Xc.

JAN. & JUNE
1906

THE BUILDER

AN : ILLUSTRATED : WEEKLY
MAGAZINE : FOR : THE
ARCHITECT : ENGINEER : ARCHÆ-
OLOGIST : CONSTRUCTOR : SANI-
TARY-REFORMER : & : ART-LOVER

CONDUCTED BY

H. H. STATHAM,

FELLOW OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

“EVERY man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruit, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kind of private princedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned.”

“Architecture can want no commendation, where there are noble men, or noble mindes.”—SIR HENRY WOTTON.

“OUR English word To BUILD is the Anglo-Saxon Bylsan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places.”—DIVERSTONS OF PURLEY.

“ALWAYS be ready to speak your mind, and a base man will avoid you.”—WILLIAM BLAKE.

English Gothic Architecture.

Y a curious but not unnatural inversion of the right order of things, the practice of Gothic architecture in this country as a revived style has preceded the adequate study and comprehension of this great and splendid phase of the art. It is not easy to say whether the earlier textbooks, such as Rickman's, were more the cause or the consequence of the newly-awakened appreciation which led to the Gothic revival in this country. But it is quite certain that neither that work

nor its immediate successors really went to the root of Gothic architecture. They tabulated external features, they created a nomenclature, and they formed a chronological system correct in its main outlines, but too precise and symmetrical in its conventional divisions to square with the living facts. Upon these bases, however, the revival arose and has run its course; and now that the practice of "modern Gothic" has died out except in its partial employment for churches—for even from that ecclesiastical stronghold it is getting daily unseated, we are beginning at last to rightly study and understand the meaning of that which, in regard to imitation of its forms at least, we are abandoning. And the position is empha-

sised by the publication, at this eleventh hour, of what may fairly be called the fullest and most complete illustrated treatise on the subject which has yet appeared,* the work not of an architect but of an amateur, who, with an educated comprehension of architecture, has for several years devoted to the study and illustration of his subject an amount of time and labour which no architect in practice could have spared for such an object.

Even if it were accepted that the practice of revived Gothic was to be abandoned and was a thing of the past,

* "Gothic Architecture in England"; an analysis of the origin and development of English Church architecture from the Norman Conquest to the Dissolution of the Monasteries. By Francis Bond, M.A., Lincoln College, Oxford; Hon. Associate R.I.B.A., London: B. T. Batford, 1905.

the study of the subject is of equal interest, even from a national point of view. As Mr. Bond truly says in his Introduction, "Of all the artistic achievements of the English race, two make unchallenged claim to pre-eminence: our imaginative literature and our mediæval architecture." And when we consider that nearly all French writers on mediæval architecture are ignorant of or indifferent to English architecture, and that American writers on the subject chiefly refer to English Gothic to belittle it and to represent French as the only Gothic worth attention, a work dealing fully and ably with our national architecture, by an author who has given proofs also of his extensive acquaintance with Continental Gothic, is the more to be welcomed.

Mr. Bond professes that his book is an attempt "not to classify, but to work out processes of development," to treat the subject by an evolutionary method. "English mediæval architecture has been presented too often as a sort of architectural Melchizedek, or as if it had sprung forth full-grown like some Pallas from the teeny head of Zeus, in the last half of the XIIIth century, in Caen or Canterbury. But the Norman offshoot of the great Romanesque stock had its roots in a distant past. Its history goes back to the earliest days of church building in newly Christianised Rome, to the first years of the IVth century. . . .

Throughout the book, therefore, reference has been made, where reasonable evidence exists, to the origin and history of mediæval architecture not only in our own country but throughout Gaul, Germany, and Italy in the Dark Ages." And so the author proceeds to an analysis as to what is Gothic. It is not necessarily pointed arches (as we have all come to see now). After mentioning various definitions into which we have not space to go, he ends by coming pretty nearly to the definition that it is the architecture of the buttress. In regard to its most complete forms it might be said to be architecture of the vault and buttress, which however would exclude some buildings, not vaulted, that are unquestionably Gothic. The universal element in Gothic is after all the buttress. But it may be replied that the buttress, although found in connexion with timber-roofed buildings, was first developed from the necessity for resisting the thrust of the vault at certain points; the vault is the *causa causans*; and even some of the existing unvaulted buildings were obviously intended to have been vaulted had not either the courage or the purse of the builders failed them. Mr. Bond goes on to point out that Anglo-Norman Romanesque represents a class of buildings which have or may have vaulted roofs, but in which the thrust of the vaults is stopped by general thickness of walls, not by buttresses. This affords a good distinction between Romanesque and Gothic, though even here, as the author implies, the line cannot be drawn exactly; the elements of Romanesque melt almost insensibly into those of Gothic. But the suggestion he makes as to the importance of the buttress as the distinctive element in Gothic is a good one. That dividing up of the walls into separate masses

placed at right angles to the axis of the building is the most essential structural distinction from the classic structure which treats the wall as a single mass parallel with the axis of the building. It is a process of resisting outward thrust instead of supporting vertical weight; and the treatment of the wall so as to express this function is of the essence of Gothic design. As long as the thickening of the wall at the required point retains the vertical lines and more or less of the suggestion of the pilaster, the character remains Romanesque; as soon as it is designed so as to express the function of leaning inward against an outward thrust, the true Gothic character is developed.

The plan adopted by the author for dealing with the whole complicated subject has been to divide his book into two main parts, of which the first, after the Introduction and a chapter on Definitions of Basilican Byzantine Romanesque and Gothic architecture, consists of a summary of the characteristics of English Romanesque and Gothic architecture according to chronological periods, which are divided thus:—1050—c. 1200; c. 1170—c. 1538; c. 1170—c. 1350; c. 1330—c. 1538; adding a chapter on "Chronological History of the Greater English Churches." The second and by far the largest part of the book is occupied with an analysis of the mediæval church architecture of England, in which separate elements—plan, supports, arches, vaulting, capitals, window-tracery, etc., etc., are each considered separately and in detail. The arrangement is a good one; we consider the subject first in its general aspect, secondly in its details. The last chapter of the Second Part consists of one of the most valuable items in the book, viz., a large selection of Gothic mouldings grouped in regard to the several portions of the building, in each of which the characteristic mouldings are arranged in chronological order, and (which is a very important merit) all are drawn to the same scale.

In considering the contents of so large a book (707 pages, besides the excellent and copious indexes), one can only undertake to deal with some special points, more particularly those in regard to which any special or new suggestion is made.

One point to which the author draws attention in the general summary is the great size of many of the early Norman churches of England, far surpassing the very largest of the mother country Normandy, and rarely equalled in the later days of complete Gothic architecture. The width of the Norman churches, he observes, was conditioned only by the length of the tie-beams by which they were spanned; but in remarking that this average width was not exceeded when stone vaulting was introduced, one may observe that it was not likely that it would be. It must have been felt, in those days of simple engineering science, that the vaulting of a roof with stone was a more difficult and risky undertaking than putting on a timber roof, which (in the form used in the Norman period) exercised little or no thrust on the walls; and the existence of churches in which the aisles are

vaulted in stone and the nave roofed with timber is an additional proof of this. If they had felt equal to facing the problem of vaults of 50 ft. span or upwards it would probably have been done; but at York, which is 45 ft., only a wooden groining was ventured on. But the fact of the great comparative scale of the Anglo-Norman churches has been rather overlooked, and is significant. May we not say that it was one of the indirect architectural results of the Conquest; a great military success nearly always leads to a greater expansion and boldness in architectural development, and more particularly when the conquerors left a province to gain a kingdom. Architecture also was to be carried out in the new kingdom on a scale worthy of the event. A remark on the same page however we must take exception to. After observing that, once the plan settled—mainly by considerations of ritual—the first object was to consider the roofing, the author goes on—"and a secondary object, insisted upon with astonishing persistence in the middle ages, was that the church, if large, should be fire-proofed by building beneath the roof a stone ceiling or vault." Surely this is putting the cart before the horse. We should rather say that the stone vault was the essential thing, and the timber roof over it a protection from the weather; and surely we may ascribe the preference for stone vaults to something higher than the merely utilitarian motive of fire-proofing. Is it to be supposed that the mediæval architects had no perception of the superior monumental effect of a building roofed with the same solid material as the walls? Men who could imagine and carry out such buildings were surely not devoid of that degree of æsthetic perception. In the course of his interesting and useful summary of the practical conditions of mediæval building the author is probably right in his suggestion that the very inefficient foundations often found—and which wreaked vengeance upon the builders—were not so much the result of ignorance or indifference as of economy, as we occasionally find very great care taken in the provision of adequate foundations. In some cases we may imagine that it was not merely economy of labour but of time; in the case of Peterborough front, for instance, there is every reason to imagine that the grand design was run up in a hurry to cut out Ely. Mr. Bond notes, too, the serious consequences sometimes resulting from the thrust of the aisle vault both against the outer wall and the arcade. It has been noted, he observes, by Sir Christopher Wren (he does not cite the passage) "that the pier arcade has not infrequently received a considerable inclination *inwards*, owing to the thrust of the aisle vault"; a distortion which the commonsense of Wren attributed to its true origin and not to what doctrinaire theorists call a "refinement." In regard to the theory that the sections of Gothic churches were proportioned according to the ratio of the sides of some adopted triangle, Mr. Bond is (like ourselves) entirely sceptical; as he says, "no two of these theories agree, nor are they based on uniform systems of measurement." In

regard however to the effect of the relation between breadth and height, he draws attention to an important point; that the width of the bays in comparison with their height has something to do with it, as well as the width of the cross section of the church. In the naves of Lichfield and Wells the height is only twice the span, yet they do not look low, as do the naves of Exeter and Lincoln, the section of which is about in the same proportion. The explanation suggested is that in the former cases the bays are narrower in proportion, and consequently impart an appearance of height to the whole. The mere incident of the vaulting shaft springing from the floor, or only from a corbel above the springing of the arcade, has also a considerable influence on apparent height, the former arrangement emphasising the vertical line.

Under the head of "abutment" Mr. Bond distinguishes five different systems for the abutment to the nave vault: (1) flying buttresses concealed beneath the aisle roof; (2) flying buttresses just showing above the triforium roof, no part of the architectural effect, but merely a constructive expedient; (3) similar merely constructional flying buttresses, as at Boxgrove, showing visibly in the air, but with a second similar buttress just beneath the triforium roof; here we have the double flying buttress in existence, but not forming a visible factor in the architectural design; (4) all abutment beneath the triforium roof abandoned, and a single flying buttress, as at Exeter, architecturally treated and soaring high above the aisle roof; (5) the visible double flying buttress architecturally treated, as at Westminster, but essentially a French feature, little used in England, where naves did not soar so high as in France. It is an eminently picturesque feature, but whether it is so admirable from a merely architectural point of view may be questioned. Its appearance round the east end of *Nôtre Dame* has tempted many a sketcher and etcher—notably *Meryon*; but after all, it is a little too much like a building propped up with stone scaffolding, indicating a want of repose and a sense of risky construction which does not belong to the best elements of architecture. This analysis of the arrangement of flying buttresses is, however, a good point in Mr. Bond's book, and we do not remember that we have seen it attempted before. We may notice also the remarks in regard to the proportion of clearstory window to wall, as an important point in regard to the skeleton structure of the building; the author remarking how, when it comes to such a proportion as in Westminster, where the window occupies 10 ft. of the width of a bay of 18 ft., and to the even larger proportion of window to wall in many French examples, the upper portion of the wall becomes no longer a wall so much as a pier, the whole masonic structure from base to roof becoming at this point in reality a very narrow and lofty pier, far too lofty in proportion to its width to stand safely alone, but propped up between the vault inside, the flying buttress outside, and the arches of the clearstory windows on right and left;

a method of considering the subject which intensifies our conception of Gothic architecture as an architecture of balance of pressures. Yet one may be allowed to question whether such a method of construction is really so impressive or so truly architectural as that of the heavier wall masses and smaller openings of the great Romanesque churches. The tendency to continually enlarge the window-spaces and reduce the piers has been commonly attributed to the growing passion for stained glass; this was the use made of it, no doubt, but we are more disposed to think that the predominant motive was a kind of pride in daring construction, an endeavour to try how far one could go with safety, and especially to outdo some rival builders; for there can be little doubt that rivalry was a prominent factor in the erection of cathedrals. The filling up of the wide window-spaces entirely with stained glass of a rich colour and thick consistency, besides being a decorative object in itself, no doubt had the effect, as Mr. Bond suggests, of masking the tenuity of the masonry structure and giving the eye broad surfaces to rest on; hence the exceedingly detrimental effect of the removal of the stained glass, and ultimate substitution of transparent white glass, in these later large-windowed churches: the voids become too apparent.

Passing over many points of interest which are suggested, we may conclude the present article with some remarks on the interesting problem of the west front and its architectural treatment. Here again Mr. Bond looks at the subject from a rather novel point of view. When a civic building, he observes, such as the Cloth Hall of Ypres, 440 ft. in length, was designed, no one dreamed of making one end of it the principal façade; yet this was what a church architect, for ritualistic reasons, was everywhere compelled to do. The French system was to mask it with twin towers with a partial screen between them to hide the termination of the nave roof. This was the more a natural system for the French to employ, because, partly on account of the great height to which they carried their nave and the crossing arches, they had little opportunity for employing that finest feature of the English cathedral, the central tower at the crossing, and in complete Gothic their predominant towers were always the western ones. York is the only English cathedral since the Romanesque period which frankly adopts the French system of the west front (unless we count Westminster among the cathedrals in an architectural sense), and even at York there is a massive central tower, which however does not dominate the composition, though it might have done so had the spire, which was probably intended, ever been carried out. Canterbury and Lichfield have their complete western towers, but not only are they quite secondary to the central tower, but they do not mask the nave roof, which shows its gable between them, making an awkward and broken-up line of front. York shows the gable indeed, but as it is at a flatter pitch it does not cut so awkwardly into the composition. But it is the only English

cathedral front which can be compared with *Nôtre Dame*, as being distinctly of the same type. Mr. Bond's view of the problem is that as it was impossible to give to the front breadth enough to enable it to dominate, as a façade, a building of which the transepts would project to a far greater width, the "adequate solution" was to give the façade in height what it could not have in breadth. But this consideration seems to us to be only one-half of the matter. It was not only that the west end was narrow in comparison with the whole size of the building, but that the section of nave and aisles, with sloping roofs and lower at the sides than in the centre, gives a form which could never be architecturally impressive in elevation, however well it might work in section. Whatever may be said in favour of the simplicity and architectural honesty of such a treatment, none of the English west fronts which are content with simply showing the end of nave and aisles, with some turreted buttresses to carry off its flatness, can be regarded as anything but failures, having regard to their position. Such a section requires to be masked to make anything like an effective façade. The French tower system is one way of doing it; the screen system, as at Lincoln and Peterborough, is another. The dual tower system is the more effective in itself; the screen system has the advantage that it leaves the central tower the dominant feature, which in the English cathedrals is a distinct advantage, inasmuch as their lower proportions of height not only admit but seem to demand the central tower. The Lincoln screen is rather barbaric in its early detail, but fine in general effect; the defect is that the towers of which the upper portion is seen above it do not seem to belong to it, and are not seen down to the ground. This is also the case with the less important towers at Peterborough, but to say, as the author does, that "they rise in an inexplicable fashion in the rear of the façade" is hardly the right way to put it; that is the case with Lincoln, but at Peterborough the façade was deliberately put in front of them, after they had at all events been founded and commenced. Our main point is, however, that there can be no doubt that in front of a nave and aisle section a screen, either of towers or of another kind, is necessary if anything worth calling a façade is to be established; and that the cathedrals where no such attempt has been made are the best proof of this.

We must defer to another article a consideration of some portions of the Second Part of Mr. Bond's book; merely observing that it is a book which every student of architecture, professional or amateur, ought to have.

AUSTRIAN GOVERNMENT EXHIBITION. — The Gewerbe Verein of Vienna will co-operate with the executive committee of the Austrian Government Exhibition, which will be held at Earl's-court next year, under the promotion and subvention of the Austrian Government. The exhibits will include specimens of the arts and crafts, and examples of the various industries, including the smaller domestic industries of Salzburg, Tyrol, Bohemia, Galicia, and Dalmatia, and illustrations of Austrian scenery. Some of the State establishments, such as the Imperial Mint and the Government printing works, will be represented, and a "Tyrolese village" is to be constructed in the grounds.

SS. SERGIUS AND BACCHUS,
CONSTANTINOPLE.

By Mr. ARTHUR E. HENDERSON.

THE church of SS. Sergius and Bacchus is one of those buildings which sets us wondering how it was planned. After the architect had grasped all the ritual requirements of the ecclesiastics he has handed down to us a beautiful and interesting example of Byzantine art. It looks as though after he had settled in his mind, roughly, what his ground plan should be, he designed from the dome downwards. This church is not a basilica, but it is designed on the principle of the central area, and, although the superstructure is carried by eight piers united by semi-circular arches—one left open for the sanctuary, three backed by arching, and the remaining four angle bays backed by semi-circular semi-domes (these united form an octagon)—yet the plan has a square appearance (see lithograph), the exedrae encircling the four corners. This octagon is by no means regular, as will be obvious in the plan of the gynæceum on the same sheet; each bay varies somewhat,

and the eastern is much wider, as it contains the sanctuary, and, of necessity, pushes out the piers of the north-east and south-east bays (exedrae); also, in consequence, the length from east to west is greater than from north to south. It is with the dome the greatest interest lies. By looking at the plan taken at the base of the dome it will be seen, although it stands clearly upon an octagonal bed, that it is divided into sixteen compartments, without the expedient of pendentives. This clever arrangement can be studied also in the plate showing the constructive sections. On looking at the transverse section and comparing it with the plan at the base of the dome (on the same sheet), it will be seen that the dome has sixteen groins, which really are the strength of the dome; their curve is somewhat peculiar, for, although the height of the dome is half the diameter, the sweep is by no means a semi-circle, and from the bed to above the window-heads the radii are greater than half the diameter, but the centres are at springing level. About 5 ft. above this the curves are quick, and again, above, very long

radii are taken, with centres considerably below the springing level.

It is impossible to say positively whether the beading to the groins is in stone or plaster, but from appearance one would say the latter. Fig. 1 shows the springing of the dome in the brickwork, as it would appear were the plaster entirely removed. Naturally the groins would meet in a point at the apex, but this is obviated by arching them into one another, leaving a saucer-shaped crown in the interior (see the section); and externally (Fig. 2) the Turks have built a large ornamental finial, making it impossible to say how the dome was originally capped.

Eight of the compartments (those over the arches) rest flush with the inner face of the octagon, without a moulding marking their commencement. The webs, if they may be so called, rise on both sides of the windows, easing into a domical curve, and above the window arches they have a common radius in the centre of the dome. Interest lies chiefly in the remaining eight compartments, or those over the piers. They are deeply segmented, or scolloped; the centres of the radii are formed by having three points given, viz.—the groins on either hand and the angle of the octagon in the centre.

With these three points, for each compartment the radius is given and an arc turned, giving the concavity required for each web at its springing. Naturally a small segmental ledge is formed between the groin and angle of octagon, two to each compartment. As the webs rise they are still kept very scolloped, and show externally (Fig. 2) as pear-shaped excrescences, making the other compartments look as though they were concave on the exterior and consequently dangerous. The external weighting and buttressing to the dome is shown on the geometrical and constructive sections, and on Fig. 2. It will be seen that a wall is carried up to about half the height of the dome and filled in to act as counterpoise to the thrust at the haunch of the dome. Each of the sixteen compartments has a square external face; eight resting upon arches, and containing the windows, are the same thickness as the main arches. The other eight faces are the same thickness; they rest upon the piers, but the webs cut somewhat into them. The whole of the wall, with its sixteen faces surrounding the dome, is further thickened on three sides by the walls carried by the gynæceum arcades and semi-domes of the exedrae, but they rise only to the height of the springing of the dome windows; and on these a small buttress rises in the centre to the whole height of the wall. The buttressing does not end even here, for further buttresses are built against these thickened walls—they run down and rest upon arches built in the massive barrel vault of the gynæceum. Those north and south transmit the thrust to the external walls. At the east

Fig. 1.

the sanctuary walls act as buttresses, and to the west the arches first span the aisle, and with a second span they reach the external wall of the upper narthex. These arches are well bound in by iron tie beams, which look to be original.

Other buttresses come down these piers and rest partly upon the semi-domes of the exedra, but principally on the substantial barrel vault, which carries the thrust over the gynaeceum to the corners of the church, which are specially massive, and small alcoves are cut out of them.

The Greek ritual and church customs are entirely different from the Latin, and necessitate a totally different plan. In the East women are not permitted the use of the nave during service, but are placed in galleries above the aisles and at the west end—even there they may only look through lattices. The planning of SS. Sergius and Bacchus is exceptionally good in respect to its spacious gallery, for, although the screen crossed under the triumphal arch, it could be seen from nearly all points, and, as most of the service was conducted in a low enclosure outside the screen by the monks and choir, all present near the front of the gallery were able to see and hear. The exedrae at the corners, besides giving a very pleasing contrast to the square bays north, south, and west, help to buttress the dome, give much more frontage to the gallery, and square out the plan. It is a strange anomaly, but the approach to this fine gallery is by a meagre flight of stone steps from the narthex, barely 3 ft. wide, the treads only enough to place one's foot upon, and the risers are as high as 9 in. The south aisle wall is strengthened by two thicknesses of arched walling, erected after one of the numerous earthquakes, very likely soon after the church was built, and probably the one which caused the destruction of the first dome of S. Sophia. The north aisle wall, which acted as a party-wall to the Basilican church of SS. Peter and Paul (now removed and the space occupied by a Turkish graveyard), has numerous arches and bricked-up openings corresponding to the south wall, and the imposts of the buttressing arches, both on gynaeceum and ground levels, now show externally. Much of this wall has been repaired, and it is at present quite impossible to find any indication as to the original appearance of this brother church.

Naturally, the ground plan is on the same lines as the gynaeceum, but of a slightly more massive description—columns are thicker, and piers take the place of the two columns of the upper narthex. It is unfortunate that the execution of Byzantine designs was carried out in such a careless manner, but this does not account for the great variation in the orientation of the central structure with the external walls. At present the only reason which can be suggested is that the external walls are built upon an earlier foundation, therefore the orientation for the outside of the church could not be adapted to the newer orientation of the nave and sanctuary, and it can be seen at a glance, from the plan, that the apse corresponds with the nave

Fig. 2. Sketch of Dome from the Minaret.

and sanctuary, and not with the rest of the exterior. Externally all trace of the monastery to the south has disappeared, as also has the arcaded atrium at the west. The Turks have erected a handsome portico, and added a cloister in front, probably following the old lines of the atrium walls of both churches. The proportions of the interior, unfortunately, have been marred by the Turks placing a joisted and boarded floor upon the pavement, and so covering the bases of the piers and columns, thus stunting the height of the lower arcades, which are at full height too low for our western eyes accustomed to Gothic proportions (see the interior in the plate of Interior Views and Details).

In studying this church one's thoughts turn to San Vitale at Ravenna, a larger church and of more perfect finish, but lacking the variety of design in the nave, so pleasing in SS. Sergius and Bacchus. The proportions of San Vitale are higher and more pleasing when viewed from below, but from the gallery the same extent of nave cannot be seen.

The architectural detail (some of which is shown in the plate of photographs) is very well worth examining, but before describing it it would be well to mention that it is now thickly coated with whitewash, and in some instances to such an extent as to lose the pattern, thus photography does not show the detail to advantage. Classic influence still lingers, but with a much greater freedom than was used when the Church of St. John of the Studium (in the same city) was built, 164 years earlier.

We will look at the details from the ground upwards (see Fig. 3 and photographs). The bases to the columns are Proconnesian marble of uninteresting debased attic form, and the columns are in pairs of Proconnesian Verd antique and red Synnadic marbles, filleted with broad bands top and bottom. The capitals,

of basket form, are exceptionally beautiful. The abaci resemble in shape their Corinthian prototype; the carving of the baskets shows four tiers of interlacing circles on the eight projecting parts, inclosing leaves and a monogram in centre, and, branching from the circles, leaves spring off into the hollows, their points meeting, all being deeply undercut. The neckings are worked with the capitals and enriched by "egg and dart" pointing upwards.

The cymata or impostos of the piers are enriched by a repeating design of two spreading leaves on either side of a flower; it is thought by some that these flowers were bunches of grapes, symbolising the name of the martyred Saint Bacchus; but, as can be clearly seen in the photographs, the grapes would be hanging the wrong way. The heavy entablature of the lower order (see plate of Details, sketch, Fig. 4) is another feature of this church—at one time it completely encircled the nave, but now the portion crossing the sanctuary has perished. The soffit of the architrave is enriched by sunk panels of various patterns, and only in two cases has a six-armed cross been used. The beadings to the facias are enriched by a "rope" design, a debased "head-and-reel," a large, flattish and wide-spreading "egg-and-dart," and above again another "head-and-reel."

The frieze is in two heights, the lower half a semi-circular polyvina, elaborately carved and very deeply undercut, the design being of freely growing and twisting acanthus leaves. At first sight it looks so delightful one can hardly call it a design, but on studying it it is found to be a true recurring pattern. The upper half is occupied by an inscription, the background being sunk from the letters, in honour of the Emperor Justinian, the donor of the church, and Theodora. Fig. 5 represents

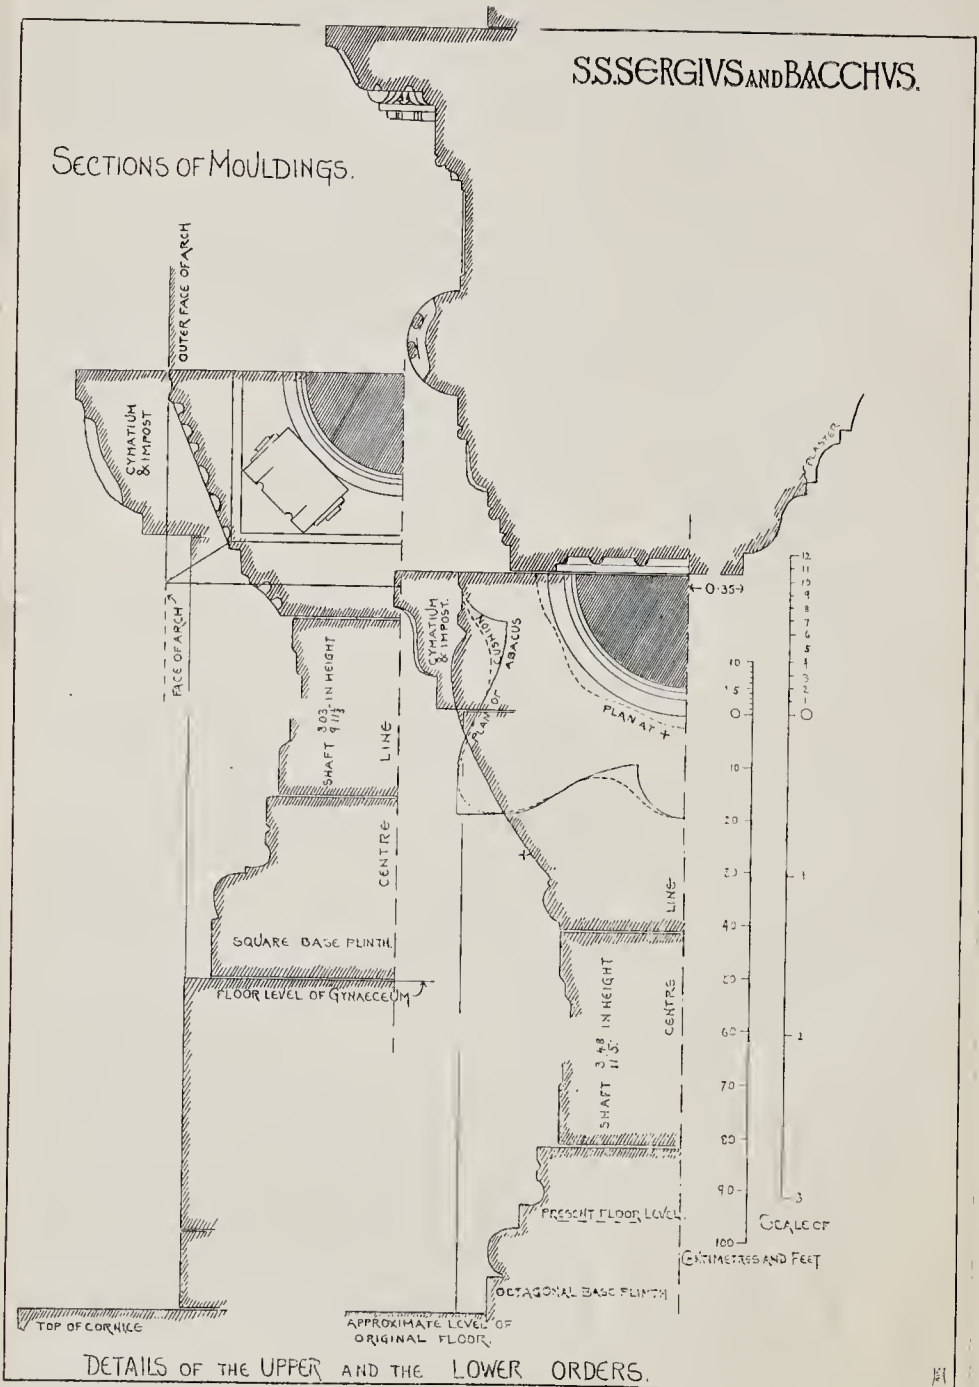

FIG. 3.

the lettering of the inscription as cut on the walls. It reads as follows in cursive Greek:—

Ἄλλοι μὲν βασιλεῖς ἐτιμῶσαντο θανόντας
Ἄνερας ὃν ἀνόητος πόνος ἐν ἡμέτερος δὲ
Ἐδοξέων σκηπτῶχος Ἰουστινιάνος ἀέξων
Σέργιον αἰγλήεντι δόμῳ θεράποντα γερῆρι
Χρίστου παγγενέτω, τὸν ὃν περὸς ἅμας
ἀνάπτων
Οὐ ἔξῳς σιχ' ἐτέρη βασιάνου εἰδράζεν
ἀνάγκη.

Ἄλλὰ θεοῦ τέτληκεν ὑπὲρ χριστοῦ δαμῆναι
Ἄματι κερδαίνων δόμον στίβων. Ἄλλ' ἐν
ποσίῳ

Κοιρανῆν βασιλῆος ἀκοιμήτου φιλῆσοι
Καὶ κράτος ἀξέσησκει θεοστέφους θεοδώρης,
Ἡ νόος εἰσεβῆθι φαιδρῖνται, ἡς πόνος αἰεὶ
Ἀκταίων θρηπῆρες ἀφείδους εἰσιν ἀγάμες.

The following is the translation:—

"Other Kings have honoured the dead, whose labour was in vain; but our Justinian, bearer of the sceptre, increasing in piety, glorifies with this splendid building the servant of Christ, Giver of all life, Sergius, whom neither the kindling breath of fire nor the sword nor any other stress of torment has shaken; but for the sake of Christ, his God, he endured to be slain, winning by his blood a heavenly home. But in all things may he guard the sovereignty of our ever-watchful King, and increase the might of Theodora, crowned of God, whose mind and whose labours are ever bright with piety, and her unsparring efforts are feeders of the poor."

This inscription dates the building of the church soon after the accession of Justinian to the throne, 527.

The cornice commences with small dentils, above which is "bead-and-reel," and consoles project from the fascia above, with leaves carved upon their soffits; a bed mould of "egg-and-dart" surmounts the fascia, and runs round the consoles supporting the cyma, the soffit of which is ornamented with leaves, and its face with intertwining acanthus leaves. The whole entablature presents an overloaded appearance, but contrasts greatly with the simplicity of the other portions of the church.

Rising to the gynæceum level, we find it is about 20 ft. above the ground and, strangely, 2 ft. above the cornice below. Here, again, the bases require no special remark, neither do the columns, which are considerably less in size than those below, but the capitals are well worthy of note.

I am of opinion that Byzantine Constantinople was strongly influenced by the architecture of Ionia and its neighbouring provinces—Ephesus, Miletus, Tralles, and Hierapolis, with other prosperous cities—all erecting handsome buildings during this period, and we know that the architects for S. Sophia were natives of Tralles and Miletus. Looking at the capitals shown in the Plate we still see vestiges of Ionic volutes, but they are merely ornamental angle brackets to square dossierets above—this dossieret device allowed a column of small diameter to carry the springings of wide stone or brick arches above. In San Vitale the expedient of placing a simple capital above the rightful one is only a makeshift. The carving on the dossierets is a free form of acanthus, only the front faces being undercut, and each carries a monogram of Justinian worked in the centre of the design. The upper cymatium is enriched by upright flutings.

Six columns have, as yet, been unnoticed; two are in the south aisle (see one in Plate of Details), having a wide

fillet worked on both sides of the bases, columns, and capitals, showing a framework of stone or wood was affixed to them. At one time, evidently, here was the approach to the monastery. The capitals are of simple Byzantine shape with monograms worked in a very free treatment of stems and leaves. Above these columns stand another two in the gynæceum, of poor design, which seem to have been brought from elsewhere and adapted to their positions; the one capital to the west is debased Ionic with dossieret, a cross being carved upon it, and the other is of basket form, with roundels carved on the faces.

The remaining two columns connect the western aisle of the gynæceum with the upper narthex (see Plate of Details), and are of similar pattern, but stouter, to those of the gallery. There is a strange lack of the cross in all the carving of the church. Dedication crosses were inlaid into the columns, certainly, otherwise, except in the three cases mentioned, there is no indication of others. No mosaics have been found in the church; fresco paintings there may have been; if remaining they are covered by whitewash and the new decorations. As far as can be ascertained, brick was the material used for walls, piers, vaults, and domes. By settlements, due mostly to earthquakes, the whole church has been greatly damaged and badly restored, but the original dome, though distorted, still stands.

It is generally remarked that SS. Sergius and Bacchus is the prototype design of the cathedral church of

S. Sophia—it certainly is of the same school of architecture, and the planning of the gynæceum has a likeness to it, in regard to its western bay and angle exedra; but in S. Sophia the transseptal arcades are the same width as the diameter of the nave, thus making the whole length of the nave a double square, whereas in SS. Sergius and Bacchus it is a single square. Again, in S. Sophia pendentives are used throughout; in SS. Sergius and Bacchus there are none. The large semi-domes of S. Sophia spring from the same level as do the exedrae and other arches, but in SS. Sergius and Bacchus spandrels are carried up on both sides of the arches, and the dome stands upon them. In S. Sophia Byzantine architecture is now fully developed, arches being placed upon all columns, and a new form of Ionic capital suitable to carry these arches was invented, but in SS. Sergius and Bacchus the architrave is still an important factor in the design. It is unfair to a small church to compare it with a cathedral, though SS. Sergius and Bacchus stands the comparison with great credit, and is one of the finest Byzantine monastic churches erected.

A few of the principal dimensions are as follows:—

	Ft.	In.
The whole internal length from east to west	129	
The length without narthex	101	
The length of aisles, absent	86	
Width, including aisles (not including recess in south wall), average	77	6
Width, excluding aisles	59	
Length of octagon	33	6
Width of octagon	50	6
Length of dome	55	
Width of dome	52	6
Width of square bays—north, 16 ft. 3 in.; south, 16 ft. 6 in.; west	17	

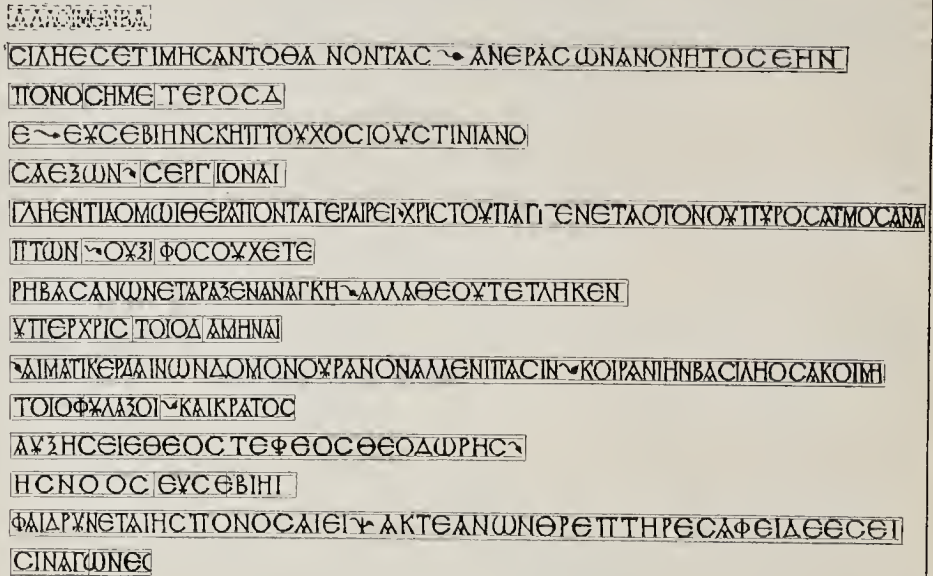

Fig. 4. Entablature of South-West Exedra.

SSSERGIVS AND BACCHVS.

INSCRIPTION ON THE FRIEZE.

Fig. 5. Inscription Round Nave in Honour of Justinian and Theodora. (See page 7).

	Ft.	In.
Depth of square bays, not including arcades, 4 ft.	4	6
Width of exedra, average	17	
Width of impost piers to arcades, average	2	9
Width between the piers of triumphal arch	21	6
Thickness of triumphal arch	4	
Width of sanctuary	25	
Depth of sanctuary	12	
Radius of sanctuary apse, about	12	3
Length of narthex	70	
Width of narthex	14	6
Height from floor to crown of dome, about	71	
Height from floor to springing of dome	45	
Height from floor to springing of main arches	33	6
Height from floor to gynaeceum	20	
Height from gynaeceum floor to crown of vault, average	13	6
Height from ground floor aisles to vault, average	18	3
Height of upper colonnades	12	7
Height of lower colonnade	14	9
Height of entablature	3	5

NOTES.

DESPITE the efforts of one or two organisations for encouraging the re-afforestation of suitable areas in the British Isles, little has been accomplished in this direction, and practically no general interest is felt in the subject. Our supplies of timber for structural and other purposes are drawn largely from abroad, but there are already indications that in process of time ordinary varieties of timber will not be exported so readily as at present. Fir and pine are growing scarce in the United States, where re-afforestation has become a necessity, and is looked after by a Government department. Notwithstanding the extensive forests existing in Canada it is highly probable that the agricultural and industrial development of that country—now proceeding by leaps and bounds—will in a comparatively short space of time deprive us of a resource hitherto looked upon in the light of a bottomless well. The position is one

that ought to be faced, especially as the remedy of re-afforestation cannot bring relief until after the lapse of many years. In these islands we have, roughly, 15 million acres of mountain and heath lands more or less suitable for afforestation. The value of such lands is small, but might become very considerable if devoted to the growth of timber upon a proper basis. Further, the establishment of a new industry would do much towards the solution of the great unemployment problem.

At a time when so many street-widening schemes are being carried out decisions under the old Act of Parliament known as Michael Angelo Taylor's Act (57 Geo. III. cxxix) are of general interest, since the local authorities derive their powers to acquire property for this purpose from this ancient statute. In our issue of August 19, 1905, in a Note on the case *Pescod v. Mayor, etc.*, of the City of Westminster, we referred to the law on this subject. The latest case is *Thompson & Jackson v. Hammersmith Corporation*, where the plaintiffs were lessees of land and a double shop in King-street, Hammersmith, and were about to considerably alter the premises under the terms of their lease when the Corporation sought to acquire a strip varying in depth from 5 ft. 2 in. to 7 ft. 2 in. of the frontage to High-street. The plaintiffs contended that they must take all the premises. It has been decided that sect. 82 of the Act is subject to sect. 80—that is to say, since sect. 80 speaks of "any part of" the premises

being acquired, sect. 82, which deals with the compulsory acquirement, is to be read as containing a like provision (see *Gordon v. Vestry of St. Mary Abbots*, 1894), and that the test as to whether a part may be acquired or the whole must be taken is, can the portion desired to be taken be removed, still leaving the house as a house capable substantially of being enjoyed as before (see the same case and *Gibbon v. Paddington Vestry*, 1900). In the present case it was attempted to differentiate the law on the ground that the plaintiffs themselves were about to pull down portions of the house; but this contention did not prevail, and the Court held that the portions required by the Corporation destroyed the house as a house, and that the whole premises must be taken.

At last the shallow underground tramway is practically ready for operation, and will be opened to the public after the official inspection of the Board of Trade. The new line will be worked in connexion with the electrified tramway route between Southampton-row and Islington, and passengers will then be able to proceed without change of car from the Angel to the Strand, and *vice versa*, the alteration of level taking place by means of the incline at the junction of Southampton-row and Theobald's-road. Owing to lack of foresight, or to an unusual, and in this case unwise, impulse in the direction of economy, it is impossible for the ordinary rolling-stock of the London County Council to enter the

subway. Consequently, single-decked cars have been built specially for this service. The disadvantage may appear small at the present time, but when the line comes to be extended and placed in communication with the southern system of tramways, none of the cars now running on the latter will be able to pass along the new subway. It would be interesting to hear what the County Council have to say upon this point.

Water Supply in Leicester. OWING to the low rainfall during the end of last year, the water authorities of Leicester are experiencing the utmost difficulty in providing supplies for the inhabitants. Water is already shut off for ten hours out of the twenty-four, and the period of supply will probably be further curtailed. One of the three corporation reservoirs is practically dry, and the others contain less than one-fourth of the normal quantity. A disused colliery shaft is at present yielding about 300,000 gallons a day to supplement the supply from the waterworks, and so critical is the situation that water to the extent of some 200,000 gallons a day is being drawn from a well close to the Belgrave-road cemetery. An idea of the grave emergency that has arisen is to be gathered from the statement that water is being pumped direct into the mains at a point only a few yards from a place where dead bodies lie and others are being buried daily. It is reassuring to learn that the water is found to be wholesome, but in these days of hygiene the procedure seems a strange one, and the inhabitants are far from feeling satisfied as to its wisdom. The case of Leicester serves to emphasise the necessity for dealing in a comprehensive manner with the question of water supplies, and of apportioning available sources so that large towns unable to draw upon gathering grounds in the mountains of Wales and the Lake district, may be reasonably free from the risk of famine, without prejudice, of course, to the requirements of smaller centres.

Railway Amalgamation. THOSE persons who live on what is known as the old London, Chatham and Dover Railway lines begin to wonder when the benefits which were promised to them on the amalgamation of this company with the South-Eastern Railway Company are to be conferred upon them. It cannot be denied that the amalgamation has been of benefit to this latter company, as when the Chislehurst tunnel subsided the Chatham Company's lines were invaluable to them, and now that Charing Cross station is closed the Chatham lines termini are again of service to them. The South-Eastern Company, however, offers no *quid pro quo*. The passengers by the London, Dover and Chatham lines suffer by the dislocation in the service, and their trains are made unpunctual owing to the assistance rendered to the South-Eastern Company, yet no facilities of quick communication between the two systems have been offered them in return. To pass from the Maidstone and Chatham branches to the South-Eastern main line is just as difficult as it was when the two

companies were running in opposition to one another; indeed some of the time-tables seem to have been preserved as models of railway obstruction to rapid means of transit.

Tramways v. Light Railways. THE Parliamentary paper recently published with the returns relating to tramways and light railways contains some very interesting statistics. The return goes back to the year 1878, when the route mileage was only 269 miles, the capital expenditure some 4,000,000*l.*, and the number of passengers 146 millions. The route mileage is now 2,116.78 miles, the capital expenditure 52,675,152*l.*, and the number of passengers 2,069 millions. It is not hard with the assistance of these figures to understand the depression in our railways. Electricity is making rapid progress as the means of locomotion, as, out of the 2,117 miles now open, 1,780 miles are worked by electricity. Although the capital expenditure per mile is originally much larger than for steam or horse traction, exceeding them both by, roughly speaking, one-third, the net percentage of receipts to the capital outlay is nearly double that given for steam and horse traction, whilst the percentage of working expenditure to gross receipts also shows a diminution, and the average fares are also at the same time slightly lower. The return shows that the local authorities still continue to absorb this class of undertaking, which possibly is the most profitable they have yet attempted to manage. Continued improvement in electric locomotion is, however a factor yet to be considered, and at any moment the ratepayers may find themselves pledged to increased capital expenditure, or, in place of this, the general public may be condemned to use antiquated and obsolete systems on account of the municipal monopolies.

"Clinton" Reinforcement for Concrete. A NEW power-house recently built in Baltimore illustrates the value of steel network for the reinforcement of concrete for building construction. This power-house is 180 ft. long by 72 ft. wide, and is 70 ft. high above the ground floor. In place of the steel rods generally used to reinforce the floor slabs Clinton electrically-welded fabric was employed. This form of netting was selected for two reasons; first, because being supplied in long lengths the architect was able to make the reinforcement continuous for the whole width of the building; and second, because the transverse wires of the fabric not only keep in position the longitudinal wires, but provide for the resistance of any strains that may be exerted at right angles with the latter. The continuous bond provided by the steel netting permitted considerable economies to be made in the upper part of the building, which contains the coal bunkers, and consequently has to bear heavy strains. One great advantage of using reinforcement in the form of sheets is that there are no bars or rods liable to be wrongly placed by workmen. Consequently the cost of superintendence can be considerably reduced. Similarly satisfactory results have already been secured by the use of expanded metal.

Bombay Harbour Works. DURING his visit to India, in 1875, the King laid the foundation-stone of the first dock in Bombay harbour. Now, after the lapse of thirty years, the Prince of Wales has inaugurated the equally important work by laying the foundation-stone of the Alexandra wet dock and a new dry dock, basins that will probably serve to accommodate the largest ocean steamships that are likely to be built for the next thirty years. The dimensions of the dry dock are based upon the requirements of a vessel 1,000 ft. long by 100 ft. beam, and a draught of 36 ft. Quays are to be built near the entrance to the docks, permitting the largest steamers to be berthed alongside so as to land passengers without the aid of tugs and lighters before discharging cargo in the Alexandra dock, which will have a water area of nearly 50 acres, and about 3 miles of quays and transit sheds. These works, involving an outlay of more than 2½ millions, form only part of the extensive programme inaugurated in 1873 by the Bombay Port Trust, and when they are completed Bombay will be not only one of the finest natural harbours in the East, but probably the best equipped port in that part of the world. Something more is to come, however, for the Trust have under consideration a great scheme for reclaiming nearly 600 acres of land along the shore of the harbour that would give space for 2½ miles of quays, and probably facilitate an extension of the city that would do much to relieve the overcrowded condition from which it now suffers.

Sanitary Condition of Barnard Castle District. DR. E. P. MANBY'S Report to the Local Government Board upon the sanitary circumstances and administration of the Barnard Castle and Startforth Rural Districts (which are comprised within the Teesdale Union), states that in the Barnard Castle Rural District the houses are built of stone but defective in various points. At Middleton, in the main street, a number of houses have been built so closely together as to contravene the most elementary rules of sanitation. Windows where existing in houses are often so fastened up by paint or otherwise that they cannot be opened. Water supply has been much neglected and is from sources liable to contamination. Few water-closets exist in the district, except at Middleton and at Gainford. Privy-middens are chiefly in use, many of them dilapidated and foul. Some pail closets were met with, but sufficient attempt has not been made in the past to get pails substituted for privies. In regard to the Startforth Rural District, the Report is much the same. In regard to water supply it is stated that in some villages where the supply of the Tees Water Board is available, on the ground of expense many residents refuse to have this water, and continue to take their supply from wells:—

"There are public wells at Mickleton, Romald-kirk, Ovington, Hutton, and other places. The quality of the water derived from these wells is said to be satisfactory, but the supply cannot be described as reasonably accessible for all the houses in any of these villages. At Rokeby School, Wycliffe School, Brignall Mill, and other places, I saw water used for drinking, which either was obviously contaminated, or was exposed to the possibility of animal and vegetable contamina-

tion. The medical officer of health reported unfavourably on the water supply at Thwaites Farm as long ago as April, 1901, but no action on the Report has been taken by the Rural District Council. The tenants have to go to a spring some 200 yds. distant for their supply of drinking water. The carrying of water for considerable distances is not infrequent in the case of isolated houses in the district."

The main point of Dr. Manby's Report is that there are three medical officers for the two districts, no one of whom has much time to give to the work of inspection, and that a single competent medical officer ought to be appointed for the whole area, at a salary that would enable him to devote his time to the work, and would organise a uniform system of sanitary improvement.

Report of Enteric Fever at Basingstoke.

THE Report by Dr. Reginald Farrar to the Local Government Board on the causes of an outbreak of enteric fever at Basingstoke, which appears to have commenced suddenly and as suddenly ceased, is a very interesting one as showing the slight causes which may infect a water supply so as to cause disease, and the necessity of constant vigilance in guarding against any contamination of water supply. We have not space to go into the details,* but the Report is very instructive as to the manner in which accidental sources of contamination may arise, and also in showing the method of investigation and reasoning by which the mischief was traced to its probable source, a temporary leakage of a small percentage of sewage matter into an otherwise satisfactory chalk well from which water for the town service was pumped. The following paragraph is worth quoting, as an illustration of the close relation between cause and effect in cases of this kind—

"The following case, which may be thought to have almost crucial value, occurred among the domestics of one of the medical practitioners in Basingstoke. All water used for drinking in this house had been systematically boiled since the beginning of the outbreak. But on a single occasion, and, so far as can be ascertained, on one occasion only, viz, on October 21, a servant maid drew off one glass of unboiled water from the tap and drank it; this girl went away to Alton, on October 23, and was notified at Alton as suffering from enteric fever on November 1, eleven days after drinking the water. It will be noted that this incident occurred on the very day before the disinfection of the mains was carried out, and is consistent with infective matter having remained in the mains for a considerable period after its introduction to them may be inferred to have occurred."

Trees in Towns. MR. F. G. HEATH recently called attention in the *Times* to the necessity of systematic tree-planting in towns. The moment is opportune for reference to this subject, because for another month the planting of deciduous trees may continue. That the planting of trees in towns should be carried on on a systematic plan is obvious. Both in London and the provincial towns it is done, as one may say, either experimentally or spasmodically. There is not a town in England, especially in the suburbs, where the planting of trees would not be an improvement. We wish a society could be formed to press this matter on the notice of local authorities. It is certainly an anomaly that whilst in the country private individuals spend so much thought and money on gardens and shrubberies,

* The Report can be obtained from WYMAN & SONS, London; OLIVER & BOYD, Edinburgh; or, E. PONSONBY, Dublin. Price 1s.

local bodies show so little energy or taste in this direction. On the Continent, where private gardens are far inferior to those of England, tree-planting in cities and suburbs is carried out constantly and systematically.

The Six Landscape Painters' Exhibition. THE exhibition of the works of six landscape-painters—Messrs. R. W. Allan, Anmonier, Austen Brown, J. S. Hill, Peppercorn, and Leslie Thomson—again makes its annual appearance, always a pleasant and interesting event. The pictures, forty-eight in number, are hung in the Gallery of the Old Water-Colour Society. Taking them in the order of hanging, those of Mr. Austen Brown, Nos. 1, 5, and 6 at all events, hardly come properly under the definition "landscape," being foreground pictures in which figures or animals are prominent. "An Early Autumn Afternoon" and "After Sundown" (2 and 3) are rather slight paintings of very different aspects of nature—different in method too, showing that the artist is not a painter of one effect. Mr. Leslie Thomson's best work is perhaps "The Brook" (10), where a stretch of distance is framed in foreground foliage, and a group of girls bathing in the brook make a bright centre to the composition. Among the others are "Norham on the Tweed" (7), a flat country with a river zig-zagging through it ("Rura que Liris quietâ mordet aquâ"), and "Holyhead Mountain" (13), a level composition divided by a strong line of water and distant hills one-third up from the foreground. In Mr. Hill's largest work, "Magdalen Tower" (17), the sky presses heavily on the composition; and in "The Thames at Milbank" (19) the Houses of Parliament are not kindly treated. "On the Welsh Coast" (18), one of the smaller works, is a powerful little picture of waste land. Mr. Peppercorn's heavy and colourless landscapes, with blotchesque masses of trees, we cannot accept as nature or even an adequate translation thereof; "Twilight" (28), where there are no trees, represents better what this artist can do in giving the sentiment of landscape; but on coming to Mr. Allan's "A Grey Day" (31), in spite of its title, we are inclined to exclaim with Milton "Hail, Holy light!" for here at least there is light and colour; the sea is very well treated too. "The Approach of Winter" (32), a hill picture with touches of snow, is fine; so is "A Haven of Rest" (36) and "In from the Sunlit Sea" (39), both notable for colour and calm light; "Autumn" also (34) is a good little wayside composition. Mr. Anmonier, whose works occupy one end of the room, has the best of it in the exhibition; his large melancholy landscape, "A Lonely Heath" (43), is unquestionably the most powerful work in the room; and "Sunlight on the Downs" (46), with the varied lights over the long folds of down, show how well he can treat a subject of totally opposite character. If we cannot admire the works of all the six painters equally, it is always interesting to be thus reminded how many different ways there are of interpreting nature through the medium of painting.

LETTER FROM PARIS.

IN 1899 the Municipality of Paris purchased, for 300,000 francs, the Hôtel de Lauzun, which was condemned to be demolished. The Council at the time proposed to reconstitute the building as a typical example of a first-class mansion of the XVIIIth century. The cost of restoring it completely, however, was seen to be so great that the proposal was abandoned. The suggestion to transform it into a museum, as a kind of annexe to the Carnavalet Museum, was also dismissed, on account of the inevitable injury to, or obscuration of, the wall paintings and wood carvings which decorated the walls. Consequently, not seeing any way to make use of it, the Council has decided to Baron Pichon, grandson of the last proprietor, who intends to make it his home, and has consented to reimburse the Municipality for all its expenditure in connexion with the building, and to put it in complete repair. The Hôtel, it may be observed, is scheduled among the "Monuments Historiques." All the money gained or recovered by the Municipality, in connexion with the transaction, is to be devoted to the enlargement of the Carnavalet Museum, which will permit of the exhibition of many objects of historic interest not at present exhibited to the public.

Having settled this question, the Council is now occupied with the Hôtel Bagatelle, which still remains empty. The Park of Bagatelle is to be transformed into a kind of ornamental botanic garden which is to be planted with specimens of as many as possible of trees and plants of French growth. The house itself is to be made use of for periodical art exhibitions, organised either by individuals or societies, and the sums arising from entrance money will be set apart for the purchase of works of art for the Municipal museums.

The Municipal Council is also occupied recently with the consideration of the completion of the Metropolitan railway system, comprising six new lines, to be carried out at a cost of 200 million francs. The first line will prolong to the Hôtel de Ville that of the Palais Royal, which was to have ended at the Cour de Carrousel. The second line, starting from and returning to the Invalides, will form an interior "ceinture" line with stations at the Place de la Concorde, Rue Royale, Grands Boulevards, Boulevard Henri IV., Rue Cuvier, Rue des Ecoles, Rue Monge, Boulevard St. Germain, and Rue St. Dominique. The third line will run from the Porte de Picpus to the Porte d'Antonie, by way of Avenue St. Mandé, Boulevard Picpus and Boulevard Voltaire, Place de la République, La Cité, Rue Monge, and Avenue des Gobelins. The fourth is to go from the Place de la Bastille to the Porte de Montreuil by way of the Faubourg St. Antoine and Rue de Montreuil. The fifth is the prolongation between the Opéra and the Trocadero of a line already voted for the Boulevard Haussmann and the Rue La Boétie and Rue Pierre Charron. The sixth will go from the church of St. Augustin to the Ternes, by way of the Boulevard Haussmann, the Faubourg St. Honoré, and the Avenue des Ternes.

The jury of the Ecole des Beaux-Arts appointed to judge the Godebeuf competition have awarded the prize to M. Danis, a pupil of M. Deglane. The subject given for the competition was "Les Portes d'un Hôtel."

In a few days there will take place, at the Rond-point des Ternes, the inauguration of Barthold's monument to the aeronauts and the carrier-pigeon societies of the Sieve of Paris. This, the last work of the sculptor, is much inferior to most of his productions. M. Mercier's monument to Alfred de Musset will also soon be in position. Of other statues soon to be erected in Paris may be mentioned that of Baron Taylor, to be placed on the Boulevard in front of the Théâtre de l'Ambigu; that of Theodore Rousset the philanthropist, to be erected on a site in the Eleventh Arrondissement; and a monument to Carpeaux, executed by his pupil Pagel, which is proposed to place in the Jardin de l'Infante at the Louvre.

The works are shortly to be commenced for the enlargement of the Palais de Justice, after the plans of M. Tournaire, architect to the Department of the Seine. The works necessitate the total demolition of the picturesque old houses forming a large quadrilateral bounded by the Boulevard du Palais,

the Quai des Orfèvres, and the Rue de la Sainte Chapelle, which latter will alone remain and will form a kind of interior court to the new portion of the Palais, with entrances from the Quai and from the Boulevard. On the new plan the Quai des Orfèvres will have a width of 19 mètres between the Rue de Harlay and the square tower situated at the corner of the Quai, which will form a symmetrical pendant to the Tour de l'Horloge at the angle of the quay of that name. The new buildings will be connected to the old ones by a footbridge thrown across the Rue de la Sainte Chapelle. The cost of their construction is estimated at 10 million francs.

The separation of Church and State recently voted will have its effect on art, in an unexpected manner, since it will permit of the utilisation of a site for a museum to contain the Luxembourg collection. It is proposed for this purpose to take possession of the large garden of the Séminaire Saint-Sulpice, which will before long be "disaffectée," and which will afford an ample site for a new Luxembourg. Considerations both of legal arrangements and funds will, however, defer for some time the realisation of the scheme.

There is at last some talk of relieving the Ile de la Cité of the untoward building of the Morgue, which rises behind the *chevet* of Notre Dame. This melancholy establishment is, it appears, to be transferred to a site at the eastern extremity of Paris, beyond the Bois de Vincennes, on the margin of the Quai Saint Bernard, near the buildings of the Fourrière, the reconstruction of which is shortly to be the subject of a public competition.

The death is announced, at the age of 66, of B. Delahaye, "architecte-expert," to the Tribunal of the Seine, and Director of the "Reforme du Bâtiment," who had rendered excellent service in the professional defence of architects. We should mention also the death of M. Amedée Pigeon, a distinguished writer on art, and for many years an assiduous contributor to the pages of the *Gazette des Beaux-Arts*.

THE OLD MASTERS EXHIBITION.

THE loan exhibition at Burlington House this year is not a very remarkable one, and few are now sure that the most interesting section of it is not that included in Gallery IV, which consists principally of works by artists not long ago deceased. Here we have the opportunity of seeing once more Millais' remarkable picture "The Knight at the Ford" (115). Near it hangs what is perhaps Rossetti's best work, "The Beloved" (117); the one which shows most of his power of colour and least of his defects of design. The figures show little more than a collection of heads; that of the beautiful blonde, the bride, in the centre, surrounded by attendant faces, while below her the head of a negro boy holding up a gold cup makes a remarkable colour contrast with her fair face and bright green drapery. The whole picture is an inspiration in decorative colour and design, and the faces are not disguised by the large and sensual lips which Rossetti was too fond of, and which appear so disagreeably in the adjoining picture of "Mnemosyne" (119), which represents Rossetti's shortcomings as decidedly as the other work represents his best powers. Various paintings by Burne-Jones appear in the same room, of which the best is the well-known "Love Among the Ruins" (128), beautiful in itself, though quite at variance with the full-blooded passion of the poem by Browning which gives the title to the picture. There is the "L'aus Veneris" also (121), another fine work of his kind, and "The Princess Sabra Dying the Lot" (122), before which one's first thought is—what a collection of weak and feeble heads! Albert Moore's decorative nude, entitled "White Hydrangeas" (111), is a typical example of that artist's power over delicate and refined colour-schemes; and close to it, as if to present the most intense contrast possible, is one of the finest and most highly elaborated of Lewis' wonderful Oriental scenes. "An Intercepted Correspondence" (109), sparkling all over with brilliant colour and delicate detail. Two very fine landscapes by Alfred Hunt, "Whitby: Morning" and "Whitby: Evening" (130, 132), are to be found in the same room; pictures the delicate colour and

atmospheric effect of which are intensified by contrast with the commonplace and heavily coloured figure-painting by a late R.A. which hangs between them. There is an ironical significance in the fact that the painter of the two landscapes which hang on each side of this was never invited to become a member of the Academy.

Coming to the older pictures, Gallery I. is rather a medley of some fine things and a majority which are not of much interest. There is Reynolds's excellent half-length portrait of himself (5); some Hogarth portraits of which the best is "Mrs. Desaguliers" (2), and his "Assembly at Wanstead House" (20), which, if it be (as we are told) his earliest known picture, is of interest as a kind of prelude to the more incisive studies of contemporary fashionable society which he was to produce later. How, by the way, did Hogarth obtain that knowledge of the foibles of dress and manner of the fashionable society of his day which he portrays with such convincing power in "Marriage à la Mode"? He could hardly have been admitted into these sacred but unsanctified circles. It was the same insight of genius, perhaps, that enabled Thackeray to portray the fashionable life of his own day when as yet he was personally outside its boundaries. Of the other portraits in the same room, there are Gainsborough's of his two daughters (10) and of Miss Adney (18), both careful and refined; Raeburn's very fine and energetic half-length of John Gilbert (17), and a half-length "Portrait of a Girl" (21) by the same painter which in colour and in characteristic expression is worthy of Reynolds, whom it rather recalls. Romney's "Mrs. Dawes" (29) is interesting because it is so different from the usual Romney style and scale of colour; it was painted in 1783, when he was in the middle of his career, and therefore at the same time as some other (and finer) works in a totally different style. One is almost tempted to ask whether it can really be his; but we have not heard of any doubt being cast on its authenticity. Opie's head of "Mrs. Warde" (35) is perfectly charming in design and colour and in a certain *espégle* of character, and raises one's idea of this artist's powers. In the centre of one wall is hung Turner's remarkable attempt to emulate Titian, the "Venus and Adonis" (28) which was exhibited some little time since in the gallery of a London dealer. The figures, as might be expected, are hardly immaculate in drawing, but the hold and unusual treatment of the sky and the landscape background leaves one in no doubt that Titian was in the mind of the artist when he painted this. Two of Richard Wilson's landscapes (4 and 6) show Wilson's limitations rather than his success; the kind of thing that Wilson could best do is seen in the smaller picture, "The Lake of Albano" (16). De Wint's "Lincoln" (9) is heavy and unsatisfactory; the "Cornfield" (11) shows more of the real de Wint. Gainsborough's attempt at a classical landscape with ruined architecture is not in his best way.

Gallery II. contains some fine things, among which we ought to mention first a superb architectural scene by Holland (63), one of the finest and most effective of his scenes of Venetian architecture. It is a real interest, too, to see the very fine portrait group of "Mrs. De Wint and her Daughter" (62) by Hilton, since it goes to explain the position held among his contemporaries by a painter whose fame seems somehow to have suffered eclipse in these days; the taste which dictated his large historical pictures is *passé*, but there is nothing *passé* about this portrait of his sister and her child, which for power of handling and colouring will hold its place anywhere. Reynolds's beautiful and well-known group of the Hon. Frances Harris and her dog, one of the best of his child portraits, holds the centre place on the walls, and would be always welcome. This room contains two noble landscapes, John Linnell's "Arcadian Shepherds" (39) and Crome's "Preston Tower on the Orwell" (45); in the latter a mass of foliage fills the centre of the composition, hatched by a warm coloured cloud which combines with it in the composition and forms a kind of radiance around the dark trees. Constable's two small Hampstead Heath pictures

(48, 49) are dull and heavy, and seem perfunctorily painted; the more so by contrast with Stark's "Rabbiting, near Crome" (51), a masterly hit of landscape-painting, and so true to the character of that part of the country. Turner's "Boats" (56) has suffered so much from decay that it is difficult to estimate what might have been its original charms; the "Venice" (60), one of the works in his well-known later Venetian style, is in a good state, and is a good example of this fascinating but rather conventional phase of his art. Besides Stark and Crome, another of the Norwich school, George Vincent, shows well in his "Greenwich Hospital" picture (54), and a small Bonington, "On the Coast of Normandy" (38), is an excellent example of the charm of composition and sky effect which are never absent from Bonington's work; it is somewhat of a conventional style—a suggestion of picture-making in it, but it is so admirably done that criticism is disarmed. In this case Bonington's peculiar delicacy and brightness is intensified by the small work being next to Linnell's dark and richly coloured landscape before mentioned. Among pictures of another class Landseer's "The Cat's paw" (50) shows a most brilliant and forcible piece of animal-painting; and two small pictures by Wilkie, "The Errand Boy" (37) and "The Rabbit on the Wall" (68), hung as pendants, are worth special attention as illustrating the care which Wilkie took over detail in subjects of this class, before his Spanish trip had unfortunately turned his attention from a class of subjects in which he really excelled to one which was foreign to his genius. In one which was noticed the contrast between the easy delight of the small spectators and the careful and serious face of the operator intent on producing his effect; it is a piece of real humour worked out with the greatest delicacy of handling, and no accessory detail of the scene is slurred over or neglected.

In the large gallery unquestionably the most remarkable work in the room is neither the large crude portrait group by Franz Hals (102), nor the large and monumental portrait of Dr. John Ash by Reynolds (73), nor yet the Vandyck portrait (83) at the opposite end of the room, but a small portrait by Gainsborough of Giardini the violinist (79), who was also an eminent composer in his day, though this fact is not mentioned in the catalogue note. There is not a portrait in the exhibition so original, so refined, so full of character and expression as this. Among the other portraits in the room Reynolds's of a little boy playing a drum (74) is noticeable for its fine colour. Hoppner's "The Sisters" (79) is effective but somewhat melodramatic; Reynolds's well-known "Venus and Piping Boy" (81), which we have always held to be a very fine design, is unfortunately so much decayed that it is difficult to realise what the effect of colour and texture may have been when it was fresh. Reynolds's "Miss McGill" (89), Hoppner's "Miss Palmer" (90), and Opie's "Master Impey" (94), are all interesting works, the last named especially. The large picture of "St. Sebastian" (87) is interesting because it is Vandyck's, and because it is rare to find him in this class of subject, but it serves rather to emphasise the fact that his real field of success lay in portraiture. Among landscapes there is a fine early Turner sea-piece, "The Pilot Boat" (77), with a much better sea than he painted in later life, and a large and rather prosaic landscape by the same artist, called "Classical Composition: Temple of Jupiter" (85), which, except for the fine treatment of the distance, looks a good deal like a stage effect; what temple of Jupiter is meant we know not; the ruin, with Doric columns, rather suggests an inaccurate representation of the Parthenon. Gainsborough's "The Woodcutter's Home" (95) is a landscape worth note for its beautiful composition; the concentration of the main group of figures at the left, and the way in which the figure of the woodcutter seems to connect them, as it were, with the distant perspective of the landscape from which he is returning, make it an admirable example of the manner of placing figures in a landscape so as to assist its effect and expression. That the same artist should have painted this landscape

and the Giardini portrait is a remarkable testimony to the versatility of Gainsborough's genius. Collins's large work, "The Harvest Shower" (75), is a fine example of a school of landscape-painting in which composition went for more than colour or truth to detail; while George Vincent's "Landscape" (71) shows how superior the Norwich school were to their contemporaries elsewhere in painting study of nature. Vincent's picture may be thought a little hard, but the careful way in which the mass of trees in the centre is painted, and the attention given to the distance, form a marked contrast to the generalities of Collins; no one would guess, from comparing these two works, that the two painters were nearly contemporary,* and these two pictures very likely painted about the same time.

Gallery V. offers some striking warnings in the way of works by artists once generally accepted as "eminent"; how do their productions show in the light of the present day? This room contains however one really fine picture, "Running Water" (140), a large painting of a river in spate by G. Paul Chambers, a painter little remembered now; but this is a really fine and powerful work. There is also to be seen Millais' portrait of Mr. Hook, one of the finest of his works of this class.

There are some fine things scattered about in the water-colour room, including three perfect little works by Frederick Walker (Nos. 225, 226, and 235), on the screen; a very fine visionary landscape by Samuel Palmer (162); a beautiful "Composition" in landscape (173) by De Wint; Boyce's "Smithfield, 1867" (196); A. W. Hunt's fine stormy picture called "Blue Lights, Tynemouth Pier" (199); two fine Alpine scenes by Turner (208, 211); and a David Cox—"Ulverstone Sands" (215), which is typical of the artist's best work.

The Black and White room contains the studies and drawings by G. F. Watts which he bequeathed to the Royal Academy; mostly outline studies of figures on brown paper, including also studies of drapery and first sketches for the composition of pictures. The rapid outline studies of different attitudes or different points of view of the same model are instructive; they show how the painter studied the outline and pose of the figure; there is no finish and no shading, only the lines that were needed to fix on the mind the action or outline of the figure. This collection of sketches will be of great interest to artists.

NOTES ON OLD LONDON.

THE THAMES-SIDE BETWEEN CHARING CROSS AND BLACKFRIARS BRIDGES; HUNGERFORD, CHARING CROSS RAILWAY, AND WATERLOO BRIDGES; VICTORIA-EMBANKMENT: 1801-1900.

Hungerford Market.—The site of Charing Cross Station and Hotel was occupied *temp.* Charles II. by Sir Edward Hungerford's house and gardens, converted for market uses under a charter of 1679. An Act of 1685 provided for the sale of general produce, Sir Stephen Fox and Sir Christopher Wren at that time sharing the profits. From them the market passed to one Wise, whose successors sold it in 1824-5 to a company, reconstituted under an Act of 1830, for 110,000. The old premises, consisting of booths and shops, with a colonnade at out a central hall, stood at the end of Hungerford-street (163 ft. long), and were traversed by a much-frequented footway—Craven-court, now Craven-passage and the archway under the railway-station. The new buildings, erected upon an incline, were opened on July 2, 1833. They were designed by Charles Fowler, architect also in 1829-30 of Covent Garden Market (see Plate II.). His signed plan of February 21, 1833, shows the site as lying between Charles-court, north-east, and Brewer's-yard, or lane, at Nos. 15 and 17, Strand, south-west, with Craven-court leading from Craven-street to the "great hall," and Hungerford-arcade leading from the "upper area" into Villiers-street. Fowler's elevations, etc., are illustrated in the (old) *Architectural Magazine* of April, 1834. The buildings, constructed of granite and

stuccoed brick, extended 475 ft. from the end of Hungerford-street, and had a frontage of 126 ft. to the Thames. The plan comprised a spacious hall between two quadrangles—the upper and lower "areas." The northern area, 140 ft. by 70 ft., in the clear of the Doric colonnades, had twelve shops for meat and produce, with living-rooms on two stories above, along its two sides, and entrances opposite the arcade and Craven-court. Between that quadrangle and the hall was a portico or corridor, with stairs at the ends leading up to galleries above the shops on the sides of the hall and down to the cellars. On the two sides of the hall, 188 ft. by 123 ft., were shops for poultry, meat, and produce; a flight of steps descended to Craven-court. The roof of the middle aisle of the hall was raised upon open arches above the roofs of the two side aisles. A portico or corridor lay at the lower end of the hall, separated from it, as at the upper end, by an open arched screen. Stairs from the corridor gave access to the galleries above and to the fish-market; and the vaulted cellars on two tiers beneath, with a prospect tower over each staircase. The level of the southern area, 120 ft. by 70 ft., lay one floor lower; a wide range of steps descended from its upper end to the fish-market, 120 ft. by 70 ft. The river-front consisted of a double colonnade having a terrace above, flanked by the Dolphin (east) and Swan (west) taverns, which had flat roofs planted as gardens. The proprietors bought more ground, and embanking the deep bay of the shore, built a quay and jetty. From the wharf, 95 ft. by 218 ft., granite steps communicated with the jetty, which projected 250 ft. into the river. From the wharf to Villiers-street extended a large open space for the hay-market; the sailing barges laden with hay formed a pleasing element of the view. On the northern wall of the old market-house was a bust of Sir Edward Hungerford (Plate II.), wearing his 500-guinea wig, over a tablet inscribed:—

REGIA VIRTUTI PUBLICÆ PERQVAM NECESSARIUM REGIA CÜRATA 2^o ANNUNTIË MURÆSTVÆ PROPRIË SVPMTIBVS CREXIT PERFECTO D. EDVARDVS HVPNGERFORD BALNEI MLES ANNO MDCLXXXIII.

That house, in the XVIIth and XVIIIth centuries a French church, was lately tenanted by the British Fire Office and a dairy. For Charles Dickens's boyhood in No. 30, Hungerford-street, and the market, *vide* "David Copperfield."

