modern methods the waste products of former industry. Professor Furtwängler had found evidence to his (the speaker's) mind entirely convincing that the temple of Aegina was dedicated either to Zeus nor to Athene, but to an obscure goddess called Anphia. He had discovered the foundations of an altar, the propylon, and other buildings of the sacred enclosure, and, above all, he had secured considerable further remains of those wonderful pedimental sculptures which were the pride of the museum of Munich, and which gave one in as high a degree as any extant work of art the impression that they belonged to a race at once hardy and artistic, and at once truthful and lovers of the ideal. Combining the new fragments with those already at Munich, Furtwängler had made an entirely novel arrangement of the two pediments, and from the plates which were exhibited in the room it could be seen how far more striking was the new grouping of the warriors who fought on either side of Athens than that which had passed as authoritative for the last century. He would say nothing of the achievements of the British School, as that body would have its own meeting in the autumn.

Mr. Pearse seconded the motion, and the Report was adopted.

On the motion of Mr. Macmillan, it was

agreed that the President of the Society be elected for a period of five years, and should not then be immediately eligible for re-election.

Mr. Cecil Smith (Keeper of the Department of Greek and Roman Antiquities in the British Museum) gave a short illustrated communication on the pediments of the Parthenon, in which he discussed the central groups in the two pediments, and pointed out that it had entered a new phase since the discovery recently made that they must remove one of the figures from the east pediment to the west.

PRESERVATION OF PLACES OF HISTORIC INTEREST.

On Tuesday, by permission of the Duke of Westminster, the annual meeting of the Council of the National Trust for Places of Historic Interest and Natural Beauty was held at Grosvenor House, under the presidency of H.R.H. Princess Louise.

Mr. L. Harcourt, M.P. (Chief Commissioner of Works), in moving the adoption of the Report and accounts, said they would agree that the National Trust and the First Commissioner of Works were brothers in arms in defence of places of historical interest and of natural beauty. They had to fight for the preservation in their respective spheres of objects which every Englishman would wish to be preserved. Their functions did not overlap, but they interlocked and supplemented one another. He was not able to buy places of natural beauty or artistic merit, and was limited by Act of Parliament only to historic monuments. The National Trust, on the contrary, had a larger field, and by the aid of the generous and confident public were able to do more for the nation in many ways. They had saved Gowbarrow Fell and had become Lords of the Manor of Hindhead, with its appendages of the Devil's Punch Bowl and Gibbet Hill—sinister names, but places of singular beauty. They had also managed to coerce his colleague, the Postmaster-General, on the subject of telegraph-poles, and he expected that Mr. Buxton, with his well-known affection for nature, was a willing victim to their friendly threats. They were taking steps to preserve and protect bits of Malvern Hills and the Pass of Aberglaslyn, both of which he knew well and greatly admired. They had still open an option on Derwent-water, which he hoped the generosity of the public would enable them shortly to complete, because it was a district instinct with literary associations as well as of scenic beauty. He hoped they would realise the assistance which was given in the case of historic monuments by the Office of Works. A great deal of energy had been employed by the higher staff in his office in helping to preserve these objects of historical interest and antiquity, and the time given was not in office hours. Only a few days ago Sir S. Macdonald and Mr. Fitzgerald at his instance used their short Whitsun holiday in visiting the Orkneys, and the result was that the standing stones of Stennes, which were the Stonehenge of Scotland, had been transferred to the guardianship of the Office. They had also recently taken over the care of the Edwardian walls and Elizabethan ramparts of Berwick-on-Tweed, and he thought they would all agree that the method of conservation of Carisbrook Castle and other places showed an intelligent appreciation of the needs of these great works. Unfortunately, however, the powers of his office were limited by an Act of Parliament, and he had but small resources. The expenditure of the Chancellor of the Exchequer allowed little for archaeology or art, and therefore they had to depend upon individual effort and upon private and public generosity. It would, however, give him the highest pleasure to work with them as a fellow-worker for the preservation of those objects which they all desired to preserve.

Sir Robert Hunter (Chairman of the Committee), in seconding the motion, said that the Report showed that the past year had been one of considerable achievement on the part of the Trust. At the commencement of the year they owned about 180 acres of land, and at the present moment they had purchased, or were in course of purchasing, acres which would bring their possessions up to about 1,700 acres. They had not only

bought Gowbarrow, but also Hindhead. There was no doubt but that they wanted wild places like Hindhead at the present time. At a time when the needs of men lead to the aggregation of the population in a few centres it was good and refreshing to be able to escape from the buildings and scenes of the town and come in contact with wild and untutored nature. Of course, Hindhead itself had been considerably tamed in the last twenty-five years. Owing to an advertisement given by Professor Tyndall, but never contemplated by him, a number of cottages and houses had been erected on land which was enclosed about fifty years ago before the Commons Preservation Society had woken to life. Happily about 750 acres of land were still left open and unenclosed, and the Trust had acquired that land. It was manorial land, and the Trust had acquired the rights of the Lord of the Manor. Owing to it being impossible to build on the land the Trust acquired it for 5l. an acre, whereas Gowbarrow cost them 18l. an acre. Hindhead was bought through the agency of a local committee, and the purchase was made possible by the generosity of a lady who at the sale guaranteed a further sum of 500l. They were anxious that that lady and other public-spirited guarantors should not be called upon to pay the whole of the sum they guaranteed, and they wanted about 400l. to relieve them of the burden. He was glad to hear how much had been done in the direction of preserving buildings of historic interest by the Board of Works. In that branch of their work the Trust had an undertaking of greater moment than any they had yet attempted, as they were in course of purchasing one of the great houses in England. There were few of them who were not sensitive of the extreme beauty of those noble houses of the Tudor Period, one of the most beautiful was Barrington Court, in Somerset. The condition of the house was somewhat peculiar. For the last two centuries it had been in general decay, and the owners had shown their interest in it by removing every scrap of wood from the inside. One wing of the building was inhabited by a farmer and the other by mice and bats. The façade of the house was, however, still intact. Its noble lines and mullioned windows and beautiful chimneys were still in the state substantially in which they were built, and a very little repair would enable the façade to be preserved in perpetuity and in the same condition as it was when the ill-fated Duke of the battle of Sedgemoor, which was fought close by. They had had for the purposes of their work 24,200l., and of that sum they had actually spent 11,400l., leaving a balance of about 13,000l., which was a little more than the amount required for the purchase of Gowbarrow. The revenues from their property yielded a little more than the cost of maintaining them.

The Report was adopted.

Mr. T. G. Jackson proposed the election of the members of the Council for the ensuing year, and, referring to the work of the Trust, said that in connexion with South Kensington the ceilings of two cottages were offered for sale. He thought it was a mistake to take such ceilings away from their surroundings, and suggested that it would be better for the National Trust to purchase the cottages and other properties of the same kind from time to time. As such properties could be let it would be a sound investment. Ancient buildings, such as Barrington House, would in France be considered national monuments, and would be brought under the guardianship of the State. In England, such matters were left to individual effort, and in the National Trust they had an organisation which was adapted for exercising guardianship over such buildings.

Professor Baldwin Brown seconded the motion, and remarked that the Council was trying to see if they could bring into line all the different bodies which had similar aims to the National Trust, so as to bring certain pressure to bear on Parliament to get a Commission appointed to see how best these valuable assets of the nation could be dealt with.

The motion was carried.

Canon Rawnsley moved:—"That the time has arrived when a constitution of high authority and more suitable character should be conferred upon the National Trust for

Places of Historic Interest or National Beauty, together with larger powers in relation to the protection and management of the property which the Trust holds for the nation; and that the Council be, and it is hereby, requested and authorised to take such steps to secure those objects as it may deem expedient." He pointed out that under their present system they were unable to deal with important questions of making by-laws for the government of their estates. Although they were only at the beginning of things they had now estates of 17,000 acres, worth about 25,000l., and they required to make by-laws for their preservation. They asked therefore for a Royal Charter, and would require a short Act of Parliament to obtain power to make by-laws to safeguard these properties.

On the motion of Mr. C. Brinsley Marley, seconded by Mr. Shaw Lefevre, a vote of thanks was passed to Her Royal Highness for presiding.

Her Royal Highness Princess Louise briefly replied, and said she felt that the Trust was doing much for the welfare of the country.

A vote of thanks to the Duke of Westminster concluded the proceedings.

PROFESSOR PITE ON ARCHITECTURAL STUDY.

The closing meeting of the Architectural Association Studio was held on Monday, June 18. An interesting exhibition of work executed by members of the studio during the past session had been arranged, and a large number of students and members of the association were present.

Professor Beresford Pite addressed the students. He said: "I have come this evening prepared to say something with regard to the present state of study, which I have a lingering suspicion are directed towards the examinations in these days. So far so good, but I cannot help feeling that a critical point with the examinee is, 'Who is the examiner?' and the absence of comfort on this point destroys to some extent the value of the examination system. An examination to be really useful can only be conducted by the person who teaches. Examinations have uses we all know. The system is not the best for the architect or artist, but unfortunately in these days we have to get through examinations, so we must make the best of the system, and, in directing our studies in some really useful lines, prepare the way for effective architectural study."

"With a view to becoming a really good architect, what lines ought I to take?" First, the study of good buildings. Every building is the expression of definite thought, therefore I must put my thoughts as far as I can alongside the thoughts of the builder. Get in the position mentally of him who built. Use every building as I would a book. The book expresses on paper, with set type and in words and grammar common to the language which the author uses, clearly and unmistakably the individual thoughts of the writer. The building in like manner is a book in which the construction, the composition, and the details are the words, the form, and the grammar.

We read a book—Homer, Virgil, Shakespeare, Molière—not to study the printer's type, the words, and the grammar and to copy them, but to get in touch with the writer's thoughts. The thoughts of the author are the "man" in the book, and as the mind of him who writes comes in touch with him who reads the book, sympathy of thought arises. As in literature, so in architecture, painting, and the arts of design. It is useless to study form without a clear conception and understanding of its purpose. For instance, mouldings is more insane than to copy Gothic mouldings without taking note of the material in which they are executed. We may as well try to imagine taking Paley's "Gothic Mouldings" and executing them in stucco. Learn nothing without learning the thought which produced the form. To study the development of Gothic art without relation to its cause is absolutely useless. Until this day we lack an effective history of English Gothic architecture—a history of definite thought and purpose. The result of bestowing the attention on form and style has been that the buildings of the Gothic

Revival and of the present-day Renaissance are nothing more than mere feasts of ornament. It has become the thing, after drawing from a Gothic or Renaissance picture book for some four or five years, to send in designs for competitions—designs which are copies, but to which no intelligent study of the thought which underlies the architectural expression is given, and the result is comparable, say, to copying the Farnese Palace in stucco. Get beneath the forms to the motives of the designers who made them, and find out how they thought, and by a parallel process we should be able to transmute XXth century thought into our designs.

The study of thought in Greek architecture is the most difficult of all; the thought is so far removed from that of our own day. It is difficult to understand the mental position of men who could build on the same hill within a short distance of each other and in the same generation the Parthenon, the Erechtheion, and then the Propylea. We look at the Parthenon's Doric severity, with its exceedingly flat, delicate, and yet strongly defined mouldings. This could only have been built by men Spartan in type. Let us but turn our heads and we see the Ionic Erechtheion, a building so entirely different, almost effeminate in effect, and with ornament repeated almost to redundancy, and then we have the Propylea, with the two brought together. But upon investigation we find that the Doric is European in origin and the Ionic Asiatic, and, spreading the one east and the other west, they meet here, the two coming together forming the elaborate architecture represented in the Temple of Diana at Ephesus.

The Roman work is not so difficult to interpret. The Romans were a great constructive nation, but they were not artistic, so they employed the Greeks to do their architecture for them and set them to pile order upon order, and we find detail running riot, while in the Pompeian decoration we see Greek fancy set loose.

In the dark ages following the destruction of the Roman Empire new methods are seen growing up, first markedly developed in the Basilica of Constantine at Constantinople—a domed architecture. This new development is delightful to watch—the erection of domes first on circular, then on square plans, and lastly supported by grouping other domes around, as at St. Mark's, Venice. No further possibilities of geometric form in domes remaining, domed vaulting ceases about 1000 A.D., practically with the fall of the Byzantine Empire, after which the Turks come and, as they always do, chop up the old buildings and use the bits as best they can.

We now turn to the development of Gothic art, and, taking England as our most accessible field of study, we find that at the time of Augustine we have the Saxon buildings, with their homely arrangement of wooden logs, soon replaced by crude stone architecture. We must bear in mind their limitation of material, and the fact that the masons had nothing to copy in their carving; they knew nothing of the arts of Greece and Rome. At times they attempted to imitate in stone the goldsmith's and embroiderer's arts, as seen on a chalice or vestment, or they attempted to copy their ornament from the illuminated manuscripts of the time.

After the Norman Conquest the quarries of Caen were thrown open to the Saxon, and materials became to a certain extent more plentiful when the country became more settled. The ecclesiastic travelling to Rome for his Orders or his Bishopric came back with his mind filled with the churches of Rome as he saw them—came back with the Basilica in his mind—and imparted his memories of them to the workmen, and we see the introduction of the apse and transepts. Vaulting now filled the mason's thoughts—vaulting which of necessity must be constructed with small stones. Until the discovery of the method of supporting the cores with a skeleton of stone ribs we find a constant failure of these vaults. With the application of this idea ribbed vaulting became universal in all important buildings, and we can study the enormous effect this had upon the whole of Gothic architecture, and by sympathetic thought imbue ourselves with the ideas which animated the men who made Gothic archi-

ture what it was. For instance, we shall note how entirely the development of mouldings reflected the growth in knowledge and skill of the mason untouched by external influence; how the square edge was formed into a round, with chamfers. Then the corner was left on the round and the chamfers hollowed. The corner was found to "flush" in fixing, so it was formed into a fillet, and so feature by feature—each a development in the mason's mind of what had been done before—the characteristic mouldings of Gothic architecture were evolved, and we are able by putting ourselves in the positions of the masons to see into the thoughts which animated him in his work. Gothic architecture was essentially a mason's architecture, and until the mason lost the mastery of his art we see no joiner's art worthy of the name.

Until the decline of the art of the mason the joiner never thought for himself, but copied the ornament of the stoneworker for wooden detail, this treatment not being successful for woodwork, linenfold panelling being the only exception, and this was copied from paintings representing hangings. It was not until the time of Elizabeth that woodwork developed itself with the introduction of the mitre, a discovery which so pleased the joiner that he could never have enough of them, and we find forty mitres in a cupboard door where we should use four.

And so we come down to the times of Inigo Jones and Wren, when architecture ceased to be a craft and became a learned profession; but if we place ourselves in sympathy with the thoughts of the old builders, and try to imagine their difficulties and surroundings, we shall derive much more pleasure, and profit considerably more than we do, from our study of old work. Try to understand the reason and thought underlying all architectural expression.

Since Wren's time, architecture having become a learned profession, all practical building is learned from books; consequently, no one knows how to do a thing unless he has learnt it from a book. It is an age of handbooks and textbooks, and architecture as a building art has ceased to exist.

Let us, however, take up the study of Classic, Gothic, and Renaissance art for the thought underlying the expression, and let thought influence our design. Furnish the mason with stonework details, the scheme in which he will at once see. Draw a block of stone on the paper, and then draw the mouldings inside, so that you will understand the limitations of the grain and qualities of the wood before designing the carving and joinery. Learn the limitations of material. It is not impossible to put ourselves in the craftsman's position. The workman's standpoint is the right one.

Study also the planning of large buildings as well as homely buildings. Put your mind in sympathy with the mind of the master. Study the buildings of any one great architect—for instance, Bramante or Michael Angelo. Follow his education, surroundings, and difficulties, examine all his works, give other men's works the go-by, and endeavour to get at the thought and reason underlying the works of this man; or even study the works of more modern masters, say Pugin or Butterfield (not to mention names of living architects). Get your thoughts in sympathy with their thoughts. This is a line of study which will be of the greatest interest and profit, although examinations do not trouble you to do this.

In conclusion, cultivate high ideals. Cultivate a compassionate contempt for modern work. Under no circumstances design from the plates published by building papers of current competitive designs. Believe that the best work of the XXth century is yet to be done. Such are the vast possibilities open to an architect that we must not rest content with the present. Let nothing satisfy you until you have done something as good as Gothic, and better than Renaissance. Express thought in your work. See that it is greater than that around us at present. Work with an intelligent use of the materials we have. Get your lines of study above the examination standpoint."

A hearty vote of thanks was passed to Professor Pite for his address, and Mr. W. G. B. Lewis, in proposing this, referred

to the work done by students during the past session, and thanked Mr. Gilbert Jenkins, the assistant instructor, for his help. He remarked that even more enthusiasm was wanted by architectural students, and it was only by continued striving to do the best that could be done that good work would be accomplished. He advised the students to cultivate their appreciation of form, as this was essential before they could begin to appreciate the thought which evolved it. He strongly advised them to devote more time to sketching and measuring, so as to increase their powers of observation and at the same time develop their powers of accurately portraying what they saw on paper. By doing this they would accustom themselves to seeing what actual work looked like when drawn in projection, and thus be able to more clearly picture, in making a design, how it would appear in execution.

Mr. Hadwen, as one of the students, proposed their thanks to Mr. Lewis for his unstinted labour on their behalf, and for the able instruction which the students had received. He coupled with Mr. Lewis's name that of his assistant, Mr. Jenkins.

With many expressions of regret by the students at the severance, after thirteen years as instructor, of Mr. Lewis's connection with the studio, the meeting terminated.

THE INCORPORATED BRITISH INSTITUTE OF CERTIFIED CARPENTERS.

The Master and Wardens of the Worshipful Company of Carpenters entertained to dinner the Incorporated British Institute of Certified Carpenters in the Carpenters' Hall, London Wall, on Saturday last week. The chair was occupied by Capt. G. R. B. Drummond, M.V.O., Master of the Carpenters' Company, supported by Sir Aston Webb, E.A., Mr. J. Willson, J.P., President of the Institute, Mr. J. Classon, Preston, Past-Master of the Carpenters' Company, Professor H. Adams, Mr. Warden W. Robertson, Mr. H. Phillips Fletcher, Col. A. C. Preston, V.D., Mr. E. Cutler, Mr. G. A. Tanner, Mr. W. Cox, Hon. Secretary, and others.

The loyal toast having been honoured, Mr. J. Classon, Preston, proposed "The Incorporated British Institute of Certified Carpenters." He said that when he was Master of the Company it was intended to hold a dinner at which the members of the Institute were to be guests, but about the time the President (the late Professor Banister Fletcher) died, and it was impossible to hold the dinner in those circumstances. As to the Institute, it was formed in 1890, under the presidency of Mr. Pocock, and it consisted at that time of eleven members; but since then it had grown considerably, and now there was a membership of 189, which was not a bad record, especially when they considered that in such societies the first few years were always the most difficult. During the next sixteen years there was no doubt that the membership would greatly increase, and he hoped the Society would have a long and useful career. The Institute, he was happy to say, was free from what he thought was the bane of almost all trades in England at the present time, i.e., trades unionism. Trades unionism was a very valuable thing when properly applied—the Carpenters' Company was originally a trades union—practically it was now—for it was formed to control the guild of the carpenters of the city of London, and if the old records were read it would be seen that the Company had power to do certain things with regard to carpenters, which would be considered, even at the present day, tolerably drastic, but he had no hesitation in saying that, though the Carpenters' Company were drastic, they were nothing like so drastic as the trades union terrorism which existed at the present day without the sanction of the law. It was because he recognised that the Institute was perfectly free of trades unionism that he welcomed them there that night. When trades unionism was used for the benefit of members of the trades, then it was good; but when it was used to terrorise the members and to prevent them working where they desired to work, then it did harm. The Institute had had three Presidents since it had been

incorporated. In addition to Professor Fletcher, there had been the late Professor Roger Smith and the present President, Mr. Willson, whose practical experience and knowledge as to technical work was very great.

The President, in reply, said they were pleased to be there as the guests of the Carpenters' Company, for the Institute was very closely associated with the Company. Some sixteen years ago the first examination in carpentry and building construction was held in that hall, and out of that examination sprang that Institute. He believed that all, or nearly all, of them possessed the certificate granted by the Company, and they would be glad to know that at the last examination, this month, there was a record number of candidates, i.e., sixty-seven, and of these sixty presented themselves for examination, and only four failed. Candidates came from all parts of the United Kingdom, and it said much for the value of the certificate which the Company granted that this should be so. The trend of construction at the present time showed, perhaps, that carpenters were being left on one side, and iron construction was being now used; but he did not think the carpenter would be superseded altogether. Some two and a half centuries ago, after the fire of London, when most of the wooden houses were destroyed, people decided that wooden houses were dangerous, and that brick and stone buildings must be built. That caused a great deal of anxiety amongst the carpenters, but they had survived the calamity, as he hoped they would all others.

Mr. J. Clark, Principal of the Technical College, Tunbridge Wells, then briefly proposed "The Worshipful Company of Carpenters," which, he said, was a most progressive body of men who did all they could for carpentry and the building industries.

The Chairman, in response, said that there were many members of the Company who were not carpenters, but they had been so associated with the trade that they could not fail to take a great interest in the calling. It was sometimes supposed that the ancient guilds existed for the sake of social gatherings and banquets, but that formed a very small part of what the Company did. As to the work of carpenters, he had been much struck with the exhibition of carpentry and joinery work which the Company held in that hall every three years. That exhibition excited a great deal of admiration.

The President of the Institute (Mr. Willson) then presented Mr. E. Cutler, the late Secretary of the Institute, and Mr. Silas Evans, the oldest member, with testimonials in recognition of their services to the Institute. Last year Mr. Cutler received a purse on the occasion of his retirement as Hon. Secretary, and the testimonial, an illuminated address—which carries with it the Life Fellowship of the Institute—was not ready, and its presentation had to be deferred until the present occasion.

Mr. Warden Robertson then briefly proposed the toast of "The Visitors," coupled with the name of

Sir Aston Webb, R.A., who, in response, said that there was no craft which was more rightly proud of its productions than the carpenters. Now that apprenticeship was dying out, for good or for ill, it was very essential that the splendid guilds of the city of London should take up the education of the younger men in those crafts to which each company was allied, and the Carpenters' Company had nobly undertaken that duty. Whether it was possible for institutes or classes to take the place of apprenticeship was not for him to say, but they must all acknowledge the enormous assistance and help which the Company had been to the noble craft of carpentry. As Mr. Willson had suggested, there was a serious competitor to carpentry in the field—iron and concrete were taking its place in many cases. In Westminster was one of the most magnificent roofs which had ever been put up, and that roof had been in existence some 400 or 500 years. Near this roof was another magnificent roof, an iron roof, constructed some thirty years ago, which was thought at the time to be one of the wonders of London; and now the iron roof was a heap of scrap-iron, and the old chestnut or oak roof was as fine as ever,

and must be smiling, he thought, at the collapse of its monstrous rival. This seemed to show the last word had not yet been said as between wood and iron. Ruskin once said in an admirable paper that endurance was better than strength, and endurance was what the carpenter's art had got. Iron might be stronger, but from the experience up to the present day he thought they could say that endurance lay with carpentry, and if endurance was the great thing in carpentry, it was the great thing in all buildings with which they were concerned. The outstanding test was the workmanship put into the building—its endurance and permanency, without which the finest design would be of little account. And there was no work where the faults more easily came home to roost. He hoped those city halls would last, for we were all proud of them. What would the city of London be without its guilds? If they took away the churches—and they were being taken away fast—and the guilds, they would have left not much beyond a number of money-making buildings. If the monuments of a higher motive than that of money-making, important as that was, were removed, the utility of a city was seriously affected. It would be a great loss if these buildings were to disappear. He had ventured to refer on a previous occasion to the modesty of some of the city companies in letting their premises and retiring into the background. He did not think the Carpenters' Company would ever do that; they now stood at a corner seen of all men and nobly representing a noble calling, that of carpentry.

Mr. J. H. Freeman then proposed the toast of "The Officers and Council of the Incorporated British Institute of Certified Carpenters," coupled with the names of Mr. W. Cox (Hon. Secretary) and Mr. W. Dixon.

Mr. Cox, in the course of his reply, said that the Institute numbered among its members principals and teachers of the leading polytechnics and technical schools throughout England and the colonies, as well as examiners and lecturers to various municipal bodies. This fact was by some deplored, the feeling being that every man should be engaged in the trade, but when one considered that the apprenticeship system was dead, it was evident that a great future, as well as a great responsibility, rested upon the shoulders of those engaged in the teaching profession, as no doubt the training of the future craftsmen would have to be undertaken in trades training schools, and he had no doubt that when that time comes we should see the Worshipful Company of Carpenters to the fore in the work of training the nation. He felt a good deal of pride in belonging to an Institute of men of proved ability, all of whom had passed the test of examination—in the case of Fellows a double test, for it was necessary for these gentlemen to have obtained both a first-class Carpenters Company certificate, as well as first-class in Honours from the City and Guilds of London, before their application was entertained. The Council of the Institute were proposing to place a sum of money at the disposition of those Fellows successfully passing a higher or University examination, so that they might be in a position to take their place with the best men engaged in the craft, and he looked forward to the day when they might crown their achievements by being admitted as freemen to the Carpenters' Company.

Mr. Dixon also replied, and the proceedings shortly afterwards concluded.

NEW NAVE, ST. JOHN'S CHURCH, MALONE.—The new nave of St. John's Church, Malone, was dedicated on the 14th inst. by the Lord Bishop of Down and Connor and Drogheda. The architect was Mr. Henry Seaver, and the work has been carried out under his supervision by Messrs. W. J. Campbell & Sons, the contractors for the church. The nave is in harmony with the rest of the building. It is approached on the north side by an old English open porch made of oak, and tile hung. Over the vestibule a gallery has been constructed, and a robing-room has been provided for the choir. Choir-stalls, a reredos, and holy table in English oak have been provided, and the chancel and sanctuary have been panelled in oak, this portion of the work having been executed by Messrs. Purdy & Millard, Belfast. The church has a system of heating installed by Messrs. Musgrave & Co., and it will seat from 700 to 800 persons.

THE ARCHITECTURAL ASSOCIATION
SUMMER VISITS.

IV.—HOUSES NEAR DORKING.

AN excellent choice of modern domestic work was made for the occasion of the fourth summer visit on Saturday, June 25, at Abinger Common, a charming spot on the Surrey Hills near Dorking.

A start was made from Gomshall station, and in the course of an enjoyable drive many old brick cottages possessing sterling character engaged the attention of the party, numbering some twenty-five members of the Architectural Association.

The interest of the afternoon's study was centred in "Goddards," a country retreat designed by Mr. E. L. Lutyens as a home of rest for women workers in London. The founder, Mr. F. J. Mirrielees, welcomed the visitors, and gave the company a description of the building, its surroundings, its purpose, and equipment. Amongst other apartments the accommodation comprises a large common room, dayrooms, recreation room, a skittle alley, and a good proportion of bedrooms. The plan is arranged somewhat in an H form, with the large room in the centre. Between the wings on the north or road side is a very pleasant forecourt, with wide hedges, stone-paved paths, and grass plots; while on the south aspect a delightful formal garden has been laid out. Other gardens are to be found on the east and west fronts, and with the selection of the plants and general scheming of the lay out the architect has collaborated with Miss Jekyll. The results are eminently successful, although a tendency to overcrowd the growths and permanent features was felt to exist.

The walls are rough cast throughout, the breadth of which is disturbed by the red brick mullioned bays, windows, and doorways. Old weathered tiles cover the roofs and dormers, but the lower courses of the main eaves have old lichen stone slates, a combination of material very prevalent in this part of the country.

The interior is perhaps the more interesting part of the work. Cottage tradition influences the construction, and consequently the effects. Oak timbers of generous sizes are much in evidence in the common room. A fine effect is produced from the ceiling timbers, the supporting beams, posts, and struts, and from the half timber porch and east wall of this apartment. The furnishing of this and other rooms is one of the most instructive elements of the place. Almost all the better pieces are Sussex antiques, the dressers and tables in particular possessing strong character. The building in every way proved a most interesting study to architects.

The next halt was made at "Pasture Wood," a large country house designed and built some twelve years ago by Mr. W. Flockhart for the founder of "Goddards." The architect, who is engaged upon an extension of the east wing, was present, and gave all the information concerning the buildings which the experts present were desirous of knowing. The house is an excellent example of the best domestic work of that time. The plan is one in which the principal rooms of the ground and bedroom floors surround a large staircase-hall, and are arranged to take advantage of the natural beauties of the hilly site. Many materials appear in the fronts, of which half timber work predominates. There are some big effects in the tiled roofs, some of which are slightly "mansarded" in form, and in the brick chimney stacks.

A large block of stables, by the same architect, showing much individuality, was included in the visit; and, finally, some estate cottages designed by Messrs Dunn and Watson. These latter include rooms for stablemen and gardeners, and are extremely interesting. The principal effect is gained from a tile-hung overhanging upper story. The detail is excellent. Indeed, these cottages were not the least attractive of the many and varied buildings seen during the course of a long and enjoyable afternoon.

BUSINESS PREMISES, AYR, N.B.—Now business premises have just been completed in Main-street, Ayr. Mr. Wm. McClelland, architect, of Ayr, prepared the designs.

THE LONDON COUNTY COUNCIL.

The first meeting of the London County Council after the Whitsun recess was held on Tuesday in the County Hall, Spring-gardens, Mr. Alderman Evan Spicer, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to sanction the borrowing by Islington Borough Council of 17,156*l.* for the extension of street arc lighting. It was also agreed to lend Wandsworth Guardians 3,700*l.* for poor law purposes.

Cost of Erection of Schools.—Mr. A. J. Shephard, Chairman of the Education Committee, in submitting the adjourned Report of the Education Committee on this question, said he did not bring up the report willingly, for if the cost of erection were reduced, the Council would not be likely to get such a good class of buildings. He brought up the Report in deference to a strong wish that the cost might be reduced. He might mention that two of their officials had reported on the German schools, from which it appeared that the schools now being erected in London were about equal to the German schools of ten years ago, and the schools at present being erected in Germany were greatly superior to London schools.

Sir Thomas Brooke Hitching said that if a little more skill, better judgment and supervision were shown in the erection of these buildings, greater economy could be secured.

Sir Melville Beachcroft said that the population was far more shifting in character than it was, and there was no doubt that schools built to-day might be untenanted to-morrow, and the Council ought not to lose sight of that.

Mr. Stephen Collins, M.P., said that although he was in favour of economy in the erection of schools, still he did not believe in making the buildings cheap and nasty, and he thought that some of the present proposals would go a long way to do that. He did not believe in doing away with glazed bricks, which made for cleanliness and lightness, and in the interest of the children he thought glazed bricks ought to be used.

Mr. McKinnon Wood, M.P., said it was not intended to abandon the use of glazed bricks altogether.

Mr. Barnes denied that the supervision exercised in the erection of schools was not satisfactory. It was often more thorough than that shown in the erection of a royal palace.

Mr. Saunders said that these buildings should be something more than sanitary. The only buildings which relieved the dull monotony of some of our sordid streets were the schools. Now it was suggested that these schools should be built to last only thirty years! London was a city whose public buildings ought to be worthy of the city. In Berlin the finest buildings were the elementary schools, and the cost of erecting them was not less than the cost of the London schools. In South Germany the schools were infinitely finer than the London buildings. The schools in Germany reflected the spirit of the people, who believed in education. There was no need for temporary buildings, for if they were not needed for elementary purposes owing to the population shifting, then they could be used for secondary schools.

Mr. Bray moved that the Report be not received, in order to give other Councillors an opportunity of expressing their views. He was in favour of the views expressed by Mr. Saunders.

Mr. Thomas seconded, and spoke against the suggested proposals, as did several other speakers.

The motion was then voted upon and rejected, and the Report was received.

New Schools, &c.—The Council then considered the following recommendations of the Education Committee, which were agreed to after discussion:—

"(a) That, whilst placing on record its opinion that on educational grounds the average number of children per adult teacher should on no account be raised, the Council, in view of the urgent necessity of increasing school accommodation in various parts of London . . . do accept the effective

accommodation calculated on the basis set forth in the foregoing report as the accommodation for school provision purposes."

(b) That the necessary steps prescribed by sect. 9 (1) and (2) of the Education Act, 1902, be taken with a view to giving public notice, and informing the Board of Education, of the Council's intention:—(i) to provide a new public elementary school for 800 children for subdivisions Q and X of the Hackney (School Board) division (Bethnal Green, N.E., and Haggerston); (ii) to provide 500 additional public elementary school places for subdivisions P, Q, R, and S of the East Lambeth (School Board) division by the enlargement of the "Oliver Goldsmith" London County Council school (Canterbury, N.); (iii) to provide a new public elementary school for 600 children, with power to enlarge for 800, upon the Hortensia-road site (Chelsea); (iv) to provide a public elementary school for 1,600 children on the Barnsbury Park site (Islington, S.), or, alternatively, a school for 800 children on that site, and a school for 500 children in the north-eastern corner of subdivision 7 A of the Finsbury (School Board) division (Islington, S.); (v) to provide 1,200 additional public elementary school places in subdivision A of the Marylebone (School Board) division (St. Pancras, S.); (vi) to provide additional accommodation for 300 children by the enlargement of the Addison gardens London County Council school (Hammer-smith, W.); (vii) to provide a public elementary school for 600 children, with power to enlarge to 800, on the Sherington-road site (Greenwich); (viii) to provide a public elementary school for 1,200 children in subdivision Z of the Hackney (School Board) division (Hoxton); (ix) to erect a public elementary school for 600 children in subdivision T of the Marylebone (School Board) division (St. Pancras, E.); (x) to erect a public elementary school for 1,000 children in subdivision U of the Marylebone (School Board) division (St. Pancras, N.); (xi) to enlarge the London County Council school (St. Pancras, N.) by the addition of 300 public elementary school places; (xii) to provide 600 public elementary school places in the neighbourhood of King's Cross (Holborn); (xiii) to provide 500 additional public elementary school places in subdivision BA3 of the Finsbury (School Board) division (Islington, W.); (xiv) to enlarge the Hungerford-road London County Council school (Islington, W.) by 414 places; (xv) to erect a public elementary school with accommodation for 600 children in the neighbourhood of Rylands-lane Lambeth (Kennington); (xvi) to provide 1,600 additional public elementary school places for subdivision C of the Chelsea (School Board) division (Kennington, N.); (xvii) to erect a public elementary school, with accommodation for 600 children, for subdivisions E, F, I, J, K, of the West Lambeth (School Board) division; (xviii) to provide 500 additional public elementary school places in subdivision X of the Marylebone (School Board) division (Marylebone, W.); (xix) to erect a public elementary school for 600 children in the north-western part of subdivision O of the Marylebone (School Board) division (Marylebone, W.); (xx) to provide a public elementary school for 1,100 children in subdivision E of the Marylebone (School Board) division (Marylebone, W.); (xxi) to provide 500 additional public elementary school places by the enlargement of the Rauce-street London County Council school (Newington, W.); (xxii) to provide a public elementary school for about 600 children in subdivision F of the Marylebone (School Board) division (Paddington, N. and S.); (xxiii) to provide 600 additional public elementary school places for subdivisions AH, AI, and AJ of the Southwark (School Board) division (Rotherhithe); (xxv) to provide public elementary school accommodation for from 500 to 600 children for subdivisions AD, AE, and AF of the XI, X2, Y of the Westminster (School Board) division (St. George, Hanover-square, and Westminster); (xxvi) to provide a public elementary school for 550 children in the eastern part of subdivision I or J of the Marylebone (School Board) division (St. Pancras, E. and W.); (xxvii) to provide a public elementary school for 550 children in subdivision K of the Marylebone (School Board) division (St. Pancras, W.); (xxviii) to provide public elementary school accommodation for 800 children for subdivisions D, G, J, K, of the Tower Hamlets (School Board) division (Stepney and Whitechapel); (xxix) to erect a public elementary school, with accommodation for 600 children, with power to enlarge to 800, for subdivisions BY and BZ of West Lambeth (School Board) division (Wandsworth).

(c) That the Board of Education be informed of the views contained in the foregoing report relating to the erection of a school for subdivision C of the Tower Hamlets (School Board) division, and D, T2, and U of the Hackney (School Board) division (Whitechapel), and that they be requested to sanction the erection of a permanent public elementary school for about 600 children on the Buxton-street site (Whitechapel).

Refreshment House, Avery Hill.—The Parks and Open Spaces Committee recommended:—

"(a) That the estimate of expenditure on capital account of 2,900*l.*, submitted by the Finance Committee in respect of the erection of a refreshment house and shelter at Avery-hill, be approved.

(b) That expenditure not exceeding 2,000*l.* be sanctioned in respect of the provision of a refreshment house and shelter, including incidental expenses, at Avery-hill; and that, in the event of the Works Committee being satisfied with the sufficiency of the estimate based on quantities of the cost of erecting the building, the drawings, specification, bills of quantities, and estimate be referred to that Committee with a view to the work being executed without the intervention of a contractor; but that if the Works Committee be not prepared to undertake the work at the amount of the estimate based on quantities, tenders be invited by advertisement."

An amendment to reduce the cost to 1,000*l.* was carried.

* See our issue for June 16, page 673, where we will be found the full report of the Committee.

An Arboreal Nursery.—The Committee recommended that about six acres of land at Avery Hill be appropriated for the purposes of a nursery for trees and shrubs, and that an expenditure not exceeding 350l. be sanctioned for the preparation of the ground, the estimated annual cost of maintenance being about 2550l.

Sir Algernon West moved that the report be referred back on the ground that the estimate for maintenance was far too low, and that there was no justification for taking away six acres which had been purchased as an open space and recreation ground for the people.

Mr. Stuart Sankey, the Chairman of the Committee, declared that the policy of growing shrubs by the Council instead of purchasing them would be found to be one of real economy, and show a saving of 500l. a year.

The amendment was carried, and the subject was referred back.

Epileptic Colony, Ewell.—The Asylums Committee reported as follows:—

"The Epileptic Colony, Ewell, was inaugurated in 1903 to provide special accommodation for epileptics of unsound mind who were able to work and were suitable for colony life. The Council on January 22, 1901, voted the sum of 85,000l. for its erection, and on July 7, 1905, a further sum of 5,018l. 16s. 7d. being the extra cost of the building work carried out by the Works Committee. A total sum of 90,018l. has also been voted for its equipment (estimates Nos. 3895 and 4144). It at present accommodates 266 male and fifty-seven female patients, and consists of an administrative block and eight detached villas. The area of land allocated for the colony is 112 acres. The total cost of the colony, including equipment, cultivation of land, and purchase of live stock (but excluding the value of the land) is approximately 313,11s. 3d.

We think that the accommodation provided at the colony may now be extended, by an additional villa for male patients. Each of the existing villas accommodates 32 patients, and is under the charge of a resident married couple. We believe that economy in administration can be effected in a larger villa, accommodating seventy-two patients under the charge of two married couples. At night time this villa could be supervised effectively by one attendant, instead of the two who would be required if two villas were erected. Until plans have been prepared we are not in a position to submit an estimate of the cost of the proposed building, but it is estimated to cost between 7,000l. and 8,000l. Provision has been made in the capital estimates for the current year for the expenditure necessary for the preparation of plans, and we therefore recommend:—(a) That the estimate of expenditure on capital account of 100l. submitted by the Finance Committee in respect of the preparation of plans for the provision of an additional villa at the Epileptic Colony to accommodate seventy-two male patients and staff be approved; (b) that an expenditure not exceeding 100l. on capital account be sanctioned for the purpose referred to in resolution (a)."

Costly Wallpaper.—Mr. Cyril Cobb asked Lord Welby if it were true that wallpaper recently used in No. 7, Committee Room cost 15s. a piece.

Lord Welby said he would make inquiries, and later in the sitting he informed Mr. Cobb that the wallpaper had cost 10s. a piece. It was ordered by an officer of the Works Department, over whom, so far as the cost of the paper was concerned, the Council exercised no control.

Electrification of Additional Tramways.—The Highways Committee reported:—

"The construction for the underground conduit system of electric traction of the Council's authorised tramways from the terminus in Trafalgar-road, Greenwich, via Blackwall-lane, to the Blackwall tunnel, has been completed, and also the reconstruction of the existing tramways from the Obelisk, Lewisham, via High-street, Lewisham, and Rushey-green, to the terminus at Catford, and of the tramways from the new lines in Woolwich-road from its junction with Blackwall-lane, as far as Tunnel-avenue.

The reconstruction of the existing lines in Vauxhall-bridge-road, and the construction of the tramways over the new Vauxhall Bridge, both for the underground conduit system of electric traction, have also been completed. In view, however, of the fact that the London County Council (Vauxhall Bridge Tramways) Act, 1896, only authorises the use of animal traction for the lines over the bridge, they cannot be worked electrically until the Council shall have obtained the powers, which it is seeking in its Tramways and Improvements Bill for the present session of Parliament, to enable electrical power to be used for working the lines. In these circumstances, the tramways from Victoria Station to Vauxhall Station, via Vauxhall-bridge-road and Vauxhall Bridge, are for the present being worked by horse traction."