York-buildings and the Water Gate.—An Act of May 15, 1624 assigned in exchange to James I. the "inn" of the Archbishops of York, which had been that of the Bishops of Norwich. He bestowed it upon George Villiers, Duke of Buckingham, who pulled down the house and built some reception-rooms in its stead. For his intended mansion he built the Water Gate, which remains in a hollow of the Embankment-gardens. The gate, bearing his cognisance, a fount anchor, as Lord High Admiral, was executed by Nicholas Stone after a design generally ascribed to Inigo Jones (September 19, 1896, Mr. W. R. Mosley's measured drawings)*. Under their London Open Spaces Act, 1893, the London County Council acquired Villiers-walk (since York-terrace) and the water-gate; they planted the walk, repaired and underpinned the gate, and roofed it with lead. On May 12, 1888, Mr. Justice Chitty made an order for winding-up a long-forgotten enterprise named the Lessee Proprietors of the York-buildings Waterworks. Ralph Bucknall and Ralph Waine obtained licence under the Great Seal in 1675 "to erect a waterwork on the grounds of York House"—being their own land. An Act of 2 & 3 Will. and Mary incorporated "the Governor and Company of Undertakers for raising Thames's water in York Buildings." The proprietors sold their venture in 1719 for 7,000l. In 1812 a sum of 30,000l. was expended upon a new engine-house, the substitution of iron mains for the wooden pipes, and an enlarged conduit to the reservoir beneath Villiers-street. By indenture of September 16, 1818, the New River Company acquired the undertaking, and covenanted to

make certain annual payments, including four annuities of 500l. apiece to terminate in June, 1911. An Act of 1829 dissolved the corporation. The works fed a reservoir in Marylebone-fields for supplying the western parts of the town; the number of houses never exceeded about 2,700. Savery constructed the engine, known as the York-buildings dragon, copying the parts, doubled in each dimension, of one he had made in 1712 for a Mr. Balle at Camden Hill, Kensington; confer R. Bradley's "Ten Practical Discourses, etc.," 1727-33. Savery's machine forced 3 tons of water per minute into a leaden cistern at the top of a wooden tower, about 65 ft. high and octagonal on plan (see Plate I.). It is the "noble engine" described by Switzer in his "Hydrostatics and Hydraulics," 1729; De La Motraye gives a view, 1735, of Savery's engine and its successor, Newcomen's beam-engine, side by side. The fuel proved to be costly, the plant often became disabled, and the soot and smoke caused great annoyance in the neighbourhood. Savery's engine, disused in 1731, was preserved there during a long time as a curiosity. The water-tower, upon a projecting wharf (latterly the site of Charing Cross Music-hall) midway between the end of Villiers-street and Black Lion-stairs at the foot of Charles-court, survived much longer. There are views of it in the National and Guildhall Collections, and a water-colour drawing of the tower and the gate in the Turner Collection at the National Gallery; see also Samuel Scott's picture of the riverside bought in 1891 for the National Gallery. Of the two houses at the south end of Buckingham-street (1675), No. 14, at the western corner has been rebuilt, as clearly appears from a painting of the riverside, in or about 1756, by W. James, which is now, or was lately, in the Queen's Presence Chamber, Hampton Court Palace. The former house, of red brick, on that site—depicted by James—had been the residence of Peyps in 1694-1700, and then, *teste* Hatton in his "New View," 1708, of Ralph, first Duke of Montagu, Master of the Royal Wardrobe. The present house was the home of Clarkson Stanfield, R.A., and in 1826-49, of William Etty, R.A. In 1689 Peyps had the Tsar Peter the Great for his opposite neighbour at No. 15, still extant, and a former home of the Institution of Civil Engineers, and of W. Black, the novelist, *vide* his "Sunrise." George-street and Of-alle are renamed York-buildings and York-place.

The Adelphi.—As the story of the Adelphi is told and illustrated in the *Builder* of December 6, 1902, there needs to say only that the once notorious "Arches" are now cleaned, guarded, and lighted, and to cite the fine perspective drawing of "the Royal Terrace . . . with the wharfs, arcade, and entrances to the subterranean streets . . ." engraved by B. Pasternini, in the third (and posthumous) volume, 1822, of "Works in Architecture" by Robert and James Adam. David Turner's water-colour drawing in the "Crowley" Pennant depicts the "sea-water house" at the west end of the wharf. In 1818 some sea-water baths were in Buckingham-street; and there were some at No. 21, St. George-street.

The Salisbury Estate and Hotel Cecil.—Under the enabling provisions of the Settled Estates Acts, the late Marquis of Salisbury sold his property lying between the Strand and the former riverside in 1887 for, it is said, 200,000l. J. W. Hobbs & Co. subsequently acquired the fresh-water pumping-lay out a curved road, to rise to 35 ft. above the embankment level, to the Strand at Wellington-street. That project gave way to Messrs. Perry & Reed's plans for covering the area, nearly 2½ acres, with a vast hotel. Traversed by Ivy Bridge-lane at No. 76, Strand, and by Salisbury and Cecil streets, the ground embraced a strip of land adjoining the Embankment gardens, whereon, at the foot of the lane, remained until the winter of 1888-9 an old messuage which, fifty-five years ago, was known as the Fox under-the-Hill, whence at Salisbury-stairs the half-penny steamboats, *Ant, Bee, and Cricket*, plied to London Bridge. The traffic ceased after the disastrous explosion of the boilers of the *Cricket*, which killed six persons and injured many more. The lane was then closed by a gate at the Strand end, though for several years afterwards it could be ascended from the Thames side. The upper

* Collins born 1788, died 1847; Vincent born 1796, died some time after 1830.

* Dates within square brackets relate to illustrations in the *Builder*. For Stone's share in the work, and the data upon which its design might be claimed for him, see the *Builder* also of May 13, 1854; June 18, 1864; May 26, 1898; and September 19, 20, 1896. Some say that Sir Balthazar Gerbier was the Duke's architect.

Fig. 1. The Savoy before the Building of Waterloo Bridge and Wellington-street.

epd, now a passage to the hotel, marks the position of Ivy Bridge, formerly Ulle-brig, in the Strand, across a rivulet flowing from Cock and Pye fields, near Seven Dials. Stow records:—

"Ivy bridge in the high street, which had a way under it leading down to the Thames, like as some time had the Strand bridge (see under Savoy), is now taken down, but the lane remaineth as afore, or better, and parteth the liberty of the Duchy and the City of Westminster on that south side."

The lane under the bridge formed a frequented thoroughfare for foot traffic between Covent Garden and the waterside; across its lower end projected, until lately, the west half of the crescent circus which, together with the retaining wall and the flight of steps descending 24 ft. to near Salisbury-stairs, the brothers Adam added to Salisbury-street, rebuilt in or about 1785 by James Payne. Ivy Bridge-lane, overlooked by the hack bay-windows of houses along the west side of Salisbury-street, presented a singular appearance, being covered for the greater part of its length by portions of houses on both sides, which darkened the way and converted it into an almost continuous tunnel, square in section. The entrance at No. 76, Strand, was incorporated in 1893 in the front of the Club Café by Mr. P. E. Pilditch, since pulled down. Many of the earlier Cecils were buried in the old church of St. Martin-in-the-Fields. The registers contain an entry of a payment of 3s. 4d., in 1650, to William Wright:—

"for a stone ingraved with letters on it which is sett in the wall of the Earl of Salisbury at his house at Ivy Bridge to divide the two parishes of St. Martin in the fields and St. Clement Dances at that place."

Sir Robert Cecil, advanced Earl of Salisbury on May 4, 1605, built a mansion on the west side of the gardens of the Bishop of Carlisle's "inn"—since Russell, or Bedford, House, and then Worcester House; Queen Elizabeth was present at the house-warming on December 6, 1602. William, second Earl, subdivided the mansion into Great Salisbury House and Little Salisbury House, reserving the former for himself, and renting the latter to his son-in-law, William Cavendish, third Earl of Devonshire, and other persons of quality. In 1692 the site of Little Salisbury House was leased for the making of

Salisbury-street, since altered by the brothers Adam, and by Payne, as already mentioned. Another parcel of the estate was leased for a range of shops, the Middle Exchange, which extended from the Strand to the river bridge or stairs. Having proved to be a failure the Middle Exchange was, together with what remained of Salisbury House, demolished in 1695, and their site was taken for Cecil-street, whereof the east side lay within the Savoy precinct, abutting against Carting, formerly Dirty, lane, at No. 38, Strand, by the side, in later times, of the Savoy Theatre. Looking down Salisbury-street (closed in May, 1892), one saw the obelisk on the Embankment. Of the hotel, opened in 1896, the southern block, abutting on Savoy-place, was built by J. W. Hohhs & Co., and the eastern and western blocks by Messrs. Perry & Co., after Messrs. Perry & Reed's plans and designs—all the metal work being calculated for and supervised by Professor A. B. Kennedy (October 20, 1888, with section and two plans; October 19, 1895, Strand façade, grand staircase, and two plans); the three blocks stood around a courtyard, 300 ft. by 80 ft. The plans illustrated in the Builder were modified on the demolition in 1898-9 of Nos. 76-7-8, Strand, between Ivy Bridge and Carting-lane, together with the northern ends of Salisbury and Cecil streets which had formed the two entrances into the courtyard, and on the setting back of the frontage so as to widen the Strand there to 90 ft. Mr. J. Carnichael built the extension to the Strand, comprising shops, offices, and Cecil-chambers, after Mr. Joseph Sawyer's designs.

Savoy Hotel.—In June, 1889, a company was formed to take over Beaufort House at the south end of Beaufort-buildings, Strand, and the nearly completed hotel erected by Mr. G. Holloway, who, we understand, acted as "working master builder," no professional architect having been employed. The south front, with its heavy iron verandahs, is incommensurate with its position, and perhaps the best one could say for it is that it gains by contrast with the adjacent Examination Hall. A special feature of the rearrangements consisted of numerous self-contained suites on every floor, and a central courtyard, 6,006 sq. ft. superficial, treated after the Continental manner. The decorations, by

Messrs. Collinson & Lock, of the restaurant, reception-rooms, etc., are from drawings by Mr. T. E. Collcutt, who also made special designs for the mantelpieces throughout. Some additions to the courtyard, by Mr. T. E. Collcutt, are illustrated in the Builder of July 11, 1896. The more recent extension, embracing the Strand front, with "Simpson's" (1843), were made by Messrs. Collcutt & Hamp, in association with the Worcester Buildings Company, and in connexion with the widening of the Strand by the Westminster City Council. The new entrance, Savoy-court, having a raised level, absorbs Beaufort-buildings and Herbert's-passage; the façade supplants Nos. 89-104, Strand, between Carting-lane and Savoy-buildings leading to Fountain-court and the Savoy. Of Fountain-court the remaining (west) side was pulled down in 1902, and with it No. 5, the home, during the last seven years of his life, of William Blake, who lodged in the back room on the first floor, and died there on August 12, 1827, drawing with a final effort a likeness of Katharine Boucher, his wife. Opposite, on the east side of the court, stood the Occidental tavern, reputedly more than 270 years old, and of high standing during the Regency, but after 1851 known as the Coal Hole, the *soi-distant* Chief Baron Nicholson's, which, with the adjoining Nos. 15-4, suddenly collapsed on the morning of March 26, 1837, after they had been dismantled for the building of Terry's Theatre [Mr. Walter Enden, April 9, 1837].

The Savoy.—The Court Leet of the Royal Manor and Liberty of the Savoy has existed during longer than 700 years, and is charged with maintaining the boundary marks in the Hotel Cecil, at the Lyceum, Child & Co.'s Bank, Twining's tea warehouse in Devereux-court, the Embankment, and other places. The jurisdiction extends from the Hotel Cecil to the Middle Temple, taking in the north side of the Strand, the south side of Holywell street (now pulled down), and the Lyceum and (old) Gaiety theatres. Of the former buildings a fragment of stone wall, by the wharf, survived until 1877 at the south-east corner of Savoy-street. The Hospital of St. John the Baptist, erected by Henry VII. and Henry VIII., and built by Humphrey Cook, the "King's carpenter," with, at its east end, Charles II.'s French

Protestant Church of St. John the Evangelist (1661), first founded in 1641 by B. de Rohan, Lord of Soubise, lay between the Chapel Royal and Duchy-lane. Duchy-lane, or place, or court, opposite the site of Strand bridge, was entered by a steep flight of steps between Nos. 137-8, Strand, and is absorbed by a recent widening and rebuilding, at the corner, east, of Wellington-street. A valuable set of (undated) drawings by Sir William Chambers and Robinson in the Soane Museum contains plans and designs for proposed public offices on the Savoy site, after the style of Somerset House, with plans of the old hospital and adjacent buildings. The latter plans plot the "coach-passage" shown in Vertue's earlier plan of 1736, leading from the Broadway to the Friary, which had been cut obliquely through the nave, or western arm, of the cruciform hospital, all of which was then occupied as soldiers' barracks. At the north end of the Broadway was Middle Savoy-gate; Savoy-street, formerly Great Savoy-hill, has replaced the Broadway and coach-passage, Wellington-street and Lancaster-place traverse the sites of the Friary, the eastern part of the hospital, and the French Church. The military prison at the south-west angle of the Chapel Royal faced Little Savoy-gate—now Savoy-steps, at Nos. 107-8, Strand. Savoy-mansions are on the site of the prison and of the western portion of the barracks. The Medical Examination Hall marks the position of the German Calvinistic Church on the east side of the river stairs, and of the (old) German Lutheran Church between the Calvinistic Church and the Friary. The Lutheran Church, rebuilt on adjacent ground, was pulled down for the widening of Savoy-street; the French Church was rebuilt in Bloomsbury-street (now Shaftesbury-avenue). On succeeding to the throne Queen Elizabeth converted the hospital chapel (1503-5) into a parish church, for the parishioners of St. Mary-le-Strand, which, by letters patent of November 27, 1775, became a Chapel Royal. George IV. repaired and improved the chapel in 1826-30; in 1845 Sydney Smirke the elder, surveyor-general to the Duchy of Lancaster (*ob.* 1877), restored the fabric for Queen Victoria, Willement designed the glass for the window above the reredos, and restored the reredos, by some ascribed to Sir Reginald Bray, and the roof and ceiling. Smirke altered the interior in 1860, removing the gallery and fitting in a new organ. A fire, which broke out in the rear of a house in the Strand on Thursday afternoon, July 7, 1864, destroyed nearly all but the walls, the roof, and the beautiful ceiling of oak and pear wood, divided into 138 enriched quatre-foil panels. Smirke re-instated the chapel at a cost of 7,000*l.*, destroyed by the Queen. Messrs. Perry & Reed added a porch and vestry in 1877; the schools, with the Royal Savoy clubroom [Messrs. Perry & Reed, May 5, 1883], were built for Queen Victoria by Mr. W. Brass. The Sovereign's ecclesiastical authority is supreme in the precinct, and all the buildings are exempted from the district surveyor's supervision and the provisions of the London

Building Acts. In 1875 the late Metropolitan Board of Works obtained powers (38-9 Vict. c. 179) to make a road (Savoy-hill) through lands belonging to the Queen in right of her Duchy of Lancaster, and one (Savoy-place) through their vacant lands to the east boundary of Lord Salisbury's property at the south end of Carting-lane. The Act further empowered the Chancellor and the Council of the Duchy to widen Savoy-street by setting back the graveyard railing and the return of No. 118, Strand, and by taking in nearly all the site of the later Lutheran Church on the west side. The improvement, completed in March, 1877, cost 3,669*l.*, the Board not being required to pay for the land thus thrown into the public way. The Turkish baths at the lower end were fitted after the Moorish mode by C. J. Phipps (*ob.* 1897), architect (1881) of the Savoy Theatre, the first London theatre lighted with electricity.

Somerset House and King's College.—Mr. W. Monk's drawing [January 4, 1902] of the south front of Somerset House, as it appeared before the making of the embankment, evinces how the raised embankment, with its land-side balustrade, has spoiled the effect of the terrace arcade rising directly from the water at full tide. The plinth course of the arches and of the side water-gates is now concealed, whilst the solemn gloom of the great middle arch which is blocked up to above the springing is quite destroyed by a wall inserted almost flush with its face for the conversion of the archway into rooms, with a door and windows in the wall. A stone wall and repository (1837) at the west end of the river front replaced the Dock House, a waterway for barges leading to Somerset-place, or West-court. Sir James Pennethorne completed Chambers's design with the west block opposite Lancaster-place in 1852-3. For his successful work on that occasion seventy-five leading architects presented him with a gold medal. One day, as he crossed Waterloo Bridge with a friend, Telford pointed to the corner of the river front, saying: "Forty years ago I heaved and laid those stones when I worked on that building as a common mason." King's College was established in 1828; the buildings are by Sir Robert Smirke, 1830-1. The Government granted a parcel of vacant land on the east side of Somerset House, stipulating that the river front should be in keeping with that of the latter. But additions carried out in yellow brick on that side spoil the continuity of the two designs. The chapel over the hall and projecting eastwards is by Sir G. G. Scott. In 1897 the school migrated from the basement and the north wing to new buildings at South Hayes, Wimbledon; in 1900 Messrs. Banister Fletcher & Sons built an additional storey on the south wing, and reconstructed the second storey of the north wing for laboratories, the museum, and the architectural, geological, and other scientific departments [November 3, 1900].

Whitefriars and Bridewell Precincts.—The Carmelite convent founded by Sir Richard Gray, 1241, stood between Inner Temple

and Water-lane—now Whitefriars-street. Crocker's, or Brocker's, lane, granted to the Friars for building their church, 1407, is now Lombard-street; Huton-street supplants the notorious Wilderness-lane. In the *Builder* of November 16, 1895, is an account of the discovery of the crypt at No. 4, Britton's-court. Of "Alsatia," in the early years of the XVIIIth century a graphic description is given by Sir Walter Scott in his "Fortunes of Nigel." The *Gazette à la mode, or Tom Brown's Ghost*, No. 3, of May 26, 1709, records the demolition of the Dorset Gardens Theatre (1671, by Wren) in that year when the New River Company took the ground for their timber-wharf, pipe-boring shops, offices, etc.; the City of London Gas Company established their works in 1814 on the site, which is now that of the City of London School. An excavation, in 1892, on the site of Bridewell Palace (*see* Plate II.), behind De Keyser's Royal Hotel, revealed a pointed arch built upon piles, and some walling carried by red brick arches with chalk abutments resting on elm piles. G. P. Boyce's drawings of St. Edward's Chapel and the adjacent buildings were deposited in the Museum, South Kensington. In the Guildhall is a picture, by Samuel Scott, of Bridewell dock, 1770, with Dr. Sacheverell's house distinguished by a mural sun-dial. The old burial-ground is in Dorset-street. The remaining buildings comprise the court-room, offices of Bridewell and Bethlehem Hospitals, and treasurer's residence. An Act of 52 Geo. III. provided that a portion of the old hospital and house of correction should be available for the detention of refractory apprentices; some cells remain, and they are still used upon occasion. The prison was pulled down in 1863-4; the chapel—where is now Bridewell-place—in 1871.

Hungerford and Charing Cross Bridges.—I. K. Brunel's suspension bridge [April 12, 1845] was erected by Sandys, Carne, & Vivian, of Cornwall, who contracted for some 15,000 tons of ironwork, and by W. Chadwick, who built the abutments and the two piers and their towers, after designs by Bunning (*ob.* 1863), in the Italian style, to harmonise with the facade of the market, where the bridge joined the terrace roof of the central colonnade. Brunel (*ob.* 1859) built the brick piers upon the gravel, without piles, adopting the coffer-dam principle after the old form. The piers, whose bases remain, carried rectangular towers, 22 ft. square on plan. The 14-ft. footway, having iron diagonal trusses to minimise undulation, hung by single suspension rods, 12 ft. apart, from four chains, in two lines, composed of 2,600 links weighing in all 750 tons; each link being 7 in. wide, 1 in. thick, 24 ft. long, and weighing 5½ cwt. The chains passed over rollers on the towers, the saddles having a free movement of 18 in. each way, and were secured in tunnels at the abutments to two iron girders, 44 ft. long and 5 ft. deep, solidly embedded in the brickwork in cement backed with concrete. The towers rose to a total height of 80 ft., or 58 ft. above the footway; the deflection of the chains

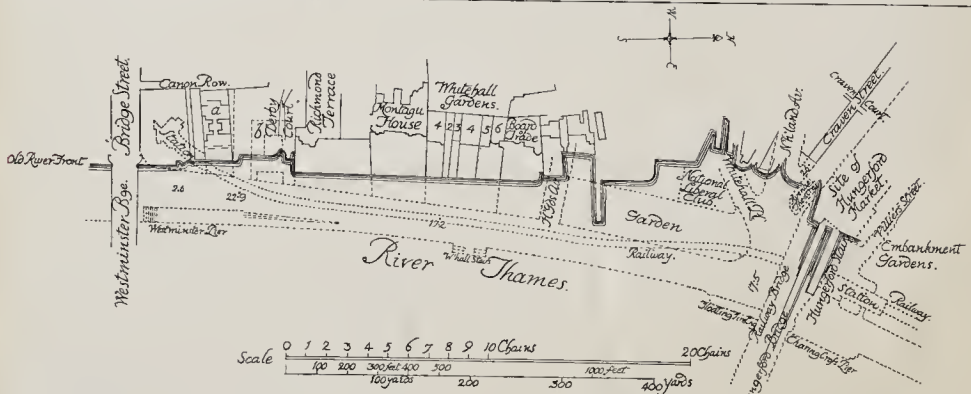

Fig. 2. The former Riverside, and Victoria Embankment.

amounted to 50 ft., their entire weight and that of the platform were thrown on to the columns and not the arches of the piers. The middle span, 676½ ft., was 116½ ft. more than that of the Menai Straits bridge, and second to only that (nearly 900 ft.) of Chaley's similar bridge at Fribourg, in Switzerland, each of the two other spans was 335 ft. The footway was 22½ ft. at the abutments, 28½ ft. at the piers, and 32½ ft. at the middle point above high-water mark, giving a graceful camber, rising to 7 ft. higher than the crown of the middle arch of Waterloo Bridge; each pier had flights of steps descending to the river. Begun in the spring of 1841, and costing a total sum of 110,000^l, Hungerford Bridge was opened on May 1, 1845; the half-penny tolls yielded a fair dividend to the proprietors. Under their Act of 1861 the South-Eastern Railway Company obtained powers to extend their line from London Bridge Station (Surrey side) to termini at Cannon-street and Charing Cross. The chains of Hungerford Bridge were taken for the completion by J. Hawkshaw and W. H. Barlow (*ob.* 1902) of the suspension bridge [August 8, 1863] across the Avon at Clifton, which I. K. Brunel had designed many years previously. They were adapted to the span there of 702½ ft., with a deflection of 7 ft. Harrison Hayter, C.E. (*ob.* 1898), designed the iron railway bridge, with footpaths on cantilevers, supplementing the two brick piers with iron cylinders. For sinking the cylinders he discarded the compressed-air method, employing divers, who worked inside until the cylinders had reached the clay to a maximum depth of 32 ft. in the river bed, when they were pumped dry. The shallower piers he sank 25 ft., the piles for the greater part penetrating the stiff London clay, with beds of septaria—confer the *Proceedings of the Institution of Civil Engineers*, vol. 49. The Metropolitan Board of Works opened the bridge toll-free on October 5, 1873, paying 98,540^l compensation to the railway company. In 1884-5 Mr. Brady, engineer to the South-Eastern, since the South-Eastern and Chatham, Railway, widened the bridge by 40 ft. on the upstream side for four more lines, Messrs. J. Cochrane & Sons being the contractors. The terminus was opened on January 11, 1863; the hotel, built by Messrs. Lucas, at a cost of about 150,000^l, is by E. M. Barry (*ob.* 1880), who also made the designs for the copy, in the forecourt, 1863-5, of the Queen Eleanor Cross, at Charing. On December 23 last we published a description, with drawings, of the station and roof designed by Sir J. Hawkshaw.

Waterloo Bridge.—For a company formed in 1809 Ralph Dodd, the projector, aided by John Linnell Bond, prepared designs for a horizontal bridge, having elliptical arches, which they based upon those of Jean R. Perronet for the bridge (1768-74) across the Seine at Neuilly; the Act of 1809 (49 Geo. III. c. 191) names Bond as "assistant architect." The designs were referred to John Rennie and Jessop; the company appointed Rennie as their engineer. Of his two designs—one for seven, the other for nine, equal arches—they chose the latter as the less costly. Rennie followed the model of his bridge across the Tweed at Kelso (1799-1803), having five semi-elliptical arches of 72 ft. span, with engaged Doric columns on the piers and abutments, a plain block cornice, and a balustrade, and a level roadway. The nine arches have a span of 120 ft., their crowns are 30 ft. above high water at ordinary spring tides; the arch stones increase regularly from 4 ft. 6 in. at the crown to 10 ft. in depth at the haunches—a correctness of principle which Rennie was the first engineer to adopt. The piers decrease in width from 30 ft. at the foundations to 20 ft. at the springing of the arches, and the abutments similarly decrease from 40 ft. at the base to 30 ft. at the springing. Over the points of the piers are two three-quarter engaged Grecian Doric columns, designed after those of the temple at Ægesta, in Sicily, each having a diameter of 5 ft. 8½ in. at the base, a height of 25 ft. 9 in., and a width of 4 ft. 4 in. at the under side of the capital, and each pair carrying a recess from the footpath, 17 ft. wide by 5 ft. deep. Between each pair of arches, at a level of 19 ft. above the springing, is an inverted arch, of which the stones are 4 ft. 6 in. deep at the crown, and decrease regularly on each side

as they unite and abut against the extrados or backs of the voussoirs of the main arches. A Grecian Doric block cornice and entablature carry a balustrade parapet 5 ft. high. Rennie employed coffer-dams for constructing the foundations of the piers, a then novel expedient in a large tidal river, with an ingenious method of constructing, floating, and fixing the centring [May 28, 1898; sections of arch and pier of Waterloo and London bridges, showing pile foundations and construction of centring—Mr. A. T.

Walmisley]. The balustrade was worked at Aberdeen; the rest of the granite was hewn on the Surrey side, and it is recorded that one horse, "Old Jack," drew nearly the whole of the stones to the work. Rennie put the face of the northern abutment in a line with the terrace of Somerset House, and laid out the roadway to be level, as nearly as possible, with the Strand, whence the rise to the top point on the bridge has a gradient rate of 1 in 250, or about 2 ft. in all; the two

THAMES ESPLANADE AND RAILWAY.

A COMPANY has just been registered under the title of the "River Thames Esplanade, Railway, and Sewage Company." The promoter, Mr. Wieland, of Glasgow, proposes to construct river walls on both banks of the Thames, extending from London Bridge to Westminster Bridge, with the view of improving the channel and navigation, while increased wharfrage accommodation would be given by means of quays and archways extending inwards from the river a depth of 120 ft. On the north side of the river the quay is to be 40 ft. wide, and 80 ft. in depth from the quay, is to be covered by a double row of groined arches, 35 ft. span, and about 35 ft. in height. It is proposed to raise a road or esplanade on the top of these arches 80 ft. wide, running parallel to the river on the level of the various bridges from London Bridge to Hungerford Market. On the river side of the esplanade is to be a parapet and balustrades, and on the land side a row of handsome shops, warehouses, or offices. Underneath would be a series of warehouses communicating with the quays. On the south side of the river it is proposed to adopt the same plan, with the exception that the esplanade would only be 40 ft. wide, and on the greater portion of it the warehouses above the shops would give way to private dwellings, built in flats, on the Scotch and Parisian plans. The esplanade on either side of the river is to form junctions with the bridges and leading streets. It is also proposed to form an additional railway under the arches of the railway on the Middlesex side of the river from London Bridge to Hungerford Market. Another feature of the

scheme is to prevent the pollution of the river Thames by conveying the sewage from the mouths of the present sewers to convenient spots, where it may be deodorised and converted into manure for agricultural purposes. The importance of the object is admitted on all hands—what is wanted is a practicable mode of effecting it, and this the company will have to show by details. The Thames ought to be embanked, and it will be, we have no doubt—it is simply a question of time and the right man.

Illustrations.

PORTION OF ROOF, MILAN CATHEDRAL.

THE Cathedral of Milan is of unknown authorship, as regards the architect, though the design is probably, to a large extent, of German origin. Its wonderful roof, with the crowd of pinnacles, statues, and flying buttresses, makes an intricate study. Many of the sculptures have been over-rated, and some of them are very meagre, as regards any artistic quality; but the effect of intricacy and elaboration of the whole, produce a *tout-ensemble* the like of which is nowhere else to be seen. The statues include saints, prophets, prelates, beings, and martyrs; the latest addition to the illustrious company being Napoléon (about 1805).

The upper slopes of the flying buttresses are adorned on each side with a carved cresting, representing different flowers (very crudely cut), from which circumstance the roof has sometimes been known as the "Garden."

The upper part of the second buttress pinnacle to the right has been omitted in the

sketch, as cutting out too much of the "Aguglia," or central lantern—a very beautiful feature. A. C. C.

THE NEW WAR OFFICE.

THE new War Office, now completed externally, was, as our readers will probably remember, designed by the late Mr. W. Young, who unhappily died before the building was commenced, and has been carried out by his son, Mr. Clyde Young, with whom is associated Sir John Taylor, as consulting architect on the part of the Office of Works.

The contractors are Messrs. Foster & Dicksee, of Rugby. The whole of the stonework is specially selected Portland stone, which has all been worked at their yard in Chelsea, where they have established a most up-to-date plant for dealing with it, and the result is a most excellent piece of masonry, on which they are to be congratulated. Needless to say, fire-resisting construction has been used throughout, and the danger of fire reduced to a minimum.

We content ourselves for the present with these few particulars. When the building is completed will be the time to give fuller details as to the whole scheme, and the treatment and purposes of the various rooms and other portions of the interior. We give however a plan of one of the floors, which Mr. Young has kindly furnished us with.

The perspective view of the exterior was specially made for this issue by Mr. E. B. Lamb.

NEW WAR OFFICE WHITEHALL

WHITEHALL

PLAN OF PRINCIPAL FLOOR

we are enabled to give illustrations of six of the figures or groups which occupy positions over the decorative pediments on the face of the building.

We give two of the groups on a small scale, as illustrations in the text, in order to show the manner in which they are arranged and combined in connexion with the line of the pediment and the central stele. One group represents "Truth" and "Justice"; the other, which has "Peace" for its ruling motive, represents on one side one of the sad results of war, "The Fatherless and Widow"; the other, which seems to us a peculiarly charming conception, represents "The Winged Messenger of Peace" bringing the glad tidings.

It is necessary to observe that these photographs, as well as those on a larger scale in the lithograph plates, were made from the models in the sculptor's studio, and therefore are necessarily deprived of the proper architectural adjuncts in the shape of mouldings, etc. On the other hand, there is the advantage that they are taken in a more favourable position than would have been possible after the figures were *in situ* on the building.

The separate plates give the figures or groups already mentioned on a larger scale, and also two figures from a group of which "War" is the motive; the two figures representing respectively "The Horrors of War" and "The Dignity of War," two views of war which are equally true, but are unfortunately often considered apart from each other; the "peace-at-any-price" people seeing only the horrors, and not the necessity which is sometimes unquestionable; while the ultra-military spirit tends to see only the glory of war. The combination of the two ideals in one composition becomes therefore a kind of moral lesson set forth in sculpture.

NEW HOTEL DE VILLE, VERSAILLES.

GOING out to Versailles two years ago, our attention was caught by what was obviously a just completed Hôtel de Ville, standing near the tramway leading up to the great palace, and then in all the bloom of fresh-hewn stone. We made a mental memorandum to have this illustrated, and now give two illustrations from photographs specially taken for the *Builder*.

These district Hôtels de Ville or Mairies (as they are sometimes termed) in the various arrondissements of Paris, are among the most characteristic modern buildings of Paris. There is a considerable family likeness between them in style and in general disposition of parts, which is as it should be, as it is desirable that the Hôtel de Ville of the district should be easily recognisable by its architectural character; in the same way and on the same principle that in London we have seen a distinctive style and treatment adopted for the London School Board schools.

The architect of the Versailles Hôtel de Ville is M. Le Grand, of Paris.

THE RICCARDI PALACE, FLORENCE.

THIS celebrated building, though now known by the name of its later owners the Riccardi, was built by Cosimo di Medici, and was at first the home of their family. Browning makes it the scene of the wedding feast in his remarkable poem "The Statue and the Bust," the heroine of which was

"A bride the Riccardi brings home to-day."

And in some vigorous lines further on the speaker, supposed to be a Florentine of the period, refers to its origin and his hatred of the original founders:—

"A feast was held that self-same night

In the pile that the mighty shadow makes.

For Via Larga is three-parts light,

But the palace overshadows one;

Because of a crime which may God requite!

To Florence and God the wrong was done,
Through the first republic's murder there
By Cosimo and his cursed son."

The palace is a remarkable example of the application of the classic cornice to a whole building, and not to a mere order attached to it; and its architectural effect really depends mainly on this tremendous cornice which (like that of its twin-palace the Strozzi) projects nearly 10 ft. from the wall line. The treatment, other than that of the cornice, is rather flat and tame, and in this respect it looks less effective in perspective than in the engraved elevations published in architectural books.

The drawing was made for us by Mr. A. C. Conrade.

PORTION OF FACADE, SIENA CATHEDRAL.

THIS facade was designed by Nicolo Pisano; it shows, in its centre gable, a very effective combination of three primary forms—the square, niche, and triangle. The lower stage contains three great doorways, with massed arches, pediments, and elaborate sculptural decoration. Detail, suggestive of the Early Renaissance, is largely introduced, though the feeling throughout remains Gothic. Each one of its crowded shafts has a different treatment, whether of spiral, narrow panelling, or fluting; the same applies to the recessed arch-moulds. The capitals are evidently based on the Corinthian; above the caps are, on projecting brackets, some very spirited figures of horses and lions. The building was, on account of the plague of 1356, never completed, and consists at present only of the transept of what was intended to have been a vast cathedral. The foundations of the nave, etc., were laid, and can still be traced.

The Fatherless and Widow.

The Winged Messenger of Peace.

"Peace": Group on the New War Office.

At each angle of the platform before the front is a column (not seen in sketch) surmounted by a group of the female wolf with Romulus and Remus; in reference to the derivation of Siena from a Roman colony.
A. C. C.

THE PICCOLOMINI ALTAR, SIENA CATHEDRAL.

This is a pleasing example of somewhat Early Renaissance. There is an iconostasis in three stages, each of which contains niches with figures of saints and ecclesiastics, with the figure of the Virgin in the centre of the upper stage, the right-hand niche of which latter is, for some reason, empty. The whole is effectively set off by the horizontal lines of the light and dark marbles which clothe all the walls and columns of the interior of Siena Cathedral. A semi-domed recess contains the altar.
A. C. C.

ILLUSTRATIONS OF THE CHURCH OF SS. SERGIUS AND BACCHUS.

Or the four sheets of illustrations of this celebrated church, given in this issue, the sheet of "Interior Views and Details" is from photographs taken by Mr. Arthur E. Henderson; the drawings are executed by him from measurements taken on the building, which he has been studying on the spot for many months. They are referred to in the article by Mr. Henderson, which, with other sketches and diagrams, will be found on another page.

VIEWS OF OLD LONDON IN THE NEIGHBOURHOOD OF THE SAVOY AND CHARING CROSS.

THESE two sheets of views are reproduced from old prints and drawings in the invaluable Crane Collection in the print-room of the British Museum. They are given as illustrations to the article on this portion of old London which appears in the present issue, and to which the reader is referred.

UNDER THE TEMPLE PORTICO.

THE intention of this drawing was to give the effect of a view of a landscape from beneath the portico of a Doric temple in strong shadow. It is not entirely realised in the reproduction; lithography by the agency of the photograph is a useful but somewhat capricious servant to the artist; you never know quite what it will do; and in the present case it was found that an impression in which the foreground was as dark as in the drawing, the distance had chosen to come out much darker than in the drawing, and to avoid this defect it was necessary to print the whole in a lighter tone, which does not altogether realise the effect aimed at in the drawing.

The scene is, of course, wholly imaginary, but the arrangement of columns, with thicker columns and wider inter-columniations in the exterior order, is taken from the Parthenon portico. It is, in fact, a very unusual arrangement as far as existing remains give evidence, but it suited the composition better than placing the outer and inner columns on the same axis.

It being a festival day (for which the young lady in the foreground is an early arrival among the spectators), the temple was festooned externally with garlands, which show against the sky, and help to break the rigidity of the horizontal lines of the entablature.

It is worth while to remark, when people are constantly exaggerating the idea of the entasis in Greek columns, that the slight entasis shown in these columns, and which is barely noticeable to the eye (but which will appear on applying a straight-edge to them), though it was intended to represent the entasis of the Parthenon columns, is really considerably in excess of that; and that on the scale of the foreground columns in this drawing the entasis as existing in the Parthenon would be represented by a deviation from the straight line of little more than half the thickness of a post-card. I tested this by scale, applying the edge of a post-card to the scale, where it just filled up the inch (the Parthenon entasis is .56 of an inch). The fact is a significant commentary on the exaggerated representations of entasis which are now often made in drawings of Greek architecture. H. H. S.

(Continued from page 15.)

landing-stairs at each abutment are a noteworthy element of the design. The dry arches of brick on the Surrey side are forty in number; thirty-nine of them are semi-circular, 16 ft. in diameter, and one is semi-elliptical over Narrow-wall and 26 ft. in diameter. The first stone was laid on October 11, 1811. The total length of the bridge and causeways amounts to 2,456 ft., made up of 1,580 ft. for the bridge and abutments, 310 ft. for the approach from the Strand, and 766 ft. for the causeway on the Surrey side. The piers are 87 ft. in length at the base. The bridge is 42 ft. wide between the parapets, with a roadway of 28 ft. The cost, with the approaches, amounted to 937,391l. 11s. 4d. Sir John Rennie, who assisted his father in the work, relates in his Autobiography that the piers and abutments were founded on the solid bed, a strong gravel, of the river, and that they rest upon a wooden platform, carried by piles 12 in. in diameter, driven 20 ft. into the bed. In his paper upon "Foundations," printed in the *Builder* of May 28, 1838, Mr. A. T. Walmisley mentions that this was the first bridge on the Thames for which coffer-dams were employed, being composed of double piling, with muddle between the piles. As in the case of old Blackfriars and Westminster bridges, the foundations were not carried through the sand and gravel down to the clay, and there was one pile to every square yard of bearing surface at the piers. The heads of the piles, having been sawn off, timber bearing piles and pieces were fastened on, both lengthwise and transversely; on them was fixed a flooring of 6-in. planks, to take the first course of masonry. Under their Metropolitan Toll Bridges Act, 1877, the Metropolitan Board of Works bought the bridge for 474,200l., and, on October 5, 1878, opened it free from toll. Indications of the subsidence had already become manifest; in 1877 stones were dropped around the piers—a futile expedient which created a backing-up of the water, and scoured out a deeper channel under the arches. Throughout the year 1879 the mean low-water level of the river was 1 in. lower than in the forty-five previous years, and the high-water level was nearly 3 in. higher than in any year before 1875. In 1882 Mr. Edward Bazalgette, engineer to the bridges belonging to the Board, made an examination of the foundations. His investigations revealed certain facts which amply justified a warning given by this journal, albeit our presage was but lightly esteemed at the time. The demolition of old London and Westminster bridges, the building of the embankment, and other concomitant causes had deepened the stream under Waterloo Bridge to an additional extent of 8 ft. The piles, denuded of the gravel, had sunk beneath the superincumbent weight. Mr. Bazalgette drove great piles around portions of the piers; their spaces were caulked with oakum and puddled, and the water was then pumped out of the dams. Each pier was then seen to rest upon vast blocks of rough Bramley Fall and Craigleith stone, which had become crushed down by a load, for each pier, calculated at about ten to eleven thousand tons; the measure of the drooping of the bridge could be gauged from the circumstance that the cut-waters, not being a part of the actual fabric, had preserved their original level. The footings rested upon piles of beech, set in rows, 3 ft. 6 in. from centre to centre. Mr. Bazalgette concentrated his labours upon the arrest of a mischief which could not be entirely remedied. He lowered blocks of concrete, weighing from 5 tons to 6 tons, into position on the river bed, so as to form an apron from 4 ft. to 5 ft. 6 in. thick, and as hard as the solid rock, around each of the piers. The apron sloped outwards from the pier at an inclination of 1 in 56, and extended 18 ft. all around, its outer edge reaching to the piles of the dam, of which the lower portions were left as an outwork to protect the foundation piles if the river should become deeper still. The piles of the dam are massive beams of American rock elm, and, being cut off at the level of the concrete apron, prevent scouring of the gravel beneath it. W. Webster contracted for 70,000l., and completed the work from shore to shore in 1884. The bridge, which Canova said was the most beautiful structure in London, was opened as Strand Bridge by the

Prince Regent and the Duke of Wellington on June 17, 1817, and Constable depicted the scene. Rennie died on October 4, 1821. In June, 1898, the London County Council began the substitution, at a cost of 500l., of attenuated and tasteless electrical light standards for the eighteen lamp standards which had been especially modelled to suit the character of the bridge, and were, besides, uncommon and admirable examples of cast-iron design [July 2, 1904, the old and new standards]. The old railings, after a similar pattern, remain in Lancaster-place.*

Victoria-embankment.—The embanking of the Thames is no new thing. Many maintain that from Richmond it flows mainly between artificial limits, and that the earthworks for protecting the marshes in the lower reaches are of Roman origin. It must, however, suffice to merely mention that many encroachments and short embankments were made in later times along both shores in London, and that larger schemes have been propounded by Wren and Evelyn, and, in the XIXth century for the left bank, by Thomas Harrison (1810), Colonel Sir Frederick Trench (1828) for a viaduct level with Somerset House terrace, and carrying a railway, James Walker and others for the City Corporation (1841), and James Edmeston, whose project is described in the *Builder* of June 29 and July 6, 1861. A report (1844) of a Commission contains plans advanced by Sir Charles Barry, Trench, Thomas Page, Walker & Burges, and John Martin, the painter. Martin exerted his unruly will, but was the first who proposed to intercept sewage from the river; he published drawings of his conceptions, notably a set, in 1856, for a sewer-quay, colonnaded wharves, and a railway. Martin's plans for public walks with gardens upon the river's bank, and Wren's for a new quay, partly begun under the Acts 1666-7 and 1670, in Upper Thames-street and a "fair quay or wharf on all the river side from London Bridge to the Temple of the breadth of 40 ft., as also from the Tower wharf to London Bridge," are described in the *Mirror*, vol. xxviii., 1856. In August, 1860, a Select Committee of the House of Commons reported in favour of three schemes formulated by Sir Joseph W. Bazalgette, Bidder, and Forster, respectively, out of more than fifty submitted for an embankment from Westminster Bridge to Queenhithe. They recommended that the construction should be entrusted to the Metropolitan Board of Works, who, being charged under the Act, 21-2 Vict. c. 104, with the metropolitan main drainage, had powers to deal with the foreshore for that purpose, and that the coal and wine duties, to expire in 1861, should be temporarily renewed to supplement the funds already voted for the new low-level sewer. They estimated the total outlay at 1,000,000l., including, at least, 250,000l. for the sewer, and that the 3d. wine duty and the 8d. and 1d. portions of the coal taxes would yield about 100,000l. per annum. The Commissioners appointed in the following year to consider the plans preferred one by F. W. Shields [August 3, 1861, two alternative sections; with text of report] for a solid embankment from Westminster to Blackfriars, with a sewer beneath the road, to many projected viaducts with docks. Whilst recommending that the embankment should not extend below Blackfriars Bridge in view of the anticipated heavy claims for compensation, they advocated the laying-out of a new street from the bridge, instead of from Queenhithe, across Cannon-street, to the Mansion House, and the making of a viaduct eastwards from the Temple Gardens, with waterways to the City of London Gas Company's works, and the adjacent wharves in Whitefriars. An Act of 1861 renewed the coal and wine levies until 1872. The much-vexed question of intercepting vehicular traffic along the east front of the Crown property at Whitehall was ultimately decided in the negative. The Thames Embankment (North) Act, 1862 (25-6 Vict. c. 93) did not include the new road—Queen Victoria-street—through the City, for which statutory powers were obtained in the following year, but did include certain works which were abandoned under an Act of 1868, as, for instance, a

* In August last, after consultation with Sir W. Richmond and Mr. G. Frampton, R.A.A., the Council agreed to replace the old standards and fit them with incandescent burners.

viaduct for a road, 70 ft. wide, from the Temple Gardens to Blackfriars Bridge, and a street from Lancaster-place, having a gradient rate of 1 in 40, and partly upon arches through the Savoy, and beneath Hungerford Bridge to Northumberland-wharf, communicating with Villiers and Buckingham streets and with a new street from Whitehall-place to George-street, near the Adelphi.

The proposed viaduct of two arches, having a span of 70 ft., and a roadway of not less than 8 ft. above Trinity House high-water mark in front of the gas-works, together with a similar arch in front of Whitefriars Dock, were disposed of by the more successful action of the Metropolitan District Railway Company. In a report of October 22, 1862, Sir Joseph Bazalgette, Chief Engineer to the Board, stated that the clear waterway of the Thames was 900 ft. at Blackfriars and Westminster, 1,120 ft. at Waterloo, 1,020 ft. at Hungerford, 650 ft. at Southwark, and 700 ft. at London bridges, so that at the two last-named places the tidal water flowed with a velocity enough to keep the channel free from deposit. But where it spreads to nearly double the width, as at Waterloo Bridge, a partial and contracted channel is formed in the north bend, with much deposit on the south side. He first struck his embankment line to take in the second arch and pier of that bridge, which would have given a more uniform section of river and 8 acres more of reclaimed land. Through some bungling, for which the Board were not responsible, the limits of deviation did not take in the second pier of the bridge. The entire scheme, as amplified by the Act of 1863, included the right bank of the Thames from Vauxhall to Westminster Bridge, and was connected with the sewerage and street improvements in the City and the western parts of the town.

Of the three separate contracts, comprising numerous short lengths of intercepting sewers, but excluding 30,000l. for ornamental work, standards, etc., the length, 3,740 ft., from Westminster Bridge to a short distance below Waterloo Bridge, was undertaken by George Furness (ob. 1890) for 520,000l.; the length, 1,970 ft., to the east end of Temple Gardens by Ritson & Co. for 229,000l., the resident engineers being Mr. T. Lovick and Mr. E. Cooper, respectively; W. Webster took the third contract to Blackfriars Bridge, and made the roadway throughout. The contractors carried the foundations to a considerable depth, for the removal of old London Bridge had caused a deepening of the river bed, which contributed to the failure of old Westminster and Blackfriars Bridges, and was also affect-

ing Waterloo Bridge. Dispensing with the old coffer-dam method Bazalgette chose, he says, a system of excavation within a connected line of iron caissons sunk below the bed and filled with Portland cement concrete to within 6 ft. from low-water level, and otherwise constructed so as to form a full-tide dam (Fig. 4). The specifications required that the river-wall foundations should be taken down to 20 ft. at least below Ordnance datum—that is to say, to 32 ft. 6 in. below high-water level, or 14 ft. below low-water level; the river wall to be faced with granite to a curved batter from 2 ft. below low-water mark to about 1 ft. 6 in. below high-water mark, where should be a chamfered plinth and surface mouldings to a plain face of about 2 ft. forming a sub-plinth to the parapet; a counter-fort, 3 ft. thick, to be built over the arch of the subway at the back of each of the fifty-eight lamp-pedestals to receive the washers of a long mooring bar passed through the entire construction, and attached to the mooring rings upon the pedestals. Each ring of cast and hammered gun-metal, appears as though it were held in a lion's mouth. For Furness's contract the caissons, contrived by Mr. Joseph Phillips, of Messrs. Cochrane, were oval on plan, 12 ft. 6 in. by 7 ft., outside measurement, having end-grooves 6 in. wide and deep. In each caisson the groove, with a similar one in the butted end of the next caisson, took the timber pile which formed one of the guides to the descent of the caissons as well as a joint, made water-tight with packing. Each caisson was built in divisions 4 ft. 6 in. high, the divisions being of wrought and riveted boiler-plate where left in below the bed, and of cast-iron where above and serving merely for the dam. Before the building up and sinking of the caissons the line of the face of the embankment was obtained with sufficient accuracy: at about the middle of the length from one bridge to another a point was fixed in the rear of the general line of staging, and marked with a pole or wand resting upon a small staging; the lines from each point to two points on the bridges made a large angle, in which the curve was found by offsets taken at every successive 50 ft., namely, at the end of four caissons.* The steamboat piers, landing-stages, and stairs for smaller

* The curve from Westminster Bridge to Temple Pier is not quite circular. The writer finds it nearly coincides with an arc struck at a radius of say 3050 ft. from a centre in Waterloo road between Aubin-street and Holmes-terrace, and passing through those two points.

Fig. 4. Section of Coffier-Dam used in Laying Foundation-stone, Retaining Wall, Sewer, and Subway of Thames Embankment, and Caissons forming the Front of the General Coffier-dam Construction in the first Contract. (From the "Builder" of August 6, 1864.)

craft, constituted an important feature of the work. The old piers, whereof some yet remain at other points on the river, consisted of worn-out barges, with shifting gangways; they had been replaced here and there with the improved structures of the Conservancy Board, the Cadogan suspension pier at Chelsea, and Thomas Cubitt's pier at Pimlico. The embankment dummies, or pontoons, rise and fall on the tide in recesses, of which those at Charing Cross and Waterloo bridges [July 30, 1864] contains the storm-water outfalls of the Northumberland-street and Savoy-street sewers. Temple pier and landing-stages, over 470 ft. long, comprise a recess of 250 ft. for the pontoon, with a middle recess 25 ft. wide at the back, the total projection into the river being 31 ft.; the recesses contain the outfalls of the Essex-street and Norfolk-street sewers. At Waterloo Bridge the total length is about 50 ft. more, for two recesses, the foundations of which, as well as of the wall, were carried down lower than the foundations of the pier of the bridge, and the soil about the bridge-pier was enclosed within a permanent dam of cast-iron plates and piles secured to the older footings with iron tie-rods bedded in concrete whereon was laid an inclined apron of granite blocks everywhere dowelled together. A large rusticated arch, with console head and plinth and pedestal for sculpture, marked the parapet at Temple pier. It was originally intended to remove York water-gate to opposite Whitehall-gardens, and to put it in the middle of a projecting space 108 ft. long, having two end pedestals for sculptured lions couchant, recesses for seats, and landing-stairs in three flights. The main roadway is 100 ft. throughout, with a carriageway of 64 ft. The general level of the road is 4 ft. above high-water mark, with an upward incline at each end. Within the wall and embodied in its structure is the northern low-level intercepting sewer, fully described in the *Builder* of August 27, 1864, an integral component of the Main Drainage scheme, having a diameter of from 7 ft. 9 in. to 8 ft. 9 in.; above the sewer is a subway, 7 ft. 6 in. high by 9 ft. wide, for pipes, wires, etc., both being beneath the footpath nearer to the river. The embankment is 1 mile 455 yds. long; of the total area, 37½ acres, reclaimed, 19 acres are absorbed by roads and paths, and 7½ acres passed under the Act to the Crown, the Inner and Middle Temple Societies, and other riparian landowners. About 9 acres were devoted in perpetuity to the public benefit and enjoyment, mainly through the exertions of W. H. Smith, M.P. for Westminster, who, on August 7, 1870, carried a motion by 156 to 106 votes against the Government for an address to Her Majesty praying she would be pleased to direct that no public offices be erected on that portion of the embankment which is reserved to the Crown, and which had been reclaimed from the river at the cost of the metropolitan ratepayers. The gardens of the houses at Whitehall were lengthened; the Templars were inhibited from building on the land added to their gardens; but that provision was relaxed by the Board of Works' Act of 1875 which permitted an encroachment in favour of Temple Gardens-chambers (see the Temple). A subway at Westminster affords access to the Houses of Parliament, the bridge, and the railway station. The net cost, with that for ancillary works, amounted to 1,156,981l.; with Bazalgette (ob. 1901) were associated C. H. Driver (ob. 1900) for the architectural features of the wall and stairs, and John Dixon, C.E. (ob. 1891), for the landing-stages and piers. G. J. Vulliamy, the Board's Superintendent Architect (ob. 1886), adjusted the settlement of compensations, about 450,000l. in all, and the purchases of property; Mr. A. McKenzie and Mr. Weston laid out the three ornamental grounds. The work was begun in the autumn of 1863, the first pile being driven in front of Montagu House, Whitehall; on July 20, 1864, Sir John Thwaites, chairman of the Board, laid the first stone in a dam sunk to 21 ft. below high-water mark on to the concrete bed and footings of the wall and sewer construction near Whitehall-stairs; on July 15, 1870, the King (then Prince of Wales) and the Princess Louise opened the Embankment on behalf of the Queen. The section, reproduced from the *Builder* of August 6, 1864, shows the actual construction of the permanent coffer-

am, with the caissons forming the front of the general dam or coffer-dam construction, and the retaining wall, sewer, and subway, foundations, etc., between Westminster and -omerset House. An Act of 1872 placed the whole thoroughfare, which passes through several parishes, under the control and management of the Board. The road is not much frequented, but is found convenient for the assembly of troops, and the marshalling of processions; the side streets from the Strand and Fleet-street are narrow and steep; with a few exceptions the buildings that line its course are unworthy of their position. Nevertheless, he has not seen London who has not seen it from Victoria-embankment in the early morning, or evening, of a bright summer's day.

SOME NOTABILLIA.

Jaenes, Plans, etc.—The riverside palaces, by Jollar, prints by Herbert and Wilkinson, 1806, that of York House from the drawing, 1630, in the Pepysiana Library, and the Museum, Cambridge (1851). *Jaenes, Plans, etc.*—The riverside palaces, by Jollar, prints by Herbert and Wilkinson, 1806, that of York House from the drawing, 1630, in the Pepysiana Library, and the Museum, Cambridge (1851). *Jaenes, Plans, etc.*—The riverside palaces, by Jollar, prints by Herbert and Wilkinson, 1806, that of York House from the drawing, 1630, in the Pepysiana Library, and the Museum, Cambridge (1851). *Jaenes, Plans, etc.*—The riverside palaces, by Jollar, prints by Herbert and Wilkinson, 1806, that of York House from the drawing, 1630, in the Pepysiana Library, and the Museum, Cambridge (1851).

NOTES ON NEW BUILDINGS IN LONDON.

V.—CAXTON HOUSE, WESTMINSTER.

On the north side of Tothill-street there has just been completed (externally at least) one of the immense blocks of new stone-fronted buildings which are now rising in so many parts of London. The prevalence of stone we are glad to see; after all that may be said about the colour effect of red brick (which does not retain its richness very long in London) there is no building material so noble and monumental in its effect as good stone; and though it darkens, it does not become grim with age, as brickwork does. Caxton House has the now usual sin of being too high for the width of the thoroughfare, and we suppose this running to height is inevitable; it might indeed be urged that the sin lies with our forefathers, who did not lay out wider streets.

Unlike the remarkable building last under our notice, Caxton House, which appears to be intended as a block of offices in the lower portion and perhaps of residential chambers above—that at least is the impression produced by the exterior treatment—is entirely built with the orthodox construction of piers over piers and openings over openings. The lower two stories are treated architecturally as one, and form a lofty rusticated podium to the remainder of the elevation. This is boldly treated with a series of arches running through both the lower stories, which are marked off only by the window and floor lines crossing the openings. This is a bold and effective treatment, but it cannot be denied that the proportions both of arches and piers are too high and narrow for the best effect, and the piers appear wanting in solidity and mass, not constructively but architecturally, for the mass of the building carried by them. Very likely the architect is of the same opinion, and has done his best to conciliate architectural effect with demands for light; but we are almost inclined to think that a better effect would have been produced by making the arcade a lower and wider one for the ground story only, as in the building in the Strand described last week, and grouping the windows of the next story with the others above the rusticated base. To the high rusticated base in itself we see no objection, only the narrow proportions of the piers and arches in it. The three stories

above are divided into bays by large pilasters treated with a simple panelling which has a good and refined effect; the windows between are square-headed with a square panellated centre column below and circular columns in the next two stories. The effect of all this is quiet and refined, but the plain raised square panels with their angles cut out, which fill the spaces above the third floor windows, form rather a commonplace detail which is neither interesting nor ornamental. The centre of the front is slightly projected and emphasised by angle quoins corresponding with those at the angles of the building. The principal entrance is treated in the now rather hackneyed form of a rusticated arch with a concave quarter-circle curve on plan at the reveals, and a pedimented and columned doorway inserted beneath it. The projecting oriel, which runs up the centre above the doorway, certainly requires more appearance of architectural support than is given by the scroll cartouche which finishes under its flat soffit; it has the appearance of standing on nothing. The balcony above the main cornice, with the graceful sculptured figure-carrying it from beneath, is much better managed; and the decorative iron railing is of a massive character suitable to the whole scale and size of the building. The central portion above the main cornice is a nice bit of composition, with its vertical curve in the shape of a segmental fronton, and the backward horizontal curve of the attic which finishes this portion; only we do not like the side scrolls or consoles; they are rather meagre in proportion for their surroundings, and not graceful in curve and outline.

A fairly powerful cornice is carried right round the building, breaking at the centre projection; it strikes us that it would have been better in effect had the modillions been closer spaced; they are rather wide apart.

The east or return elevation is very simply treated as a mass of brickwork, with cornice and angle quoins of stone. A deep recess in the plan on this side divides it into two pavilions treated alike, each with a stone oriel running up the centre in the middle of a field of brickwork. The effect of the massing of the building here, with the deep recess between the two wings, is very good from a distance, but will unfortunately be hidden when the new Wesleyan Hall is built, which will come to eastward of it with only a 40-ft. passage between.

ELECTRIC POWER BILLS IN 1906.

A LARGE number of private Bills relating to schemes for the supply of electric power to large consumers are down for consideration during the coming Parliamentary session. The large number of these Bills shows that the supply of electric power in bulk gives good promise of being commercially successful. The reason of this can be readily understood from an inspection of any of the more modern power supply stations which have been erected round London during the last two or three years. Take, for instance, the Brimsdown Station of the North Metropolitan Electric Power Company which supplies the power to work the Metropolitan Tramways. It is situated on the banks of a canal, so that the great quantities of coal slack required can be conveyed cheaply by barges, and the large amount of water required for condensing purposes can be had for a nominal fee, as it is returned into the canal. The crane and coal-conveyor plant for unloading the barges are worked electrically, and take very little power. As automatic stokers are used, and the ash and clinker are carried away by the buckets of the conveyor, practically no manual labour and almost no supervision is required in the furnace and boiler-house. The prime movers are Parsons' steam turbines, which require very little supervision, compared with that required by reciprocating engines. The dynamos are coupled directly to the turbines and generate at 10,000 volts. The power is transmitted at this pressure by a three-core cable, sheathed in lead, directly to the rotary converters at the tramway substation, twenty miles away. Under these circumstances it is not surprising that electric power can be sold profitably at a price less than half the minimum price required by an ordinary lighting station. One point

DESCRIPTION

MODELS OF THIS KIND CAN BE MADE OF ONE UNDIVIDED PIECE OF ORDINARY DRAWING PAPER, UNITED AT ANGLES BY THE FOLDING FLAPS, WITHOUT THE USE OF ANY ADHESIVE MATERIAL.

A SHARP PENKNIFE SHOULD BE USED TO CUT OUT THE MODEL, WHERE INDICATED BY THICK BLACK LINES. THE DOTTED LINES SHOW WHERE THE PAPER IS TO BE FOLDED OR BENT. AFTER THE FOLDING FLAPS

HAVE BEEN PASSED THROUGH THE SLITS, ALSO INDICATED BY THICK BLACK LINES, THEY SHOULD BE FLATTENED OUT.

A MODEL CAN BE FURTHER STIFFENED AS ILLUSTRATED IN THIS DESIGN BY PASSING CERTAIN PARTS OF IT UP THROUGH THE ROOF.

WITH A LITTLE INGENUITY ALMOST ANY DESIGN CAN BE MODELLED IN THIS WAY IN ONE PIECE, OR SEPARATELY AND JOINED TOGETHER.

THE SCALE TO WHICH MODELS ARE DRAWN DEPENDS UPON THE SIZE OF A BUILDING AND THE STRENGTH THAT A HOLLOW PAPER MODEL MAY BE EXPECTED TO HAVE. IN THIS CASE IT IS $\frac{1}{6}$.

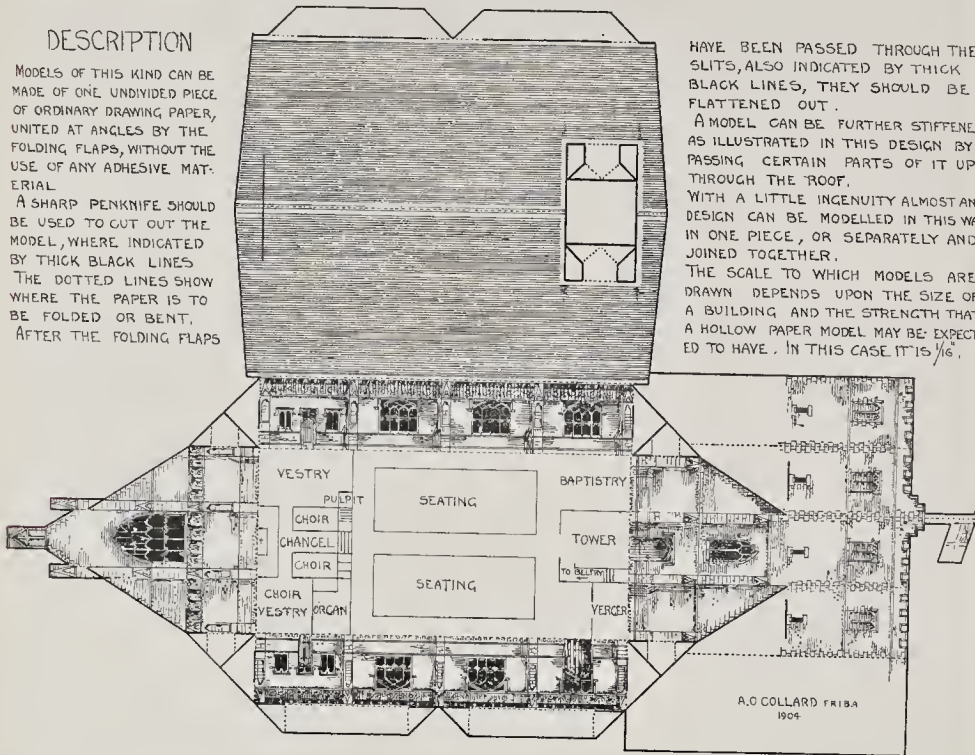

Diagram of Construction of a Paper Model. By Mr. A. O. Collard, F.R.I.B.A.

we wish to emphasise in connexion with the Drimadown Power Station is that power is transmitted for twenty miles by underground mains at a pressure of 10,000 volts. The engineer tells us that there has not been the slightest trouble in working at this pressure since the station opened, about a year ago. It seems to us that the Parliamentary Committees should not sanction the claims made by many of the power companies—the London County Council amongst others—for permission to erect overhead mains without the closest scrutiny and a clear statement of the additional cost required for underground mains. The use of electric power for industrial purposes in London will probably increase enormously in a few years, but there is plenty of room for extension in most of the existing power stations. Owing to the great progress that has been made in electrical engineering, the mechanical and electrical problems involved admit of easy solution, and there is no reason for treating the promoters of the power Bills more leniently than the local authorities whose streets they are seeking permission to break up.

PAPER MODELS OF BUILDINGS.

We give an illustration, from a drawing by Mr. Allan O. Collard, architect, of Buckingham-street, showing his method of making up a model of an architectural design out of elevations drawn on paper, and then put together. Mr. Collard writes:—

"The idea shown by the plan illustration, reduced from an eighth to the inch scale, was partly the result of a desire to show to a client, quickly and cheaply in model form, the general appearance of a proposed building. When drawn in some such way as suggested, and coloured, it can be cut out with a penknife and be united at the corners in a few minutes, the angle flaps rendering any adhesive fixing quite unnecessary.

A complete model is astonishingly substantial

considering it is only made of ordinary drawing paper.

A large building of complicated plan could be treated with similar ease, by making some

of the blocks separately, though, of course, there may be limitations to the process. The small illustration is from a model actually made, to show how the idea works out."

SCHOOL, GLASGOW.—The Hayfield Public School, Glasgow, has just been opened. The school, situate at the junction of Rutherglen-road and South York-street, is a red stone three-story building, Italian Renaissance in character, and covering about 1,863 sq. yds. There are in all twenty-four classrooms, twenty-one of which have a southern aspect. The classrooms seat nearly 1,500 pupils. Accommodation for drill and marching is afforded by the central hall, which is 64 ft. long by 28 ft. broad. The walls of the rooms are timber-lined for 5 ft. up, those of the hall, passages, etc., being tiled to the same height. The architect is Mr. John Hamilton, I.A.

DIARIES AND ALMANACS.

VERY little can be added—except to mention certain new features—to what we have said in previous years concerning the "Mechanical World Pocket Diary and Year Book" for 1906 (Emmott & Co., Ltd., Mechanical World Offices, Manchester). A short section on the Steam Turbine, by Mr. R. M. Neilson, contains a concise account of and practical data as to seven varieties of this essentially modern type of prime mover. Another new section on Refrigerating Machinery, Ice Manufacture, and Cold Storage seems scarcely necessary in a handbook of this class, owing to the somewhat special character of the subject. Other additional information that is perfectly appropriate relates to High-speed Steel Tools, Screw Threads, the Strength of Crane Chains, Shaft Bearings, Gas and Oil Engines, and sundry matters of everyday interest to mechanical engineers and contractors. The table giving Factors of Evaporation, for use by engineers and boiler owners, has been extended by the inclusion of pressures from 150 lb. up to 300 lb. per square inch, and by doubling the number of temperatures for which factors are given. This is a desirable and perfectly appropriate addition to a convenient book of reference.

Messrs. Waterlow Bros. & Layton, Ltd. (Birchin-lane, E.C.), have sent us a copy for which we will publish, and the excellence of which we have often referred to. The diary portion gives one day to a page, and there is an index in connexion with it. The rest of the work consists of all that useful information generally to be found in a publication of this kind, such as lists of members of the various professional bodies, the London Building Act, 1894, and the Amending Acts of 1898 and 1905, and much other matter of interest to professional men. The diary is published at 3s. 6d. and 6s., according to the binding.

From Messrs. Hudson and Kearns (Stamford-street, S.E.) we have received specimens of their excellent blotting-pads for 1906. The principal pads are No. 8A and the "Banker's," each of which consists of blotting-pad, blotting-pad diary, and date remembrance, while No. 8A has provision for standing memos. These and other specimens are neat in appearance and very convenient in form and arrangement, and leave little or nothing to be desired.

The "City Diary" for 1906 (W. H. & L. Collingridge, 148 and 149, Aldersgate-street, E.C.) is the forty-third annual edition of a useful little diary containing much information as to City matters. The diary proper gives three days to a page, and is interleaved with blotting-paper. It is well bound and neat, and is published at 1s.

The "Gloucester Diary" (published for the Gloucester Railway Carriage & Wagon Company, Ltd., Gloucester) is well bound and convenient in size, but unfortunately the back of each diary page shows an advertisement.

Messrs. L. & C. Haridmuth have sent us one of their "Koh-i-Noor Pencil Calendars."

Messrs. Edward Wood & Co., Ltd., constructional engineers, Cannon-street, E.C., have issued a neat little pocket diary for 1906. It contains tables of Safe Loads for Compound Girders and Stanchions, which have been considerably augmented.

Messrs. Ashwell & Nesbit, Ltd., engineers, of London, Leicester, Manchester, and Nottingham, have again issued their Shaking-spear tear-off date indicator. The indicator is suitable for office use, as the figures are of good size.

Books.

The Architects' Law Reports and Review (illustrated). By ARTHUR CROW, F.R.I.B.A.; Legal Editor, A. F. Jenkin, of the Inner Temple, Barrister-at-Law. Vol. II. (London: Printer for Arthur Crow, 18, Great Prescott-street, E.C. 1905.)

The second volume of "The Architects' Law Reports and Review," Vol. I. of which publication created a new departure in this form of literature, contains much information of use to that public whose requirements it is intended to serve, and who are particularised on the cover as being "architects, surveyors, engineers, and others interested in the laws affecting buildings and streets." It is stated in the Introduction that it was originally suggested that this work should be regularly issued in quarterly parts, but this scheme seems to have been abandoned, and apparently the publication of future volumes will depend upon the importance of the decisions given in the courts dealing with the subject matter this publication is concerned with. In the volume before us the first ninety-three pages constitute the Review, whilst the Reports fill 249 pages. Of the Law Reports themselves it is sufficient to say that they are reprinted, by permission, from the *Law Times* and the *Justice of the Peace*, and, therefore, their excellence and accuracy is assured. Certain plans and photographs have been published with them, and these may lend an additional interest to the Reports in the eyes of the lay reader, but will be accepted with caution by any lawyer, unless they were formally proved and put in evidence at the trial, a fact which will always be stated in the report. The cases contained in the Reports are grouped under alphabetical headings, and there is an index both to the names of cases and to their subject matter. The volume also contains what are termed "Accumulating Subject Indexes"—should not this be "Indices"?—this, in reality, is a digest under similar headings of the cases reported in the two volumes which have been issued, and thus every facility for reference has been afforded. The Reports are preceded by "Legal Notes," which are chiefly confined to some comments on the law regulating single private drains and by-laws as to lodging-houses. These notes appear to us written with rather more boldness than discretion. For instance, the statement that the Court of Appeal had no jurisdiction to hear the appeal in the case of *Thompson v. Eccles Corporation* seems unnecessarily daring in a publication of this

description, and the notes generally appear framed rather with the view of criticising the judgments than of assisting the reader, and especially the lay reader, to a comprehension of the law which is binding upon him.

The first portion of the Review is devoted to the London Building Act of 1905—the Act which is intended to secure greater security from fire in the metropolis. There is an excellent Introduction, and the text of the Act is published with notes containing cross references and references to decided cases which should be most useful. This part of the work especially commends itself to us. The Act in question is one of those numerous "Private" Acts of Parliament which deal with matters of primary domestic importance to the public, and which are extremely difficult for that public to obtain information upon or to refer to. If we may make a suggestion to the editors in a most friendly spirit, it is that, in future publications of this Review, they should extend this part of their work even to the exclusion of so many reports of cases. We think, in doing this, they will be rendering a valuable service to those classes they intend to assist. Full reports of cases are not of so much assistance to the public this publication is intended for, except in cases when construction or drainage systems, etc., are entered into in detail, and, as a rule, a headnote, or a note in popular language, stating the effect of the decisions, is equally serviceable to the layman. Full reports of cases, moreover, in the space available, cannot be carried out exhaustively, thus, in the volume before us, only two cases on Workmen's Compensation are given, whereas, in the period covered by this issue, there are numerous decisions equally important and equally *ad rem*; but a publication of Acts of Parliament with notes such as the above, brought out as quickly as possible after the measures are passed, supplies a felt need, especially in the case of "Private" Acts, and we congratulate the editors on having engaged in this enterprise. The Act is well indexed, and the volume also contains papers on "Building By-laws and Rural Architecture," and "Matched-Lined Buildings and Escape from Fire."

Knights' Annotated Model Bye-laws. Seventh Edition. Edited and Revised by WILLIAM A. CASSON, of the Middle Temple, Barrister-at-Law of the South-Eastern Circuit; late of the Legal Department of the Local Government Board. (London: Knight & Co., Local Government Publishers, 1905.)

The first edition of this work was published twenty-two years ago, the present author being associated in that and the subsequent editions with Sir Richard Thorne-Thorne and Mr. P. Gordon Smith. Owing to the death of these gentlemen, the present author has been left to edit this last edition alone, although, as he explains in a somewhat curiously worded paragraph at the end of the Preface, he has received assistance from other of his late colleagues still associated with the Local Government Board. Perhaps the most important feature of the present edition is the inclusion of the Local Government Board's model code of by-laws for urban districts of 1904 and the model rural code of 1903. With regard to the rural by-laws, the author with a touch of officialism accuses the public of entirely failing to appreciate the real issues involved in the application of by-laws, but he himself refrains from alluding to the real point at issue—the discretion vested in local authorities to adopt by-laws unsuitable to particular districts. This work is invaluable to those in any way connected with local government, and, as the tendency to legislate by by-law is increasing, the demand for such a work must be the greater. The present edition consists of 342 pages and an index, and seems well edited and brought up to date. One or two of the recent cases on invalid by-laws in connexion with common lodging-houses might possibly have been included with advantage.

The Painter's Pocket-book. A reference guide in everyday work. By PETER MATTHEWS. (London and Manchester: John Heywood, 1905. 3s.)

This is a conveniently shaped book for carrying about, containing practical information in

relation to house-painters' work. It contains a list of permanent and non-permanent colours, a table of combinations of colours for producing various tints; advice as to dealing with a great number of practical difficulties in connexion with defects arising in old work or from the nature of the materials to be painted, etc.; hints on practical geometry and setting out work; examples of various forms of lettering, etc. It seems a thoroughly practical little book, and likely to be very useful to painters.

"STANDARDISING" BILLS OF QUANTITIES.

SIR.—With reference to the several letters appearing in recent numbers of your valuable paper relative to the proposed standardising of quantities, the Council of the Quantity Surveyors' Association beg to state that they have had the subject under discussion for some months past (*vide* our issue of April 22, 1905, page 435, entitled "A Plea for a Uniform System of Measurement in England," and also that of June 3, 1905, page 535, entitled "Practice of Our Profession and Suggested Reforms"), and propose in due course to call a meeting of the various interested bodies to consider the matter.

P. B. HOLZES,

Hon. Secretary and Treasurer
Quantity Surveyors' Association.

DRILL HALLS AND GYMNASIA.

SIR.—At a public meeting recently held at Royston (pop. 3,500) it was decided to try and raise a sufficient sum of money to build a drill hall and gymnasium with a false floor, under which a swimming bath should be built for use in summer. At a committee meeting held later it was felt that it was desirable to try and get information from towns where similar buildings existed, and that the best means of getting to know what towns possessed buildings of this description would be through the columns of your paper, if you would be kind enough to insert this letter.

Names of such towns and any information regarding probable cost of erection and subsequent upkeep would be gratefully received by me.

C. F. WHITMAN.

Royston, Herts.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—I.

Introduction—Mathematical Signs.

FEW words will suffice to make clear the general aim of the articles commenced in the present issue. The possibility of misunderstanding may be prevented if we state at the outset that the series is not intended to constitute a mathematical treatise, although some simple branches of mathematics will necessarily be discussed.

After collecting and defining mathematical signs, symbols, and terms in convenient form for reference, we purpose to deal briefly with some labour-saving methods of performing calculations such as fall within the province of architects and others engaged in work connected with the design, construction, and equipment of buildings. Simplicity will be the keynote throughout, for simple methods are generally best suited for practical men, who regard mathematics merely as a means of arriving at approximately accurate results, and have other absorbing interests that debar them

from attaining those lofty levels where mathematical science is looked upon as an end and almost becomes a religion to its devotees.

Having dealt sufficiently with methods of computation, we propose to give selections of formulae, memoranda, tables and diagrams, such as appear to us most likely to be of service to students of building construction and allied subjects.

Modern science has advanced so rapidly that several subjects now brought within the daily practice of architects cannot be thoroughly familiar to all.

There are only two correct ways of dealing with problems arising out of unfamiliar departments of work. One is to invite the co-operation of a consulting engineer, and the other for the architect to become his own engineer.

One of our objects in presenting this series of articles is to help the rising and present generation of architects to become more dependent upon their own knowledge in dealing with subjects occupying a subsidiary place in ordinary curriculum of study, or lying beyond its limits.

One of our objects in presenting this series of articles is to help the rising and present generation of architects to become more dependent upon their own knowledge in dealing with subjects occupying a subsidiary place in ordinary curriculum of study, or lying beyond its limits.

Multiplication is also indicated by placing two factors closely together. Example: $ab = a \times b$.

A dot placed in front of one or more figures indicates that the quantity is a decimal fraction.

: : This sign has two meanings. (1) Indicating multiplication. (Rare.) (2) Signifying *as is, equal to, or is equal to*.