Deptford and Greenwich Generating Stations.—The Committee recommended and it was agreed:—

"(a) That the estimate of expenditure on capital account of 2,450l., submitted by the Finance Committee in respect of the provision of an additional high-tension cable for use between the Greenwich electricity generating-station and the Deptford temporary generating-station, be approved.

(b) That expenditure, on capital account, not exceeding 2,450l. be sanctioned for the provision of the high-tension cable referred to in the foregoing resolution (a).

(c) That the contract entered into in pursuance of the resolution of November 13, 1905, with the Western Electric Company be extended so as to include the provision, at a cost not exceeding 2,450l., of the additional high-tension cable referred to in the foregoing resolution (a); that the chief officer steps in the matter; and that the seal of the Council be affixed to any necessary documents in connexion therewith."

White Hart-lane Estate—Finishing of Roadways on Section A.—The following recommendations of the Housing of the Working Classes Committee were agreed to:—

"(a) That the supplemental estimate of expenditure on capital account of 900l., submitted by the Finance Committee in respect of the paving of the footways on sect. A of the White Hart-lane estate, be approved.

(b) That additional expenditure on capital account not exceeding 900l. be sanctioned in respect of the paving of the footways on sect. A of the White Hart-lane estate, that the contractor be ordered to provide and lay Patent Victoria stone and to make up the footways required for 6s. a square yard be accepted; that the contractor do prepare, and obtain the execution of, the necessary contract to give effect to the arrangement; and that the seal of the Council be affixed thereto when ready."

Brickmaking, Norbury Estate, Croydon.—They also recommended, and it was agreed:—

"(a) That the estimate of expenditure of 1,500l., submitted by the Finance Committee in respect of the moving of bricks on the Norbury estate, Croydon, and in respect of the provision thereon of the necessary tram-rails and trucks be approved.

(b) That expenditure not exceeding 1,500l. be sanctioned in respect of the moving of bricks on the Norbury estate, Croydon, and in respect of the provision thereon of the necessary tram-rails and trucks."

Cottages, Totterdown Fields Estate, Tooting.—They reported that 106 further cottages, containing accommodation for 684 persons, on section B of the Totterdown Fields Estate, are almost finished. Upon the completion of these cottages accommodation for 4,146 persons in 570 tenements will have been provided on the estate.

The Council, having transacted other business, adjourned.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Kensington, South.—Buildings on the site of Nos. 42, 43, and 44 Hyde Park-road, Kensington-road, Kensington, to abut also upon Hyde Park-gate.—(Messrs. Weatherall & Green for the Trustees of the Camden Charity).—Consent.

Kensington, South.—A deviation from the plan approved on October 4, 1904, for the erection of buildings on a site on the south side of Kensington-road, Kensington, to abut also upon Palace-gate, so far as relates to an alteration in the frontage line at the north-eastern angle of the buildings (Messrs. Millard & Pryce for the Royal Exchange Assurance Company).—Consent.

Islington, North.—Buildings upon a site at the junction of Hornsey-rise and Upper Hornsey-rise, Hornsey (Mr. E. Bates for Messrs. G. W. Cook and E. R. Smith).—Consent.

Chelsea.—Buildings on the south-eastern side of Fulham-road, Chelsea, to abut also upon College-street and Kimbolton-row (Messrs. Elms & Jupp for Mr. E. Bingham and Messrs. T. Crapper & Co., Ltd.).—Consent.

Dulwich.—An open wooden porch at "The Limes," Dulwich, to abut also upon (Mr. W. Griffiths for Messrs. J. Bowyer & Co.).—Consent.

Hammersmith.—Nine houses with shops on the western side of Askew-road, Hammersmith, northward of "The Sun" public-house (Mr. F. J. Brewer for Mr. A. Gard).—Consent.

Hampstead.—Retention of an iron sign erected on the forecourt of Nos. 139A and 139B, Finchley-road, Hampstead (Messrs. E. T. Morris & Co.).—Consent.

Kensington, North.—Projecting balconies in front of a proposed building between Nos. 10 and 12, Bosworth-road, Kensington (Messrs. Chapman & Shepherd for the Bosworth Temperance Club).—Consent.

Kensington, North.—Open porches in front of Nos. 1 to 23 (odd numbers only) inclusive, Kingsbridge-road, St. Quintin Estate, Kensington (Messrs. Trant Brown & Humphreys for Messrs. Daley & Franklin).—Consent.

Kensington, North.—Projecting bays with gables over, and porches to Nos. 19 to 65 (odd numbers only) inclusive, and Nos. 22 to 44 and Nos. 48 to 70 (even numbers only) inclusive.

High Lever-road, St. Quintin Estate, Kensington (Messrs. Trant Brown & Humphreys for Messrs. Daley & Franklin).—Consent.

Lewisham.—The retention of a greenhouse in the garden of "Hyndford House," Inglemere-road, Forest-hill, Lewisham, abutting upon Bampton road (Messrs. G. Hayward & Co.).—Consent.

Norwood.—The erection of houses with shops on the western side of Norwood-road, and dwelling-houses on the northern side of Trinity-road, Norwood (Mr. T. L. Fearon).—Consent.

St. George, Hanover-square.—That permission be given to Mr. G. Odono to retain a projecting iron and glass shelter at the entrance to No. 152, Victoria-street, Westminster, extending beyond the general line of buildings in the street.—Consent.

St. George, Hanover-square.—The retention of the bases to five projecting pilasters on the Piccadilly frontage and to five projecting pilasters on the Old Bond-street frontage of buildings upon the site of Nos. 44, 45, and 46, Old Bond-street, and Nos. 57, 58, 59, and 60, Piccadilly (Messrs. Callard, Steward & Wood, Ltd.).—Consent.

Kensington, South.—Retention of a photographer's showcase erected on the forecourt of No. 154, Holland Park-avenue, Kensington (Mr. A. Langlier).—Consent.

St. Pancras, West.—A bay-window, balconies, and porch at No. 1, Albert-terrace, Regent-square (Mr. W. Eastman for Mr. William Sanders, M.P.).—Consent.

Wandsworth.—Buildings on the western side of Thrale-road Streatham, southward of Clairview-road (Mr. W. Bartholomew for Messrs. Antill & Squires).—Consent.

Hammersmith.—Retention of a projecting illuminated sign at the "Red Cow" public-house, Hammersmith-road, Hammersmith (Messrs. Bull & Bull).—Consent.

Strand.—The retention of an iron and glass shelter at the Adelphi Hotel, John-street, Adelphi (Messrs. Jeffries & Co. for Messrs. Flower & Sons, Ltd.).—Consent.

Wandsworth.—Four houses on the eastern side of Sauer-street, Wandsworth, between Tooting Bec-road and Prentis-road (Mr. J. S. Gibson for Mr. J. Carmichael).—Refused.

Brixton.—A shop front in the passage-way leading to the railway arches (Nos. 33x and 34x) on the western side of Brixton-road, Brixton, and to the roofing over of a portion of such passage-way (Mr. H. Tanner, junior, for Messrs. Sanders & Co.).—Refused.

Brixton.—A shop front in front of the railway abutment, between Nos. 456 and 462, Brixton-road, Brixton (Mr. H. Tanner, junior, for Messrs. Sanders & Co.).—Refused.

Marylebone, East.—A one-story motor-house and an iron and glass covered way at No. 20, St. John's Wood-road, St. Marylebone, to abut upon Grove-road (Mr. A. W. G. Harding).—Refused.

Marylebone, East.—An addition at No. 3, Accacia-road, St. John's Wood (Mr. W. R. Phillips for Mr. J. M. Swan, R.A.).—Refused.

Marylebone, West.—A covered way in front of No. 36, Abercorn-place, St. John's Wood (Mr. H. Tanner, junior).—Refused.

Wandsworth.—The retention of four one-story shops in front of Nos. 65, 67, 69, and 71, Westcote-road, Streatham (Mr. J. Harding).—Refused.

Width of Way.

Kensington, South.—The retention of the forecourt fence-wall in the front of three houses on the southern side of a roadway leading out of the south side of St. John's-hill, so far as relates to an alteration in the height of such two-story building, and of the addition to such building (Mr. E. S. Barr).—Consent.

Dulwich.—Working-class dwellings at the rear of No. 184, Camberwell-grove, Dulwich, to abut upon Stories-road, with external walls at less than the prescribed distance from the centre of the roadway of Stories-road (Mr. A. Laycock).—Refused.

Clapham.—A further deviation from the plan approved for consent to the erection of a two-story building on land at the rear of Nos. 20, 22, 24, and 26, St. John's-road, Battersea, with external walls at less than the prescribed distance from the centre of a roadway leading out of the south side of St. John's-hill, so far as relates to an alteration in the height of such two-story building, and of the addition to such building (Mr. E. S. Barr).—Consent.

Dulwich.—Working-class dwellings at the rear of No. 184, Camberwell-grove, Dulwich, to abut upon Stories-road, with external walls at less than the prescribed distance from the centre of the roadway of Stories-road (Mr. A. Laycock).—Refused.

Clapham.—A further deviation from the plan approved for consent to the erection of a two-story building on land at the rear of Nos. 20, 22, 24, and 26, St. John's-road, Battersea, with external walls at less than the prescribed distance from the centre of a roadway leading out of the south side of St. John's-hill, so far as relates to an alteration in the height of such two-story building, and of the addition to such building (Mr. E. S. Barr).—Consent.

Dulwich.—Working-class dwellings at the rear of No. 184, Camberwell-grove, Dulwich, to abut upon Stories-road, with external walls at less than the prescribed distance from the centre of the roadway of Stories-road (Mr. A. Laycock).—Refused.

Width of Way and Lines of Frontage.

Paddington, South.—A urinal in Cambridge-grove, Southwick-street, Paddington, at the rear of the "Marquis of Clanricarde" public-house (Mr. W. H. Collins for the City of London Brewery Company, Ltd.).—Consent.

City of London.—The retention of an oriel window in front of No. 7, Wood-street, City, at less than the prescribed distance from the centre of the roadway of such street (Mr. W. H. Waterman).—Consent.

Width of Way and Construction.

Greenwich.—Retention of two wooden sheds of a temporary character at the premises of the Cheep Wood Company, No. 66, Deptford-green, Greenwich (the Cheep Wood Company).—Consent.

Lines of Frontage and Construction.

Islington, East.—The erection of a wood and glass time-keeper's box in front of the "Myddleton Arms" public-house, Canonbury-road, Islington (Mr. B. T. Kingham for the London General Omnibus Company, Ltd.).—Refused.

Formation of Streets.

Hammer-smith.—That an order be issued to Messrs. F. Newman & Blatt, sanctioning the formation or laying out of a new street for carriage traffic in continuation northward of Willow-vale, Uxbridge-road, Hammer-smith (Messrs. Williams & Wallington).—Consent.

Wandsworth.—That an order be issued to Messrs. F. Newman & Blatt, sanctioning the formation or laying out of new streets for carriage traffic upon the Streatham Lodge Estate, Streatham Common-south, Wandsworth (Mr. C. H. Copley Du Cane for the Trustees of the De Cane Estate).—Consent.

Woolwich.—That an order be issued to Mr. H. Bustard, sanctioning the formation or laying out of a new street for foot traffic only, to lead northward out of Godfrey-street and Lower Pellipar-road, Woolwich, and in connexion therewith the erection of a Sunday-school upon the site approached by such street (for the Building Committee of the Pellipar-road Sunday-school).—Consent.

Lewisham.—A building on the land at rear of No. 43, Springbank-road, Hither-green, Lewisham (Mr. P. Roche).—Consent.

Wandsworth.—That the Council do consent to the application of Mr. F. Newman for an extension of the time within which the formation or laying out of new streets for carriage traffic on the Streatham Lodge Estate, Streatham High-road, Streatham, approved by the Council on April 29, 1902, was required to have been completed.—Consent.

Wandsworth.—That an order be issued to Mr. J. C. Radford refusing to sanction the formation or laying-out for carriage traffic of a street to lead out of the southern side of a proposed continuation of Chalfield-avenue, Putney.—Refused.

Space at Rear.

Hackney, South.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of four shops and dwelling-houses on a site on the western side of Mare-street, Hackney, between the "Dolphin" public-house and No. 175, with irregular open spaces at the rear (Mr. D. Morris).—Consent.

Deviation from Certified Plans.

St. George, Hanover-square.—Deviations from the plan certified by the district surveyor, under section 42 of the Act, so far as relates to the proposed rebuilding of Nos. 22 and 23, Grosvenor-square (Messrs. Reed & Macdonald for Messrs. Holloway Brothers).—Consent.

Cubical Extent.

Hackney, North.—Additional cubical extent to the Stamford Hill Brewery, Stamford-terrace, Hackney (Mr. C. G. Smith for Messrs. Michell, Goodman, Young & Co., Ltd.).—Refused.

Alteration of Buildings.

Strand.—An addition at the rear of Nos. 7 and 8, Rupert-street, Strand (Mr. R. H. Kerr for Mr. C. Manzel).—Consent.

The applications marked † are contrary to the views of the local authorities.

Archaeological Societies.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—The closing meeting of the session was held on Wednesday, the 20th inst., Mr. Compton, Vice-President, in the chair. A ten-cady of a very ornate character, probably of the time of Queen Anne, was exhibited, but the allegation that it had belonged to Anne Boleyn obviously could not be entertained, as tea was not introduced into Europe until early in the XVIIIth century, and Pepys in his diary mentions it as something new in his day. Mr. Patrick, Hon. Secretary, read, in the absence of the author, a paper by Mr. Richard Mann on "The Roman Residency at Darenth, Kent." This Roman villa, admittedly the largest ever discovered in England, was excavated in 1894 and 1895 by Mr. George Payne, F.S.A., at the expense of Mrs. Rella Hoare, under an agreement made by Mr. Clowes, her son-in-law, with the Ecclesiastical Commissioners, the owners of the property, and is fully described in "Archæologia Contiana," Vol. XXII. It has been suggested in some quarters that this

vast building bears evidence in the curious system of tanks and drainage of having been a trading establishment, probably that of a "fuller or dyer," but Mr. Mann questions whether it may not with greater probability be described as having been the central station or headquarters of an official having control of the surrounding district, and in a very ingeniously arranged plan of the remains he showed how this may have been the case. —Mr. Patrick opened the discussion, and was disposed to agree with the author of the paper that the buildings were far too extensive to have formed the residence of a person engaged in the trade of a dyer or fuller, but were more likely from their position, adjacent to the Watling-street, and in the centre of a group of Roman buildings which extended over the surrounding neighbourhood, to have been the official residence of the governing authority of the district. —Mr. R. H. Forster did not agree with the early date attributed to the remains by Mr. Mann (early in the Roman occupation), and pointed out that the large building supposed by him to have been the quarters of a body of cavalry was more likely to have been the stables of a mansion or posting-house on the road to London. He also urged that the absence of any fortifications precluded the idea that the buildings were the residence of a military or civil governor, particularly at the early period assigned to them.

COURT OF COMMON COUNCIL.

A MEETING of the Court of Common Council was held at the Guildhall on Thursday last week, the Lord Mayor presiding. **Improvement of Gracechurch-street.**—The Improvements and Finance Committee submitted for adoption an arrangement for acquiring so much of the premises Nos. 1 and 2, Gracechurch-street, as is needed to widen the public way thereat, for the sum of 2,200*l.*, to include all interests.—The Court approved.

The London Almshouses.—The Freeman's Orphan School Committee were authorised to accept the tender of Messrs. R. and E. Evans for repainting the exterior of the London Almshouses at the sum of 159*l.* 10*s.*

Southern Bridge.—The Bridge House Estates Committee asked for authority to accept the tender of Messrs. E. Parry & Co., of 81*s.* per annum for cleansing, watering, gravelling, and repairing Southwark Bridge for three years from midsummer next.—This was granted.

Loan Exhibition.—The Coal and Corn and Finance Committee reporting on the reference of May 10, 1906, referring back for re-consideration the adverse Report of this Committee on the Reference of April 3, 1906, on the Report of the Library Committee as to holding a Loan Exhibition of Pictures in the Art Gallery in the summer of 1907, at a cost of 450*l.*, exclusive of insurance, recommended the adoption of the proposal of the Library Committee, and the holding of the exhibition accordingly.—The matter was referred to the Library Committee.

Pollution of the Thames.—Mr. William Henry Williamson moved that having regard to recent legal decisions on the question of sewage pollution, this Court is of opinion that the time has arrived when a conference of the various authorities interested in the subject of the purification of the estuary of the River Thames and elsewhere should be convened for the purpose of considering the existing situation, and with a view to taking such further action as may be deemed necessary in the interest of the public health, and that it be referred to the Port of London Sanitary Committee to arrange and hold such conference accordingly, Mr. Cloudsley seconded, and the motion was adopted.

METROPOLITAN ASYLUMS BOARD.

The usual fortnightly meeting of the managers of the Metropolitan Asylums District was held on Saturday last week at the offices, Victoria Embankment, E.C.

Proposed New Central Laboratory.—On the recommendation of the Finance Committee, it was agreed to apply to the Local Government Board for an order authorising the expenditure of a sum not exceeding 9,090*l.* on the erection and fitting up of a central laboratory at Peckham Rye. The Works Committee submitted a report dealing with the same matter, in the course of which they recommended that Messrs. Fowler & Huggan be appointed to take out the quantities for the work. This also was agreed to by the Board. The architects' estimate for the building is 7,990*l.* Laboratory fittings will cost some 950*l.*, and the rest of the amount is made up of salaries, commissions, etc.

Joyce Green Hospital.—On the recommendation of the Finance Committee it was agreed to apply to the Local Government Board for sanction to the expenditure of 114*l.* 11*s.* 7*d.*, on the

provision of additional bathing, lavatory, and disinfecting accommodation at this hospital.

South-Western Hospital.—The Works Committee reported that they considered it desirable that bills of quantities should be taken out for the adaptation of two wards at the South-Western Hospital as cubicle wards, the cost of which adaptation was estimated at 1,730*l.* As the work was of a comparatively minor character it was recommended that the architects, Messrs. T. W. Aldwinckle & Son, should take out the quantities. This the Board agreed to.

Darenth Asylum.—The Asylums Committee submitted a report by the Chief Engineer on the exhaustor and engines at the gas works at this Asylum, in which that officer pointed out that the working of the gas works was absolutely dependent upon the exhaustor being capable of dealing with the make of gas, and that for this reason this particular portion of the plant should be doubled. During the last winter the present exhaustors, which are capable of dealing with 5,000 cubic ft. per hour, had to be run faster than was desirable, and in the event of a greater demand for gas arising during the coming winter they would very likely be taxed beyond their capacity. Under the circumstances the engineer recommended that a new plant capable of dealing with 10,000 cubic ft. per hour should be provided in time to meet the coming demands. Dealing with this report the Committee stated that the Bryan Donkin Company had quoted the sum of 117*l.* for the supply of the new plant, an offer which had been accepted. The Committee's action was endorsed.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XXV.

VARIETIES OF SLIDE-RULE.

IN this, the concluding article of the present series, we give a brief account of the chief varieties of slide-rule other than the type illustrated in Figs. 16, 17, and 18.

Faber Improved Calculating Rule.—This type of the Gravet slide-rule, illustrated in Fig. 20, embodies the following features:—

- (1) The body and the slide are about $\frac{1}{2}$ in. longer at each end than in the ordinary type, this additional length being provided for the purpose of affording a firm hold for the cursor when this appliance has to be used near the extremities.
- (2) Scales A and B are graduated 1—100, and not 1—10, 1—10, as in the ordinary manner.
- (3) The body is fitted with a longitudinal spring, intended to cause the slide to work evenly and smoothly at all times.
- (4) On the spaces provided by the extra

length the inscription $\leftarrow + \rightarrow$ is engraved at

each end of scale A, and the inscriptions QUOTIENT + 1, PRODUCT - 1, at the left-hand and right-hand ends of scale D respectively. These inscriptions enable the operator to fix the position of the decimal point at the end of any calculation, without the necessity for remembering the various rules given in Articles XXI, and XXII.

(5) The cursor is made with an extension of the metal frame, on which is engraved a semi-circular scale graduated from -6 to +6, and provided with a rotary pointer registering digits and movements of the decimal point during calculations.

(6) The spaces 1—2, 2—3, 3—4, and upwards, which are divided into ten parts each, are marked with decimal values, as 11, 12, 13, and so on. This graduation is optional, being considered superfluous by most operators.

(7) The special constants engraved on scales A, B, C, and D are as follows:—A and B: $\pi = 3.1416$; B: $M = 100 \div \pi = 31.83$; C: $c = \sqrt{4} \div \pi = 1.28$, and $c^2 = c \times \sqrt{10} = 3.368$. By the aid of constant M the circumference and curved area of a cylinder can be read with only one setting.