In this sense the sign is used to denote proportion, or the equality of ratios.

÷ Indicates geometrical in contradistinction to arithmetical proportion. (Rare.) Example: $m : a :: b :: c : d$.

— Division is very generally indicated by placing the dividend above a horizontal line, and the divisor below the same line.

÷ Division is also frequently indicated by this sign, which has the advantage of saving space. Example: $6 \div 3$.

/ Division is sometimes indicated by placing the dividend before a sloping line, and the divisor after the same line. Example: $6/3$.

÷ Division can also be indicated by this sign. (Rare.)

• Division can also be indicated by two dots one above the other, but the more general application of the sign so formed is to indicate ratio.

• When placed between two symbols or numbers, this sign signifies *is to* or *the ratio of* one factor to the other.

• Because, or hence.

> Is greater than. Example: $3 > 2 = 3 - 2 = 1$ is greater than 2.

< Is less than. Example: $2 < 3 = 3 - 2 = 1$ is less than 3.

≥ Is not less than. Example: $2 \geq 2 = 2$ is not less than 2.

≤ Is not greater than. Example: $3 \leq 3 = 3$ is not greater than 3.

∞ Infinity, infinite, or indefinitely great. This sign is employed to indicate a quantity greater than any finite or measurable quantity.

∞ Infinitesimal, or indefinitely small. This sign has three uses:— (1) As the numeral *naught*.

(2) As a symbol indicating zero. (3) As a symbol indicating infinitesimal, or indefinitely small.

∠ Angle. Example: $\angle ABC$ is the angle ABC .

∧ The angle between. Example: $A \wedge B$, or $A \wedge B$, that is, the angle between the lines A and B .

∩ This sign is a less common sign denoting an angle. (Rare.)

⊥ Right angle. Example: $\angle ABC$ is the right angle ABC .

⊥ Perpendicular, perpendicular to, or is perpendicular to.

∥ Parallel, parallel to, or is parallel to. Example: Draw $AB \parallel CD$ = draw AB parallel to CD .

∦ Not parallel, not parallel to, or is not parallel to. Example: $EF \not\parallel GH$ = the line EF is not parallel to the line GH .

∇ Equiangular, or is equiangular to. Example: $ABCD \nabla EFGH$ = the square $ABCD$ is equiangular to the square $EFGH$.

⊚ Equilateral, or is equilateral to. Example: $ABC \oslash DEF$ = the triangle ABC is equilateral to the triangle DEF .

○ Circumference of a circle. ○ Circle. ◌ Semicircle. ⌒ Arc of a circle.

□ Quadrant. △ Triangle. ▣ Square. ▢ Rectangle.

° Degrees in angular measurement, also in thermometric measurement.

' Minutes in angular measurement, and in measurement of time, and feet in linear measurement.

'' Seconds in angular measurement, and in measurement of time, and inches in linear measurement.

— Vinculum, placed above figures or factors meaning they are to be taken together. Example: $(4 + 2) + a + b$.

() Bracket, meaning that the figures or factors enclosed are to be taken together. Example: $(4 + 2) + (a + b)$.

[] Bracket enclosing smaller brackets, also meaning that the enclosed quantities are to be taken together. Example: $[a \times (4 + 2) + 3] + [c \times (a + b) - d]$.

{ } Bracket enclosing the preceding terms of a bracket. Example: $\{ [8 \times (4 + 2) + 3] \}$; $\{ e [c \times (a + b) + d] \}$.

√ Root, or radical sign—a modification of the initial letter of the Latin word *radix*.

When used without a small numeral above it, this sign indicates square root.

To denote any other root a small figure indicating the degree of the intended root is placed above the sign.

Examples: $\sqrt{4}$ = the square root of 4; $\sqrt[3]{4}$ = the cube root of 4; $\sqrt[4]{4}$ = the fourth root of 4; and so on.

The root of a quantity is sometimes denoted by a fraction in small characters placed after and near the top of the quantity, the denominator of the fraction indicating the degree of the intended root.

Examples: $4^{1/2}$ = the square root of 4; $4^{1/3}$ = the cube root of 4; $4^{1/4}$ = the fourth root of 4; and so on.

Index.—A small number or letter placed after and near the top of a quantity is termed an index, and indicates the power to which the quantity is to be raised.

Examples: $a^2 = a \times a$, or the square of a ; $a^3 = a \times a \times a$, or the cube of a ; $a^4 = a \times a \times a \times a$, or the fourth power of a , and so on.

When the index is preceded by the *minus* sign, the reciprocal of the corresponding power is indicated.

Examples: $a^{-1} = \frac{1}{a}$; $a^{-2} = \frac{1}{a^2}$; $a^{-3} = \frac{1}{a^3}$.

OBITUARY.

MR. SANG.—Mr. Frederick Sang, the once well-known decorative artist, died at Tynford Abbey on December 27 in his ninety-third year.

MR. W. H. R. CRABTREE, Borough Surveyor of Doncaster, died on the 27th ult. at the age of forty-eight. Mr. Crabtree was born at Manchester in 1857, and was the son of Mr. Wm. Crabtree, who was for many years Borough Surveyor of Southampton.

romenade extension works. In 1879 he carried out extensive works under the late Mr. Mansergh, and seventeen years ago was appointed Borough Surveyor of Doncaster. Many important schemes and works of street improvement have been carried out at Doncaster under his direction, including the electricity works, the tramway scheme, and the erection of Corporation schools. He had just completed plans for carrying out three schemes, comprising the erection of a Municipal Secondary School, the erection of Corporation elementary schools, and a model lodging-house, at a cost of over 50,000. Mr. Yerkes leaves a widow and seven children.—*Yorkshire Post.*

MR. YERKES.—Mr. Charles Tyson Yerkes, who died in New York on December 29 in his sixty-ninth year, held large interests in several railway and tramway schemes in both this country and the United States. His parents were Quakers of Philadelphia, where he was educated in the Quaker and High schools. By his own preference he began life in a very humble capacity, his first regular employment being a clerkship in Messrs. James P. Ferot & Brother's flour and grain warehouse, and then as cashier, at an annual salary of 600, in Philadelphia. In 1868 he became a stock-broker in that city, and later came eastwards to buy a banking business there. His fortunes were for a while adversely involved in the financial panic which followed the great fire at Chicago; and, being heavily indebted to the corporation, he was compelled to suspend payment and to make an arrangement of his property. The result was that he lost the right of the exercise of their legitimate rights as ranking amongst his creditors, and he, obliged to submit, suffered a term of civil imprisonment. Mr. Yerkes, however, speedily recovered from that disaster: in 1873 he speculated heavily in stocks of all kinds upon his discharge from any creditor, and in a short time he had acquired a large fortune. He became owner of the 17th and 19th Street Railway and similar undertakings in Philadelphia. Enlarging the field of his enterprises, he built a loop-line to connect all the elevated and other railways into one system, having an aggregate mileage of 500 miles in Chicago, and he opened a branch line and acquired extensive railway interests in New York. With his co-capitalists he gradually acquired control of several local tramways, changing the motive power from horse to cable. Five years ago he came to London where he realised that a fortune lay in the similar schemes for passenger traffic, and as chief promoter of the "Yerkes-Perks" syndicate, began operations for the construction of tube railways, worked by electricity, traversing London in various directions. For one of these schemes, the Baker-street and Waterloo station line, which is nearly completed, he placed the contracts with British companies and was solicitor for the employment of only British labour. He was chairman of the Underground Electrical Railways Company, who are owners and constructors of the Baker-street and Waterloo, the Charing Cross, Euston, and Hampstead, and other suburban railways, and he carried out the contracts for the Metropolitan, the Metropolitan and District lines. Mr. Yerkes presented the big telescope to the observatory he founded at Lake Geneva, Wisconsin, and evinced his artistic tastes in forming a remarkable collection of pictures in his residence at New York. Mr. Yerkes, who married twice, leaves a son and a widow. He bequeaths his art collections and two houses in Fifth-avenue to the Metropolitan Museum of Art; the bequest, valued at five million dollars, comprises twenty-three rugs, which, it is said, are the finest and most valuable known.

GENERAL BUILDING NEWS.

MISSION CHURCH.—St. GEORGE, BRISTOL.—The new mission church of St. Ambrose, Stratford-road, St. George, was dedicated on the 21st ult. This new church, together with the classrooms, has been erected by the vestry of St. John the Baptist, Bristol, and it consists of the mission church, which will accommodate 300, together with two large classrooms with accommodation for 1,000 persons. The architect for the building is Mr. H. C. M. Hirst, and the contractors Messrs. E. Walters & Sons.

BUILDING IN DUNDEE.—With the cry that is at present very general for the creation of garden cities and the transfer of the people from the crowded central cities to outlying areas, it is curious to note that during the past year the building trade of Dundee has been given over chiefly to the construction of large blocks of tenements such as are already so numerous in the city. On former occasions certain districts of the city were noted for the erection of tenements, but this year all quarters of the city present a large block of dwelling-houses erected. There are at present in course of erection in the city thirty-two tenements, twenty villas and cottages, two shops, and one warehouse.

The Corporation undertook a large number of contracts during the year, the most important of which were in connexion with the scheme for providing work for the unemployed. This scheme embraced new streets or improvements on existing ones, and represented an expenditure of between 6,000, and 7,000. The Craig-street Markets were considerably remodelled, and shops erected on the west side at a cost of about 1,000; while wash-houses have been erected in the West End costing over 6,000. The year, on the whole, has been a very steady one for the workmen, for although there has been no work of any magnitude other than the Courier building, the large number of tenements and villas have kept the various tradesmen well employed. There were no disputes during the year, and wages ruled as formerly.—*Dundee Courier.*

BRADFORD CENTRAL FREE LIBRARY.—On the 18th ult. the Mayor of Bradford reopened the Bradford Central Free Library after extensive alterations and rearrangements which have been carried out during the past eighteen months. The removal of the art gallery to the Cartwright Hall in the spring of last year rendered the large room hitherto used for picture exhibitions in the uppermost story of the Darley-street premises available for an extension of the Free Library, and work towards this end has been proceeding since that time. The whole building has been subjected to an entire reorganisation, an important part of the work being the adoption of artificial ventilation. The old art gallery has been divided into four sections, the part nearest the entrance being reserved as magazine-room. A considerable part of the accommodation is devoted to the reference library, with tables for casual readers, and there are in addition two smaller rooms. The room on the floor above, divided previously between the magazine readers, the reference library, and the ladies' reading room, has now been reserved, and will provide accommodation for the leading library, a very much enlarged reading-room for ladies, and a work-room for the staff. The space vacated by the leading library at the side of the newspaper-room, has made an addition to the accommodation for newspaper readers. The whole building has been redecorated, and alterations of a minor character have been made. The total cost of the whole work, which has been carried out to designs by the City Architect (Mr. F. E. P. Edwards), has been about 3,000.

ISOLATION HOSPITAL, AMPHILL.—His Grace the Duke of Bedford recently opened the new Isolation Hospital which has been built in the parish of Steppingley, for the Amphil Rural and Urban District Councils, at a cost of nearly 10,000, not including the site. The new hospital, which is situated about three-quarters of a mile from Flitwick station, is a hospital for twenty beds, and for the simultaneous isolation of three diseases, which do not include small-pox, provision for that disease having been already made in an iron building about half a mile nearer Millbrook. The buildings consist of five blocks. The administration and isolation blocks enclose a hollow square, outside of which and a little to the north stands the laundry and disinfection block. Most of the front elevations have a southerly aspect. The hospital was built from the design of Mr. H. Percy Adams, and the contractor was Mr. S. Foster, of Kempston, whose foreman on the works was Mr. F. Taylor.

HIGHWAY OFFICES, LEEDS.—The new highway offices of the Leeds Corporation, which have been erected in Kirkstall-road, were opened on the 19th ult. The building has been erected by Messrs. Charles Myers & Sons, contractors, of Woodhouse, the architect being Mr. W. Bruce, of Leeds.

THEATRE, SOUTHSEA.—A new theatre is to be erected at Southsea, at the junction of Albert-road and Exmouth-road. The plans have been prepared by Messrs. Frank Matcham & Co., of London, and the theatre, to be known as the King's, will be built of fireproof materials, and lighted by electricity, and will accommodate about 3,000 persons. The principal elevation is to be towards Albert-road, and there will be a tower at the angle, with entrances to the stalls and dress circle. The doors giving access to the other parts of the house will be situated at the eastern end of the building, and between this and the tower several shops will be erected. On the Exmouth-road side there will be additional entrances and exits.

BUILDING IN HALIFAX.—During the year the Halifax Corporation Improvement Committee have had 276 plans submitted for their consideration, and 236 were approved. The latter number was made up as follows: New streets, 15; alterations to public buildings, 1; mission-rooms and farm buildings, 27; cattle and cart sheds and trade premises, 48; motor houses, 2; and green-houses and minor buildings, 140. The houses certified fit for occupation number 170, and are distributed amongst the wards as follows:—Blingworth, 9; Ovenden, 10; North, 12;

Kingston, 15; Skircoat, 60; Pellon, 23; Copley, 9; Southowram, 4; Wadley, 3; Southowram, 1; and Akroydon, 24. The foregoing statistics have been prepared by Mr. Tylecote, Deputy Borough Engineer.

PUBLIC HALL, EPWORTH, YORKSHIRE.—A new building, to be known as the Imperial Hall, erected by a company at Epworth at a cost of 1,000, was opened on the 20th ult. The hall is in Chapel-street, and comprises a public-room, with accommodation for over 400 people, and two rooms at the back, measuring 12 ft. by 11 ft., and there are two entrances, with ticket office and lobby. There is a billiard room, 30 ft. by 24 ft., with reading-room, 12 ft. by 12 ft., at the rear. The building, the plans for which were prepared by Mr. Henry Kelsey, architect, Epworth, has been erected by Messrs. Kelsey Brothers, Epworth and Goole.

BANK, HULL.—The new premises of the Halifax Commercial Bank are situated in White-Inn-gate, Hull. The lower story, to a considerable height, is built of black Labrador pearl granite, with bands of red Aberdeen. The upper stories are of coarse millstone grit, from the Halifax district. The interior of the bank hall is paneled in oak. The floors are of granite and concrete, finished with mosaic terrazzo and wood blocks. The architects are Messrs. Walsh & Nicholas, of Halifax. Mr. George Houlton, Baker-street, was the contractor; Messrs. J. Houlton & Sons, joiners; Mr. J. G. Mason, mason; Mr. W. G. Padgett, plumber; Mr. T. W. Bailey, painter; and Messrs. Williamson & Co., slaters.

THEATRE, POPLAR.—The new Prince's Theatre in the East India Dock-road was opened on the 23rd ult. The building was designed by Messrs. Owen & Ward, architects, of Birmingham; and it has been erected by Messrs. Kirk & Kirk, of Westminster. There is accommodation for an audience of 2,500. The auditorium is 78 ft. deep from the curtain line to the back of the pit, and it has a clear width of 61 ft. The stage is 60 ft. in width and 41 ft. deep from the curtain line, and the grid is 54 ft. high from stage level. At the rear are arranged the dressing-rooms, seventeen in number, heated, and fitted with lavatories with hot and cold water. The principal elevation has a frontage of 60 ft. to East India Dock-road. It is of red brick with buff terra-cotta facings, supplied by the Hathern Station Terra-cotta Company. The building is equipped with fire hydrants and appliances supplied by Messrs. Motleyweather & Co. The decorations of the auditorium, which are in the French Renaissance style, have been executed by Messrs. F. De Jong & Co.

PRESBYTERIAN HALL, SIX BELLS, ABERDEEN, MON.—The memorial hall of a new hall, which is being erected in connexion with the Presbyterian Forward Movement, were laid recently at Six Bells. The building comprises a chapel and schoolroom, accommodation being provided for 700 people in the former, and 400 in the latter. It is built in the Gothic style, of native dressed stone, faced with native polished stone and in many parts of Dean stone dressings. The schoolroom will be underneath the chapel. There are galleries all around the chapel, with an organ platform arranged in the centre of the gallery at the rear of the rostrum, with a vestry underneath. The seats, rostrum, and inside fittings will be of pitch-pine, with which the ceiling will also be panelled. A heating chamber is provided under the schoolroom, and the entire building will be heated on the hot-water principle. The contractors are Messrs. D. W. Richards, Ltd., Newport, and the work is according to the designs, and is being executed under the supervision of Mr. R. L. Roberts, Aberdeen, the total cost being about 2,300.

BUILDING IN NEWCASTLE-ON-TYNE.—Though the past year has not been marked by the general activity that characterised some recent years, a fair amount of work has been got through. The prospect for the coming twelve months is, however, not so promising. In many parts of the centre of Newcastle business premises have undergone demolition and reconstruction, more in accord with modern ideas of light and space, and this class of work, as one can see on a perambulation of many of the central thoroughfares, is yet far from accomplished. Collingwood-street is rapidly taking rank with the best streets in regard to architectural features, and the transformation of Pilgrim-street proceeds steadily. A large amount of property has been razed to the ground in connexion with the Market-street extension to New Bridge-street, whereby the east end of the Central Station will be brought into more direct communication, and the pressure of traffic of Blackett-street and the east end of Grainger-street considerably relieved. This latter scheme was adversely criticised by Mr. J. T. Cackett in his presidential address to the Northern Architectural Association a few weeks ago, when that gentleman expressed the opinion that one of the most desirable improvements would be to add to the usefulness of Percy-street—and thus relieve Grainger-street—by either improving the approach to it or making a new

street to the north of Clayton-street. A street from the Monument to the Haymarket he also thought desirable, and he trusted the building of a free high level bridge across the Tyne would not be long postponed. The present scheme, which he regretted had been postponed *sine die*, he thought provided an admirable route through route from High-street, Gateshead, to the North-road. The latest improvement undertaken by the Council—he referred to the Market-street extension—would, if properly carried out, prove one of the greatest boons to the city since the days of Grainger; for it duplicated New Bridge-street, and so might relieve it of the great amount of through traffic which so congested it now. But when they looked at the details of the scheme, it seemed to leave much to be desired; and, in his opinion, it was a striking example of shortsightedness. Continuing, Mr. Gackett said that apart from the centre line there was nothing in the scheme worth preserving, and that it had been conceived in the most parochial spirit. His criticism of the Market-street extension had tempted him to consider whether, by dealing with the matter as Grainger and Dobson certainly would have done, there was not room for a magnificent improvement to this part of the town, which would also be financially successful. The great expense of the scheme lay in the purchase of all the property between New Bridge-street and New Market-street and the old property to the south of New Market-street. With, he thought, one or two unimportant exceptions, all the property in this area was old, and there were schemes for rebuilding a very considerable portion of it. Were this property brought up and the area laid out as he had planned, they would have blocks commensurate with modern requirements, and with frontages that would command prices that would go far to pay for the scheme, even if it did not do more. He did not think the most extravagant reconstruction would produce a finer or more appropriate site for municipal buildings.—*Newcastle Journal*.

BUILDING IN SHEFFIELD.—"The year has been a bad one, but the outlook is not altogether gloomy." In this sentence an expert summed up the state of the building trade in Sheffield to our representative. Building is still keeping in front of the demand by tenants. This applies to all classes of houses, and especially to middle-class houses from 200 to 400. Fairly large houses which have previously been rented at more than 40l. are not now fetching so much. This is the more noticeable in the case of houses which are not on or near to the tram routes, while there is still a strong movement by people who have been accustomed to living within walking distance of the centre of the city to go to the more distant suburbs where the trams help them. But suburban houses that are not near the tram routes are a bad speculation. Expert opinions as to the condition of the cottage property market are conflicting. One has it that it has not been so bad in Sheffield for many years; another holds that there are not quite the number of empty houses that there were a year or even two years ago, for the simple reason that many cottage builders have cried halt, and fewer now have been built. In any case, statistics show that there has been an inclination during the year to build half a dozen cottages instead of a dozen. The realisation of that class of property has been bad all through the year. So far as Corporation building is concerned it may be said at once that partial failure has attended the departure of building lock-up shops in the blocks of flats which have been erected in Sing-hill and Skales-moor. The controversy which has been going on for some time as to the expense of erecting dwellings for working classes at such a rate as to enable the Corporation to let them at a rent which could be paid by the average worker, has resulted in the carrying-out of a scheme at Wincobank. Official figures obtained from the City Buildings Inspector (Mr. Green) show that while he and his staff have been fairly busy they have not had so much to do as last year. There has been a marked decrease in the number of plans deposited. Last year there were 1,530, but this year, up to December 20th, there have been only 1,288. Of these 974 have been approved, as compared with 1,093 last year. Sanctioned on those plans were 2,076 houses—451 fewer than twelve months ago. Plans have been approved for 661 buildings of a general description. Here, again, the decrease is considerable, since in 1904 there were erected 777 general buildings, and the same remark applies with even greater force to the number of houses certified. Of these there have been 1,191, whereas in 1904 there were 1,963; while there have been 392 other buildings of a general description written off as satisfactorily completed. Last year there were 371. A large number of dangerous structures have been dealt with, and a good deal of attention has been paid to the means of exit from various public buildings and workshops. There have been comparatively few large and important buildings completed during the year. First and foremost is the University. One of the largest plans submitted during the year was

that for no fewer than 87 houses in Anns, Fryem- ing, and Mill-hill roads, in the Olive-grove district. A glance at the list of principal plans submitted during the year indicated that extensive develop- ments have been made in the church and chapel life of the city, and mission halls and parish rooms have not been at all few and far between.—*Sheffield Independent*.

THE UNITED SERVICES CLUB.—Recently it was decided to modernise and renovate the club entirely. The work carried out is as follows, viz.:—The entire re-decoration of the club from top to bottom; a large addition to the smoking-room on the ground floor, making this noble room still more spacious; the conversion of a large portion of the basement into the "Shone" system; electric passenger lift from basement to first floor; new heating system and additions to the cooking apparatus; additional staircases, and alterations and improvements to the kitchens, parlours, and offices generally. The work has been carried out under the direction of Messrs. Isaacs & Florence, architects. The manage- ment system has been carried out by Messrs. Shone & Ault. The general contractors were Messrs. Aldin Bros. & Davies, of South Kensington (whose contract amounted to nearly 15,000l.), and the personal supervision of the work under the personal supervision of their manager, Mr. Leslie Shingleton, assisted by Mr. Robinson, their general foreman, Mr. Sutton acting as clerk of works. The Otis Elevator Co. supplied the electric passenger lift; Messrs. George Jen- nings the sanitary fittings; and Messrs. J. Slater the heating and cooking apparatus.

THE YORKSHIRE BUILDING TRADE.—There is remarkable unanimity in the tone of the reports from the big centres of Yorkshire as to the state of the building trade during the past year. In nearly every instance the word "depressed" summarises the position. In many cases the towns are over-built, in some slackening of municipal enterprise has had an unfavorable influence, and bad trade generally is the dominant factor. Thousands of joiners, bricklayers, masons, and plumbers are either out of work or working short time. According to the latest official returns, the percentage of trade union members unemployed among carpenters and joiners at the end of November, though smaller than last year's percentage, was 10½. The percentage of unemployed plumbers was higher at the end of last month, being 11½, as compared with 10½ at the same time last year. One effect of the slackness in the building trade has been a corresponding depression in the fire-clay industry. The price of material has varied during the year. Lead has gone up in value lately, but common bricks have been rather cheaper during the last month or two. Certain kinds of timber have fallen in price, but generally speaking this class of material is dearer than it was a few years ago. As to the future, there is generally a more hopeful tone, and it is anticipated that the present year will be more active than the year that has passed. This feeling is entertained in Leeds. Here 1905 has been a very uneventful year. A few large schemes have been conceived of or commenced. But big schemes of any kind are very scarce. The most important is the new sewage scheme which the Corporation have just decided upon. The number of empty houses in the city—reckoned by thousands—does not encourage speculative building. Never in modern times, it is said, have building operations been so scanty in Bradford, but in the Huddersfield district a good number of cottages and middle-class houses have been put up. A few new mills and weaving sheds have also been erected, and extensions of mills have been carried out in Hindesfield and The Colne, and Holme Valleys. It is probable, however, that but for the extensive buildings that are being put up at the West Riding Asylum at Storthes Hall short time would have had to be resorted to. Many men in Hull are out of work, and the amount of unemployed property is a very disquieting feature of the situation. Good progress is being made with the new law courts, and the second part of the new City Hall is pretty well advanced. From Hull to Halifax is not a far cry, and a similar story of slackness is told in the West Riding town. The new Halifax Theatre Royal having been finished, no new large buildings are rising. Not much speculative building of any kind is going on, but there will be more activity in this direction early in the new year. The two large contracts in the York district—the North-Eastern Railway offices and the new Asylum at Naburn—are completed, and with one exception there has been no work of the warehouse type. Extensive private street works have been undertaken, but the building of cottage property and private residences has been reduced to a minimum. In the latter respect Harrogate has a rather different tale to tell, a fairly large amount of medium and cottage property having been built in the popular watering-place. It must be remembered that about a thousand new houses have been built since 1901, about 125 of them during the past year. The new Free Library is practically

completed. There is considerable work in hand in the conversion of private property into shops and business premises. Here, as elsewhere, the year ends with a brightening prospect.—*Yorkshire Post*.

BUILDING IN ABERDEEN.—The past year has not been prosperous for the Aberdeen building trade. The revival that is taking place in the general industry of the country has not yet begun to make itself felt in the trade, and 1905 must be regarded as one of the very leanest years in the experience of Aberdeen builders. So far as prospects for the immediate future are concerned, it cannot be said that the outlook is at all cheerful. It is the misfortune of builders that their trade is ever the first to be hampered by any serious depression in the industry of the country, and is over one of the last to be reached by the returning wave of prosperity. In Aberdeen, building has passed through a variety of experiences during recent years; time was, and that not so long ago, when the city was famous for the amount of speculative building that was carried on within its bounds. The results of this craze were soon seen, when the city built over its own means, and speculators suffered, and, judging from the past year or two, it was seen that the speculative building mania has practically entirely subsided. The number of plans passed by the Town Council during the year is the smallest that has been before them for about fifteen years, so that unless there is a very decided change for the better experienced during this year, it is probable that the builders of Aberdeen will have another twelve months of dull trade to look forward to. The most important mason-work contract that has been completed during the year is the Marischal College extension.—*Aberdeen Free Press*.

EDINBURGH BUILDING TRADE.—The building trade has not by any means been in full swing, and as a consequence a large number of artisans and labourers have been idle, and many of the large building yards in the city have been practically like deserted villages. It was expected with the introduction of machinery into these yards that manual labour would be largely diminished, but even the machines have had their term of inactivity during the year. The most important buildings which have passed through the Dean of Guild Court are as follows:—For the School Board were the new schools at Drummond-street and Gilmore-place, additions to Students' Union, Park-place; new church, McDonald-road, for the Rose-street United Free; extensive additions to and alterations of the old Infirmary buildings for the University; the King's Theatre, Tavist-street; a large new warehouse in Elder-street for Messrs. Ritchie & Co., and additions to Messrs. Nelson & Sons' Printing Works, Parkside. Under-noted is a record of the work of the Dean of Guild Court work for the year and a comparison of the previous year. The total for the year represents a value of 658,013l. Embarked in this amount were 713 warrants for 62 tenements, 51 villas, 269 self-contained houses, 132 public and other buildings, and 492 alterations. In the foregoing tenements were 10 shops, 19 houses of 1 apartment, 118 houses of 2 apartments, 147 houses of 3 apartments, 19 houses of 4 apartments, 30 houses of 5 apartments, and 9 houses of 6 apartments, representing a total number of 513 tenement houses. For the corresponding period last year the total work represented a value of 977,883l., representing 832 warrants for 67 tenements, 71 villas, 312 self-contained houses, 123 public and other buildings, and 583 alterations. In the foregoing tenements were 8 shops, 37 houses of 1 apartment, 266 houses of 2 apartments, 218 houses of 3 apartments, 156 houses of 4 apartments, 23 houses of 5 apartments, and 9 houses of 6 apartments.—*Scotsman*.

STONE AND BUILDING TRADES, SHIPLEY.—During recent years there has been a great deal of building done in Shipley, and each year as it has come round the opinion has been expressed that the place was being over-built. Yet of all the hundreds of new houses erected in that short period few have remained long unoccupied. The past year has been considered a comparatively quiet one in this direction, and yet 100 new houses have been entered upon the rate-books. In the past the great bulk of the new houses erected have been of the terrace class, with rental values ranging from 19l. 10s. upwards. Latterly, however, a strong demand has arisen for semi-detached and detached houses, surrounded by a little private ground, and selling at 400 and more. A considerable number of these have been erected or are in process of being built. Out of the hundred houses forty-four are in the West Ward, and are all of a large size, while thirty-four, of a little less value, have been erected in the South Ward. Twenty cottages have been built in the East Ward. Notwithstanding the fact that there has been about the increase in houses, the stone trade has only been moderately busy, and prices have been low.

THE BUILDING AND STONE TRADES, BRADFORD.—The depression in the Bradford stone and building trades, which in 1904 was said to have reached a point unknown for nearly twenty years, has

been still more serious during the year which has just ended. "There is no doubt," says the representative of a prominent firm, "that 1905 will be regarded as a year of most unparalleled inactivity. The present generation of builders and contractors do not remember ever before to have passed through such a period of severe depression." No large contracts have been let either for public or private buildings, and comparatively few small ones. Of contracts let there may be enumerated the hospital at the Bradford Workhouse, consisting of blocks for maternity and children's coves, the cottage homes at Daisy Hill, the Crematorium at Scholemoor Cemetery, Hanson School extension in Barkerend-road, and the basement for the Town Hall extension. The Bradford Dyers' Association have done a good deal of reconstruction and made additions at many of their works. Other private building enterprises include a wool store in Subbridge-road, box works off Manningham-lane, a warehouse in Canal-road, shop premises in Darley-street, an extension to dye-works in Cemetery-road, and new truck works in Preston-street. Eighty-eight buildings and a number of houses in Bradford, the speculative trade has been very poor, and although many fewer houses have been put up than was the case last year, more appear to have been built in some districts than the demand has warranted. Toller-Lea district is still being developed, and at the top of Underley, the London and Midland road, a good deal of house building has been going on. The hope is entertained that the depression has reached its lowest level, and that an improvement in the staple trade of the city may bring in its wake better times for the building and allied trades. One class of building materials, bricks, is still in short supply, and the number of enquiries of the state of trade that only about half the brick-works in Bradford have been kept running. Quarries in various parts of Bradford are shut down for the reason that the quarry-hills are overstocked. Whilst the local trade in stone has been worse than in former years, prices having had a lowering tendency, the London and Midland trade has also fallen off considerably. Prices have ranged somewhat as follows:—Self-faced flags, 1½ in., 1s. 6d. to 1s. 8d.; 2 in., 2s. to 2s. 2d.; 2½ in., 2s. 6d. to 2s. 9d.; 3 in., 3s. to 3s. 4d. per super yard. Tooled flags, 2½ in., 4s. to 4s. 4d.; 3 in., 4s. 2d. to 4s. 6d. per super yard. Ashlar, 1s. 6d. to 1s. 9d. per foot cube. Outside wallstones, 3s. to 4s. 2s. per rod; inside wallstones, 18s. to 21s. per rod; pitch-faced wallstones, 38s. to 42s. per rod.—*Yorkshire Observer.*

BUILDING IN MANCHESTER.—Several housing schemes have had the attention of the Manchester City Architect's Department during the year. A site for one has been purchased in Hulme, and sketch plans for its utilization are in course of preparation. Tenements have been erected in Rochdale-road, at the corner of Sudell-street and Moore-street. The elevation to Rochdale-road is a good example as a commencement of improved buildings in that thoroughfare. The much-criticised barracks appearance is avoided in the treatment. Accommodation for six-hundred families in tenements of two and three rooms has been provided, and a corner of the site, which could not be thus utilised, has been covered by two shops, with work-rooms over. Land in Barrack-street has been purchased, and application has been made to the Local Government Board to sanction the money for the erection of a building thereon of workmen's dwellings. Several works have been carried out during the year by the Parks and Cemeteries' Committees, the Markets Committee, and the Fire Brigade Committee.

BUILDING IN GLASGOW.—The year just closed has not been a prosperous one for these trades connected with the building industry. For several months they were all affected by a large number of the operatives in two of those trades stopping work with the view of resisting a reduction of wages, and other differences arose between those connected with the Employers' Union and the Union of Engineers, and the result was working by-laws. There has been a considerable falling off in the number of applications to the Dean of Guild Court for new buildings, as well as in the value of all classes of property, in contrast with previous years; indeed, the value is the lowest since 1896. No doubt the reason for this has been the scarcity of the supply, which is sufficient for present requirements. The large amount of building of dwelling-houses which is in progress in the suburban districts of the city has also to be taken into account. These houses in most cases become occupied as soon as they are ready, showing that there is a growing disposition to migrate from the city to the suburban districts. Nor is there any doubt but that suburban houses will continue to be supplied so long as the demand exists. There are other reasons for the decline in building operations in the city. Speculative building, for instance, is for the present practically at a standstill, for in every district of the city empty houses are to be seen, while many of the older properties of the warehouse class have either

been entirely demolished and re-erected into handsome buildings or otherwise altered to suit the more modern requirements. The total valuation of the new property which came before the Dean of Guild Court this year is 1,439,434, as against 2,118,800, for the previous year. During the year there were ninety-two linings granted for houses and shops with a valuation of 582,853, against eighty-three linings in the previous year, the valuation being 621,400. There has been a considerable increase of houses of one and two apartments in the eastern district as compared with last year, viz., 1,403 houses as against 999, being the highest in any district of the city. Queen's Park comes next with 426 houses, and Maryhill district third with 279 houses. No dwelling-houses have been erected in the southern or northern districts. As already mentioned, the greater falling off is in buildings of the warehouse class, for which 125 linings were granted, the valuation being 376,715, as against 131 linings and a valuation of 828,720, in the previous year. There were twenty linings for public buildings with a valuation of 193,514, against eight linings and a valuation of 248,060, for the previous year. For churches, halls, and schools ten linings were granted, compared with eleven linings last year, the valuation being 72,400, while for alterations and additions there were 221 linings against 276, the valuation being 303,351, against 307,070. For the length in yards being 3,298 against 5,891 in the previous year. While there has been a considerable falling off in the erection of all classes of buildings, it is encouraging to note that the ordinary building trades are fairly well employed. The large decrease in operations will, it is stated, principally affect those who have been building for speculative purposes.—*Glasgow Herald.*

BUILDING IN LEEDS.—Between March 25 and November 29 last, 1,172 houses have been erected in Leeds, of which 565 are through, and 522 back-to-back houses. In the same period 973 miscellaneous buildings have been completed. At the present moment 952 houses are in course of erection, of which 629 are through and 352 are back-to-back houses. The number of miscellaneous buildings now being proceeded with is 737.

LEITH BUILDING TRADE.—The building trade in Leith during the past year has been in a depressed condition, and there are no signs of work becoming brisker for some time to come. During the year forty-one warrants were granted by the Dean of Guild Court for new buildings, in addition to fifty-nine warrants of a minor character. The total value of these buildings is estimated at 92,000. This compares unfavourably with the two previous years, the value of the buildings in 1904 having been 180,000, and in 1903 260,000.

SCHOOLS, HAWKLEY.—New Church of England schools have been built at Hawkley at a cost of 1,000. They were erected from the plans of Mr. H. T. Keates, architect, of Petersfield, by Mr. Marshall, builder, of Lass.

PROVIDENT WORKMEN'S INSTITUTE, ROSHERVILLE.—A workmen's institute is to be erected on a site between Bersford-road and Burnaby-road, Rural Vale, Rosherville, from plans prepared by Mr. Clay. The building will contain a reading-room and card-room on either side of the entrance, a central hall, and the usual offices, provision for the caretaker's apartments being made on the upper floor.

THEATRE, WOOLWICH.—On December 21 last Earl Roberts opened the new Royal Artillery Theatre at Woolwich. The building has been erected on a site facing Woolwich Common at a cost of 11,000. Mr. W. G. R. Sprague was the architect of the work.

STAINED GLASS AND DECORATION.

MEMORIAL WINDOW, ST. FRIDESWIDE'S.—A memorial window has been unveiled in the parish church of St. Frideswide's to the late Rev. A. J. Miller. It was designed and executed by Mr. Herbert Davies, of North Finchley. The subjects are in painted glass, and the three central lights represent the Crucifixion, the light on the north side "The Nativity," and on the south "The Adoration of the Magi."

FOREIGN.

TIMBER RESOURCES OF NEW ZEALAND.—According to a report on the timber industry just issued by the Lands Department of the Colony, the estimated quantity of milling timber on Crown lands in 1904 was 20,000,000,000 superficial feet of all classes of timber, whilst, on a very rough estimate, there were 21,000,000,000 superficial feet on private and native lands. The saw mills of the colony number 414, with an aggregate of 9,497 horse-power; cutting capacity per annum, 704,930,600 superficial feet; output per annum, 413,289,742 superficial feet; number of hands employed, 6,912.

ARGENTINA.—A despatch received at the Foreign Office from H.M. Consul at Buenos

Ayres (Mr. A. C. Ross) states that there is a large amount of building going on in that city on account of private individuals, but it is improbable that any of the projected municipal works which require skilled workmen will be undertaken in the near future. Bricklayers and carpenters, it is reported, do just as they please about working or resting, and contractors are very chary of binding themselves under contract.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. William H. Thorp, architect, has removed his office from 61, Albion-street, to Phoenix-chambers, South-parade, Leeds.

CROWN LANDS.—A departmental measure has been prepared for the ensuing session to authorise the Commissioners of Works to convey bridges under their management to bridge authorities who are willing and able to accept such conveyances, and to transfer the management of Richmond and Kew greens to the Richmond Borough Council. The Bill provides further for the improved management and regulation of the New Forest, and for vesting the veredors with increased powers to prohibit the discharge of sewage, the placing of refuse, rubbish, etc., and the erection of booths and encampments upon the forest lands. Other clauses of the Bill relate to powers for authorising the transfer of any forest-shore under the control of the Commissioners of Woods to the management of the Board of Trade, and *vice versa*, and for authorising the Commissioners of Woods, the Board of Trade, and the Chancellor and Council of the Duchy of Lancaster respectively, to enter into agreements for compensating claims to foreshore.

COPYRIGHT IN WORKS OF ART.—The *Copyright in Works of Art Act, 1905*, passed in the last session of the Cape Parliament. As regards the importation and sale of copyright works of art, it is provided by sect. 6 that "if any person, not being the proprietor for the time being of the copyright in any work of art, shall without the consent of such proprietor make or cause to be made any copy, reproduction, repetition, or colourable imitation of the work in which such copyright exists, for sale, hire, exhibition, or distribution, or shall knowingly sell, let to hire, exhibit or distribute, or cause to be sold, let to hire, exhibited, or distributed any copy, reproduction, repetition, or colourable imitation made without such consent, or shall import, or cause to be imported, any copy," etc., "such person shall be liable to an action for damages for infringement of the copyright, and all such copies shall be forfeited to such proprietor." Works of art, as defined by the Act, include sculpture, paintings, drawings, and photographs.

ST. JOHN'S CHURCH, HULL.—It is proposed to acquire the site of the church of St. John the Evangelist and of Osborne-street mission-rooms for the erection thereon of offices for the tramways of the Corporation, and the disposal of the remainder of the ground for general building purposes. The church was built, in 1790-1, of red brick with stone dressings; the pinnacled tower was erected a few years afterwards, and the chancel was added in 1866. It became a parish church in June, 1868, and contains 1,690 seats.

THE NATIONAL COLLECTIONS OF PICTURES AND PORTRAITS.—Amongst the recent additions to the National Gallery of British Art, Millbank, are "The Shrine of Edward the Confessor," by David Roberts, R.A.; "Cottage at Hambleton," by Myles Birket Foster; and "A Street in Antwerp," by Samuel Prout—bequeathed by Mr. Charles Fraser. The trustees of the National Portrait Gallery have accepted as a gift of the artist Mr. H. R. Hope-Pinker's portrait bust of the Right Hon. William Fawcett, M.P., and have purchased the original portrait, in crayons, of William Cowper drawn by Romney in August, 1792; Gainsborough's portrait of John Joshua Kirby, writer on perspective, and President of the Incorporated Society of Artists (*obit* 1774); portraits by Kneller of Charles Talbot, Duke of Shrewsbury, Secretary of State, etc., and Richard Graham, Viscount Preston, statesman and diplomatist; and Lely's portrait of Admiral Sir John Harman. The portraits will be exhibited in the galleries as soon as the trustees have sufficient funds at their disposal for the purpose. The trustees of the Chantry Bequest have bought C. W. Furse's "The Return from the Ride," F. E. Cowper's "St. Agnes in Prison," H. Speed's "The Alcantara, Toledo," E. Bundy's "The Morning of Sedgemoor," J. Ammer's "The Black Mountains," and E. Alexander's "Peacock and Python."

THE BRITISH FIRE PREVENTION COMMITTEE.—During the year 1905 the membership of this Committee has increased by 75, and the number of subscribers (non-members) by 35. The Committee, during the year, moved its testing station to Recent's Park and equipped it with additional testing chambers, etc., the removal and extensions involving a fresh capital expenditure of

over 1,100. The testing operations for the year have increased from 6 to 17. During these 17 testing operations, the following subjects have been under investigation: Four floors, 1 ceiling, 4 partitions, 1 wall, 4 column encasements, 6 window openings, and 4 skylights glazed with special glazing, 2 doors, 1 shutter, 7 concrete aggregates, and 1 fire alarm system. Fifteen "Red Backs" have been issued, also two numbers of the Committee's *New Journal*. A competition for the production of a useful fable for children, setting forth the dangers of playing with fire, has been dealt with. The meetings of the Executive during the year numbered 14; of its General Purposes Sub-Committee 8, and of the General Testing Arrangements Sub-Committee 8. Further, 17 special sub-committees were appointed to deal with individual fire tests.

THE LABOUR MARKET IN THE COLONIES.—The January circulars of the Emigrants' Information Office, 31, Broadway, Westminster, S.W., state that it is too early in the season for the ordinary emigrant to go to *Cuba*, unless he goes to friends, or has sufficient means to keep himself till the spring. In *New South Wales* there is a demand for skilled miners, but there is not much demand for mechanics. In *Victoria* there is no demand for more labour at Melbourne or other towns. There is little demand for more labour in country districts. In *South Australia* the labour market is fully supplied, and speaking generally, no working man is advised to go there unless he is specially skilled in his trade, or has friends to go to, or sufficient money to live on at first. In *Queensland* there is not much demand for emigrants other than skilled farm labourers, unless they have received cheap nominated passages through friends in the State, or have means of their own. In *Western Australia* the returns of the Department of Labour at Perth for the quarter ending September 30, 1905, show that there is no demand for men in the building and other trades, and at Kalgoorlie, Perth, and one or two other places, the supply exceeds the demand. In *Tasmania*, miners and mechanics on the west coast are fairly well employed, but the local supply is as a rule sufficient. In other parts of the State there is no general demand for more mechanics, but there is an opening for them if they have sufficient money to keep themselves at first. In *New Zealand*, single men who can push their way into the country need not be out of employment, work of all sorts offering in the season, such as shearing, bush work, road-making, fencing, general farm work, etc. Competent workers in the building trades, and plumbers, and blacksmiths should be able to secure employment at this season without difficulty. No one may enter *Cape Colony* unless he possesses 20*l.* on arrival, or has secured work beforehand. The labour market in the building, engineering, and other trades, though the demand for men has improved, is still fully supplied, and a great many unqualified mechanics and labourers at Cape Town, Port Elizabeth, East London, King William's Town, Alwal North, Cradock, and other places are unable to find work. Most of the men out-of-work in the different trades are either unemployed, or are second-rate workmen; first-class men on the spot can almost always find places. But there is very little opening for mechanics (especially house carpenters or bricklayers) from this country, unless they go out to situations engaged for them, or have means of their own sufficient to keep them for some months, and in any case there is no opening for indifferent workmen or unskilled labourers. In *Natal* at present labour is plentiful, and some carpenters and bricklayers, and especially unskilled workers and indifferent mechanics, are unable to obtain employment. Plasterers' wages have been reduced 1*s.*, and now stand at 15*s.* a day. No one, therefore, should go to *Natal* at the present time unless he has means of his own, or is nominated by friends in the Colony. *Transvaal*.—No one may enter the *Transvaal* without a permit; no permit is granted to any one who does not possess 20*l.* on arrival, or has secured bona-fide employment beforehand. Affairs in Johannesburg and the *Transvaal* generally show no signs of improvement; almost every trade complains of stagnation, and a considerable number of persons are receiving relief. The cost of living, especially for a married man, is very high. Trade in *Pretoria* is reported to be very dull, and labour to be plentiful. *Orange River Colony*.—No one may enter the Colony without a permit and no immigrant can obtain such permit unless he possesses 20*l.*, or has obtained bona-fide employment in the Colony. There is no opening for more labour at the present time.

THE "CRANVILLE" PATENT GUTTER-CUTTER.—Contractors who have to fix gutter cutters, and iron merchants who deal in guttering, should appreciate the simple machine illustrated on this page. The appliance was originally devised for his own use by a practical plumber, with the object of reducing the cost of cutting by the ordinary method, and the frequent waste of material occasioned by breakages when half-round gutters had to be cut to length. It is equally valuable in iron warehouses, as by its aid old and broken pieces of gutter can be cut

square for sale instead of being consigned to the scrap heap. Upon the bedplate of the machine a hollow saddle block is fitted of suitable size for receiving the largest size of gutter ordinarily made, and the saddle is supplied with loose half-round backing pieces, so that the smaller sizes can be held in position. The cutter, which is

circular in shape, is reversible to four different cutting positions, and consequently is equivalent to four separate cutters. A spring is provided in the sleeve carrying the cutting tool for the purpose of allowing the latter to ride over the hard pieces which frequently occur in castings. To operate the machine the gutter is laid in the half-round saddle, or in the parking pieces inserted therein, and fixed in position by means of two cams on one side, and by a bar with wing nut on the other side. The cutter is then fed into its work by the star wheel on the handle until sufficient cut is put on, and then the gutter is cut through by working the handle backwards and forwards, the tool operating on each movement. The weight of the machine is less than 50 lb., and by its aid any gutter castings can be cut off square and clean without the least risk of breakage.

HONOURS FOR A STEVEDOR.—On the occasion of his retirement, after thirty years' service, Mr. Frederick Strimmons, deputy-surveyor of Windsor park and forest, was decorated, on December 29, with the Fourth Class of the Royal Victorian Order and at the same time received a cheque for 500*l.*, with an illuminated address and other gifts from residents and servants on the King's estate.

IRON AND STEEL.—Messrs. Matheson & Grant's thirty-first annual Engineering Trades' Report states that pig-iron has gradually advanced in value during the past year, and is now high enough to upset the price-lists of many manufacturing engineers. The enormous stocks held by warehouses always render forward-purchases speculative, but trade prospects seem to justify the present current rates. Steel plates and beams rise and fall in value mainly in accord with the demands for ship-building, and the present activity at the rolling-mills is assumed for some time to continue. Recent amalgamations among steel-makers tend to economy in manufacture, and it is now claimed that nowhere in Europe or America can rolled steel be produced so cheaply as in the North of England, and that Spanish or other foreign ores are only contributing to the main sources of material, namely, Middlesbrough ore and Durham coke. The demand for steel had increased sufficiently to justify the present improved prices when assisted by tacit agreement among makers. The trade in structural steelwork has only slightly improved during the year, for although there is a steady advance in the prices of material, the aggregate tonnage of iron and steel work ordered has been below the manufacturing capacity available. The very great depression in the building trades throughout the country has necessarily limited the use of iron and steel work, and the export demand for steel bridges has not been brisk enough to make up for this slackness at home. The recent failure of a large life of a portion of the iron roof over Charing Cross station need cause no alarm in regard to roofs in which proper and available precautions are taken. A faulty weld, aggravated by rust, was the apparent and probable cause. Welds can and should be avoided in such structures; and so should even smith's work where steel is the material. Easy and convenient access should be provided to all parts for examination,

and no part exposed to the air should be beyond the reach of the painter's brush. Unfortunately, however, there are too many structures in which the designers seem to consider only the primary purpose of a roof covering strong enough to withstand stresses from wind and snow, and in which no allowance is made in the factor of safety for the contingency of waste by rust. All these things are even more necessary to modern steel structures, than when the bars or plates were rolled from puddled iron, of which the Charing Cross roof was constructed forty years ago.

THE PLUMBERS' COMPANY.—At the quarterly meeting, held at the Guildhall last week, the following operative plumbers were admitted to the Freedom of the Plumbers' Company on having passed the Examination of the Company in the technology of plumbing and workmanship in the Honours Grade. Their ages range from twenty-two to thirty-two:—F. G. England, R.P., of Sunderland (trained at the Cheltenham Technical School); F. J. Fearn, of Manchester (winner of two scholarships under the Lancashire Education Committee, tenable at the Company's special course of advanced instruction for plumbers at King's College, London); Alexander Forbes, R.P., of Aberdeen (was a student at Robert Gordon's College, Aberdeen, where he is now teacher of the plumbing classes); William Morris, R.P., of Southport (winner of two scholarships under the Lancashire Education Committee tenable at the Company's special course of advanced instruction for plumbers, held at King's College, London, winner of second prize in the prize competition for workmanship held under the auspices of the Lancashire Education Committee and the Company in 1904); Hargreaves Riley, R.P., of Artington (winner of several scholarships under the Lancashire Education Committee tenable at the Company's special course of advanced instruction for plumbers at King's College, London); J. Palmer, R.P., of Blackpool (winner of several scholarships under the Lancashire Education Committee tenable at the Company's special course of advanced instruction at King's College, London); and E. J. H. Upham, of Cardiff (trained at the Cardiff Technical School, winner of several local scholarships). The Master of the Company, Mr. W. D. Coles, in congratulating the new Freemen on the result of their work, urged them to remember they were obtaining no security by their admission to membership of the Company, as they were binding themselves by its old oath of allegiance to maintain its best traditions of good craftsmanship and loyal citizenship wherever their work might be done.

Legal.

DANGEROUS BUILDINGS.

At Marylebone Police Court recently, before Mr. Plowden, two summonses, issued at the instance of the London County Council, against the owners of business premises at 168 and 170, Edgware-road, W., for failing to comply with an order of the Council to take down the back walls where loose, cracked, or otherwise defective, the structures being in a dangerous state. Mr. Coles, who is prosecuted for the Council, explained that the proceedings had been instituted at a day's notice as it was a matter of great urgency. Already about a ton and a half of bricks, etc., had fallen while workmen were engaged on the premises; and it was feared that unless something was done to the walls serious and perhaps fatal consequences would ensue. Mr. Arthur Ashbridge, the District Surveyor for Marylebone, said the danger arose through the taking away of the lower portion of the walls for the purpose of putting in a girder over the shop-fronts. Originally both the front and the back walls were in a very dangerous condition, and he had no doubt that if he had not interfered the front walls, at any rate, would have been the cause of a serious accident. That wall, however, had now been secured; but the back was still in a perilous state, and unless it was more securely shored or pulled down an accident might happen at any moment. Mr. Plowden: What is the danger you apprehend? Mr. Ashbridge: The wall may give way, and if it does the fifty men employed there are bound to meet with serious accident. Mr. Plowden: You do not think they are aware of the danger they are running?—a miniature Charing Cross. Mr. Ashbridge said he had both matters in hand, and he was far more anxious about this than about Charing Cross. The defendant, (Mr. Edward Burns) denied that the walls were dangerous, and was supported in his denial by his builder and his architect, Mr. J. W. Stevens, who complained that the District Surveyor had practically taken the matter out of his hands for three weeks. The builder expressed the opinion that the buildings were 140 years old. Mr. Plowden said that, if this had been an ordinary case in which the experts on either side differed, he should probably have dismissed it. But in view of the serious statement of Mr. Ashbridge, the District Surveyor, that the walls were in imminent danger

of falling and injuring a number of workmen employed there, he felt he ought not to be a party to such a possibility; and he preferred, therefore, to be in the wrong with Mr. Ashbridge, if he were wrong, than in the right with the defendant. He therefore made an order for the walls to be immediately secured to the satisfaction of the District Surveyor.—Times.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

27,815 of 1904.—W. F. PROBERT: Boiler for Heating Water for Domestic and other Purposes. This relates to boilers for heating water for domestic purposes, and consists of an outside shell of the boiler made of sheet metal, corrugated or fluted as may be desired, either longitudinally or vertically in relation to its axis. Inside the boiler is fitted a fire-box, which fire-box is made conical with the larger end towards the bottom of the shell of the boiler and may form part of the shell of the boiler, or it may be fixed into the boiler by riveting, bolting, or by any suitable means, and may be of any required outline, that is to say, it may be fluted or corrugated either vertically or horizontally or in any angular direction.

556 of 1905.—F. C. PULSFORD: Steam Heating Apparatus.

This relates to a steam heating apparatus comprising in combination a radiator, a hand-operated steam admission valve therefor, a cut-off valve the diameter of which exceeds that of the admission valve by an amount proportional to the difference in the lifts of the two valves, a rod or tube located within the radiator and fixed at one end thereto so that when heated by steam it expands in the direction of its other end to operate the cut-off valve, and a spring located between the latter and said rod or tube to prevent the valve being forced with undue pressure on to its seat, due to negligence or failure of the reducing valve in the steam supply pipe.

6,167 of 1905.—W. F. STANLEY and W. F. STANLEY & CO., LD.: Perspective Drawing Tables.

This relates to a perspective drawing table, and consists of a suitable standard for supporting the table top, preferably terminating with three feet, which is provided with a screwed pillar working inside the outer pillar connected to the latter and said rod or tube to prevent the valve being forced with undue pressure on to its seat, due to negligence or failure of the reducing valve in the steam supply pipe.

6,633 of 1905.—J. SHANKS: Valve Closets.

This relates to a valve closet, constructed with the usual valve or valves for direct downward discharge, and with a swinging vertical lever for operating said valve or valves, having its lower horizontal arm engage with the valve levers connected by a detachable cover, allowing freedom of movement of the handle and accessibility to the working parts thereby enclosed and protected.

12,693 of 1905.—R. FLEMING: Lifts for Use as Fire-escapes and the like.

This relates to a fire-escape or lift of the kind in which the elevator platform is raised by means of an extensible standard on the lazy-tongs principle and a fluid actuated telescopic standard, rods located within the extensible standard and forming a pivoted connexion between the lengths of the telescopic standard and the connecting cross rods of the extensible standard.

13,651 of 1905.—J. S. YOUNG: Tools for Cutting Stone.

This relates to a stone saw and consists of a series of thin flat blades vertically arranged at intervals between two bars which form the back or body of the saw, bolts or screws clamping the bars together, means for simultaneously operating the bolts or screws, and means for securing the bars in the reciprocating frame of the machine.

18,160 of 1905.—A. BELL: Ranges or the like Fireplaces.

This relates to ranges or like fireplaces, and consists in the flue being formed and made in one with the casting of the cover plate at the back of the range—that is to say, the said plate is set back or channelled from its front face in the shape of the required flue, which at its lower part or junction with the oven is made about as wide as the oven itself, but tapers in width to a narrow exit at the top of the said plate, and at the same time deepens on it reaches the top so as to give time dependent on the same superficial area at the top as at the bottom. The cover plate is then provided, which by means of screws or other convenient fastenings, may be readily secured upon the front of the said flue. The top doors and dampers may be provided as required.

18,247 of 1905.—H. A. GEORGE: Safety Catches for Window Sashes.

This relates to a safety catch for window sashes and consists of a loose tumbler or bolt pivotedly mounted on a round stud and projecting from the vertical plate of an angular open case, the horizontal plate of which is furnished with holes for the attachment of the whole to the upper surface of the frame of the lower sash, the head or tongue of said tumbler being heavy, the head normally in an inclined position against the vertical side of the frame of the upper sash, and tending to fall on a raised support fixed to the bottom of the case by the potential energy of gravity in such manner that the upper part of the said tongue shall project beyond the vertical plane of the rear surface of the frame of the upper sash.

20,061 of 1905.—T. MATTERSLEY: Kitchen Fire Ranges.

This relates to a kitchen fire range and consists of means for fixing a horizontally extending adjustable shelf by constructing the said shelf with rearwardly extending arms having upstanding hooks or equivalents at their ends, the arms being adapted to pass in between the sides of the bar frame, and to take under lateral projections on the inner surfaces of the said sides, while the hook parts pass behind said projections, the parts of the shelf extending beyond each outer side of said arms entering slots formed in flanges projecting forwardly from the bar frame, whereby such shelf is not dislodged by being drawn forwardly while it is supported horizontally by a long supporting base at each side.

20,651 of 1905.—J. WAHRE: Flushing Cisterns.

This relates to a cistern having a main flush and an after flush, and consists in the main flush being operated by the raising of a conical valve off the discharge outlet whilst the after flush works siphonically.

1,188 of 1905.—J. SMITH: Siphon Flushing Arrangement for Cisterns.

This relates to a siphon flushing arrangement for cisterns having siphon bend which can be tilted, said bend being pivoted near the bottom of its one leg to a bolt secured to the bottom of the cistern and at the bottom of its other leg is provided a rubber sleeve which is fixed to the grooved part of the leg by an interlocking bead and groove, and is also curved or curved inwards on its under side and provided with a stiffening ring so as to close tightly into the mouth of the outflow pipe which is flared for its reception.

7,183 of 1905.—T. W. DEBNEY: Joints for Uniting Soil Pipes to Closet Basins or Traps.

This relates to a joint for uniting soil pipes to closet basins or traps, and consists in the formation in the end of the mouth of the closet basin or trap of a number of holes or recesses of suitable shape, and in fixing therein by means of jointing material corresponding shaped tapped metal plugs.

7,394 of 1905.—W. SMITH, R. S. SMITH, C. S. WALKER, E. E. SMITH, and D. R. MAYHEW: Fireproof Ceilings and Floors.

This relates to a fireproof structure for ceilings and floors, and consists of a metal skeleton framework made up of girders having circular apertures in the webs thereof, and joists of tubular form rigidly fastened at both ends in the apertures in the webs of the girders.

MEETINGS.

FRIDAY, JANUARY 5.

London Institution.—Professor Vivian B. Lewis, on "Our Atmosphere and its Wonders," illustrated by experiments. 4 p.m.

MONDAY, JANUARY 8.

Royal Institute of British Architects.—General business meeting. (1) The chairman to move "That the Council be instructed to enter into negotiations concerning a site for new Institute premises, and to report to a general meeting." (2) Election of candidates for membership. 8 p.m.

Liverpool Architectural Society (Incorporated).—Mr. Percy Scott Worthington, M.A., on "The Houses of the Monks in the Middle Ages," illustrated by lantern slides. 6 p.m.

The Incorporated Clerks of Works Association.—Paper by Mr. J. Palm (President) on "Coal and its Formation." 7.30 p.m.

TUESDAY, JANUARY 9.

Institution of Civil Engineers.—Papers to be submitted for discussion.—(1) "The Elimination of Storm-Water Sewerage Systems," by Mr. D. E. Lloyd-Davies. (2) "On the Elimination of Suspended Solids and Colloidal Matters from Sewage," by Lieut.-Colonel A. S. Jones, D.C., and Mr. W. O. Travis, M.D. 8 p.m.

WEDNESDAY, JANUARY 10.

Edinburgh Architectural Association (Associates' Meeting).—Mr. Ramsay Traquair on "Tombs," illustrated by lantern slides. 8 p.m.

The Association of Engineers-in-Charge (S.I. Brite's Institute).—Mr. Frank Croxer on "Storage Batteries and their Application to Public Institutions." 8 p.m.

THURSDAY, JANUARY 11.

Institution of Electrical Engineers.—Conclusion of discussion on Mr. W. H. Fratch's paper on "The Charging Cross Company's City of London Works." 8 p.m.

FRIDAY, JANUARY 12.

Institution of Civil Engineers (Students' Meeting).—Professor J. D. Cornack, B.Sc., on "The Theory of Machines." 8 p.m.

PRICES CURRENT OF MATERIALS.

* * * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quants and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table listing prices of various materials such as Bricks, Hard Stocks, Rough Stocks, Facing Stocks, Shippers, Pictons, Red Wire Cuts, Best Fareham Red, Best Red Pressed, Best Blue Pressed, Staffordshire, Do. Bulhouse, Best Stourbridge Fire Bricks, GLAZED BRICKS, Best White and Ivory Glazed Stretchers, Headers, Quoins, Bulhouse, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered Squints, Best Dipped Salt Glazed Stretchers and Headers, Quoins, Bulhouse, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered Squints, Second Quality White and Dipped Salt Glazed, Thames and Pit Sand, Thames Ballast, Best Portland Cement, Best Ground Blue Lias Lime.

NOTE.—The cement or lime is exclusive of the ordinary charge for sacks.

Grey Stone Lime (Harl Bed) 11s. 0d. per yard, delivered. Stourbridge Fireclay in sacks 37s. 0d. per ton at rly. dep.

Table listing prices of stone: BATH STONE—delivered on road wag. s. d., 1 6 1/2 per ft. cube. Do. do. delivered on road waggons, 1 8 1/2. Nine Elms Depot, 1 8 1/2. PORTLAND STONE (30 ft. average)—Brown Whitbed, delivered on road waggons, Paddington Depot, Nine Elms Depot, or Fulham Wharf, 2 1. White Bashed, delivered on road waggons, Paddington Depot, Nine Elms Depot, or Fulham Wharf, 2 2 1/2.

Table listing prices of stone: Aeneaster in blocks, 1 10 per ft. cube, del. rly. depot. Beer, 1 6. Greenhill, 1 10. Darley Dale in blocks, 2 4. Red Corsehill, 2 2. Clonsburn Red Freestone, 2 0. Red Mansfield, 2 4.

YORK STONE—Robin Hood Quality. Scappled random blocks, 2 10. 6 in. sawn two sides landings to sizes under 40 ft. super., 2 3 per ft. super. 6 in. rubbed two sides ditto, ditto, 2 6. 3 in. sawn two sides slabs (random sizes), 0 11 1/2. 2 in. to 2 1/2 in. sawn one side slabs (random sizes), 0 7 1/2. 1 1/2 in. to 2 in. ditto, ditto, 0 6.

HARD YORE—Scappled random blocks, 3 0 per ft. cube, 1 in. sawn two sides landings to sizes under 40 ft. super., 2 3 per ft. super. 6 in. rubbed two sides ditto, ditto, 3 0. 3 in. sawn two sides slabs (random sizes), 1 2. 2 in. self-faced random flags, 0 5.

HOPTON WOOD (Harl Bed) in blocks 2 0 per ft. cube, del. rly. depot. 6 in. sawn both sides landings 2 7 per ft. super. M.D. rly. depot. 3 in. sawn both sides random slabs, 1 0. 2 in. do., 0 5 1/2.

Table listing prices of slates: In. lb., £ s. d. 20x10 best blue Bangor 13 2 6 per 100 of 1200 at r. d. 20x12, 13 17 6. 20x10 first quality, 13 0 0. 20x12, 13 15 0. 16x8, 7 5 0.

PRICES CURRENT.—Continued on page 30.

List of Contracts, etc.

CONTRACTS.

(For some Contracts still open, but not included in this List, see previous issues.)

Table with columns: Nature of Work or Materials, By whom Advertised, Form of Tender, etc., supplied by, and Tender to be delivered. Contains numerous entries for construction projects across various locations like London, Manchester, and Birmingham.

AUCTION SALES.

Table with columns: Nature and Place of Sale, By whom Offered, and Date of Sale. Lists auction sales for items like Great Hall, Winchester House, and Freehold Property in Lewisham.

* Those with an asterisk are advertised in this number: Competitions, —; Contracts, IV. VI. VII. X.; Public Appointments, XIX.; Auction Sales, I.

PRICES CURRENT.—Continued from page 29.

Table listing prices for slates, including columns for size (e.g., 16x8), material (e.g., best blue Port), and price per 1000.

TILES.

Table listing prices for various types of tiles, including columns for tile type (e.g., Best plain red roofing tiles) and price per 1000.

Table listing prices for ornamental tiles, including columns for tile type (e.g., Do. Ornamental do.) and price per 1000.

WOOD.

Table listing various wood products like Deals, Battens, Fir timber, etc., with prices per standard.

JOISTS, GIRDERS, &c.

Table listing joists and girders with prices per standard.

METALS.

Table listing various metal products like Iron, Sheet Iron, etc., with prices per standard.

METALS (continued).

Table listing metals like Iron, Sheet Iron, Galvanised flat, etc., with prices per ton.

ENGLISH SHEET GLASS IN CRATES.

Table listing sheet glass in crates with prices per ft. delivered.

OILS, &c.

Table listing oils like Raw Linseed Oil, Turpentine, etc., with prices per gallon.

VARNISHES, &c.

Table listing varnishes like Fine Pale Oak Varnish, etc., with prices per gallon.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications...

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is sent direct from the offices to residents in any part of the United Kingdom at the rate of 12s. per annum (52 numbers) PREPAID. To all parts of Europe, Australia, New Zealand, India, China, Japan, etc., 26s. per annum.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. (N.B.—We cannot publish Tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100*l.*, unless in some exceptional cases and for special reasons.)

Table of tenders for various projects like ACTON, ROVEY TRACEY, BRIDLINGTON, BURGH-NEXT-AVISHAM, etc., listing contractors and amounts.

Table of tenders for various projects like BRIDLINGTON, BURGH-NEXT-AVISHAM, etc., listing contractors and amounts.

Table of tenders for various projects like BRIDLINGTON, BURGH-NEXT-AVISHAM, etc., listing contractors and amounts.

Table of tenders for various projects like BRIDLINGTON, BURGH-NEXT-AVISHAM, etc., listing contractors and amounts.

Table of tenders for various projects like BRIDLINGTON, BURGH-NEXT-AVISHAM, etc., listing contractors and amounts.

LICHFIELD.—For erecting six villas at Cherry Orchard, for Messrs. Taylor, Mr. G. W. Barrett, architect and surveyor, Chesterfield-road, Lichfield.—
Smith £2,400 0 Twist £1,955 10
W. Walsance 2,279 0 J. Maddocks 2,095 0

English Gothic Architecture.—II.

CONTINUING from last issue our review of Mr. Bond's important work on this subject, we may just note that his Part II., entitled "An Analysis of the Mediaeval Church Architecture of England," commences with a chapter on early Christian basilicas and their influence on English mediæval plan, with some very useful sheets of comparative plans to one scale, and the subject of planning generally is considered in the succeeding five chapters, ending (Chapter XIII.) with an analysis of the various forms of plan adopted in parish churches, of which, as the author says, the most common is the three-aisled nave with a long chancel and a western tower. It is the simplest and most symmetrical form of plan—a little too symmetrical and straightforward perhaps, at any rate it is obviously felt to be so now, as in most modern churches of the aisled nave and long chancel type the architect prefers to place his tower at the side or at the angle of the plan. Mr. Bond suggests that but for the collapse of church architecture at the Reformation, the further step would probably have been taken of removing the aisles, reducing the church to the type of the University chapel. This would have been no doubt a practical step towards bringing the church into the condition of an auditorium; but

then it was only the influence of the Reformation which led to this new ideal of a church service (if indeed the Reformation went so far as that), and our impression is that the three-aisled nave would certainly have continued had there been no Reformation. Both architectural effect and historic association were on its side.

But we must quit these larger questions, as our intention was in this article to go a little into a consideration of the details of English Gothic, to which a very large proportion of Mr. Bond's book is devoted. And whatever differences of opinion there may be as to the respective merits of French and English Gothic considered in its broader aspects, there can hardly, we think, be any question that in detail English Gothic is in the main superior to any other. The exception would perhaps be in regard to decorative figure sculpture, of which there is a much larger amount remaining in France; and indeed so much of our English Mediaeval sculpture was probably destroyed at the Reformation that the comparison can hardly be fairly made. Even in this class of work, however, we have occasional examples in England, such as the angels inside the Chapter House door at Westminster, which are equal to anything to be found elsewhere (the Resurrection Series at Wells we do not count, because we are convinced that it was the work of foreign artists). But apart from figure sculpture, English Gothic can hold its own against any other phase of the style. In the important chapter of mouldings this is emphatically the case. As before

mentioned, Mr. Bond gives a liberal illustration of sections of mouldings; twenty-eight sheets, grouped under the headings of piers, arches, strings, bases, etc.; each sheet showing all its examples drawn to the same scale. There is a variety, a beauty, and a force of effect in English Gothic mouldings which cannot be found among those of French Gothic. Not only is their surface effect so good, but even their sections show a beauty and refinement of line which seems to have been studied for its own sake in the drawing; and, allowing for the difference of possible refinement between mouldings in marble and stone, those of English Gothic come nearest to the refinement of section of Greek mouldings, and when considered in respect of fitness for climate and the material in which they were executed, may be put on a level with Greek work, as exhibiting an equal perfection for their purpose.

In the matter of compound piers, as the author points out, we must acknowledge a foreign origin. As he puts it, when the Normans began to build their great churches in England, the compound pier had already a long pedigree. In regard to this question of the compound pier we do not quite agree with the author as to the slight importance he attaches to the system of bringing the vaulting-shaft down to the floor. He seems rather inclined to think that the architects were in the right who cut off the shaft on a corbel above the springing of the nave arcade, his reasons being that the shaft disturbs the continuity of the pier capitals;

that it does not really support the vault (which would apply equally, however, to the shaft stopped on a corbel), and that it practically narrows the space on the floor. "So much was this felt at Lincoln, that when the present stalls were placed in St. Hugh's choir, his vaulting-shafts were chopped off from the piers." All these are points for consideration, no doubt; but after all that can be said, the fact remains that there is an architectural completeness of design in bringing the vaulting-shaft down to the floor, which to our thinking compensates for any practical or logical objection that can be urged against it. And in regard to the fact of its cutting through the ground-arcade capitals, is that not rather an advantage in composition than otherwise? The main tendency in Gothic is to verticality of line, and the breaking through of the vaulting-shaft just prevents the capitals from presenting too marked a horizontal division when seen in perspective succession. We quite agree with the author, however, in preferring the corbelled vaulting-shaft to the system more often found in France, and occasionally in our Norman churches, of starting the vaulting-shaft from off the edge of the capital of the main arcade, with a little base to itself standing on the edge of the capital. It is a system at variance with the true spirit of Gothic architecture, and always has rather a makeshift appearance.

The adherence of the French to the square abacus capital, long after it had been abandoned (save in some exceptional instances) in England, and the prevalence in France down to a comparatively late date of the square abacus form and of a design of capital directly and obviously derived from the Roman Corinthian capital, is one of the most important notes of distinction between French and English detail. We all recognise the great beauty of many of these French capitals of quasi-Classical form; but there is more of originality in the carved Early English and early Decorated capital with its conventional rounded-lobed foliage growing out of the bell of the capital, than which no finer form of carved architectural ornament has ever been evolved; and it is far more exactly suited to stone treatment than the French form, and more in accordance with the general feeling of Gothic architecture. In regard to the important distinction between this and the naturalistic foliage of a later period in England Mr. Bond is perfectly sound. The naturalistic capitals of Southwell Chapter-House, beautiful in a sense and evidently done with enthusiasm by the carver, have the fault of having entirely lost or masked the idea of architectural support below the abacus; they are as if tied round the bell as applied decoration, instead of forming an efflorescence from it; and moreover, they invite a direct comparison with nature which must be to the disadvantage of the work. As the author truly remarks, "in all this work, workmanship had gone ahead of design. Design indeed there was none. What credit there was belonged to the mason; and to nature, who fashioned the leaf, the fruit, and the bloom."

The chapter on the development of

window tracery from what has been called "plate" tracery follows in the main the usual lines on which we have been in the habit of regarding the development of this characteristic of Gothic work, but the author suggests that the origin of plate tracery may be earlier than has been usually assumed; that even in the Anglo-Saxon towers of Northumberland it was not uncommon to pierce the spandrel of the baluster windows with a quatrefoil or some such aperture; he cites Billingham as an example, but gives no illustration; the earliest example figured is that of St. Maurice at York, with its two round-headed lights under one label, and a small circular opening in the spandrel. Two of the bays of Peterborough triforium, side by side, form a curious instance of that experimental character which is found in other details also at Peterborough; one spandrel pierced with a small round opening, the other with four smaller ones arranged as if on the arms of a cross. A suggestion as to the final abandonment of groups of lancets, so graceful in themselves, is that the desire for harmony in bay design may have been one prompting cause: "with one bay and two windows, as in Salisbury aisles, or three as in Salisbury clearstory, there was a lack of harmony. What was wanted was one bay, one window." There may be something in this, which as far as we remember is a new suggestion:

"Here and there, too, the builders may have been feeling their way to the realisation of the ideal of the Gothic building, as one whose vault could be made to stand without the support of walls; an ideal realised early in such chapter-houses as those of Westminster and Salisbury. In such a building it was unnecessary to confine the glass within the jamb of narrow lancet windows; the whole space from buttress to buttress could, if desired, be glazed. But if glazed, the glass must have mullions and bars of stone to support it; in other words there must be tracery. From one cause or other the tracery window was inevitable."

In the case of geometrical tracery Mr. Bond makes a division of it into two types—those with centre-pieces and those without. The former, we may observe, are both the more numerous and the best in effect; geometrical tracery naturally lending itself to the centre-piece treatment. We are not sure that we agree with the author as to the superiority of curvilinear tracery, though we agree that this and its cousin the French Flamboyant have come in for a good deal of uncalled-for reprobation. The advantage in point of design in geometric tracery is that tracery-bars and spaces alike form symmetrical design; in curvilinear tracery the true design is only in the bars, the spaces are what their design will leave. It is true that geometrical tracery gives many meeting-points awkward to deal with; but this is counterbalanced by the fact that curvilinear tracery cannot in most cases be made to fit naturally into the space enclosed by the window arch, but the design seems to be cut off by it, while geometrical tracery can readily be designed so as to fill symmetrically the space of the arch. On the whole it may be said that geometrical tracery is the more architectonic form: We do not observe that the author anywhere notices what is one of the great architectural advantages of tracery, viz.:

that it carries the masonry design over the windows, instead of leaving them, as seen externally, mere openings. We are glad to find that he has a good word to say for the Perpendicular window which unquestionably is the finest of all for the exhibition of stained glass, but which also has, in its masonic design as seen externally, a quality of architectural repose combined with richness which is worth a great deal. There may be less poetry about it than we find in the earlier tracered windows, but it has an architectural fitness that cannot be denied.

Doors, to which of course a chapter is devoted, have always been a weak point of English churches and cathedrals, not because they are not beautifully and richly treated, but because they are on so small a scale; except at Peterborough, with its great portico unique in England, there is no attempt to give appearance of scale and pomp to the entrance, as in the French cathedrals, by providing a great arched framework with sculpture in the tympanum, and limiting the actual door-head to the level of the springing. In England, as Mr. Bond's illustrative examples show, the arch is generally the actual doorway, and is but of small dimensions. This may be said to give scale to the building, but in the bolder French method the size of the actual door gives the scale of the human figure, and the deep and richly sculptured and recessed arch over it gives a dignity which English church and cathedral doorways for the most part sadly want.

On the question of towers, Mr. Bond refers on an earlier page, in his chapter on "Transepts," to the question whether the central tower preceded the transept, i.e., was the transept only a structural necessity for abutment to the tower? It is often regarded in this sense, and we are inclined to think rightly. Mr. Bond is against it, and asserts that transepts existed long before there were central towers; but the transepts of the double-aisled basilicas of Rome in the 14th century, to which he refers, can hardly be called transepts in the mediæval sense. The author makes a further suggestion on this point; viz.: that where the four roofs met, nearly always not all of the same height, there was a difficulty in arranging their junction, and that a simple way would be to carry the four walls up, above each of the crossing arches, sufficiently high to abut the roof against them; that this was the origin of central towers, and hence the low elevation of the earliest towers. There may be something in that, but the low elevation might be sufficiently explained by the unwillingness to load the crossing piers and arches more than could be helped. Our feeling is that the mediæval transepts and central tower developed *pari passu*, and were as much the result of a desire for an effective architectural centre as anything else. In the chapter on "Towers" there are some interesting remarks on the possible original intention of the tower where the transepts formed a *crux commissa*; i.e., were close up to the apse, in very early churches. The author thinks there is no doubt about it; Gregory of Tours speaks of the

central tower as *domus aræ*, the lantern over the altar, and that the lantern in the upper part of the tower was to pour down a flood of light on the altar. Mr. Bond mentions an existing interior, St. Eusebe, Auxerre, where a similar arrangement has, he says, come about "fortuitously," and where "the contrast between the brilliant late Gothic choir with clearstory soaring out of sight and the low and dark nave is strikingly effective"; but from the reference to "the choir" this can hardly be an example of the *cruc. convissa*, which presupposes only an apse east of the crossing. On the whole, we prefer the architectural to the ritual origin of the centre tower; and as to the roofing difficulty, if the transept roof were the same height as the nave (as it generally would be), there would be no particular difficulty in stopping the lower choir roof against the east side of it. The interposition of the tower is certainly a practical convenience in this respect, but we hardly think that so important and costly a feature as even a low tower would be introduced merely for that reason. Mr. Bond admits indeed, ultimately, that the central tower was "of supreme artistic value," but that a heavy price had to be paid for it:—

"In most cases, however, the central tower was erected; by the cautious only so high as to provide a ring of windows, as at Beverley, Münster, Westminster, Winchester, and Bristol; by the bolder so as to be of imposing height and bulk, as at St. Albans, St. David's, New Shoreham, and Tewkesbury; by the venturesome crowned with a wooden spire, as originally at Ripon, Hereford, and Lincoln; by the rash surmounted by a spire of stone, as at Norwich, Chichester, and Salisbury."

A list is given of some that have collapsed, as indeed Salisbury unquestionably ought to have done; and the putting of that lofty spire above those small piers was one of the rashest and most risky things ever done. But the subject ought not to have been mentioned without a mention of the manner in which all such danger was avoided at Tewkesbury, by the monumental seating of the tower on masses of solid wall extending east and west between the crossing and the nave and choir arcades; a remarkable piece of business-like construction; no driving in of the arcades there, at all events. The critical remarks on the subject of towers are very good; on the necessity for depth of window opening, and how much the character of the tower depends on the treatment of the angles. "If it is to overawe, the tower may rise in sheer verticality from pavement to cornice, like the campanile in the piazza [or that was in the piazza] of St. Mark's But the cornices are the weak points of towers. We [in England] did not like to lose the help of buttresses." It depends on the character that is wanted. Mr. Bond distinguishes between four types of towers: (1) without ornament; (2) with equally diffused ornament; (3) ornament concentrated in the ground story and belfry story; and (4) ornament concentrated at the summit. Of these we may remark that 2 and 4 are the best types. The Victoria Tower is a splendid example of the second; among church towers Mr. Bond selects Wrexham, of which a separate plate is given, nor could there be a finer example of its class. But to our thinking nothing, on a large

scale especially, equals in effect the 4th type, plain substructure with ornament concentrated at the top. Perhaps the generally rich treatment, with a line slightly set back as it ascends, best suits the repose proper to a church or cathedral. But it is in the 4th type that the full grandeur of a tower erection is realised.

While thinking of this question of the transeptal plan and the central tower, it may be suggested whether there is not something new to be done, architecturally, with this type of church, in a plan and design framed on the general lines of a mediæval building, but with a new treatment in detail. A transept church has been so almost universally treated in modern times as a mediæval church, that it hardly seems to have occurred to any one that the same general architectural scheme might be susceptible of a perfectly new and different treatment in detail. The experiment would be worth trying.

THE APPLICATION AND INCIDENCE OF THE LONDON BUILDING ACTS (AMENDMENT) ACT, 1905.

BY BERNARD DICKSEE, F.R.I.B.A.

THE articles published in this journal upon the subject of this Act have dealt with its various requirements; it is now proposed to consider the application and incidence of those requirements.

For our present purpose the requirements may be classed under two heads:—A, cases in which power is given to the Council to require "such means of escape in case of fire as can reasonably be required under the circumstances of the case"; B, cases where definite provisions have been set out in the Act.

Class A will include sect. 7: Provisions for new buildings being either "high buildings" or "twenty persons buildings"; sect. 9: Provisions for existing buildings being either "high buildings" or "twenty persons buildings"; and sect. 11: Provisions for living rooms over premises used for storage of inflammable liquid.

Class B will include sect. 10: Rules for projecting shops, and sect. 12: Rules for access to roofs.

The administration of this Act differs in many respects from that of the London Building Act, 1894, on the one hand, and the Factory and Workshop Act, 1901, on the other; it also differs in the case of the various provisions of the Act itself; it will therefore be convenient to consider the administration of each provision under the classification indicated above.

Class A, sect. 7: Before commencing any "new building," being either a "high building" or a "twenty persons building," the "owner" is required to deposit with the Council such particulars as will have to be subsequently included in the building notice to the District Surveyor, together with a copy of the "plans" of the building, showing, so far as may be necessary for the purposes of the Act, the means of escape proposed to be provided. The Council may within one month (extended to two months in

the summer vacation) approve, refuse to approve, or approve subject to conditions, stating fully all their reasons for any refusal or conditions; but if they fail, within the time, to notify their refusal or their conditions, such failure is to be deemed an approval. If dissatisfied with the requirements of the Council, the "owner" may within two months appeal to the Tribunal of Appeal (sect. 22). It is noteworthy that no such appeal is provided under the Factory Act in the case of new buildings, nor was any appeal provided for against requirements of the Council under sect. 63 of the London Building Act, 1894, in respect of buildings exceeding 60 ft. in height.

No building within the provisions of this sect. 7 may be occupied until a certificate of the Council has been granted that the building has been provided with the means of escape required, but such certificate must be issued within fourteen days of notice to the Council of the completion of the building, and an appeal lies to the Tribunal against the refusal to grant such certificate. Any alteration of, or addition to, a certified building (including a change of user or circumstances) that would materially increase the "risk of fire" can only be made with the assent of the Council or, on appeal, of the Tribunal.

Sect. 9: The procedure in the case of "existing buildings" is somewhat different; the Council are by sect. 17 first to request in writing the District Surveyor to ascertain and notify to them such buildings within his district, or any part thereof, as in his opinion comes within the provisions of this section dealing with "existing buildings" being either "high buildings" or "twenty persons buildings." From and after January 1, 1907, the Council may, if in their opinion the building be not sufficiently provided with means of escape in case of fire, serve on the "owner" a notice requiring him to provide such means of escape as can reasonably be required under the circumstances of the case. The "owners" may, however, within twenty-one days submit alternative proposals for the sanction of the Council; and the whole matter is subject to an appeal to the Tribunal; but when a final decision has been arrived at, the "owner" must execute the necessary works, and, should he fail to do so, he will be liable to penalties, and a Petty Sessions Court may make an order prohibiting the occupation of the building or part of a building affected.

Sect. 11 prohibits the use as a living room, workshop or workroom of any room over or directly connected with any part of a building in which certain inflammable liquids are kept for sale or trade, in such quantities or in such manner as to be liable to cause fire or explosion, without the provision of safeguards and means of escape to the satisfaction of the Council; subject by sect. 22 to an appeal to the Tribunal. In this case there is no provision for a preliminary survey by the District Surveyor, or for the service of any notice as to the requirements of the Council, though, of course, no conviction could be obtained against any person until some notification of the requirements of the Council had been given to him. It is also noteworthy that in this section the

obligation is not placed upon the "owner," but the person who uses or permits to be used the room contrary to the section is liable to penalties.

In all cases under Class A the Council are required by sect. 16 (2) to furnish particulars of their requirements to the District Surveyor, whose duty it is to supervise the work and to ascertain that the means of escape are properly provided, and to report to the Council any failure to provide the same.

It is evident that in all cases under Class A it is intended that the Council shall make their requirements and serve notice of them upon the "owner" or other person upon whom the obligation falls, and that the District Surveyor shall supervise the execution of all consequent works; but it is not so clear who it is intended shall take proceedings for the recovery of penalties for any neglect to comply with the requirements of the Council when made. The duty of taking such proceedings is not imposed upon any authority in particular, and may therefore be exercised by either, though in all probability it will be exercised by the Council.

Class B: The rules for projecting shops and for access to roofs, being similarly administered, may be considered together, but the application of those rules compulsorily to an existing building necessarily differs from their application in the case of a new building or work voluntarily undertaken by the owner.

When the Act left the House of Commons it contained a definite provision for the service of a notice to be enforced in like manner as a notice of irregularity under the Act of 1894; but in the House of Lords that provision was struck out, leaving the procedure much less clear.

In an existing building, therefore, as there is no provision for the service of a notice requiring the compulsory alteration of the building to make it comply with the provisions of sects. 10 and 12, proceedings will be by a summons against the "owner" under sect. 24 (1), for the recovery of continuing penalties; such proceedings may be taken at any time subsequently to January 1, 1906, the commencement of the Act, and without any previous notice to the "owner"; the mere existence of the building in its original condition is an offence under the Act. The law is undoubtedly harsh in this respect, but in practice, no doubt, the District Surveyor will, as a matter of courtesy, notify the owner before any proceedings are taken. The duty of taking these proceedings has not been specifically imposed by the Act upon the Council or upon the District Surveyor, such proceedings may therefore be taken by either authority, or indeed by anyone; but as the approval of the District Surveyor is a factor to be dealt with, it is difficult to see how any proceedings can be taken without him. The District Surveyor is required by sect. 16 (3) to report to the Council any building that he finds not to be in conformity with either of the sections, but beyond provision for the payment by the Council to the District Surveyor of a fee for the work of ascertaining what buildings

come within the sections, the Act gives no directions. The most convenient course will probably be a joint action by the Council and the District Surveyor, the former taking proceedings and the latter making the necessary surveys and giving evidence in like manner to the Dangerous Structure procedure, which has been found to work well. The Council have power to dispense with all or any of the provisions of the sections, and an appeal from their decision lies to the Tribunal.

When, however, the work has been commenced (either as the result of any proceedings against the "owner" or on the initiative of the "owner" in erecting a new building or altering an existing building) the execution of such work is, by sect. 16 (1), subject to the supervision of the District Surveyor in like manner as any work done to, in, or upon the building under the provisions of the Act of 1894. If, therefore, during execution of the work any irregularity, whether of omission or commission, be committed, procedure will be by service by the District Surveyor on the builder of notice of irregularity as under the Act of 1894; followed, when the notice has not been complied with, by a summons for a magistrate's order requiring the builder to comply with the notice. Should the builder fail to comply with the magistrate's order he will be liable to the penalties provided in the Act of 1894 for such neglect; but such penalties are distinct from those imposed by the new Act upon the "owner" for failure to comply with the provisions of the sections.

It is worthy of note that every offence against the Act is a continuous offence, and that the liability to the penalties continues for every day on which the offence continues; consequently proceedings may be taken at any time within six months of any day on which the building continues to be not in accordance with the Act (*M. B. W. v. Anthony*, 49 J.P. 229).

The responsibility of complying with the requirements of the Act falls in the first instance upon the "owner" as defined in sect. 6, being the person entitled to receive the "rack rent"—i.e., a rent being not less than two-thirds of the full annual value, based on the assumption that the tenant pays rates and taxes, and that the landlord bears the cost of repairs and insurance; the annual value will, therefore, be the gross assessment value, whereas under the Factory Act the annual value is equivalent to the rateable value.

Having complied with the Act and paid the expenses of executing the necessary work, such "owner" may, by sect. 20, apply to the County Court, and the Court may issue a summons "requiring the several persons entitled to any estate or interest in the building" to appear and may make an order apportioning the expenses among the various parties interested, as may be just and equitable in the circumstances of the case. This provision is the same as that contained in the Factory Act with the addition that regard is to be had to the terms of any lease or contract affecting the building. This difference is more apparent than real, as in the case of *Mosk v. Arnold* (1902) 1 K.B. 761,

decided under the Factory Act, it was held that the County Court is bound to take into consideration the contract between the parties, but, unless there is something in the terms of the lease to make it unjust and inequitable that he should apportion the amount between the parties, he has jurisdiction to do so; it would therefore appear that the additional words in the Act we are considering merely give effect to that judgment.

There is, on the other hand, a provision (sect. 21) that where the occupier claims to have sustained any damage directly and solely caused by any works under the Act, such claim is to be referred to arbitration; so that we may have two sets of claims arising out of the same work, the claim of the "owner" against the occupier for contribution, referred to the County Court, and the claim of the occupier against the "owner" for damage referred to arbitration. This double reference does not seem likely to work satisfactorily in practice; it certainly would have facilitated the working of the Act had the same tribunal been appointed in respect of both claims.

The actual cost of the work of altering existing buildings is by no means the full extent of the burden upon those affected; the inconvenience and disorganisation of trade will be of much moment; and, in the case of projecting shops, the loss of light will not be the least important factor; but careful forethought will doubtless mitigate the hardship. Means have in some cases already been devised of constructing a self-supporting flat of concrete and steel over the existing flat, so obviating the nuisance caused by drippings from wet concrete, and allowing the trade to proceed undisturbed during the work. The difficulty of light may in some cases be met by constructing the fire-resisting roof or flat at two levels, a flat 6 ft. wide at a higher level, close up to the main front wall, affording the opportunity of a vertical light between the front edge of that flat and the rear edge of that on the lower level.

PAYMENT OF DISTRICT SURVEYORS.

THE letter which we print in another column, addressed by the President of the District Surveyors' Association to the Chairman and members of the London County Council, raises important questions with regard to the recommendations of the Building Act Committee, whose Report on the question of payment of District Surveyors by salaries was published in our issue of December 16 last. Unlike other municipalities, London has hitherto been fortunate in securing for the work of supervision of buildings under the Building Acts the services of independent men who for the most part have received a liberal professional education; the majority of the District Surveyors have been practising architects (only restricted from working for private clients within the areas of their respective districts), and not a few have been men of high position in the profession, such as—to mention only those deceased—Edward

PAnson, Thomas L. Donaldson, John Whichcord, George Godwin, Robert Kerr, Banister Fletcher, T. Roger Smith, and Charles Fowler.

It may be said that the public who build do not want Past Presidents of the Institute and Royal Gold Medalists for this work of supervision; but the fact nevertheless remains that the building public have obtained, at an expenditure of about 50,000*l.* per annum, the services of fifty-seven highly-trained professional men, and the same public, under the new scheme now suggested, will continue to pay 50,000*l.* per annum—but into the coffers of the London County Council. The difficulty that the members of the Council, whatever their qualifications may be, are, neither by training nor experience, qualified to earn professional fees is to be met by sub-letting the job, and the work which at present is divided among fifty-seven Surveyors is now to be done by thirty-three officers, who are to receive by way of salary not 50,000*l.* per annum, but 28,000*l.* per annum. The difference in the gross total is to be expended in establishment charges, wages to an army of assistants, and, if it should fall out that the forecasts of the Building Act Committee prove correct, "there would be a balance in the favour of the Council" of about 2,000*l.* per annum.

That is all very well, but the balance in favour of both the building public and the rate-paying public is farther to seek. The following questions would seem to require an answer:—Will the public be willing to pay to the Council the same professional fees they have hitherto paid for this service? Will the Council, paying the men who do the work little more than one-half of the fees those men earn, be able to ensure that efficient and high-class service which the public has a right to expect? What guarantee have the ratepayers that this work, which it has hitherto taken fifty-seven men to do, can be continued without a break-down by thirty-three men? The London County Council are accustomed neither to overwork nor to under-pay their staff, therefore, if it be found necessary to increase the number thirty-three by the appointment of five or six additional men, how far will the "estimated profit" of 2,000*l.* a year go to prevent this service, like some other services of the London County Council, becoming a charge upon the rates? Is there not rather a strong probability that the ratepayer will find himself called upon to share with the building-owner a burden which hitherto the building-owner alone has had to bear? Unless a satisfactory reply to these questions is forthcoming, we think that, with a County Council Election impending next year, the present Councillors will be wise to leave well alone.

BUILDING IN LEEDS.—A return of the building operations in Leeds for the nine months ending December 30, which was presented at a meeting of the Building Plans Committee of the Corporation on the 29th ult., shows that, in spite of the outcry that Leeds is overbuilt, the builder, speculative and otherwise, has been fairly active. During the period there were completed 20 villas, 70 semi-detached residences, 626 through houses, 600 back-to-back houses, and 4,285 miscellaneous buildings; while there are in hand at the close of the year 17 villas, 49 semi-detached residences, 537 through houses, 322 back-to-back houses, and 1,575 miscellaneous buildings.—*Leeds Mercury.*

NOTES.

Building By-laws in Rural Districts. THE recent discussion of the subject of Building By-laws in Rural Districts and the supposed difficulties which they put in the way of cottage building (difficulties which, as before said, we believe to be much exaggerated) has had the effect of inducing the Local Government Board to address a circular to the Rural District Councils on the subject. The gist of this circular is that the series of Urban Model By-laws were not necessary nor intended for a district or part of a district of quite rural character; and the Board think it probable that amongst the rural districts in which the Urban Model By-laws are in force there are many parishes or other districts which cannot be said to have "urban" characteristics, "and in which the by-laws in some respects impose undue restrictions on building and are more onerous than the circumstances require." The following quotation indicates the action which the Board wish the Rural District Councils to take in respect of this subject:—

"The Board would be glad if the Rural District Council would carefully review the circumstances of their district for the purpose of seeing whether any modification of the present by-laws is desirable, and whether any part of the district might more suitably be placed under a series based on the Rural Model, or, if this is not thought suitable, by such a series supplemented by a limited selection of clauses from the Urban Model. In some cases relaxation has already been given by a clause exempting detached dwelling-houses from certain of the restrictions as to the construction of walls. Even where it is considered that the full code of by-laws should be retained, the existing by-laws, unless made very recently, might with advantage be reviewed in connexion with the latest form of the Urban Model. This contains many additions and modifications based on the experience of the working of the old model, and at the same time is framed so as to give more elasticity in the administration of the by-laws.

The Board wish to be informed of the result of the consideration of this letter by the Rural District Council."

It seems to have been inevitable that the Local Government Board should have taken some action in consequence of the public outcry that has been raised, and perhaps the tentative course indicated in the above paragraph is the best they could have taken under the circumstances. They have, however, set the Rural District Councils a sufficiently difficult task in asking them to endeavour to define the limits at which "urban" character merges into "rural" character; limits not only difficult of determination at the moment, but liable, in some parts of the country at all events, to frequent alteration. However, the suggestion is a very well-intentioned one, and perhaps some practical enlightenment on the subject may result from it; but we should think that, in order to give any practical reply, the Rural Councils would be under the necessity of formulating some definite standard of circumstances which may be held to distinguish a "rural" district from an "urban" one.

The Charing Cross Inquest.

By the evidence given by Sir Benjamin Baker and Sir John Wolfe Barry, at the adjourned coroner's inquest, held on Monday last, it is made quite clear that the cause of the recent disaster at Charing Cross was simply the failure

of the main tie-rod in the first roof truss from the southern end of the station. The facts recorded in our recent article as to the condition of this rod are amply confirmed by the statements of these experts. It is now evident that the bar had an original defect at the centre of a weld, although, so far as could be judged after the accident, the metal had originally been continuous at the outer surface. The examination made by Sir John Wolfe Barry showed that the flaw in the tie-rod extended over two-thirds the area of the rod, and was in itself an ample reason for the failure. In his opinion nothing but a laboratory experiment could have revealed the presence of the flaw, and it is very satisfactory to find in this evidence proof of the fact that the railway company's inspectors are not to be blamed for not having discovered the flaw in the course of their periodical examinations. All the expert witnesses examined were positive on the point that the mishap was in no way due to deterioration of the ironwork generally, and the estimate made by Sir Benjamin Baker was that, in its forty years of existence, the roof had lost only about 6 per cent. of its original strength. This computation may be open to question, but it is no doubt the case that the strength of the ironwork had not been seriously diminished by corrosion. The evidence of Mr. Percy Tempest and his assistant shows that a good deal of attention has been devoted to the cleaning, painting, and repairing of the Charing Cross roof during the last few years, and we are glad to find that in returning the verdict of accidental death the coroner's jury attached no blame of any kind to the officials of the railway company. The most important lesson to be drawn directly from the accident is that a roof like this ought not to depend for safety upon a single tie-rod. Sir Benjamin Baker said that in modern practice there would be two tie-rods "so that if there were an invisible flaw they would have another to fall back upon." This confirms the opinion expressed in our note of December 9 last, but we must point out that as long ago as 1851 Mr. Berkeley designed the Fenchurch-street station roof with duplicate ties, a good example that was not followed by Sir John Hawkshaw, and has not been adopted by many of his successors. No doubt really practical and careful engineers actually employ two tie-rods in roof trusses, but we are sorry to say that the practice is by no means so general as it ought to be, even in the present day.

Demolition of Charing Cross Roof.

At the present time and during the next week or two our readers will be able to witness at Charing Cross one of the most interesting and extensive processes of demolition that has been conducted in the Metropolis. The contractors are now busily engaged in disconnecting and lowering the roof principals and other parts of the station roof by the aid of timber staging built up from rail level to the first remaining truss at the south end, and a massive travelling gantry, to be equipped with four powerful cranes, is almost completed for dealing with the other principals in succession. An

inclined roadway leading down to the embankment affords convenient means for carting away the old iron work and other materials without causing inconvenience at the north end of the station, or interference with traffic in the Strand. As the public are admitted freely to the space in front of the station platforms, anyone desiring to observe the progress of the work can do so quite conveniently. It is not often that a great engineering operation of the kind is conducted in our midst, and the present opportunity is one that ought not to be lost.

ALMOST every aspect of this important subject has been thoroughly threshed out in various treatises, papers, and articles in the technical press, and it is extremely difficult for anyone to write upon it without going over ground that has been repeatedly trodden by others. However, in a paper read by Mr. J. F. Reade at the last meeting of the Civil and Mechanical Engineers' Society, a useful summary of the present position is given. After dealing with the various difficulties that first arose in determining the best means for adoption, and discussing the results ascertained by chemists and bacteriologists as to various systems of purification, the author referred to the controversy that has arisen between advocates of the septic tank and the contact bed systems, and pointed out that neither system alone was able to accomplish all that was originally claimed for it. For instance, the septic tank does not completely liquify the solid constituents of sewage, and sludge disposal has still to be effected. Contact beds, again, are apt to choke and to become useless until they have been renovated. It is a fact that no simple process has yet been discovered which will give an effluent perfectly satisfactory from a bacteriological standpoint, and suitable for discharge at all times into unpolluted streams. Passing on, the author gave an analysis of the various Reports issued by the Royal Commission on Sewage Disposal, which is quite deserving of perusal. At the present time the attitude of public bodies is not particularly marked by any evidence of the desire to make changes in existing methods of treatment, and we agree with the author in the opinion that, until the establishment of the central authority and subsidiary river boards advocated by the Commission in their Report of 1903, it is improbable that local authorities will undertake any schemes involving considerable expenditure except such as are shown to be absolutely necessary.

THE Committee on Science and the Arts of the Franklin Institute, having undertaken to inquire into the merits of the Shuman concrete pile, report that after due consideration they recommend the award of the John Scott legacy premium and medal to the inventor. The invention to which we refer comprises two parts—(1) a tool for the formation of holes in the ground to contain concrete; and (2) several devices for filling the bole with concrete and for holding the material in compact position in loose or permeable soil. The tool consists

of a hollow shank having a steel point of larger diameter, and shaped somewhat like a shell used in gunnery. The point is riveted to the shank, and is made so as to favour the admission of air below it when being withdrawn. Under this patent the process of forming piles is conducted by driving a preparatory tool or mould into the ground, and then by filling the opening with concrete, which, when hardened, forms the pile. Owing to the use of an enlarged point the tool is very readily withdrawn, and, in some cases, it is said to be advantageous to substitute a solid concrete head for the steel point, and to leave this head at the bottom of the hole. A large number of piles formed in the way described have been used in the United States, and some 2,000 of them were driven not long ago at the Washington Barracks, and tested to the satisfaction of the United States engineers in charge of the works.

A SCHEME brought forward for the erection of a transporter bridge as part of the project for connecting Middlesbrough and West Hartlepool by means of a light railway does not appear to meet with the approval of the Tees Conservancy Commission. The grounds for the opposition in question are certainly not unreasonable, for, while the clear headway proposed by the promoters of the bridge undertaking is only 120 ft., vessels are built on the Tees with masts rising to the height of 170 ft. above water level. If that were the only difficulty we presume the promoters would agree to increase the height of the bridge rather than face opposition. Another point urged is that the inconvenience to vessels caused by the passage of the car, and the risks to shipping during stormy and foggy weather and on dark nights, would seriously affect navigation and trade. As the undertaking of the Commissioners represents a capital of more than a million pounds, it is quite right that their views should receive consideration, but we fear that they overrate the obstacles likely to be offered by the use of a transporter car. Experience of transporter bridges at other seaports certainly does not lead to the conclusion that any serious injury would be caused to shipping on the Tees, providing the height of the connecting girder were adequate.

It is now several years since Sir Alexander Kennedy reported to the London County Council on the various systems of electric traction and recommended the "open conduit" system. At the time, if we remember aright, the only practical "surface contact" systems were the Westinghouse and the "Claret-Vuilleumier," and in our opinion neither of these was as good as the system adopted by the London County Council. At the present time, however, when it is proposed to spend large sums of money in electrifying the Northern system of tramways, it is highly desirable that the merits and demerits of "surface contact" systems should be again considered. For this reason we welcome the clearly written and well-illustrated paper on this

subject by Mr. Noble Twelvetrees which appeared recently in the *Engineering Review*, and is now issued as a pamphlet. We agree with him in thinking that an objection to the Lorain system is that a stud may be left alive after the car has passed over it; and although it does not often occur, yet the mere possibility of it will make careful people in Wolverhampton avoid stepping on a stud when crossing the road. Mr. Twelvetrees gives deserved praise to the Kingsland contact systems, the earliest forms of which we described in these columns a good many years ago. We understand that the new electric tramways in Lincoln will be run on the Kingsland system, and the working will be studied with interest by all interested in the future of electric traction. The rapid development of new methods of electric traction naturally makes municipal authorities and financiers chary about expending large sums in installing the track. The "antiquating factor" of this part of the undertaking is undoubtedly serious, and it is therefore desirable that the relative advantages of open conduit and surface contact systems should be carefully considered.

AN executive committee is formed to consider the proposal which has been made for the establishment of a national naval museum and to open a fund estimated at 100,000*l.* Inasmuch as Gwydyr House will at no distant date be vacated by a branch of the Board of Education upon the completion of the new Government Offices in Parliament and George streets, it is suggested that the house should be demolished for the erection of a national naval museum, to be supplementary to the adjoining Royal United Service Institution. Gwydyr House, the first home, until 1840, of the Reform Club, was built in 1795-6 upon Crown land by John Marquand, Surveyor to the Woods and Forests, for Sir Peter Burrell, Surveyor-General of Land Revenues, who was advanced Lord Gwydyr in 1796, and had obtained a thirty-one years' lease of part of the old Privy Garden of the Palace at Whitehall. After Lord Gwydyr's death in 1820 the house was inhabited by his widow, Priscilla, in whose favour was terminated the abeyance of the ancient Barony of Willoughby de Eresby, and subsequently by their daughter Elizabeth, Countess of Clare, who rented it in 1842-69 to the Commissioners of Woods and Forests for departmental purposes. Gwydyr House has since been the offices, in turn, of the old Poor Law Board (Local Government Board), of the Charity Commission, and of the staff for administering the City of London Parochial Charities Act. In 1884-5 the Office of Works converted the attics into a top floor; the one-storied wing added in 1898 projects on to the site in the Privy Garden of the dial constructed by Edmund Gunter for Prince Charles, and for which in 1622 Nicholas Stone made the pedestal: see his MS. "account-book" in the Soane Museum.

THE rehabilitation of the beautiful little Church of St. Peter Hungate (the Hundred-way), on Elm Hill, Norwich, is

The Sewage Question.

to] be carried out under the directions and superintendence of Mr. Weir. The demolition of the fabric was contemplated some months ago, but the Consistory Court agreed to delay a grant of the faculty in response to the requests of Prince Frederick Dhuleep Singh and the Society for the Protection of Ancient Buildings. The church, cruciform on plan, having a western tower and a porch with parvise, was rebuilt in 1460 by John and Margaret Paston. The nave and transepts are faced with flint; in the nave wall are squints directed towards the side chapels; some of the original glass and window tracery remain, together with the fine hammer-beam roof. The church is cited in the Paston Letters, and Margaret Paston made bequests of money for the services by the priest and to "each household of the parish that will receive alms."

The Carfax Gallery. At the Carfax Gallery is a collection of paintings by Members and Associates of the Royal Academy. We do not know how many of them are new or first exhibited; some certainly are not; Sir L. Alma-Tadema's portrait group (7), for instance, we have seen before; but there are some fine examples of some painters at their best. Mr. North's "Brightest Days" (3) is one of these, a sparkling landscape of sunlight and colour, with two foreground figures very effectively put in. Mr. Hacker's "La Cigale" (4), if a new work, represents a change in his practice in colour effect; it is a piece of exceedingly rich and warm colour shown in the treatment of a half-length draped figure. One of the most interesting works is a small but highly finished view of "Bam-borough Castle" (6) by Sir E. Poynter, one of the finest of his small landscapes that we have seen. Mr. Solomon exhibits a recumbent "Psyche" (15) which is an admirable piece of drawing, but his life-size head of "St. George" (21) is very weak in conception, and looks more like the head of a woman. Among other things is a clever sketch of a nude figure by Mr. Tuke, "Sun and Sea" (31) (the first time we remember to have seen a female nude study with his name to it); a fine little pastel of an evening landscape and cattle (11) by Mr. H. W. B. Davis; two fine sea pictures (14 and 29) by Mr. Napier Hemy; a bold sketch of two figures of children lighted by fire-light (19) by Mr. F. Bramley; a landscape with foreground figures, "Molecatchers" (35), by Mr. Swan, which looks good, but was lighted by artificial light and therefore difficult to estimate as a landscape; and a good Thames scene by Mr. Wylie, "Towing past the City" (24), with a steamer and barges in the foreground. Sir W. Richmond's curious fantasy called "Phaeton in the Mid-day" (1) is at all events a very successful attempt to represent the actual flash of light from the wheel of the solar chariot.

The Fine Art Society. At the Fine Art Society is a collection of water-colours of "Animal and Pastoral Subjects" by Mr. J. C. Dollman. A considerable number of them are studies of different types of horses, all good, that called "Trespassers" (16)

being perhaps the best; and better even than these is one of a lion lying on its side (11), which is quite masterly. Kittens also are well represented in more than one frame; and a monkey looking curiously at a penny held in its hands, and entitled "Pourquoi?" (33), is a capital bit of humour in animal painting. The collection includes also some charming little landscape sketches; "Summer" (19), "September" (22), "The Happy Valley" (24), and "Hazy Afternoon" (34).

The New Academicians. The Royal Academy have elected Mr. S. J. Solomon, A.R.A., as R.A. As a most accomplished technical executant Mr. Solomon is fully entitled to the honour, though we cannot say that we find his works very inspiring in an artistic sense; but that limitation may apply to some older Academicians. Herr Josef Israels, the great Dutch painter, and Mr. St. Gaudens, the American sculptor, were elected Honorary Foreign Academicians. The first of these two elections will only excite surprise that it comes so late; the second will perhaps serve to attract more notice in this country to the works of Mr. St. Gaudens, which, however, as far as we know them, appear to us to be more remarkable for vivacity of intention than for elevation of style. Mr. Edward Stott and Mr. Pomeroy have been elected Associates—the latter name will be more universally approved than the former, though Mr. Stott has earned the distinction; and Mr. Frank Short and Mr. W. Strang have been elected, according to the daily press reports, "Associate Engravers." If this is to be their title, and not only a journalistic way of putting it, we must say that we cannot see why these two artists, who are original artists in black and white and not mere engravers of other men's work, should not be A.R.A. *sans phrase.*

THE INTERNATIONAL SOCIETY AT THE NEW GALLERY.

THE "International Society of Sculptors, Painters, and Gravers," whose sixth exhibition is open at the New Gallery, have done wisely in placing the sculpture exhibits in the Central Hall in the first pages of their catalogue, for but for the sculpture the exhibition would not be much worth a visit, and moreover it is the sculpture hall alone, in which M. Rodin, M. Bartholomé, and the late Constantin Meunier are represented by important works, which gives it any good right to the title of "International." As far as the pictures are concerned, there is a certain proportion of foreign works, but none of them of any importance. The Society deals largely in promises and in the circulation of anticipatory paragraphs (some of which we have prudently declined to print), but their performances contrast singularly with these documents. We heard not long since that this exhibition was to include a representative collection of modern American painting, for which special arrangements had been made. There are eight pictures from America, only one of which, Mr. Brush's "Mother and Child" (214) is a work of any importance; this, like six more out of the eight, are lent by the Pennsylvania Academy; but this certainly is hardly a representative exhibition of American painting.

M. Rodin's group on heroic scale, "Le Baiser" (1), has been illustrated over and over again, and is one of the best of his recent works; were all his work like this, in passionate suggestiveness and in modelling, there would be more excuse for the attitude of adoration which contemporary critics and society babblers assume in regard

to him; it is really an impressive thing, though detail is much slurred over in some portions. At the opposite end of the hall a colossal Adam and Eve by M. Bartholomé (3) is also a very fine group, both in expression and modelling; it is after The Fall, and Eve is consoling Adam, whose face is hidden in his hands; the figure of Eve is of fine and ample modelling, worthy of the mother of mankind. M. Bartholomé also exhibits a graceful figure of a kneeling girl—"Jeune Fille se Coiffant" (2). But this sculptor has never equalled, in poetic feeling and originality, the wonderful group of the man and woman looking into the tomb, which first made him famous. M. Rodin's smaller work, "Paolo and Francesca" (69), is in the centre of the South Room; this, however, is one of those rather fantastic groups of figures which seem only half disengaged from the marble, or as if made in some substance which has half melted down, of which this sculptor has set the fashion; but these will not retain their position in the art when the temporary taste for this kind of work has toned down. Of the works of Meunier, who was in sculpture a good deal what Millet was in painting, there is a considerable collection, all of high interest and power of a certain kind. Among the work by English sculptors Mr. Havard Thomas's little bas-relief of a figure from real life, "The Camomile Gatherer" (16), is very clever and far superior to the "Lycidas" about which such a talk was made last year. Mr. Alfred Drury exhibits his study for a head of St. George and the head called "The Spirit of the Night" (42 and 43), both of which, if we remember right, have been seen at the Academy. Mr. Paul W. Bartlett, a sculptor with an English name but who dates from Paris, exhibits two cases of bronzes (40 and 45)—lions' heads, figures of lions, and other small works, which (whether intentionally or not) have a kind of air of being antiques, and a small-scale figure of a "Man Crouching" (68), which is a good piece of work.

The pictures commence in the South Room, where the presence of such a work as Mr. Neven Du Mont's "John Jorrocks, Esq., M.F.H." (72), lent by the Cologne Museum (how did it get there, of all places?) indicates that the Committee have been obliged to be not too particular in taking what they could get to fill the walls. A life-size portrait of a lady by M. Boldini (79) shows this artist's usual clever vulgarity of style. M. Desnard's "Au Bord du Lac" (89), an impressionist view of a family bath, occupies another centre position in a not very interesting manner; but this painter has realised two fine and powerful cloud effects in his two coast scenes (88 and 90). The fourth centre position is occupied by Mr. Greiffenhagen's portrait of Mrs. Greiffenhagen, as sombre in key as the Boldini opposite to it is loud and flashy, but it is an interesting portrait study both in colour and design. M. La Touche's iridescence of colour is illustrated in his picture of "Le Mariage de Riquet à la Houppe" (81); Herr Schuster-Woldau, of Munich, exhibits a portrait of a little girl (112) quite obviously "made in Germany," both subject and treatment; and among the landscapes in the room is a small American work "Sheep Pasture" (84), by Mr. H. W. Ranger, very pleasing in colour and light; a "Woodland" (77) by a Dutch artist, Herr Schregel, which seems to owe something to the inspiration of Diaz; a not very good view of "Notre Dame, Paris" (78), by M. Rafaell; and a good "Moonrise on the Seine" (94), by Mr. R. Macaulay Stevenson.

Sir James Guthrie holds the place of honour in the West Gallery with a very fine and heroic-looking full-length of "The Marquis of Tullibardine" (137), faced by Mr. Lavery's portrait group of two ladies (160), where blue and white dresses and lighter blue sunshade make a most effective colour combination. The centre of the north wall is occupied by the late Robert Brough's fine portrait of Lord Justice Vaughan Williams; so that Scottish art is rather pre-eminent in this room. On the south wall we have a large and new picture by Herr Israels, entitled "Indoors and Outdoors" (124), looking on to the landscape from inside a cottage door; but—as is too often the way with Dutch painters, even of the calibre of Herr Israels—the outside scene seems to have no

more brightness or colour than we get inside the doorway, and the figures are not of the highest interest. Among the best works in this room is Mr. Bertram Priestman's gloomy and powerful landscape, "A Stormy Evening" (144). Mr. Millie Dow's "The Enchanted Wood" (131) is a poetic twilight landscape spoiled by a too large and unnatural-looking moon. Mr. Paterson's small landscape sketches, "Autumn" (133) and "Wind in the Trees" (135), are suggestive little compositions; Mr. Morrice's "Marine" (139) is a pleasant sea-piece; Mr. H. Goodall's "Camber Castle" (140) is a vigorous splash of windy sky and trees; and Mr. Oliver Hall's "Outskirts of Parham Forest" (164) is a good example of landscape composition. Mr. William Strang, in "The Sea Pool" (147), surprises us by producing a quite classically designed nude. What seems to pass for landscape at Munich is curiously illustrated by Herr Frank's large work, "The River's Mouth" (159), as flat and airless as if it were cut out of wood.

The North Room contains some of the curiosities of the exhibition; among them two or three of the utterly unlovely and repellent figure studies by Manet which it is the fashion to admire, and a perfectly hideous nude study (if such a thing can be called a study) by M. Legrand, "Le Bain" (236), an ill-drawn awkward posed figure, plastered over with paint laid on thick without an attempt at truth of colour or texture. Into the much-abused Royal Academy such a work would not have a chance of admission, which is at least one thing in favour of the Academy; and the same may be said of Mr. Conder's ridiculous "Croquet Players" (225), which one might suppose to be exhibited as a joke, but which in the present state of "art-criticism" (?) will no doubt find its admirers. M. Charles Cotte's "Au Pays de la Mer" (171), a triptych which has been seen, if we remember right, at the Salon, is here, and is an example of the artist's work before he took to painting figures in the hard black style which he has recently affected. Mr. Cameron's "Glencleugh" (176) is a good landscape; M. Cézanne's "Nature Morte" (199) a good Still Life painting; Boudin's "La Plage" (183) shows a good sky; Mr. Neven Du Mont's "Souvenir de Romney" (219) is a pretty figure sketch answering to its title; Mr. W. Nicholson's portrait of a lady seated at table (232) is graceful and spirited; and Mr. Sydney Lee's large and solid painting, "The Stone Bridge" (254), has a great deal of merit as a picture of a class of architectural subject which is seldom treated in painting on so large a scale and in so happy a manner. But the pleasure to be derived from the picture part of the exhibition, taken as a whole, is but of a doubtful and chequered description.

We observe that at the luncheon given by the Society at the Savoy Hotel on Wednesday, a long letter was read from M. Rodin explaining the objects of art (he alone, apparently, being supposed to understand them), in the course of which he remarked that the great sympathy shown for their Society perhaps arose from the fact that "au fond tout le monde attend ces artistes simples et humains, on montreron de leur force claire que la beauté n'est pas l'exception, qu'elle est partout." Those who are of a cynical turn of mind may perhaps find a certain amusement in studying these words in the presence of some of the paintings exhibited. The real meaning, nowadays, of the sentiment that "la beauté est partout" seems to be that there is no difference between the ugly and the beautiful.

DRAIN-PIPES AND MOTOR TRAFFIC.—Dr. Walter Blyth, the Medical Officer of Health for the Borough of Marylebone, in his Monthly Chronicle for November, 1905, remarks in regard to this subject:—"The vibration from heavy motor traffic and from underground railways is affecting this district, and indeed the whole metropolis, more or less seriously along the main channels of traffic. There have recently been instances of absolutely new drainage becoming defective from fracture of the pipes, and in the writer's opinion in certain situations in which vibration is to be expected the only safe way will be the construction of iron instead of earthenware drainage. Drainage is a costly matter, and when once put down should not require renewal for at least a quarter of a century."

ROYAL ACADEMY LECTURES.

ON Monday afternoon Mr. Clausen gave the first of his set of four lectures to the Royal Academy students, the subject being "Drawing." Something seemed to have gone wrong with the Royal Academy management, for the numerous visitors were kept standing in the Hall till nearly the time for commencing the lecture, when they were bidden to come up the main stairs and enter through the Exhibition rooms; and on Mr. Clausen taking his place at the lecturer's desk he had to inform his audience that the lantern had been forgotten and he would be unable to show any illustrations; a kind of mismanagement which is not very creditable. The illustrations which should have been given at this lecture were promised for the next one.

Drawing, Mr. Clausen said, was a convention; there were no boundary lines in nature; the forms of surfaces were defined by difference of tints. Yet the expression of form by lines seemed to be a process that nature herself recommended itself; all primitive art was expressed by outlines, and was in early stages regarded as a sufficient method of expression; modelling the surfaces by shading was a later development. Drawing was a means of expression, and this view of it enabled us to realise that there might be an expression, perfectly intelligible to its originators, in some forms of drawing to which we had not the key. The forms of Celtic drawing, which seemed strange and meaningless to us, had no doubt a distinct meaning to those who drew them and those for whom they were made. Even now children were satisfied with exceedingly crude representations of objects, and primitive peoples were in this respect in the position of children. Two types of drawing might be distinguished—the old symbolical type and the modern realistic type. Blake's drawings, which were full of meaning, were nevertheless to a great extent symbolic rather than realistic. Rembrandt might be said to represent the opposite extreme; the mere representation of form as influenced by light. Drawing appealed to the intelligence first in the search for form; secondly, in the effect of light and colour on form.

In the drawings of old masters we saw the scaffolding on which their finished works were built; and it was worth notice that these old drawings were all made with a definite purpose, not, as in the modern work in the schools, for mere study of the form and the old system of pupillage, when the student was employed on work in progress, and its advantages over the mere school study for the purpose of obtaining aptitude. The old drawings of the figures were definite; ours were tentative; we reposed too much on the model. School work was only a means to an end, and sometimes led to the consequence of the draughtsman being helpless with the figure unless he had a model before him.

There were few drawings by the early painters known and accessible. But we had unfinished pictures, such as one by Piero della Francesca in the National Gallery, in which we could see the lines of the first drawing on the panel. The older Italian drawing was, like the Flemish, rather angular in manner, but the figures were of a finer type; a difference partly racial, the Italians being a finer type of humanity than the Flemings, but partly also owing to the tradition of the antique, which had never been quite lost in Italy, while the Flemings had no ancient art to support them. They aimed at truth to nature and precision of line, as the works of Van Eyck and Dürer plainly showed. A study of Dürer's for the hands for his Adam and Eve carried precision and attention to nature as far as it was possible to carry them. Early German work was thorough in this sense, but mannered; there was a tendency to make the lines "curly," not like the severe line of the Italians. We could see this to some extent even in Holbein, but not in his best work, especially his well-known drawings of heads. Here he was entirely free from mannerism; and it might be observed that in the highest type of drawing, such as these, we were never reminded of any other style. In short, the object of the drawing of the northern artists was observation only, while the Italian artists had a standard, and a greater sense of beauty. Why the one was beautiful

and the other was not would lead into the very abstruse question, what was beauty; which they could not go into now. He thought that practically the Greek artists had, after long effort, fixed a standard of beauty of the human figure, which had been accepted and had influenced subsequent art. The modern painters who had called themselves neo-Raphaelites were, he thought, largely influenced by Flemish art; their early drawings were very well worth study, those of Millais especially, in book-illustrations, which were equal to Holbein. Returning to the Italians, we found in the drawings of Leonardo da Vinci even greater evidence of genius than in his few finished pictures. His anatomical studies showed how he aimed at obtaining a full knowledge of the construction of the figure; and with this certain knowledge, thus acquired, his line was always precise. The drawings of Raphael might be considered to represent the high-water mark of figure-drawing; they were given with the greatest economy of means, and the construction of the figures was always well expressed. Among his modern followers there was perhaps no one equal to Ingres in these qualities. (Several beautiful small-scale figure-studies by Ingres were hung on the wall, balanced by some of Leighton's on the other side.) Ingres might be said to have recreated the academical spirit in drawing, in its best sense. He was one of the greatest draughtsmen who ever lived, and one never wished his line otherwise than it was. Leighton's drawings showed the same fine tradition. The main point about these, as about the drawings of Michelangelo, was that they showed the human figure as it exists. Most of these drawings probably occupied no more than half an hour in execution; they showed the swift application of great knowledge. To gain this power one should not merely imitate the model (in the life school), but learn from it. "Watts's drawings, then in the exhibition, were an instance of this; they were studies of the figure not from the picturesque but from the constructional point of view—outlines drawn with the quiet authority of a master. Mr. Clausen mentioned also the drawings of Alfred Stevens, who was decorator, sculptor, and painter, as worth attention, and also those of Millet, some of which were as fine as the work of Watts; and all were permeated by the same object—expression by definition of form through knowledge of construction.

Ought we to try, in drawing from the model, to express surface gradations of contour? He thought not; the study of the form was difficult enough in itself; and besides, if one began expressing surface gradations, this could only be done through difference of tone, and then the tone of the whole surroundings—the background, etc., must come in, and further complicate the problem. It was better to think of the form only, the firm basis of the artist's work, in the first instance, even if he had eventually to give it a second place. Mr. Clausen read a very interesting and frank letter from Whistler to Fantin-Latour, written in 1867, in which Whistler lamented the temptation he had yielded to, of getting over problems of drawing by facility in the use of colour, saying "what a painter I should be now if I had studied form more carefully," or words to that effect. The influence of Courbet, he said, had been very injurious to him (not so much that he disliked Courbet's art as that he disliked his method); and he added, "Why was I not a pupil of Ingres? How healthy his influence would have been." This testimony of Whistler was valuable. Mr. Clausen said, because as far as Whistler was an influence the qualities in his work that were now imitated were those that were not the best in it. Should we take any particular artist's manner in drawing as an example to follow? If so, Ingres and Watts were the best examples; try to imitate their qualities—accuracy and simplicity. To take

* We heard of an able teacher at the Slade School saying one day to a pupil at work from a cast— "You are doing that, you are to draw it"; an admirable distinction.

† We may remind our readers that we have already called attention to this quality in the Watts drawings in our article on the Loan Exhibition, that they are outlines taken from various points of view in order to get the construction of the figure.—Ed.

the manner of some particular artist of earlier times was very likely only to lead to a "pose." But it was largely a question of temperament; each man expressed himself best in his own way.

THE BRITISH SCHOOL AT ROME.

The first open meeting of the British School at Rome for the current season was held at the School on Thursday, January 4, and was attended by the British Ambassador (Sir E. H. Egerton, K.C.B.), the Swedish Minister (Baron de Bildt), Professor Körte, First Secretary of the German Institute, and other foreign scholars, and by many British residents in Rome.

The Assistant-Director (Mr. T. Ashby-jun.) read a paper upon "XVIIth Century Engravings, Illustrative of Roman Sculpture." He began by pointing out the importance of the subject in relation to the catalogue of the municipal museums, which the School has undertaken. Much might be learnt from early engravings as to the condition of sculptures when found before they have undergone restoration, as to the date and locality of their discovery, and as to the various collections through which they have passed.

Though the majority of XVIIth century engravings which are influenced by the antique do not reproduce it with sufficient accuracy for the present purpose, there are a certain number of actual representations of famous statues among the engravings of Marc Antonio and his school; and of these many—especially from the hand of Nicolas Beatriset—came to form a part of the collection known as the *Speculum Romanæ Magnificentiæ*, published by Antoine Lafréry, which, however, was quite eclectic as regards sculpture, and included views of all sorts relating to Rome of both the Classical and the Renaissance period.

The first collection of engravings of sculpture exclusively was the first edition of the work of Joannes Baptista de Cavalieris (*Antiquarum Statuarum Urbis Romæ Uber primus*), published before 1570, in which year a reprint of the original undated edition appeared in Venice. It contained fifty-two plates only, and dealt with a small number of collections. The noteworthy omission of the Vatican was due, no doubt, to the practical inaccessibility of the collection under the anti-humanist, Pius V. The first edition of a larger work (100 plates) appeared after his death, but before 1573, and was reissued in 1585. The first twenty-five plates of the original were, for some reason, not used, but new plates were engraved. The original plates reappeared, however, in subsequent publications of the XVIIth century.

The third and fourth books (100 plates) appeared in 1595, and were arranged according to subjects rather than collections. The engravings were inferior in style, but showed independent research, which was not the case with the album of Lorenzo della Vaccaria (1584). In the meanwhile, collections of busts were issued by Achilles Statius (1569) and Fabricius Arsinus (1570), both published by Lafréry.

Mr. Ashby then gave a short description of the wood block plan of Venice of 1500 (which was really something between a plan and a bird's-eye view), a copy of the first edition of which he had recently acquired. It was in six sheets, measuring altogether about 10 ft. by 5 ft., and was perhaps the finest work of the kind in existence. The accuracy and fulness of detail were remarkable, and in these points it was far in advance of any of the plans of Rome of the XVIIth century. The author was unknown; it was often attributed, but without any certain proof, to Jacopo de Barbari.

The second paper was read by Mr. A. T. Wace, Librarian of the School. He discussed two Roman historical reliefs in the Louvre, one representing an *extispicium* before the temple of Jupiter-Capitolinus, the other showing the sacrifice of two bulls. These were formerly in the Borghese collection, and at the end of the XVIIth century in the Capitoline collection. He proved that the first relief was found about 1540 in Trajan's forum by reference to some sketches of Antonio da Sangallo the younger. Sangallo gave a full description of the pediment of the temple which was now lost, but of which several XVIIth century drawings survived. He connected with this a mention by Flaminio

Vacca of the finding of some historical reliefs in Trajan's forum, including a relief showing a Dacian rider swimming a river. Vacca's statement that these reliefs were in the house of Prospero Boccafaduli was confirmed by a note of Pierre Jacques Wace, therefore, conjectured that the Louvre reliefs, the Dacian, and other relief fragments (now lost, but drawn in the famous *Cordex Orsinianus Vaticanus*, 3439) were all found together in Trajan's forum about 1540. The Louvre relief represented the *nuncupatio veterum* before Trajan set out on his Dacian campaign. It thus fitted in well with the Dacian battle scenes on the arch of Constantine. The other Louvre relief, with the fragments drawn in the Orsinianus, represented, perhaps, the Parthian triumph of Lucius Verus and Aurelius in 166 A.D. This agreed well with the style, which was totally different from the Trajanic reliefs, and much more like the Aurelian panels on the arch of Constantine. Thus it seemed likely that Trajan's forum was not completed during his lifetime, but was finished and decorated by Hadrian and the Antonine emperors. All these reliefs, with perhaps some others, were probably in the collection of Prospero Boccafaduli, who was in charge of the building of the capitoline palaces from 1555 onwards. He probably kept them there hoping to sell them to the Municipality. On his death, or before, the two Louvre reliefs passed to the Borghese collection, and the Dacian to the Villa Medici; the rest of his collection of reliefs has disappeared.

Professor Hülsen, Second Secretary of the German Institute, made some remarks on the last paper, emphasising the importance of the discovery of the provenance of the Louvre reliefs, especially as regarded the architecture of Trajan's forum.

MAGAZINES AND REVIEWS.

The *Burlington Magazine* heads its issue with a plate of the Rokeby Velasquez, and an editorial article on this highly unsatisfactory topic, the end of which we have now little doubt will be that the picture will be lost to England. The position as put in the article is that England is somewhat in the case of Italy in the XVIIIth century; she has great possessions in works of art, such as no other European country can match, but she is surrounded by countries in which money is being made more quickly, and from a buyer of works of art has become a seller, to such an extent that in a few years the choicest of her treasures will have vanished for ever. But is it exactly the case that England has less money to spend than formerly? Is it not rather that the class who have chiefly owned great pictures have lost money, and therefore want to realize; and among the people who now have the money there is not sufficient interest in art to spend money on it. Neither an English Parliament nor an average Englishman can understand that the retention of great works of art in the country is an object worth paying for. It will take at least half a century to educate Parliament and the Englishman up to that, and by that time the finest pictures will be gone. There are several good suggestions in the *Burlington* article, and we especially agree on the importance of endeavouring "to save for the National Gallery, at any cost, some twelve or fifteen pictures of the highest importance which, if once lost, could never be replaced." As we might remark, the value of a permanent collection goes by quality rather than quantity; "three or four masterpieces in a gallery make it important; twenty or thirty make it a famous place, which all students of art must visit." All this and much more in the article is quite true, but it will produce no effect; the average Englishman will pass by on the other side. Professor Baldwin Brown concludes his article on "How Greek Women Dressed." In Part IV. of "English Architectural Leadwork" Mr. Weaver deals with lead fonts, of which some fine illustrations are given, especially of the Brookland and Pycombe fonts, the former the more archeologically interesting, the latter the more decorative. An article on "The Furniture at Windsor Castle" (a review of Mr. Laking's book) is the occasion for the production of some illustrations of French highly elaborated furniture of the Louis Quatorze and Louis

Seize periods, with its exquisite detail of the most artificial and, one might say, soul-less character; for that is the impression that this class of French work produces—the desire for finish of workmanship rather than for real beauty.

The second number of the *Magazine of Fine Arts* (which is dated "December," but appears to be issued near the end instead of the beginning of the month) devotes an article to Piero della Francesca, as "the most modern of the pre-Raphaelite painters," and according to Mr. Housman, the author of the article, the first painter to discover light as a pictorial subject; but we are rather sceptical about these kind of special attributions, which always strike us as being a part of the furniture or stock-in-trade of modern writers on art. Piero della Francesca is a painter worth study, but not one to arouse enthusiasm. More interesting to us is the article on and the numerous illustrations of the work of the great French sculptor Barye, the Michelangelo, one might say, of animal sculpture, though his "Thesens and the Minotaur" shows how powerfully he could also treat the human figure. He at least is an artist about whom there can be no doubt; the eight illustrations of his works given here are enough in themselves to show his extraordinary versatility of power. M. Geoffroy, who contributes the article, does not quote the highly characteristic anecdote, worth repeating here, of Barye and Thiers; when Barye had been modelling an eagle seated on a branch, for some official commission, Thiers (officially) came to see it, and was peevishly criticising the position of the bird's claws, which he said was not correct; "an eagle grasped thus"—and was proceeding to illustrate it with his hands, when the sculptor, who had had enough of it, cut him short with—"Enfin, M. Thiers, vous n'êtes pas un aigle"! We are glad to see an article by Sir J. D. Linton on "The Art of William Etty," a painter who deserved more recognition than has been accorded to him of late years. "Woven Fabrics of Sicily," "French and German Champlevé Enamels," and "The Landscapes of Rubens" are among other articles in the number; the last named exceedingly interesting subject is treated by Mr. Robert C. Witt. We entirely agree with him in his estimate of the value and importance of Rubens's landscape, especially remembering, as Mr. Witt reminds us, how little had really been done in landscape before his day.

The *Architectural Record* (New York) contains an illustrated article on "Japanese Houses," with full descriptions of their building methods, and a reproduction of an old Japanese sectional working drawing which was used in the construction of several houses; for of course the methods of construction and design vary little. Some other interesting drawings from an old Japanese book are also reproduced. In an article on the Minnesota State Capitol, which had been sympathetically described in a previous issue, Mr. Russell Sturgis takes exception to that building and to the admiration for it, mainly apparently on the plea that the dome is only a kind of copy of the dome of St. Peter's, not so good as the original, and merely "one more added to the host of public buildings copied from the neo-classic architecture of Europe"; and he suggests that at this rate one might as well have copied St. Peter's dome entirely, as the result would have been better. There is something in this, though it is surely rather late in the day to begin objecting to American adoption of European classic forms, after the amount of French Academic architecture which has been produced by leading American architects. After all, the centre dome has a certain long association with State and municipal architecture on a large scale, and one can sympathise with city councillors who say that they want their building "to look like a Town Hall." The Minnesota dome seems a graceful one; our complaint against the published design was that it wanted more emphasising at the ends of the façade. We may suggest, however, that it is perfectly possible to employ the dome on a State Capitol without employing borrowed Renaissance detail with it, and Mr. Sturgis's criticism may do some good if it suggests to any American architects to recollect that the dome, as an architectural feature, is not after all the exclusive property of the Renaissance style, though it happens

to have been most largely developed under Renaissance influence. The First National Bank of Chicago, to which an article is devoted, seems to be a truly palatial building internally, ruined externally by greed of gain. As the writer of the article says, there are two alternatives for a bank which proposes to build for itself on expensive land in a large city—either to build a one or two-story block for its own exclusive occupancy, or to build an immensely high building and let off fourteen or fifteen stories. It is pretended that financial reasons have nothing to do with the selection of either method; but it will be difficult to make any rational person believe that. The First Chicago Bank managers have chosen to erect a building like a cotton-mill at the meeting of two streets, and use the basement as the bank; it looks in the photograph as if it were an acute angle, which would make the appearance still worse; whether it is so or not is impossible to say with certainty, for it is a singular thing that although one professional publication seems intended as a serious professional publication for architects, a plan seems to be one of the last things it thinks of giving. In any case one can only come to the conclusion that the First Chicago Bank is a building with a sumptuous architectural interior, completely ruined and reduced to commonplace internally by this erection of a grid-iron building over it, and moreover its whole architectural character as a bank destroyed. Imagine the Bank of England treated in the same way, with a building of thirteen stories erected over it. Its "Bank" character would be gone at once. In this sense the First National Bank of Chicago is an object-lesson and a warning.

The *Berliner-Architekturwelt* this month is mainly occupied with decorative detail and furniture, some of which is very interesting. Five designs for stained glass, by Herr Franz Eissing of Charlottenburg, though they will seem rather odd to English eyes, are worth attention because they suggest a kind of decorative treatment which provides for rich colour effect in conventional foliage, etc., in a manner which is new and not connected with any past style, either Gothic or classic. We cannot tell of course what the colour may be from these monochrome reproductions; but we can see that, granting an eye for colour, the nature of the design gives plenty of scope for it in a manner suitable to the character of stained glass. The illustrations of furnished rooms show that there are fortunately some Berlin architects or furniture-makers who still design furniture in a sensible and reasonable manner, instead of twisting it all into ugly and unexpected curves. The *Architekturwelt* also issues a large special number devoted to the life and works of Herr Messel; to this we shall return.

In *The World's Work* the writer under the name of "Hone Counties," who thinks he knows more about architecture and building than he really does, is holding forth this month on "building without a builder." He is perfectly right in condemning the contract system, which is the curse of modern architecture, though his reasons for condemning it are quite different from ours. The paper proceeds to the sneers at architects which are now popular with English magazine writers (no French magazine would insert such articles—the French public knowing better what an architect means), and unearths the old absurdities of the *Quarterly Review*, which have been exposed and done with for a quarter of a century. But one can understand that the digging up of such a diatribe is a godsend to a writer who was ready to champion such ineptitudes as Sir W. Grantlath's cottage plans, which were published in *The World's Work* as something remarkable. With critics of this class, anything in architecture is right which is done by ignorant people, whether of the upper or lower class; and every sneer at the educated architect is a bid for a cheap popularity.

"Matter, Motion, and Molecules" is the title of an article in the *Cornhill* by Mr. W. A. Shenstone, F.R.S., is a popular exposition of the scientific attitude of to-day in regard to matter and energy, and is very well calculated to awaken the mind of the general reader on this subject. There is one point that seems rather illogical in the way

of putting it. In considering whether a piece of stone which has fallen and lies motionless on the ground is "bankrupt of energy," the writer says: "In the first place the stone may lie on a hill side, and in that case obviously it possesses energy of position, which would become kinetic if we set it rolling down the hill." Surely that is the energy of the earth, not of the stone.

The *Century* gives illustrations of Mr. D. C. French's groups of sculpture, representing the four quarters of the globe, intended for the main front of the new Custom-House in New York. They are good architectural decorative sculpture; but, like most American sculpture so far, rather notable for energy than for style. The same magazine contains also an article on "The Treasures of Pre-historic Moundville," the circle of mounds on the Black Warrior River, in Alabama. The article is by Mr. H. Newell Wardle, of the Academy of Natural Sciences of Philadelphia, and gives illustrations of some very interesting early Indian work. An article on "Up Town, New York," contains some picturesque sketches of the outskirts of New York.

The *Antiquary* contains a long article by Mr. J. Herbert Slater on that very curious phase of mediæval study, the pursuit of the supposed possible elixir of life. The history of the repeated research after this elixir, which, if it were once discovered, would relieve its possessor from the dread of death, is both curious and in a sense pathetic, so many wild hopes were founded on it. A book might be written on the subject; we are indebted to Mr. Slater for a brief outline of it. "The Heraldic Glass in Brasted Church" is the subject of a long article by Dr. W. E. Ball.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

THE PRESENT POSITION OF THE SEWAGE QUESTION.

A MEETING of the Civil and Mechanical Engineers' Society was held at the Caxton Hall, Westminster, S.W., on Thursday last week, when a paper was read by Mr. J. F. Reade, A.M. Inst. C.E., on "The Present Position of the Sewage Question."

He said that the number and kind of processes which had been advocated for the purpose of the purification of sewage were very great and various; yet, notwithstanding the fact that many of these had been tried, the present position remained indefinite, in so far as no one of them had been found to be universally applicable and satisfactory. As to the disposal of sewage by applying it to the land, it was early suggested that here was not only a ready, scientific, and economical way of its disposal, but of making a profit as well. But the reasoning was by no means correct. It was based upon the idea prevalent until the discoveries of Pasteur and others that the assimilation by plants of organic matter presented to them in the form of manure was an entirely chemical process, depending on the presence of oxygen; whereas it was now known to be primarily a biological one, also dependent on oxygen. Public opinion took some exception to this means of disposal, on the ground that extensive irrigation with sewage must be injurious to health, but the advocates of sewage farming, and experience, had shown such fears to be not well founded. Present opinion did not condemn properly managed farms as being directly dangerous to health. The promises held out of sewage proving a source of wealth seemed so feasible and proved so fascinating that people clung to it with great tenacity, and even now, when extensive and costly experience had proved it to be very rarely capable of fulfilment, the idea was abandoned only with reluctance. In its practical application the purification of sewage by treatment on land could not always be carried out within reasonable limits of cost. Owing to physical or geological surroundings, a sufficient area of suitable land could sometimes not be got in a convenient position near towns contemplating sewage works. Difficulties such as this, and analogies drawn from the rapid advances made in chemical industries, seemed to open out an excellent prospect to inventors that a solution of the sewage question could be discovered by the aid of chemistry. A vast amount of time and thought had been given to research in pursuance of this idea, but

with only a small amount of success. Indeed, it might be said with much truth that the application of chemistry to sewage purification had been a singular failure, because purification, in the sense in which it was understood at the present day, had never been effected by any practical chemical process. The researches of chemists in this direction had, however, not been fruitless. Some valuable processes had been discovered by which precipitation of solid matters held in mechanical suspension and partial solution might be effected, the sewage clarified and deodorised. Such, for instance, were the methods of treatment by lime, by lime in addition to sulphate of alumina, by sulphate of iron and burnt magnesium limestone, by hydrochloric acid and chloride of lime, by sulphurous acid and carbonic acid with magnesia and lime, and by sulphate of iron and lime. All these, in various degrees, caused changes in the physical constituents of sewage which appeared to the eye and had frequently been mistaken and described as a real cleansing of foul water. That some further advance might be made in the chemical and physical cleansing of sewage was possible and recent investigations into the physico-chemical nature of solutions had proved fruitful in the acquisition of new knowledge concerning them, and might possibly lead to better methods of dealing with waste water. But chemical treatment gave rise to sludge difficultly, and the clarified liquid, drawn off after precipitation of the solids, contained a considerable quantity of impurity, and in that state could not be considered sufficiently free from noxious matters to allow of its being discharged into streams. It was, however, quite a natural step to combine the process of clarifying the liquid by chemical means and its further purification by applying it to land in either of the two ways known until lately as "broad irrigation" and "intermittent downward filtration." Some very good results had been and were at present obtained by means of a combination of chemical and land processes. The chemical treatment was employed to eliminate the grosser constituents, the land afterwards completing the purification of the clarified liquid. But it had been proved that sewage could be purified on land without having undergone any previous chemical treatment; hence, where land of the right kind was available, and if worked intelligently and within the limits of its capacity, chemical clarification was in no way essential to purification. It was soon discovered that sewage could be purified by land without growing any crops; and the original idea of the direct consumption of manurial matter by surface plant life as the only factor in the cleansing process was upset. The passage of sewage through a certain depth of land, from, say, 3 ft. to 9 ft., as a limit, was a process of filtration which under favourable circumstances could be made a very efficient one and by repetition capable of giving almost any degree of purification. Strangely enough, these facts did not seem to have induced anyone to search for further explanation. It was not until the discovery of the function of micro-organisms in breaking up the organic matter in soils that new light was thrown on the subject and the way opened for further advance.

At the present day what was known as the bacterial treatment of sewage very nearly engrossed the attention of sanitary engineers, but much hesitation was displayed regarding the details whereby this valuable principle of bacterial agency might be applied. One of the most noteworthy of positive facts discovered was that sewage and all waste substances of organic origin under natural conditions contain within themselves the micro-organisms necessary to break them down into the more simple inorganic compounds. This demonstrated that the cultivation of special organisms was, at all events so far as present knowledge took us, superfluous. Therefore, if sewage was allowed sufficient time, it would effect its own purification. The sewage problem of the present day resolved itself into the discovery of the best means whereby the great natural force—i.e., the vital activities of bacteria—might be made to exert itself with the maximum result to effect purification, though this statement did not exclude land treatment nor clarification by chemical means. The methods of bacterial treatment were various, and differ not

alone in detail, but in principle as well. The greatest divergence was probably that illustrated by the two methods, one of which employed two distinct stages to effect the process, and the other made use of one stage only. The first was exemplified by the septic tank system, and the second by the contact bed arrangement. Much controversy had arisen between the advocates of these two methods regarding the relative merits and efficiency of their proposals. It was, however, now recognised that neither system would alone do all that was originally claimed for it. The septic tank did not completely and indefinitely liquefy the solid part of sewage, and sludge had still to be disposed of. Contact beds sometimes choke and become useless until they have been remade, and a simple process had yet to be discovered which would produce an effluent universally satisfactory according to a moderate bacteriological standard and admissible at all times into polluted streams. The important feature to be noted in connexion with the advance made in the developments of bacterial methods, whether carried out naturally on land or artificially in tanks or beds, was their capability of producing effluents which would not subsequently putrify when admitted into streams. This was the crucial test of all purification processes at present. It was not sufficient to sterilise the liquid if putrescible matter was allowed to remain, because under natural conditions it would very soon become foul. Sewage having undergone treatment and reached such a standard might be classified amongst sound, but not of course safe water. By means of the well-known methods of sand filtration, as practised in town water supplies, water containing considerable organic impurities could be made to attain a very high degree of purification both chemically and bacteriologically by repeated operations. It would be perceived that a link was thus established between the two valuable, concentrated, natural processes of bacterial purification and ordinary sand filtration. They were no doubt intimately related to each other, but in practice it would be impossible to purify raw sewage by sand filtering, and an unfiltered drinking water could scarcely be made fit for use by passing it through a septic tank installation. But it was only a matter of time and cost to cause sewage to pass through successive stages until it reached a degree of freedom from organic and bacterial impurities that it could not be distinguished from ordinary drinking water. There was no doubt that these recent developments had increased the responsibilities of engineers, and careful designing and a full appreciation of the circumstances of each particular case were at the present time more than ever necessary. It was to be hoped that the present Royal Commission would indicate at least some broad principles which should govern the choice in any circumstances, since in developing more powerful and efficient means of dealing with sewage the complexity of the problem had been at the same time increased. A large quantity of literature in the shape of reports, evidence, etc., had been published by the Royal Commission on Sewage Disposal which was appointed in 1898, but the final report, which was eagerly expected, and which, it was hoped, would be more conclusive than what had been heretofore published, had not been issued.

Millions had been spent on efforts to purify sewage, and a large sum was annually required to pay interest on capital expenditure and to maintain and operate the various works established. Notwithstanding this, purification was by no means universally successfully accomplished. Moreover, the effluents were scarcely ever of a uniform character, and were sometimes discharged, even from most efficient works, only very partially purified.

The lecturer then touched on the difficulties which had to be faced in such works, i.e., sudden heavy rain storms, and in certain localities the sudden discharge of vats or tanks containing waste liquid from manufacturing processes. He also briefly reviewed the reports and conclusions of the Royal Commission, and concluded as follows:—

"From this comparison it would appear that artificial processes should ultimately be extensively introduced either to help or supersede land treatment. Where inferior land has been in use this is no doubt going

on. But, as pointed out before, hesitation on the part of public bodies is at present more characteristic of the position than any active tendency to make changes, and until the river boards are established and in operation, and working standards of purity laid down, it is improbable that towns will undertake schemes involving considerable expenditure of public money."

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The fifth general meeting (business) of the session was held on Monday, when the chair was taken by Mr. Edwin T. Hall, vice-president.

The minutes having been taken as read, the Chairman moved "That the council be instructed to enter into negotiations concerning a site for new Institute premises, and to report to a general meeting."

Mr. John Slater seconded, and the motion was carried unanimously.

The following gentlemen were then elected as members:—

- As Fellows.*

AMERICAN BRICKWORK.

The first impression of the English bricklayer, after commencing work in the United States, is the keen competition among his fellow-workmen; unfortunately not in the direction of quality or neatness, but of speed alone.

The bricks are all kiln burnt, have no frogs or hollows of any kind to serve as key for mortar, are very small, averaging 8 in. by 4 in. by 2½ in., as compared to the London 9 in. by 4½ in. by 3 in., and are consequently lighter to handle; the gauge for face work is about four courses to 10 in., and for rough work about nine courses to 2 ft., there being no standard gauge in the writer's experience.

The lime used is very fat and white, the chief cement being "Rosendale" (corresponding more or less to our Roman), of a dark brown colour, which is very much used in sewers and waterworks because of its hydraulic qualities, and it will take more sand than our "Roman." Tubs are used instead of mortar-boards, and

Fig. 1.

are about 2 ft. 6 in. square, with sloping sides, and about 8 in. deep.

The bonding of the brickwork is of the most elementary description, such a thing as sectional bond not being even dreamed of. The rough work usually consists of five, seven, or even nine courses of stretchers to one course of headers, the walls being built from one side only, the overhead side being built first in a series of steps (Fig. 1), the lower headers being used to stand on, and the upper ones as ledges to place the bricks ready for the overhead course. Starting from a quoin, no closer is used, two headers with a cross-joint breaking-joint about ½ in., as the rough bricks are about 8½ in. long and 3¼ in. wide, and no care is taken in the bedding course to guard against "straight joints."

In house or shop building, when not built with a steel skeleton, the inside walls are all carried up independently of the front, "blocking courses" (Fig. 2), instead of

Fig. 2.

"toothings" and "anchors" (tie-irons), being the only provision for bonding the front to the cross walls.

The front is usually built by "lumpers," or piece-workers, and is generally in half-bond (Flemish bond being very rarely used), tied in at rare intervals with a "clip course" (Fig. 3)

Fig. 3.

perhaps every fifth, seventh, or ninth course. The best bricks used for front work are known as "Philadelphia pressed," red in colour, with a very true arris, and are laid in fine, pure white mortar with a joint of ½ in., being only "battered," and not bedded solidly. As the mortar squeezes out on the front when the brick is laid it is left till it gets stiff, and is then cut off with the trowel, thus doing away with the liability of smearing the face of the brick, which would occur if the mortar were cut off in a soft, wet condition. As the bricks are laid they are given a slight overhanging tilt, which enables the work to proceed more rapidly, as less care is needed than if the work were left perfectly straight and true, for when looking up the face of the work there is no projecting under edge of a brick to be seen, and it looks perfectly smooth, but when looking downwards, which, of course, is not the way a building is viewed, the face appears to be a series of ledges. The joints are finished with a small trowel, cut off top and bottom, and correspond to our tuck-pointing work, without the artificiality of red stopping.

There is one specially fast style of laying bricks which is not universally known, and is called the "Boston Stroke," no doubt because it originated in Boston, and which is chiefly used on rough work (sewers, etc.). It consists of picking up one brick and enough mortar for that one brick at a single operation, and as no mortar is spread, but the brick pressed home in the mortar with the hand only, it is obviously very labour-saving, as compared to the usual method of stooping for mortar only, then spreading the bed for perhaps three or four bricks, stooping separately for each brick, and by the time the third or fourth brick is laid the mortar is stiff and the brick is laid with great difficulty.