(8) The left-hand slot at the back of the body is double the usual width, thus permitting the sines of angles to be read at both ends of the rule—a simple but most convenient improvement.

(9) The graduations on all the scales are incised, thus making them far more distinct than graduations which are impressed on the scales.

As may be gathered from the foregoing description, this is a well-arranged and very useful type of slide-rule for practical work.

FIG. 20

FIG. 21

FIG. 22

FIG. 23

Illustrations to Student's Column.

Davis Improved Slide-Rule.—To overcome the liability of the slide to become too tight in damp climates and too loose after a time when used in a dry atmosphere, Messrs. Davis, of Derby, have introduced a special slide-rule, having a spring steel back adjustable by three screws, as illustrated in Fig. 21. The ordinary rule of the same firm, Fig. 22, is similarly fitted with a steel back, but without the adjusting screws, and all their slide-rules are made with elongated ends, permitting the cursor to be used in any position without overhanging.

Sheppard Cubing Slide-Rules.—These are made in two forms, by Stanley, with decimal and duodecimal graduations respectively. In each variety the body is provided with two slides, on the back of which are marked lines of squares, square roots, and numbers, so that all powers and roots can be obtained. In using the rule for obtaining cubic dimensions, length is taken on the upper scale of the body, breadth on the upper slide, thickness on the lower slide, and the result is read on the lower scale of the body.

For many calculations which have to be performed by architects, quantity surveyors, and builders the duodecimal rule is extremely convenient, because results are given directly in feet and inches, but for general use the decimal rule is to be preferred.

Reitz Cubing Rule.—This slide-rule, made

by Nestler, of Lahr, is similar to the ordinary type, but has two additional scales, as shown in Fig. 23. One of these, at the top of the rule, is a logarithmic scale from 1 to 1,000, divided by the figuring into three equal scales from 1 to 10. Therefore the cube of any number represented on scale D is found exactly above it on the upper additional scale, and, conversely, the cube root of any number represented on the upper additional scale is found exactly below it on scale D. The other additional scale, at the bottom of the rule, enables the operator to find the log. of any number on scale D. This variety of slide-rule is a most convenient instrument for all calculations where cubes and cube roots are frequently required. It is supplied by W. H. Harling, and can be obtained from other makers of mathematical instruments.

Universal Slide-Rule.—Another rule, made by Nestler, for all ordinary calculations, at the same time giving cubes and cube roots directly, and permitting various tacheometrical computations to be readily performed.

Logologarithmic Scales.—These, shortly termed "log-log," or "logo-log," scales, are applied in conjunction with the ordinary logometric scales of a slide-rule for finding any power and any root of any given number. The principle involved in the log-log scale

will be readily understood by the following illustration:—

Suppose we have to find the value of $5^{2.5}$ by logarithms, the ordinary process is expressed

$$(\log. 5) \times 2.5 = 0.6990 \times 2.5 = 1.7475.$$

$$\text{antilog. } 0.17475 = 14.95.$$

But by the logologarithmic method the operation is effected thus:—

$$\log. (\log. 5) \times \log. 2.5 = 0.8445 + 0.3979 = 1.2424.$$

$$\text{antilog. (antilog. } 1.2424) = 14.95.$$

Such is the principle of the log-log scale, which is graduated so that the divisions represent the logarithms of the logarithms of the numbers marked upon it, and when used in conjunction with the ordinary logarithmic scales of the slide-rule any powers and roots (within the limits of the scale) can be obtained with the greatest facility.

Some varieties of slide-rules having log-log scales are mentioned below.

Dunlop-Jackson Slide-Rule.—This is an ordinary slide-rule, as made by Davis, with a spare slide having log-log graduations from 1.07 to 2, and 2 to 1,000 on the front, and from 0.001 to 0.5, and 0.5 to 0.93 on the back.

Jackson-Davis Double Slide-Rule.—This is a slide-rule of the Davis type having clips for the attachment of the log-log scale against one edge without the necessity for removing the ordinary slide.

Perry Slide-Rule.—The essential feature of the logologarithmic rule as originally arranged by Professor Perry was the substitution of a log-log scale for the usual D scale. In the improved form of the rule made by Thornton this inconvenient feature is obviated by the retention of scale D and the provision of two log-log scales, one above scale A, ranging from 1-1 to 10,000, and the other below scale D, ranging from 0.001 to 0.93.

Fuhr Logologarithmic Slide-Rule.—In this instrument the measuring scale on the bevelled edge has been replaced by a log-log scale in two parallel sections, the first half ranging from 1.1 to 2.9 and the second half from 2.9 to 100,000. The cursor has a metal tongue, the end of which corresponds with the hair-line on the cursor glass, and serves as a marker for the log-log scale. At the bottom of the groove two logarithmic scales are substituted for the usual measuring scale; of the two scales, the upper is for calculating the efficiency and output of dynamos and electric motors, and the lower for calculating loss of potential and other results in electric circuits. While available for all ordinary computations, this type of rule is particularly suitable for mechanical and electrical engineers.

Hudson Beam, Girder, and Shaft Rule.—This instrument, made by Stanley, gives at sight safe loads for rectangular beams or flanged girders of iron and steel, dimensions of rectangular beams or flanged girders for given loads, safe loads for wrought-iron or steel shafts, diameters of wrought-iron or steel shafts for given loads, and the average tensile, compressive, shearing, torsional, and

FIG. 24

FIG. 25

Illustrations to Student's Column.

transverse strength of cast-iron, wrought-iron, and mild steel.

Hudson Pump Scale.—An instrument, made by Stanley, giving at sight the dimensions and discharges of pumps, the diameter of pipes for any given discharge, the velocity of flow through pipes corresponding with any given discharge, and the usual proportions of auxiliary pumps for boilers and engines.

Hudson Horse-Power Computing Rule.—A double slide-rule, made by Stanley, giving at sight the horse-power of engines from the usual data, the size of engine for any given power, and other results useful to the designer or user of steam engines.

Pickworth Power Computer.—A double slide-rule, made by Davis, giving at sight the horse-power of steam, gas, and oil engines, the size of engine for any given power, the speed of pulleys and belts, the speed ratios of pulleys and gearing, and other useful results.

Honeysett Hydraulic Slide-Rule.—An instrument, made by Stanley, specially arranged for calculating the flow of water in pipes.

Anthony Hydraulic Calculator.—A circular form of slide-rule, made by Stanley, for computing the flow of water in pipes, canals, and other channels.

McPherson Hydraulic Slide-Rule.—A rule made by Thornton, and specially designed for calculations connected with waterworks, drainage, and irrigation practice.

Thornton Engine Indicator Slide-Rule.—An ordinary slide-rule, as Fig. 16, having on the bevel edge a scale of inches divided into tenths and fiftieths, and a cursor provided with a projection to serve as a pointer for the inch scale. This rule is also applicable to harmonic analysis.

Anderson Improved Slide-Rule.—The idea of arranging a long scale in parallel sections or lengths was suggested in a paper read by Dr. Everett before the British Association in 1866, since which year several slide-rules and calculating scales embodying the principle have been introduced. None of these have become popular, and apparently it was reserved for Colonel Anderson to devise a sectional length slide-rule, which is made by Casella, in such a form as to render the instrument of practical value in the everyday work of architects, engineers, and others. As shown by Figs. 24 and 25, the Anderson slide-rule is somewhat similar to the ordinary variety, but has only three scales, two on the body and one on the slide.

The upper scale, eight times the length of either half of scale A on the ordinary slide-rule, comprises four lines, with graduations as follows:—Line (0), 1 to 1.77+; line (1), 1.77+ to 3.16+; line (2), 3.16+ to 5.62+; line (3), 5.62+ to 10.

The lower scale, eight times the length of scale D on the ordinary slide-rule, comprises eight lines, with graduations as follows:—Line (0), 1 to 1.33+; line (1), 1.33+ to 1.77+; line (2), 1.77+ to 2.37+; line (3), 2.37+ to 3.16+; line (4), 3.16+ to 4.21+; line (5), 4.21+ to 5.62+; line (6), 5.62+ to 7.5; line (7), 7.5 to 10.

The scale on the slide comprises four lines graduated to correspond with the upper scale.

The lines are distinguished at each end of the scales and slide by positive and negative "line numbers" (L.N.), which serve the purpose of indicating different decimal multiples and submultiples of the numbers engraved on the scales. Only two columns of line numbers are engraved on the cursor.

Additional line numbers can be added mentally, but, as those on the rule give a range on the upper scale and slide from 0.1 to 1,000 and on the lower scale from 0.1 to 100, this course is rarely necessary.

To facilitate adjustments, each end of the slide is provided with a transparent indicator extending over all the scales on the rule.

The graduation on the scales is simple and easily read. The whole numbers 1 to 10 are figured in red, the prime divisions are subdivided into tenths, which are figured in black, these are subdivided into hundredths, and these again to thousandths as far as their size permits. Hundredths and thousandths are not figured, but some of the main subdivisions are indicated either by dots or diamonds to guide the eye.

The following examples illustrate the advantage of the Anderson rule in giving results without the customary manipulation

of the decimal point, and without the application of rules such as are necessary when the ordinary slide rule is employed.

Example (1): (a) Multiply 2 by 4. (See Fig. 24.)

Set L.H. index of slide to 2 on upper scale (L.N. 1), bring cursor to 4 on slide (L.N. 2). As L.H. index is used, the result is read on the line whose L.N. is the sum of the L.N.s of the two factors. Hence the result is on (1 + 2) L.N. 3 = 8, and L.N. 3 being in the first column, the answer is in units.

(b) Multiply 20 by 40. (See Fig. 24.) Set L.H. index of slide to 2 on upper scale (L.N. 6), bring cursor to 4 on slide (L.N. 6). Read result on (5 + 6) L.N. 11 = 8, which must be taken as 800, because L.N. 11 is in the third column, and signifies hundreds.

Example (2): (a) Multiply 2 by 3. (See Fig. 25.)

Set R.H. index of slide to 2 on upper scale (L.N. 1), bring cursor to 3 on slide (L.N. 1). As R.H. index is used, the result is read on the line whose L.N. is one more than the sum of the L.N.s of the two factors. Hence the result is on (1 + 1 + 1) L.N. 3 = 6, and L.N. 3 being in the first column, the answer is in units.

(b) Multiply 2,000 by 3. (See Fig. 25.) Set R.H. index of slide to 2 on upper scale (L.N. 13), bring cursor to 3 on slide (L.N. 1). Read result on (13 + 1 + 1) L.N. 15 = 6, which must be taken as 6,000, because L.N. 15 is in the fourth column, and signifies thousands.

The foregoing examples show the direct and unerring manner in which products can be correctly interpreted by aid of the line numbers. They are equally useful for setting the decimal values of all results obtained by other forms of calculation.

Apart from certainty of interpretation, the great advantage of the Anderson slide-rule is to be found in the high degree of accuracy obtainable by the extended scales, which give definite results to one decimal place further than the ordinary scales.

Special Cursors for Parallel Slide-Rules.
Faber's Digit Registering Cursor and the **Pointed Cursor** have already been described, and reference was made in Article XX, to the **Dennert and Pape cursor**. Others which deserve mention are the following:—

Broken Line Cursor. with interrupted hair-line permitting adjustment with greater certainty on any graduation.

Magnifying Cursor. with plano-convex glass in which the hair-line is set; also made with ordinary glass and hair-line, and a swivelling lense attached by arms to the cursor frame. Both of these devices are useful for minute readings.

Precision Slide-Rule.—An instrument, made by Nestler, having the scales divided into two parallel parts, so that the accuracy of a 20-in. rule is obtainable in a length of 10 in. This rule can be obtained through all dealers in mathematical instruments.

Goulding Cursor.—An arrangement by which small spaces on the scales can be mechanically divided, thus enabling results to be read up to seven figures.

Ratchet Cursor.—An ingenious attachment facilitating the direct calculation of any power and root by the ordinary slide-rule. In addition to the slide-rules mentioned above, there are other logarithmic instruments, such as the Fuller and Fuller-Bakewell calculating rule with a spiral scale 500 in. long, the R.H.S. calculator with a spiral scale 50 in. long, and various forms of the Boucher pocket calculator. All of these are valuable aids in certain branches of practical mathematics, but for general purposes are less serviceable than the parallel slide-rule, of which the more important types have been considered in this series of articles.

NATIONAL COLLECTIONS: RECENT ACQUISITIONS.—For the Gallery of British Art, Millbank, the trustees and director have bought out of the interest of the Clarke Bequest Fund the late Mr. C. W. Furse's "Diana of the Uplands"; Mr. J. Loewenthal has presented a bust of Mr. W. P. Frith, R.A., executed in marble by Mr. John Thomas, and Mr. J. W. Carille has presented "The Last Load," by John Linnell. To the National Gallery the late Mr. C. Hartree's executors have presented "Sunny Days in the Forest," by N. Diaz; and Mr. S. W. Graystone has presented marble busts, by Sir Edger Boehm, R.A., of Mr. and Mrs. Wynn Ellis.

ARMSTRONG COLLEGE, NEWCASTLE-ON-TYNE:

COMPLETION OF THE BUILDINGS.

THE site acquired in 1887 by the College of Science comprised 6 acres of land, and was then known as Lax's gardens; it is situated between the Barras Bridge on the east, and the Leazes—a public common—on the west. A new road known as College-road now divides the site from east to west, and of the 6 acres two are occupied by the College buildings, and two as garden ground to be retained for possible future extensions, whilst the remaining two acres may be considered as salable, and is partially covered by the Grand Hotel and assembly-rooms. The buildings forming the College have been erected in three periods, and form four sides of an irregular figure. The first block occupies part of the north and east sides of the quadrilateral; it comprises the physical and chemical laboratories, and was commenced in 1887. The second, to the east and south, accommodates the engineering laboratory, drawing and lecture rooms, and the school of art, and was erected between the years 1892-4. The third block just completed occupies the west side overlooking the Castle Leazes, and possesses (inclusive of the "Sir Lowthian Bell" tower) a frontage 100 yds. in length towards the new Queen Victoria-road; it also embraces at the rear, and projecting into the quadrangle, the great hall to accommodate 750 persons. The cost of the erection of the first and second blocks was each about 20,000l., together they do not equal the floor area or the cost of the latest building scheme, which includes the administrative apartments, great hall, library, botanical and zoological laboratories, and will, with the boundary railing, carriage drives, etc., approximate 60,000l.

The buildings have been designed to provide the precise accommodation which experience has suggested to the staff and council as necessary to cope with the demands of the XXth century, and although the character of the old buildings erected nineteen years ago has not been allowed to dominate the latest scheme of the buildings, consideration has been given to ensure that the whole shall agree architecturally in style.

The south and west boundaries are enclosed by a tall wrought iron railing, that on the west being divided by paneled and moulded stone pillars, broken at two points by wide gates, over which is some ornamental cresting combining the College monogram. The carriage drive is semi-circular in form, and leads to the main entrance, which occupies the lowest stage of the "Sir Lowthian Bell" tower, and is placed in the centre of the west elevation. This entrance gives access to the spacious hall, which communicates by corridors with the north and south wings, with the principal staircase and the great hall. The outer entrance is placed under an open portico and the entrance hall, 23 ft. in width, is arranged in two bays with a semi-dome ceiling, carried on coupled columns of Hoptonwood marble with verde antique bases and carved Ionic capitals; the walls are lined to the height of the doors with red marble, having a green marble capping and skirting; whilst the floors are of marble arranged in circular form with radiating panels.

The staircase opposite the main doors is largely constructed of Hoptonwood stone with a massive balustrade, supported on a series of columns. Beyond the main staircase is the great hall for use during convocation and for examination and lecture purposes; it is 70 ft. by 50 ft., and is a small gallery at the south end. It is a lofty apartment, with a coved plaster ceiling supported by ornamental trusses with traiered and moulded panels, brackets, and pendants, and arranged in seven bays, in each of which are modelled figures in slight relief, representing "Practical" and "Theoretical" science, bearing suitable emblems, and enclosed by panels with modelled styles. Around the walls is a stencilled frieze formed of medallions containing the emblems of the various sciences taught in the College. The medallions are connected by festoons, and the roof timbers and other features are bordered with patterns in quiet colours. The dado is of panelled oak 10 ft. high, broken by pilasters, and at the frieze level by small shield-like panels to receive the names of prizemen. Over the chief entrance door is a balcony—opening off the staircase landing—of plaster and circular pediment, and with carved scroll work and mantling enclosing the College arms.

The hall is lighted by a series of two-light windows, set over the dado and divided by two moulded transoms, the mullions being wrought in the shape of columns with modelled capitals and bases the middle range of lights is intended to receive the arms of benefactors. On the north is a large seven-light window, the three centre ones contain the territorial coats of the district which contributes to the college, viz., Northumberland, Cumberland, Westmoreland, Durham, and Newcastle, and above them respectively the arms of the University of Durham and of the Armstrong College; three of the four side lights are filled with the arms and crest with suitable mantling of Lord Armstrong, Sir Lowthian Bell, and Mr. T. G. Gibson. From the

middle of the ceiling depend two large electroliers, and at the sides ten smaller ones, all specially designed. The floor is of oak boards in narrow widths together with a platform of the same material, designed to put together in varying dimensions. The great hall is accessible from corridors on three sides.

Returning to the entrance hall, a corridor runs north and south, and connects the new with the old blocks; for a certain distance—extending to the doors opening into the administrative apartments—the corridor has a marble floor and low dado, and is enclosed by double swing doors. On the left of the entrance is the principal's office, panelled in oak in which are arranged bookcases, and cupboards for stores and robes; adjoining is the Council-room, which measures (including a large square bay at one end, and a deep recess at one side) about 40 ft. by 20 ft. It is lined to the height of 11 ft. in oak, having a heavy cornice broken by the doors with circular pediments and pilasters, and a large open fireplace lined with old Dutch tiles, and containing a dog-grate. In the pediment over the fireplace is a carved shield, crest, and mantling on which is emblazoned the College arms. The frieze is deep and covered with American leather paper, and the ceiling is divided into panels by ribs filled with ornamental plaster work. The oak furniture, upholstered in leather, was specially designed by the architect, and made by Messrs. Robson & Sons. Adjoining the Council-room is the staff-room, and beyond occupying the north-west angle of the building is the union or men's common-room, about 42 ft. square, each room has a deal painted panelled dado, and solid wood block floors. On the right or south side of the main entrance is the general office with strong and store rooms, the office of the secretary, and minor committee-room, and beyond them the junior electrical engineering laboratory, with professor's room and a gallery at one end, this laboratory occupies a corner position, is well lighted, and partially lined with encaustic bricks; opening off it is a lecture-room 40 ft. by 27 ft., with demonstration table complete, and below the senior electrical engineering laboratory and preparation-room, near to it is the storage for accumulators, and opening off the gallery in the junior laboratory a photo metric and standardising room arranged over the corridor.

On the first floor the chief apartment is the library, 60 ft. by 45 ft., with two large bays on the side towards the Leazes: it has a large open fireplace with a dog grate, enclosed by an oak chimney piece, large double doors opening into the north and west wings, and with the fireplace designed to combine with the bookcases and panelling, which the students, past and present, intend to provide as a donation to the College. The remainder of this floor is occupied by lecture-rooms for mathematics, classics, and naval architecture. The classrooms and corridors have each a panelled wood dado. On the second floor the northern half is occupied by two botanical laboratories, one 48 ft. by 30 ft., and the other 60 ft. by 18 ft., with a museum, lecture, preparation, and dark rooms, each with a glazed tiled dado, and replete with appliances. In the southern half of the second floor are lecture-rooms for history, literature, and languages, and a number of small rooms for professors.

On the third floor is the zoological department comprising a large laboratory, 36 ft. by 31 ft., and a combined museum and laboratory, 72 ft. by 34 ft., together with a private laboratory, lecture, professors', and preparation rooms, contiguous to these laboratories are flat asphalted roofs intended to receive glass conservatories. Below the great hall and lighted from the quadrangle, is a refectory or dining-room for students, 60 ft. by 30 ft., a dining-room for the staff, and the usual kitchen offices, together with a range of men's lockers and lavatories. In the tower are some lecture-rooms, and on the third floor a large glass dome transmits light through a circular well arranged on each floor.

The whole of the new buildings are warmed on the atmospheric steam-heating system, whereby, by a series of radiators, each or all of the rooms can be heated to any degree of warmth required by comfort, according to the weather, and a uniform temperature maintained until the steam valve to each radiator is changed either to a greater or reduced opening. From each room a ventilating shaft of proportionate size is taken to a large chamber in the tower, in which are two powerful fans 5 ft. in diameter worked by electricity.

On the exterior the buildings are of stone and red brick, and the roofs covered with red tiles. The tower, 120 ft. in height, as previously mentioned, is situated in the centre of the west elevation. The lowest stage comprises an open corridor of the Ionic order, with a straight pediment, which affords protection to a shield bearing the College arms and enclosed by scroll work and cherub supporters. Surmounting the three stages immediately over the entrance, which are formed successively of the Doric, Ionic, and Corinthian orders is an arched pediment containing a large shield bearing the arms of Sir Lowthian Bell, the donor of the tower which bears his name. Flanking the first floor stage of

the tower the masonry continued from the ground floor forms a pedestal, on which are seated figures of "Science" and "Art." The upper stages of the tower are pierced with windows having broken pediments, which are surmounted by an open curved balustrade, and the angles of the tower octagonal on plan terminate in turrets. The main elevation is flanked at each end by large gables, and is pierced at each floor level by large transomed and mullioned windows, broken by square buttresses with small conical terminations. Between the tower and the angle gables are projecting bay windows square on plan as to the ground floor and octagonal above. The external mullions have carved angle volutes, from which are suspended elongated shields. An open ornamental parapet, of stone balusters and scroll work crowns the bays and intervening spaces, and partially screens the fourth floor, which is set back from the main wall and constructed in oak half-timber work, with deeply-projecting eaves, supported on brackets.

The whole of the work has been carried out from the designs and under the supervision of Mr. W. H. Knowles, architect, of Newcastle. Between the tower and the angle gables are projecting bay windows square on plan as to the ground floor and octagonal above. The external mullions have carved angle volutes, from which are suspended elongated shields. An open ornamental parapet, of stone balusters and scroll work crowns the bays and intervening spaces, and partially screens the fourth floor, which is set back from the main wall and constructed in oak half-timber work, with deeply-projecting eaves, supported on brackets.

Fifty Years Ago.

FROM THE BUILDER OF JUNE 28, 1856.

BUILDING BY CONTRACT.

THERE seems to be so many evils in the practice of building by contract, that it is difficult to determine how it can have gained the popularity it has; but probably it is to be ascribed to the laudable desire of knowing what the thing will cost before we buy it. It is, no doubt, satisfactory to know, not only that the proposed works will cost no more than such a sum, but that someone has bound himself to execute them for that sum. Would not the architect's estimate answer this purpose? No! because there is no guarantee of its accuracy beyond the *bonâ-fide* result of a fallible judgment; whereas, if the builder make the mistake, the loss is his, and not mine, says the employer, and herein is my guarantee that I spend no more. The real state of the case is, that if the architect has a mistake in his estimate, the building costs the proprietor more money, but not more than it is worth. If the error is with the contractor, the employer does not pay more money, but experience shows there is strong presumptive evidence that he does not get the article he intended to have—certainly a semblance of it, but not one that looks as well, or that will last as long as he intended it should, or one that has cost *anybody* as much as it ought to have done to realise that intention.

The result of the system of public competition for the execution of buildings or works has been to deteriorate workmanship, to introduce bad materials, to provoke disputes, to involve litigation, to offer a premium to rascality, to disappoint those embarking in building speculations, and to lower the tone of moral principle in masters and men.

CHURCH IMPROVEMENT, STEVINGTON.—The reopening, after alterations, of the Stevington Primitive Methodist Church took place on the 14th inst. The old seats and floor have been taken out, and the chapel lengthened 7 ft. 6 in., and a new vestry and classroom, 10 ft. by 10 ft., new kitchen, new floor has been put to the chapel, and a 4 ft. 6 in. dado round the walls. Four new windows have been put in, besides two in the gable, which, with four of Boyle's fresh-air inlets inserted in the walls, serve for ventilation. The seating arrangements have been improved, and a lobby has been formed with a door-room each of two aisles. Mr. E. H. C. Inskip prepared plans and specifications, and the building work was entrusted to Mr. T. Dickens, of Bedford, the wood work and interior fittings and decoration being carried out by Mr. C. Negus, of Bedford.

Illustrations.

DESIGN FOR THE PEACE PALACE AT THE HAGUE.

WE publish this week Mr. Cross's fine design for the Peace Palace at The Hague, which was specially mentioned in our second article on the designs in our last issue.

The following extracts from the Report accompanying the design, which have been sent to us by the author, will explain his intentions in the design:—

"The problem to be solved appeared to the author to be best met by the production of a design containing all the architectural essentials of a single monumental edifice, of which the two departments (A) the court-house and (B) the library form separate groups of buildings connected only at the ground floor level. In the accompanying design ("Temple of Peace") a monumental and regular system of planning has been adopted, resulting in the accommodation being obtained in two perfectly symmetrical blocks of buildings connected by spacious colonnades enclosing a large open central court, whence access is gained to the staircase hall of either department.

Subsidiary exits to the park are provided from each of the buildings, and the whole structure is conveniently accessible from the back of the site. The period of design selected—that of the Italian Renaissance—is one eminently suitable both to modern everyday requirements and to monumental architectural effect. It was thought that the large single Doric order proposed to be employed would result, if properly detailed, in the erection of a building of a stately, durable, and imposing character, fully suggestive of its purpose, and free from meaningless rococo ornamentation and embellishments. The estimated cost of the design, exclusive of the lofty column of Peace and the external sculpture, was 135,000."

MANSIONS AND FLATS, CLEVELAND-ROW, ST. JAMES'S.

The accompanying illustration shows an elevation of these buildings, facing St. James's Palace and Bridgewater House, now nearing completion.

The block has been designed for three town houses which front Cleveland-row, and suites of residential flats, having an aspect to Cleveland-square and the Green Park. The London Fencing Club, whose premises formerly occupied this corner of the site, have new accommodation on the fourth and fifth floors of the latter block. The elevations have been governed by the main horizontal lines of the neighbouring property. The windows are grouped symmetrically and enriched with iron balconettes. The whole building is surmounted by a modillion and dentil cornice, the former being coupled to bring the whole in scale with the cornices of the adjoining buildings.

The general contractor for the work is Mr. J. Carmichael, and it is being executed from the designs and under the superintendence of the architect, Mr. Frank T. Verity.

SOME ENTRANCE PORCHES:

HARE HALL, ROMFORD.

HARE HALL is a fine example of late Renaissance mansion, standing back from the main Chelmsford road, about two miles east of Romford station. Its date is about 1666. The north, east, and west fronts are wholly faced with Portland stone. The late Mr. Edward Castellan restored and remodelled the building, adding new dining and drawing rooms, garden loggia, and entrance porch. Messrs. James Smith & Sons were the contractors.

HYDE HOUSE, BULSTRODE-STREET.

This building has just been completed. It is faced with best red-facing bricks dressed with Portland stone. The contractors were Messrs. Patman & Fotheringham. Mr. Ammonier did the carving, and Messrs. Wrang the ironwork, both to the staircase and the area railings. Messrs. Seth-Smith & Monro were the architects.

OFFICES FOR HOLBORN COUNCIL.—In a report circulated on Monday, the Establishment Committee of Holborn Borough Council stated that they had considered in detail the plans sent in by the six selected architects for the additional office accommodation required. With a view to affording the members of the Council sufficient time for the inspection of the plans, arrangements had been made by which the plans could be on view in the Council Chamber for a week, after which they would be considered, together with the Committee's full report upon them, at a special meeting to be held on July 4.

THE CARABINIERS WAR MEMORIAL, CHELSEA.

SIR.—Some of your contemporaries have been led to ignore my connection with this monument, and in the *Times* I am referred to as if I were a bricklayer and stonemason. That, however, would not disgrace me, for the whole of the work has been admirably executed by the contractor, Mr. Thos. W. Haycock, Ebury-street.

The present time being the sixty-first anniversary of my entry into the architectural profession, I feel somewhat sore on the ground that Capt. Adrian Jones—notwithstanding his disclaimer (which I have here) of any desire "to sail under false colours"—has allowed his friends to trumpet his name as the so-called designer of the monument, and has refrained from informing the Press generally that the architect is

JOHN LIDDELL.

Obituary.

MR. MOSELEY.—The death a few days ago at his residence, the Hollies, Munster-road, Fulham, is announced of Mr. Andrew Moseley, who had attained the age of ninety-four years, formerly of Churchfield House, King's-road, S.W., and District Surveyor for Fulham. Mr. Moseley was architect of the Westminster Palace Hotel, a Fellow of the Royal Institute of British Architects, and served as a member of the Council. He retired from the profession, and he was, it appears, the *doyen* of the members of the Institute. The brothers, Messrs. W. & A. Moseley, were architects of the Westminster Palace Hotel, Victoria-street, S.W., 1858-61, of which a drawing and two plans were published in the *Builder* of April 10, 1858, and Mr. William Moseley's detailed description in our issue of March 8, 1862. The western portion of the building shown in the drawing was taken for the India Board.

MR. COLLINS.—We regret to announce the death, at the age of thirty-two years, of Mr. Horace W. Collins, of Clinton-road, Redruth. Having served his articles to the late James Hicks, of Redruth, he began to practice in that town ten years ago. Mr. Collins made the plans and designs for the renovation, with decoration and many improvements of the Wesley Chapel, Redruth; the remodelling of the interior, with decorative work, etc., of the Wesleyan Chapel at Troon (1896); a hotel, with shops, at Llanerdd (1900); the rebuilding of the Manor House, Marbury, Tavistock; for Mr. R. Collins; South Downs Wesleyan Schools, Redruth; schools at Laner, near Redruth; rebuilding for the Redruth Brewery Company of the Pendrives Arms Hotel, Gwentlan; the enlargement, with improvements, of the Druids' Hall, Redruth, for the Public Rooms Company, Ltd. (1905); extension of the Gerauns School, Portscatho; and a villa residence in Clinton-road, Redruth for Mr. J. Simmon. Of his most recent work there are drawings in the current Royal Academy Exhibition—a boating-cottage near Falmouth, and the proposed Secondary School, Redruth.

MR. WILKINSON.—The death, on June 13, is also announced of Mr. Philip Wilkinson, aged eighty years, of No. 68, Lincoln's Inn-fields, W.C., and of No. 2, Greville-place, St. John's Wood, N.W. Mr. Wilkinson was elected a Fellow of the Institute in 1890.

MR. CHURCH.—The death occurred a few days ago of Mr. W. D. Church, the senior partner of the firm of W. D. Church & Son, architects, of 12, South-place, Finsbury. Deceased was the architect of several churches in London, viz. St. Mark's, E.C.4., Mr. George James Snelus, F.R.S., M.I.Mech.E., and of the Iron and Steel Institute, of which he was a Vice-President, died in his seventieth year at his residence, Ennerdale Hall, Frizington, Cumberland, on June 18. He began life as a school-teacher, but having obtained a Royal Albert Scholarship, he went through a course at the Royal School of Mines, and was then appointed chemist to the Dowdles Works. On his return from the United States, whither he had proceeded upon the nomination of the Iron and Steel Institute to frame a report upon the Danks rotary puddling furnace, Mr. Snelus took out a patent in this country for a process, with which his fame is closely associated, whereby he obtained a basic lining immune from the action of a basic slag by lining the Bessemer converter with lime rendered impervious to water by having been burned at a very high temperature. In 1883 the Iron and Steel Institute awarded him, conjointly with Sidney Thomas, their Bessemer medal, and his invention won for him also gold medals at the Inventions Exhibition, 1885, and the Paris Exhibition, 1878. Mr. Snelus was elected a Fellow of the Royal Society in 1887.

General Building News.

METHODIST CHURCH, BELFAST.—The new Methodist church erected on the Lisburn-road was dedicated recently. The building forms part of a larger scheme, in accordance with the objects of which it will in the course of a few years be used as a lecture-hall. The walling is of rubble masonry from the Ballyvaughan Quarry, with white Scotch stone for angle quoins and string courses. The tracery of the large window in the main gable and the dressings of the other windows in the main front are of red freestone. The dressings of entrance doors and gable barge are also of red stone. The internal dimensions of the hall are 52 ft. by 34 ft. The joist work throughout is of selected pitch-pine. Pews have been provided for 260 persons, and additional seating for 70 is provided by chairs. The speaker's platform has a paneled pitch-pine and mahogany front. At the back of the platform is a wide seat under an arched recess, paneled and mounted up to the springing line of the arch. The heating apparatus has been fitted up by Messrs. Musgrave & Co. At the rear of the main hall are two classrooms, the larger of which is to be used as a church parlour, and the smaller as a temporary vestry. The general contractor for the work was Mr. Thomas McMillan, and the architect Mr. St. John Phillips.

CHURCH RESTORATION, CORHAMPTON, HAMPSHIRE.—The church of Corhampton, situated on the banks of the River Meon, has just been repaired and restored, at a cost of 800*l.*, under the superintendence of Mr. T. G. Jackson, R.A. The Saxon chancel arch has been strengthened, the bell cote, dating from 1600, reconstructed, and the bells, dated 1619 and 1829, rehung, and the Saxon west window opened. Some XIIIth century decorations and ancient consecration crosses are to be seen on the walls, and a stone altar slab, formerly used as a seat under the yew-tree, has been placed in the porch. The porch, a comparatively modern structure of brick and plaster, has been taken down, and a new one erected with a buttress on the east side to serve as a support for the south wall of the church, which was in a very weak state. The walls and foundations have been repaired and strengthened, iron wall-plates and tie-rods being used. The windows in the gable at the west end of the nave, which were bricked up, have been opened and glazed to give additional light in the church. The roof has been stripped and repaired throughout and retiled, mostly with the old tiles; the ceiling taken down and replaced to show part of the roof timbering. The interior walls have been stripped of whitewash and battening, and the panework of the windows brought out and repaired. The deal pews, which were much decayed, have been removed, and a wooden block floor laid for the new seats, which are of oak. These were made on the spot by the local carpenters, Mr. T. Green and Mr. Couzens, from designs prepared by Mr. Jackson, as were also the new organ-desk and the lectern. The old Jacobean pulpit has been repaired and set on a new base, and the altar-rails, dating from 1636, repaired and cleaned of the paint with which they were covered. The work of repairing and re-seating the church has been carried out by Messrs. Green, of Meonstoke, and under the direction of Mr. R. Long, of Oxford, clerk to the works.

SCHOOL, SWINTON.—The new school in connexion with St. Peter's Church, Swinton, opened recently, will accommodate 640 boys and girls. There are twelve classrooms grouped on either side of a central hall 80 ft. long by 28 ft. wide. The building has cost over 8,000*l.* The internal

woodwork is of pitch-pine, and the rooms are heated by pipes and radiators on the low-pressure system, and are lighted by gas. The building is of one story, and glazed folding screens divide the classrooms from the central hall. The exterior is faced with red Accrington bricks with golden buff terra-cotta architectural features. The classrooms and hall have tiled dados with plastered walls above, and the corridors, cloak-rooms, and paving, dados of glazed bricks, with red brick lining over. Messrs. Gerrard & Sons, Ltd., of Swinton, were the general contractors; and Messrs. C. K. and T. C. Mayor, of Manchester, the architects.

HARTLEY PRIMITIVE METHODIST COLLEGE, MANCHESTER.—A new part of the Primitive Methodist College in Alexandra-road, South, Manchester, has been built by Mr. Hartley. This new portion contains some 120 rooms, and is the largest part of the College. The entrance to the new extension is immediately beneath the clock tower, by a corridor which extends northward into the new portion, and by joining the old portion of the College forms practically an unbroken corridor 260 ft. in length, running parallel with the whole front of the buildings. Branching off to the west from this new corridor at right angles are two secondary corridors, from which are entered the studies. One hundred and seven new studies are provided, each 11 ft. by 9 ft., the whole grouped in three-story buildings around a rectangular quadrangle. The lecture-hall is 60 ft. wide and 32 ft. deep. The lecturer's desk faces three sides of a large octagon, around which is a rising gallery containing a separate desk for each student. Along the main corridor at its north end the College chapel is entered. This structure provides sitting accommodation for 150 persons. Its length is 44 ft. and its width 30 ft. There are a chancel and organ chamber at the west, and a north and south transept. The vestibule at the east end of the chapel, and the entrance door from the College grounds. All the windows are filled in with stone tracery and clear leaded lights, and the whole of the woodwork is in oak, lightly wax polished. A two-manual organ has been built by Messrs. Hardy & Son, of Stockport. A new library has been provided on the first floor, and the old library on the ground floor has been converted into a common room for the students. The new dining-hall, on the west of the corridor, 48 ft. long and 30 ft. wide, is finished in varnished pitch-pine, with paneled wainscoting. The old dining-hall has been converted into a second lecture-hall. The College and grounds cover an area of over 5*1*/₂ acres. There are 305 rooms in all, and all the corridors in the buildings make a consecutive length of 944 lineal yds. or well over half a mile. Messrs. Fred. W. Dixon & Son, of Manchester, are the architects of the whole of the designs, under whose supervision the work has been carried out.

COTTAGE HOMES, HALIFAX.—The Mayor of Halifax, Councillor R. D. Ward, J.P., decided some time ago to build twenty-four cottages for the homes, in proximity of his own residence, for the benefit of the poor. The "Cottage Homes" consist of three blocks, situated on the south side of Upper Washer-lane, overlooking the Calder Valley. Each block comprises eight cottages, four of which enter from Upper Washer-lane, and four underneath being approached from a terrace 34 ft. wide, entering at the extreme ends of the three blocks. The buildings appear as one story high to the roadway and two stories to the terrace side. Each house consists of a living room, 14 ft. by 15 ft. 3 in., with an additional recess, 7 ft. 6 in. high to the roadway and two stories to the terrace side. Each house consists of a living room, 14 ft. by 15 ft. 3 in., with an additional recess, 7 ft. 6 in. high to the roadway and two stories to the terrace side. Each house consists of a living room, 14 ft. by 15 ft. 3 in., with an additional recess, 7 ft. 6 in. high to the roadway and two stories to the terrace side. Each house consists of a living room, 14 ft. by 15 ft. 3 in., with an additional recess, 7 ft. 6 in. high to the roadway and two stories to the terrace side. Each house consists of a living room, 14 ft. by 15 ft. 3 in., with an additional recess, 7 ft. 6 in. high to the roadway and two stories to the terrace side.

FREE LIBRARY, TWICKENHAM.—The foundation-stone of the new free library, Twickenham, has just been laid. The new building has been designed by Mr. Howard Goadby, F.S.I., of Twickenham, and the contractor is Mr. E. E. Nightingale. Opening out of the entrance lobby is the hall, 19 ft. by 22 ft., on the right of which are the stairs leading to the first floor and the doors to the magazine-room; on the left, the entrance to the newsroom, and immediately opposite, the counter and entrance to the lending library. The lending library has been designed on the "open access system." The lending library is 43 ft. long by 26 ft. broad, and provides shelving accommodation for 21,000 books. The newsroom is 40 ft. by 22 ft., and has direct side and front

light. The magazine-room is 23 ft. by 30 ft., and will seat thirty people. Behind the newsroom is the staff workroom, with separate back entrance. The basement contains a book-store and file-room, 42 ft. by 26 ft., heating chamber, fuel store, and lavatories. The staircase from the ground floor to first floor will be constructed of oak and teak, and the walls panelled with wainscot oak. A domical ceiling will form a feature over the hall, and immediately opposite the main entrance is a stained-glass window. Leading from the first floor landing are the librarian's and committee room, reference-room, and lecture-hall. The latter is 23 ft. by 40 ft., and a platform will be constructed at one end. The hall will seat 110 people. At the rear of the platform are ladies' and gentlemen's retiring-rooms, with lavatories attached. The reference-room will seat twenty-five students, and is 30 ft. by 23 ft. The walls will be lined with shelves to accommodate 500 folio books and 2,500 octavos. A book-lift will run from floor to floor. The warming medium will be low-pressure hot water, generated by means of a boiler in the basement, and distributed to the various rooms, in which radiators will be fixed. The ventilation will be effected by special fresh-air inlets, and the vitiated air will be extracted by shafts leading to a chamber in the roof, fitted with a 36-in. electric fan.