The scaffolding, being of a very simple

character because of the overhand work, is built up on each floor, and consists of "horses," which are really elongated carpenters' stools, about 4 ft. 6 in. high and 5 ft. wide, while the scaffold "boards" consist of 9-in. by 3-in. planks in about 10 ft. lengths, two "horses" to each length. This system would be used for three tiers in height, and then, if necessary to go higher, standards, ledgers, and putlogs would be built up to make a platform for the "horses" to be used again. These standards, ledgers, etc., would be composed of rough timbers to hand, and not resembling in any way the poles, putlogs, and boards so dear to the London scaffolder. J. A. W.

Fifty Years Ago.

FROM THE *Builder* OF JANUARY 12, 1856.

On the 3rd inst. Professor Cockerell commenced his course of lectures on Architecture, at the Royal Academy, to a smaller audience than we would have seen there, mainly owing, as we believe, to the want of proper notice to the public. The now veteran Professor apologised for his reappearance for the third time since his announcement of a successor who would give to the students his new lights and a fresher activity, suited to our times, especially after a fifteen years' prosecution of these lectures, through the same hands and enunciation; but his appointment had not yet been concluded in the slow

progress of academic changes. With respect to academical provisions, he must say that the comparison of our own architecture with those of France showed us to be wholly deficient—that paternal government contrasted with our orphan government most advantageously for our instruction. It might be called the comparison of the system of protection and the voluntary and free-trade system, which might do much that was good, as the Institute and others, but there must be much that perished in the wearing. Concentration and a systematic order and administration, as in France, of all education—of this, as of other departments—was most desirable. We had learnt, by fatal experience, what the neglect of such administration was in war—it could not be doubted that it might be so in peaceful occupations, if put to the test, no less to our disadvantage; and it was the deliberate opinion of the scientific English members of juries in France that the French protective system of culture, encouragement, and honours, was fast leaving our own orphan and desultory system in the rear. The architectural drawings of the *monuments historiques*, and of the *grands prix de Rome*, greatly surpassed our national productions in diligence, style, and beauty, and were examples to follow.

RENOVATION OF CLUB PREMISES, BRADFORD.—The premises of the Bradford Liberal Club have recently been repainted and redecorated. The whole scheme was carried out by Messrs. E. Harland & Sons, under the direction of Mr. B. D. Fairbank, architect.

Illustrations.

PROPOSED CHURCH HOUSE, MANCHESTER.

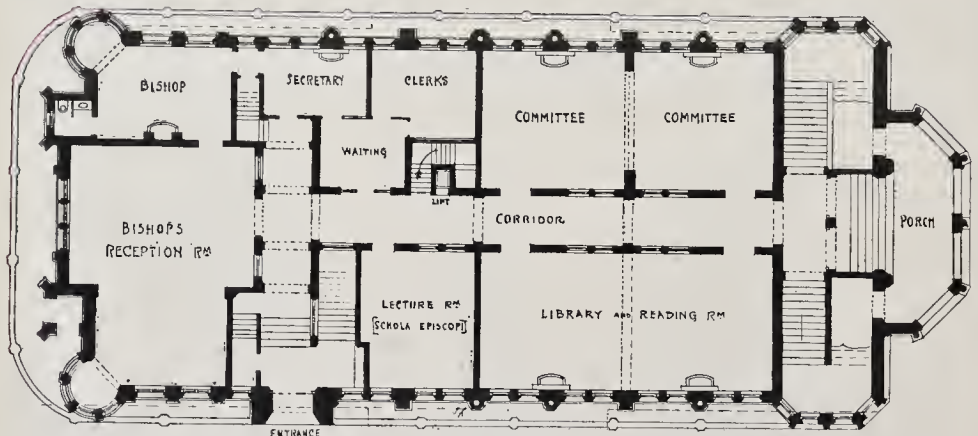

THIS design was made with special reference to occupying the site of the present church of St. Peter's, situated in St. Peter's-square, now proposed to be removed. A portion of the present site has been added to the surrounding streets for the benefit of traffic at this point, which is very considerable. It is an "island" site, and even if the whole of it were allowed to remain open, some at least would probably have to be taken for the purpose of road widening.

The main entrance is at the Peter-street end, and is in the form of an angular porch. The upper floor is occupied by a large hall to hold 1,200 people, available for public meetings, lectures, or sacred concerts, with suitable platform and organ. A smaller hall is provided on the lowest floor to hold 250. Accommodation has been provided for the requirements of the Bishop of the diocese, for the Church Conference, Bishop's Commission Scholæ Episcopali, as well as for diocesan societies, home and foreign missions, Church Defence and other institutions, library and reading-rooms, etc.

The building is proposed to be executed in stone, and the style of architecture adopted is Perpendicular Gothic freely treated. The architects are Messrs. Smith & Matley, of Ridgefield, Manchester.

Premises, Nos. 45 and 47, Wigmore-street.

NOS. 45 AND 47, WIGMORE-STREET.

These premises have recently been rebuilt in this increasingly important thoroughfare, and are arranged for business purposes on the ground, first, and second floors, with a residential flat on the third floor, and another flat on the fourth and fifth stories. The front is faced with Lawrence's rubbers and Portland stone, the builders being Messrs. James Simpson & Son, of Paddington-street and the architect Mr. F. M. Elgood.

THE MANSION HOUSE, DONCASTER.

This is said to be the oldest mansion house in England, being erected prior to those of London and York. The drawings here shown are from measurement of the building as at present existing. In Paine's original design it was intended to add wings on either side, which would have added considerably to the imposing character of the building.

James Paine published in 1751 a book with the plans, elevations, and sections of the mansion house, and in which appears the following somewhat quaint Preface describing the origin and purpose of the building:—

"The Corporation of the antient Town of Doncaster in YORKSHIRE, being honour'd at their Entertainments with the Company of frequently in great Distress for suitable Rooms to receive them in, and therefore determined, in the Year 1744, to build a Banqueting-House. And in Case any Mayor was inclined to keep his Mayoralty in it, Care was taken to provide convenient Apartments to receive a Family. Having at that Time the Honour to be engag'd in several Gentlemen's Buildings in that County, I was made Choice of for their ARCHITECT. The Designs were accordingly prepared, and the FOUNDATION-STONE laid in the Spring of 1745. But the Rebellion breaking out the latter Part

of that Year, the Work was stop'd early, and the Walls were cover'd. Before the Spring following, the Corporation was pleas'd to desire me to undertake it according to the Estimate deliver'd in. To which agreeing, I proceeded with the Building, and finish'd it in the Year 1748, with the Approbation of the Gentlemen who engag'd to inspect into it, on Behalf of the Corporation, and to the general Satisfaction of that worthy Body."

The illustrations are from measured drawings by Mr. E. Holsworth Walker, of Manchester.

"UNDER THE TEMPLE PORTICO."

In my note on this drawing last week there is a correction to make; the amount of entasis of the Parthenon column should have been printed "66 in.," not "56"; perhaps '67 is nearer according to Penrose's proportions, but in fact it would have been quite near enough to have written "3 in." Penrose's extreme particularly about decimal fractions of measurements is really rather an affectation; if every column in the Parthenon had been whole and unjured, and could have been measured separately, there would probably have been found differences between one column and another which would hardly have required decimals to express them.

While on the subject, I may add that I very much doubt whether the entasis of the Parthenon columns was really set out as an arc of a hyperbola. If we knew the truth as to the manner of working, we should possibly find that it was arrived at by a much simpler process.

WILLING'S PRESS GUIDE.—The 1906 issue of this guide—the 33rd annual issue—has been sent us. The work is one of the best-arranged and most convenient guides we know of; it is a handy little book and the information required can easily be found. The guide is published at No. 125, Strand.

THE SAXON PORTLAND CEMENT WORKS.

In the early days of Portland cement the chalk and clay of the Thames and Medway were used almost exclusively for the manufacture of this material. Among other deposits utilised at later dates were the Cambridgeshire marls, but the product yielded gained a somewhat unenviable notoriety, which has only been dispelled within quite recent years. At the present time the cement produced from this source is fully equal, if not superior, to the best Thames and Medway brands. The Saxon Portland Cement Company, of Cambridge, have played an important part in demonstrating the suitability of the Cambridgeshire marl as a raw material, and since the completion of their works, some four or five years ago, the Saxon brand of cement has justly acquired a reputation for high quality and reliability, and, owing to the greatly increased demand, it has become necessary to build and equip additional works, which are described below. The main feature of the new works is that the machinery and plant have been arranged so that the product will pass through the entire process of manufacture without handling, thus ensuring a considerable economy in labour cost. Raw materials are conveyed by a cableway from the quarry to the drying-house, where there are two sets of double crushing rolls with a capacity of about 10 tons an hour. The material is next conveyed to two rotary drying-drums, supplied with hot gases from the kiln-house, the raw material passing from the lower end of the drums perfectly dry and ready for conveyance to a grinding-house furnished with a battery of seven Griffin mills, from which the powdered marl is elevated to mechanical mixers, and, after having passed the requisite chemical tests, is delivered into a silo holding some 200 to 300 tons. From this silo the powdered marl is elevated to hoppers over each of the five rotary kilns, being slightly damped so as to give the necessary "bind." Each rotary kiln consists of a slightly inclined steel cylinder, 60 ft. long and 6 ft. in diameter, mounted on rollers and slowly rotated by gearing. The powdered coal used for fuel is introduced into the kilns by a jet of hot air, issuing under a pressure of about 60 lb. per square inch. The marl mixture is delivered into the upper end of the cylinder, and, descending gradually, meets the incandescent gases from fuel fed into the cylinder from the opposite end. Becoming heated to redness as it approaches the centre of the cylinder, the material assumes the form of small round balls, which reach a nearly white heat in the lower third of the kiln, and finally emerge as clinker in balls about the size of a pea. The hot clinker is cooled by five rotary coolers, through which cold air is drawn by the coal-blast fans, and the heated air thus obtained is utilised for the kilns. In the clinker grinding-house a battery of nine Griffin mills reduces the clinker to the required degree of fineness, and from them the Portland cement issues as a marketable product. The new stores have a capacity of 10,000 to 15,000 tons, the lower part being in the form of a large hopper with sloping sides, arranged so that the cement can be discharged through openings into a tunnel, along which it is carried by a screw conveyor to the loading-house. The cement is here elevated into hoppers over two automatic weighing-machines, and at this point the sacks of cement are mechanically weighed in readiness for delivery. Railway sidings with a length of nearly one mile adjoin those parts of the works where materials are loaded and unloaded. We may add that the coal used in the rotary kilns is dropped from trucks on the sidings into a hopper, whence it is elevated to a 400-ton storage hopper, being conveyed thence to the dryer, which is fed by waste gases from the kilns. When the coal is perfectly dry it is automatically conveyed to the coal grinding-house, where it is reduced to an impalpable flour by a battery of three Griffin mills. The coal-dust is then conveyed and elevated to hoppers ready for delivery to the kilns. The new works of the Saxon Cement Company have been designed by the company's engineer after exhaustive examination of the latest methods adopted on the Continent and in America, and we are informed that, while no definitely ascertained

improvement has been omitted, great care has been taken to avoid the adoption of any insufficiently tested process or apparatus.

APPOINTMENT OF DISTRICT SURVEYORS.

The following letter has been addressed to the London County Council on this subject:—
"To the Chairman and Members of the London County Council.

MY LORDS AND GENTLEMEN—

I am desired on behalf of the District Surveyors of London to address you on the question of certain proposals which have been submitted to you by your Building Act Committee involving very serious and important changes in the terms of the appointment of District Surveyors. From the report of the Council's proceedings as printed, to which your attention has been drawn in the public Press, it would seem that the changes suggested would include:—

1. (a) A reduction in the number of districts from 57 to 33.
- (b) A consequential increase in the size of the districts.
- (c) A corresponding diminution in the number of qualified professional men acting with statutory authority.
- (d) A consequential devolution of a large portion of the work of supervision to a number of assistants.
2. A dual system of payment of District Surveyors
 - (a) by salary in respect of the duties they perform under the London Building Act, 1894, and
 - (b) by fees in respect of their duties under the Amendment Act of 1905.
3. The payment of building fees to the Council in respect of works executed under the Act of 1894 and to the District Surveyor in respect of works executed under the Act of 1905.

It will be manifest that changes such as these may easily lead to confusion and misunderstanding, and tend to increase the difficulties of efficient administration of the law.

The District Surveyors respectfully submit that the supervision of building operations has been carried out by highly-trained men—many of whom have occupied the highest positions in their profession—that the public has grown accustomed to pay professional fees for professional services thus adequately rendered, and it is at least doubtful whether the suggested payment by salary will attract educated men of the first ability; from a professional point of view therefore the reflection suggests itself that changes in the direction indicated above may not be in the interests of the best and most efficient administration of the Building Laws.

The District Surveyors do not wish to suggest that there may not be points of detail in the present system which may with advantage be altered, and they desire me to add that they will be happy by conference or otherwise, to assist the Council in its efforts to improve a system which, in the opinion of many, has hitherto worked to the public advantage,—I am, my lords and gentlemen, yours faithfully,

THOMAS HENRY WATSON,
President of the District Surveyors' Association.

9, Conduit-street, W., January 8, 1906."

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The fifth meeting was held at 13, Tufton-street, S.W., on Wednesday, January 3, Mr. E. W. M. Womacott in the chair.

Mr. Philip J. Turner, A.R.I.B.A., read the following paper on the "Houses of Parliament":—

"My principal reason in selecting the 'Houses of Parliament' as the subject of my paper was the opportunity afforded me by Mr. Charles E. Barry (the grandson of the architect of Westminster Palace) of bringing such interesting drawings as you see here this evening.

In dealing first of all with the site and the old Houses of Parliament it should be remembered that for many hundred years Westminster, from the time of the Conqueror, appears to have been the Metropolitan seat of Government, the principal palace of the King, and the Court of Judicature of the kingdom. The ancient Royal Palace of Westminster covered, in fact, the ground now occupied by the two large courts known as 'Old Palace' and 'New Palace' yards. William Rufus erected Westminster Hall in 1097 as the nucleus of an extensive Palace he proposed building, which, though destroyed by fire, was almost entirely rebuilt by Richard II. in 1394-97. King Stephen founded St. Stephen's Chapel, which was

rebuilt in 1364, and, though it was destroyed in the fire of 1834, its memory is still retained, the name St. Stephen being synonymous for the Houses of Parliament themselves. This chapel seems to have been a perfect and magnificent specimen of the style in which it was built. The chapel was fitted up for the House of Commons in the reign of Edward VI. After the ancient Palace had been almost wholly destroyed by fire in 1512, Henry VIII., in 1530, bought Whitehall, and the Palace from this time became deserted by Royalty. All that now remains of the old Palace is the great hall and the crypt under the Chapel of St. Stephen.

For many years previous to the destruction of the old Houses of Parliament by fire, various plans had been suggested for enlarging and improving the buildings, and negotiations for building a new House of Commons were actually in progress in 1834. Previously, in 1739, William Kent had submitted plans for new Houses of Parliament and Law Courts. The general idea of the two Houses separated by a central vestibule in his scheme resembles that adopted in the present buildings. The elevations remind one very much of the Horse Guards. Sir John Soane's designs, dated 1794 and 1769, for various improvements to the old Houses are to be seen in the Soane Museum. After the fire of 1834 Sir Robert Smirke roofed and refitted the Painted Chamber as a temporary House of Lords, the Commons occupying the Court of Requests. Instructions were also given to him to prepare plans for a new building, but this was finally abandoned for an open competition. The claims of the Gothic style were now in the ascendant, and when, in June, 1855, the terms of the competition were published, the instructions to competitors stated that the style to be adopted was to be 'Gothic or Elizabethan.' Four premiums of 500*l.* each were promised, and six months allowed for preparing designs—surely far too short a time for such an important building. Ninety-seven designs were sent in, and the Commissioners' Report, dated February 29, 1856, recommends that the successful architect's drawings "shall be submitted from time to time to competent judges of their effect, lest from over-confidence, negligence, or inattention in the execution of the work we fail to obtain the result to which our just expectations have been raised."

A good definition of what we should look for in the design of a Parliament House is given by Mr. H. H. Statham in his book on "Modern Architecture." He says:—"A Legislative Palace should be the symbol of the greatness of the nation in regard to wealth, artistic taste, and political power." "The character of the architectural design should have something distinctly and recognisably national about it—something which could not well be found on any other soil."

The general idea of the plan, a large central hall connecting the two chambers, is well known and seems to have been adopted by almost every national Parliament House since built. In studying the accepted design it must be remembered that the architect had not an absolutely free site, but was governed by the existence of Westminster Hall and the Law Courts and the Crypt of St. Stephen's Chapel. The lowness of site was a great drawback, and the erection of a great terrace, as at Somerset House, was proposed, but never pressed, owing to the great cost involved and other drawbacks. The site is irregular, being wedge-shaped on plan, and the existence of Westminster Hall and the Law Courts make a continuous elevation on the land side impossible. Mr. Barry, in the competition perspective made in 1836, intended that the Courts should be removed, and continues his design right up to the north-west corner of the site, thus enclosing New Palace-yard.

There is little doubt that Gothic and Perpendicular Gothic was the right style to adopt, rather than the alternative, viz., Elizabethan. As Westminster Hall would either ruin any design or make a special feature of it, Mr. Barry decided to make the hall his great public approach, and by building St. Stephen's Hall over the old chapel crypt access was obtained to the centre of the site. The principal floor of the Palace is all on one level, with not a single step except to Westminster Hall and the altered lobbies of the House of Commons.

The plan has been described as a Classic

design with Gothic detail, and many, including Mr. Pugin, would have preferred a more picturesque treatment, but the architect always contended "the symmetry and regularity were essential to unity and grandeur." The spire, 266 ft. high, over the central hall, was not part of the original design, but added to meet the requirements of Dr. Reid's ventilating schemes. St. Stephen's porch is also an addition, made by Mr. Barry on being appointed to carry out the work. The central hall was intended to be much higher than it now is, but was lowered in execution to meet Dr. Reid's requirements in his ventilation scheme. The House of Lords was lavished with decoration, it being not merely a place of business, but also the Court of the sovereign. In this decoration Mr. Welby Pugin took an important part. The size, shape, and acoustic properties of the House of Commons have always given rise to considerable criticism. There is only a small average attendance of about 300 members, and no doubt this and the advice of the authorities of the House led to the chamber being made of the smallest possible size. The requirements of Dr. Reid for his schemes of ventilation entailed alterations to both plan and design. Dr. Reid's appointment being independent of the architect complicated matters considerably. His scheme never met with Mr. Barry's approval, and were always the subject of repeated controversy between them until the cessation of Dr. Reid's connexion with the new Palace.

In comparing the original design of the river front with that executed a different treatment is discovered. Some means being required for breaking up the monotony and comparative bareness of this long front, Mr. Barry decided to further raise the centre portion, to make towers of the flanking masses, and to introduce visible roofs and turrets. The windows of the two principal stories were formerly set in arched recesses, but these were abolished, together with the pointed heads of the windows. The general character of the front to Old Palace-yard is the same as the river front, except that the alternate bays are advanced and the front is divided into three floors instead of two above the basement.

The great Victoria Tower underwent various alterations. Originally designed 100 ft. square, it has been reduced to 70 ft. The present fine arches, 53 ft. to the apex, replace an entrance of quite moderate dimensions. The numerous studies Mr. Barry made for this tower show that it must have caused him enormous trouble. The tower is 336 ft. high to the top of the pinnacles, and over 400 ft. to the top of the flagstaff. The flagstaff is of rolled sheet-iron, bolted together, and is 110 ft. long and 3 ft. in diameter at the base. The design of the Clock Tower must have given even more trouble, as drawing after drawing were made and rejected by the architect. The clock in this case had to be the prominent feature on the topmost story and of immense size, and the idea carried out of projecting the clock story beyond the body of the tower was at last adopted.

The elevations, in a general way, have been criticised as being overloaded with ornament and small detail, but Sir Charles Barry's contention was that detail could not be excessive in amount if continued consistently in every part of a building.

The whole Palace covers a site of about 8 acres, the river front being 840 ft. in length. The House of Peers is a double cube, being 80 ft. long and 45 ft. high and broad; the House of Commons is 75 ft. long by 45 ft. wide. The work of the river wall was begun in 1837, and from the outset of the work unforeseen troubles were met and expenses incurred. The Royal Commission, appointed to select the stone to be used, reported that Bolsover Moor should be adopted. Unfortunately, it afterwards appeared that the quarries could not meet the demand, and a limestone from North Anstone was used, which has not proved itself able to resist the London atmosphere satisfactorily. The interior walls are built with Cowley bricks and faced with Caen stone. An iron and brick construction was adopted in the floors; the roofs were constructed and roofed with galvanised iron, so that the entire building is of fire-resisting material.

The first stone was laid on April 27, 1840, and the works were rapidly proceeded with

under the contractors, Messrs. Grissell & Peto. The architect seems to have been hampered from the beginning, and in 1844 a Commission of Inquiry was appointed, in which the Duke of Newcastle, then First Commissioner of Works, urged that Mr. Barry should be allowed a freer hand. Before the Fine Arts Commission of 1841 Mr. Barry laid his views regarding the best way of encouraging painting and sculpture in connexion with the new building. Briefly, he recommended the adoption of decorative historical paintings, the use of British marbles, encaustic tiles for paving, and that the windows be doubly glazed with stained glass. Westminster Hall was to be used as the depository of naval and military relics of former wars. A suggestion made by Sir Charles Barry was of forming a "campo santo" between the hall and the proposed additional buildings enclosing New Palace-yard.

Between 8,000 and 9,000 original drawings and models were prepared for the works, in the preparation of which Mr. Welby Pugin ably seconded Mr. Barry. The former was appointed superintendent of the wood-carving; he also supervised the execution of the woodwork, stained glass, and tiles. The head carver was Mr. John Thomas. The scaffolding for both towers was designed by the architect, and dispensed with the use of external scaffolding. In February, 1847, the House of Peers was occupied for the first time, and in 1852 the Royal approach was finished, and finally the towers, last of all being the Victoria Tower, incomplete at the architect's death in 1860. The original estimate was 707,104*l.*, the amount expended being nearly two millions. The main item in this increased cost was the cost of the fittings, decoration, and sculpture required by the Fine Arts Commission. The cost per foot cube is about 2*s.* 6*d.* Various schemes have been suggested for providing extra accommodation, notably a fine plan submitted by Mr. Barry in 1855 for extending the buildings westward along New Palace-yard and southward to St. Stephen's Porch, thus enclosing the whole square. This would have given a fine public entrance at the north-west angle of the site. Mr. Pearson's work in the restoration of the hall was carried out in Kelton stone, which seems to have stood well. Of the various suggestions made for enlarging the House of Commons, that of lateral extension, proposed by the late Charles Barry in 1893, seems to be by far the best.

The paper was illustrated by original drawings, kindly lent by Mr. C. E. Barry, and by lantern slides.

Mr. R. H. Weymouth, in opening the discussion, pointed out how much better the exterior detail was than the interior detail. The terrace, though a fine feature, he thought inferior to a water frontage. The latter was warmly discussed by other speakers, as also the justice of the criticism that it was a Classic plan with Gothic detail. Mr. Fyfe suggested that all great buildings should have a museum of drawings and models open to the public.

Mr. H. H. Statham, in summing up the discussion as Special Visitor, said that the position of the Houses of Parliament close to the river, in spite of the low site, was he believed partly selected for political reasons, and on the advice of the Duke of Wellington, who thought that the House of Legislature should never be so placed that it could, in any time of tumult, be surrounded on all sides by a mob. The existence of the building was one illustration of the advantage of architectural competition for national buildings. According to his recollection, the choice of style for the competitors was Tudor or Elizabethan, which would be quite right, seeing that these two phases of architecture were both distinctly English and national. In regard to the question of symmetry, Fergusson held that the building should have two symmetrical towers, two Victoria Towers as it were, instead of two of different design; but he did not agree with that, as the two towers were for perfectly different objects, one a state, the other for the practical purpose of carrying a clock, they were therefore rightly treated differently. Their position at the two extremities of the building was a good point, as it showed the extent of the plan from a distance; and the centre spire, marking the centre octagon, was one of the happiest of afterthoughts, and in this case the

architect might be considered to be indebted to the ventilating engineer for the requirements which led to it. He had not heard of any new scheme of ventilation being suggested recently, though there might have been some improvements in detail. He had gone all through the ventilation system of the House some years ago, and believed it was on the whole one of the best ventilated buildings in existence, and that complaints to the contrary effect only emanated from a certain class of members of Parliament who would never be contented with anything; but he thought the admission of the air through the floor was a bad point, as it tended to carry up dust from the floor with it. Barry's objection to bringing forward the centre of the façade of a great building was a general principle with him, and the objection to it was remarkably illustrated at Versailles, where the centre of the garden front was brought out a long way in front of the main line of the building, with the consequence that from no point of view could the whole extent of the façade be taken in. Barry's proposal to carry the architectural design of the building round Westminster Hall and enclosing Palace-yard, thus making the architectural treatment homogeneous, was he thought entirely right; the west side of Westminster Hall had been entirely destroyed externally, and the restoration that had been made was valueless because only conjectural. He could not agree with Mr. Weymouth that any more irregular plan was desirable to be in accordance with Gothic feeling; the existing plan was really the essence of the design, and the finest thing about it; but he agreed that the river front would have had a finer effect had it risen straight from the water without the intervention of the terrace, though the terrace no doubt was a great practical convenience. He felt quite sure that no spire had ever been intended for the Victoria Tower, and it certainly would be no improvement; the tower was quite complete as it stood. What Mr. Weymouth and Mr. Fyfe had said about the interest of the drawings of such a building being available for inspection was very true; the best suggestion of the two, he thought, was Mr. Fyfe's of having a museum-room of drawings and models in the building itself. The small area of the actual "Houses" in the plan of the building was no doubt remarkable; but it was a practical question of keeping the Chambers small enough for a speaker to be heard without undue effort; and after all, the proportions in the plan represented Parliamentary life, for every hard-working member would say that it was not so much attendance in the House as work in the Committee-rooms which formed the real labour of Parliamentary life. He differed entirely from the suggestion that the Victoria Tower would be improved by another story; he considered it a perfectly proportioned tower. He was one of the greatest admirers of the architectural aspect of the Houses of Parliament, having for many years lived close to them, and having found the varying aspects of light and atmosphere, a constant source of enjoyment. He might mention that one very effective view of the Victoria Tower was that which was to be seen from the "Little Cloister" of Westminster Abbey. He considered that Mr. Turner had made a very good summary, within necessarily brief limits, of a great subject.

On the instance of the Chairman, votes of thanks were passed to the author, to Mr. C. E. Barry for his kind loan of drawings, and to Mr. Statham for his attendance amidst the pressure of business.

ARCHITECTURAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—At the general meeting of the Birmingham Architectural Association, held on Friday last week, the Vice-President, Mr. J. L. Ball, in the chair, Mr. Mowbray Green, A.R.I.B.A., read a paper on the "Architecture of Bath of the XVIIIth Century," which was illustrated with a large number of lantern slides.

PROPOSED CLUBHOUSE, OGMORE DOWN.—Plans for a new clubhouse for the Ogmere Down Golf Club have been prepared by Messrs. Linton & Barker, architects, of Newport. The building will consist of one story, with an attic floor above, and the work will be carried out in stone.

ENGINEERING SOCIETIES.

THE JUNIOR INSTITUTION OF ENGINEERS.—With the permission of Mr. Vincent W. Hill, General Manager of the South-Eastern and Chatham Railway, a visit of this Institution took place on Saturday afternoon, the 6th inst., for the inspection of the methods adopted in supporting the end of the Charing Cross Station roof after the recent disaster, and of the operations which are now in progress and which are proceeding night and day for the removal of the entire structure. Upwards of 200 attended. Mr. G. Ellison, of the Engineer's Department, and Mr. J. W. Nisbet, who is in charge of the work for Messrs. John Aird & Sons, fully explained all the features of interest to be observed, including the steel ropes connecting the feet of the three end principals to relieve the strain on the tie-rods, the two wooden towers and connecting timbering and the travelling stage now in course of construction for taking down the entire roof. The members also had the opportunity of ascending the timber towers, and seeing closely how the principals are supported at seven points, and how the removal of portions of the roof is being accomplished.

THE INSTITUTION OF CIVIL ENGINEERS.—At the ordinary meeting on Tuesday, the 9th inst., Sir Alexander Binnie, President, in the chair, two papers were read—namely, "The Elimination of Storm-water from Sewerage Systems," by Mr. D. E. Lloyd-Davies, Assoc.M.Inst.C.E., and "The Elimination of Suspended Solids and Colloidal Matters from Sewage," by Lieut.-Colonel A. S. Jones, V.C., M.Inst.C.E., and Mr. W. O. Travis.

The scope of the first paper was limited to a description of experiments and investigations into the subject of the discharge of storm-water from populous districts. A formula was framed for the estimation of storm-water discharge likely to obtain in underground channels from various defined areas, and this formula was proved by means of tables and diagrams compiled from experiments in the sewers of Birmingham, extending over twelve months, together with figures obtained from various other sources. An endeavour has been made to prove the accuracy of the various instruments used for the experiments, and the validity of the calculations adopted. The paper concluded with a description of a new type of storm-water overflow chamber constructed in 1904 in Birmingham. The importance of constructing bell-mouths on outlets from man-holes in surface-water culverts, and of making the connexion above the highest flood-water level when the velocity in the main exceeds that of the affluent, was emphasised.

In the second paper attention was drawn to the fact that the solids in suspension in sewage, and the sludge resulting therefrom, have monopolised general attention, to the entire exclusion of the colloids and the sludge to which they give rise. The presence of colloidal substances in sewage was established, and it was shown that, though variable in amount in different sewages, and in the same sewage at different times, they may be safely estimated as at least one-half of the organic constituents of settled or filtered sewage. The importance to be attached thereto, however, was demonstrated to be not so much a question of quantity, as of behaviour in, and method of elimination from sewage. It was shown that ordinary tank operations, though they will cause the deposition of the suspended solids, and the formation of that sludge which has always been regarded as the crux of the sewage-disposal problem, will have practically no influence upon the colloids, which will require to be brought into intimate or prolonged contact with material upon which they become particulate, forming a hitherto unrecognised and consequently disregarded sludge. Observations and experiments were adduced to substantiate the contention that sewage is clarified by the physical operations—deposition of suspended solids, and abstraction of colloid and other substances as solid matters from solution and pseudo-solution—and that the bacterial influence is secondary and subservient thereto. So that whether sewage be discharged into the sea, or a river, or on to natural or artificial filtration areas it is clarified in virtue of the elimination of solids, and not by reason of the biological character of the operation

which has attended the liquid in its passage. The secondary nature of the bacterial action was evidenced by the fact that the organisms are occupied in dealing with the solid matters which have been separated from the sewage, and which therefore are, in so far as the original liquid is concerned, out of consideration. Its subservience was illustrated by the existence of large accumulations which necessitate removal, proving that the ratio of deposition is in excess of bacterial resolution. The accumulated solids were demonstrated to be much greater in amount than is commonly supposed, and to have, in all parts of the treatment area, the characteristics of, in fact, to be identical with, ordinary sludge. These statements were substantiated by the results of nearly seven years' work in connexion with the triple contact beds at Hampton-on-Thames. These triple contact beds were adduced as a striking object lesson, not only as regards the retention of organic solids, but also as an example of the protracted, if not inadequate, character of the bacterial operation. In addition, they point to the necessity for the greater protection of artificial filtration areas from the intrusion of depositable matters. In land treatment this necessity was demonstrated to be not so manifest, and certain data being assumed, tanks, etc., which have had a long practical trial are described and illustrated. On the other hand, where artificial processes are adopted, the more perfect elimination of suspended solids and colloidal matters becomes imperative, and means for ensuring such removal must be provided. A means to this end was described, and illustrations of the hydrolytic tank system, with the results of ten months' working, were given.

It was announced that forty-eight Associate Members had been transferred to the class of members—viz., Messrs. C. W. Anderson, J. T. N. Anderson, G. S. B. Andrews, R. J. Angel, Eduardo Argenti, Herbert Ashley, C. J. Batley, Harry Becher, C. E. Brenner, C. J. Brown, James Brown, F. A. Campion, J. P. Copland, W. R. Copland, jun., H. G. Coventry, F. J. R. Dixon, W. B. Dawson, A. L. Dickie, J. R. Dixon, R. J. Durley, G. E. Fedden, F. C. Fovle, J. W. F. Gardner, David Gravel, T. A. Hall, H. J. S. Heather, C. Q. Henriques, D. W. Herbert, Arthur Hill, Frank Howarth, J. L. Joken, W. O. Leitch, jun., F. H. Longhurst, J. A. McPherson, D. E. Marsh, Frank Massie, H. J. Morton, James Munce, H. E. Oakley, Hugh Oldham, F. G. Royal-Dawson, W. B. Shaw, A. M. Tippet, C. B. Trye, William Waddell, L. A. B. Wade, J. E. Wilcox, C. B. Williams.

It was also reported that twenty candidates had been admitted as Students—viz., J. P. R. T. B. Bacon-Phillips (London), M. A. Beg (Manchester), W. D. Donkin (New South Wales), E. P. Hill (Manchester), A. L. Lawrence, B.A. (Cantab.) (London), W. D. McLaren (Glasgow), A. B. Marshat (Rockdale), K. P. Peddie (Coopers Hill), J. E. Pullen (Wolverhampton), M. K. Rice-Oakley (London), R. A. Routh (Coopers Hill), S. A. Sayer (London), W. Sharp (Coopers Hill), D. Shepherd (Edinburgh), S. T. Stubbs (London), A. J. Venables (London), H. D. Wheeler (Norwich), A. Williams (Wrexham), C. M. Wilson (London), F. W. Wilson (Malvern Wells).

The monthly ballot resulted in the election of three Members—viz., C. E. Dupois, M.A. (Cantab.) (Sudan), R. F. W. Hodge (Howdon-on-Tyne), G. Jones (London); and of twenty-eight Associate Members—viz., D. Anderson, B.Sc. (St. Andrews) (London), H. Anderson, Stud.Inst.C.E. (Bombay), J. B. Benjamin (Lagos), J. C. Collett Stud.Inst.C.E. (Sudan), W. W. Coster (Cape Town), D. J. Daruvala, L.C.E. (Bombay) (Bombay), J. A. Davidson (Cape Town), T. M. Davies, B.A. (Cantab.) (London), J. L. Dixon, Stud.Inst.C.E. (London), W. E. Fox, B.E. (Royal) (Eastleigh, Hampshire), A. H. Gibson, B.Sc. (Victoria) (Sowerby Bridge), J. M. Granzer (Cape Town), W. F. Hole, B.E. (Sydney) (Johannesburg), E. F. Homer (Swanage), W. J. A. E. Horne (Cape Town), F. W. R. Hurt (Transvaal), J. H. Inglis (Cape Town), H. W. Minnitt (Devonport), L. Morgan (Cape Town), A. E. Paul, B.A. (Cantab.), Stud.Inst.C.E. (London), O. B. Rattenbury, Stud.Inst.C.E. (Malta), E. A. Salt, Stud.Inst.C.E. (London), P. A.

Thompson, B.A. (Cantab.) (Penarth), A. F. Trederoft, Stud.Inst.C.E. (Searforth), S. G. Turner, Stud.Inst.C.E. (London), A. V. Venables, Stud.Inst.C.E. (Bengal), H. S. Watson, Stud.Inst.C.E. (London), A. Whittington-Cooper, Stud.Inst.C.E. (London).

COMPETITIONS.

OFFICES FOR HOLBORN BOROUGH COUNCIL.—The Establishment Committee of Holborn Borough Council reported on Monday having gone into the question of the best course to adopt to obtain suitable preliminary plans for the new offices of the Council. The Council is in possession of a certain site, but it is possible that an architect, having the requirements of the municipal authority before him, may be able to utilise a portion of this only and leave a residue for sale. The Committee was of opinion that the competition should be limited, and had resolved, subject to the usual sanction, (1) that no more than six architects be invited to submit preliminary plans for the Council offices, and that they be paid an honorarium of twenty guineas each; (2) that when the plans are ready the Committee will consider them and submit a further proposition on the matter; (3) that it be an instruction to the competing architects to give attention to the economical use of the land.

LIBRARY, PLEASLEY.—Mr. Ernest R. Sutton, F.R.I.B.A., of Nottingham, has been appointed to act as assessor of the competitive plans which architects have been asked to send in for the proposed new library buildings at Pleasley.

Books.

The London Building Acts, 1894 to 1905. Edited by BERNARD DICKSEE, F.R.I.B.A. Second Edition, revised and enlarged. (London: Edward Stanford, 1906.)

ALL prudent architects practising in London may, as regards their relation with the building laws, be divided into three groups. First, those who bring with them to their drawing-boards a King's Printers' copy of the statute and their own common-sense; next (and this group is becoming larger in proportion as the multiplicity and complexity of regulations increase), those who prefer to consult a specialist; and, thirdly, there is that majority of professional men who, relying wholly neither on their unaided though robust common-sense nor on information obtained in consultation, elect to keep for reference a well-annotated edition of the various Acts with a sufficiently comprehensive index. Impudent practitioners, but these seldom survive, are they who let their artistic fancies have free course until a little "notice of irregularity" in an official envelope razes to the ground their castle in the air.

The aspirant to any one of the three first-mentioned groups should have, for the first class, a more than ordinarily clear understanding of legal phraseology and a more than common common-sense; for the second class he must know the best man to advise him, that is to say, one who has made a special study of the subject; whilst for the third, one good book with its matter well arranged, with its comments not too long but really illuminating, and its table of decided cases concisely but precisely "digested," one such book is worth half a dozen handbooks designed perhaps primarily to air some particular view or to criticise some regulation which has already been placed on the Statute-book, and is therefore beyond effective criticism.

It is our pleasant duty to record our opinion that Mr. Dicksee's book possesses all those qualities which the majority of architects will find desirable in order that they may be aided in their obligatory studies of the recently amended Building Acts.

Our readers will not need to be informed of the scope and incidence of the new Act, which has already been analysed in these columns; it will be sufficient if we proceed to point out in detail some of the points in the work under notice which seem to call for special commendation, and at the same time to make one or two suggestions as to possible improvements which the Editor may consider when preparing the next edition.

As regards the old Act, Mr. Dicksee has in his notes preserved that character which made the first edition of this book deservedly

popular among professional men and others. The notes are concise, the cross-references are adequate, and the decided cases have been brought up to date so as to include the decisions in the following important cases, amongst others:—Leadbitter v. Marylebone Borough Council (1904), Horner v. Franklin and another (1905), and the case which recently attracted some attention—known as the Fulham-road Building Line Case—in re London Building Act, 1894, and the London County Council (1904).

In his treatment of the new London Building Acts (Amendment) Act Mr. Dicksee has also been commendably concise, nor has he fallen under the temptation, in the necessary absence of decided cases, to overburden the text with notes, the vague uncertainty of which is scarcely concealed by the question-begging phrase, "It is submitted that."

There is however plenty of definite information as to rules and regulations cognate to the Building Acts; for example, we have here the regulations as to procedure made by the Tribunal of Appeal, a reprint of those sections of the Factory and Workshop Act, 1901, which are pertinent to building material, the requirements of the London County Council as regards means of escape in case of fire under the text with a reprint of the Public Authorities Protection Act, 1893, and the important decision of Mr. Justice Farwell in *Sharplington v. Fulham Guardians* (1904) is noted.

We think the usefulness of the work as a book of reference would be increased if Mr. Dicksee could see his way to include the by-laws as to water-closets under the Public Health (London) Act, 1891, and the drainage by-laws under the Metropolitan Management Act, 1855; we also think that the thirty sections of the Arbitration Act, 1889, might well find a place here, as this Act is needed with reference not only to Part VIII. of the Act of 1894 (Rights of Building and Adjoining Owners), but also to Part IX. (Dangerous and Neglected Structures).

We have said enough to indicate our appreciation of the practical usefulness of Mr. Dicksee's book; now for one word of criticism.

To punctuate an Act of Parliament may or may not be commendable, but why it should be thought necessary to indicate by inclusion within square brackets [] such portions of the Acts as were not contained in the former and superseded Acts, we altogether fail to understand. To historians of the law it may be interesting enough, but to most of Mr. Dicksee's readers it can, we imagine, be a matter of small moment to know that subsect. 4 of sect. 103 of the Act of 1894 was not included in the Metropolitan Building Act of 1855. Moreover, this bracketing where it occurs in the middle of a clause is a positive stumbling block, for example in the schedule of materials deemed to be fire-resisting we read:—

In the King's Printers'

Copy:—

Flagonettes when used

for floors over arches, but

such flagonettes not to be

exposed on the underside

and not supported at the

ends only.

BOOKS RECEIVED.

RATING OF LAND VALUES. By Arthur Wilson Fox, C.B. (P. S. King & Son, 3s. 6d.)

THE HISTORY OF AMERICAN PAINTING. By Samuel Isham. (Macmillan & Co.)

LOCKWOOD'S BUILDER'S AND CONTRACTOR'S PRICE-BOOK: 1906. (Crosby Lockwood & Son, 4s.)

TRADE CATALOGUES.

THE Electro Motor and Dynamo Company, London and Manchester, send us their electrical hoisting catalogue, which contains particulars and illustrations of specialities for various types of hoisting machinery. Among the direct motor-driven gears, two simple and neatly-designed winches are shown. One of these is of the friction type, with raw hide motor pinion and machine-cut spur wheel and friction wheel with turned grooves, driven by a completely enclosed motor and mounted on a self-contained bed-plate. This machine is made in four sizes to lift weights up to 10 cwt., at a speed of 110 ft. per minute. Another is a spur-gear winch, specially designed for warehouse cranes, with raw hide motor pinion, machine-cut gear with guards, and an enclosed slow-speed motor, the whole being mounted upon a cast-iron bedplate in the smaller sizes, and upon a riveted steel base in the larger sizes. This machine is made in fourteen sizes, the maximum load being 3 tons and the speed of 200 ft. per minute. Near the middle of the catalogue several very compact patterns of gears are illustrated, these being suitable for goods and passenger lifts of all kinds. A good assortment of controllers for cranes, hoists, and lifts is offered by the same firm, who also give particulars of automatic lift gate locks, magnetic brakes, electric pulley-blocks, and travelling hoists and crabs. The catalogue is a useful guide to the selection of electric hoisting apparatus such as is very generally employed in buildings of all kinds, and in the execution of building and other contracts.

We have received from the Simplex Steel Conduit Company, Ltd., of Norfolk-street, Strand, a small pocket list giving details of their well-known system of conduits for electric wiring, both of the ordinary and the screwed type. We notice that several novelties are described. In particular, we may mention an ironclad type of water-tight wall plug, which seems to us to be well adapted for workshop or outdoor use. The catalogue is of a very convenient size.

Messrs. Gibbons Brothers, of Dibdale Works, Dudley, send us their catalogue of band conveyors for the local transport of building materials, minerals, grain, and other substances. Although containing a good deal of useful information, this catalogue is not arranged so well as could be desired. For instance, careful study and constructive reasoning are necessary to reveal the fact that the firm make four types of conveyor, three with deep trough, shallow trough, and flat bands respectively, and the fourth a "slat" conveyor, in which the band is replaced by strips of wood fixed to chains or india-rubber bands, for the transport of boxes, barrels, sacks, and other bulky packages or materials. Illustrations and prices are given of all essential parts of conveyors and accessories, and some photographic views depicting representative installations. The value of conveying plant is suggested very clearly on p. 5 by a table stating the capacities of different bands in tons per hour, when run at the speeds most suitable for the materials carried.

Correspondence.

RE STANDARDISING OF QUANTITIES. Sir,—If you have space for the continuation of this discussion, I would like to point out that in my opinion it is not so much a standard bill that is required, but, as put forward by Mr. Pease, surveys should be agreed as to what labours should be measured and the mode of measurement; especially should they be unanimous on the measuring of labours of stonework, for nearly everyone has his own particular method with this work, and I venture to say that many could not efficiently take these off, and even when taken off very many builders do not trouble to price them in detail.

Providing that a standard bill were required, it must needs be an exceedingly bulky one if it is to contain all that would be necessary on any job of every nature; and even then many of the old school with established practices would not turn from their present methods.

One point in favour of such a bill would be that provincial surveyors and those adopting the Northern practice might prepare their bills in a similar manner to that adopted by their London colleagues, as this is where the great dissimi-

larity occurs, for every day terms in London are practically unknown by many in the provinces. Assuming a provincial job is done by a London surveyor, it is more difficult for some of the local builders to estimate for, and therefore a speculative price is the result on certain items, of which the descriptions, etc., vary from local customs; again, several items are given in Northern practice which are unknown in London.

One great drawback to a standard bill would be that it would considerably simplify our work, thereby causing far more competition, and would enable anyone with an elementary knowledge to prepare a set of bills which would on the face look correct, but if gone into would be found hopelessly wanting.

As regards the statement made by Mr. Pease that "surveyors' fees are so reduced," they have no one to blame but themselves for this unhappy state, for why cannot they agree amongst themselves to accept only the recognised fee? This would then place all on an equality, instead of the present manner, which is fast turning the profession into a pure business, when, as is often the case, the one who will do the work at the lowest rate (whether he is competent or not) gets the job.

If this could be brought about, it would enable them to employ competent assistants, instead of as now, at any rate in the Midlands, having a large part of the work done by juniors, some of whom do not understand the most elementary terms.

I heard the other day of a man over thirty years of age offering his services as a thoroughly competent draughtsman, experienced in quantities and details, etc., for the princely salary of 2l. per week. What may one expect for that amount?

I believe it has been discussed by the Quantity Surveyors' Association, and that it is their aim, if possible, to make their members accept only the recognised fee. STEWART G. MUMBY.

Withington, Manchester.

THE "PARIS IN LONDON" SCHEME.

Sir,—I notice that in your issue of the 30th ult. you refer to me on page 710 as joint architect for a "Paris in London" scheme. Will you allow me to correct this? Mr. G. D. Martin, of 3, Pall Mall East, is the joint architect with the author, M. Génard, whereas I am only acting in conjunction with Mr. Martin. DETMAR BLOW.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—II.

Mathematical and Technical Symbols.

IT is convenient to draw a distinction between signs and symbols, and to regard the former as marks pointing, where necessary, to the alphabetical characters constituting the latter.

Some mathematical symbols are employed in accordance with clearly-understood rules, and a few have universally accepted meanings.

For instance, in algebra the first letters of the alphabet, a, b, c, and others, are generally used to denote constants or coefficients, and the last three letters, x, y, z, to symbolise unknown quantities. As examples of symbols having invariable meanings or values, we may mention g = gravity or the velocity of a falling body, and π = the ratio of circumference to the diameter of a circle.

Unfortunately, writers of mathematical books do not always keep to generally-understood symbols. As an example, we may point to the use of M to denote moment of resistance as well as bending moment, thus losing the distinction between these equivalent, but not similar, moments. If M = bending moment and R = moment of resistance, then the equation $M = R$ conveys a meaning. But it is absurd to have $M = M$, because this intended meaning is not thereby conveyed. Instead of R, some writers use μ to indicate moment of resistance, and there is no objection to this. Some confusion is caused, however, when μ is employed to denote bending moment and also Poisson's ratio. For, if $M = R = \mu$ the last of these symbols cannot correctly be used for Poisson's ratio, or the ratio of longitudinal extension to lateral contraction, as this is quite a different thing.

We need not refer at length to the perplexing inconsistencies of mathematical nomenclature. Some of them arise out of the fact that the letters of the alphabets

commonly adopted are not sufficiently numerous to provide distinctive symbols for the ever-increasing needs of modern science. Writers pick out characters to suit themselves, and seem to care very little for the practice of their contemporaries. Consequently we have now arrived at a stage when standardisation is urgently wanted, and not merely national, but international standardisation.

In the following lists we have included symbols employed in those branches of mathematics of direct interest to architects. It would have been easy to extend the category very materially, but the additional symbols so collected would have been of little practical use, except for the purpose of showing the glorious state of confusion which is sufficiently demonstrated by the tabulation of the more generally used symbols.

The subjoined lists include, in addition to purely mathematical factors, various symbols and abbreviations employed in different branches of technical work. These are intended for the convenience of readers who are not familiar with the precise meaning of expressions such as "A.C. generator," "I.W.G.," "B.Th.U.," "r.p.m.," and others frequently to be found without explanation in engineering papers and books.

(1) General.

- a = abscissa, angle, area, axis, constant.
- b = br aila, coefficient, constant, known quantity, ordinate.
- c = coefficient, constant, known quantity, conductivi y, correction.
- cg = centre of gravity.
- d = deflection, density, depth, diamet r, differential, discharge, distance, known quantity.
- e = base of Napierian natural or hyperbolic logarithms, coefficient, known quantity.
- f = force, function, unit stress, constant or coefficient, known quantity.
- g = gravity; the velocity of falling bodies, which in British units = 32.168, and in Metric units = 9.8124.
- h = height, head.
- i = inclination or slope.
- k = coefficient, constant, reciprocal of the modulus of a logarithmic system.
- l = length.
- m = mass, modulus, modulus of common logarithms, moment.
- n = number, one or more functions.
- o = zero.
- p = parameter, perimeter, unit pressure.
- q = quantity, unit pressure.
- r = radius, ratio.
- s = sectional area, surface.
- t = temperature, difference of temperature, thickness.
- u = deflection, length.
- v = velocity, volume.
- w = weight or load.
- x = abscissa, unknown quantity.
- y = ordinate, unknown quant y.
- z = surface or area, unknown quantity.
- A = Angle, Area, Axis.
- B = Barometric Height, Breadth.
- C = Circumference, a Constant, or Coefficient, Curvature.
- D = Density, Depth, Diameter, Differential Coefficient (sometimes written d.), Discharge, Distance.
- E = Elasticity, Coefficient or Modulus of Elasticity, Energy.
- F = Factor, Force, Function.
- G = Gravity (centre of).
- H = Head, Height.
- I = Inertia, Moment of Inertia.
- K = Constant or Coefficient.
- L = Length, Loss.
- M = Mass, Modulus, Moment, Bending Moment.
- N = Number.
- O = Zero.
- P = Parameter, Perimeter, Power, Pressure, Force.
- Q = Quantity, Force.
- R = Radius, Reaction, Refraction, Resilience, Resistance, Moment of Resistance, Resultant of any System of Forces, Revolutions.
- S = Sectional area, Space, Stress, Surface.
- f = the sign of integration, a modified form of S, standing for sum, the integral being the sum of the differentials placed at the top and bottom of the sign, thus: \int_a^b
- T = Temperature, Thickness, Time.
- U = Unit.
- V = Velocity Versed Sine, Volume.
- W = Weight or Load, Work.
- Z = Modulus.
- α (Alpha) = angle, coefficient.
- β (Beta) = angle, coefficient.
- γ (Gamma) = inclination.
- Δ (delta) = Finite Differ nce.
- δ (delta) = distance variation.
- ϵ (Epsilon) = extension, base of Napierian or hyperbolic system of logarithms, reciprocal of E.
- ζ (Zeta) = abscissa, coefficient, width.
- η (Eta) = efficiency.
- θ (Theta) = angle, absolute temperature.
- λ (Lambda) = latitude, longitudinal extension, strain.
- μ (Mu) = Moment of Resistance, Poisson's Ratio.
- π (Pi) = ratio of circumference of a circle to diameter = 3.14159265358979323846264338327950 + (usually taken at 3.1415).
- ρ (Rho) = radius, ratio, ratio of circumference of a circle to radius (usually taken at 6.2832), resistance.

Σ (Sigma) = Summation, the Sum of Finite Quantities.
 σ (Sigma) = coefficient, Poisson's ratio, volume.
 φ (Phi) = angle, or the supplement of an angle, arc, entropy.
 Ω (Omega) = Megohm (see Electricity).
 ω (Omega) = angular velocity.

(2) Materials and Structures.

a = area.
 b = breadth, width of a beam.
 d = deflection, deflection of a beam, depth, depth of a beam, diameter.
 e = extension or stretch per unit of length in an elastic strain, coefficient of expansion.
 f = coefficient of friction, unit stress, extreme fibre stress in a beam, modulus of transverse rupture, rise of an arch.
 h = height, distance from neutral axis to the surface of a beam.
 i = inclination or slope.
 k = radius of gyration.
 l = length, length of span between supports of a beam or abutments of an arch.
 p = unit stress, or intensity of stress.
 q = intensity of tangential stress.
 r = radius, radius of gyration, rise of an arch.
 s = strain.
 t = thickness.
 v = vertical component of a strain.
 w = unit weight or load.
 A = Area.
 B = Breadth.
 C = Crushing Strength, Modulus of Rigidity or Shear Modulus.
 D = Deflection, Depth, Diameter.
 E = Coefficient or Modulus of Elasticity, i.e., the Modulus of Longitudinal Extensibility, Young's Modulus, or the Stretch Modulus.
 F = Force, Tensile Force, Tensile Strength, Total Stress, Factor of Safety.
 G = Centre of Gravity of a Figure.
 H = Height, Horizontal Thrust at Support of an Arch.
 I = Moment of Inertia.
 K = Coefficient or Modulus of Cubic Compressibility or Bulk Modulus.
 L = Length, Length of Span Between Supports of a Beam.
 M = Modulus of Transverse Rupture, Bending Moment, Moment of Resistance.
 P = Pressure, Force, or Thrust, Normal Stress, Vertical Force, Load on a Column, Reaction at One Support of a Beam.
 Q = Horizontal Force, Tangential Stress, Reaction at One Support of a Beam.
 R = Moment of Resilience, Moment of Resistance, Radius of Curvature, Resistance of a Column.
 S = Shearing Stress, Span of an Arch or Beam.
 T = Thickness, Modulus of Torsion.
 V = Vertical Component of Strain.
 W = Weight or Load on a Beam or other Member, Breaking Weight, Weight.
 Z = Modulus of a Structural Section of Material, a Geometrical Quantity Depending upon Shape and Size.

δ (Delta) = central deflection of a beam.
 ε (Epsilon) = moment of inertia.
 λ (Lambda) = longitudinal strain.
 μ (Mu) = bending moment, Poisson's ratio.
 σ (Sigma) = Poisson's ratio.
 B.M. = Bending Moment.
 B.W.G. = Birmingham Wire Gauge.
 S.W.G. = Standard Imperial Wire Gauge.
 I.W.G. = Standard Imperial Wire Gauge.
 O.G. = Ogee.
 c.g. = centre of gravity.
 s.g. = specific gravity.
 r.s.j. = rolled steel joist.

(3) Heat, Water, and Air.

c = coal consumption per second, specific heat.
 d = diameter, density.
 f = coefficient of friction.
 g = gravity, grate area of a boiler.
 h = head, loss of head, heating surface of a boiler.
 k = coefficient of contraction, or discharge.
 p = pressure.
 r = coefficient of contraction, or discharge.
 t = temperature, temperature of hot air or water, difference of temperature.
 u = unit of heat (see B.Th.U.).
 v = velocity, velocity of hot air, volume.
 A = Area.
 B = Barometric Height.
 C = Centigrade Coal Consumption per Hour, Cubic Feet, Specific Heat.
 D = Density, Discharge, Hydraulic mean depth.
 F = Fahrenheit.
 G = Gallons Discharged, Grate Area of a Boiler.
 H = Head, Heat, Height.
 M = Monometric Efficiency.
 P = Pressure.
 Q = Quantity Discharged.
 R = Radius.
 S = Surface, Heating Surface of a Boiler, Stroke of Engine Piston.
 T = Temperature, Temperature of Cold Air or Water.
 U = Unit of Heat (see B.Th.U.).
 V = Velocity, Velocity of Cold Air, Volumetric Efficiency.
 W = Coal Consumption, Weight, Work.
 θ (Theta) = Absolute temperature.
 φ (Phi) = Entropy.
 B.T.U. = British Thermal Unit.
 B.H.P. = Brake Horse Power.
 I.H.P. = Indicated Horse Power.
 N.H.P. = Nominal Horse Power.
 R.P.M. = Revolutions per Minute.

(4) Electricity.

a = ampere, area.
 c = current, strength of electric currents.
 e = efficiency, electromotive force.

k = heat conductivity.
 m = strength of a magnet pole.
 ml = moment of a magnet pole.
 n = number of turns.
 q = quantity of electricity.
 r = specific resistance of metal.
 s = section and area.
 t = temperature, difference of temperature.
 v = volt, ratio of electrostatic to electromagnetic unit of quantity.
 w = Watt, measure of resistance.
 A = Ampere, Asynchronous.
 B = Magnetic Induction.
 C = Current, Strength of Electric Current.
 D = Duty.
 E = Difference of Potential or Pressure, Earth, Electromotive Force.
 F = Force, Frequency, Power absorbed in Electrical Work, Magnetic Moment.
 G = Gramme.
 H = Heat developed, Intensity of Magnetic Field.
 I = Impedance, Intensity of Magnetisation.
 J = Joule.
 K = Heat Conductivity.
 L = Inductance.
 M = Magnetomotive Force.
 N = North pole of a magnet, Magnetic Flux.
 O = Neutral, or Earth Potential.
 P = Potential.
 Q = Quantity of Electricity.
 R = Resistance, Ohmic Resistance.
 S = South pole of a magnet, Second, Sectional area.
 T = Time.
 V = Volt.
 W = Watt, Work.
 Γ (Gamma) = ampere.
 μ (Mu) = magnetic permeability.
 ρ (Rho) = resistance.
 Υ (Upsilon) = Milliamperes (10⁻³ A).
 Ω (Omega) = Megohm.
 ω (Omega) = Ohm.
 A.C. = Alternating current.
 B.T.U. = Band of Trade units = 1,000 Watt-hours.
 C.C. = Continuous or direct current.
 C.G.S. = System of measuring electricity, the unit of which is one dyne.
 D.C. = Direct or continuous current, the Centimetre Gramme Second.
 E.H.P. = Electrical horse power = 746 Watts.
 E.M.F. = Electromotive Force.
 K.W. = Kilowatt.
 M.G.S. = The Metre - Gramme - Second system of measuring electricity. (The M.G.S. = 100 dynes).
 P.D. = Potential difference.

(5) Metrical Abbreviations (Paris Conference, 1881).

Linear Measure.	Cubic Measure.
km = kilometre.	km ³ = cubic kilometre.
m = metre.	m ³ = " " " "
dm = decimetre.	dm ³ = " " " "
cm = centimetre.	cm ³ = " " " "
mm = millimetre.	mm ³ = " " " "
Square Measure.	Weight.
km ² = square kilometre.	t = tonne = 1000kg.
m ² = " " " "	q = quintal = 50kg.
dm ² = " " " "	kg = kilogramme.
cm ² = " " " "	hg = decagramme.
mm ² = " " " "	g = gramme.
ha = " " " " hectare.	dg = decigramme.
a = " " " " are.	cg = centigramme.
	mg = milligramme.
Capacity.	
M = hectolitre.	
l = litre.	
dl = decilitre.	
cl = centilitre.	

OBITUARY.

MR. HENRY JOHN YOUNG.—We regret to announce the death, at the early age of thirty-six, of Mr. Henry John Young, jun., eldest son of Mr. H. Young, of Messrs. H. Young & Co., Nine Elms, with whom he served his apprenticeship, and on whose staff he has since been occupied in the design and execution of constructional engineering work. In this some of the most important buildings in London were included. At the time of his death he was engaged as Consulting Engineer for the new Piccadilly Hotel buildings now in progress, and a distinguished professional career seemed to lie before him. He leaves a widow and three children. Being Past-Chairman of the Junior Institution of Engineers, a number of the members were present at the funeral, bearing testimony to the esteem in which he was held. To perpetuate his memory a fund has been opened with the object of placing a bronze medallion portrait in the reading-room of the Institution.

BUILDING IN GRIMSBY.—Generally speaking, builders and contractors have experienced a quiet year, and they are fervently hoping that a revival may characterise 1906. The absence of any particularly large schemes has had the effect of making labour more plentiful than work, and but for the fairly extensive erection of house property the year would have been abnormally disappointing to the building and kindred trades. Practically the enlargement of Messrs. Marshall's mills in Victoria-street and the new "Tivoli" corner are the only important schemes that have occurred during the year, though the improvement of "Palmer's corner" and the completion of the Sheffield Arms have given a good deal of employment.

GENERAL BUILDING NEWS.

SCHOOL, STRATHDON.—A new school has been built near the Bridge of Poldulloch, Strathdon, from the designs of Mr. George Bennett Mitchell, architect, Aberdeen, and the contractors for the various works were:—Mason, Mr. James Gerrie, Cambus Mays; carpenter, Mr. Thomas G. Archibald, Huntly; slaters, Messrs. S. Christie, jun., & Company, Dyce; plasterer, Mr. William Rust & Company; plumber, Mr. William Lesak, Alford; and painters, Messrs. W. Duguid & Son, Ballater.
 ENLARGEMENT OF BOSTON HOSPITAL.—A new wing which has been added to Boston Hospital at a cost of 1,000, was opened on the 22nd ult. The new wing is situated at the north-west corner of the existing building, and has been erected from plans by Mr. Samuel Marjorson, architect, of Boston, by Messrs. H. W. Parker & Son, contractors, Boston. The clerk of works was Mr. Rossington. The additions consist of duplicate sets of wards, kitchens, sick-rooms, bath-rooms, lavatory, etc., accommodation on each floor. The exterior is faced with white bricks, has stone dressings and red-moulded brick to harmonise with the old building. The interior walls have green and white glazed tile and brick dados, with circular glazed tiles at junction of walls and floors. The first floor is of fireproof construction, formed of steel joists and concrete. The corridors are paved with terrazzo mosaic paving and the rooms are paved with encaustic tile paving. In addition to the new wing a new lift, by Messrs. Waygood, of London, has been erected.

THE GRANITE AND BUILDING TRADES OF ABERDEEN.—The building trades of Aberdeen have been less fully occupied during last year than in its predecessor. Within the city, as the records of the Burgh Surveyor's Department show, the number of new erections, and the alterations and additions to existing premises have been fewer than in 1904, and not only in that year, but for a considerable time past. Still it would be wide of the mark to say that 1905 has witnessed depression. It would be more accurate to affirm that the previous years had witnessed an undue expansion, and that the gradual decline in the totals of late mark a return to a more cautious policy and a wiser regard for the requirements of the city. In the quantity of unoccupied property—the assessable value of which is nearly 29,000,—the proofs of the overbuilding that has taken place in recent years, and in fact needed halt is now being called in this direction, therein is a sign not necessarily of stagnation, but of a return to a normal and healthier view of the situation. Under the head of new dwelling-houses, alterations to existing houses, and extension of business premises, there are an aggregate of 419, and the value of these operations is stated at 253,681. It is true that, compared with the figures for 1898—the year of the "boom," when the total was 514,113,—the difference is striking; but set alongside of 1904—a juster comparison—the decline in 1905 is only some twenty-three buildings, and in value only about 4,000. Naturally, fewer builders have been required. On an average there have been about 300 fewer masons engaged in the building sections than has been the case during the past year or two. These, however, have not remained unemployed. While probably not earning so much as they would have done at their own business, they have been able to turn their hands to other jobs—such as carting, and labouring in some of the departments of shipbuilding; while a good many have gone to America. The local prospects, however, are not bright. The public buildings at present on hand—the extension of Marischal College and the new theatre—are nearing completion; and the coming year will witness the discharge of probably between one and two hundred men.—*Scotsman*.

BUILDING TRADE IN DUNDEE.—Little work of importance has been inaugurated in the building trades, and it would appear as if the new year were to be equally quiet, although the cry of the unemployed is not nearly so accentuated as at this time last year. The only works entered upon by the Corporation have been new public washing-houses in Miller's Wynd and the extension of Craig-street Market. James United Free Church congregation are erecting a new building in Arklay-street, in the Clepington district. The only other work of a public kind completed is in addition to the Victoria Hospital for Incurables, consisting of cancer wards. The residential property built has, for the most part, been of the tenement class.

NEW ISOLATION HOSPITAL, WALTHAM ABBEY.—The buildings comprise entrance lodge, administrative building, an isolation block with four beds, diphtheria block with eight beds, scarlet fever block with twelve beds, and laundry and mortuary block. The whole are surrounded with a fence 6 ft. high, except that the lodge and administrative block are on the line of the fence. All other buildings are not less than 40 ft. from the fence and from each other, and are grouped round a lawn in the rear of the administrative building. The isolation block consists of nurses' duty room and two wards, each entered from a verandah, so as to be as completely as possible isolated from

each other. The diphtheria block is situated to the west of the lawn, and consists of nurses' room, bathroom, two wards (male and female) with four beds each, and the usual offices on the ground floor, whilst over the nurses' room is a linen and cistern room. This block follows the almost invariable plan adopted throughout the country for the pavilions of isolation hospitals. The scarlet fever block is situated to the east of the lawn, and is similar to the last, but with six beds in each ward. It has on the first floor a large convalescent room. The laundry block is situated at the south-west corner of the quadrangle formed by the last four mentioned buildings. It consists of the laundry, with washing and ironing room fitted with the most modern appliances for a hand-labour laundry by Messrs. Summerscales; it also includes the disinfecting station, which consists of one room from which the infected goods are placed in the disinfectant (of Dr. Thresh's) and another room from which they are removed when disinfected. There are also in this block a large coal store, a mortuary, shed for ambulance, and a large store shed. Except for some half-timber work and rough-cast introduced, the buildings in general are faced with local red bricks and covered with Brossley tiles. Internally the walls are finished with the administrative block, the lodge are plastered and are fitted with a material hard and capable of being finished with a smoother face than ordinary plastering, and are coated with Hall's washable distemper. In the ward blocks skirting are omitted and all corners rounded so as not to harbour dust. The floors of the wards and nurses' room are pitch pine, polished, the bathroom and lavatory are tiled. The sanitary fittings have been supplied by Messrs. Morrison & Ingram. The wards are warmed with Messrs. Shortland's ventilating grates and stoves, and the remainder of the rooms with open fireplaces. As there was no sewer available, sewage purification works have had to be constructed, and consist of a series of septic tanks and a bacteria tank fitted with one of the Automatic Sewage Distributor Company's revolving sprinklers. The architects are Messrs. Walter Starr, of Chingford, and Herbert Tooley, of Buckhurst Hill; and the contractor Mr. J. Bentley, of Waltham Abbey. The contract price was 7,100.

NEW ASYLUM.—The New York City Council are erecting an asylum at Naburn. The new buildings are of red brick with stone dressings. The plan of the building, which was designed by Mr. A. Creer, the City Engineer, is in accordance with the requirements of the Commissioners in Lunacy, and is, roughly, fan-shaped. The main facade is to the south and extends for a distance of 140 ft. from north-east to south-west, the depth from north to south being 430 ft. The chief entrance is by a broad avenue from the main road from York to Naburn. The entrance-hall is flanked by the principal administrative offices, committee-rooms, and so on, the wings being formed by the ward blocks, of which there are six, three for males being on the north-east side, and three female blocks occupying the south-west side. The present accommodation is for 362 patients, but the facilities for extension will admit of the erection of a female block to accommodate 74 inmates, while the male accommodation may be increased to another fifty, giving a total of 284 females and 200 males. The accommodation is divided on each side into epileptic, chronic, recent and acute, sick and infirm. In addition to offices for the medical superintendent, assistant medical superintendent, clerks, storekeepers, etc., there is a bakehouse furnished with modern appliances, a laundry, a store, engine-house, boiler-house, and work-shops where employment will be found for the artisan patients. Each ward is furnished with larders and pantries adjacent, and lavatories. Hydrants are placed inside and around the building. Fire alarms and telephones are placed all over the building. Corridors communicate from the administrative block to every part of the institution. The first floor is made of fire-resisting materials, while under each corridor is a subway along which the steam pipes, water pipes, and electric lighting cables all radiate from the engine-room. The heating will be by means of exhaust steam from electric lighting engines and pumps. A feature of the building is a water-tower, six ft. high, surmounted by a tank with a capacity of 18,000 gallons. The hot water supply is generated by means of two tubular heaters fixed in the pump-room. The whole of the institution will be lighted by electric light generated on the premises. A dining-hall and recreation room with stage, proscenium, etc., has been provided, capable of seating 600 persons. This apartment is heated and ventilated on the plenum system. A chapel in the Early English style has been erected in the grounds facing the road. A residence for the medical superintendent has been built in the grounds, and also a lodge and several cottages for the attendants. The estimated cost of the institution, fully equipped, is 135,000. Of the total cost, the building contract absorbs 90,453; the land and incidental costs of the purchase, 14,034; furnish-

ing, 17,000; isolation hospital, 9154; planting and fencing grounds, airing courts, etc., 473. The cost works out approximately at 280, per bed, exclusive of the land, the sum representing the cost of the contemplated future extensions to an accommodation of 488.

FOREIGN.

FRANCE.—The Académie des Beaux-Arts have elected Mr. Whitney Warren as Corresponding Member in the Section of Architecture, in place of the late Signor Sacconi, of Rome. Mr. Warren, a former pupil of the Ecole des Beaux-Arts, had obtained a premium in the competition for the Baltimore State House, and is architect of the New York Yacht Club House and the principal railway station there. The Municipal Council of Paris have passed a vote of 1,200,000 francs for the arrangements and beautifying of the Champ de Mars and the making of approaches to it. When laid out as proposed, it will form a park twice as large as the Parc Monceau. M. Theunissen (sculptor) and M. Savignac (architect) have been commissioned to carry out a monument, to be erected at Lamarche (Vosges), in honour of Colonel Renaud, the inventor of the navigable balloons. The jury in the competition for a group of schools at Saint-Cloud have awarded the first premium to MM. Félix and Emile Plat and Auguste Roy. A bridge is to be made over the Seine, between Levallois-Perret and Courbevoie. The jury in the competition for new schools at Pré-Saint-Gervais have awarded the first premium to M. Bovière. Important works are to be executed at Havre for the improvement and enlargement of the port and docks, at an estimated cost of near 6,000,000 francs. Important street improvements are to be carried out at Poitiers, at an estimated expenditure of 1,000,000 francs. The municipality of Nîmes-Bains intends to devote a sum of 2,200,000 francs to various buildings and street improvements. A Roman piscina with marble revêtement has been discovered at Nîmes-Bains. The municipality of Carcassonne is about to open a competition for a new hospital. The death is announced, at the age of thirty-eight, of M. Marcel Berger, a former pupil of M. Guadet. He carried out some important works in collaboration with Maistrasse, and was architect for the Hôtel de Ville d'Argenteuil, the Trouseau Hospital, and various business buildings in Paris. **SOUTH AFRICA.**—At Durban Sir Benjamin Greenacre laid the foundation-stone of the new premises to be erected for the Ladies' College. The building is to consist of three stories, and will be completed about July next. Messrs. Payne & Payne are the architects and Mr. W. F. Johnstone the builder. Sir Henry de Villiers (Chief Justice), Sir John Graham, and Mr. C. H. van Zyl have been appointed by the Cape Government a Committee to investigate, in conjunction with Mr. Mervyn Macartney, and to decide upon the competitive plans for the new Law Courts, and to make a selection from the various designs. At a meeting of the Cape Town City Council the proposed regulations for the erection of needle scaffolding were referred to the Master Builders' Association, and also, on the suggestion of Mr. Baxter, to the City Engineer. When the last mail to hand left Cape Town tenders were being invited by the architects (Messrs. Reid & East) for the erection of a cottage hospital at Worcester.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. Henry Ough, M.Inst.C.E., architect and surveyor, of 64, Basinghall-street, having retired from business, has transferred his practice to Mr. J. Moir Kennard, A.R.I.B.A., of 13, Railway Approach, London, Bridge, E.C. **DIARIES.**—We have received from Messrs. Hudson & Kearns (Hatfield-street Works, Stamford-street, S.E.) specimens of their diaries for 1906. These prepared for the use of architects, surveyors, civil engineers, etc., are Nos. 12 and 13—one and two pages to a day respectively, specially ruled and printed and with index—and excellent productions of the kind they are, including the facts usually to be found in a diary and, in addition, a great deal of information of use to professional men, such as: Cases decided in the Superior Courts of Justice during the legal year from November, 1904, to August, 1905, of interest to the profession; a professional practice and charges of architects; complete list of metropolitan surveyors and districts, with official and private addresses, and list of architectural surveying and engineering institutions, with their presidents, etc. No. 11 is the builder's diary—two days to a page—and it contains: A series of practical tables of daily use in the office, a series of tables on the valuation of property, leases, life interests, insurances, etc., estimate tables, a wages table, tables of scantlings, etc.,

for floors and roofs, method of cubing, with illustrated diagrams. These excellent diaries are well-printed and bound, and have been brought well up to date, for they contain a list of the new Ministry and principal officers of State.

THE LATE MR. RUDOLF LEHMANN.—The late Mr. Lehmann, who died on October 27, has left an estate of which the gross value amounts to 34,491l. 15s. 6d., and the net personality is sworn at 34,343l. 8s. 3d. He bequeathes his picture—"May We Come In?"—to the Tale Gallery trustees, and his collection of musical instruments, etc., to the Hamburg Gewerbe Museum (already deposited there in last June); his trustees are directed to consult Sir Edward Poynter, P.R.A., Sir L. Alma-Tadema, R.A., and Professor Seymour Lucas in appraising the intrinsic value of his collection of pencilled portraits of celebrities signed by their subjects, and then, in the first place, to offer the portraits at that valuation to Professor Sidney Colvin for deposit in the prints and drawings department of the British Museum.

STATUE OF QUEEN VICTORIA, WOOLWICH.—The statue of Queen Victoria, recently unveiled at Woolwich Town Hall, was sculptured in Carrara marble by Mr. F. W. Pomeroy, and is a replica of his bronze statue executed for the city of Chester, representing the Queen in her robes of state.

MAPLE FLOORING.—According to Messrs. Foy, Morgan, & Co.'s annual report on the timber trade, steadily business continues to be done in this article, the merits of which are becoming more and more appreciated by all classes of users. Prices have slightly advanced during the past year, and it is not unlikely that they will go still higher in the near future; but even a further moderate rise in price would not make maple an expensive flooring when the lasting qualities of the wood are taken into account.

MANCHESTER IMPROVEMENTS.—Among matters which were proceeded with during the year was the purchase of properties for the widening of Cateaton-street, the widening of Hanging Ditch, Corporation-street, and a portion of Cannon-street, and the widening of Church-street, at the corner of High-street. Then there were the rebuilding of Minshull-street bridge, and the widening, paving, and making-up of Charles-town-road, Blackley, Water-street has been widened by the removal of the old bridge carrying the London and North-Western Railway Company's goods line over that street and the substitution of a modern steel bridge having a span of 48 ft.; and Prince's bridge, after rebuilding was opened for traffic by the Lord Mayor and the Mayor of Salford on August 3. The new street between Ardwick station and Fairfield-street, now known as North Western-street, is complete. The formation and making-up of Higher Sheffield-street, the straightening and continuation of Holywell-street, the widening of Temperance-street, the widening and completion of Walter-street, and other improvements in this immediate locality have been carried out by or at the cost of the London and North-Western Railway Company, except that a proportion of the cost of the new North Western-street is being borne by the Corporation, in accordance with the provisions of the company's Acts sanctioning the widening and extension of their railway between Ardwick station and London-road. There has been an extension of Station-road, Crumpsall, to Clarendon-road, which gives the residents in Clarendon-road and the locality a direct route to the station, which has hitherto had to be approached by vehicles by a detour to the north and through Bury Old-road, Seymour-road, Lansdowne-road, and Crumpsall-lane. Four new roads were formed, opening out the district of Clayton Vale and forming connexions between Newton Heath and Clayton. These works, though previously contemplated, were continued and the roads formed with a view to giving employment to unemployed citizens. A new trunk road connecting Slade-lane with Wilmslow-road is in course of formation. The sewerage and other works are now in progress. When this road is completed it will form a continuation of Wilbraham-road, and will be a direct route between the main roads assumed thence by Albert-road to Stockport-road in an easterly direction and in a westerly direction by Wilbraham-road to Chorlton. This new road is to be made 18 yds. in width. The widening and improvement of Middleton-road, Blackley, between Sheepfoot-lane and the Three Arrows public-house was undertaken with the view of giving employment. A new trunk road, known as Victoria-avenue, which is about one and a half miles in length, is being made up as a builder's road by the Corporation across the estate of the Earl of Wilton, at a cost of about 10,000l., the greater part, of which cost will be borne by the Earl of Wilton. When this work is completed it will form a main thoroughfare from Rochdale-road, Blackley, to Middleton-road, near the Heaton Lodge entrance to Heaton Park. The Corporation have obtained Parliamentary powers to construct tramways in this road when the road is finished. Among the most costly improvements at present under consideration is

that of the widening of Cross-street. Two-thirds of the property required for this improvement has been purchased during the year, and the negotiations are now proceeding with a view to the acquisition of the remainder of the property.—*Manchester Courier.*

BRITISH GOODS AT CAPE TOWN AND CHICAGO.—The Board of Trade desire to draw the attention of the commercial community to the fact that Mr. E. J. Cattell, their correspondent at Cape Town (who is also the Secretary of the Cape Town Chamber of Commerce), and Mr. A. Finn, H.M. Consul at Chicago, are prepared to receive samples from British manufacturers, at the manufacturers' risk, but free of expense to them except as noted below, and to exhibit such samples, respectively, at the Chamber of Commerce and at the Consulate. Prices should be attached in sterling f.o.b., or c.i.f., or if possible in currency, landed, duty paid. No charge is proposed at Cape Town, but at Chicago a small fee of 8s. per square foot occupied by the exhibitors has to be made for any period not longer than a year.

BIRMINGHAM ART GALLERY AND UNIVERSITY.—The late Mr. John Feeney, who in his lifetime presented to the Art Gallery some examples of Rossetti and Sir E. Burne-Jones, with fine collections of Oriental armour, Japanese enamels, and ivories, etc., has bequeathed 50,000, to the Art Gallery, and 20,000, to the University for the endowment of a professorship for lectures upon subjects having a direct bearing upon the local trades and industries.

THE LATE MR. A. W. MILLS.—A sum of 21,000, to the Manchester and district charities and numerous legacies to his dependants are bequeathed under the will of the late Mr. Mills, architect (of the firm of Messrs. Mills & Murgatroyd), whose estate is valued at 92,000. The bequests include 8,000, to the Manchester Society of Architects, 500, to the Architects' Benevolent Society, 4,000, to Owens College as permanent endowment, and 3,000, to Manchester Grammar School to found scholarships tenable at Oxford or Cambridge.

PROPOSED SALES OF CHURCH PLATE.—At a sitting of the Consistory Court in Exeter Cathedral on December 20, Mr. C. E. H. Chadwick-Healey, K.C., Chancellor of the Diocese, refused to grant a faculty for the proposed sale by the rector and churchwardens of Churchstanton of a silver chalice bearing the inscription "Churchstanton, 1660," and what is presumed to be a local hall-mark. It was desired to apply the proceeds towards the fund for a repair of the parish church, but the learned Chancellor was of opinion that, other objections apart, the donor of the chalice did not intend that it should be converted to such a purpose. On the other hand, Dr. Tristram, K.C., Chancellor of the Diocese of London, has just directed the issue of a faculty authorising the sale of a disused silver flagon, part of the Communion plate of Cowley parish church, near Uxbridge. The flagon, of early XVIIIth century workmanship, was given to the church by one Haynes, a parishioner, and an offer of 136s. is made for it. Dr. Tristram agreed to the appropriation of the proceeds of the sale, firstly, to the purchase of a smaller flagon, and, secondly, towards the erection, at an estimated cost of 600s., of a parish club and mission room, for which a site has been presented.

S. PETER'S, BUDLEIGH SALTERTON.—Messrs. Percy Bacon & Brothers have just executed another window of three lights in this church, as a memorial. The lights contain the figures of S. Edward the Confessor, in the left light; S. George in the centre, and S. Alban in the other. There is also a memorial brass beneath the window.

OPEN DOMESTIC FIRE GRATES.—We have received from Dr. Pridgin Teale a very interesting and courteous letter in which he takes exception to a statement of ours in our issue of December 16 ("Tests of Open Domestic Fire Grates") about fire grates "of the well-known type recommended by Dr. Teale." The type to which we referred is, of course, that which is first recommended by Dr. Teale and is now generally associated with his name; it is known by its splayed sides, forward-sloping back, conical, and vertical front bars. Dr. Teale reminds us that "the fireplace in which the fire is sunk below, or rather beneath, the hearth, so as to substitute the hearth raised above the grid for front bars, was invented by my son and myself," and adds that "the various sunk fireplaces are more or less a copy of his patent and were brought out a considerable time avant his invention." We had not forgotten this later grate invented by Dr. Teale and his son and patented by the latter; but we still think that our reference to "the well-known type recommended by Dr. Teale" was not misleading. The grate invented by himself and his son, and known, not as the "Teale" but as the "Front Hob Fireplace," obviously belongs to the class which we described as "a more modern kind without front bars." Dr. Teale's name is so honourably associated with the reform that has taken place in domestic fire grates in recent years, that we should be very sorry indeed to say anything which might in any way detract from the credit due to him.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

19,469 of 1904.—A. R. HUBBARD and R. FLAY: *Kitchen Ranges.*

This relates to kitchen ranges, and consists of a fire grate constructed with teeth, cast upon two parallel horizontal shafts or axes, the teeth being formed with two of their sides of greater length than the third or top side, the three sides being convex in end view, and the two lower sides terminating in a point at the bottom and presenting a greater surface for the air to travel through in its passage to the fire, the two shafts being carried through from the front to the back of the fireplace and arranged to revolve in bearings in the latter, and geared together so that when one of the shafts is turned more or less, the two shafts with their teeth are caused to rock, and the fuel resting upon them is agitated to any desired extent.

19,470 of 1904.—A. R. HUBBARD and R. FLAY: *Boilers for Kitchen Ranges and the like.*

This relates to a boiler for kitchen ranges and the like, consisting of a hollow metal ring placed horizontally at a short distance above a fire pot or grate below, so that the flame and hot products of combustion beat the bottom and inner side of the hollow ring, through which they pass, and are then conveyed away to a chimney and a circulating pipe supplying water to the interior of the boiler.

3,941 of 1905.—W. G. HARRISON and T. WORRELL: *Locks and Latches, such as Rim and Mortise, which are Adapted to be Operated by a Key from either Side of a Door.*

This relates to locks and latches, such as rim and mortise, which are adapted to be operated by a key from either side of a door, and consists of a bridge fixed about midway between the front and back plates of the case, beyond which the key-bit cannot be passed in inserting the key within the case prior to turning it therein, in combination with a bolt, which may be moved by the key, as the key-bit is simply turned round at either side of the bridge after the bit has been inserted into the case up to the bridge only, from the corresponding side thereof.

4,584 of 1905.—H. R. ANTELIFF: *Fasteners for Windows, Doors, and the like.*

This relates to a fastener for windows, and consists of a bracket fixed in a line with the top sash of the window frame, said bracket having an inclined piece pivoted thereto, in such a manner that the end of the pivoted piece always bears against a right-angled projecting plate fixed to the other sash, a peg on the plate of the bracket takes a hole in the right-angled projecting plate, the sashes or parts being firmly held together until the end of the pivoted inclined piece is turned free of the right-angled projecting plate when the window is opened, and when the window is being closed the edge of the right-angled projecting plate takes against the edge of the inclined piece, and thus the same free on one side until the right-angled projecting plate is free of the end of the inclined piece, when the same moves into its closed position.

5,799 of 1905.—C. W. TONKS, G. A. TONKS, and E. TONKS: *Pre-payment Locks for Closets and the like.*

This relates to a pre-payment lock for closets and the like, and consists of a device, which, as the latch bolt is moved in by the closing of the door, is thereby caused to press upon the coin and ensure that it will fall clear of the mechanism in case it does not otherwise fall, and such bolt is moved in.

6,107 of 1905.—H. WILSON: *Boilers for Kitchen Ranges and like Purposes.*

This relates to boilers for kitchen ranges and other purposes, and consists of a flue or passage being formed through the body of the ordinary rectangular or like-shaped boiler usually constructed of copper, and fixed behind the fire-grate space of a kitchen range. The flue or passage is preferably of a flattened oval shape, but it may be of round, square, or any suitable form, and extends from the back part of the bottom of the boiler to the front part of the top, thus forming a diagonal flue through the boiler. Instead of one such flue two or more may be employed.

6,168 of 1905.—W. C. KIMBER, H. T. TALLOCK, and W. F. STANLEY & Co., LTD.: *Drawing Appliances.*

This relates to drawing appliances, and consists of a substantial frame having hard wood runners upon right and left hand edges. A metal bar of the length of the frame is mounted upon wheels running upon the said runners, the parallel motion of which is ensured by a endless wire passing over pulleys at top and bottom of frame and crossed underneath, so that the wire from the top of the bar on one side is fixed to the bottom

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

of the bar on the opposite side and vice versa, suitable pulleys being provided under the frame for guiding the wire.

6,526 of 1905.—A. H. NEWBY: *Ventilators.* This relates to ventilators, and is characterised by a quick grooved screw plug working in a collar on a perforated face plate, the one end of the screw plug being attached to a back plate in such a manner that when the screw plug is partly rotated the back plate is caused to recede away from or move towards the face plate.

7,199 of 1905.—J. F. BUCKLEY: *Disinfecting Apparatus in Connection with the Water Waste Preventers of Water-closets and the like.*

This relates to a disinfecting apparatus for water-closets and the like, and consists in effecting the horizontal travel of a slide to discharge the tablets by means of a link connected to the ball lever.

9,050 of 1905.—R. W. SEWELL: *Mortise and other Locks for Doors and the like.*

This relates to mortise and other locks for doors and the like, and consists in the arrangement of a spring latch, the head of which protrudes from and works through a face plate, whilst its stem is carried by and works through and within one or more bent, bifurcated, and elbow-pivoted levers, and which latch is opened by an ordinary rotating or other style knob or handle impinging or acting on said pivoted lever or levers.

10,665 of 1905.—H. F. E. HOPMANN: *Spade.* This relates to a wooden spade having a blade consisting of several parts, and is characterised by the fact that the blade is composed of a number of separate narrow laths or staves, the middle stave carrying the shaft and two edge or side strips, the said staves and strips being shaped to form the blade, and held together by means of anchor wires or tie-rods running transversely through the staves and strips.

11,620 of 1905.—DR. O. ZIMMERMANN: *Formation of Stacks of Tubes Especially Applicable for Water Cooling and Heating Apparatus and the like.*

This relates to a process for the formation of stacks of tubes especially applicable for water cooling and heating apparatus, in which process the tubes are formed by pouring molten metal into the space between the ends of the tubes and the casing surrounding the same, said metal being thus produced firmly cast upon the tube and casing ready for forming the ends of the apparatus.

14,672 of 1905.—T. P. RUDKINS and P. K. O'BRIEN: *Means for Lifting and Otherwise Transferring Goods.*

This relates to a device for lifting and otherwise transferring goods, and consists in the combination with a supporting frame of means for connecting it to a platform, a truck pivotally connected to the frame, a lever or levers for turning an axle or the like, having frame support, and connexion between the axle and the truck.

15,035 of 1905.—C. H. LOVERING: *Gates.*

This relates to a gate comprising oppositely disposed posts, a cross piece connecting the upper ends of the posts, a gate hinged at its lower rear end to each of the posts, pivoted together at their inner ends, a connexion between the outer end of each lever, and the rear of the gate there beneath, and means connected with the aforesaid connexion whereby both gates may be tilted simultaneously.

15,579 of 1905.—J. W. WESTWOOD, C. BARTER, and T. TAYLOR: *Apparatus Forming a System for Combined Hot-water and Steam Warming of Buildings and the like.*

This relates to an apparatus forming a system for combined hot-water and steam warming of buildings and the like, consisting of a steam generator, a hot water heating boiler or part boiler, a tank situated at the top of the building, having two plates in connexion with the flow pipe, distributing return pipes in connexion with radiators, the steam pipe with automatic valve, the injector or steam mixer in connexion with the flow pipe, the automatic float valve in the tank, the controlling weighted safety valve in the tank, a valve in said tank being connected by levers, with the valve in the main steam pipe,

27,308 of 1904.—J. WARD: *Tar Paving.*

This relates to tar paving, and consists in the employment of a bonding tar compound for adhering and holding the pieces of stone together, consisting of distilled tar and ground lime, ground chalk, limestone dust, or like, alkaline powdered earth or substance, compounded by adding the powdered substance to the tar while in a hot state.

5,865 of 1905.—W. HEWORTH-COLLINS: *Construction of Conductors for Containing Electric Cables and Wires and other Tubes, Pipes, and the like.*

This relates to the construction of conduits for containing electric cables, and wires, and other wires, tubes, pipes, and the like, and consists in the combination of a number of rectilinear

sectional lengths to form the sides and part of top and bottom with two T sections, to form the rest of the bottom and the lid.

097 of 1905.—F. M. PROCKTER and J. B. HOWARTH: Apparatus for Supplying Humidified Air to the Intakes of Buildings.

This relates to an apparatus for supplying and distributing humidified air, comprising a shallow vessel for containing the liquid for humidifying the air, and consists of a fan situated in a shaft above it with a deflector intervening between said fan and liquid, and another deflector over-arching said fan.

066 of 1905.—H. SUTCLIFFE: Means for Joining Flushing Pipes to Closet Basins, or for Making like Pipe Connections.

This relates to a device for joining flushing pipes to the flushing horns of water-closets, or for making like pipe connections, comprising a cone having a number of radial leaves, each one of which is slightly twisted in such a manner that when applied to form a joint the said leaves overlap and present a solid or unbroken surface, without interstices.

SOME RECENT SALES OF PROPERTY:

Table with columns for property details and prices. Includes entries like 'ESTATE EXCHANGE REPORT, January 5.—By COOPER & GOLDING, Upton Park—35 to 45 (odd), 65, 67, and 69, Lucas-av., W.1, 92 and 92 1/2, W.1, 327 1/2, 1/2' and 'By WALLEN & CHURCH, Strand.—43, Bedford-st. (Williams' Dining Rooms), L. Yr. 90L'.

TO CORRESPONDENTS.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications. We are compelled to decline pointing out books and giving addresses. Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. The Editor cannot undertake to read and consider articles offered for acceptance unless they are type-written. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertising and other business matters should be addressed to THE PUBLISHER, and not to the Editor.

MEETINGS.

FRIDAY, JANUARY 12. Institution of Civil Engineers (Students' Meeting).—Professor J. D. Cornack, B.Sc., on "The Theory of Machines." 8 p.m. MONDAY, JANUARY 15. Royal Institute of British Architects.—President's "At Home." A small Exhibition of Working Drawings is being arranged for the occasion. 8.30 to 11 p.m. Surveyors' Institution.—Mr. A. T. Walmisley on "Modern Surveying Instruments." 8 p.m. London Institution.—Mr. A. Guinness' Broodbank on "The Port of London," illustrated. 5 p.m. TUESDAY, JANUARY 16. Architectural Association Camera and Cycling Club.—Mr. G. Trotman on "Winchester Cathedral." 7.30 p.m. The Institution of Heating and Ventilating Engineers.—Annual general meeting (Institution of Mechanical Engineers, Storey's-gate). Election of officers, etc. Presidential address by Mr. W. Nelson Haaden, and paper by Mr. A. H. Barker on "Colorimetric Methods of Investigating the Loss of Heat from Buildings and Radiators." 7 p.m. Institution of Civil Engineers.—Papers to be further discussed:—(1) The Elimination of Storm-water from sewerage systems," by Mr. D. E. Lloyd-Davies, (2) "On the Elimination of Suspended Solids and Colloidal Matters from Sewage," by Lieut.-Colonel A. S. Jones, D.C., and Mr. W. O. Travy, M.D. 8 p.m. WEDNESDAY, JANUARY 17. The Quantity Surveyors' Association ("The Chinese Room," Holborn Restaurant).—Adjourned discussion upon Mr. F. B. Hollis's paper, "Some Thoughts on the Quantity Surveyor, and his Relation to the Building Owner, the Architect, and the Builder." 7 p.m.

Builders' Foremen and Clerks of Works Institution.—Annual meeting of the members. 8 p.m. Edinburgh Architectural Association.—Mr. W. T. Oldrieve on "What H.M. Office of Works is doing for Historic Buildings in Scotland." 8 p.m. Northern Architectural Association.—Mr. R. G. Hatton on "Jacobean Floral Patterns." 7.30 p.m. Institution of Civil Engineers.—Students' visit to the works of the South Metropolitan Gas Company, 709, Old Kent-road, S.E. 2.30 p.m.

THURSDAY, JANUARY 18. Society of Arts (Indian Section).—Mr. C. E. Duckland, C.I.E., on "The City of Calcutta." 4.30 p.m. Society of Arts (Howard Lecture).—Professor Silvanus Thompson, D.Sc., on "High Speed Electric Machinery with Special Reference to Steam Turbine Machines." 1.8 p.m.

FRIDAY, JANUARY 19. Architectural Association.—Mr. F. Lynn Jenkins on "The Consideration of Sculpture by Architects." 7.30 p.m. Royal Institution.—Professor J. J. Thomson on "Some Applications of the Theory of Electric Discharge to Spectroscopy." 9 p.m. Institution of Mechanical Engineers.—(1) Discussion to be held and concluded on paper on "The Behaviour of Materials of Construction Under Pure Shear," by Mr. E. G. Izod; (2) Mr. Robert A. Bruce on "Worm Contact." 8 p.m.

PRICES CURRENT OF MATERIALS.

* * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table of material prices including Bricks, Glazed Bricks, Rough Stocks and Gravel, Facing Stocks, Shippers, Best Fire Bricks, Best Blue Pressed Staffordshire, Do. Bullnose, Best Scotch Bridge Fire Bricks, Glazed Bricks, Best White and Grey, Stretchers, Headers, Quoins, Bullnose, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered, Squares, Best Dipped Salt Glazed Stretchers and Headers, Quoins, Bullnose, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered, Squares, Second Quality White Bricks, Dipped Salt Glazed, Thames and Pit Sand, Thames Ballast, Best Portland Cement, Best Ground Blue Line Lime.

NOTE.—The cement or lime is exclusive of the ordinary charge for sacks. Grey Stone Lime 11s. 0d. per yard, delivered. Stourbridge Fireclay in sacks 27s. 0d. per ton at rly. dpt.

Table of stone prices including Bath Stone, Portland Cement, Nine Elms Depot, Portland Stone, Brown Whilbed, Elms Depot, White Bashed, Ancaster in blocks, Beer, Greenhill, Darley Dale in blocks, Red Corshill, Closebar Red Freestone, Red Mansfield, York Stone—Robin Hood Quality, Scappled random blocks, 6 in. sawn two sides landings to sizes (under 40 ft. super), 6 in. rubbed two sides ditto, 3 in. sawn two sides slabs (random sizes), 2 in. to 2 1/2 in. sawn one side slabs (random sizes), 1 1/2 in. to 2 in. ditto, ditto.

STONE (continued).

Table of stone prices including Hard York, Scappled random blocks, 6 in. sawn two sides landings to sizes (under 40 ft. super), 6 in. rubbed two sides ditto, 3 in. sawn two sides slabs (random sizes), 2 in. self-faced random flags, Hopton Wool (Hard Bed) in blocks, 6 in. sawn both sides landings, 3 in. sawn both sides random slabs, 2 in. do.

SLATES.

Table of slate prices including 20x10 best blue Bangor, 20x12, 20x10 first quality, 20x12, 16x8, 20x10 best blue Portmadoc, 20x10 best Brecka fading green, 20x12, 18x10, 16x8, 20x10 permanent green, 18x10, 16x8.

TILES.

Table of tile prices including Best plain red roofing tiles, Best Broseley tiles, Do. Ornamental tiles, Best Buxton red, brown, or brimled do. (Edwards), Do. Ornamental do., Hip tiles, Valley tiles, Best Red or Mottled Staffordshire do. (Peakes), Do. Ornamental do., Hip tiles, Valley tiles, Best "Rosemary" brand plain tiles, Best Ornamental tiles, Hip tiles, Valley tiles, Best "Hartsill" brand plain tiles, sand faced, Do. pressed, Do. Ornamental do., Hip tiles, Valley tiles.

WOOD.

Table of wood prices including Building Wood, Deals: best 3 in. by 11 in. and 4 in. by 9 in. and 11 in., Deals: best 3 by 9, Battens: best 2 1/2 in. by 7 in. and 3 in. by 7 in. and 8 in., Deals: seconds, Battens: seconds, Foreign Sawm Boards, 3 in. and 1 1/2 in., Fir timber: best middle bur Darnley, Seconds, Small timber (8 in. to 10 in.), Small timber (6 in. to 8 in.), Swedish battens, Pitch-pine timber (30 ft. average), JOINERS' WOOD.

Table of wood prices including White Sea: first yellow deals, 3 in. by 11 in., 3 in. by 9 in., Battens, 2 1/2 in. and 3 in. by 7 in., Second yellow deals, 3 in. by 11 in., Battens, 2 1/2 in. and 3 in. by 7 in., Petersburg: first yellow deals, 3 in. by 11 in., 3 in. by 9 in., Battens, 2 1/2 in. and 3 in. by 7 in., Second yellow deals, 3 in. by 11 in., Do. 3 in. by 9 in., Battens, 2 1/2 in. and 3 in. by 7 in., Third yellow deals, 3 in. by 11 in., Do. 3 in. by 9 in., Battens, 2 1/2 in. and 3 in. by 7 in., White Sea and Petersburg: First white deals, 3 in. by 11 in., 3 in. by 9 in., Battens, 2 1/2 in. and 3 in. by 7 in., Second white deals, 3 in. by 11 in., Do. 3 in. by 9 in., Battens, 2 1/2 in. and 3 in. by 7 in., Pitch-pine: deals, Under 2 in. thick extra, PRICES CURRENT.—Continued on page 55.

List of Contracts, etc.

CONTRACTS.

(For some Contracts still open, but not included in this List, see previous issues.)

Nature of Work or Materials.	By whom Advertised.	Forms of Tender, etc., supplied by	Tenders to be delivered
300 and 350 Gallon Hosed Steam Fire-Engine	Hendon U.D.C.	S. Slater (Grimley, Engineer, Council Offices, Hendon, N.W.	Jan. 15
*ROADMAKING AND PAVING WORKS	do.	do.	do.
Improvement in Smauthorne-avenue	Castledoff U.D.C.	W. Green, Surveyor, Castledoff	Jan. 16
Making-up Streets	Acorn F.D.C.	D. J. Ebbetts, Surveyor, 57, High-street, Acton, W.	do.
Goods and Materials	Plymouth Corporation	F. Howarth, Water Engineer, Municipal Buildings, Plymouth	do.
Fireclay Pipes, Grit Sets, etc.	Lancaster Corporation	J. C. Mount, Borough Surveyor, Lancaster	do.
Infant School, Hawthorn	Pontyprrad U.D.C.	P. R. A. Willoughby, Surveyor, Pontyprrad	Jan. 17
Twelve Months' Supply of Paint, etc.	Manchester Corporation	R. Williamson, Town Hall, Manchester	do.
Infant School at Croydon	Monmouthshire Education Comm.	H. J. Griggs, Architect, Newport, Mon.	do.
Alterations at Mixed School, Crosswell	do.	do.	do.
Alterations to Gates & Paving at Wkham, Crescent-rd., Crimppall	Manchester Guardians	A. J. Murgatroyd, Architect, 23, Strutt-street, Manchester.	do.
Cabmen's Shelter, Chandeleet	Hill Corporation	Clerk of the Council, Castle-terrace, Edinburgh.	do.
Painter's Work, Craigleith Poorhouse, Comely Bank	Edinburgh Parish Council	W. Harris, Architect and Surveyor, Gilfach Bargeod	do.
Heating C.M. Chapel, etc., with Hot-water, Gilfach Bargeod	do.	A. H. Malin, Clerk, Oranham	Jan. 18
Granite and Slag	Grantham R.D.C.	C. T. Rathbone, Architect, Bank-chambers, Heathfield-st., Swansea	do.
Granite and Slag	Goss-lane Baptist Church	T. A. Bushwiler, District Surveyor of Highways, Spilsby	do.
*MARRIED COUPLES' QUARTERS AT WORKHOUSE	Sulby R.D.C.	Clerk to Guardians, Fulham Palace-road, W.	do.
Sunday Schoolroom, Fitzthum-embankment, Cardiff	Fulham Guardians	A. Grove, Architect, 15, Clifords-inn, London, E.C.	Jan. 19
Sinking a Well at Gransha, 75 ft. deep	Rev. H. A. Coe	C. C. Doig, Architect, Elgin	do.
Villa to be Erected at the Crofts, Elgin	Londonderry Lunatic Asylum	A. Thorne, Borough Surveyor, Barnstable	do.
Sewer and Paving Works, Bontrivock-street	Barnstable U.D.C.	E. Wilson, 10, Westgate, Galsburgh	do.
Primitive Methodist Chapel and School, Galsburgh	do.	J. Brooke Smith, Surveyor, Church-street-chambers, Cardiff	do.
Renovation of No. 2, Church-street, Cardiff	do.	Rev. H. A. Coe	Jan. 20
Stoneware Pipes and Goods	Tyldesley-W. Shakerley U.D.C.	T. H. Murray, Architect, Cossett	do.
House, Avelley-terrace, Cossett	Shibley Bridge, etc., Gas Co.	A. M. Cross, Engineer, 23, Valentine-road, King's Heath	Jan. 22
Making good All Saint's-road, King's Heath	Middleton Cheney R.D.C.	W. J. Treadwell, District Sur., Middleton Cheney, Banbury	do.
2,200 yds. of Wrought-iron Railing, Franklyn-road	St. Northern Ry. Co., Ireland	T. Morrison, Secretary, Amiens-street, Terminus, Dublin	do.
Harthill Stones, Granite and Slag	Metropolitan Water Board	A. B. Pilling, Clerk, Savoy Court, Strand, W.C.	do.
1,000 or 4,000 Tons of 90-lb. Steel Bullhead Rails	Bangor Corporation	O. Roberts, Architect, The Temple, Dale-street, Liverpool	do.
1,250 or 2,500 Tons of Cast-Iron Chairs	Twickenham F.D.C.	H. H. Samlles, Clerk, Town Hall, Twickenham	do.
700 Tons of 16-in. Cast-Iron Pipes	Croydon Guardians	H. Holt, Clerk, Mayday-road, Thornton Heath	do.
43 Workmen's Dwellings, Saffron-walden, etc.	Dover Town Council	H. E. Stulge, Surveyor, Maison Dieu House, Dover	do.
School Furniture, Trafalgar Schools	West Wylam, etc., Co-op. Soc.	Central Stores, Prudhoe	do.
Unbroken Guernsey Granite	Beckenham U.D.C.	Council's Surveyor, Beckenham	do.
Infants' School, Common-lane, River	Croydon Borough Council	Croydon Engineer, Town Hall, Croydon	do.
Two Houses at Crawbrook	Lancashire and Yorkshire Ry.	F. Pylon, Borough Engineer, Municipal Buildings, Plymouth	Jan. 23
*DEFECTIVE SCHOOL, ETC.	Willesden District Council	Council's Engineer, Dyne-road, Kilburn, N.W.	do.
*BUILDER'S WORK AT STROUD GREEN WELL	Salford Corporation	T. Kershaw, Architect, Lancs. and Yorks. Bank-chs., Halifax	Jan. 24
Stores.	Carshalton U.D.C.	J. Corbett, Borough Engineer, Town Hall, Salford	do.
Widening Railway between Littleborough and Summit Tunnel	Chelsea Borough Council	C. P. Lovelock, Clerk, High-street, Carshalton	do.
*BOUNDARY WALL, NEASDEN	Edon R.D.C.	Borough Surveyor, Town Hall, Chelsea, S.W.	Jan. 25
Residence, Stables, etc., Free School-lane, Halifax	do.	A. Gladwell, Engineer, Council Offices, 160, High-st., Slough	do.
Raking Machinery for Sewage Works	The Managers	Rev. Canon Raven, The Vicarage	do.
Making-up Five New Roads	Technical Instruction Comm.	G. T. Moore, Architect, 1 & 2, Foster-pl., College Gn., Dublin	do.
*ANNUAL CONTRACTS	County Borough of West Ham	Borough Engineer, Town Hall, Stratford, E.	do.
Sewage Purification Works, Burnham	Blackburn Guardians	F. C. Rutledge, Architect, 4, King-street, Blackburn	Jan. 26
4 miles of Pipe Sewers, etc., Burnham	Chipping Norton R.D.C.	R. Entwistle, Surveyor, Charlbury, Oxon	do.
Technical School, Eblana-avenue, Kilmcrauna	Westminster City Council	Works Dept., Westminster City Hall, Charing Cross-rd., W.C.	do.
*ANNUAL CONTRACTS	Hertfordshire County Council	Urban A. Smith, County Surveyor, Hatfield	Jan. 27
*HEATING APPARATUS, ETC., AT WORKHOUSE	West Sussex Education Com.	J. H. Howard, Architect, Lover-street, Haslemere	do.
Granite	Governors of Grammar School	F. T. Malby, Architect and Surveyor, Dorchester	do.
*SEWER WORKS IN CITY OF WESTMINSTER	Warrington Paving Com.	R. H. Engineer and Surveyor, Town Hall, Warrington	Jan. 29
Broken Granite and Slag	Lancashire Education Comm.	H. Litter, County Architect, 16, Ribblesdale-place, Preston	do.
Road at Camblehill, Sussex	Alverstoke Guardians	H. A. F. Smith, Architect, Star-chambers, Gosport	do.
Alterations to No. 40, South-street, Dorchester	Hants County Council	County Surveyor, The Castle, Winchester	do.
Forming and Paving Six Streets and Sixty-six Passages	Nelson Corporation	Poyser & Savage, Architects, King-street, Nottingham	Jan. 30
Public Elementary School, Erwood-road, Levenshulme	Lambeth Borough Council	Borough Engineer, 348, Kennington-road, S.E.	do.
Bathrooms and Hot-water Works at Workhouses, Gosport	F. Sussex, Local Educ. Auth.	County Surveyor, County Hall, Lewes	Feb. 1
*SCHOOL AND HOUSE AT BEAULWORTH	do.	do.	Feb. 2
Villa at Cranmore-gardens, Lishurn-road, Belfast	District Gas and Water Co.	T. H. Martin, Engineer, Nation-road, New Barnet	do.
*FREE LIBRARY	Wilton Corporation	J. Taylor, Sons, & Santo Grimm, 27, St. George-street, S.W.	Feb. 3
*WORKS AT CORNER'S COURT	Municipality of Pretoria	Res. Lowlyne, Architect, Birchmore House, Brixingrove	Feb. 5
*INFANTS' SCHOOL, PORTSLADE-BY-SEA	Bishopthorpe R.D.C.	Mosenthal, Sons, & Co., 72, Basinghall-street, E.C.	Mar. 15

The Arts and Crafts Exhibition.

It is a pleasure to be able to say that the eighth exhibition of the Arts and Crafts Exhibition Society, at the Grafton Gallery, is the best they have ever held, in one respect at all

events—that it is an exhibition almost entirely free from eccentricities. "L'Art Nouveau" is conspicuous by its absence; there are none of those freaks of design which were the result of a kind of struggle after what is supposed to be originality, and which became a source of not unmerited derision to the Philistine critic. The rooms are full of work nearly all of which is interesting, and much of it beautiful. There may have been in some former exhibitions individual exhibits which were superior in their kind to anything in the present collection; but there is at any rate nothing of any importance to object to. And, partly owing to the larger extent of the Grafton Gallery, the exhibition is better and more effectively arranged than it ever was in the New Gallery; things are not crowded together so much, and there is room to see the total effect. The large gallery, in which are hung most of the exhibits which approach the pictorial side of applied art—designs for stained glass and various forms of mural decoration—is decorated at the top by the continuous frieze designed by Mr. Walter Crane for the British section of the St. Louis Exhibition; a

very graceful design in which groups of conventional foliage are arranged with symmetrical spacing, leaving a considerable amount of white ground between, the whole being very bright and decorative. At the end of the room a kind of semi-architectural screen is formed by Mr. Dressler's large plaster model for the stone carving for the Victoria Infirmary at Newcastle, the main portion of which consists of life-size spandrel figures in bas-relief on either side of a large doorway opening, the whole thing extending across a great part of the width of the room. The figures, whose hands meet in the centre over the arch, symbolise respectively "Hygiene" and "A Crown of Wild Olive." As we shall not return to this again, we may say that while the figures have the spirit and vigour of style which we are accustomed to associate with Mr. Dressler's work, it seems to us that in a decorative sense the effort to make them accommodate themselves to and fill up the space of the spandrel has not been quite happily managed, the two figures being, as one may say, bent at the waist in a manner which, considering them as figures and apart from the setting, is a little awkward and displeasing in line, and conveys too much the appearance of an effort to make them fill the space. A figure designed to fill a special space ought to have the appearance of having naturally fallen into the attitude necessary for that object, while these figures appear a little forced in their attitude and do not produce an agreeable line.

The main object of the Arts and Crafts

Society is set forth by its president, Mr. Walter Crane, in what he calls a "foreword" (an affectation of phraseology, since "preface" is an old and legitimised English word now) as being "a search for increased beauty, refinement, and sincerity in design and workmanship in the accessories of human life, united by an architectonic ideal; and as affording scope, in what may be considered the useful arts, for the artistic expression of individual taste and character in contradistinction and protest against purely commercial, mechanical, and machine production" (there seems a suspicion of tautology in the closing sentence). This definition of the objects of the society should in fairness be kept in mind in judging of the contents of the exhibition, because it will be seen that the main object is to give character and beauty to common objects, as implied by the expression "useful arts," rather than to foster the production of objects of great costliness and elaboration, such as are defined by the adopted French term *objets de luxe*. While we have the greatest possible sympathy with this aim of giving beauty and interest to common things, and admit that it has the wider application, since the number of those who can afford the most costly work is comparatively limited, we cannot help wishing that there were a little more recognition of the *objet de luxe*, which may have its worse or its better taste just as much as the plainer and cheaper object. As we remarked the other day in reference to some French work of the Louis Quinze period, with all its exquisite and costly finish there is a want of soul in it; but

this defect is not necessarily inherent in costly work. On the contrary, provided the artistic spirit in design is present, the more costly and the more finely elaborated is a work of construction, such as a table or a sofa, the more beautiful and valuable it is; there is nothing vulgar in itself in costliness; what is vulgar is costliness without art. The Arts and Crafts Society might perhaps be fulfilling its mission even more fully if it were to encourage a little more the production of furniture of the class which would suit a palace, but with more of the true artistic spirit than is generally found in palatial furniture. As it is, there is a little too much of the feeling that plainness and simplicity are essential qualities in artistic work. They are not necessarily so. The truth runs only so far as this; that simplicity with artistic character is worth more than costliness without it. The impression given by the general character of the objects of use exhibited, on this as on former occasions, is that art is something for the middle and lower class rather than for the prince or the millionaire. Of the two possible alternatives it is perhaps the more wholesome and certainly the more generally useful. Still, why leave the prince and the millionaire out in the cold? They also have, artistically, souls to be saved; they want teaching that man doth not live by money alone. There is a socialistic feeling at the bottom of all this, also wholesome, but—just a little one-sided.

In regard to the influence which these exhibitions have had, however, more we believe might be claimed for the Arts and Crafts Society than the president claims in his preface—we beg pardon, "foreword." In referring to the steady growth and development of the movement, he remarks that "arts and crafts exhibitions have become common throughout our country, and handicraft classes have now generally become a necessary part of any art-school curriculum." He might have gone further than "our country." We have had evidence that the Arts and Crafts exhibitions in England have had a very considerable effect on the Continent, in Germany especially; that exhibitions have been started there on the same lines; and the fact of their connexion with English influence was plainly shown in the remark reported to us the other day of a German shopkeeper, who, in endeavouring to explain to an English customer what sort of building it was that he was showing a photograph of, said "It is a kind of Walter Crane Museum." That is a reputation at any rate; and it is one well earned.

We shall, of course, devote more than one article to the varied contents of the exhibition; but we naturally turn first to furniture, which is in itself a kind of architecture on a smaller scale, governed by the same principles; sound construction to begin with, and decoration based upon and expressing construction. The most noteworthy exhibit in this class is perhaps the "Inlaid Mahogany Sideboard" in the middle gallery, designed by Mr. George Jack, executed by Messrs. Thatcher, Gauntlett, & Millard, and exhibited by Messrs. Morris & Co. This is a truly fine and sumptuous work, noticeable for the harmony of line shown

in the bold, sweeping curve of the front, the bold decorative lines of the inlay, and the monumental effect of the square pedestal cupboard beneath, flanked by shelves which echo the curved line of the main front; even the very simple perforated ornament which is carried round the whole has its value. The octagonal angle shafts are carried up a considerable height above the shelf of the sideboard and expand into circular candle-brackets (for as such they must be regarded, if they are anything), according to a fashion which has obtained lately; this furnishes, no doubt, an effective finish to the shafts, but it is hardly a good practical position for candles or any object which would suffer from being overturned, and as a whole the sideboard would have been better for the omission of these features. The price is not appended to this, as it is to many of the pieces of furniture; it would be interesting to know for what sum it could be carried out. Another piece of furniture which claims special mention is Mr. Sidney H. Barnsley's "Library Table in English Walnut" at one end of the large gallery; a simple but excellent piece of work, in which the supports near each end, which carry small drawers between, have that appearance of steadiness and solidity which is so desirable in a library table. A little very simple inlay decoration is applied to emphasise the principal lines of the design. Having mentioned these two rather prominent objects, we may take some of the rest in order of position. In the octagon-room a small oak table with folding legs, by Mr. Pymont, is good in construction and as a very simple design. Mr. Lethaby's "Writing Table" suggests the question whether it is an altogether suitable disposition of ornament (wood inlay) to concentrate it on the legs, leaving all the rest nearly plain; unless indeed it is assumed that the table would be covered by a cloth and only the legs seen; in that case there is reason in it. The "Mahogany Cupboard" by Mr. Munihane is a highly finished piece of work, but the angle shafts and the framing are rather too much cut up with carved ornament which gives them rather a fidgety look and which is hardly interesting in itself. Mr. Bultitude's "Mahogany Escriptoire" is well constructed and put together, and a good surface effect is obtained by the simple expedient of veneering with lozenge-shaped pieces fitted together with the grain reversed. Mr. Gimson's "Sideboard in Elm" is one of the best things in this room; there is a great deal of character in it, with excellent finish; it is absolutely destitute of mouldings, the edges finishing square—we do not say this is necessarily a virtue, but the whole thing is in keeping. In this and in two or three other examples in the exhibition we notice a method of marking and defining the outline of the drawers and doors by a narrow slip (about $\frac{1}{4}$ in.) of dark wood let in and projecting a little above the general plane, rounded on the top; the effect of this is simple, neat, and permanent. But in this and other examples we notice a tendency to a rather too small and trivial treatment of the loose metal handles, which in this example are flat and hang so close to

the woodwork as to be not convenient to get hold of. In two or three other exhibits, by different exhibitors, there is a form of brass hanging handle something like this, which is certainly not very artistic in character and is uncomfortable for the hand and bad to grasp; it looks more like a kind of thing to be bought by the gross in a shop than a fitting appendage to furniture designed for an art exhibition. In Mr. Barnsley's "Library Cabinet" we notice another

little peculiarity which seems to be a new fancy and is met with in other exhibits of the same class; the treatment of the drawer fronts with a small moulded ledge projecting all round beyond the framework of the drawer and forming a rebate on the inner side, so that when the drawer is closed there is a projection all round which covers the joint and is supposed, no doubt, to keep out dust. We rather doubt its doing so; dust is a very insinuating element; and the result is that when the drawers are closed they present the appearance of a series of raised panels, and the effect is not very good. Among some of the metal articles in this room there is a want of the stability of base which is necessary for an article which is to stand loose on the floor; this is the case with Mr. E. Spencer's "Lectern in Wrought Iron," which is much too unsteady on its base for a lectern; and to some extent though not so much, the same objection applies to Mr. R. Evans's "Floor Standard for Electric Light," which however, with its white silk lamp shades, looks very well as a whole. A "Font of Cast Lead" by Mr. G. P. Bankart is a revival of an ancient type of work, and a good design in itself; but lead is a somewhat grim material for a font bowl, justified only on archaeological grounds, and moreover ornament in relief in the interior of the bowl is out of place; what is wanted there is merely a smooth bowl to hold water. This is or should be a general principle in all things made to hold liquid: the most decoratively treated mediaeval chalices are nearly always smooth inside. Mr. Bainbridge Reynolds's "Lectern in Brass and Leather," which stands in the centre of the room, has the merit of mass and solidity, but is not otherwise very interesting. Mr. Gimson's "Wrought Iron Fire-dogs," which we seem to have seen before, are beautiful pieces of decorative design in this material.

In the middle gallery we are first greeted by a "Stone Sundial" by Mr. H. W. Falliser, curiously planned in the form of a concave quatrefoil, with heads of monsters forming brackets under the projecting arms; an original but not very seductive work. Neither can we feel much pleased with Mr. Ashbee's "Writing Cabinet with Tooled Leather" next to it; the expanse of dull red leather has a heavy effect. Mr. Gimson's "Corner China Cabinet in English Oak," with its simple embroidery of inlay on the bars, is a nice bit of work, but for the cottage or kitchen rather than the drawing-room. A "Chair," designed by a guild of four designers, seems rather a small matter

to have occupied the resources of four designers; but it has original character. Mr. Bultitude's "Writing Cabinet," with no very marked character, has qualities of gracefulness and good finish. A "Writing Cabinet" by Mr. Gimson, with the same flat character and absence of mouldings as his exhibit in the octagon room, is, like that, a good piece of work, but one of those that are rather spoiled by the commonplace hanging handles already referred to. Then we come to a more important work, an "Inlaid Sideboard" by Mr. Lethaby, with an elaborate inlay of conventional floral forms on the front of the drawers, and which is distinguished by having sensible and workmanlike brass handles, convenient to the hand and agreeable at the same time in design. Whether the inlaid round spots on the legs of this piece of furniture are any improvement to its appearance may be questioned. Among the objects arranged on it are an excellently designed metal tea-set by Mr. Beuson, almost devoid of ornament, producing its effect solely by fine line; and two charming earthenware bowls of Mr. Lethaby's design, made by Messrs. Wedgwood & Sons. Mr. G. L. Morris's "Clothes Press in Mahogany" is a refined and highly-finished piece of plain work, a little spoiled by the four square blue stones placed rhomboid-wise in the middle of the circular panels; they seem to have no relation whatever to the rest of the design. Two oak chairs designed by Mr. Daltou point the moral that it is a mistake to be too architectural in furniture forms; the columns and arcades which adorn each are not wooden forms, and are out of place. The "Oak Wardrobe" by Mr. G. Ogilvie rather suggests the idea of being formed on Louis Quizeze lines with the ornament left out; it is not a bad-looking thing, but the two semicircular gablets which crown it are rather a deception, having nothing behind them, and look better in front than when seen edgewise. Mr. Ashbee's "Oak Armchair with Inlay" is a good piece of plain but characteristic wooden structure, contrasting in this sense with the architecturally decorated chairs before referred to. Mr. Penty's "Dresser" and "Cabinet of Drawers," both very plain work, would have been a good deal better for the omission of the commonplace and not very well cut ornament which runs along their top edges, and which was not worth doing at all if it were not done better than that. On the dresser are some delicate and charming painted China plates designed by Mr. A. Powell, and made by Messrs. Wedgwood. Mr. Lethaby's "Painted Dresser" is a curious piece of work; a plain unmoulded erection with square thick legs, entirely painted over with conventional foliage in predominating green tones, the whole of the table top even being covered with a small-scale conventional scroll work in green, not quite so well designed as it might be—there are some bad broken-backed curves in it. It is certainly something new, and looks attractive at present, though we should think its style much better suited for a bedroom washstand than for a dresser in the usual sense of the word; the drawback is that with any kind of daily usage the painted ornament would soon become more or less rubbed

and defaced, and it would then look a rather unhappy object. Mr. F. C. Eden's "Ebony Cabinet" repeats the device before mentioned in another cabinet front, of the semicircular gablet finish at the top; but in this case the semicircular section is carried to the back of the cabinet, and thus the shape of the front really represents the construction. On another occasion we will consider some of the more purely decorative and less constructional work exhibited.

TECHNICAL SCHOOLS AND THE CO-OPERATION OF EMPLOYERS.

ONE of the main difficulties in regard to technical education is the problem of education and employment; in other words, how to enable a young man to combine education with breadwinning, or, at any rate, with the means of breadwinning at a comparatively early age. We have all heard how in the Scotch Universities the sons of farmers would study there for one period of the year, and work on the parental land for another, and how American students have been found as waiters in a restaurant during a large part of the year. These are primitive methods; but the stories, true or not, indicate a very practical difficulty, which, if it can be overcome, will assist greatly in the satisfactory technical education of those who are to spend their lives in the engineering and kindred professions. It is because it exhibits the union of practical technical work with theoretical technical education that a small publication now being issued by the Association of Technical Institutions is so valuable.* The result of the inquiry held by this association appears to show that it is quite possible for young men to obtain precept and practice contemporaneously, provided that employers will go a little out of the ordinary groove to enable technical students to be workers in the shop.

But it is clear that without the goodwill and the co-operation of employers this desirable union of theory and practice is impossible, and those employers and firms who are pioneers in the new movement are, we have no doubt, acting in an enlightened manner and on sound lines.

The Report of the Institution states that the trades to which the scheme of co-operation applies are chiefly those connected with engineering, or to some extent with building. It will be useful to give some examples of the manner of co-operation. At Leicester, for instance, apprentices in the building trade are sent for one afternoon a week by employers to the technical school in that town, and apprentices to house painters for one full day a week during the months of November, December, January and February. Here we have co-operation in a slight and rudimentary state. If we go north to Glasgow, we find a very different state of things, which has resulted in the employment of Glasgow engineers all over the world. "The 'sandwich' scheme for the training of engineering day students has been in

operation for many years, and the whole curriculum of day classes for engineers is based on the assumption that in the case of nearly all students the winter session of twenty-five teaching weeks will be followed by service in works during summer. Hitherto the students have been able to gain admission to works during the summer without difficulty, although no formal arrangement has existed between the college and employers." Here we have co-operation on a broad and simple plan, and it is on the basis of this plan that the difficulties of the problem may, at any rate, be partially solved.

A modified but apparently satisfactory plan is that to be seen in connexion with the Barrow-in-Furness Technical School. In this town are the works of the famous firm of Vickers, Sons, & Maxim, Ltd., 720 of whose apprentices attend the technical school. This is what the Report says of the interesting state of co-operation between this great firm and this school. It appears to show plainly that this question of co-operation has passed out of the experimental stage:—

"All apprentice lads are advised to become students at the local technical classes, and, providing satisfactory evidence is given that attendance of not less than two nights per week has been carried out through the session, such apprentices may, as vacancies arise, compete for entry into the drawing offices."

During the session apprentices attending recognised technical classes will be allowed to commence work at 7 a.m., in place of 6 a.m., on the morning following a class attendance, up to but not in excess of three per week. The principal of the technical classes will make a return of attendance, and any violation of this counts as lost time.

A course of classes extending over four years is suggested, and in order to encourage attendance at the classes the firm is prepared to make increased allowances to apprentices for successes in these or allied technical subjects, provided that they have attended the classes regularly so as to obtain the parliamentary grant, on the following scale:—

	2nd class.	1st class.
	Per week	Per week
Extra pay for each subject passed in 1st year's course	3d.	to 6d.
Extra pay for each subject passed in 2nd year's course	3d.	to 6d.
Extra pay for each subject passed in 3rd year's course	3d.	to 6d.
Extra pay for each subject passed in 4th year's course	3d.	to 6d.

The total number of subjects for which payment is claimed is not to exceed four for any one year.

Apprentices who furnish satisfactory evidence that they have pursued a course of study during the term of their apprenticeship may receive permission to attend a technical college, the time spent at college counting towards the completion of their apprenticeship, on condition that at the close of the college course the apprentice will, if required, agree to serve the firm for a period equivalent to that of the college course, the rate of pay being determined by the value assessed for the service, but being in no case less than:—

For any period under 21 years of age, 20s. per week.
For any period under 22 years of age, 25s. per week.
For any period over 22 years of age, 30s. per week.

The firm undertakes to give such apprentices employment during college vacation at rates of pay corresponding to their year of service, counting such as continuous.

The firm is desirous of giving encouragement to apprentices to attend at a technical college, and points out that facilities exist by which prizes or scholarships may be earned, enabling the student to follow such a course without heavy financial strain on his resources.

The firm will at all times be prepared to favourably consider any modification in the above scheme that will be of assistance in bringing about this result; and, further, that so far as particular conditions appertaining thereto will permit, preference will be given to lads possessing technical training in making appointments of trust in the works. This must not, however, be taken to act to the exclusion of any person who is, in the opinion of the firm, fitted for promotion."

* "Report of an Enquiry as to the Co-operation of Employers and Technical Institutions." Issued by the Association, December, 1905. (London: St. Bride's Press, Ltd., New-street-hill, Shoe-lane, E.C.)

If so satisfactory a state of things is found at Barrow-in-Furness, it is clear that, allowing for the different circumstances of other trades and other places, this plan of co-operation is capable of extension all over England. At present but an infinitesimal number of employers interest themselves in the technical instruction of their workers. But the useful Report which is before us shows that an intelligent and enterprising, if small, minority in different parts of England is awake to the necessity of improving the technical education of the country by means of educational and business co-operation. It may be, in the words of the Report, that "the question of the co-operation of employers is the question of the hour in technical instruction"; it is certain, at any rate, that it is a question of vital importance. We hope, therefore, that this Report will be carefully studied by employers all over the country, for, after all, it is primarily their interest to have workers as well educated in technical matters as possible, and when employers and technical institutions generally co-operate for the same end one great educational problem will be nearly solved.

NOTES.

VENDORS and purchasers of house property should note the case of *Carlsh v. Salt*. The action was brought by the purchaser to recover the deposit and the expenses he had incurred in investigating the title. The premises were freehold, but were in a tumbledown condition, and were shortly likely to be rebuilt. The contract for sale was an open contract and was entered into on October 12, 1904. On November 12th, 1903, a party wall notice under the London Building Act had been served upon the vendor, and on October 10, 1904, the usual award had been made rendering the owners liable to pay a certain portion of the costs of rebuilding the party wall. The purchaser was not informed of this liability when he entered into the contract, and when it came to his notice he claimed compensation, and the vendors subsequently treated the contract as abandoned, retaining the deposit. The Court held that the party wall notice and the award constituted a material fact in the knowledge of the vendor which the purchaser could not be expected to discover for himself, and as such amounted to a latent defect in the title; and the plaintiff recovered his deposit as well as the expenses incurred in investigating the title and the costs of the action. This case has a very important bearing upon the sale of property. As we have frequently shown, liabilities may attach to house property, as, for instance, for street improvement, some time before payment is required; such liabilities cannot be discovered by an examination of the title, however careful, and a purchaser, unless he is informed, may find himself saddled with wholly unexpected liabilities.

THE case of *Wandsworth Borough Council v. Baines* is one of considerable importance to householders in London.

The Borough Council, wishing to institute a daily system of removal of house refuse, had served the respondent with a notice that he must cause the refuse to be placed in a movable receptacle at the edge of the kerbstone or footpath in front of his house. The notice had been given pursuant to a by-law made under sect. 16 of the Public Health (London) Act, 1891, and applied to a considerable area. The respondent occupied a house approached by a carriage-drive and distant some 40 ft. from the highway, and he refused to comply with the notice, and as the Council then neglected to collect the house refuse he proceeded against them under sect. 30 of the same Act. The case involved considerable legal argument, in which it was contended that the by-law was *ultra vires*, but the point decided seems simply to have been that the notice served on the respondent went beyond the by-law. The by-law prescribes that the refuse shall be placed on the kerbstone or the edge of the footpath, "or in a conveniently accessible position on the premises." In this case there was such a conveniently accessible position on the premises, and the householder was willing to place his refuse there, so the Court held that the proceedings against the Council must succeed, and they had without reasonable cause failed to perform the duty cast upon them to remove the dust. The larger question, assuming there to be no convenient place on the premises, as to whether by-law a specified householder can be compelled to have the refuse placed in the public street remains undecided.

THE Board of Trade Report has now been published on the collision which occurred on the District Railway in November last near Mill Hill Park station. On this part of the line the signals are operated on the electro-pneumatic system, and the passage of a train into and out of any locked section automatically places the intermediate signal at "danger" and at "safety," respectively. The signals are fitted with a train-stop apparatus, which, when a signal is at "danger," makes contact with a trigger on the train, thereby opening the valve of the continuous brake, and bringing the train to a standstill. From the evidence given at the inquiry it seems probable that the signal near the site of the collision was at danger when the Ealing train passed it. Major Pringle, the Board of Trade inspector, considers it to be proved that this was the case a few minutes after the collision. Thus a matter for explanation is why the brake trigger on the leading coach was not operated by the train-stop. The trigger actually struck the stop, but the movement given thereby was not sufficient to open fully the brake-valve. One of the railway officials suggested as a reason for this failure that the trigger mechanism had become twisted or otherwise disorganised—a tendency that is inseparable from most automatic arrangements. It is extremely important that automatic railway signals should be absolutely reliable, otherwise the employment of fogmen and ordinary fog signals can scarcely be dispensed with in the interests

of public safety. The railway authorities are doubtless alive to the importance of this point, and we have reason for believing that they are already taking steps to remove the defects brought to light by the Ealing accident.

Iron Roofs and Iron Ships.

THE disadvantage that sometimes attends the use of similes is illustrated by one employed by Sir Benjamin Baker in the evidence given last week at the Coroner's inquiry into the Charing Cross accident. Sir Benjamin then made the incidental remark that, as regarded rust and stresses, the Charing Cross roof was in a safer condition than half the Atlantic steamers. This expression has been taken by some as a suggestion that such steamers were unsafe, an inference which, of course, was never intended to be drawn. Sir Benjamin Baker has now found it necessary to write a letter to the *Times* explaining that he merely meant that, although perfectly safe, most steamers were probably more pitted with rust, and were at the same time subject to higher calculated stresses per square inch on the metal than was the Charing Cross roof. In our opinion it is quite inappropriate to institute any comparisons between a roof and a steamship, for not only are the types of construction entirely different, but the forces to which the two classes of structure are exposed differ most materially, and the risks to which a steamship is exposed are in every way greater and more trying than those occurring in the case of a roof.

Modern Surveying Instruments.

DURING the year 1887 Mr. A. T. Walmisley described in a "Student's Column" series in the *Builder* all the best-known surveying instruments that were available at the time the articles were written. Since that date various new instruments have been introduced which are fully dealt with in a paper read by Mr. Walmisley on Monday last before the Surveyors' Institution, and of which an abstract appears in our present issue. Many of these new instruments are extremely ingenious, and are particularly adapted for use in the Colonies and other countries, but they are less serviceable in Great Britain, because, although capable of effecting great savings of time, the results obtained by their use do not come within measurable distance of those furnished by the familiar and well-tried instruments—the chain, the level, and the theodolite. In preliminary and approximate surveys of extensive regions where land is of little value, and where errors of a few yards, or even hundreds of yards, are not of great importance, much advantage is to be obtained by some of the special appliances described by Mr. Walmisley. On the other hand, in a country like Great Britain, and especially in large cities, where land is divided up into small parcels and is of relatively high value, the utmost possible degree of accuracy is essential, and it is necessary that measurements should be correct within a few inches. This point is one that is well worth remembering, and its importance is duly emphasised in the admirable and exhaustive paper to which we refer.

By-laws and Dust Removal.

The Lincoln Tramways. We find that we were misinformed in saying, in our "Note" of last week on "Surface Contact Traction," that "we understand the new electric tramways in Lincoln will be run on the Kingsland system." They are to be on the Griffiths-Bedell ("G.B.") system. The correction does not affect our argument as to the financial risks involved in expending large sums of money on the track of electric traction systems.

The Resurrection Sculpture, Wells. Mr. ST. JOHN HOPE writes to us, in reference to a parenthesis in our leading article of last week, to know on what grounds we are convinced that the resurrection sculptures at Wells are by foreign artists. We reply, on sculptural grounds. We know of nothing in English mediæval art in any way resembling this work, and no indication that English sculptors of the period had anything like the power of modelling the nude figure which is evident in this series of figures (if we make allowance for the action of the weather); and we speak from close examination of the work when a scaffold was up. We are quite aware that Mr. Hope and other archaeologists are prepared with reasons for maintaining that these are English, but sculptural reasons are more powerful than archaeological. All the archaeologists in the world will not persuade us that these works are done by the same class of men who carved the stiff and unnatural (though highly decorative) draped figures in the lower portion of the façade.

Hellenic Society. On Tuesday afternoon, at the meeting of the Hellenic Society, at the Society of Antiquaries' rooms, Mr. W. C. F. Anderson gave an interesting lecture on the subject of "Greek and Roman ships with Multiple Banks." The lecture was ostensibly a reply to one given last year on the same subject, in which it was maintained that the idea of the existence of ships with banks of oars one above another was a mistake, due to a misreading of references in Greek and Latin literature; that it was impossible and unworkable, and that the meaning of "biremes," "triremes," etc., was to be read to refer to the number of men at each oar. We considered this to be an exceedingly far-fetched idea; and the quotations which Mr. Anderson gave from various authors (which were photographed as lantern slides, so as to be more easily followed), and his exposition of them, went to confirm us in our previous opinion that the generally received idea of the Greek and Roman galleys having banks of oars one above the other is the most natural interpretation of most of the passages in ancient authors bearing on the subject, and that there was nothing impossible in it at all, though we may admit that it seems a somewhat clumsy way of propelling ships, and was rather calculated to ensure power than speed. There seems to be at present, however, rather an inclination to set the face against this interpretation, even in the teeth of what seems very obvious evidence. Mr. Anderson exhibited a photograph of one somewhat crude representation of a galley (we did

not gather whether it was from a coin or a carving), where the two tiers of oars were shown so manifestly that one might have thought it conclusive, and the meeting was rather startled to hear one eminent Hellenist assert that it was only a conventional method of representing that the ship had oars on both sides, to show them both on one side; an explanation certainly more far-fetched than anything that has been urged in favour of what we may perhaps call the popular view. The same member was of opinion that three banks of oars would always be in collision, as the shorter and longer ones would not row at the same speed; but he was reminded that they could always keep time if ordered and directed (as they probably were) by music or some other form of signal. On the whole our decided opinion is that the *triremes* carry the day, and we shall continue to believe in them. The suggestion was made that some wealthy man should be invited to bear the cost of building a restored *trireme*, full size, as a practical test of the problem; which would certainly be an interesting though costly experiment. At the commencement of the meeting Professor Percy Gardner, who was elected provisional President, read a short memorial address in honour of the memory of the Society's late distinguished and lamented President, Sir Richard Jebb.

The President's "At Home." THE smoking "At Home" given by the President of the Institute of Architects on Monday was as well attended as these functions always are. A small but interesting collection of working drawings was hung on the walls, lent by Professor Pite, Sir Aston Webb, Mr. Flockhart, Mr. R. Blomfield, Mr. Ernest George, and two or three others; and in the Old Council Room was a special collection of working drawings of the Cardiff Municipal Buildings, by Messrs. Lanchester & Rickards. In the same room was arranged on the table a very interesting collection of medals of various kinds, some portraits and some including representations of buildings; these are the property of the Institute, but had been almost forgotten, and it was a good deed to bring them to light again. In the meeting-room also was to be seen a collection of casts from ivory sculpture, which had been presented by some one (we could not learn who) to the Institute at some former time; these also were new to the members. One hopes that there may be yet more hidden treasures in the archives of the Institute, to be produced at future meetings of the same kind.

The Wrath of Professor Goodyear. NOT content with circulating a pamphlet against us among English architects, Professor Goodyear has filled whole pages of an American architectural journal with a new edition of his diatribes, in which he has chosen, instead of referring to the *Builder*, to attack by name the person whom he assumes to have been the author of the offending article, a proceeding which we can only characterise as a most unwarrantable impertinence. What would people in England think of a writer who replied to a leading article in

the *Times* by a personal attack on Mr. Buckle? We have of course long been aware, from former experience, that an American critic is always right, and that it is presumption for any Englishman to question his conclusions; but we never saw such a rampant demonstration of it as in this case. No one, we think, could say that our article entitled "The Glamour of Crooked Building" was in any point either offensive or ill-natured, but Professor Goodyear seems to have been so aggrieved at our declining to take him seriously that he has not only lost his temper but ignored the rights of anonymous journalism, and presents the singular spectacle of a man filling pages with violent writing in reply to a critic who he says all the while is beneath his notice. Reasonable persons will, we think, conclude that a writer who spends all this trouble in denunciation of his critic has probably felt himself to be rather hard hit.

The Leicester Galleries. THREE new collections are now on view at the Leicester Galleries, the most important of which is that of the one hundred drawings and sketches by Millet which were the property of the late Mr. Forbes. A good many of these are very slight, memoranda for figures or compositions rather than drawings; but there are others which are fine examples of Millet's work in black and white. The most interesting of all is the beautiful pastel in monochrome showing a later edition of the "Angelus" (82), in which the effect is that of dawn instead of the evening effect shown in the painting; in other respects the composition is the same. Among the larger drawings is the fine and energetic "Départ pour les Champs" (71), known through publication, in which the eager stride of the man, as if no time were to be lost, is a kind of summary, almost pathetic, of the burden of daily toil. In some of the drawings, such as "Une Paysanne gardant sa Vache" (84), Millet's care in the arrangement of his lights and darks is illustrated. There are some fine landscape sketches. "Les Falaises: Environs de Greville" (16) is a remarkable example of bold broad sketching of just the facts of a scene; others, such as "Les Ramasseurs de Varech" (61), are powerful studies of landscape effect. As examples of composition two are especially noticeable—the arrangement of the two figures in "La Leçon de Tricot" (54), and the whole composition of "La Bergère" (62), with its high back and mass of trees overshadowing the figure, contrasted with the clear light on the left; it is characteristic that the only weak point in the drawing is the commonplace and rather hastily indicated face of the shepherdess: Millet made no attempt to idealise his rustics, but the composition was worth a better figure than this. Among the most poetically suggestive of the drawings is "Le Soir" (67), an interior with two figures of seated women facing each other, one with her back to the spectator; it is very little made out, but perhaps all the more suggestive on that account. In the adjoining room a collection of water-colours by Mr. Lee Haukey, under title "Idylls of the Country," deals with a

class of subjects akin to those of Millet, and in a somewhat similar spirit. The pictures show a good many repetitions of the same *motif*—mother and infant variously posed, and the style of execution is rather too indefinite for our liking—a sponge seems to have gone over them all; but there are fine qualities both of feeling, composition, and colour in many of them; and the one on the largest scale, "We've been in the Meadows all Day" (33), is the best of all; there is a complete harmony both of colour and composition in it, and the mother's face is very beautiful, which cannot be said of many of the faces in other drawings. The little one called "The Meadow Farm" (47), however, where a girl in the foreground leans her back against a fence, is a bit of pure beauty. There are also some fine little landscape studies, of which the heath scene entitled "Stormy Weather" (65) is the best, and is a work of great power. The third element in the galleries is a small but very interesting collection of French illustrated books of the XVIIIth century, arranged in cases in the ante-room.

ROYAL ACADEMY LECTURES.

At his second lecture on "Drawing," given at the Royal Academy on Thursday, the 11th, Mr. Clausen commenced by showing the slides which he had been unable to show at the first lecture for want of a lantern. The first was from a small drawing by Van Eyck for a picture of the Virgin seated in a landscape, with a great amount of background detail, and he drew attention to the care and minuteness with which all this detail was drawn out, in what was nevertheless only a preliminary study. Durer's study for the hands and arms of his "Adam" showed the same minute care, especially in the three repeated studies for the hands. A head by Durer illustrated what might be called the German manner in drawing, which was felt at once on looking at the drawing, though it might be difficult to define in what precise details this manner consisted. A composition by Breughel, "The Blind Leading the Blind," was shown as an illustration of the German angularity in the lines of the draperies. An early study by Millais, for an idea for "The Flood," an indoor group with one figure at a window looking out, was adduced as a very fine example of drawing, equal to anything of the same kind among the drawings of the Dutch masters. Masaccio's drawing of his well-known subject of Adam and Eve leaving Paradise followed; an example of figure-drawing which had hardly been surpassed since. The same painter's head of an old man was an example of precision in drawing and certainty in definition of features. A nude outline study by Raphael followed, and then a figure by Michelangelo (from the picture of the Bathers, if we remember right); a fine nude study by Stevens, and a drawing by Millet of a youth lying on the bank at the edge of a stream completed the series. [This last must have been an early work of Millet's, as he never drew nude figures after his first period.]

Mr. Clausen then said that in this lecture he wished to speak of drawing not so much as recording actual forms, but as recording the effect of form under special lights. This development of drawing from mere record of forms to a record of effect corresponded with the development of painting. The painters of the full Renaissance period had a wider range than their predecessors. With them a figure was not a single problem; each figure took its place in a general scheme of light and colour (which thus also included landscape). This advanced style showed not perhaps deeper insight into nature than was shown in earlier drawing, but a wider sympathy; the artists were interested in more things than the personages they represented. As examples of this he proposed to speak more particularly of the works of Watteau,

Claude, and Rembrandt. Watteau was not so definite in regard to effect as Claude or Rembrandt; he, like Rubens, was on the borderland between the two styles, combining in some degree the elements both of personal interest and of general effect. Claude was not only careful in his definition, but also in effect, arrangement, and lighting. Among illustrations of this more developed school of drawing he commenced by showing a landscape of Titian's, in which the effect of light and shadow in modelling the landscape was illustrated. A sketch of a bear hunt, by Rubens, showed the care which he took in placing his masses of light and dark; the dark horseman against the light ground on the right, the light figure against a dark background on the left. A head by Vandyck was shown as a fine example of the drawing of form only. In Watteau the influence both of Rubens and of the Venetians could be very plainly traced in his colour and freedom of movement, though with a difference—with little graces of manner in his figures which were peculiar to himself and which Millet did not like ("mariottes," he called Watteau's figures). A nude study by Watteau which was shown conveyed a strong sense of the influence of Rubens. Two studies of a man with a guitar, and another study of four figures, showed Watteau in his more usual style; and in the indications of the costume here, and in another study of a mother and child, they could see how the lines and shadows of the drapery represented effectively not what actually was there, but what appeared to the eye, and were treated so as sufficiently to indicate the form beneath. A particularly fine and characteristic drawing which followed this was one representing a figure seated on the ground with the back to the spectator. A landscape of Gainsborough's followed; Mr. Clausen remarking that it was undoubtedly very conventional, as were all Gainsborough's landscapes, but that it showed a very effective arrangement of lights and darks. In regard to Claude, it might be said that he appeared a greater artist in his numerous drawings and studies than in his finished paintings. He had a remarkable power of showing the effect of the sun in a clear sky, and also the receding planes of a wide prospect. In these respects he had never been surpassed, but his finished landscapes had too much the effect of a methodical planning, a look of being "composed," and the classic figures in his foregrounds added to this conventional effect. Conventional landscape of this kind was a thing one got rather tired of. But his drawings of trees and temples were not only prettily arranged, they were real and delightful studies from nature, more attractive than the finished landscapes with the mythical figures. These latter were in the taste of the time; mere landscape as an object for its own sake had hardly been thought of then. The criticism which had been made that he could not draw trees was true of the conventional Claude of the pictures, but not true of the Claude of the drawings. Several slides of Claude's drawings were then shown; a portrait of a tree, obviously a genuine study from nature. Of one showing a hedge, trees, and a river the lecturer remarked that it was a kind of drawing which seemed to suggest the origin of Corot. One showing a half-buried Roman triumphal arch in a tree-less landscape was remarkable for the power of treatment of the foreground. It was Claude's practice in his studies of landscape to make a careful outline and then arrange tints on it. Sketches from nature by the old masters were rarely in colour, and were not coloured after nature; but the balance of light and shade was from nature. It was on record that Claude did occasionally paint a picture entirely from nature, but no such work by him was known to be in existence; and apparently he did not search so much for exact truth of colour as for truth of light and shade. Only one of Claude's known drawings was altogether in colour. Turner's early landscape studies were all in outline, and tinted afterwards; but later he sketched from nature in colours. In modern landscape we were more true in detail of colour, but there was the danger, in seeking that side of the truth, of losing the grasp of the scene as a whole. It was exceedingly difficult to combine success in both points—in truth of detail and in the

grasp of the whole; perhaps Turner came nearer to it than anyone else; but in general it would be found that something must be given up on one side or the other.

Rembrandt's great power lay in his sense of the gradation of light and shadow, and in the human sympathy and dramatic insight which characterised his compositions.

In Keene's black and white drawings we found great care taken to indicate the line or form which shadows took. Phil May's accent in his drawings was determined by line, Keene's was determined by shadow. In Rembrandt's pen-sketches of landscape it would be found that a finer pen was used for filling in the distance. A drawing of Rembrandt's was shown which, with very little work on it, conveyed admirably the effect of a winter scene; also a fine drawing showing the effect of a mass of trees giving a concentrated dark in one portion of the composition. But any method was good as long as nature was followed intelligently. The best method perhaps was to draw in lines first and fill in the light and shade afterwards. In Madox Brown's "The Last of England" they had an example of a picture that was intensified by the separate study of each detail; there was no losing or finding in it. Rembrandt's drawing of "The Shepherds" was an effect got by quite opposite means. The one was like a story told; the second a suggestion—vague but full of human sympathy. Ingres was the opposite of this; he showed the utmost beauty of form; the scientific side of the artist's work evinced by skill in drawing; but we did not trouble ourselves much as to what his beautifully drawn figures were doing, and his pictures could not be said to be interesting. Ingres represented the scientific side of art, Rembrandt the emotional side. Such differences occurred because art was a personal expression. Two scientific men at opposite sides of the world would work out the same problem in the same way; but two artists might treat the same problem quite differently. The Ingres school was too perfect in execution in comparison with the thought expressed; Rembrandt, the man who had something to say, affected us more, even if he worked with less perfection of method. Different aims, however, might each be true in their own way; no one could claim that his alone were true. "Truth to nature" was indeed a phrase often very loosely used; we could not well define in what it consisted. The great thing was for each to best use his own means to attain it in his own way.

Mr. Clausen's third lecture, on "Quality in Colour," which was delivered on Monday, was unillustrated, there being as yet no means of representing colour design by the lantern. He commenced by observing that when we saw an engraving or a photograph of a painting we often found that we got quite a different impression from that which the original picture gave when we came to see it. A work might be effective in black and white, but not in painting, since this depended on the effect of the colour; and colour was a thing full of mysteries. The colours might not be actually those which they stood for in the picture; that, for instance, which had the effect of white in the picture might not be really white, but only something which appeared so in relation to the other colours. That was a question of what was called "value." "Quality" was a different element, which depended mainly on the way in which the colour was put on. If the same composition were painted by two different persons, we might find one looking heavy and dull, the other bright and attractive, though the same pigments had been used; in the latter the colour had been clearly laid on, not churned and muddled; and this was the characteristic of colouring in the finest works. But a picture might have fine quality in colour and yet not be harmonious, harmony consisting in the right colour relation of the various parts; and it might be harmonious as a whole without good quality in parts. In the early Victorian days it was thought that quality was the principal thing to aim at, and there were consequently many works painted at that time of which the quality was excellent, but which showed no true harmony of colour. The existence of good quality was a proof that the artist, in a sense, knew his business—understood how to lay colour on. But what had preserved the reputation of the greatest treasures of art was, more than

anything else, harmony of colour, which appealed to us more strongly than accuracy in drawing. The works of Ingres, Schaeffer, and Gérôme, were all admirably drawn, yet they failed to retain our sympathy on account of their poor colour, and could not stand against the work of Delacroix and Bonington. Manet's drawing was often bad, but he had the feeling for colour which made his work effective. Velasquez was one of the few who had succeeded in combining fine quality of colour with draughtsmanship.

It had been said that "Time and varnish were the greatest of the old masters"; but it was a shallow saying, for nothing could ever make a bad picture into a good one. Varnish might have imparted a certain richness of tone in some cases, but the colour must have been good to begin with. In Crivelli's altarpiece in the National Gallery the figures were as fresh now as when painted; the quality of the paint was beautiful; this had never been varnished, and varnish would only spoil it. The same point would come out in comparing H. Morland's work in the National Gallery with that of Hogarth and other great painters of the period, in the same room; these latter, though darker in parts than H. Morland's work, were brighter and more brilliant in general effect.