WORKHOUSE ACCOMMODATION AT LEICESTER.—The principal matter which came before the Leicester Board of Guardians on the 12th inst. was with regard to the alterations to the workhouse rendered necessary by the report from the Local Government Board inspectors as to the necessity for better accommodation at the house for certain classes of inmates, and proper provision for certain diseases. Mr. Howe, as Chairman of the House Committee, moved the adoption of a scheme prepared by Mr. A. H. Hind, architect. It was proposed to erect male and female receiving and itch wards on the vacant land fronting the lous, giving dormitory and ward accommodation for 40 persons. It was also proposed to remove the present receiving and itch wards, and build two two-story dormitories to accommodate 104 beds. Each block of the receiving wards was designed to contain day-room dormitory (12 beds), water-closets adjoining, bathroom, containing bath and lavatory basin, discharging-room, officers' bed and sitting rooms, and private water-closet. Each block of itch and venereal wards was to contain two wards (four beds each), two bathrooms, with bath and lavatory basin, two water-closets. The wards were perfectly isolated, and were provided with separate entrances. The entrances to the main dormitories were arranged on either side of existing principal front and connected to the house by the old passage at rear of offices. By projecting the building 5 ft. from the existing principal front building, line additional space was given to offices and yards, Nos. 1, 2, and 19. The accommodation provided was—Ground floor, male, 27 beds; first floor, male, 27 beds; total, 54 beds. Ground floor, female, 25 beds; first floor, female, 25 beds; total, 50 beds. The floors were fireproof, and the staircase was of concrete. The exterior of the building was to be faced with pressed bricks, relieved with coloured bands, the copings and sills being of stone. Fireplaces were arranged to all wards, in addition to ventilating radiators, and other ventilators. It was suggested to carry the steam from present boiler for heating purposes. The approximate cost, which had been ascertained by taking rough quantities (allowing 6000 for heating purposes), would be about 6,300. After discussion the question was voted upon, and it was decided, by 24 votes to 10, to adjourn the matter for consideration by the Board in committee.

EXTENSION OF HOSPITAL, ASHTON-IN-MAKERFIELD.—The extensions to the Infectious Diseases Hospital at Ashton-in-Makerfield were opened recently by the Chairman of the Sanitary and Health Committee. The new buildings are erected upon land adjoining the old hospital, which was built about twenty years ago, off Bryn-road. The new buildings consist of four distinct blocks, namely, the administration block, scarlet fever pavilion, diphtheria pavilion, and the laundry block. The administration block contains matron's sitting-room, nurses' sitting-room, dining-room, medical officer's room, kitchen, scullery, stores, pantry and cellars, eight bedrooms, three linen storerooms, bathroom, and lavatory, etc. The scarlet fever pavilion contains wards for eight male and eight female patients, two separate wards of one bed each, nurses' duty-room, two bathrooms, and lavatories, etc. The diphtheria pavilion contains two wards of two beds each, nurses' duty-room, bathroom, and lavatories, etc. The laundry block contains washhouse, drying-room, ironing-room, linen-rooms, disinfecting-rooms, mortuary, ambulance shed, stable for two horses, engine (5-h.p.) and boiler, and all the necessary machinery for a complete laundry establishment. The old fever pavilion, hitherto used for scarlet fever cases, will be improved and used for typhoid cases for eight beds and one small probationer's ward. The total bed accommodation is for thirty-one patients. The cost of the buildings, machinery,

furniture, road-making, drainage, boundary walls, and contingencies will amount to 10,000, exclusive of land. Messrs. John Johnson & Son, of Wigan, were the builders, Messrs. A. H. Barlow, of Wigan, provided the furnishings, and the joint architects were Messrs. Heaton, Ralph, & Heaton, of Wigan, and Messrs. Haywood & Harrison, of Accrington.

NEW BUILDING IN PRINCES-STREET, EDINBURGH.—Plans were passed on the 14th inst. in the Edinburgh Dean of Guild Court for a new building which is to be erected in Princes-street at the south-west corner of South St. Andrew-street, by R. W. Forsyth (Ltd.), Glasgow, from plans by Messrs. J. Burnet & Son, architects, Glasgow. The site is overlooking Waverley Station. It has a frontage to Princes-street of 90 ft., and to South St. Andrew-street of 70 ft. A feature of the elevation is a corner tower rising to a height of 127 ft. 6 in., and finished with a sculptured group and a ball of lead, copper, and bronze. The height of the building to the wall head will be 80 ft. There will be in all seven floors—the first five being used for sales purposes, and the remaining two for administrative work. The main entrance is in Princes-street, with a subsidiary entrance from South St. Andrew-street; and a special feature of the interior fitting will be the staircases and its electric elevators giving access to the upper floors and basement.

NEW LIBRARY FOR SOUTHWARK.—The Libraries Committee of Southwark Borough Council reported on Tuesday having had a number of interviews with Mr. C. Batley with regard to his design for the new library in the Old Kent-road. Various amendments had been made in the design, and the Committee now propose that after same has been formally approved by the Council, it be forwarded to Mr. Carnegie, and Mr. R. J. Dickins (Surveyor to Lord Langstock) for their sanction. In the meantime the architect is to be instructed to proceed with the necessary detail drawings in order that the quantities of the new building may be taken out.

Stained Glass & Decoration.

CHURCH OF ST. MARY, DATCHET.—A reredos, carved in English oak carried by a marble base, and executed after designs by Messrs. Arthur Blomfield & Sons, has been erected in the parish church to the memory of the late Canon Thompson, Vicar, and Rural-Dean of Burnham.

Appointments.

BRITISH MUSEUM.—The Principal Trustees have appointed Mr. Herbert A. Grueber to be Keeper of Coins and Medals *vice* Dr. Barclay V. Head, who has retired from that appointment.

GLoucester.—Mr. R. Hampton Lucas was to have been appointed Borough Surveyor at the last meeting of the Kingston Town Council in succession to Major Macaulay, who recently resigned.

Sanitary and Engineering News.

THE ROYAL SANITARY INSTITUTE.—At an examination in Hygiene in its bearing on school life, held in Leeds on June 15 and 16, 1906, thirty candidates presented themselves—seven for Part I., nine for Part II., and fourteen for the whole examination. The following fifteen candidates were awarded certificates:—Bowena M. Bracewell (Todmorden); Martha A. Chappell (Barnsley); T. Clegg (Elland); Lilian F. P. Cory (Settle); Mabel Lilian Fry (Shipley); Annie Greenwood (Mytholmroyd); Alice Holmes (Menston); W. Kidd (Leeds); A. Longbottom (Drighlington); H. Pawson (Micklefield); Florence E. Relf (Bradford); Elizabeth M. Richardson (Wakefield); Felicia Southam (Darton); Sarah K. Smithson (Dewsbury); W. J. Woodruff (Leeds). The following eight candidates were successful in Part I. only:—Lavinia Barker (Wakefield); T. J. Bedford (Badsworth); B. A. Dakin (Mytholmroyd); Jessie M. Gordon (Mytholmroyd); T. F. Greenwood (Helden Bridge); Edith A. Platt (Sowerby Bridge); Ethel A. Roberts (Barnsley); Charles Turner (Barnsley). The following three candidates were successful in Part II. only:—G. F. Holland (Sowerby Bridge); Fanny Waring (Keighley); H. Woodhead (Settle).

INSTITUTION OF GAS ENGINEERS.—At the annual general meeting opened on Tuesday in last week Mr. Charles Wood, President, observed in his inaugural address that the most significant advance in gas legislation during the twelve months had been the abolition of the onerous restrictions as to sulphur compounds, and the adoption of the Carpenter burner as the standard for testing purposes. He pointed out that whilst in his opinion the fear of electrical competition had ceased to seriously disquiet the

gas industry, the cost of distribution and of the laying of mains was greatly increased by the multiplicity of electric cables.—Awards were made of the London Gold Medal to Mr. J. H. Brown, of Nottingham, for his paper upon "Experiments with Low-grade Mixed Gases," the Institution Silver Medal to Mr. W. Deig, Club for "Notes upon Structural Engineering," and the Bronze Medal to Mr. John Bond for a paper upon "Pyrometers and Carbonisation."

WATER SUPPLY, MELBOURNE.—The reservoir at Allanshaws, near Lauder, which is to provide the Burgh of Melrose with a new water supply, has been completed and opened. The area covered by water when the reservoir is full is about nine acres. The reservoir is formed by impounding the water of the Elwyn water by means of an embankment constructed across its course. The main embankment, which extends at right angles across the Elwyn water, is about 170 yds. in length, while a wing embankment along the south-west side is about 180 yds. in length, making a total length of embankment of 350 lineal yards. The depth of available water in the reservoir at its deepest part is 20 ft., and the capacity of the reservoir is 20,000,000 gallons. The area draining into the reservoir is 500 acres. A Wilson's patent automatic self-cleaning filter, capable of passing from 50 to 60 gallons per minute, has been erected and through which will be passed the water taken from the reservoir. The filter, together with a regulating chamber, etc., are situated in a concrete house on the outside of the main embankment. The works were designed and carried out under the supervision of Mr. George Somervell Cairnes, Edinburgh. The cost of the scheme is between 8,000, and 9,000.

THE PANAMA CANAL.—The Government of Washington convey the information that the Senate of the United States has approved the lock type for the Panama Canal by 36 to 31 votes, a result which was by no means a foregone conclusion. As the lower House has already decided in favour of the same type of canal, the controversy which has agitated American engineers and the general public is deemed closed, and we may now expect to hear of vigorous efforts for the completion of the work at the earliest possible date.

Foreign.

FRANCE.—The works being carried out in the Ile de la Cité, on the site of the Marché aux Fleurs, in connexion with the Metropolitan Railway on the left bank of the river, have led to the discovery of some further portions of the walls of the ancient Lutetia. Some fragments of sculpture have been found, probably connected with tombs of the 11th century A. D., and also a funeral stele with a Latin inscription, entirely intact.—An exhibition of work in silk and velvet was opened on Thursday at the Musée Galliera, including some very fine modern work from Lyons, Paris, and St. Etienne, as well as an interesting collection of old examples.—The Municipal Council of Paris has under consideration a proposal by M. Leoncavallo for the erection of an International Theatre on the Champs Elysées, on the site of the former Franconi Circus.—M. Adolphe Thiers, the architect, has been awarded this year the prize founded by the late M. Bartholdi, which has been bestowed on him for his entitled "Ensemble de Décoratif et de Confort de Deux Fleuves," which was specially mentioned and commended in the review of "Architecture at the Salon" in our columns.—The jury in the competition opened by the Municipality of Montignou for the construction of a new barracks, have awarded the first premium to M. Talbourdeau, architect, of Montignou.—The Municipal Council of Lyons has decided on the foundation of a district school of architecture in the town.—The art museum of Montpellier has received a number of paintings and water-colours by M. Harguinias as an addition to its contents.—The statue of Alfred de Musset, by M. Granet, was inaugurated last Sunday at the road-point of the same day there was inaugurated at Alfort, near Paris, a monument raised to the memory of the former Director of the Veterinary School, Edmond Nocard. It comprises a stele surmounted by a portrait bust, the work of M. Geoffroy. At the foot of the monument are three figures by M. Boucher, symbolising "Science" grouped with figures of a man and woman of the peasantry, offering palm-branches.—The Rouville prize, founded as an award to an engineer who had carried out a work realising a progress in engineering science, has been presented to M. Sejourne, the author of some very important works, among them the Luxembourg viaduct and the Pont des Amidonniers at Toulouse.

BELGIUM.—The Acting British Consul-General at Antwerp (Mr. W. Lydcoote) has forwarded particulars of a notice, issued by the Municipal authorities of that city, inviting tenders for the work of construction of the Government Bonded Warehouses, known as the Nord-Ancien and Nord-Nouveau. The specification ("*Cahier des Charges*," No. 1,144) relating to the contract may

be obtained from the Hotel de Ville, Antwerp, at a cost of 2 francs. All tenders should be sent in sealed registered envelopes, addressed "A Monsieur de Bourgmestre en l'Hotel-de-Ville d'Anvers," and should reach the Hotel de Ville not later than August 16. A deposit of 1,000 fr. is required to qualify any tender. A copy of the specification may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C.—*Board of Trade Journal.*

Miscellaneous.

DUFFEIN MEMORIAL, BELFAST.—On the 8th inst. the Marquis of Londonderry, K.G., unveiled the statue of the late Marquis of Dufferin and Ava, which has been executed by Mr. F. W. Pomeroy, A.R.A., and placed on the west side of the new City Hall. The design of the monument is based on the Italian Renaissance. The material used for the structural portions is brown Portland stone from Dorsetshire. All the sculpture on the monument is of bronze. Two figures on either side of the pedestal represent respectively India and Canada. The statue of Lord Dufferin is on the top of the pedestal, and is 8 ft. in height, and is surmounted by a canopy, supported by Ionic pillars, on the top of which is a figure of Fame. The total height of the monument, with the steps, is about 36 ft. The bronze work was done at the foundry of Mr. A. B. Burton, Thames Ditton, Surrey. The architectural portions of the work were designed by Mr. Brunwell Thomas, the architect of the new city hall.

THE "SHARK" OPAL TILING.—Messrs. Callow Wright & Hewlett send us a specimen and description of their "Shark" opal tiling, which is so named from the tooth-like section of the key at the back of each tile. It is a new design, and is to be the only novelty in the tiles, but it is a good form, and likely to be more effectual in keeping them in their places than any other form of key that we have seen on this class of tile.

CONVERSATION.—The Institution of Electrical Engineers held their annual conversation at the Natural History Museum, South Kensington, on Tuesday night. The guests were received by the President, Mr. Ganey, of the Post Office, and the President-elect, Dr. Glazebrook, the director of the National Physical Laboratory. Many of the foreign electricians who have been invited to the country as the guests of the Institution of Electrical Engineers, were present, and were very interested to meet Lord Kelvin and Sir Joseph Swan. Music was provided by the band of the Royal Engineers and the Leonie Ladies Quintette.

SOUTH-WESTERN POLYTECHNIC, CHELSEA.—At the lectures on "Architecture and History," given by Mr. Banister Fletcher, and arranged under the auspices of the University of London Extension Board, held during the past session, the total number of students who entered for the course was 60, and at the examination held at the conclusion of the course the following students satisfied the examiner, the Rev. F. H. Woods, B.D., St. John's College, Oxford:—**Winifred M. Burlingham, **Annie C. Burton, *Henry Dearden, *John Dovston, *Claire Gaudet, *Francis Grissell, *Ethel Hendry, William S. Hinton, Harley C. V. Strickland, Charles S. Welles. Those with a double asterisk against their names received a mark of special distinction, and those with one a certificate of merit. The scheme of instruction consisted of weekly lectures (at which selected notes were given out), illustrated with lantern slides, and specially prepared large lecture diagrams followed by sketching classes, and further explanations of the styles.

HAMPSTEAD GARDEN SUBURB COMPANY.—The Select Committee of the House of Commons on Unopposed Bills, of which Mr. Emmott is Chairman, have passed the Bill promoted by the company, and have ordered it to be reported for third reading. Some amendments have been introduced into the measure for limiting to accommodation roads, and, with the local authority's consent, the exemption of the company from the operation of the London Urban District Councils' by-laws in respect of the width of the roads. The accommodation roads will in no case be less than 15 ft. wide; the other roads on the estate will have a minimum width of 40 ft., and between any two houses standing upon opposite sides of the road there will be a minimum space of 50 ft., having thereon no buildings except a fence, gate, or wall. The promoters undertake to erect no more than eight houses per acre on an average throughout the whole area of the suburb.

ST. PAUL'S CHURCH, FOREMAN SQUARE.—At a sitting of the Consistory Court of London last week Dr. Tristram, K.C., Chancellor of the diocese, decreed a faculty for proposed alterations and improvements of the church, until recently Portman (Proprietary) Chapel, in Baker-street. It is intended to expend about 3,000l. in transforming the basement and cellars—which hitherto have been used as wine-valets—into a hall, and to build four or five classrooms for work connected with the church and parish. The church will at the same time be fitted with a new

system for heating and ventilating purposes, and new flooring is to be laid down.

A. A. STUBBINS'S DRAWINGS.—Mr. Hubert Keys writes to say that his drawings of Stationers' Hall were not sent in competition with those of the Mansion House, as might be inferred from our notice, but represented the work required to be done after winning the Banister Fletcher Bursary, which he gained last year with drawings of Morten College.

INCORPORATED CHURCH-BUILDING SOCIETY.—This society held its usual monthly meeting on Thursday, the 21st inst., at 7, Dean's-yard, Westminster, the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Birchfield, Staffs, 50l.; Harey, S. Michael and All Angels, Staffs, 75l. for the first portion, and Leyton, S. Paul, Essex, 100l. for the first portion; and towards enlarging or otherwise improving the accommodation in the churches at Ascham, S. Nicholas, near Retford, Notts, 25l.; Bylechan, S. Thomas, near Denbigh, 10l.; Clare, S. Peter and S. Paul, Suffolk, 35l.; Great Kent, S. Mary and S. Lawrence, Suffolk, 20l.; Scillinge, S. Mary, near Hythe, Kent, 15l.; and Monevden, S. Mary, near Framingham, Suffolk, 30l. in lieu of a former grant of 25l.; grants were also made from the special Mission Buildings Fund towards building mission churches at Bosch, near Triton, Staffs, 30l.; Newport, S. Barnabas, Mon, 50l.; Portsea, S. Wilfrid, Hants, 100l.; Welches Dam, near Manes, Cambs, 15l., and Werrington, S. Philip, near Caversham, Staffs, 35l.; and towards enlarging the mission school at Llangrannog, S. David, Cardiganshire, 100l. Grants were also paid for works completed: Wakefield, S. John, 75l.; South Barnett, S. Michel and All Angels, Middlesex, 125l.; Fohbing, S. Michael, Essex, 30l.; Babraham, S. Peter, Cambs, 10l.; Llantwit Major, S. Iltyd, Glam., 25l., making 775l.; Rowley Regis, S. Giles, near Birmingham, 55l. on account of a grant of 105l.; and Willisl, S. Michael and All Angels, Yorks, 30l. In addition to this the sum of 200l. was paid towards the repairs of nine churches from Trust Funds held by the Society. The Society likewise accepted the trust of a sum of money as a repair fund for the church of S. Thomas, Greatland, near Halifax.

THE BUILDING LINE IN REGENT-STREET.—In a report circulated on Tuesday the Improvements Committee of Westminster City Council stated that in connexion with the plan submitted for the new building line proposed by H.M. Office of Woods and Forests in Regent-street between Glasshouse-street and Oxford-circus, the Committee had addressed a communication to the London County Council suggesting that that body should ask the Commissioners of H.M. Woods and Forests not to grant leases of the site at the junction of Argyll-place, Chapel-court, and Beak-street, with Regent-street, until the London County Council or the City Council had had an opportunity of considering the advisability and practicability of a widening at either of those points with a view of improving the means of communication between Regent-street and Wardour-street. The London County Council had replied to the effect that the Building Act Committee had decided to comply with this suggestion.

INSTITUTE OF SANITARY ENGINEERS.—The members of the Institute of Sanitary Engineers are holding their summer meeting this year in Manchester, on July 6, 7, and 8. Sir Wm. Mather, M.Inst.C.E., will preside at the meeting, and an interesting programme of discussions and visits has been arranged.

HOUSING OF THE WORKING CLASSES.—Mr. Rider Haggard was the principal witness on the 25th inst. before the Select Committee of the House of Commons which is considering the Housing of the Working Classes Acts (Amendment) Bill. Sir John Dickson-Poynder presided.

Mr. Rider Haggard said that inquiries which he had made showed him that housing was generally defective in rural districts. The worst place he knew in this respect was a village in Somersetshire. In that village there was not a house fit for a human being—all the houses seemed to be falling down and the doors and windows were all loose. He spoke to the medical officer about it, and asked why the houses were not condemned. His reply was that that was a long and troublesome process, and that even if the houses were condemned it was not much use, because to pull them down would only render people homeless. The most extraordinary case of rural housing, or rather the lack of it, was one he met with in Essex, near Waltham. There he found twenty men working on a farm but could see no cottages. He asked where the men lived, and on being told that it was in one of the farm buildings, he asked to see it. The place shown him was a brickshed about 14 ft. square, and looking like a wagon-house. It had no windows. Sacks were laid on the floor round the wall, and there the twenty men slept. Some of them had been there three years. A hundred yards away he saw an elm-tree on a hill. There he found the ashes of a fire and a rod to hold a pot. This was the dwelling place—the kitchen and the parlour of the twenty men. Winter and summer they

did their cooking and spent their Sundays under the tree. Cottages were not built because people could not afford to build them. This farm had been in the same occupation one hundred years. Continuing, witness said that in Huntingdonshire he found the houses perfectly awful. The instances he had cited were the worst which he found on a tour through twenty-six counties. It was a mistake to suppose that the number of houses in villages was always insufficient, and in Norfolk there were more houses than were wanted, because of the desertion of the land by the labourer. Housing was worst when the cottages were bought by speculative people. For instance, a man who had saved a few hundreds would buy some country cottages cheaply and thus get a high rate of interest for his money. He would never do any repairs, and the houses were sometimes allowed to get into such a bad state of repair that they tumbled down.—The Chairman: So the inference is that the powers of control of the local authority are unsatisfactory and inadequate?—Mr. Rider Haggard: I am inclined to think they are.—Answering questions as to his opinion of the Bill before the Committee, witness said he would not give compulsory powers to a District Council unless there were a right of appeal. He would not mind leaving the matter in the hands of the District Council subject to the confirmation of the Local Government Board. His own opinion was that a man should only be required to sell land for the erection of houses or the provision of small holdings in proportion to his own holding in the village. After hearing further evidence the Committee adjourned.

THE PROPOSED NEW LONDON COUNTY COUNCIL CITY HALL.—The Earl of Camperdown's Committee of the House of Lords began on the 26th inst. the consideration of the London County Building Bill. It is promoted by the London County Council, and contains the scheme for the erection of a new County Hall. It is proposed to acquire six acres in extent, on the Surrey side of the Thames adjoining the down stream of Westminster Bridge. The site has a frontage of 800 ft. to the river and to Belvedere-road. On it a building is proposed to be erected somewhat larger than Somerset House, with a terrace or embankment between it and the river. The cost of the land and buildings is estimated at 1,700,000l.

Mr. Cleland, M.P., Chairman of the Establishment Committee of the London County Council, told the Committee that when the Council began work it had a staff of 200. Now the number had risen to 2,000. The departments of the Council were now housed in 30 different buildings, some of them being widely separated. In the buildings which it was now proposed to erect there would be a Council Chamber, committee-rooms, and accommodation for a staff of 2,300. As the Council already had a works department on a freed site adjoining the one which it was now proposed to acquire there was room for expansion should it become necessary. The yearly amount for repayment of loan and interest at the end of six years—which might be taken as the time for completing the building—would be 84,000l., but the Council would save 40,000l. which it now paid for rent of offices. After other witnesses had been heard, the further consideration of the Bill was adjourned.

WAR MEMORIAL, OXFORD.—The memorial to the members of the Oxfordshire Light Infantry, which has been erected in St. Clement's, Oxford, has been completed. It consists of a bronze figure of a soldier in khaki, standing with his rifle at the "ready." The sketch model from which the bronze was copied was executed by Mr. Ambrose Neale. The whole of the work has been done under the supervision of Messrs. Boulton, and carried out in their studios at Cheltenham. The casting, which weighs over half a ton, was executed by Messrs. J. W. Singer & Sons, bronze founders, of Frome.

Legal.

BUILDING DISPUTE IN THE WATERLOO-ROAD.

MR. JUSTICE SWINFEN EADY, in the Chancery Division on the 22nd inst., had before him the case of Williams v. Johnson & Co., on a motion by the plaintiff for an *interim* injunction restraining until the trial or further order the raising of a building called the "Union Jack Club" in the Waterloo-road to a greater height than it was at present. Plaintiff, by his motion, also asked for an order that defendants should pull down the walls already erected, which it was said interfered with the light and air coming to the plaintiff's premises.

In the result no injunction was granted, arrangements being made for an early trial of the action, leave being given to make an application to fix a day for the trial this week. Leave was also granted to add the Union Jack Corporation as defendants.

Mr. Micklum, K.C., and Mr. Eustace Smith appeared for the plaintiff; and Mr. Eve, K.C., and Mr. Attwater for the defendant.

MAIDENHEAD BUILDING DISPUTE.

The bearing of the case of *Lanning v. Davy & another* concluded before Mr. Justice Darling and a common jury in the King's Bench Division last week—an action by Mr. Harold Sydney Lanning, of Maidenhead, to recover from the defendants, also of Maidenhead, damages for alleged negligence by them as architects and surveyors. The defendants denied the alleged negligence and counter-claimed for 87l. 3s., fees for work and labour done.

It appeared that the dispute arose in connexion with the creation of a house, conservatory, and stables for the plaintiff at Boy'n Hill-avenue, Maidenhead. The plaintiff's case was that in the early part of 1903 he instructed Mr. Davy to prepare plans, specifications, etc., for the buildings, and these were prepared. Ultimately tenders were invited and sent in. That of Messrs. J. K. Cooper & Sons was the highest (1,856l.), and that of Messrs. Cox & Sons the lowest (1,698l.). On January 19, 1903, Mr. Davy informed the plaintiff that Messrs. Cooper were prepared to reduce their tender by 5 per cent., and the plaintiff finally accepted this figure. On March 6, 1903, the contract was signed, which was for the erection of a house, conservatory, and stable, and the work, with the exception of the stable, was finally completed with some variations by September or October, 1903. Mr. Davy gave four interim certificates for 300l. each, which the plaintiff paid in April, 1904, and the architect gave a further certificate for 350l., but on May 9 plaintiff's solicitors wrote revoking defendant's authority to certify. Defendants, however, on August 11, 1904, certified for a further 350l. as due to the builders, and on October 30 they certified the balance of 80l. 18s. 2d. Shortly afterwards Messrs. Cooper issued a writ claiming payment of these two sums, making together 130l. 18s. 2d., and the plaintiff in that action, by his defence, alleged that the work was badly done, and counter-claimed in respect of a certain right of way, and for the cost of putting the work right. Messrs. Cooper, by their reply, set up the contract, and alleged that the plaintiff could not maintain his defence and counter-claim upon the main grounds that the contract provided that the architect's certificate should be conclusive evidence of completion, and that as the architect had given a final certificate the plaintiff was precluded from relying upon the various matters alleged in his defence and counter-claim. That action came on for trial, when Mr. Lanning's counsel advised him to settle the case. The action was settled on terms which provided in effect for the plaintiff selling his house to Messrs. Cooper for 2,000l. less the amount of the certificates and the taxed costs of the action. In the present action the plaintiff alleged that the defendants had not carried out his instructions with regard to the position and size of the rooms, that they had been negligent in supervising the execution of the work, in taking out the quantities, and in advising him not to accept the lowest tender. The plaintiff further alleged that the defendants negligently and without any authority express or implied, and in breach of their duty as plaintiff's architects, purported to bind the plaintiff by the terms of the agreement of March 6, 1903, whereby the defendants, as between the plaintiff and the builders, Messrs. J. K. Cooper & Sons, constituted themselves final and sole arbitrators, and made their certificate final and conclusive.

The defendants by their defence denied that they had failed to carry out the plaintiff's instructions in preparing the plans as alleged, and said that they had exercised all reasonable care and skill in their employment. Defendants further said that they asked Messrs. Cooper to reduce the amount of their tender at the plaintiff's request, and the tender was reduced to the sum of 1,764l. They also denied that they had negligently supervised any of the work or had been guilty of any negligence. Defendants further relied upon the agreement of March 6, 1903, made between the plaintiff and Mr. Henry Cooper as barring the plaintiff's claim, and particularly to provisions thereof whereby it was declared that the architect's certificate should be final and binding as between architect and client, and that in all disputed points arising from such agreements the architect's decision should be final and binding by both parties, and that such agreement should be deemed a reference to arbitration. Defendants said it was the fact that they purported to bind the plaintiff by the written agreement of March 6, 1903, but they denied that they did so negligently or without authority, or in breach of their duty as the plaintiff's architects. They said that such agreement was prepared in the plaintiff's interest, and was put forward and procured to be executed by the builders in the ordinary course of the defendants' duty as such architects. By the counter-claim defendants claimed 87l. 3s., being 5 per cent. on the contract price, duplicate copies of plans, etc.

After hearing a great deal of detailed evidence, the jury in the result returned a verdict for the plaintiff for 750l. on the claim, and for the defendants for 50l. on the counter-claim.

Judgment accordingly.

His lordship stayed execution for a fortnight with a view to an appeal.

Mr. G. A. Scott appeared for the plaintiff; and Mr. Marshall Hall, K.C., and Mr. George Wallace for the defendants.

ACTION AGAINST LANDLORD FOR DEFECTIVE FLOORING.

In the House of Lords, composed of the Lord Chancellor, and Lords Macnaughton, James of Hereford, Robertson, and Adair, on the 22nd inst. judgment was delivered in the case of *Cavalier v. Pope* on appeal from the order of the Court of Appeal, setting aside so much of the judgment of Mr. Justice Phillimore as adjudged that the appellant, Minnie Cavalier, should recover from the respondent, William Pope, the sum of 75l. (The case was reported in *The Builder* of August 19, 1905.)

The action was brought by Mr. and Mrs. Cavalier to recover damages from the defendant for personal injuries sustained by Mrs. Cavalier owing to the omission of the defendant's agent to carry out an agreement to do certain repairs in a house known as No. 18, Bridport-place, Hoxton, of which Mr. Cavalier was tenant to the defendant. Mr. Cavalier also claimed from the defendant the expenses he had incurred in consequence of the accident to Mrs. Cavalier.

The facts of the case were as follows:—Mr. Cavalier, in December, 1901, entered into a verbal agreement with the defendant's agent for the tenancy of three rooms in the house in question at a monthly rent. The plaintiff during the tenancy repeatedly called the agent's attention to the fact that the kitchen floor required repairing, and on December 9, 1902, the agent (according to the plaintiffs' case) agreed to do the necessary repairs if Mr. Cavalier stayed on as tenant. The repairs, however, were not carried out, and on October 21, 1903, while Mrs. Cavalier was sitting in a chair in the kitchen, the back legs of the chair went through the floor, and the result was that Mrs. Cavalier was thrown to the ground and sustained serious injuries. At the trial the jury found, in answer to specific questions left to them by the learned judge, that the agent had notice or knowledge that the kitchen floor was in a defective state; that the agent promised to repair it, and that in so doing he was acting within the scope of his authority. They assessed the damages at 75l. for the wife and 25l. for the husband, and judgment was entered accordingly with costs. Mr. Justice Phillimore holding that the wife was entitled to recover because, although the defendant was not liable to her in contract, her injury was caused by the defendant's neglect of a special private duty he owed towards her in reference to the dilapidated condition of the flooring. In their opinion the agreement to repair did not bring the landlord within that class of case where the owner or occupier of dangerous premises was held liable for inviting an unsuspecting guest or stranger to come upon the premises. The contract with Mr. Cavalier to repair could not create a special private duty on the part of the landlord to the wife, which would have had no existence in the absence of the contract. Lord Justice Matthew, however, dissented, being of opinion that the decision in the case of *Langridge v. Levy* was an authority for the position taken on behalf of the wife. By a majority of the Court, therefore, the appeal was allowed, and judgment entered for the defendant as against Mrs. Cavalier. Hence the present appeal to the House of Lords.

The Lord Chancellor, in giving judgment, said he thought the decision of the Court of Appeal ought to be affirmed. He could find no right of action in the wife of the tenant against the landlord, either for letting these premises in a dangerous state or for failing to repair them according to his promise. The husband had sued successfully for breach of contract, but the wife was not party to any contract. He thought that the appeal failed.

The other learned lords concurred, and the appeal was accordingly dismissed with costs. Mr. E. E. Lever and Mr. Wiltshire were counsel for the appellant; and Mr. Montague Lush, K.C., and Mr. Lilley for the respondent.

Patents of the Week.

APPLICATIONS PUBLISHED.*

11,350 of 1905.—DR. F. FURSTENHEIM and C. HIRSCHORN: *Gas Heating Apparatus for Baths.*

This relates to a gas heating apparatus for baths wherein the supply of gas to the burner is regulated by a valve opened by the pressure of the water to be heated, and in which the burner is pivoted or rotatable for the purpose of opening

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

the main gas cock, and consists of the construction wherein the valve is provided with a by-pass through which a quantity of gas sufficient to feed an igniting flame is supplied to the burner when the valve is closed.

12,532 of 1905.—J. J. RATHBONE and J. E. BUTLER: *A Cowl for the Prevention of Down Draught in Chimneys and Uptakes.*

This relates to a cowl for the prevention of down draughts in chimneys or uptakes, and consists of a chamfered fillet running along the underside of the cowl or semi-spherical hood and socket joint or loosely held at its apex by a ball and socket joint to a rod projecting centrally above the chimney or uptake.

16,834 of 1905.—G. J. EARLE, W. FLOWERDEW, and ELLKAY & CORNES, LTD.: *A Folding Cover for Baths.*

This relates to covers for domestic baths, and consists in providing a cover or lid for the bath, which is as long as or slightly longer than the bath, the said cover being hinged to a rail, which is secured to the wall at the side of the bath, a chamfered fillet running along the underside of the rail to support the cover. If one end of the bath rests against the wall one end of the cover may rest on a rebated wood bearer of the same width as the cover fixed to the wall. The other end of the cover is supported by a strut hinged at its upper end to a suitable bracket, which is screwed or otherwise secured to the underside of the cover, the lower end of the strut being hinged or otherwise connected to a guide iron, which moves in a groove in the vertical portion of a bracket, which is fixed to the wall below the cover. This strut and bracket can be made to suit any width of cover.

17,423 of 1905.—J. GARLAND: *Earth Closet Doors.*

This relates to doors for earth closets, and consists in making a frame with a groove on either side in which grooves the door slides. A piece of metal or other material is suitably fixed in the said grooves, so as to extend about half-way up, leaving space for the door to slide upon the top of the said piece, on which the bottom of the door can rest to keep it open. A catch is fixed which can be turned outwards by means of a key, so as to lock the door when closed or open, as may be required. The said frame is fixed in wall.

17,516 of 1905.—A. BLACK: *Windows.*

This relates to windows, and consists of a mechanism for raising and lowering a sliding and hinged sash, comprising in combination a screwed spindle, a worm wheel on the spindle, a worm for rotating the worm wheel and spindle, and a nut working on the screwed spindle, which is made integral with or connected to the hinge of the window sash.

19,403 of 1905.—R. T. SURTEES: *Fireproof or Concrete Structures.*

This relates to means for bracing, hooping, or bonding the embedded rods, bars, or the like in fireproof or concrete structures, and strengthening said structures, and consists of a length of metal of suitable cross-section and length made to form a bracing hoop or bond, and coiled at one or more points to form a loop or loops, and also so connected at a distance from each end as to cause its two ends to form long arms extending fully across the area enclosed by the bracing, by which the bracing is held to the core of the structure and the core is reinforced.

21,022 of 1905.—W. OATES: *Dry Closets.*

This relates to dry closets, and consists in the arrangement of an earthenware or like casing comprising a base, sides, and top, the top being provided with a seat aperture, and the back of the casing being open or having an opening therein for the introduction and removal of a pail or receptacle.

21,706 of 1905.—J. CALVERT: *Window Appliances for Ventilation.*

This relates to means for ventilating rooms, and consists in the provision of a pivoted device composed of a longitudinal strip of wood or other suitable material formed with a central opening, and a door hinged at the lower side of said opening, a sheet of gauze or perforated plate covering the outside of the opening.

1,624 of 1906.—C. DAEM: *Windows and Fastenings Thereof.*

This relates to a window-fastening device, with oval-shaped wooden rods for opening and closing the windows while the casement is in constant contact with said rods, and is characterised by the fact that the wooden rod being of oval section and rotating on a longitudinal axis, the window casement lies in a flat position and is lifted into the top frame abutment when said rod is turned.

3,591 of 1906.—A. KNIGHT: *Ventilating Apparatus.*

This relates to a hit-and-miss ventilating apparatus for shop windows and the like, and consists of a fixed grating, a sliding grating on the fixed one, roller guides and adjustable guiding screws for the slide and springs, and a cord attached to opposite ends of the slide.

BUILDING.

JUNE 30.—Callington.—SHOWROOMS.—New furniture and general showrooms at premises in Fore-street, Callington, for Mr. W. W. Dymond. Plans and specifications may be seen at the office of the architect, Mr. Lawrence Scantlebury, Callington. Tenders to be delivered on or before June 30.

JUNE 30.—Chard.—MILL.—Extension.—Extension buildings to the Holyrod Mill, Chard, for Messrs. Gifford, Fox, & Co. Names to Messrs. Synnes & Madge, architects and surveyors, Somerset House, Chard, on or before June 30, after which date plans and specifications may be seen at the office of the architect, Mr. Lawrence Scantlebury, Callington. Tenders to be supplied, on receipt of cheque for 3s. 3d.

JUNE 30.—Exeter.—ALTERATIONS.—Proposed alterations at Nos. 11 and 12, and for the erection of two shops and dwelling-houses at Nos. 13 and 14, North-street, Exeter, for Mr. G. H. Skinner. Names to Mr. Charles Cole, architect, 50, High-street, Exeter, by June 30.

JUNE 29.—King's Heath.—HOMES FOR EMPLOYEES.—The Education and King's Norton Joint Poor Law Establishment Committee invite tenders for the erection of six homes for epileptics and other works on the Maynall Hall Estate, near King's Heath, Birmingham, according to plans and specifications prepared by Messrs. C. Whitwell & Son, Architects to the Joint Committee. Builders desirous of tendering must apply to Mr. R. F. Curtis, Clerk to the Joint Committee, at Guildhall Buildings, Birmingham, and deposit the sum of 25s. on or before June 30, 1906. Tenders to be delivered to the Clerk on or before July 25.

JUNE 30.—Leeds.—HOUSES.—House and shop, and two back-to-back houses, in Harbottle-lane, Leeds, for Mr. T. H. Avo. Names to Messrs. Thomas Winn & Sons, architects and surveyors, 64, Albion-street, Leeds, on or before June 30, when bills of quantities will be duly forwarded.

JUNE 30.—Mirdford.—SHOPS, HOSES, ETC.—A shop, house, and slaughter-house at Mirdford, for Mr. F. Lister. Drawings and specifications at office of Mr. E. Vincent King, A.R.I.B.A., architect, 24, Westgate, Dewsbury, to be seen on or before July 20.

JUNE 30.—Ravenshoe.—BILLIARD ROOM.—Various works required in the erection of a billiard room for the Ravenshoe Working Men's Club and Institute. Names and addresses of architects to be delivered to Mr. David H. Lamb, architect, Ravenshoe.

JUNE 2.—Belfast.—ADDITIONS TO COLLEGE.—Tenders addressed to the Education Secretary, Office of Public Works, Dublin, for additions to Queen's College, Belfast, will be received up to, but not later than, 10 a.m. on July 1. The plans and specifications are to be seen at the office of the architect, at the office of Messrs. Stephens & Son, 13, Donegal-square, N., Belfast, by whom forms of tender and bills of quantities will be supplied on deposit with them of 1s.

JUNE 2.—Bingley.—MILL.—ADDITIONS.—Bricklayer's and mason's (including ironfounder's) work, carpenter's and joiner's, slater's, plumber's, plasterer's, and painter's work required in the erection of dressing, twisting, and store rooms, at the Albert Mills, Bingley, for Mr. A. R. Wright. Plans may be seen at the office of Mr. Wm. Rhodes Nunn, architect and surveyor, 13, Market-street, Bingley, from June 25 to July 2.

JUNE 2.—Duffus.—SCHOOL.—IMPROVEMENTS.—The mason, carpenter, plumber, and painter works of improvements at Duffus School. The plans and specifications may be seen with John White, architect, Elgin, and at the school, and estimates must be lodged with the architect on or before July 2.

JUNE 2.—Halifax.—SHED.—Halifax Improvement Committee invite tenders for the execution of the work required in the erection of a store shed in Booth-fold, Halifax. Plans and specifications may be seen, and forms of tender obtained, on application to Mr. James Lord, C.E., Borough Engineer, Town Hall, Halifax, upon the payment of the sum of 1s. Tenders, endorsed "Store Shed, Booth Fold," must be sent to Mr. Keighley Walton, Town Clerk, not later than 5 o'clock p.m. July 2.

JUNE 2.—Invercarron.—WORKSHOP.—The bricklayer, carpenter, slater, plumber, and steel works of a workshop proposed at Invercarron, Stenhouse, for Messrs. James Jack & Sons. Schedule of quantities may be obtained from the architect, Mr. Geo. Gregory, 24 David-street, Stonehouse, with which officers are to be lodged before 12 o'clock noon on July 2.

JUNE 2.—Lochely.—HOUSES AND COTTAGES.—Brick and digger, joiner, plumber, slater, blaster, glazier, iron grates, and painter's work of 110 houses, to be erected in Lochely for the Lochely Iron and Coal Company, Ltd. Schedules of quantities may be had, and plans may be seen at the office of Mr. William Birrell, architect and surveyor, 200, High-street, Kierkeady, on deposit of 1s. 1s. Offers to be lodged with the Secretary of the company, Mr. Vincent-place, Glasgow, on or before July 15, sealed and endorsed "Tender, etc., Houses, Lochely."

JUNE 2.—Northorram.—WALL AND PORCH.—Halifax Education Committee invite tenders for rebuilding

wall near Satterlee School, Keil-lane, Northorram, and for a new porch at Siddal School. Plans and specifications may be seen, and forms of tender obtained, on application to Mr. James Lord, C.E., Borough Engineer, Town Hall, Halifax. Tenders, endorsed "Wall," Satterlee School, and "Porch," Siddal School, respectively, must be sent to Mr. W. H. Osler, Secretary, by or before 12 o'clock noon, July 2.