Fresco, tempera, and oil had each their special qualities. Oil was the most supple medium, because it could be used in three ways, either as transparent colour, as opaque colour, or as a mingling of the two methods; and in fact most of the greatest works in oil painting had been laid out in this mixture of methods. Consequently, oil paintings were much more various in effect than fresco or tempera painting. Fresco had a far less range of possible colour. On the other hand it had a beauty of surface of its own, arising from the granulation of the plaster into which it was painted, which reflected more light than an oil painting, producing also minute lights and shadows all over the surface which gave it a kind of grey lustre, and assisted to harmonise the colours. A somewhat similar effect was produced from the ground in a tempera painting, and might even be produced in oil when painted thinly so as to show the inequalities of the ground; but varnish filled up the cavities and destroyed this effect. In fresco no alterations could be made; and in tempera, though it was possible to make alterations which did not show as such at the time, they unfortunately showed up at a later period. This could be noticed in Piero di Cosimo's "Procris" in the National Gallery, where there had been a correction made in one of the hands, in consequence of which the colour was muddy there in comparison with the rest of the picture.

As a piece of fine and beautiful colour not often noticed he would mention the landscape background of Michelangelo's unfinished painting of "The Entombment," a bit of thin colouring laid over a white ground, which had all the clear bright effect of real sky.

The painter's method in many early works was the reverse of ours; the lights were transparent and the darks loaded with colour, as they might see in the works of Bellini and other early Italian painters. In modern painting it was more the custom to paint the lights in solid colour, and in fact it was this power of body light which gave oil painting the victory over tempera.

Painting a picture straight off with all the colour laid on at once as it was intended finally to appear, which was done not infrequently in old work, implied a most perfect command of the means employed. No one could do it now; the required balance was obtained by slow degrees and repainting. The old painters were ignorant of many things that we had been obliged to learn; but nevertheless those who could paint a picture with the desired effect straight off, and without retouching, might truly be called great masters. Such examples showed the advantage, no doubt, of knowing exactly what one was going to do, but the problems were simpler; we were more difficult to satisfy now. In the sleeve of the portrait by Titian, said to be that of Ariosto, they had there dark colour, yet it was full of light; in all probability it was painted thinly over a white ground; a process which Titian seemed able to carry out without the risk

of a mistake. In Titian's later works the colour was very simple throughout, laid on in large masses of red, blue, etc.; generally a thin colour over a light ground. If he had to make alterations in any portion of a work it would seem that he erased it down to the ground and built it up afresh. Watts, on the other hand, when he had to make an alteration, painted in a figure, or whatever was required, in a strong black and white monochrome, and then coloured over that, the original work being entirely hidden. Titian's quality in colour was always fine, but to this he joined the element of harmony also, especially in his manner of arranging his lights and darks; and this was the case also with Rembrandt. Though some of Rembrandt's works, single heads especially, were full of regradings and alterations, he at other times painted quite simply. The head of the old lady in the National Gallery was apparently painted straight off at one operation. Glazing and repainting served however practically to increase the range of colours.

Quality in colour was the outcome of perception and feeling rather than of any adherence to rule. To paint the apparent colour at once was good, if they could do it; but there were difficulties; the system would not accomplish everything. One must vary the kind of painting—transparent colour in one place, solid in another place—otherwise a certain monotony would result, as they could see in the works of Franz Hals, the picture now in Burlington House especially. There was a beautiful quality of colour in Watteau and Gainsborough. Watteau showed bits of solid bright colour contrasted with transparent darks. In the charm of lightness of touch Gainsborough was supreme; even Velasquez (if he might venture, to say so) looked a little heavy in comparison with Gainsborough. This had particularly struck him when the Venus by Velasquez had been hanging between two Gainsborough portraits at Messrs. Agnew's Gallery. No artist showed so much of the charm that comes from the sense of ease of execution; it was so clear, such a different kind of paint, one might say, from most other pictures. Many modern pictures got leathery in appearance through the practice of "oiling out," which had quite a different effect from that of mixing colours with oil. Solidly painted pictures, laid on over and over again, were generally heavy in appearance; though when the paint was laid on so thickly as to cause a certain degree of relief of surface, the effect of this would to some extent counteract the appearance of heaviness.*

Wilson, Romney, and Morland were all artists who painted solidly throughout, and their pictures had a rich fat surface. Hogarth's portraits had a somewhat heavy effect from over-painting, being worked over many times. Some of the old painters, as for example Canaletto and Claude, would paint in light thin colours over a dark ground. The result of this was that in process of time the light colour became more transparent and the dark ground showed through it. It was safest to paint equally solid throughout; in that case it was of no ultimate consequence whether the ground was dark or not. This clear and certain touch was one of the secrets of permanent painting; the less one did to the paint after it was on, the better paint it was.

It was eminently desirable for the artist to know exactly what he wanted. One of the best methods of study was one little practised now, viz., that of painting Still Life; flower subjects especially. There was no sense of effort in flowers, and their study was one of the best means to render the hand light and sensitive. Velasquez and Chardin were examples of painters whose work was free and not laboured; and perhaps the treatment of mere painting so as to make it beautiful and attractive in itself, independently of the subject treated, had never been carried further than by Claude.

In old pictures one often found the method of glazing done with warm colours over a thickly painted surface. Should we imitate this? He thought not, because it was a mistake to deliberately adopt another man's method which did not come naturally to ourselves. We could discern

* We might instance Dugre's powerful Landscape, "La Mare aux Oies," where the clouds are loaded on quite in relief, yet the picture could never be called heavy.—Ed.

this method in Reynolds, and could see how he made it serve his purpose, but it was not wise to take up and copy another man's experience ready made. Watts practised this method in his later works, but his early work was very straightforward in character. Velasquez, Vandyck, and De Hoogh were among the best models for method in painting—combined of course with the study of the effects of Nature.

THE SURVEYORS' INSTITUTION.

An ordinary general meeting of the Surveyors' Institution was held on Monday, at No. 12, Great George-street, S.W., Mr. C. Bidwell, President, in the chair.

Mr. Percival Currey, hon. secretary, announced that a number of donations had been made to the Library and Library Fund, and, on the motion of the Chairman, a hearty vote of thanks was accorded to the donors.

Modern Surveying Instruments.

Mr. A. T. Walmisley then read a paper on "Modern Surveying Instruments," in the course of which he said that, in 1887, a series of articles descriptive of the use and construction of the best-known instruments employed by surveyors formed the subject of the Student's Column in the *Builder*, and repetition of the explanatory matter in these articles was not, therefore, necessary. In his own experience, there was no survey so accurate as an ordinary chain survey properly triangulated, and the measurement of horizontal distances in levelling operations by the chain was a system unrivalled for correctness. Various ingenious devices had nevertheless been brought forward to attain, not only records of levels, but also horizontal measurements by optical instruments, and for giving greater simplicity of setting up during outdoor work, transport in the field, and other improvements calculated to aid speed, accuracy, and concise records, independently of these influences upon the question of price of an instrument. He proposed to draw attention to a few modern types of instruments with the view to remove the prejudice which exists against the adoption of such new forms as time economisers, where the accessories could be proved to be free from liability to derangement, and easily attached for use. A beginner should start with an instrument supplied by a good firm of manufacturers, although an experienced surveyor, who thoroughly understood the use of an instrument with which he had to work, might be well able to attain accuracy with a less perfect instrument. For a beginner, a 14-in. dumpy level, without the addition of a compass (which only increased the cost), and with comparatively heavy tripod legs for stability in the field, would undoubtedly prove the most suitable, but an experienced surveyor could work equally well with a 12-in. or even with a 10-in. telescope, supported upon lighter tripod legs.

In speaking of various forms of levels and their arrangements,* the author said that Mr. Blochins and Mr. Lyne Freeman connect the parallel plates of new instruments by vertical screws having a deep pitch, through which works a second screw, having a fine thread, and terminating in the locking plate; the fine threads work within the deep thread screw, and a small clamp is provided upon the upper plate for use if either one of the deep pitch screws should adjust too quickly for the attainment of a level bearing. When adapting this device to an existing instrument, a second set of parallel plates, connected by parallel plate screws having greater pitch than the existing screws of the instrument, were added. This additional set of parallel plates was attached to the tripod head, and the original set of parallel plates which carry the instrument were connected to this apparatus by a bush, the size of which was dependent upon the requirements of the instrument. The approximate level was first sought by use of the deep-pitch screws, and the final adjustment attained with the small-pitch screws. In a level made by Mr. Stanley, the centre was cast in hard gun-metal in one piece, with, and directly upon, the telescope body and object end, the cast telescope body being bored out to a suitable thickness so as to provide an instrument combining strength and rigidity, with reduction of weight, compared with

* See our issues, January to June, 1887.

the old form of tubular body, collars, and stage. This instrument was denominated the new Engineer's Level, and was fitted with clamp and tangent adjustment, tribrach levelling, and locking-plate, so that it could be used on a wall or masonry coping, as well as on the tripod.

In most modern dumpy levels stadia lines are now added in the diaphragm set to 1-100, so that in taking the readings, on a distant staff by means of these subtense lines, the surveyor reads every 1-100 foot (or metre) upon the staff as being equal to 1 ft. (or metre) of the distance from the centre of the instrument, adding to the reading a constant for any distance shown. This constant was usually given by the maker of the instrument, and could be checked experimentally by the surveyor.

In Brightmore's collimation adjustment for use in the telescope of a level, a sliding plate was attached at the back of the eyepiece, on the face of which cross hairs were stretched, the sliding plate being caused to move in a groove in the diaphragm by a screw pressed against its support by means of a spring. It was made by Messrs. Elliott Brothers, and could be fitted to theodolites for adjustment in one or two directions at right angles. The diaphragm might consist of (a) webs, (b) platinum iridium points, or (c) lines on glass. Mr. Stanley argued that the use of iridium points obviated the covering of the divisions on a level staff, but Messrs. Troughton & Simms, who had given considerable attention to the construction of optical instruments, adhered to the old form of spider-web diaphragms as preferable, both for reading an ordinary level staff or a special stadia rod. Messrs. Cooke & Sons also maintained the superiority of web diaphragms, except for reversible eye-pieces. The author then described a number of diagrams of instruments. Diagram No. 1 showed a 5-in. theodolite fitted with Ferguson's circles, which gave the semicircle divided into four parts, each octant being subdivided into 100 unequal parts by drawing lines through the centre of the circle through the octant arc to intersect 100 equal divisions of the tangent to the octant, so as to be read in percentage divisions of angular measurement on one half of the circle and in units of a degree upon the other half, thus converting the instrument into a telemeter.

Hoskold's form of transit theodolite was made by Messrs. John Davis & Son, of Derby. Except the bearings, bushes, and screws all possible parts are constructed in aluminium, and the telescope is fitted with a sensitive spirit level independent of the theodolite part. A plan of the instrument was shown, and a plan of a wall plate with clamping arrangements. In this form of transit theodolite, an extra large and sensitive hubble was also attached to the vertical circle. The micrometrical eye-piece reads to one second of arc. The sights above the telescope were removable. The internal vertical axis, which was screwed to the horizontal vernier circle, was made larger than usual, and, instead of being solid, was perforated for its entire length, and had a cylindrical form, the hole through it being about 1 in. in diameter. This axis works in another or exterior vertical axis which was screwed to the underside of the horizontal divided circle, and the axis revolves in a socket which forms the central part of the levelling apparatus. In order to avoid too much friction, the exterior parts of the two axes were, in two or three places, turned down below the general level. A corresponding hole to that in the central axis was made in the centre of the horizontal vernier circle in order to obtain a direct sight through the telescope and centre of the instrument down a shaft or central pier opening. The telescope could be raised through a sleeve or axis collar to clear a horizontal base, enabling standards to be constructed shorter than in most instruments, so as to contribute compactness to the instrument. Some instruments were made with covered limb and turn-up microscopes for protection in conveyance. The instrument was graduated upon silver to read to 15 secs., but had also a micrometrical eye-piece attached reading to single seconds of arc. The arrangement for taking small angular records enabled a subtense process to be adopted, which consists in setting up a rod, say, 20 ft. in length at any distance required

to be known, and measuring the angle between two metal discs, one placed at each end of the rod, and then by the application of trigonometrical calculations finding the distance required.

In Davis's traversing stand, designed for use with the Hoskold Civil and Mining Engineers' Transit Theodolite, when the telescope of that instrument was employed for sighting down vertical shafts, the frame supported by the legs was circular and 12 in. in diameter. This supported a tube across the centre, a corresponding tube, running parallel, being attached firmly to the circumference. Along these tubes a carrier traverses, to which was screwed the usual centring apparatus common to all theodolites. The theodolite was brought approximately over two points fixed at the pit bottom; it was then traversed on the stand, which allowed a movement of 6 in., and it could also be adjusted in any direction for about 1 in. by the centring motion. The centring motion was then clamped, the long traverse was also clamped, and the fine adjustment comes into operation, bringing the vertical spider line into coincidence with the two illuminated marks placed at the pit bottom. Mr. W. G. Bligh, M.Inst.C.E., introduced a vertical adjustable base, with the view of setting an instrument always at a fixed height above a peg, to attain which the instrument, instead of being screwed on to the top of a tripod, was attached to a thick hollow brass rod which, passed through a hollow socket formed in the head of the tripod. This rod, 18 in. in length, could be clamped at any desired height, and at its extremity hangs a chain to which was attached a brass disc, so that when the disc touched the top of the peg over which the instrument was set, the line of collimation in the telescope could be arranged to be some even number of feet or half feet above the level of the peg. Mr. Bligh had also introduced a simple alternative arrangement in which the instrument was mounted on a wooden post which was threaded through a large brass socket formed on the head of the tripod, the purpose of the tripod being to hold the post upright.

In Wells's Improved Theodolite, made by Messrs. Elliott Brothers, the principal advantages claimed were as follows:—1. A method of fixing the locking-plate, whereby the locking-screw was fixed on the outside, and was easy of access. 2. The winding of the plumb line on a drum through the centre of the instrument, providing an easy method of regulating the height of same, and by this means enabling a plumb bob to be used when the instrument was placed on a fixed stand at a minimum depth below it. 3. A new shifting centre which had two definite movements only, viz., a sliding and a rotary movement so as to obtain a wide range of action. The former was to be used when the plumb bob was lowered to the level of the station point, the distance from the same being measured, and the instrument moved a corresponding distance on a scale marked on both sides of the plates which hold in position the sliding-plate. The centre was then clamped with a locking-screw at the bottom of the shifting centre, and the instrument was then revolved on its true centre until the plumb bob comes over the station point. The distance from the station point to the plumb bob, when the instrument was at zero, was the radius of the circle described, so that when this radius was fixed the station point must be in the path of the periphery of the circle so described. The shifting centre being self-contained, was, when the instrument was once levelled, always level, no matter in what direction it was required to bring the plumb bob over the station point. This could be adapted to any ordinary theodolite without altering the main construction of that instrument.

Messrs. Cooke & Sons advocated Littlejohn's patent stand to provide combined centring and levelling arrangements. This could be easily fitted to an old 5-in. or 6-in. theodolite. Mr. Stanley's Dunbar-Scott auxiliary top and side telescope, being interchangeable with the top and side positions, and having the means provided to ensure perfect adjustment with the minimum of trouble, claimed to form a mining transit which would perform all requirements in mine surveying, and so need no correction for eccentricity. The auxiliary telescope was provided with a

centre that might be screwed to the threaded extension of either the transverse axis or the vertical pillars of the main telescope. In either position it was clamped firmly and ranged quickly into alignment with the main telescope by two opposing screws. The diaphragm of the auxiliary telescope had one web only, so placed that it was vertical when on top, and horizontal when at the side. The observation of steep horizontal angles was made with the auxiliary with the use of precipitous vertical angles with the auxiliary on the side. A counter-balance was provided which exactly balanced the auxiliary member, so as to obviate the effect of strain upon the instrument. In Stanley's new model transit theodolite the parts were not built up in separate pieces, but every possible casting was shaped out of the solid into the finished form. For convenience of packing, he (the author) personally preferred the old form of separation in the instrument box to the single type of complete instrument in one piece; but then "use is second nature," and he had been brought up in the old school, and accustomed to pack the telescope, the body of the instrument, and the parallel plates in separate pieces.

Surface levels could be expeditiously compared by the use of an aneroid. The surveying aneroid was held in the hand at a known height over a peg or bench mark, and the incidence of the needle upon the graduated scale of heights was read off on the vernier. Other readings taken in a similar manner over comparative levels to be recorded, due allowance being made for the diurnal wave and local barometrical changes during the time the operations were in hand. Precautions might be taken to neutralise such disturbances by using twin aneroids, two observers being necessary. The one remained stationary in a position as close to the day's operations as convenient, and had one of the aneroids upon a table before him, the reduced level of which was ascertained by connecting it with the incidence of the needle of the nearest peg on the traverse, the level of which was already recorded, and every succeeding half hour the observer read and booked the incidence of the needle on the graduated circle for future comparison with the aneroid used at the same time by the observer in the field. The range of the instruments need only be reduced within reasonable limits, as the result was approximate.

The principle of a tachometer and the effect of the addition of a fixed tube and stop-piece to a theodolite telescope was shown in Diagram O. Considering such an instrument as a transit theodolite with an extra lens added to the telescope to convert it into a telemeter, the use of an anallatic or conveying lens (6½ in. focal length to an object glass of 12 in. focal length) in a tachometer dispensed with the addition to every reading of what was called "the constant" of the instrument, which was always necessary in the case of theodolites merely provided with stadia lines to attain a similar object.

The principle which governed the action of the instrument dominated its construction. In order to overcome the loss of light occasioned by the introduction of the extra lens, the telescope of a tachometer was correspondingly larger than that of a theodolite, while at the same time eye-pieces of higher power were employed, which facilitated the reading of the stadia rod with ease and accuracy. The focal length of the anallatic lens depended in different instruments on the focus of the object glass and the distance the eye-pieces were required to measure. The eye-pieces were made to slide vertically across the eye-end by means of a rack and pinion movement, so as to obtain a better view of the outer pair of lines. A very small movement sufficed for this. The lines on the diaphragm were usually placed so as to provide a ratio of 1 in 50 between the outer pair, and 1 in 100, or 1 in 200, between the inner pair and the anallatic lens served to make these values constant for any distance. For very long distances an omnimeter permitted of greater accuracy than a tachometer, as the range of a tachometer was limited by the distinctive readings of the divisions recorded upon the vertical staff. It was necessary that the position of the anallatic lens with reference to that of the object glass of the telescope should be fixed and unvarying, and hence the adjust-

ment to focus was maintained at the eye-end of the telescope.

The Bell-Elliott tachometer had a powerful microscope permanently fixed at right angles to the telescope as in Eckhold's omnimeter, both the microscope and the telescope revolving upon the same axis. A special staff 10 ft. long accompanied the instrument, and this staff was fitted with two sighting cross-pieces, the lower one being preferably adjustable in vertical distance from the upper one. This tachometer formed a tangent reading instrument, the vertical height and the horizontal distance from the vertical axis of the instrument being calculated from the tangent of angles read upon the staff. The natural tangent of any such observed angle was read direct either from the drum scale or from the drum and tangent scales combined. Hence the use of tables in the field was not needed. The tangent scale could be moved backwards and forwards by means of the micrometer drum-head attached thereto, which in one revolution caused the tangent scale to move a definite number of parts of the radius determined from the axis of the instrument.

Mr. W. H. Wells, M. Inst. C. E., introduced into the diaphragm of a level a second horizontal cross-line, fixed either above or below the central cross-line used for collimation, at such distance therefrom as to bear a relative proportion to sights read through the telescope at a distance of 100 ft. apart. The vertical readings were taken upon the two cross-lines of the diaphragm so as to record the vertical space upon the staff at a distance of 100 ft. from the centre of the instrument. If the second cross-hair was so placed as to record one foot distance vertically on the staff, above or below that read by the centre cross-hair, then the proportion of vertical distance to horizontal distance was 1 in 100, and thus, by this simple contrivance other distances might be relatively arrived at.

Mr. Short's gradient telemeter level, supplied by Casella, also seeks to obtain linear distance gradients for railways, irrigation, drainage works, etc., by the aid of a level staff, without the use of a chain or tape, regardless of rough and broken ground or the intervention of a stream or other water between the observer's station and the distant object.

By the use of such instruments an immense amount of work might be saved in setting out the surface of land for width of slopes or hatters by pegs, over the ordinary system of pegging, by calculation with a theodolite, where each peg required a separate setting of the instrument. In taking cross-sections and all levelling on sloping, uneven ground, the saving of time and labour was also very great, and the work resulting therefrom was sufficiently accurate for trial sections and preliminary investigations.

In Sir George Leach's level a small telescope with a spirit tube on the top was pivoted off its centre towards the object-end on a thin brass circular plate with a weight under the centre to keep the instrument level laterally and the cross-hair horizontal. The level itself was actuated by a small fine-threaded screw directly under the telescope, working freely on the circular plate. The end of the pivot being spherical, and the plate circular, the telescope and level could be revolved in any direction. Adjusting screws were provided to place the level in accurate adjustment, and a levelling staff, rather over 8 ft. long (folding in half for convenient transport) accompanied the instrument.

Mr. Sheldon's suspension level, made in 1893, could be used for taking flying levels between two fixed points, by stretching a fishing-line or tin wire over a distance of about 100 lineal yds. in order that the level of one point might be transferred to another point. When the bubble was in the centre of its run in the centre of the suspended line the extremities of that line were at the same level, and when the ends of that line were at the same level the bubble of the instrument would be in the centre of its run in the centre of the suspended line.

Mr. Stanley had a combined mining dial, level, and theodolite, fitted with sliding stand and Hoffman head with clamp and tangent movement to the limb. The telescope was fitted with stadia points and a gimbal carriage, cranked in form, and

enabled the surveyor to read through the telescope at right angles in two directions.

Messrs. Adie (Westminster) had also brought out a combined level and theodolite. Used as a transit theodolite, the telescope was rendered steady by the attached vertical circle, but when used as a level a German clamp was introduced for the purpose. He did not advocate the adoption of combination instruments. They were very ingenious, but a surveyor generally had notes to make relating to external circumstances, besides recording angles and distances, and he did not need his attention to be distracted by clamp screws which were not required to be manipulated for the special object of the inquiry.

In reflecting hand levels the reflecting plate divided the vision half into a direct or through sight and half with the reflection of a bubble in a mirror. The same process formed the principle of Captain Abney's level. Sir Howard Grubb had sought to improve this arrangement by producing, with the aid of chemical deposition of a specially prepared film upon a plate of glass, a surface rendered capable of reflection, while simultaneously transmitting a large percentage of the light which fell upon it, so that two objects in different directions were presented to the eye of the surveyor either directly or through the object glass of an observing telescope.

In the Grubb miners' dial the object to be observed was viewed through a tube. The sight and object were virtually on the same plane; there was, therefore, no strain on the eyes due to focussing two or more objects at different distances. The eye need not be close to the sight nor in the centre of the sight, as there existed no parallax error in the Grubb instrument. The sight was readily illuminated underground, and might be preferably constructed of a short piece of rectangular brass tube, about $\frac{3}{4}$ in. square 3 in. long, open at both ends. About midway in this tube, fixed at an angle of 45 deg., was a plate of glass, coated with a semi-transparent and highly effective film, chemically deposited on its surface. At right angles to the square sight, and opposite to the reflector, a circular tube was fixed. At one end was a diaphragm coated with opaque material, through which were cut or photographed cross-lines, a star, a scale, or any other convenient device. At the base of this circular tube was an achromatic lens, to a focus suitable to the distance between the lens and diaphragm. This achromatic lens brought into parallelism the luminous rays from the markings on the diaphragm, which rays were bent at right angles by the reflector and directed into the eye of the observer, the result being that the rays from the diaphragm entered the eye under exactly the same conditions as if from the distant object, and the surveyor saw the image or sight-lines virtually superposed on the distant object—that was, at the same distance.

It was not claimed for the Howard Grubb system that it would displace the telescope in standard instruments, such as the theodolite and level, but such instruments were often used for work for which they were not suitable, and in which their accuracy, delicacy, weight, and size were a disadvantage. Portable instruments, such as the clinometer, Abney level, and Prismatic compass might be constructed with the Grubb sight and without complicating the effect of observation; the level angle of declination or direction might be simultaneously observed. The main feature of the Grubb sight was that it sought to eliminate errors due to parallax, as the rays of light entered the eye in parallel lines by the aid of the pair of convex lens introduced in the construction. The demerits of the prismatic compass were the shortness of the line of sight due to the small diameter of the instrument, the tendency to force the needle when the box was tilted in use upon uneven ground, and the effect of weight of the graduated card or rim carried by the magnetic needle, which tended to introduce sluggishness in the movement of the needle.

Puller's new tachymeter sought to obtain the plans and levels of the observed points without the necessity of noting the distances and horizontal angles, and thereby enabled the surveyor to dispense with the labour of calculating and checking the results. This

instrument consisted of a horizontal circular plate, about 16½ in. in diameter, mounted on a tripod. The plate was graduated to read horizontal angles, and at the centre was a vertical axis carrying a telescope upon one side and a projective apparatus upon the other. The arrangement consisted of graduated horizontal and vertical scales connected to the telescope and receiving motion from it, and by means of which the distances and heights were read off, and the observed points plotted, when weather permitted, upon paper stretched upon the horizontal plate by pressing a needle-point into the paper.

The Eidograph had superseded the Pentagraph, as by its principle of construction the friction of the supporting wheels to the Pentagraph was entirely obviated, and there was consequently less damage to the drawing paper involved in its use. A level drawing board or table free from indentations was desirable.

Professor Goodman had patented a planimeter. It consisted of a tracing-rod held in the right hand, and a hatchet held at a point outside the boundary to be traversed, the instrument forming an inverted channel. The hatchet should not be allowed to work on a rough surface—smooth writing or drawing papers were alone suitable. This instrument was simpler than Amsler's planimeter in construction, but was not likely to be so extensively employed for accurate work.

Mr. J. Bridges Lee had shown how photography might be combined with surveying in a manner that should fix the direction of view upon a plan so as to embrace full detail as viewed through a telescope, and he argued that, having all the landscape thus recorded, a surveyor could select at leisure any topographical details he required to be known. A complete description of this photo-theodolite was given by Mr. Bridges Lee in a paper read before the Society of Engineers in 1899. He effected his purpose by adding a fixed focus camera set up on a stand and accurately levelled so as to make the picture plane truly vertical. The line of view was also marked on the photograph, and its position on plan recorded upon an horizontal plate whose centre was vertically under the centre upon which the attached telescope revolved. It was probable that photography would prove quite as satisfactory a process as the method of fixing survey lines by the magnetic needle of a compass for general plans, and that it would come gradually in greater use for assisting the surveyor to record not only the base lines of plans, but the vertical section lines of the surface of the ground. Building plans, in which dimensions were to be stated, must, of course, be correctly measured in the field, but for index or key plans showing general position and surroundings, the value of photography was universally acknowledged.

In the course of the discussion which followed, Lieut.-Col. Sir G. Leach, K.C.B., hon. member, moved a vote of thanks to Mr. Walmisley for his very able paper, which gave such a clear account of the instruments in use for surveying purposes, and which it was desirable that they should preserve for future use. Surveying varied in character very much, and the instruments must be adapted for the purpose of the work to be done. Mr. Walmisley had not alluded to the most magnificent surveying instruments which were ever made, i.e., two theodolites with 3-ft. circle, made a good many years ago by the original firm of Troughton & Simm, one for the Royal Society, and the other for the Ordnance Survey. Of course, no matter what the work was, the instruments were all based on the same principles, but an ingenious man would probably discover little points and make changes, etc., which would facilitate his work. That happened in his own case. One of his hobbies was landscape gardening, and, as they knew in the lay-out of roads, etc., a level was necessary. He wanted a small level, and, as he never felt confident in the work he did with the level, he set to work to invent a small level for the purpose. The characteristic of it was that it could be taken about anywhere, and it was not a playing, but a useful tool, which had been found useful in India and for architectural purposes. The architect had constantly to take levels to determine the site of his buildings, etc., and this little level could be carried

about in a bag, and the staff could be used as a walking stick. The level was very light, and he had done some very accurate work with it. Of course, if they had to level for a railway for fifty or sixty miles, they would want a better instrument. He was one of those engaged in the great levelling work for the Ordnance of the country, and they had no difficulty in getting most accurate work with the ordinary level.

Mr. C. J. Mann seconded the vote of thanks. He said that to use very elaborate instruments. Mr. Walmisley said there was no survey so accurate as that made with an ordinary chain, and he was glad to hear that. He had also been interested to hear Mr. Walmisley's remarks as to the part that photography was likely to play in the future on this matter. The members, especially the younger members, must feel deeply indebted to Mr. Walmisley for the pains and trouble he had taken in the preparation of his paper.

Mr. J. W. Tyler said they did not often use these elaborate instruments. They used the theodolite and the level sometimes. The level with the stadia reading, he had found of great assistance in making preliminary surveys for railway work, and the work could be done with a considerable degree of accuracy. As to the material for the manufacture of surveying instruments, aluminium had been used largely lately, and he gathered that it was not so desirable for the heavier class of instruments.

Mr. D. Gravell said that one was amazed at the enormous number of instruments which had been invented and constructed. The micrometer, as applied to the theodolite, seemed to be the principal invention since the articles in the *Builder*, and it was useful for tunnel work, but for ordinary survey work the vernier arrangement was ample. As to what had been said about the chain being the best method of surveying for arriving at a really good survey, he was surprised that the chain was used at all except for the roughest work. The chain ought to be relegated to the top shelf, where it could not be got at easily. The steel band was, he thought, the only proper method; it required more skill in handling, but for intricate surveys there was nothing like it.

Lieut.-Col. Sir G. Leach added some further observations in reference to the necessity of solidity in some of these instruments. He gave the opinion of Sir G. Airey, Astronomer Royal, as to a 2-ft. circle theodolite, which could not be got to do good work. According to Sir G. Airey, it was a perfectly sound instrument, but it was not solid enough, and that it would never be got to do good work until stronger supports were put in. This advice was acted upon, and the theodolite then did good work. One of the features which characterised the instruments produced by Sir George Airey was their solidity; he did away with all brasswork where he could, and put in cast-iron, and got rid of as much spring as he could. It was desirable to make these instruments as low and as rigid as possible.

The vote of thanks having been heartily agreed to.

Mr. Walmisley, in reply, said that these new instruments were brought to their notice from time to time; they were ingenious and they possessed merits as time economisers. There was no doubt that abroad some of them would be more useful for approximate work than in this country. As to the steel band, he was perfectly well aware of its accuracy, but the chain commended itself to him in some cases. For instance, if they crossed a road where traffic went on, a heavy iron chain would allow a cart to go over without effect, and a chain was not so likely to snap as a steel band. But there were improved arrangements for winding up the steel band, and its merits for accurate work could not be denied.

It was announced that the next meeting would be held on January 29, when Mr. F. Marshall, K.C., would read a paper on "The Value of Machinery for the Purposes of Rating."

The meeting then adjourned.

WAR MEMORIAL, BEAULY, N.B.—A monument has been erected in the square of Beaully in memory of the men of Lovat's Scouts who were killed or died in the Boer war. The memorial was designed by the Hon. Evelard Stourton.

ARCHITECTURAL SOCIETIES.

SHEFFIELD SOCIETY OF ARCHITECTS.—The monthly meeting of the Sheffield Society of Architects and Surveyors was held on the 11th inst. in the Lecture Hall of the Library and Philosophical Society, Leopold street. Mr. Joseph Smith occupied the chair in the absence of the President, Dr. H. Scrimfield, Medical Officer of Health for the city, delivered a lecture dealing with "The Advantages and Disadvantages of Mechanical Ventilation." Some of his points were:—"The air ordinarily contains about four parts per 10,000 of carbonic acid, and it has been found that when the air of a room occupied by human beings and not artificially lit contains as much as six parts per 10,000 of carbonic acid it begins to smell. When the carbonic acid in such a room reaches eight parts per 10,000 the air begins to be distinctly foul. An average human being gives off 6 cubic ft. of carbonic acid per hour. He will therefore load 1,000 cubic ft. of air to the extent of six parts per 10,000 in an hour, and 3,000 cubic ft. to the extent of two parts per 10,000. As four parts per 10,000 is the amount normally present in the atmosphere, and six parts per 10,000 is the limit of good ventilation, it follows that 3,000 cubic ft. of fresh air per hour must be supplied for each occupant in order to maintain the ventilation of a room efficiently. If the room is lighted by gas, oil, or candles, the amount of carbonic acid cannot be taken as an index of the impurity caused by human occupation. A gas burner, for example, which burns 3 cubic ft. of gas per hour forms $\frac{1}{2}$ cubic ft. of carbonic acid, or more than that given off by two persons. The problem to be achieved by good ventilation is to provide 3,000 cubic ft. per hour of fresh air for each individual.

If each individual has a cubic space of 1,000 cubic ft., the air must be changed three times in the hour, if 150 ft., only the air must be changed twenty times in the hour. It is generally agreed that in this country during the colder months a change of air more frequently than about three times in the hour cannot be borne unless the incoming air is warmed. Mechanical ventilation has been introduced, on account of the difficulty of changing the air of a building sufficiently often to maintain good ventilation without intolerable draughts, by ordinary means, such as open fires, and the provision of inlet and outlet shafts and openings through which the air is moved by differences in temperature, and the law of the diffusion of gases. Extraction fans also answer satisfactorily for single rooms, such as restaurants, hotel dining-rooms, etc. I think that churches (which, by the way, are apparently not supposed to require ventilation) and public halls might readily be ventilated by the provision of extraction fans and plenty of inlets equipped with radiators for warming the incoming air." In a summary of the lecture Dr. Scrimfield says he thinks that where the cubic space allowance is small, as in our elementary schools with 120 to 150 cubic ft., mechanical ventilation is the only system which is capable of giving really good results as regards the purity of the air; but that where the cubic space allowance is large, as in hospitals with 2,000 cubic ft., its introduction is probably undesirable. In the second place, he thinks that if mechanical ventilation is decided upon for a building the fact ought to be realised that by its means the air of the building can be changed at least twice as frequently as by other methods, and that its introduction is equivalent to doubling the cubic space of the building, and that it is therefore well worth while to pay for as perfect an installation as can be obtained. In the third place, the contract to what air changes are to be accomplished by the method should be carefully drawn, and after the work is completed careful tests by chemical analyses of the air and the anemometer should be made in order to ascertain that the terms of the contract have been fulfilled. In the fourth place, the person responsible for the management of the building should thoroughly understand what are the capabilities of the system, so that it may not be expected to perform impossibilities. For example, mechanical ventilation will keep the air in the classrooms of an elementary school good for a matter of eighty minutes, but if the classrooms are not emptied and filled with fresh air at the

breaks the air in them will be just as bad at the end of the morning or afternoon school as the air in the classrooms of a naturally ventilated school just before the break.—At the conclusion a hearty vote of thanks was accorded on the proposal of Mr. E. M. Gibbs, seconded by Mr. J. J. Bingham, and supported by Messrs. J. B. Mitchell-Witbers, H. L. Paterson, T. Winder, and the Chairman.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—At the rooms of this Society on Thursday, the 11th inst., a paper was read on "The Better Housing of the Artisan Population" by Mr. W. P. Rylatt, who won the prize for an essay on the subject. Mr. Rylatt said: "The question of the housing of our artisan population is one of the greatest problems of the present day. Ever since 1851, when the attention of Parliament was first drawn to the disgraceful state of the houses of the artisan classes in London and in other large cities, Acts have been passed and measures taken to improve the condition of these dwellings. A very great fact in the health of the people, physical and mental, is a cheeriness of surroundings and a pleasant outlook obtained by providing plenty of open spaces, laid out as gardens, such as is carried out on the Millbank estate in London. Many difficulties are met with in carrying out schemes of workmen's dwellings in large cities, one of which is the high price of land, and another is the increase of recent years, of the cost of materials and labour. Every advantage should be taken of cheaper methods of building, and perhaps a more reasonable application of the by-laws by the local authorities would allow more latitude in this respect. In a workmen's dwelling scheme everything should be cheap and simple, consistent with good workmanship. The most economical plan of tenement buildings is a parallelogram, two rooms deep, and with a common staircase, everything, as far as possible, fire-resisting. All staircases, landings, and passages should be reduced to a minimum. To bring a little brightness into the lives of the tenants the buildings might be planned round a paved court or quadrangle, opening into a street by one or more archways, and laid out with flower-beds. This court might be overlooked from balconies on each floor. Much might be done by providing cheaper and quicker means of transit by electric car and railway to enable the better class of artisan to live in the suburbs, and so leave more dwellings in the congested parts of the city for the lower class of workman.

In providing dwellings for the artisan class private enterprise has signally failed and there are acres and acres of jerry-built property in the suburbs, which probably in a few years will fall into a condition almost as bad as that of the wretched dwellings now being cleared away in our stumps. The problem of the housing of the agricultural labourer in the country naturally does not attain the vast proportions of the same problem in the city. In this case a cottage, costing from 100l. to 150l., everything included, is needed. To effect this, purely local materials and labour should be utilised as far as possible."

MANCHESTER SOCIETY OF ARCHITECTS.—The seventh meeting of the students of this Society was presided over by Mr. Charles Potter, who, after a few preliminary remarks, called upon Mr. Gerald Solomons to move the following resolution:—"That the revival of the ancient styles of architecture be encouraged by architects." The resolution as above expressed failed to be carried, for it was held that the Renaissance style and other styles in an analogous state were the development of styles, and not the revival of them, the "revival" at this meeting being taken to mean (as literally it does) the actual reusing of the styles in their purest state, showing no innovations, all proportions being equal, and applied as it was applied when discovered. One speaker referred to the Renaissance as being an ancient style, which remark was interrupted by another speaker, who called the ancient styles only such as Classic and Egyptian, and the Chairman, in endeavouring to save the remarks of the former, included both in the class by constituting it as follows:—"Ancient architecture is other than modern." Thus both speakers were allowed to proceed. In this debate St. Paul's Cathedral was held to be in style "a

development of the Classic architecture," and not, as is generally expressed, a revival of Classic architecture.

Fifty Years Ago.

FROM A LETTER IN THE *Builder* OF JANUARY 19, 1856.

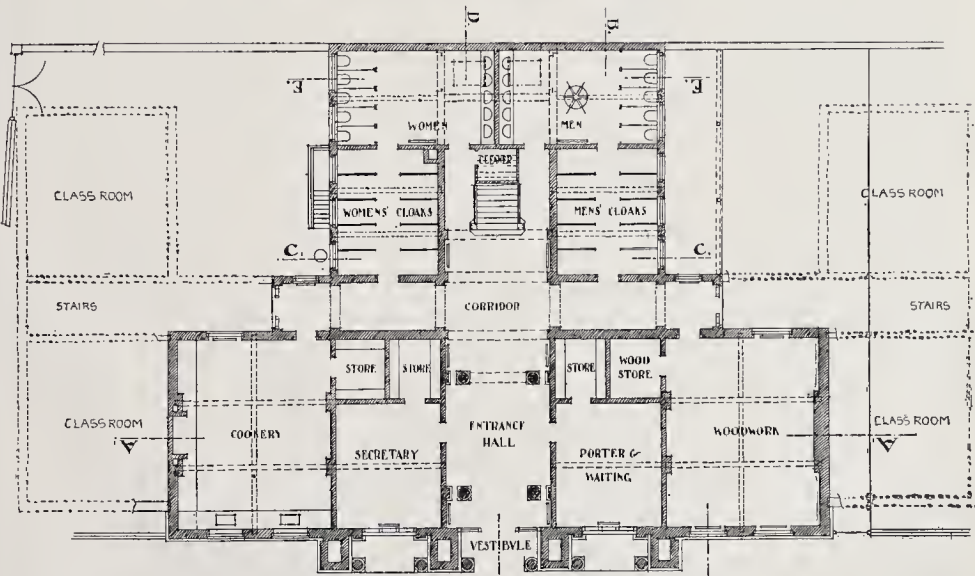

If there exist fools enough in the world to give work to those who do not possess even elementary knowledge, a diploma system would not prevent them from obtaining it.

It might, perhaps, induce those to study who have not yet practised, in order that they might pass the examination with honour. It would, perhaps, ensure a certain amount of practical knowledge in the coming generation, but would it increase talent by offering it a more enticing remuneration? In my opinion it would not, by reason of its proving no check upon the influx of new members into the profession. Some would say, establish a system of collegiate education, and raise the qualifications to a higher standard; but there are evils inseparable to the system. You compel young men to go through a course of training which is as likely to be bad as it is

to be good, and is certain to be expensive. The management may also, through interest or routine, fall into the hands of incompetent persons, and thus become a repetition, on a small scale, of Government imbecility and incapacity. It is a principle becoming day by day more significant, that every institute should stand on its own merits as a basis, and be self-sustaining. Let architectural education be no exception to the rule. Establish colleges, but let them depend upon the support of the profession. If they are required, they will answer; if not, they will soon be numbered with the things that were. After considering the question of voluntary

Premiated Design for Public Library, Herne Hill.

examination in all its bearings, the only conclusion I can come to is, that it will be impossible for it to become a moral necessity, that the feeling of the profession will be against it, from the extra trouble and expense incurred, and the dislike of many to let the decision of the great question of their lives, "whether they shall practise or not," rest with any but themselves; that the public, finding many able men among those who have no diploma, will encourage them in preference even to those possessed of one—for the English people, above all things, hold in abhorrence any attempt at monopoly, which the movement would undoubtedly be considered to portend.

PRIZE DRAWINGS BY STUDENTS OF THE INSTITUTE.

To prevent misunderstanding, we think it as well to say beforehand that we are always glad to publish the designs which obtain the Soane Medallion, the Tite Prize, and the Grissell Medal; a statement which may be taken as a standing notice. On several former occasions winners of prizes have expressed their regret at not having their designs published in our pages, having promised them elsewhere, apparently through not being aware that we should be willing to publish them. We have always been glad to do so; but students ought hardly to expect that this journal should take part in a kind of scramble to see who could get their consent first.

TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—At the usual fortnightly meeting of this Society, held in the Technical College on the 12th inst., Mr. Colin Sinclair presiding, Prof. F. O. Bower delivered a lecture on "Dry Rot." The nature of the fungus, its growth in dead wood under favourable atmospheric and chemical conditions, the germination of the spores, which are extremely minute and produced in vast numbers, the process of ferment, and the characteristics of timber attacked by the disease were described in detail and illustrated by lantern views. The Professor thereafter explained the most likely causes of growth, also the precautions to be observed to ensure its prevention and elimination.

Illustrations.

SCULPTURE, CENTRAL LIBRARY, BRISTOL.

HIS panel is one of three on the exterior of the building; the figures, which are life-size, represent King Alfred, four chroniclers, and two wandering bards. Mr. Charles Pibworth is the sculptor.

Mr. Pibworth gives us the names of his characters as follows, taking the figures from left to right of the illustration:—Cynwulf (wandering bard); Nennius (historian); Gildas (historian); King Alfred; William of Malmesbury (historian); Florence of Worcester (historian); Wace (Norman minstrel).

DOORWAY, S. RENIERI CHAPEL, PISA CATHEDRAL.

This small doorway, constructed entirely of marble, in the Crociera di San Renieri of Pisa Cathedral (forming the south transept), is upon the north-west side of the transept, and upon the opposite side to the entrance containing the famous bronze doors of twenty-four compartments which escaped the fire of October 15, 1596.

It is probable that the doorway here illustrated, having been greatly damaged by the fire mentioned above, has been reconstructed with the original portions. Other similar doors in the Duomo show caps upon either side under the lintel. The mouldings are typical of Greek influence. The figure over the doorway is evidently intended to represent one of the Evangelists. The door itself is of sheet iron and bronze toned to a delightful colour by age.

L. U. G.

ROCHESTER TECHNICAL INSTITUTE.

This design was selected out of 113 submitted in an open competition in which Mr. Baggally acted as assessor.

The motive of the plan was to design the present requirements in such a way that the extensions required could be added in a simple manner, interrupting the work as little as possible, and leaving both the

present and ultimate building with a complete appearance.

The road in front is to be private to the Institute, Eastgate House Museum, and the future library. The building is designed to harmonise with Eastgate House, though the type chosen is not Domestic Elizabethan, a style considered by the architects to be unsuitable for modern school requirements. The school will be devoted mainly to art teaching, and the special rooms for that purpose are placed on the second floor.

The materials to be used are red and stock bricks, with Ancaster stone dressings, and tiles for the roof.

Tenders will be received this month, and it is expected that the building will be completed in a year.

The architects are Messrs. S. B. Russell & T. Edwin Cooper.

PREMIATED DESIGN FOR PUBLIC LIBRARY, HERNE HILL.

This design, by Mr. Thomas Wallis, is one of six that were premiated in the competition, though it was not the one selected for execution.

The planning of the Library was specified in the instructions to be on the Free Access system, and this design was planned for that system, though we understand that it was abandoned in the actual erection of the Library.

The buildings were to be of red brick, with terra-cotta facings, roofed with green slates; the cost not to exceed 10,000.

MEXBOROUGH HOUSE, DOVER-STREET.

This building is erected on the site of the town house of Lord Mexborough, and consists of two large blocks of buildings, having frontages of about 40 ft. to Dover-street and Berkeley-street.

The old house had some fine carved doors and over-doors, dado and other panelling, which have been preserved.

The new buildings will be known as Mexborough House, and are planned as residential flats on the upper floors, each flat consisting of hall, sitting-room, three bedrooms, and bathroom. The service will be from a common kitchen, and the tenants will

be supplied with all meals on a fixed tariff, and also with all domestic services.

The frontage to Dover-street is designed for business premises on the ground floor, now occupied by the Well Fire Company, and having unpolished grey granite to the first floor level and Portland stone above, with metal casements to the window openings.

The frontage to Berkeley-street is treated with red brick and Portland stone dressings.

The whole of the buildings are of fire-resisting construction, and the finishings throughout are of first-class materials.

The contractor is Mr. James Carmichael, and Mr. P. Watkins has acted as clerk of works.

JAMES S. GIBSON.

THE QUANTITY SURVEYORS' ASSOCIATION.

A MEETING of the Quantity Surveyors' Association (Incorporated) was held on Wednesday in the "Chinese Room," Holborn Restaurant, when the adjourned discussion was resumed on the paper read by Mr. F. B. Hollis, on December 6 last, entitled "Some thoughts on the Quantity Surveyor and his Relation to the Building Owner, the Architect, and the Builder."

The chair was occupied by Mr. A. J. Gate, Vice-President.

The minutes having been read and confirmed, Mr. F. B. Hollis, Hon. Secretary, read some correspondence arising out of his paper.

Mr. H. Smith (London) wrote saying that there were two points to which he would call attention. Mr. Hollis, in his definitions of "Quantity Surveyor," mentioned that the quantity surveyor should have intimate acquaintance with the law of dilapidations, etc., light and air cases, and value of property for mortgage and other purposes. He (Mr. Smith) agreed that they should have intimate and full acquaintance of such matters, but, from personal experience, he found that a "quantity surveyor" had but very little standing in the eyes of the law on these matters. He had been engaged upon very many cases of such description to give expert evidence, and he had found that nothing but the term "building surveyor" would satisfy the law that one knew what one was talking about and was capable of giving expert evidence; and, although a quantity surveyor might be fully capable and able to give first-class evidence, he was discredited because he was a quantity surveyor and not a building surveyor, and in many instances of important cases he had been engaged upon he had been compelled to use the term "building surveyor" to get any importance attached to his evidence. In the question as to whether quantities should form part of the contract, he said "Yes, providing that the quantities, being a part of the contract, did not invalidate the responsibility of the quantity surveyor for errors." He did considerable work in both private and public buildings, and he could say that in not one solitary case had the quantity surveyor's work been allowed to form part of the contract; and why? simply because it was thought—and somewhat truly under the present conditions—that if the quantities formed part of the contract it invalidated the question of responsibility as to the accuracy. One of the many reasons he had given was that "if the quantity surveyor's work be accepted as part of the contract, then the provisions usually included by the architects for 'contingencies and extra work' cover also any omission, if any, on the part of the quantity surveyor." How many architects carried out a job of any sort without the "contingency provision"? Not many, he feared, and if not put into actual lump sum amount they insisted on having an item measured for provision of brickwork or digging and concrete, etc.; and why? simply as a cover to allow for any matter which, according to the plans and specification, might require altering or adjusting as the work proceeded, and they liked those provisions entirely for their own use. He admitted that it was desirable in the practice of an architect, where alteration works or uncertain party-wall works, etc., occurred to include something to deal with to cover matters that arose when old work was exposed, as that usually happened

where one had so many to satisfy where more than one person was interested. He knew that this question on the point of provisions was a very delicate one, and until that point could be dealt with to the architects' satisfaction they would, he feared, not give the quantity surveyor any recognised position in the contract. He used the architect's name in this matter because he was the man that prepared the contract on behalf of the employer. Another serious clause in quantities which did not tend to improve matters, and which was often used by supposed "qualified men" was "that the quantities have been prepared with care and accuracy as far as possible to obtain same, but the contractor must satisfy himself as to whether they are accurate or not before he signs the contract, as no claim will afterwards be considered if any error or omission be found." It was this sort of clause that made the contractor dissatisfied and the employer suspicious, and especially when they had to pay full price to a man who was uncertain whether he was competent or not. That sort of quantity surveyor was not the man to head his bills of quantities thus: "That these bills have been carefully prepared and are guaranteed correct by the quantity surveyor." He had spoken to many architects as to why they object to quantities forming part of the contract, and the answer invariably was: "No thank you; we get quite enough trouble without giving ourselves more." As to the employment of the quantity surveyor direct by the employer, he was of opinion that the employment direct would be a great mistake both as to the surveyor's side of the question and to the architect's side. It certainly meant "chiselling" down prices, and allowed of incompetent men being pushed on to the architect, and he need not discourse on the many drawbacks that would arise to those who were experienced in the matter of the present competitive rules and ways of getting work. Certainly one question the employers would be sure to insist on was that no fees ought to be paid to the surveyor till the job is complete and account settled to the building owner's satisfaction. What a time for the poor quantity surveyor!

Mr. Acheson Bergesen (Belfast) said he quite agreed with Mr. Hollis's definition of the relations of the quantity surveyor to the architect and the building owner, which must in reality mean that the latter was the principal and the former his agent. Therefore, it followed, as a matter of course, that if the principal, or the building owner, allowed the bill of quantities to form part of the contract he fully admitted his responsibility, and the Association's clause 13 did no harm. This reasonable course was not adopted in many cases owing to the principal, or building owner, refusing to allow the quantities "to form part of the contract," thereby shifting his responsibility to the shoulders of the building contractor, who in turn passed it over to the quantity surveyor. At this stage clause 13 became operative, and, if acted on, would not only compel the quantity surveyor to take a risk other than that laid down by law, but also to pay the debt of his principal for a shortage in quantities, which he, the principal, alone should pay for, as he alone derived the benefit of the same; surely there was something wrong in a clause that would operate so unjustly. The remedy he suggested was to amend clause 13 to read as follows:—"Any member of the Association who shall supply bills of quantities may hold himself responsible for their accuracy as a whole, or in cases where the quantities are not intended to form part of the contract he may insert an item in same to cover any risk the building contractor is obliged to take by having to accept the bill of quantities to be correct as a whole." If this were adopted the building contractor could protect himself by an insurance policy, and the insurance company could protect themselves by stipulating that the bill of quantities should be prepared by a member of the Association. He thought that every reasonable effort should be made to get a charter as soon as possible, and the amendment of clause 13 would, in his opinion, clear the way.

Mr. A. Lawrence Cox, of Manchester, said he was of opinion that a quantity surveyor should be designated by his true title and not merely as a "surveyor." The house agent, amongst others, was much too

* See our issue for December 9 for a report of the meeting.

fond of annexing this title. The crying abuse of the use of the title "quantity surveyor" by men who issued quantities containing such choice items as those quoted in the paper called for serious and immediate consideration. He thought it desirable that the Association should continue in the good work of educating the public by the publication and discussion of papers bearing upon the peculiar intricacies and arduous nature of the work of quantity surveyor and the necessity, as a matter of justice between owner and contractor, for the work to be solely in the hands of skilled and qualified practitioners. He thought that they would all be of opinion that the profession should be "protected" from unskilled and unscrupulous competition. The best form of protection would be some form of compulsory registration, and he should be glad to hear that the executive had this goal before them.

Mr. B. Laine Pearson said, as to the latter part of the fifth section of the definition of a quantity surveyor, which states that he should be a man having an acquaintance with the value of property for mortgage or other purposes, this appeared to be more the business of valuation surveyor or house agent, as, although there were many quantity surveyors in London who occasionally did this kind of work, he believed by far the greater number did not engage in it, and rightly so, as a quantity surveyor proper was a man of detail rather than of piecemeal valuation. Second, as to the difference in modes of measurement of London, the Midlands, and the North, as a man who had had considerable experience in measuring up works, and also of estimating, and bills of quantities in a great many different towns in the North and Midlands, he had found that, with a few exceptions, their chief systems were a want of system, practically no two men following the same procedure, and all having one system—viz., that of shortening detail. Even in cities like Manchester and Leeds, where there were printed modes of measurement agreed between the architects and the builder, each man had followed his own method, and, although there had recently been a lot said about standardising mode of measurement, he was afraid it would have to take the form of perfecting the London system only, as on the one hand the men who prepared quantities in the North and Midlands would mostly be unwilling to change, and on the other hand there were only a few improvements that could be culled from their practice, the chief of them being the running of extra double course at eaves and cutting and waste in slating and tiling, and the number of tees in iron and copper pipes. In view of a probable perfecting of the London system among the members of the Association, he mentioned a few of the items it seemed to him desirable to revise—i.e., concrete in deep trenches should have the distance below surface stated; drains should be stated as digging and laying commencing at a certain depth below surface; brick facings to external and internal angles, also to reveals to doors and windows, should be measured per foot run, stating width and girth, and in the case of external angles making a deduction of the girth of the quoit. Brick arches sadly need revision, so as to be able to fix an accurate price. Wrot stonework should, in his opinion, always have the labours measured separately, and in the case of some of the millstone grits, which were not usually sawn, should have all beds and joints measured, and those of these latter that were sawn should have the rough stone measured run.

Mr. H. J. West having made a few remarks,

Mr. Theo P. Pietersen said, as to the quantities forming part of the contract, he thought that it would be an excellent thing if such a course were to obtain that all quantities should form part of the contract. He was quite sure that all errors were not made by qualified men. Slight clerical errors there might be for which he thought it would be most unjust to hold a surveyor responsible, and, although this clashed with clause 13 of the articles of association, still he could not help thinking that on the whole it would be beneficial to the profession if quantities were always made part of the contract. He knew of one public body who made quantities part of the contract, and

they stipulated that any errors made by the surveyor should be paid for by him, and *vice versa*. Such an arrangement got over the difficulty of, at all events, the possible charge that a surveyor will take the quantities out more fully in order to increase his fees.

Mr. B. S. Smith said he had seen it suggested that quantities should be standardised.

The Chairman said that standardising quantities was impossible. If an immense volume should be prepared, with every item possible in it, it would be a little bigger than the "Encyclopaedia Britannica."

Mr. E. A. Wylie said that he believed that bills of quantities should form part of the contract. He also agreed with clause 13 that the quantity surveyor should guarantee his quantities.

Mr. T. W. Biggs having spoken on various points dealt with by Mr. Hollis,

The Chairman, in putting the vote of thanks to the meeting, said that Mr. Hollis suggested that the first, second, and third requisite for the quantity surveyor was accuracy. He should be sorry if that was all; the really successful surveyor should be a good deal more than accurate. The first thing he required was brains, the second industry, and the third tact. A man with those three qualifications would, if he exercised them all, have a reasonable hope of getting near enough to the top of his profession not to have to carry out work at some of the prices which were now offered. A man with accuracy only, remained a drudge all his life.

Mr. Hollis, in the course of his reply, said that the principal points touched upon by the gentlemen who had spoken were briefly:—Whether or not the bills of quantities should form part of the contract; clause 13 of the Association; and uniformity of fees. As to the first point, Mr. Cross, who opened the discussion, contended that such a course was an evil one, inasmuch as it tended to lower the status of the quantity surveyor, and to make him careless as to whether his bill was a good one or otherwise. He (the speaker) would not go so far as his friend had in his assertion, as he thought that the production of one bad, or even indifferent bill, would do a quantity surveyor more harm than twenty good ones could neutralise, in the opinion of the employer or the architect for whom he was working. He was still of the opinion that making the bills part of the contract would tend to a more thorough consideration of doubtful points in the specification and plans, as with the bills part of the contract they would be even more carefully prepared than at present, seeing that so much more depended upon their accuracy. Now, as to clause 13, Mr. C. John Mann demurred very much to going beyond the law of the land in the matter of a quantity surveyor being liable, or rather making himself liable, for the inaccuracies in his bill of quantities. But this idea was of the "Eogey" description, and must, in a great measure, be due to a mistaken conception of the law as it at present stands in its relation to a quantity surveyor's liability. Did not the clause merely emphasise the law? As he understood the law in its relation to this, it was that the party who paid for the bill of quantities had a claim in common law against the surveyor who prepared it if it contained inaccuracies directly due to negligence. That was all that they as an Association insisted upon the offender doing, if the case was brought before the Association officially, and, of course, the only authority they possessed to compel the person complained of making the necessary restitution was the threat of expulsion in the event of his non-compliance with such rule, after it had been duly gone into by the Association. Mr. Sanders thought that the quantity surveyor's liability should be limited to the amount of his fees in the matter in dispute. This, of course, was opening up the whole question of a surveyor's liability, and he could only say that if such an amendment to the Articles of Association was duly proposed by a member that the machinery existed for ascertaining the wishes of the majority of the members upon the question. At present he knew of no such general feeling amongst the Association. As to a schedule of fees for any

particular class of work, public or private, from a humble cottage to a lordly mansion, it was a most delicate and difficult subject to deal with. A "Fees" sub-committee had been appointed by the Council of the Association, and he was sure that if they could formulate any scale of fees, or assist in any way the object they all had in view as regards this, they would do so. Some would take work at a fee which made it impossible that good work could result, but how to stop such practices was a very difficult matter even to suggest, not to say undertake. A district council, in advertising for tenders for preparing bills of quantities for a proposed building, had stipulated that the surveyor should be a member of the Association. When more public bodies were like this one in that respect then uniformity of fees came within a measurable distance of becoming practicable. As to writing the specification, he considered the architect the best person to do this, but he also agreed with Mr. Mann that a quantity surveyor could do so, perhaps in greater detail from his dimensions, and he was sure that no member of the Association but would be glad to give his architect all the assistance in his power in this respect. The question of supplying a copy of the dimensions to the successful firm in tendering for the work had been touched upon. It was one thing to answer the request of a builder for information upon any one particular point and to supply him with a copy of the dimensions bearing upon that individual item, and quite another matter to permit him to have a copy of the whole of the dimensions, and he agreed with Mr. Mann that such a course placed a weapon in the hands of a person with which the architect might be unduly harassed. With regard to the question of quantities being ordered and paid for direct by the employer, he could not quite agree that the quantity surveyor should be paid direct for them. This course might possibly result in the work being more evenly distributed amongst the members of the profession than was at present the case, and would doubtless prevent some architects from placing all their work in the hands of one quantity surveyor, but, from his experience of architects, the majority preferred to have a quantity surveyor who was cognisant of their methods and style, and the course suggested might lead to incompetent men being employed. He could not quite agree with Mr. West that, because a man was a measurer, he was a quantity surveyor. He agreed as to the utter impracticability of issuing standard bills of quantities. He was also glad to gather from the remarks of Mr. Pietersen and others that there was such a general opinion that bills of quantities should form part of the contract. He agreed with all that the Chairman said, but he must defend his reference to the first requirements of a quantity surveyor being accuracy, the second accuracy, and the third accuracy. Mr. Gate objected to this, and said that accuracy was only a habit, and that he should have added as a chief requirement brains. He submitted that no man could be accurate without brains. He was glad the Chairman condemned the frequent reference that had been made to inaccurate work caused by hurry. There could be no half measures in a bill of quantities.

Upon the motion of Mr. L. G. Cross, seconded by Mr. H. J. Camp, a unanimous vote of thanks was passed to the Chairman, who responded, and the proceedings terminated.

COMPETITIONS.

BAPTIST CHURCH AND SCHOOLS, WALTHAMSTOW.—Acting on the advice of their assessor, the Building Committee have adopted the designs of Messrs. W. D. Church & Son, submitted in a limited competition. The building is to cost 7,500l.

BAPTIST SUNDAY SCHOOLS, ILFORD.—In a limited competition for these schools, the designs of Messrs. W. D. Church & Son were placed first by the assessor, and the Committee have instructed them to proceed with the work. Messrs. F. & A. Willmott, of Ilford, are the contractors.

SHIREHALL, NORWICH.—At the quarterly meeting of the Norfolk County Council, held at Norwich Shirehall, the Shire-

house Extension Committee reported with reference to the proposed enlargement of the Shirehall. They stated that they engaged the services of an expert, Mr. A. J. Wood, of 22, Surrey-street, to advise them, and had selected three sets of plans for the awards of a first premium of 100*l.*, second 50*l.*, and the third 25*l.*, the designs being marked respectively M, G, and D. The architect of design M estimates the cost at 8,850*l.*. Mr. Wood's estimate is 13,820*l.*; the estimate of design G 13,210*l.*, Mr. Wood's estimate 13,640*l.*; of design D 9,500*l.*. Mr. Wood's being 15,400*l.*. It is probable, therefore, the Committee says, that the cost of the extension will in the end be 14,000*l.*. It was stated that the following had won the premiums for the best plans submitted.—1, Mr. E. J. French, Upper King-street, Norwich, 100*l.*; 2, Mr. W. Waddington, Cheapside, 50*l.*; 3, Mr. J. W. Durhan, Opie-street, Norwich, 25*l.*

Correspondence.

ROYAL ACADEMY LECTURES.

SIR,—In the report of my lecture at the Royal Academy on the 8th, which you have kindly sent me, I notice that you comment on the inconvenience caused by there being no lantern. May I be allowed to say that the responsibility in this matter rests with me, and not with the management of the Royal Academy?

I had to make the necessary arrangements, and had done so, but unfortunately the lantern was sent by mistake to one of the other societies at Burlington House, and we waited for it in vain. Hence the delay, etc., which I very much regret.

GEORGE CLAUSEN.

APPOINTMENT OF DISTRICT SURVEYORS.

SIR,—The letter from the President of the District Surveyors' Association to the London County Council, published in your last issue, is of interest, and presents an opportunity for the consideration of other points in addition to those referred to in the letter in question.

It is a well-known fact to architects practising in the London area that the London County Council has for some considerable time past been reducing the position of the District Surveyor to that of a machine.

Generally speaking, they are no longer allowed to think, and are prevented from applying their knowledge and experience to dealing on their own responsibility with the various and many points that arise from time to time due to the inconsistent provisions in the Building Act.

If it is the intention of the London County Council that without exception the District Surveyors are to see that the Act is carried out with all its inconsistencies, it is simply a waste of the ratepayers' money to have such experienced men. Less experienced men at about 250*l.* per annum could do the work just as well, and the fees now charged could be much reduced. As matters stand at present many things have to be done simply because it happens to be the "law," and not because it adds in any way to the better construction or safety of the work or building, and in most cases is opposed to all rules of common sense, and last, but not least, the unfortunate client has to pay for this state of affairs.

It would be much better if some arrangement was made that in cases where architects lodged drawings with the Council, and the drawings having been approved by them, it would not be necessary for the surveyor to superintend the works, but he would have only to make a final visit to satisfy the Council that the approved drawings had not been departed from, for which a small fee might be charged. In this way the proper functions of the architect would not be encroached upon, the client's pocket would be saved somewhat, and the District Surveyor would have more time at his disposal to attend to the requirements of

the "speculating" builder, where he would be more usefully employed.

I do not suppose for one moment that the Council will venture to dispute the fact that the architects practising in London are just as able to carry out their duties without supervision by the District Surveyor as with it.

The arrangement I have suggested above has been the practice in Scotland for over 300 years, and is administered by the Guild Court. It deals with all questions relating to a building, so that when the certificate to proceed has been granted nothing can prevent the works being completed provided the regulations and approved drawings are not to any extent departed from.

London on account of its size requires more than most places a clear, simple, but thorough system; instead we have the overlapping of Acts dealing with building, light and air, and sanitary matters—a state of affairs that it would be difficult to find equalled elsewhere. AN ARCHITECT.

INDEXES OR INDICES?

SIR,—Referring to the query in your appreciative notice of Vol. II. of the "Architects' Law Reports and Review," my authority for "indexes" is Dr. Morris, who at page 77 of his "Historical English Grammar" (Second Edition, 1875) says—"Foreign words when naturalised form their plural in the ordinary English way, as *indexes, memorandums, automats, focuses, beaus*, etc." He goes on to say that "Some of these have two plurals with different meanings, as *indexes* and *indices*," but he does not state the difference in meaning. Webster, however, while allowing the use of both plurals, makes the use of "indices" imperative for "the figures or letters (in arithmetic and algebra) which show the power or root of a quantity."

Referring to the plans and photographs, these are, of course, the special feature of the Reports, and, as pointed out in the introduction to the first volume, they are reproduced from the drawings actually "put in" at the trial. It will be well, however, to make this possibly a little clearer in future numbers by a note to each illustration.

Your remarks as to review matter are noted with thanks and will be well considered. The aim is in the direction you indicate.

ARTHUR CROW.

** We agree with Dr. Morris and Mr. Crow that "index" is a naturalised English word and forms its plural accordingly. The query inserted by the reviewer escaped the Editor's notice, or it would have been deleted. We find, however, that some English dictionaries of repute give it as optional, "indexes" or "indices"; but we think "indexes" should be accepted as the proper form, regarding "index" as an accepted English word.—Ed.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—III.

Numbers, Notation, and Numeration.

ARITHMETIC may be briefly defined as the science of numbers, and is sometimes considered to be divisible into two branches: *theoretical* or *abstract arithmetic*, dealing with systems of notation and rules of computation, and *practical arithmetic*, devoted to methods of employing computations in science, art, and trade. It is very difficult, however, to draw a clear distinction between the theoretical and practical aspects of the science.

Numbers.

A number was formerly considered as a quantity comprising two or more units. According to this definition, which is accepted by Euclid, the figure or numeral 1 is not a number.

The view of Ramus, which is generally adopted in arithmetic, is that 1 constitutes the lowest number. Modern mathematicians, however, treat 0 as a number, this being the starting-point of positive and of negative reckoning.

In a restricted sense the figure 1 certainly stands for the lowest whole number and signifies unity. Hence it is the lowest whole number that can be divided or multiplied by itself or any other whole number. As all numerical systems appear to have originated from the practice of counting on the fingers, 1 is obviously the first digit, and can be termed quite correctly the first numeral.

Digital calculations still come natural to children, and grown up people cannot always avoid the tendency to make the fingers of some service in the same way. But mathematicians who are able to detach their attention from physical aids to intellectual exercises are quite right in considering 0 as a number, although it

cannot be defined as a digit. In a wide sense 0 can be taken as a number.

When standing alone 0 has no value. It is then neutral, and may be written ± 0 . But if placed at the right hand of another numeral it possesses a positive value, and clearly has a right to be included in the ascending series +0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, etc.

As the starting-point of positive reckoning 0 is distinctly significant. Thus the equations $0 + 1 = 1$, $0 + 6 = 6$ mean that 1 and 6 respectively have been added to 0, and give this numeral a real position under the ordinary rules of addition. Similarly, the equations $1 - 1 = 0$, $6 - 6 = 0$ show that the numeral comes under the rules of subtraction.

In digital calculations 0 is the value denoted when no fingers are held up, and by freeing the mind from the idea that arithmetic has a material or corporeal basis it is not difficult to conceive negative or minus values, corresponding to a state of less than no fingers.

Consequently 0 is the starting-point of negative reckoning and can be properly included in the descending series -0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, etc.

So, to use a simile, 0 may be likened to the fulcrum of a double lever, one arm of which is formed by an infinite series of positive numbers, and the other arm by a infinite series of negative numbers.

To proceed a stage further, it was not difficult for men in the early days of arithmetic to catch the idea that a finger was divisible into parts. Customs prevailing in those times were quite capable of suggesting the physical possibility, and the reasoning capacity of man was no doubt quite equal to the conception of fractional parts of a digit. In the present day we have passed far beyond the stage of regarding a digit as the sum of three joints or parts, and know that the number of fractions into which it may be divided is infinite. Hence an interminable number of values exists between 0 and 1, showing still more clearly that the former and not the latter figure is the starting-point.

Notwithstanding all that has been said above, the figure 1, as the lowest whole number, must be considered for some purposes as the starting-point.

In support of this view we have the fact that 0 multiplied by any number or any number multiplied by 0 is not increased in value. Thus $0 \times 10,000,000 = 0$. Similarly, 0 divided by any number, or any number divided by 0, is not decreased in value. Thus $\frac{10,000,000}{0} = 0$, and also $\frac{0}{10,000,000} = 10,000,000$.

If the abstract mathematical idea of treating 0 as a number were universally applied to arithmetic, we might argue that as

$$50 \times 0 = 3 \times 0, \quad 50 = 3$$

which, in accordance with the classical remark of Euclid, is absurd.

Notation and Numeration.

Notation is the expression of numbers by characters, and numeration the reading of the characters so written.

The system of notation in general use is founded upon the radix 10, the decimal basis having originated in all probability from the method of reckoning by the fingers. There is no reason, however, why any other scale should not be used. As a matter of fact, the duodecimal scale would be preferable for some reasons, since the radix 12 is capable of more complete resolution than the decimal radix, and the duodecimal system is found convenient in certain calculations which have frequently to be made by architects, builders, and others.

Confining attention for the present to decimal notation, we find that the nine digits 1 to 9 together with the cipher 0 enable us to make one group of 10, that groups of 10 can be assembled until 100 is reached, that groups of 100 may be put together until their sum is 1,000, and that the process of grouping can be continued *ad infinitum* in units of 10 or multiples of 10 as may be preferred.

Each digit has two values according to circumstances; the first an absolute and the second a relative value.

The absolute value indicates the number of units expressed and is unchangeable. Thus 5 always means five, although the figure may serve to denote 5 units, 5 tens, 5 hundreds, and so on.

The relative value depends upon the order of the units indicated and upon the nature of the unit of comparison, which may refer to tens, hundreds, or any other groups or multiples of 10. The various multiples of 10 are too well known

in themselves to require enumeration here, but as the interpretation of some of them is not the same in all countries we give in Table I. the British, American, and Continental readings of a few multiples or powers of 10 from 10⁰ to 10¹⁰.

As a power is the result of multiplying a number into itself a specified number of times, the number of ciphers following the figure 1 in any power of 10 is denoted by the index placed at the right hand of the number itself. Thus 10⁰ = 1, 10¹ = 10, 10² = 100, 10³ = 1,000, and so on.

The uses of powers will be discussed later, but at the present juncture we may note the convenience of denoting large multiples of 10 by the aid of an index, instead of having to write a long succession of ciphers. For instance, it is far more economical to indicate a thousand million by the expression 10⁹ than by 1,000,000,000.

TABLE I.—SOME POWERS OF TEN AND THEIR DESIGNATIONS.

Power of Ten.	Power of Million.	British Empire.	United States and Continent.
10 ⁰	—	one	one
10 ¹	—	ten	ten
10 ²	—	hundred	hundred
10 ³	1,000,000 ⁰	thousand	thousand
10 ⁴	—	1,000 million	billion
10 ⁵	1,000,000 ⁰	million	trillion
10 ⁶	1,000,000 ⁰	trillion	quadrillion
10 ⁷	1,000,000 ⁰	1,000 trillion	quintillion
10 ⁸	1,000,000 ⁰	quadrillion	sextillion
10 ⁹	1,000,000 ⁰	1,000 quadrillion	septillion
10 ¹⁰	1,000,000 ⁰	1,000 quintillion	octillion
10 ¹¹	1,000,000 ⁰	1,000 sextillion	nonillion
10 ¹²	1,000,000 ⁰	1,000 septillion	decillion
10 ¹³	1,000,000 ⁰	1,000 octillion	—
10 ¹⁴	1,000,000 ⁰	1,000 nonillion	—
10 ¹⁵	1,000,000 ⁰	1,000 decillion	—

This table shows that a very serious discrepancy exists between the British system of numeration and that adopted on the Continent and followed in the United States. Our own system is derived from that of the Italians, who possessed two methods of numeration for a higher multiples, one proceeding by powers of a million and the other by powers of a thousand. It appears that the French confused the two methods of proceeding, and in adopting the names properly belonging to powers of a million. Consequently so much confusion has arisen that words denoting numbers higher than a million are rarely used in the present day.

In writing numbers of more than three figures it is usual in this country to employ a comma at the left of each group of three figures, thus: 10,000,000, for the purpose of assisting the eye in reading the values. On the Continent and in America it is the general, but not universal, practice to dispense with a separating stop and to arrange the figures thus: 10000000 or 10 000 000.

The comma is sometimes employed on the Continent in accordance with British custom, but unfortunately it is also used as a decimal point. This is a most inconvenient arrangement, and one exceedingly apt to cause serious misconception on the part of British and American readers of Continental technical literature.

For example, the length 1.875 metres is frequently written or printed on the Continent 1,875 metres, which, of course, is a very different thing. In France, the rational use of the full stop and comma is now being introduced, but in Germany the comma is still generally employed as a decimal point. The result is that considerable discrimination has to be exercised by those who read books and periodicals published abroad.

One great convenience of the decimal system of notation is the facility it affords for the division of numbers by moving the decimal point from its understood position at the right hand of a whole number to any other position. For example, 1,000 ÷ 100 = 10.00.

Similarly any number can be multiplied by adding ciphers at the right hand with a corresponding movement of the decimal point, as 10 × 100 = 1,000. The same operation can be performed with mixed numbers or those consisting of a whole number and a decimal fraction. Thus 105.62 × 10 = 1,056.2.

People have become so accustomed to the decimal system that it is not obvious to all that

calculations can also be performed to any scale of notation.

Any radix other than 10 might have been adopted, as, for instance, 2, 3, 4, 5, 6, 7, 8, 9, 11, or 12, corresponding with the binary, ternary, quaternary, quinary, senary, septenary, octary, nonary, undecenary, and decenary, or duodecimal systems of notation.

Of these the duodecimal system is used to a certain extent in our own country, owing to the fact that 12 inches are contained in 1 foot and 12 pence in 1 shilling. But to suit the scale for employment in a general way it would be requisite to assign new symbols for the numbers 10 and 11 so as to avoid confusion. This will be made clear by inspection of Table II., comparing the decimal and duodecimal numbers up to 12 in each case.