JUNE 3.—Belfast.—BOARD-ROOM.—Belfast Guardians invite proposals for executing certain works at the board-room of the workhouse, in accordance with plan and specification prepared by Messrs. Young & Muckel's civil engineers, which can be seen at office of Mr. Joseph W. Robb, Clerk of the Union, Clerk's Office, Union Workhouse, Tenders, endorsed "Board-room Alterations," to be lodged in the tender-box, board-room, before 12 o'clock noon on July 3.

JUNE 3.—Halifax.—GREENHOUSES.—Halifax Parks Committee invite tenders for the erection of the joiner's work required in the erection of greenhouses at Arkroyd Park. Plans and specifications may be seen, and form of tender obtained, on application to Mr. James Lord, M.I.C.E., Borough Engineer, Town Hall, Halifax, upon payment of the sum of 1l. Tender, endorsed "Greenhouses, Arkroyd Park," must be sent to Mr. Keighley Walton, Town Clerk, not later than 5 o'clock, on July 3.

JUNE 3.—Hetton.—SCHOOL.—ALTERATIONS.—Durham County Education Authority invite sole tenders for alterations to the school buildings, situated at Hutton, Station Town, and Middleton-in-Teesdale. Plans, specifications, and conditions of contract may be seen at the respective schools, and at the architect's office, Quantities for Station Town and Middleton-in-Teesdale may be obtained on application to Mr. W. Rushworth, F.R.I.B.A., architect, County Education Office, Durham, to whom sealed and endorsed tenders must be delivered not later than July 3.

JUNE 3.—London.—AREAS AND STEPS.—Whitechapel Guardians invite tenders for certain work required to be done in forming area and steps to boiler-house, and in the alteration of the drains to "C" block of the Mill-lane-road, to be carried on enclosed recreation ground for New Herrington Workmen's Club. Tenders to be sent in not later than July 3, before 5 p.m. complete specifications can be seen, and copies taken any day at the club premises, East Terrace, New Herrington, Fence Houses, Mr. Wm. Hill, Secretary.

JUNE 3.—Penlyta.—RESIDENCE.—A residence at Penlyta, Alverton. Plans and specifications may be seen at office of Mr. J. A. James, architect, Port Talbot. Tenders to be delivered not later than July 3.

JUNE 3.—Stockport.—CAR SHED EXTENSION, ETC.—Stockport Tramways Committee invite tenders for the masonry and joiner's labor and materials required in the erection of car shed extension and river retaining wall at Messy-square, Stockport. Plans, sections, specifications, and conditions may be seen, and forms of tender obtained, on application to the Borough Surveyor, St. Peter's-cum-Stockport, on payment of 1s. Tenders, addressed "The Town Clerk, Stockport," sealed and endorsed "Tender for Car Shed Extension," to be left at his office at or before noon on July 3.

JUNE 3.—Wakefield.—ROOMS.—The West Riding General Purposes Committee invite tenders for works in connexion with the erection of two rooms at the County Hall, Wakefield. For bills of quantities and further particulars apply to office of Mr. G. Vickers Edwards, County Architect, County Hall, Wakefield. A deposit of 1l. is required. Cheques, etc., to be sent to the West Riding Treasurer. Sealed tenders, properly endorsed, to be sent to the Architect not later than 10.30 on the morning of July 3.

JUNE 4.—Holmfirth.—REBUILDING MILL.—The mason's, bricklayer's, joiner's, plumber's, ironfounder's, carpenter's, and slater's works required in the rebuilding of Ford Mill, Holmfirth, for Messrs. J. & J. Baldwin & Partners, Ltd., Wood and Butri's branch. The drawings and specifications may be seen, and bills and quantities obtained, at Ford Mill, Holmfirth, between 10 a.m. and 5 p.m. on June 29, and at the offices of Mr. Fredk. W. Ridgway, F.R.I.B.A., architect, surveyor, and valuer, 11, Union-street, Dewsbury. Sealed and endorsed tenders must be delivered to architect on July 4, not later than 12 o'clock noon.

JUNE 4.—Monmouth.—CHURCH BUILDINGS.—The Trustees of the Baptist Church, Monmouth, invite tenders for the erection of their new buildings. The drawings and specifications can be inspected on application to Mr. Sambrook, or at the office of Mr. B. Lawrence, architect, Newport, from whom bills of quantities can be obtained on the deposit of 1s. 1s. The tenders are to be sent in under cover to Mr. Sambrook, Monmouth by July 4.

JUNE 4.—Newcastle-on-Tyne.—RAILWAY STATION BUILDINGS.—North-Eastern Railway Directors invite tenders for works in connexion with buildings and

platform roofing at Newcastle Central Station. Plans and specification may be seen, and quantities and further information obtained, on application to Mr. William Bell, the company's architect, Central Station, Newcastle-on-Tyne. Quantities supplied on personal application to parties tendering for the whole of the works, sealed tenders, marked "Additions, Central Station, Newcastle," to be sent to the Secretary at York not later than noon on July 4.

JUNE 4.—York.—HOUSES.—Dwelling-houses on Poppleton-road. Sealed and endorsed tenders to be sent in to Mr. George H. Pegg, architect and surveyor, 23, Spurr-street, York, not later than July 4.

JUNE 5.—Bately.—HOSPITAL.—Extension.—District Hospital Committee invite tenders for extension of hospital. Specifications and bills of quantities ready on July 5. Apply to Mr. Walter Hamstock, Son, architect, Bately.

JUNE 5.—Bingley.—WASHHOUSE.—A washhouse at Bingley. Plans can be seen, and quantities obtained, on application to Messrs. Samuel Jackson & Son, Tannery-chambers, Bradford, on June 30, until July 5.

JUNE 5.—Devonport.—ADMINISTRATIVE BUILDING.—Devonport Corporation invite tenders for the erection of a new administrative building at the Infectious Diseases Hospital, near North Prospect. Plans, specifications, and conditions may be seen, and forms of tender and quantities obtained on application to the Borough Surveyor, 29, Ker-street, Devonport, to whom tenders must be delivered, properly endorsed, on or before 10 a.m. on July 5. The sum of 1l. 1s. will be required as a deposit.

JUNE 5.—Fochabers District.—BUILDINGS.—The mason, carpenter, slater, plaster, and painter work of the following buildings, Gordon-Richmond Estates:—(1) New barn at Broadley (tenant, George Newlands); (2) alterations on farm offices at Nelher Dalnally (James Mackay, tenant); (3) alterations on farm offices at Nelher Auchtertyth (John Rose, tenant); (4) alterations on farm offices at Corskie (William Feltes, tenant); (5) new wooden cottage at Fochabers. Plans and specifications may be seen at the Estates Office, Fochabers, and tenders will be received by Mr. D. J. Cunningham, factor, up to 12 o'clock on July 5.

JUNE 5.—Hemlingborough.—SCHOOL.—ALTERATIONS.—East Riding of Yorkshire C.C. Education Committee invite tenders for the carrying out of additions and alterations to the Council School at Hemlingborough. Drawings, specification, and forms of tender on application to the Building Surveyor, County Hall, Beverley, or at the above school during the usual hours. Tenders, endorsed "Hemlingborough," to be forwarded not later than July 5, to Mr. John Bickerseth, Clerk to the East Riding Education Authority, County Hall, Beverley.

JUNE 5.—Hildenborough.—ENGINE-HOUSE.—Tonbridge R.D.C. invite tenders for the erection of an engine-house and pump well, and other works incidental thereto in connexion with Hildenborough Sewerage and Sewage Disposal Works, contract No. 2. Plans and sections can be seen at the office of Mr. Frank Harris, Engineer to the Council, Broadway, Southborough, Tunbridge Wells, from whom specification, conditions, and form of tender can be obtained upon depositing the sum of 1l. 1s. Sealed tenders on the form supplied, endorsed "Tender for Engine House, Contract No. 2," must be delivered at the office of Mr. Neville B. Stone, Clerk to the Council, 23, Church-road, Tunbridge Wells, on or before 4 o'clock on July 5.

Specification may be seen, and form of tender obtained, on application at office of Mr. Arthur E. Collins, M.Inst.C.E., City Engineer, etc., Guildhall, Norwich. Tenders, on the forms supplied, enclosed in an envelope, sealed with sealing wax, endorsed "Creosoted Blocks" or "Jarrah Blocks," as the case may be, and addressed to the Chairman of the Executive Committee, to be delivered at office of Engineer, not later than 3 p.m. on July 2.

July 2.—Rhymney.—ROAD MATERIAL, ETC.—Rhymney U.D.C. invite tenders for the following—No. 1: The hiring of a 10-ton steam roller and scarifier for about 100 days; tenders to supply living van, bagman, notice boards, water-cart, coal, and all stores. No. 2: About 2,000 tons of clean limestone, broken to a gauge of 2 1/2 in., delivered as follows—

Rhymney R.R. Station, about 1,200 tons; Rhymney and M. Station, about 700 tons; Rhymney Bridge and N.W. Station, about 100 tons. Samples to be sent to G. High-street, Rhymney. No. 3: About 200 tons limestone gravel, delivered as follows—Rhymney R.R. Station, about 200 tons; Rhymney B. and M. Station, about 100 tons. No. 4: Half-tone of limestone and gravel per ton. All the above are man (day-work). Tenders on forms to be obtained from Mr. W. Lloyd Marks, Surveyor, G. High-street, Rhymney, sealed, and endorsed "No. 1, 2, 3, 4 or 5" (as the case may be), must be sent or delivered to Mr. L. Reynolds, solicitor, Milborne-chambers, Merthyr Tydfil, not later than 12 noon on July 2.

July 2.—Wakefield.—SETTS AND MACADAM.—The Corporation of Wakefield invite tenders for the supply and delivery at Wakefield of granite or whinstone setts and macadam. Forms of tender and any other information may be obtained from the City Surveyor, Wakefield. Tenders, sealed and properly endorsed, must be sent to Mr. W. W. Greenhalgh, Town Clerk, Town Hall, Wakefield, not later than 9 a.m. on July 2.

July 3.—Halifax.—STORES.—Halifax Gasworks Corporation invite tenders for the supply of (1) brass lump fittings; (2) brass main cocks and unions; (3) cast-iron valves; (4) cast-iron gate valves; (5) cast-iron of iron; (6) sulphuric acid; (7) lime; (8) spent oxide for the purchase of (2) cast-iron valves; (9) spent oxide for the purchase of (2) cast-iron valves; (10) spent oxide for the purchase of (2) cast-iron valves. Forms of tender and further information may be obtained on application to Mr. W. G. Evans, Engineer, Gasworks, Halifax. Tenders, properly endorsed, must be sent to Mr. Keighley Walton, Town Clerk, on or before July 3.

July 3.—London.—STORES.—Bomby, Barohn, and Co. invite tenders for the supply of the following stores, viz.—Class A: (1) Axes for carriage and wagon; (2) boiler plates; (3) brass boiler fittings; (4) crank arms; (5) spiral and valve castings; (6) cast-iron for carriages and waggon; (7) wheels for carriages and waggon; Class B: (1) Carriage fittings; (2) copper plates; (3) iron and steel; (4) iron and steel; (5) iron and steel; (6) iron and steel; (7) iron and steel; (8) iron and steel; (9) iron and steel; (10) iron and steel. Tenders must be made on forms, copies of which, with specification, can be obtained at the office of Mr. W. V. Constable, Office Secretary, of the Gas Company, Bishopsgate-street Without, London, E.C., on payment as follows—For Class A, 1s. 1d. each; for Class B, 10s. 1d. each; for Class C, 2s. 6d. each (which will not be returned).

July 4.—London.—GRANITE.—Lambeth Board of Health invite tenders for the supply of 200 tons of waste granite, broken into pieces of 1/2 yd. or 3/4 yd. square, for use in breaking, to be delivered at their show-yard, 8, Wincob-street, Kennington-road, S.E., having first obtained the sanction of the contractor at the weigh-bridge of the workhouse in Kenton-road. Tenders, with bills of quantities, and forms of tender, and full specification, including name of quarry, to be sent to Mr. W. Thornall, Clerk, Guardians' Board, 11, Abchurch-lane, London, E.C. 4. Sealed tenders, addressed to the Chairman of the Board, must be delivered at the office of Mr. W. Thornall, Clerk, Guardians' Board, 11, Abchurch-lane, London, E.C. 4, before July 3.

July 5.—Salford.—STORES.—Salford Gas Company invite tenders for the following material, in twelve months ending August 31, 1907:—(1) Gas valves; (2) iron and steel; (3) cast-iron valves and connections; (4) iron castings; (5) iron and steel; (6) iron and steel; (7) iron and steel; (8) iron and steel; (9) iron and steel; (10) iron and steel; (11) iron and steel; (12) iron and steel; (13) iron and steel; (14) iron and steel; (15) iron and steel; (16) iron and steel; (17) iron and steel; (18) iron and steel; (19) iron and steel; (20) iron and steel. Tenders, with bills of quantities, and forms of tender, and full specification, including name of quarry, to be sent to Mr. W. Thornall, Clerk, Guardians' Board, 11, Abchurch-lane, London, E.C. 4, before July 3.

July 9.—London.—STORES.—The Madras Railway Company invite, until 12 o'clock on July 9, tenders for the supply and delivery, free on board of white metal, copper, tool steel, twist drills, screw stocks, pins and cotter, bolts and nuts, carriage door locks, and screw taps, tube expanders, circular saws, steel and window catches, hinges, commode stools, hammock springs, engine lamps, engine packing, horseshoe, buffalo hoes, belting, rubber hose, floorcloth, brushes, plate-glass, fire engine tubes, and transfers, as per specification, to be seen at the Company's office. Tenders to be delivered in sealed envelopes (supplied by the Company), a check (which cannot be refunded) for 10s. to be sent to Mr. W. H. Cole, Secretary, 1, Broad-street-place, Finsbury-circus, London, E.C.

July 10.—Romsey.—FLINTS.—Romsey Corporation invite tenders for the supply (including field flints, and weighing of 250 tons of hand-picked flint) to be delivered at the Fair Field, Romsey, before September 1 next. Sealed tenders, endorsed on the outside with the words "Flints," to be sent to the office of Mr. B. W. Atline, Town Clerk, 2, Porters-gate, Romsey, before 5 o'clock p.m. on July 10, and must be for lots of not less than 100 tons. Specification and conditions can be seen at the office of the Borough Surveyor, Market-place, Romsey.

July 12.—Brighton.—DRAIN PIPES.—Tenders are invited for the supply of such glazed earthenware pipes as may be required by the Brighton Corporation for the year ending July 31, 1907. Specification and form of tender can be obtained at the office of the Borough Engineer, Town Hall, Brighton, and addressed to the Town Clerk, Town Hall, Brighton, and endorsed "Tender for Supply of Drain Pipes," to be delivered before 10 a.m. July 12.

July 12.—East Barnet.—GRANITE, ETC.—East Barnet Valley U.D.C. invite tenders for the under-mentioned for one year, ending September 30, 1907:

Supply of broken granite for roadways; supply of gravel for roadways; supply of hoggins; horsing of water tubs, etc.; general cartage; cartage of granite, gravel, hoggins, etc. Further particulars and forms of tender can be obtained on application to Mr. Henry York, C.E., Surveyor to the Council. Tenders, which must be on the forms supplied, must be sent in, addressed to the Chairman of the Council, not later than 12 noon on July 12.

July 15.—**Epping**.—GRANITE AND GRAVEL.—Epping, U.D.C. invite tenders for the supply and delivery of (1) 120 tons of granite (more or less), broken so as to pass in any direction through a 1½-in. ring, and 450 tons of well-scriven gravel, to be delivered at Epping Railway station in such quantities and at such times prior to March 31, 1907, as may be ordered by the Surveyor. Samples of material to

accompany each tender, and the tender is to state the rate per ton of the material. Tenders, endorsed "Tender for Highway Material," to be delivered to Mr. G. J. Creed, Clerk of the Council, Epping, not later than 4 p.m. on July 16.

July 15.—**Leeds**.—PITCH.—Leeds Electricity Committee invite tenders for 150 tons of coal tar pitch, to be delivered in carts in such parts of the city of Leeds, and at such times, as the committee may require, during the twelve months ending July 31, 1907. Conditions and forms of tender may be obtained at the office of the Electric Lighting Department, 1, Whitehall-road, Leeds. Tenders must be in the form provided, and must reach Mr. Robert E. Fox, Town Clerk, Leeds, on or before July 16, in sealed envelopes, endorsed "Electric Lighting—Tenders for Pitch."

July 17.—**Rochester**.—ROAD METAL.—Rochester Corporation invite tenders for the supply of the undermentioned for the period of twelve months ending June 24, 1907, viz.:—(1) 1,500 tons 2-in. broken Quenast, Guernsey, or Aberdeen granite; (2) 40 tons 1½-in. broken Cherbourg quartzite; (3) 350 tons 3-in. granite chippings; (4) 350 tons ¾-in. granite chippings; (5) 500 tons 2½-in. broken Kentish sandstone; (6) 150 cubic yds. Aylesford sand; (7) 150 cubic yds. Aylesford gravel; (8) 500 cubic yds. Thames ballast. Specifications and form of tender can be obtained on application to Mr. William Banks, A.M.I.C.E., City Surveyor, Rochester. Sealed tenders, endorsed "Tender for Road Metal," are to be delivered at offices of Mr. Apsley Kennette, Town Clerk, Guildhall, Rochester, before 4 o'clock on July 17.

PATENTS.—Continued from page 738.

4,106 of 1906.—J. K. WINDEMULLER: *Ball and Socket Joints for Pipes.*

This relates to a ball and socket joint for pipes comprising a ring bearing against the ball, which extends through an annular nut screwed into the fixed portion of the joint, the arrangement being such that when the nut is tightened the packing material situated in the stuffing chamber is compressed, but the ring is not acted upon.

5,522 of 1906.—A. FRIEDERICH: *A Fastening Device for Doors and the like.*

This consists of a fastening device for doors and the like, comprising two rigid portions that are hinged together, the former of which is adapted to be attached to the door frame, adjacent to the edge of the door, whilst the latter is provided with a pivoted latch that is adapted to engage with the former part and thereby lock the two parts together at right angles to each other, and thus prevent the opening of the door.

5,976 of 1906.—H. E. PRATORIUS: *Flush Bolts.*

This consists of a safety flush bolt in which the lower end of the bolt is held in an inclined guide on the frame plate, in such a manner that on rearward movement or withdrawal of the handle the latter is caused to project from the frame plate.

17,776 of 1905.—A. TRACY: *Apparatus for Making and Forming Cavity Bricks or Blocks of any Plastic or Semi-plastic Material to Enable the last Side or End to be Formed and the Cavity left Perfect.*

This relates to an apparatus for making and forming cavity bricks or blocks of any plastic or semi-plastic material to enable the last side or end to be formed and the cavity left perfect, and consists of a pair of comblike interlocking bridges so constructed that separately they are made up of strips, and together they form a single perfect and complete table or surface. These comb-like bridges are placed on either side or on either end of the box or die that is used for forming the brick or block, and suitable spaces are cut out of the sides or ends of this die to enable the bridges to pass through and across the cavity that has been formed in the material used to make the bricks or blocks.

19,588 of 1905.—A. H. MOUNTAIN: *Gully Top for Drains.*

This consists of a gully top for house drains, having a grid formed with a number of parallel bars of approximately triangular or wedge-shaped cross-section and cauted with their sharp or knife edges in the direction of the waste or down pipe outlet, thus forming openings which are wider at the top than at the bottom,

23,541 of 1905.—W. E. EASTAUGH: *Stone Dressing Chisel.*

This relates to a chisel for dressing or cutting stone and other material, having a detachable and reversible cutter of a diamond or double wedge formation, said cutter having depressions and projections on the sides thereof, and adapted to fit into a handle having corresponding depressions and projections.

7,883 of 1906.—N. KETELSEN: *Manufacture of Drain Pipes.*

This relates to a machine for the production of drain pipes, comprising a mould for forming the lower half of the drain pipes, a hand-actuated ledge for forming the upper half of the drain pipe, and means for raising the finished drain pipes above the mould.

TERMS OF SUBSCRIPTION.

Text detailing subscription terms for 'The Builder' magazine, including rates for London and other regions.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses. Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the Editor, who retains the right to reject it if unsatisfactory.

All communications regarding literary and artistic matters should be addressed to THE EDITOR, and not to the Publisher. Business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

Communications for insertion under this heading should be addressed to 'The Editor,' and must reach us not later than 10 a.m. on Thursdays. (N.B.—We cannot publish tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is stated, nor any list in which the lowest tender is under 1000, unless in some exceptional cases and for special reasons.)