TABLE II.—COMPARISON OF DECIMAL AND DUODECIMAL SCALES UP TO 12.

Decimal System.	Duodecimal System.
1 = 1	1 = 1
2 = 2	2 = 2
3 = 3	3 = 3
4 = 4	4 = 4
5 = 5	5 = 5
6 = 6	6 = 6
7 = 7	7 = 7
8 = 8	8 = 8
9 = 9	9 = 9
10 = (1 × 10)	(10) = (10)
11 = (1 × 10) + 1	(11) = (11)
12 = (1 × 10) + 2	10 = (1 × 12)
—	11 = (1 × 12) + 1
—	12 = (1 × 12) + 2

When we write 1 ft. 11 in., or 1' 11". Or, as it is, there is no difficulty or confusion. But to write 111 as an expression for (1 × 12) + 11 would be misleading, for that is the proper way of denoting (11 × 12) + 1; and to write 1 (11) for (1 × 12) + 11 would be clumsy. Hence the need for new symbols in the duodecimal system.

The application of duodecimals to architectural practice will be discussed later, and for the present we shall leave the subject after giving some illustrations showing the manner in which the system is applied under the four simple rules of arithmetic.

Example (1).—Find the sum of 9 and 7 and express the result in duodecimal notation.

When the two numbers are taken together they evidently contain 1 unit of twelve and 4 primary units or (9 + 7) = (1 × 12) + 4. Hence the answer is 14.

The process is analogous to that performed when we add 9 in. and 7 in. Then, as above (9 + 7) = (1 × 12) + 4, and the answer is written 1 ft. 4 in.

Example (2).—Find the difference of 25 and 18 and express the result in duodecimal notation.

Remembering that 25 = (2 × 12) + 5, and 18 = (1 × 12) + 6, it is clear that we must borrow from the second place of 25, 1 unit of 12, add this to the 5 in the first place of the same number, and then subtract 8, leaving 9, which is the difference required.

The procedure is practically the same as that followed in finding the value of 2 ft. 5 in. — 1 ft. 8 in. = 9 in.

Example (3).—Find the product of 9 × 8 and express the result in duodecimal notation.

The product of the two figures includes 6 units of 12 and 0 as remainder, or (9 × 8) = (6 × 12) + 0. Hence the answer is written 60, whereby the proper relative value of 6 is given.

This process is practically the same as that involved in the multiplication of 9 pence by 8, stating the answer in shillings, or 9d. × 8 = 6s. 0d.

Example (4).—Find the quotient of 24 ÷ 4 and express the answer in duodecimal notation.

Here 24 = (2 × 12) + 4, and four divided into this gives 7 with no remainder. Hence the required quotient is 7.

A parallel case is afforded by dividing 4 into 2 ft. 4 in. = 7 in.

Two simple but useful rules arising out of duodecimal notation are:—

- (1) Shillings per foot = pence per inch.
- (2) Shillings per dozen = pence per unit.

OBITUARY.

MR. JOHN WALKER.—We have to record the death of Mr. John Walker, of the firm of Messrs. Walker & Slaters, builders, of Derby. Deceased, who had undergone a long illness, passed away at his residence, Uttoxeter-road, at the age of sixty-four. The late Mr. Walker became a representative of Priar-gate Ward in the Town Council in 1895, and retired last year.

GENERAL BUILDING NEWS.

FABRIK, EDINBURGH.—Among those who received warrants at the Edinburgh Dean of Guild Court on the 14th inst. was the publishing firm of Messrs. Thos. Nelson & Sons for a factory and warehouse at Parkside Works, Dalkeith-road, Edinburgh. This is to be a large addition in the rear of the present works of the firm, and the building will be the first in Edinburgh to be constructed on the Henricque's system of ferro-concrete. It will be made entirely of steel rods encased in concrete—walls, roofs, pillars, and beams. The architects are Messrs. Cousin, Ormiston, & Taylor.—*Scotsman.*

LIBRARY, WREXHAM.—On the 1st inst. the Mayor of Wrexham laid the foundation-stone of a new library for the borough. The architect is Mr. Vernon Hodge, and the builder Mr. George Rowley, of Gresford.

PHOENIX INSURANCE COMPANY'S OFFICES, LEEDS.—In 1903 the Phoenix Insurance Company purchased a valuable site in South Parade, Leeds, for their proposed new offices; the existing buildings were pulled down and a new building has been erected by the Phoenix Company which not only gives accommodation for their own use but also provides several suites of offices for letting-off purposes. The new block faces South Parade and its back elevation faces Bedford-street. In addition to the basement it rises to a height of four stories and is crowned with a Mansard roof. The suite of offices occupied by the Phoenix Company is situated on the ground floor of the front block and comprises a large general office, secretary's private office, and type-writer's office. The remainder of the building in the front and back blocks is planned to accommodate ten suites of offices with all requisite lavatory accommodation fitted up with the most recent type of sanitary fittings. The front elevation and return side is faced with stone from the Selkirk quarries, the eastern side with white glazed brickwork and the back elevation fronting to Bedford-street with red pressed brick. The roof is covered with green slates from the Tilberthwaite quarries. Glazed brickwork and tiles have been used largely in the interior of the building, the former supplied by the Leeds Fire-clay Company, and the latter by Mr. Alfred Whitehead, of Leeds. The whole of the walls of the Phoenix suite of offices are lined with tiles of a deep tone of ivory white, and all corridors and staircases are provided with celadon green glazed tile dadoes, 5 ft. in height. In addition to a wide staircase of concrete steps provided by the Granite Company, a passenger lift, Messrs. Waygood & Co. make gives access to the various floors. The contractors for the building are as follows:—Basement work, Messrs. Chas. Myers & Sons; mason, brick, carpenter, and joiner, Messrs. Henry Atkinson & Sons; plumber and glazier, Messrs. Thos. Storey & Co.; plasterer, Mr. F. Moore; iron and steel, Mr. Leonard Cooper; slater, Mr. J. Season; painter, Mr. Fred Jackson (all of Leeds). The electric light is fixed by Messrs. John Collier & Co. (Manchester). The wood and stone carving have been executed by Messrs. Smithson & Wallis (Leeds); the iron railing and grate over entrance, by Mr. Nelson Dawson (Chiswick); bronze cartouches, electric light fittings, etc., by The Bromsgrove Guild of Handicraft; stained and leaded glass, by Messrs. Pape & Co. (Leeds); and plaster enrichments of ceilings by Mr. G. P. Bankart. The heating system is by Messrs. W. Richardson & Co. (Darlington). The fittings and furniture in the Phoenix suite of rooms have been specially designed by the architect. They are carried out in polished teak and stained and polished Kauri pine, and have been executed by Messrs. T. Horman & Co. (Leeds). Messrs. Elgodd & Co. have supplied locks and ironmongery. The new building, which is in the Renaissance style, has been erected from the designs and under the superintendence of Mr. William Clark, of Leeds. Mr. W. H. Tarran has been the clerk of works. The total cost of the structure, including the fittings, but exclusive of the site, will amount to upwards of 11,000.

THE WOOLWICH TOWN HALL.—The new Town Hall for Woolwich, which was opened on the 13th inst., is situated in the centre of Woolwich, in the vicinity of a group of public buildings, including the Polytechnic, the Public Library, the Police and County Courts, and the Public Baths. The principal facade on Wellington-street is 114 ft. long, and the facade in Upper Market-street 230 ft. long. Around the central hall, which runs up through two stories, the whole of the official departments are grouped together with the Council suite and the suite of Committee rooms. On the ground floor are the Borough Engineer, the Medical Officer of Health, the Borough Treasurer, and the Electrical Engineer, the accommodation of each department being supplemented by an equal number of rooms in the basement. Ascending the principal staircase at the end of the hall a gallery is reached which leads to the suites of principal rooms and the Town Clerk's department. The Council suite includes the Council chamber, the members' ante-room, and lavatory, all intercommunicating,

the chamber being in the form of a Greek cross surmounted by a dome. It provides seating accommodation for fifty-six members and a public gallery for sixty persons. The Central Committee room is a domed apartment divided from the two adjoining committee rooms by movable screens. By the raising of the dividing screens by means of a simple mechanism this suite of committee rooms is transformed into a reception-room 60 ft. long by 30 ft. wide, suitable for mayoral and other functions. Adjoining the committee suite is the Mayor's reception-room and communicating with both is a service-room with an electric lift to the kitchen in the basement. In the tower at the corner of the building is placed the public hall, so designed that it may be shut off for public purposes. The warming and ventilation is on the Plenum system. In the centre of the entrance-hall is a statue of Queen Victoria by Mr. Pomeroy. The interior of the council-room is ornamented with gilded plaster work, and the walls are finished with plaster. The room is in wainscot oak. The windows of the committee suite overlooking Wellington-street are filled with stained glass illustrating historical subjects. In the design of the Public Hall, which accommodates an audience of 750 and a chorus on the platform of 100, an endow of 100 ft. long by 10 ft. wide is placed in the customary long hall of the distance of the back rows of seats from the performers on the stage, and by the adoption of the Greek cross arrangement it is claimed that the whole of the audience is well concentrated round the stage so that all persons have an equal opportunity of hearing and seeing the performance. The large windows of the hall are filled with stained-glass windows commemorating three distinguished natives of Woolwich, viz., Lovelace, Maudslay, and Gordon. Mr. Brunwell Thomas is the architect. The stained glass is the work of Mr. Geoffrey Webb in consultation with the architect and Mr. W. Vincent, the President of the Woolwich Architectural Society. The wood carving and the external stone carving is the work of Messrs. Martyn (Cheltenham); the modelling of the plaster enrichments of the principal rooms is the work of the Bromsgrove Guild (Worcester), and the bronze electrolytes are by Messrs. Singer (Frome, Somerset). The further list of firms employed in the building is as follows:—General building contract, Messrs. J. E. Johnson & Sons (Leicester); heating and ventilation, Messrs. Jeffreys (Westminster); electrical work, the Borough Electricity Department; decorative plaster, Messrs. Tanner (Liverpool); wrought ironwork, Messrs. Starkie Gardner (Lambeth) and the Bromsgrove Guild; marble work, Messrs. Farmer & Brindley (Westminster); locks, etc., Messrs. Cibbons (Wolverhampton); mosaic work, Messrs. Simpson; Casements and lead glazing, Messrs. Hope (Birmingham); strong room doors, Messrs. Tann; safes, Messrs. Ratner; grates, the Well Fire Company; lighting conductors, Messrs. J. W. Gray & Son; clock in tower, Messrs. Smith (Dorset); fire alarm clocks, the Magnet Company; fire alarms, the Pearson Fire Alarm Co.; fire appliances, Messrs. Merryweather (Greenwich); council chamber fittings, Messrs. H. H. Martyn & Co. (Cheltenham); committee suite fittings, Messrs. Hampton & Sons; furnishing, Messrs. Hampton & Sons; Waring & Gillow, Shoobredes, and Martyns (Cheltenham).

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENT.—Messrs. Andrew Brown & Co., 110, Cannon-street, E.C., have been appointed the London and district agents for Messrs. Vaughan & Son (West Gorton, Manchester), makers of electrically-driven cranes.

ARCHITECTURAL ASSOCIATION STUDENTS' CONCERT.—The Second Annual Stocking Concert of the Architectural Association Students takes place on February 2, at the Gaity Restaurant. The tickets are 2s. 6d. each, and any surplus is to be given to the Architects' Benevolent Society and towards the foundation of an Architectural Association Musical and Dramatic Society.

GLASGOW ARCHITECTURAL TRAVELLING SCHOLARSHIPS.—A meeting of the Council of the Glasgow Association of Architects, who, along with Mr. John Shields, are the trustees for the Alexander Thomson Travelling Studentship, was held on the 11th inst., when the first prize was awarded to Mr. James Whitelaw, Loanacroft, Uddingston, and the second to Mr. F. M. Craik, 136, Stanmore-road, Glasgow. The prizes are 60l. and 20l. respectively.

BEDFORD BUILDERS' ASSOCIATION.—The Bedford Builders' Association held their annual dinner at the Central Restaurant, Bedford, recently, when Mr. Richard Black occupied the

chair. The loyal toast having been honored, "The Mayor and Corporation" was proposed by Mr. Chas. Negus. The Mayor responded, and said it was thirty-eight years ago since he started for himself in the building trade, and he remembered the first builders' dinner twenty-three years ago. The annual dinner fell through for some years, but had been revived. The Mayor then commented upon the progress, improvements, and low rates of the town. Mr. Valentine in responding, referred to the work of the Buildings Committee, who, he said, were always pleased to see plenty of plans. The trade had been under a cloud in Bedford and most other places, but those before him did not look very doleful, and they would pull through. Let the builders get out good plans, novel ideas, and something attractive to induce people to come, and the Corporation would maintain the good character of the town for good sanitation. Mr. Longhurst said the Corporation, he was sure, would do their best to further the interests of the town, and the building trade in particular. The Rev. W. P. Beckett, in proposing "Success and Prosperity to the Bedford Builders' Association," said the builders had had to contend with shortness of money, keen competition, and the water scare. Another bugbear was the Workmen's Compensation Act. They could hardly get a job without the said man would tumble off a scaffold, with the result that the builder, who would otherwise be doing well, would have to put his hands into his pockets. As the Builders' Association had considerable power, he hoped they would keep the rates low without losing money. He thought there should be more equitable agreement between landlord and tenant. The Bedford tenants were not at all his ideal. They stayed for only a short time, and at the end of three or four years the landlord had to spend a year's rent in doing the house up again. The builders might very well arrange with the house-agents to draw up an agreement in accordance with the practice in London. He had seen lately houses sold at a price which should yield a 10 per cent. rental, but it would be whittled down in the long-run to about 3 per cent. by repairs, etc., whereas in other parts of the country a 6 per cent. rental was considered fair. The Chairman replied, and said that in 1904 the Chamber of Plans passed by the Council was 105, including 52 new houses, but in 1905 there were numerous plans, including 119 houses. He agreed with Mr. Beckett that a fresh tenancy agreement was needed, but it could only be got by united effort. The least they could expect to spend on a three years' letting was a year's rent. Mr. J. B. Richards, in proposing "The Town and Trade of Bedford," referred to improvements carried out in the town during his twenty-three years' residence. He thought the introduction of works employing skilled labour should be encouraged, but they did not want to turn Bedford into a little bit of black country. Mr. J. P. White having retired to a recess, the Chairman, after a few remarks, spoke hopefully of the prospects. He said there were 7,341 inhabited houses, against 5,946 ten years ago. There were not so many empty houses by a long way as there had been.

CHANCEL SCREEN, PARISH CHURCH, MELTON MOWBRAY.—A chancel screen has just been placed in this Church at a cost of about 60l. The screen was designed by Mr. J. Oldrid Scott, and the work has been carried out by Messrs. Thompson, of Peterborough.

RAPID BRIDGE ERECTION.—A remarkably expeditious engineering operation was effected at Beckenham on Saturday last by the erection of a railway girder bridge in less than a single day. The bridge is on the line between Norwood and Beckenham Junctions, joining the South-East and Chatham and the London, Brighton, and South Coast Railways. For some time past the condition of the old bridge has been such that it became evident the structure would have to be replaced, and while the new steel girders were being prepared, it was shored up so as to avoid the risk of any mishap. On Saturday the members of the new bridge were delivered and assembled on the site, and in the evening of the same day, after traffic had ceased, the superstructure of the bridge was taken away and the piers were prepared for the reception of the new girders. These were placed in position by means of two large cranes, and by Sunday afternoon the bridge was ready for the restoration of the permanent way, which was completed in time for the resumption of traffic on Monday.

ARCHITECTS' BENEVOLENT SOCIETY.—The President of the Architects' Benevolent Society (Mr. John Belcher, A.R.A.) has received 60l. from Mr. Howard Chetfield, Clarke towards the 500l. which it is hoped may be raised in accordance with the terms of Mr. Walter Emden's offer of 50l. if nine other gentlemen contribute a like sum. So far, including Mr. Emden, there have been four responses to this appeal.

AN ARCHITECT M.P.—Mr. John Edward Sears, the new member of Parliament for Cheltenham, is the son of the late Rev. James Sears, for nearly twenty-five years minister of the Cottage Green Church, Camberwell. He is a

Fellow of the Royal Institute of British Architects, and he became a member of the London County Council in 1901, and at the present time is Chairman of the Housing Committee.

Legal.

DISPUTE AS TO A BUILDING ESTATE.

An application was made to Mr. Justice Swinfen Eady on the 16th inst. in connexion with an action by the executors of the late Dr. Gurney, of Gosforth, against Messrs. Packman & Sons, Ltd., of Blackpool.

Counsel stated that the plaintiffs entered into a contract with the defendants for the sale to them of the residential estate of Rosewith, at Gosforth, in September last. The purchase was to have been effected by November 11, but despite constant applications the defendants had not yet completed the contract. Notwithstanding the fact that the defendants were not entitled to have possession, they had trespassed on the premises by putting a padlock on the entrance-gate, by removing turf from the lawn, and by putting up a notice that the trees on the estate were for sale, and inviting tenders. If the purchase was not completed very serious damage would be done to the property as a residential estate. The defendants, who had paid 1,300l. out of 13,000l., which was the purchase price, were buying the property simply as a building estate, and had put up a notice intimating that they were prepared to sell plots of the land for that purpose. He asked for an injunction to restrain the defendants from committing the acts complained of until next motion day.

His lordship granted the application, with liberty to serve the defendants with notice of motion for the 19th inst.

CONVERTING A BUILDING.

At the Stratford Police Court on Saturday last week the justices gave their decision in a case in which Ernest F. Selby, a builder, of Hartley-road, Leytonstone, was summoned by the Wanstead Urban District Council during August, 1905, he caused to be converted into more than one dwelling-house a building known as "Canfield," Hermain-hill, originally constructed as one dwelling-house, and refused to send to the Council plans and sections of every floor of such building, contrary to sect. 90 of the Council's by-laws.

At the hearing of the case it was contended by Mr. Mallinson for Mr. Selby that the by-law was bad, because it had not yet been sanctioned by the Local Government Board, and there was uncertainty as to the meaning of it. The alterations carried out did not, it was urged, involve any alteration to the exterior of the house, and the only thing done was to put up a partition inside the house.

In giving the decision of the Bench, the Chairman said they found that By-law 90 was not bad for uncertainty, and, as a fact, Mr. Selby converted the building in question, which was originally constructed as one dwelling-house, into two dwelling-houses. The by-law also applied to a new building as defined by sect. 159 of the Public Health Act of 1875, and the Bench were of the opinion that that section had been infringed. The attention of the Court ought, however, to have been drawn to the case of Hall and others v. Eastbourne Mayor, etc.

A fine of 40s. and 4s. costs was imposed, and the Bench agreed to state a case.—*Tribune*.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

19,903 of 1904.—A. R. HUBBARD and R. FLAY: *Cooking Ranges*. This relates to a cooking range in which a fire contained in a fire place is used for heating a hot plate placed above it upon which different cooking operations can be performed, and also for heating an annular horizontal boiler arranged above the fire place. According to the invention, two rectangular ovens, placed one above the other, are arranged at one side of and adjoining the cooking range, the bottom of the upper one being level with the hot plate above the fire and the bottom of the one below reaching to the bottom of the range near the ground.

27,362 of 1904.—C. E. KONIG: *Doors, Windows, and Shutters*. This consists in connecting the stiles and rails of a window or door by means of tenons, which at the connection of the lower rail with the stiles are made to slope down to the outside, and which are covered by the whole thickness of the wood on the inner side by a shoulder which overreaches the lower rail and slopes upwardly towards the outside, and in front and on the outer side by the sloping of the cheeks, for the purpose of preventing entry of water in the mortice.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

28,032 of 1904.—G. S. MAYHEW: *Machines for Forming Compound Deals.*

This relates to a machine for assembling compound deals, and consists of a table provided with a series of guides on which is or are mounted a lower clamp or clamps and a series of upper clamps, said lower clamps and series of upper clamps being respectively adapted to be moved together to compress pieces of wood to build up a compound deal and to be moved apart to allow a fresh piece or pieces of wood to be placed in position.

3,120 of 1905.—M. J. ADAMS: *Fire Places.*

This relates to a fire place, and consists in the use of a fire brick so constructed that the lower portion, which is subject to damage by fire, may be renewed without disturbing the upper portion, which is carried on brick or other support.

3,978 of 1905.—R. BLESSIN: *Electrical Alarm Contacts for Door Locks.*

This relates to an electrical alarm contact for door locks, consisting of a handle and cone or plug of insulating material provided with contacts on the outer end and a spring on the side of the cone.

4,824 of 1905.—H. LAWRENCE: *Fender and Ash Pan Fronts.*

This relates to a sheet metal fender or ash-pan front, having a quilled or twist-patterned ornamental metal integral with or fashioned from the metal of the said article.

5,416 of 1905.—C. H. WILSON: *Windlasses.*

This relates to a windlass consisting of a pawl box preferably provided with only one pawl, said pawl being pivoted in the box and having a tail piece which projects outside the box, to which tail piece the rod from the pivoted cross-head of the windlass is connected.

7,457 of 1905.—W. OLDAKER and J. H. OLDAKER: *Window Casements.*

This relates to the method of opening and closing window casements by means of hinges sliding in the head, and sill channel and lever gear so fixed as to be wholly outside the head and sill channel of the casement, thereby preventing any cutting away of the head, sill, or casement, which would cause the casement to be more effectually rain and weather proof, and which opens outwardly with an aperture at the hinged side for cleaning.

9,026 of 1905.—E. L. P. DAVISON: *Grates for Stoves and Fire Places.*

This relates to domestic stoves and fire places having the ash grid or grate resting upon a frame and being capable of having a sliding or shuffling movement imparted to it within the fire grate.

9,067 of 1905.—F. J. GIBBONS: *Hinges for Doors or Windows.*

This relates to a butt-hinge for a door or window, comprising a tubular lining within the socket of each leaf, and a hinge pin adapted to fit the interior of both tubular linings, each tubular lining being enlarged at the end which butts against the other, and one tubular lining being adapted to be longitudinally displaced, an adjustable distance, relatively to the socket within which it fits.

9,409 of 1905.—A. REID and A. HENDERSON: *Disinfectant or Fluid Disinfectant or Detergent Supplying Vessel for Flushing Cisterns and the like.*

This relates to a disinfectant, comprising a container, a discharging tube, an air pipe, and an annulus or hollow ring having jet orifices therein from which the discharging tube and the air tube extend.

9,591 of 1905.—F. W. CROSS and R. BOUGHTON: *Combined Window Fasteners and Draught Excluders.*

This relates to a device forming a combined window fastener and draught excluder, which consists of a lateral bar with screw stem and operating thumb screw housed in the top bar of the lower window sash and adapted to be moved outward into a corresponding groove in the adjacent bottom bar of the upper sash in such a manner as to lock the sashes and prevent draught between these bars.

14,288 of 1905.—F. D. JACOBS: *Building Materials for Roofing and like purposes.*

This relates to a roofing material comprising a base or body portion consisting of a sheet of annealed steel and a protective layer of asbestos sheeting on each side of said piece, said asbestos being united to said base by a uniting material composed of rubber solution and asphalt.

15,132 of 1905.—S. BROADBENT and A. STEPHENS and F. D. JACOBS: *Chimney Pot or Top.*

This relates to a chimney pot or top of the kind in which an outer cover is supported over an inner pot or top in such a manner that the air or wind can enter through the bottom and pass up through tapered air passages between the inner pot and the cover, and consists in forming the square lower portion of the inner pot with claws or lugs at its corners to support an outer cover,

and with inclined air admission conduits or apertures between the said claws or lugs.

22,310 of 1905.—S. E. PAGE: *A Socket for Securing Bolts in Walls.*

This relates to a socket for securing bolts in walls, and consists of a bolt anchor section formed with a plurality of interiorly transversely corrugated portions and a plurality of exteriorly corrugated portions, said portions being alternately disposed, the exteriorly corrugated portions being of the greater diameter.

2,629 of 1905.—J. SOUTHERN: *Receptacle or Vessel for Use in Supplying Disinfectant in a simple and Economical Manner to the Water Discharges or Flushes from Cisterns of Water-Closets and the like.*

This relates to a receptacle or vessel for supplying disinfectant to water discharges from cisterns of water-closets and the like, consisting of a bottle of glass or other non-porous material formed with an aperture or apertures on or near the shoulder of the bottle and with or without a perforated cap or stopper.

13,164 of 1905.—J. CRAWFORD: *Interlocking and interchangeable Hollow Blocks for Breakwaters and the like, and Means for Connecting them together.*

This relates to an interlocking and interchangeable hollow block having upon the exterior faces thereof projections in the form of dovetails, half dovetails, or squares, provided with ducts or grooves and ports or slots, by which the blocks may be connected together.

17,602 of 1905.—J. NISBET: *Construction of Composite Beams and Columns for Use in Connection with Fire-proof Building or other Fire-proof Constructional Work.*

This relates to a composite beam or column made up of two or more lengths of corrugated iron or steel, arranged to present a series of tubes or tubular formations communicating with each other, in conjunction with concrete filling.

19,317 of 1905.—J. NISBET: *Formation of Supports for Concrete Floors, Ceilings, and Walls.*

This relates to a fire-proof support for floors, ceilings, or walls, and consists in the provision, in conjunction with an iron or steel support of corrugated section, of the rods situated in the depression of said beam and adapted to be surrounded by concrete or cement run in in semi-liquid form.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

Table listing property sales including locations like Leytonstone, Park Grove, and Bow, with prices and details.

Contractions used in these lists.—F.g.r. for freehold ground-rent; l.g.r. for leasehold ground-rent; l.g.r. for improved ground-rent; g.r. for ground-rent; r. for rent; f. for freehold; c. for copyhold; l. for leasehold; p. for possession; s.r. for estimated rental; w.r. for weekly rental; q.r. for quarterly rental; y.r. for yearly rental; a.v. for avenue; g.m. for garden; yd. for yard; gr. for office; b. for beerhouse; p.h. for public-house; o. or offices; s. for shops; c. for court.

MEETINGS.

- FRIDAY, JANUARY 10. Architectural Association.—Mr. F. Lynn Jenkins on "The Consideration of Sculpture by Architects." 7.30 p.m. Royal Institution.—Professor J. J. Thomson on "Some Applications of the Theory of Electric Discharge to Spectroscopy." 8 p.m. Institution of Mechanical Engineers.—(1) Discussion to be resumed and concluded on paper on "The Behaviour of Materials of Construction Under Pure Shear," by Mr. E. G. Izod; (2) Mr. Robert A. Bruce on "Worm Contact." 8 p.m. SATURDAY, JANUARY 20. Builders' Foremen's Association.—Twelfth annual dinner, King's Hall, Holborn Restaurant. 6.30 p.m. MONDAY, JANUARY 22. Royal Institute of British Architects.—(1) To read the deed of award of prizes and student medals for 1905-6. (2) Papers on "Metalwork," by Messrs. J. M. Swan, R.A., Montague Fordham, and Walter Oilbert. 8 p.m.

Liverpool Architectural Society.—Mr. T. T. Rees on "The Laying-out of Streets, Buildings, Open Spaces, Parks, Planting of Trees, Advertising Hoarding, and Smoke Nuisances." 6 p.m.

TUESDAY, JANUARY 23. Royal Institute of British Architects.—Annual Exhibition of Designs and Drawings submitted for the Institute prizes and studentships, in the gallery of the Alpine Club, Conduit-street, 10 a.m. to 8 p.m. (Close on February 3.) T. Square Club.—The first meeting and invitation supper to be held at the "Monico" Restaurant, Rogen Street, Piccadilly-circus, W. 8.30 p.m. Institution of Civil Engineers.—Discussion of papers read at previous meeting. 8 p.m.

WEDNESDAY, JANUARY 24. Society of Arts.—Dr. J. Nisbet on "The Planting of Waste Lands for Profit." 8 p.m. Edinburgh Architectural Association.—Mr. J. M'Kessack on "Architectural Photography," illustrated by lantern slides. 8 p.m.

THURSDAY, JANUARY 25. Society of Arts (Howard Lecture).—Professor Silvanus Thompson on "High Speed Electric Machinery, with special reference to Steam Turbine Machines," II. 8 p.m. London Institution.—Mr. Maurice N. Druceur, M.A., on "Legal History of Trades Unionism." 6 p.m. Institution of Electrical Engineers.—Mr. F. W. Carter, M.A., on "Technical Considerations in Electric Railway Engineering." 8 p.m.

FRIDAY, JANUARY 26. Junior Institution of Engineers (Westminster Palace Hotel).—Honorary members' lecture, during which Professor "Notes on Boiler Trials," by Professor J. D. Cornack, F.R.C., 8 p.m. Institution of Civil Engineers.—(Students' meeting.) 8 p.m.

SATURDAY, JANUARY 27. Junior Institution of Engineers.—Visit the engineering laboratories of University College, during which Professor Cornack will demonstrate the methods of conducting a boiler trial. 3 p.m.

PRICES CURRENT OF MATERIALS.

Table listing prices for materials like Hard Stocks, Grizzlies, Facing Stocks, Shippers, etc.

Table listing prices for various types of bricks and blocks, including Glazed Bricks, Best White and Ivory Glazed, etc.

Table listing prices for various types of sand, including Thames and Pit Sand, Portland Cement, etc.

Table listing prices for various types of stone, including Bath Stone, Portland Stone, etc.

STONE (continued).

Table listing stone products like 'Scrapped random blocks', 'Hoop Stone', and 'Hopton Wood (Hard Bed) in blocks' with prices per cubic foot.

WOOD (continued).

Table listing wood products like 'Joistens' Poods', 'White Sea and Petersburg', 'Pitch-pine deals', and 'Compound Girders' with prices per standard unit.

ENGLISH SHEET GLASS IN CRATES (continued).

Table listing glass products like 'Fluted Sheet, 15 oz.', 'Hardley's Botted Plates', and 'Figural and Oxford Rolled' with prices per square foot.

OILS, &c.

Table listing oil products like 'Raw Linseed Oil in pipes', 'Turpentine in barrels', and 'Genuine Ground English White Lead' with prices per gallon or ton.

VARNISHES, &c.

Table listing varnish products like 'Fine Pale Oak Varnish', 'Superfine Pale Elastic Oak', and 'Eggsell Flattening Varnish' with prices per gallon.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications...

JOISTS, GIRDERS, &c.

Table listing joist and girder products like 'Rolled Steel Joists', 'Compound Girders', and 'Iron' with prices per ton.

METALS.

Table listing metal products like 'Common Bars', 'Staffordshire Crown Bars', and 'Sheet Iron' with prices per ton.

Table listing slate products like '20x12 best blue Bangor', '20x12 first quality', and '20x10 best blue Port' with prices per 1000 or 1200 at r.d.

SLATES.

Table listing tile products like 'Best plain red roofing tiles', 'Hip and Valley tiles', and 'Best Ornamental do.' with prices per 1000 or per doz.

WOOD.

Table listing wood products like 'Deals: best 3 in. by 11 in. and 4 in.', 'Battens: best 2 1/2 in. by 7 in.', and 'Foreign Sawed Boards' with prices per standard unit.

TENDERS.

Communications for insertion under this heading should be addressed to 'The Editor', and must reach us not later than 10 a.m. on Thursday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner...]

LEAD, &c.

Table listing lead and other metal products like 'LEAD—Sheet, English, 3lb. and up.', 'Pipe in coils', and 'Zinc—Sheet' with prices per cwt.

ENGLISH SHEET GLASS IN CRATES.

Table listing glass products like '15 oz. thirds', '21 oz. thirds', and '26 oz. thirds' with prices per square foot.

Table listing tender notices for reconstruction work, including names like 'BOLSOVER', 'BRAINTREE', and 'Mason & Son' with details of the work and contact information.

MOULE'S PATENT EARTH CLOSET COMPANY, LIMITED.

This Business, having been ESTABLISHED 40 YEARS, has all the experience that time and thought can give and ingenuity can devise in producing the

Most Perfect Earth Closet.

Where used there is no danger of typhoid fever. The Company has obtained A NEW PATENT, 1905, For further improvements, making its apparatuses

The Perfection of Earth Closets

Without increase of prices. They have been awarded Gold Medals and other Highest Prizes ever given for Earth Closets. BEWARE OF INFERIOR AND UNRELIABLE IMITATIONS.

They are also especially suited for buildings and places below the level of drains and outfalls, and also where there is difficulty in obtaining a water supply. Testimonials of their value in these respects can be seen at the Company's Offices. They are well made and finished, in plain and in elegant woods, and can be fitted in any position inside or outside Mansions, Cottages, Schools, Hospitals, and Workshops. They are supplied to Camps, and for use on board ship. They have been supplied to Windsor Castle and Sandringham. Over twelve thousand have been supplied to Departments of H.M. Government. When they are required temporarily the Company will contract for lending quantity, and will fix them if necessary.

On view at the Company's Address. Descriptive illustrated pamphlets and particulars sent post free.

Students' Designs: Institute of Architects.

THE drawings sent in by the students for the various prizes given by the Institute of Architects are at present on view in the large room at the Alpine Club; and a very

fine collection they make. The two most interesting and significant sets are always those submitted for the Soane Medallion and the Tite Prize, as these alone represent the original treatment of an architectural problem, the other competitions representing diligence and accuracy in the study and representation of existing work, except the Grissell Medal, which is mainly given for drawings showing knowledge of construction, though the question of design unavoidably enters into it to some extent.

The subject for the Soane Medallion—the realisation of the ideal mansion described in Bacon's essay "Of Building," was first suggested in a paper read some years ago before the Architectural Association by the editor of this journal, whose recommendation of it was accepted by the Council last year, and who has every reason to be gratified with the result. The subject has evidently proved an attractive one, and has brought out a good deal of very clever and meritorious work, besides that shown in the two sets which have gained prizes. Mr. W. S. George, to whom the medallion has been awarded,

has been evidently and confessedly influenced by John Thorpe, whose name he has adopted as his motto, and whose rhyming propensities he has imitated in a distich in the corner of one of his drawings—

"These 7 drawings that you see,
Though not all I would have them be,
I hope will win the Soane for me."

There is a calculated archaism in the style of the drawings and the writing on them, which does not affect the design in any way, but which is a picturesque and perfectly harmless fancy in a competition of this kind. There can be no question that the award is the right one, as among the two or three which may be considered to be before the rest in architectural quality, this is the only one which properly realises the idea of a building which, however sumptuous in character, must still have something of the character of domestic architecture, and impress itself upon us as a dwelling, though a palatial one. In fact, in regard to general style and treatment, it comes remarkably near to representing what Bacon probably had in his mind; though there are two points of detail which do not quite accord with the language of the essay. Bacon undoubtedly speaks of "a great and stately tower in the midst of the front," an expression which has misled some of the competitors into producing designs which suggest a town-hall rather than a mansion; but on the other hand, Mr. George's rather small cupola or turret, though it is perhaps what would have been most likely to be built in the reign of Elizabeth, does not agree with

Bacon's actual expression. Then we do not see quite sufficiently emphasised the "two delicate and rich cabinets" which were to be placed at the further side of the building, "by way of returns," i.e. they were to be projections from the main line of building, in one or another direction, it is not easy to say which. There are rooms with projecting bays, near each corner of this portion of the plan, which may be held to answer for these; but they are not sufficiently emphasised; they were evidently intended to be marked features in the plan, and several of the other competitors have recognised this and treated them accordingly. But these two inaccuracies, or discrepancies with Bacon's description, are not sufficient to counteract the fact that this competitor has best realised the general spirit of Bacon's ideal, besides showing, in the perspective especially, an exceedingly fine architectural conception.

Mr. Atkinson's design, which receives an Honourable mention and ten guineas, is in some respects a very fine one, and he has followed Bacon correctly in the provision of the special "cabinets," which are placed as indicated in the essay; he also has "a great and stately tower in the midst" of the front; but it errs on the other side, in being massive and castellated—too like a "keep." The main front, with a range of lofty mullioned windows in four tiers, and large circular windows adorned with massive swags over them, has a very fine and broad effect, and the pencil drawing which shows it in

perspective is a capital piece of work; but the whole has too much the appearance of a public building. The greater part of the plan is designed in the modern fashion, with a corridor round the quadrangle on the sides next the courtyard, except in the cross block, where there are rooms on both sides of a central corridor, which latter must be very insufficiently lighted. This and some others of the plans show that the competitors have not quite appreciated Bacon's meaning when he says "Let all three sides be a double house without through lights on the sides, that you may have rooms from the sun, both for forenoon and afternoon." He did not think of a central corridor, with rooms on each side; that is a modern idea; he simply meant two sets of rooms, the uses of which were to be so disposed that one could with as little inconvenience as possible be made a passage to the next; as we see at Burleigh House and other such XVIth century mansions. The author has shown a fine lay-out of the ornamental gardens in his block plan. His forecourts, except the third one next the house, are very large, and in connexion with the second one, which is laid out with a circular walk and intersected by cross walks at right angles, he has provided for those "offices" which Bacon dismisses so summarily in the last sentence of the Essay, by a "stable block" on one side of the green and a "laundry block" on the other; both forming small courtyards.

The author of the design distinguished by a red fly in the corner shows a very good plan, and has understood Bacon's meaning as to the double sets of rooms. In the general character of the design, the faces towards the courts especially, he seems to have been influenced by Hampton Court—the Classic, not the Wolsey portion; the exterior design is correct and dignified but rather cold, and the perspective view does not make the best of it. The large tower is effective in itself, but again a little too municipal in appearance; the design as a whole, however, is more that of a mansion for habitation than that of Mr. Atkinson, but it is certainly not so architecturally interesting. "Regal," in general aspect, is simply a Town Hall. "Palazzo," though weak in plan, is a design with a good deal of architectural merit, as judged by the perspective view; it is somewhat bare and heavy in character, and wants what is called "pulling together," but it has a distinctly marked architectural character of its own, and the author has in this case contrived to provide a large and massive tower which is not municipal in character, but belongs to a mansion. "Peruzzi" is a very modern plan, and suggests a large hotel; it is a masonic classic design with a rusticated ground story and an order above; in connexion with which architectural ordinance one is rather surprised to see a square brick tower rising over the centre, crowned with a stone lantern and cupola; this brick tower is an excrescence in any sense, whether we regard the building as private or public—it has more the appearance of the latter. The tinted elevation is a credit to the author, as are the drawings generally. "Fraxinele"

only shows a plan of one floor, which is a good one and quite after Bacon's idea, and his design is domestic in character, but in this case the design errs in not being palatial enough for the idea of a princely residence; it rather suggests a very large rambling country house which has been added to at different times; still there is a great deal that is picturesque and interesting in the perspective view, and the plan shows a good arrangement of the offices in two quadrangles at some distance on each side of the house, "and with some low galleries to pass from them to the palace," exactly as described in the essay.

For the Tite prize also a most attractive subject has been set—"An Open Air Swimming Bath," to be designed according to the principles of Palladio, Vignola, Wren, or Chambers. Is "principles" the right word to have used? The principles of architecture on classic models are much the same in all its variations of detail; "according to the practice" would have been the better term. In designing a structure of the kind indicated an important point is that its external treatment should convey the impression of an open-air structure; that is to say, the architectural surroundings should give the impression of a screen rather than of a building. The general merit of the designs is very high, but some of the competitors have made the mistake of producing designs which, viewed from the outside and from the ground level, would convey more the impression of a roofed building; the bird's-eye perspectives show that they are not so, but that would be the impression produced on the spectator by the actual building, at first sight. Mr. A. G. Horsnell, to whom the prize has been awarded, has entirely avoided this; his design is, in fact, the most distinctly open-air one of any of them, and in its treatment evinces no little natural architectural genius. His bath is in the midst of a very large enclosure defined by a columnar semi-circular screen sweeping round one side of the area, with the pavilion entrances at the starting of the curve; at the other side is a large erection on a slightly curved line, containing a lofty bank of seats for the spectators, with the bath, a long parallelogram, below them, forming the chord of the arc. On the side of the large bath furthest from the spectators is a smaller circular bath with a fountain in the middle, the circle being concentric with that of the large colonnade which forms, as observed, the boundary on one side of the enclosure. The small bath has two large pedestals for sculpture, built on lines radiating from the centre. The effect of the collection of erections, with its play of curved lines, is exceedingly fine, and is shown in a large pencil perspective which, though not highly finished, shows a fine freedom in drawing. We do not perceive anywhere in the plan or section any distinct provision for dressing rooms, though it is easy to see where they might be got in, beneath erection for spectators. But the whole design is unquestionably the best thing sent in, and is a great credit to its author.

Mr. C. L. Wright, who receives an "Honourable Mention," adopts a nearly

square form for his main erection, the bath being a long rectangle and the spaces for seats filling up the square on each side of it. His design is also of the nature of a screen erected round the bath, with two orders on it, Ionic above, and a form of Roman Doric below, the capital of which we do not like though there is precedent for it. The design generally is marked by a classic correctness and finish, though hardly by genius or originality; it represents very well, however, what Tite intended by his bequest, which was to encourage the study of Italian architecture. Mr. C. E. Pearson, who receives a medal of merit, adopts an elliptical plan of bath, the ellipse being expressed both internally and externally; the exterior screen forms a loggia with coupled columns, following the line of the ellipse, and interrupted at four points by square projecting pavilions which form the entrances. The effect would have been better if these pavilions had been treated in a rather more broad and simple manner, and on the same architectural scale as the rest; as it is, they do not seem quite to belong to the composition; but the general conception is a good one.

"Fiat Lux" is an ambitious design with a very clever perspective, but it is overdone with architectural erections, with a large dome at each end with a colonnaded hall beneath it. These halls would have a good effect in themselves internally, but the whole design has more the effect of a building—a town hall or something of that kind, than an architectural screen to a bath. The side colonnades, it is true, are open, showing the bath through; but it is overbuilt, and the bath compartment becomes rather the secondary than the principal feature. "Aristobulus" is a design properly treated for the subject, and the internal pavilion at the end of the bath and projecting partly into it is well managed architecturally. "Pleiades" has some effective points in the internal treatment, but his arrangement of dressing boxes and entrances to the swimming bath for "ladies" and "gentlemen" at opposite sides seems to contemplate the use of the bath by both sexes simultaneously, which is hardly "within the range of practical politics." "Bo'sun" has the right idea for the architectural treatment, with the open colonnaded screen at the top of the range of seats, but the details are not very good, and his elliptical plan of the bath is too narrow and has too sharp a curve at the ends; in other words, the foci are too near the end of the axis. "Hodden-Gray" is not a very good design as a whole, in particular the square blocks of building containing retiring rooms cut very awkwardly into the curve of the bath at one end; but he deserves mention for an effective planning of the dressing rooms, which are arranged around four semicircular halls in the basement, opening off the margin of the bath and partly screened from it by columns, so that the dressing boxes themselves are kept quite out of sight (as in a monumental bath of this type they should be), and are yet conveniently placed for access. "1905" shows rather a fine design for a straight-sided bath with circular ends,

the straight portion flanked on one side by an entrance pavilion with a cupola, and a large flight of steps at the base. "Aqua" shows a very respectable two-story design of Palladian character, with an open arcade round the bath, and he introduces, not unsuitably, an impluvium over the entrance hall to the establishment. "A.D. 1906" is a meritorious design which would have been done more justice to by a better-drawn perspective view; the bath is in an enclosure which is a parallelogram with rounded ends, with projecting halls at the sides defined by screens of piers and columns, the piers bearing decorative tablet for inscribing the names of victors in the races. Internally, on the chord of the end semicircles and on the axis of the bath, is a large pedestal at each end over the reception of a group of sculpture. "Cui Bono?" is a very clever and original design, which is a credit to its author; but as its architecture is based on mixed elements of Greek Doric colonnades and adaptations of Egyptian pylons, it does not come properly within the programme of the competition. "E Pluribus unum" is a design on the proper kind of lines, with an open colonnade round the bath, and a kind of narthex across the end, terminating in a semi-circular colonnade at each end; but the position of the dressing-boxes at the farther side of this narthex is putting them a great deal too far from the bath. "Michelange" shows a plan in the shape of a rather wide parallelogram with rounded angles—not a beautiful shape, but the double colonnade along each flank of the bath has a good effect, and the whole thing looks well in the perspective view.

In the Grissell Medal competition architectural design is not the most important point, though at the same time we do not think that the medal should be given for a design which was thoroughly bad architecturally, on account of cleverness in construction; nor do we remember that this has ever been done. In the present case Mr. G. Nott's design, to which the Medal is awarded, is architecturally the only one that is really good; the bridge is very simply treated, but in perfectly good taste. "Nil" shows a nice-looking bridge in a good pencil drawing, and we do not know that there is any other design that is worth mention on purely architectural grounds. From the constructional standpoint the drawings submitted possess various degrees of merit. The design to which the gold medal has been awarded has been well worked out, the sheet containing the graphical determinations of the line of resultant pressures in the arch ring and abutments, and the development of the arch soffit, being particularly worthy of commendation. While quite agreeing with the justice of the award, we may point out that the abutment shown in the half longitudinal section of the bridge appears to contain an unnecessary amount of material at the outer top corner, which might have been sloped off or stepped back to a greater extent without impairing the stability of the structure. The abutments are not represented in a separate drawing, but from the general plan it is evident that they are based upon the principles

generally adopted in the design of skew arches, and about the accuracy of which there is now some doubt. Although the drawings under the motto "Catenary" do not include a sheet giving graphical determinations, they are noteworthy for the reason that the arch has been designed in accordance with the theory of Professor Kerol of Melbourne, which shows that the principles adopted by Rankine for the design of skew arches are not correct. There is much to be said in favour of the new theory, and if "Catenary" had submitted full particulars of the means by which his design was evolved his chances of securing the medal might have been considerably improved, for the construction itself is decidedly good. The other sets of drawings by "R." "Bydand," and a second "R" also deserve praise, for an evident knowledge of the essentials of arch construction and for the careful manner in which the calculations for stability have been made, but limits of space will not permit us to deal in detail with the distinctive features of each design.

The Arthur Cates prize is awarded to Mr. John H. Markham, among whose drawings figures a very agreeable and suitable design for a "Town Hall or Public Offices for a small Town," in which he has contrived to give the character of a municipal building while preserving an appropriate simplicity of style and treatment. He also shows two finely executed detail elevations of parts of Hampton Court Palace. The drawings for the Pugin Studentship cover the whole of one wall and half the end wall, and show a great amount of interesting illustrative work. The Studentship is awarded to Mr. G. Drysdale for a varied set, which show not more work, but more style in drawing (pencil drawing especially) than any other. Mr. J. S. Richardson sends some good work; Mr. Jordan Green receives an Honourable Mention for a set which includes much clear and careful pencil drawing, of the kind that are accurate rather than effective; Mr. Morison has careful drawings of the screen at Aberdeen University and the sedilia at Furness Abbey; and Mr. W. S. George, the winner of the Soane Medallion, shows a good set of Pugin drawings, including large tinted drawings of the central pillar in the porch at Amiens, with its well-known sculptured Christ; also drawings of the lavatory at Fountain Abbey.

The measured drawings for the Silver Medal are also numerous and of a high average of excellence. Mr. G. Coombs gains the medal mainly by a set of fine drawings of Christ Church Priory. Mr. A. E. Poley also receives a medal (*ex æquo* apparently) for a set of drawings of Hampton Court; and an Honourable Mention is given to Mr. Percy W. Lovell, whose principal subject is Sta. Maria dei Miracoli at Venice. Wren's Orangery at Kensington is the subject of three different sets, of which "Auspicante Deo" is the best. There is a fine and careful set of St. Stephen's, Walbrook, signed "Reflex"; drawings of St. Mark's Library by "Sansovino"; and drawings signed "Fiat Lux" of the Grand Trianon, not a very inspiring subject, though interesting as an unusual choice.

In regard to the drawings for the Owen Jones' Studentship the examiners seem to have had so much difficulty in deciding on relative merits that they have come pretty near to giving prizes all round. The actual Studentship is awarded to Mr. Charles Gascoyne, whose drawings, though less showy than one or two other sets, have a delicacy and refinement of the highest kind. He shows details from San Vitale and other buildings of renown in Italy, and various water-colour sketches of what may be termed architectural landscape and of separate buildings—Sta. Maria in Campitella, Rome; the façade of Villa Papa Giulia, etc. Prizes of five guineas are awarded to Mr. A. D. Nicholson, Mr. A. R. H. Jackson, and Mr. W. J. Davies, all of whom have many fine and elaborate coloured drawings to show. Those of Mr. Davies are perhaps the best; among them is an admirable drawing of the decoration of a doorway at Siena, the colouring of the marble very well rendered, and one of the sculptured holy water stoup in the same cathedral, backed by three or four courses of the black and grey bands of one of the piers, making a very effective combination.

Taking the collection of drawings as a whole, we do not remember that the Institute Students have ever shown a better record than this year.

AN EMINENT BERLIN ARCHITECT.

AS we mentioned under the heading of "Magazines and Reviews" a fortnight ago, the *Berliner Architektur-welt* has issued a special extra number on the work of the eminent Berlin architect, Herr Alfred Messel. As the publication was sent to us accompanied by a note inviting our special attention to it, we thought it would be of interest, instead of merely giving a written description, to reproduce a few of the numerous illustrations of Herr Messel's architectural work, and we have therefore deferred further mention of it till we could illustrate it in this manner.

Herr Messel is a native of Darmstadt, but his professional career has been chiefly connected with Berlin. He studied at the Bau-Akademie of Berlin, where he came under the influence of such teachers as Strack and Bötticher. Later he was elected Professor of Architecture at the Berlin Technical Schools, and was afterwards appointed a lecturer at the Kunstgewerbe Museum. As a young man Herr Messel was distinguished by the thoroughness of his work, and attained the general recognition which he now enjoys, as the result of patient and careful study of the problems of architectural design and construction.

It seems to be agreed that the most remarkable building he has carried out is the Wertheim warehouse, an establishment which is said to be to Berlin what Whiteley's is to London, but has been made much more important in an architectural sense. On one of our lithograph sheets we give a general view and two portions of the details of this building, reproduced from the illustrations of our Berlin contemporary. How far English architects will sympathise with

Details of Carving, Wertheim Warehouse, Berlin.

the style of this building may be doubtful; there is probably rather too much of "L'Art Nouveau" about it for some of us; but we think no one can deny that it possesses one of the most important qualities that a piece of modern architecture can have—viz.: that it is unquestionably interesting; far more interesting than many a piece of correctly designed architectural commonplace. As the building extends over a great deal of ground and faces at different points to various streets, it seems to have been the aim of the architect to render it as multifarious as possible, and to make it a kind of free fantasia in architecture, presenting different aspects at different points. The plan of the building will be found on the page devoted to "Illustrations," and we give also here some examples of the carved ornament with which it is decorated.

The classically treated doorway to a school building at Berlin shows, however, that Herr Messel is not committed to eccentricity in architecture, and can design on scholastic lines when it so pleases him. More interesting than this, however, to us, is the entrance to a stable building (page 84), with its rough rusticated work in the doorway, and the big scrolls above which serve to remind us that an architect has been at work here.

These, however, form a very small proportion of the work illustrated in the special number of the *Berliner Architektur-zeitung*, which English architects would do well to procure.* They will find in it numbers of illustrations of exteriors,

interiors, and decorative detail, all, whether or not one agrees with the taste of it, the work of a vigorous and original mind in architecture. Among the works of Herr Messel are the museum at his native town, Darmstadt; the Berlin Post Office buildings, the Chamber of Commerce, the Coln-Uppenheim Palace, etc. The Darmstadt Museum forms the frontispiece to the number; it is a quiet building in a very sober style of classic, but with a distinct originality; the only thing we do not like about it is the rather ungainly shape and outline of the roof over the central entrance. A good many small dwelling-houses are included in the illustrations, as well as street houses and mansions of a more important class. Among these a classically treated house in the Victoria-strasse is worth attention, not only for its general design but for the number of interesting decorative details which are illustrated; also the "Landesversicherungsanstalt" in Berlin (the Germans are terrible people for long compound words), with its interesting sculptured details, internal and external.

We are glad to take the opportunity of calling attention to the work of a very original German architect, and also to a notable example of the journalistic form of what is sometimes called in London "a One-Man Exhibition."

COLLEGE OF SCIENCE, SOUTH KENSINGTON.—The President of the Board of Education has appointed Professor W. W. Watts, M.A., F.R.S., of Birmingham University, to the Professorship of Geology at the Royal College of Science, South Kensington, vacant by the retirement of Professor Judd. Professor Watts was a Fellow of Sidney Sussex College, Cambridge, from 1888 to 1894, and a member of the Geological Survey from 1891 to 1897.

NOTES.

In our Note of October 14 last we referred to the fraudulent devices adopted by certain Belgian cement makers in marking their products so as to lead purchasers to believe that they are buying the British-made Portland cement, a reprehensible practice which is encouraged by the action of the Customs Authorities in permitting the importation of foreign cement without the warning obviously intended by the Merchandise Marks Act. A good deal of the foreign material so placed upon the British market is not Portland cement at all, but "natural cement," which is admittedly of very inferior quality, and, owing to its low price, has found extensive sale in the United Kingdom. Of course, in some cases it may happen that the rock employed in the production of natural cement may be more or less correct as to chemical composition, but there is no guarantee that this will be the case as the process of manufacture does not include methods of scientific control, or any attempt to regulate the proportions of the ingredients. It may be asked if the material in question is of such inferior quality why those concerned in its sale are able to publish satisfactory results as to its tensile strength. From a pamphlet issued by the Associated Portland Cement Manufacturers it appears that the answer is very simple, namely, that samples of cement are prepared for advertisement purposes from specially selected rock,

* It is published by MM. Ernst Wasmuth, of Berlin.

but that these do not truly represent the bulk of the cement afterwards delivered, nor do they afford any criterion of its quality. Considering the endeavours that are being made by British architects, engineers, and manufacturers to improve the quality of Portland cement, it is much to be regretted that the nefarious methods of business to which we refer should be countenanced at all in this country, and especially by those upon whom devolves the duty of seeing that the provisions of the Merchandise Marks Act are properly carried out.

In a paper read before the Electric Railway Institution of Electrical Engineers, Mr. F. W. Carter deals in a general way with the technical side of the electrification problem, leaving alone the larger questions of economic engineering and descriptions of apparatus and material. Even with this limitation the subject certainly provides ample material for a lengthy paper, and its importance is evident from the fact that the electrification of railways can only be undertaken after full technical investigation. The author takes chiefly into consideration continuous-current motors as applied to suburban services. It should be noted, however, that the single-phase and polyphase systems also receive attention. This is a point we are glad to observe, in view of the claims possessed by the single-phase system. Mr. Carter discusses the features of four classes of railway services all differing in their requirements with respect to rates of acceleration and speed, behaviour on grades, and maximum speeds attainable on the level. We quite agree with the conclusion that the chief immediate development of railway electrification is to be expected in urban and suburban districts. There is also a good opening on branch and inter-urban lines for electric train services conducted by means of single cars or short trains run at fairly high speeds and at frequent intervals. As for main line passenger and goods traffic, it is somewhat doubtful at present whether general electrification would justify the great outlay involved. This is a matter upon which some engineers who are directly interested in electric traction may have something to say.

Heat Losses from Buildings and Radiators. THERE is undoubtedly need at the present time for more precise data as to the amount of heat dissipated through the walls and by way of windows, doors, chimneys, and ventilators of buildings. The consideration of this point occupies part of a paper read by Mr. A. H. Barker before the Institution of Heating and Ventilating Engineers; and with the object of obtaining information for the guidance of those who have to design and instal heating systems the author proposes a series of tests, to be conducted as far as possible under actual working conditions. In view of the somewhat doubtful character of the purely theoretical data given in many text-books, the idea is certainly a good one, and we are sorry that their financial position will not permit the Institution to vote the necessary funds for the purpose of undertaking an investigation of the kind. Of course, even if equipped with the most

reliable practical data, architects and engineers would still have to contend with a good many variable factors. But these must be present in any event, and the fact that they exist is no reason why the basis of calculations should not be as accurate as possible. Another matter discussed by Mr. Barker is the desirability of determining, for the various types of radiators on the market, the correct rate of heat emission under given conditions. This again is a subject well worth inquiry.

VENDORS and purchasers of real property should note the decision of the Court of Appeal in the recent case *re Nisbet and Potts Contract*. The vendor of certain land had purchased it in 1901 under a contract which provided that the title should commence with a conveyance dated August, 1890, which only showed a title by thirteen years' possession. The purchaser, hearing from some outside source that the land was subject, by virtue of a deed dated 1872, to restrictive covenants which would render the land useless for his purpose, requisitioned

the vendor, and the vendor relying on his purchase in 1901, when the existence of such covenants had not been disclosed to him, asserted that the land was not subject to the covenants, especially having regard to the thirteen years' title by adverse possession. The Court of Appeal has held, however, that those restrictive covenants are in the nature of negative easements binding, except on a *bona-fide* purchaser for value without notice, but—and in this lies the importance of the decision—such a purchaser must have required a forty years' title; the reason for this being that constructive notice will be assumed if the purchaser neglects to take this precaution. People anxious to buy a particular site are far too apt to waive a forty years' title, but if they do so the present case shows that they run a serious risk of finding their building schemes frustrated by some undisclosed restrictive covenants.

THE Annual Report by Mr. O. Claude Robson, the Engineer and Surveyor to the Willesden District Council, is, as

Doorway to School Building, Berlin.

Entrance to Stable Buildings, Margareten-Strasse, Berlin. (See page 82.)

usual, a long and ahy drawn-up document, forming a hook of more than 200 pages, and presenting a complete synopsis of the work in his department during the year. Among the points mentioned it is recommended that motors should be used for cartage of road material and watering roads. The necessity for rolling the roads becomes more pronounced every year, owing to the demands of cyclists, but, as the Engineer observes, "it is difficult to ensure every patch being instantly rolled over an area of 7 square miles, and upon roads nearly 70 miles in length." In regard to the prevalence of paper and other *débris* on the roads on Sunday mornings, Mr. Robson doubts if scavenging work in respect of this would justify the employment of such a number of men as would be required to carry it out; but it must be observed that this prevalence of rags of paper on the roads is a disgrace to most English municipalities (in London especially), and ought to be abated: we are glad to see it even referred to as a matter to be considered. The number of upcast ventilating shafts to the sewers in the district has been increased, and it is stated that these have proved very efficient as extractors of foul air. The sewage disposal is an increasing difficulty in the district, the capacity of the

precipitation tanks being at present 600,000 gallons, while the dry weather flow is 1,800,000 gallons, and it is proposed to construct eight additional tanks. Without this work it is feared that the present impervious land beds will become more and more useless for filtration purposes. The filling in of the old arm of the Brent, as far as it extends through the property of the Council, is recommended to be carried out during the present year; "at present it is a stagnant elongated pool, of no great utility, and at times threatening to become a nuisance." The work, it is suggested, might be allocated to the unemployed. The following remarks are worth attention by borough authorities generally:—

"The sewer proper still remains approximately under the centre of the Tramway. In London, with large brick sewers and the frontages of streets fully developed, but little necessity to open ground over sewers need occur, but should it be necessary at any time to obtain access to pipe sewers, such as those that so largely exist in Willesden, at any other point than by the side entrances, great difficulties will be encountered, as the excavation of a shaft within the boundaries of the Tramway line will be almost impossible, and access to the sewer must consequently be obtained by tunnelling if possible, in order to avoid disturbance of the line. Thus one more obstacle is added to the many now existing in our main roads where the ground has to be opened for public purposes, the larger area being monopolised by Gas, Water, Cables, and Tramway undertakings. It is greatly to be regretted that powers are not given to compel the construction of proper

brick subways in all streets of any importance, the cost being defrayed by all those who would be benefited by the work both in the present and in the future."

Village Halls. We have more than once called attention to the necessity in large villages of a public village hall in which meetings of any kind can be held. The recent General Election has in numerous instances shown the need for these buildings. Political meetings are out of place in the elementary schools, and are troublesome in causing disarrangement of desks and furniture. In every village there is a constant need for a hall, but at such a time as a General Election this need is emphasised and made more apparent. We certainly hope that some legislation may be introduced to give parish councils power to buy land compulsorily for the purpose of village public halls, and to borrow money for the purpose. Such a hall would form a centre of local life, and give opportunities for its expression, and it is by such means that rural life can be made more interesting. Everything that tends to give interest to it tends also to keep the countryman on the land.

Stationers' Almanac, 1906; and a View in London. THE almanac for the current year issued by the Stationers' Company is illustrated with a reproduction of J. H. Nixon's drawing, engraved by Henry Wallis, of the prospect from the east end of the Poultry as it appeared seventy years ago. The view embraces Soane's Bank of England, with Wren's Church of St. Bartholomew-by-the-Exchange in the background, since replaced by Cockerell's Sun Fire office; the triangular block—(old) Bank-buildings—which remained until 1843, where is now Chantrey's equestrian statue of the Duke of Wellington, behind which appear portions of E. Jerman's Royal Exchange as completed by Cartwright and burned on January 10-11, 1838; and, in perspective, Cornhill, Lombard-street, and King William-street as laid out by William Mountague, the City Architect, in 1824-30 for an approach to London Bridge. The view should be compared with T. Malton's aquatint of 1781, which is reproduced in our number of December 23, 1899, and delineates the offices, with a Classical front, erected by Sir Robert Taylor at the angle of Bank-buildings for the lottery office of Richardson, Goodluck, & Co. A plan of the buildings, signed and dated by Sir John Soane in March, 1802, is preserved in a portfolio of his drawings, etc., in the Soane Museum. At the angle of Cornhill and Lombard-street appear the old offices of the London and Liverpool and Globe Insurance Company, recently rebuilt for them after Mr. J. MacVicar Anderson's designs. The former offices of the insurance company on that site were built after the demolition, by Mountague, of two or three houses on the south side of Cornhill, including No. 1, latterly known as "Lucky Corner," Pidding's lottery office, which had been occupied by Thomas Guy, publisher and bookseller, a benefactor of St. Thomas's Hospital and founder of Guy's Hospital, Southwark. In Nixon's drawing the then proposed statue of the Duke of Wellington is placed on the site of "Lucky Corner."

The present exhibition at Messrs. Tooth's Gallery is not quite a new one, for several of the more important pictures—Bouguereau's "Offrande à l'Amour," Fr. D. Farquharson's "Summer," Chreyer's "Chevaux de Poste en l'alachic," M. Dagnan-Bouveret's "Sihylle," and M. Israels' "The Day before the Departure"—were in the same places in the last exhibition, and were noticed by us at the time. Among the oil-paintings there is a beautiful little Corot "Twilight" (47), and a large picture by Clays, "The Zuyder Zee—Calm" (48), which represents this painter's one effect at its best. The collection of water-colours in the small room is, as far as we remember, new, and contains one thing which is alone worth going to see—Alfred Hunt's exquisite drawing entitled "When Summer Days are Fine" (33), which we remember years ago in one of the Society of Water-colours' Exhibitions, and have not seen since. This is a drawing so ethereal in its representation of foliage and hills in the brightest sunshine, that one loses the sense of it being painted on paper; the mechanism of execution disappears; it is almost as if Nature herself were, so to speak, melted down on to paper. It is curious that the owners of the Gallery do not seem to understand the value of this work, which is the gem of their water-colour collection, or they would not have put it close to the floor and hung far inferior works on the line. Among the other water-colours are a fine free sea-piece by Mesdag, "Dutch Pinks" (1); a landscape and horses, "Ploughing" (4), by A. J. Grønewegen (a name new to us), which is notable for its delicate colour effect; two large drawings by Mr. North "View on the Darenth" and "January in Algiers" (27, 28), hung in a very bad light, but fine works, apparently painted a good while ago, as they do not exhibit the artist's present very strongly-marked style; two or three good landscapes introducing buildings by C. De Windt (not to be confounded with De Wint); a very conscientiously finished coast scene in an old-fashioned style (42) by Mogford; two examples of Prout in his best manner (30, 40); David Cox's "A Welsh Valley" (32), fine and broad in its general treatment of the landscape, but curiously old-fashioned in its foreground; and two street pictures, "The Hague" (17) and "Amsterdam" (26) by K. Klinkenherg (another name new to us), which are admirable of their kind, and remind one of Van der Heyde.

At the Gallery of the Society of Fine Arts is a fresh collection of garden pictures by Mr. Elgood, who has made a reputation in this class of subject, which the present exhibition entirely maintains, though one feels that it is possible to get a little tired of garden pictures, or at least that a whole room full of them becomes a little monotonous, though all are good taken separately. Among the best in this collection are two of "Cawdor Castle" (6 and 18), in which the mass of the castle, rising above the trees, is hacked

by white cumulus clouds which greatly assist the composition. "Barncluth: Cat's Castle" (9) is a highly-finished drawing of one of those old gardens with clipped trees cut into huge rounded masses, which are more curious than beautiful; another of "Barncluth" (27) is good, and "The Fountain. Murthly" (12), and "Villa Borghese" (37), with its statues and foliage under a tenderly-painted sky. Among the largest and most effective drawings is that of "La Vasca dell' Isolotto, Boboli Gardens" (60). Some small drawings of general landscape, chiefly Italian, are added to the collection; among which two or three small and delicate views of the "Isola dei Pescatori" (61) are very charming, and there is an interesting little view of "Pisa" (23) seen from rising ground beyond the town, with the well-known forms of the baptistery and the leaning tower peering at a distance through the trees.

We are glad (and agreeably surprised) to learn from a letter in the *Times* that the efforts of the National Art-Collections Fund to secure this fine work for the nation have been successful. Three thousand pounds, it is true, is yet required to make up the price, but this sum Messrs. Agnew have given the Society time to collect, and we may assume that there is little doubt that it will now be collected. But that the purchase of such a work, which would otherwise probably have gone out of England for good, should have been left entirely to private enterprise without any assistance from public funds, is not creditable to the country.

ROYAL ACADEMY LECTURES.

MR. CLAUSSEN'S fourth and last lecture, delivered on Thursday last week, was on the much-vexed question (in the present day) of "The Relative Importance of Subject and Treatment." Pictures, he said, might be considered on various different grounds—as to the subject, the drawing, or the colour. Success in regard to any one of these elements would justify the existence of a picture, but the highest excellence could only be realised by success in all three. Some people, painters especially, when they looked at a picture were chiefly occupied in studying it as painting; others looked at it for its sentiment; and there was often a want of accord between the painting and the sentiment, between the treatment and the subject. What relation ought there to be between the two? Well, he would say that a picture ought to be the result of a single impulse controlling both the subject and the treatment. That a picture told a story was not a sufficient excuse for its existence; nor was it sufficient to say that it told its story clearly; it must also have technical excellence, and it would live by that more surely than by its story, for the story might be forgotten or have ceased to interest, as they saw in the case of some of the paintings by old masters, but the technical excellence remained. Take the case of the picture by Velasquez which professed to represent Christ in the House of Martha; the treatment there was out of relation to the professed subject, for the figures were of quite secondary interest; it was really a Still Life picture and it only retained its value as such, for the painting of the foreground detail; and the professed story was merely an excuse for the painting. In the same painter's "Dead Warrior," on the other hand, the subject and the treatment were in true relation with each other; the treatment grew out of and assisted in the expression of the subject; even the incident of the candle going out and its smoke drifting away was symbolically in harmony with the subject. A picture was not better for being

without a subject; a picture which told a story interested a larger number of people than one that did not; and after all, pictures were made to be looked at. With artists, however, there was a certain antagonism in regard to subject and treatment. The relative importance to be given to either was a good deal a matter of taste. Painting seemed to have had its origin in a desire to express something in a better way than could be done by mere narration. Thus, early painting was essentially the story of Christianity; it was an expression. The idea of looking to the beauty of things seen, just for the sake of their beauty, only developed later. But should not the setting forth of a story in painting really be good for us? And as to method, where the painter was much possessed by his story, the method was the servant of the mind; he would find his own method for the best expression. They saw that in Blake, who was deeply impressed with his subject, and employed a method of expression entirely his own and derived from no one else. They might see the same in Rossetti's picture of the "Annunciation," a simple expression of a story, to which the method was subordinate. The old painters were masters of their methods and made them subserve the purpose of expression; the mere pleasure in appearance for their own sake did not then exist; the whole object was to express something; their minds were left free to do this without being hampered by considerations of method, and this was to a great extent the source of their charm. We saw very much the same characteristics in the drawings of children at the present day. He showed a painting of an old woman and a boy, executed by a schoolboy. Here they would see that the boy considered that a face as a whole was of a certain colour, and he put that colour all over it; he knew that the cloak was of a certain colour, and he put that colour on it; he did not trouble about variations of shadow and texture; he was just giving the facts. A Japanese drawing of a lady, which was exhibited, they would see had the same characteristics; the face showed no modelling, only the decorative detail of the costume was elaborate and carefully drawn. If they compared a picture of Fra Angelico's they would recognise that, though somewhat more advanced in execution, it was essentially the same kind of thing—the endeavour to represent facts in the most simple and direct manner. These early works nevertheless were beautiful in their way, because they showed good taste though with primitive methods, and they were controlled by an impulse which led the painter to adopt a composition suitable to the sentiment of the story. Thus in Paolo Uello's "Battle of Egidio" in the National Gallery, the composition and the contrasts of line and colour were violent and abrupt, in keeping with the nature of the subject. In Bellini's "Death of Peter Martyr," on the contrary, there was a want of relation between treatment and subject; the little peaceful town and the quiet trees assorted ill with the subject; one felt that in looking on at a deed of violence one would not be disposed to note these tranquil accompaniments.

So much had come between us and the early painters that we could hardly work in their manner except in accordance with an adopted conviction; and this to be of any value at all must be a sincere conviction, as it was with the pre-Raphaelite artists. Rossetti's "Annunciation," before referred to, was planned out in the definite manner of the early painters—one could even trace the pencil outline in which it was laid down. But this manner was not really natural to Rossetti, as it was to the early painters, and he could not keep it up; but this shows true accord between subject and treatment. Rossetti had made the very pregnant remark that in painting "the essential thing was fundamental brainwork." In comparing Crivelli's "Annunciation" with Rossetti's they would see that there was not this harmony between subject and treatment; there was no repose in the scene and in the figure of the over-dressed angel, which was fantastic and affected; there was a quantity of irrelevant detail which interfered with and distracted one from the ostensible subject of the picture; it was a picture that missed its point in regard to subject and only survived in virtue of its workmanship.

There were but few works in existence

which touched the highest excellence of complete balance between subject and execution. The Sistine paintings and the Stanze of the Vatican were among them. There we saw great themes treated with the highest power of execution. Ordinary mortals were wont to lean somewhat either to the one side or the other; to lay either too much stress on subject or too much on treatment. The greatest artists used their technical skill only to serve their mental conceptions. In these modern days we had so many things before us that it was difficult to judge which of numerous possible paths it was best to follow. Good work, technically, always had its value, but execution was not an end in itself; art had to influence the mind. We could not hold to the principle to let nothing come between us and nature; we could not help ourselves; all that had been done before us came between us and nature, and we could not ignore its influence. Reynolds indeed said that the best pathway to originality lay in the study of what had been done by our predecessors; but not to lead to the mere imitation of them. The present frequent attempt to imitate Velasquez was a mistake; it was only an imitation of his weaker side. Velasquez himself revealed that the easy mastery of his later work had not been easily attained; in his early period he was a plodding painter, as his early works distinctly showed; and his later works, in spite of their apparent freedom of style, were very carefully executed. But he was not at home in work requiring imagination. His so-called "Venus" was an example of this. It was not Venus, it was merely a model, and had it not been so splendidly painted it would have been valueless. So with Rubens; his goddesses were not goddesses, but merely Flemish women; he had little imagination; yet it must be said for him that he was obviously interested in his subjects for their own sake and not as a mere exercise in painting; he interested us by the dramatic force with which he represented the legends which he depicted; the "Abduction of the Sabine Women" for instance, though full of clever and interesting technical execution, was more than that—it was a very vivid and dramatic representation of the event. In imaginative work there was more than mere painting; the artist must have an ideal in his mind; and it was of no use to take great imaginative legends and treat them in a trivial and realistic manner. In the works of the old masters representing imaginative subjects it must be remembered that the archaic character of their work (as it now appeared to us) was in itself a quality which tended to remove them (to us) from the plane of realism; Botticelli's "Birth of Venus" was an example of this; and in Botticelli's work generally there was accord between subject and treatment: there was an endeavour to render an imaginative subject in a realistic manner. His Madonna in the Louvre, of which an illustration was shown, was not only fine in the design and expression of the figure, but was surrounded by beautiful accessories which all helped the main spirit of the picture, and yet did not distract the attention from the figure, because that still remained the strongest thing in the picture. Giorgione's "Fête Champêtre" in the Louvre might be cited as a perfect work; colour, subject, treatment all made one harmony; there was not a discordant detail in it. Veronese, like Velasquez, had technical power rather than imagination. His "Marriage at Cana" was merely a representation of a festival; it might be anything else than the marriage at Cana; and his "St. Helena" in the National Gallery was only a beautiful woman asleep; she might be any one; the angels with the cross in the air added nothing to the expression of the picture. Rembrandt and Watteau were among the imaginative painters. Rembrandt's treatment was always in accord with his subject; he always gave a dramatic realisation of the incident; in his "Good Samaritan" in the Louvre they could recognise this, for even the light and shade were so managed not merely for effect as such, but because some figures were intended to be prominent and others to be less so. Watteau might perhaps be said to be a poetic rather than an imaginative painter; he gave an air of reality to an unreal world. He exercised the will of the artist in choosing what he

wanted; and he produced his effects by concentration of light, somewhat in the same way that Rembrandt did. Hogarth might be described as an imaginative realist. In his own inventions of subjects, representing contemporary life but not actual facts, he was led along by his own mental impulse to treat the class of subject which he best understood; and it was noticeable that when he endeavoured to treat a subject of pure imagination, as in his "Sigmunda," he was much weaker in style.

In creative work dealing with purely imaginary subjects there was often a want of accord between the subject and the treatment because the artist's interest in the subject was not sincere. Sincerity of feeling was absolutely necessary to art, and with sincerity of interest any subject was justified. Where a picture represented something seen the artist's task was easier, as it was reduced to a matter of technical skill, and this quality was necessarily wanted, and there was no mystery about it; you could look and see how it was done and feel perhaps—"Well, if I were to give the same pains to it I could do that as well myself." Of this kind of unimaginative work where the treatment was in accord with the subject Velasquez, Moroni, and Veronese were examples, and the whole of the painters classified generally as "The Dutch School." Teniers showed the extreme of realism yet with a certain breadth of handling; he painted his pictures with a thick and full underpainting which came near the colour he ultimately wanted, and then finished by glazing over that. De Hooghe's pictures were remarkable for their simplicity of style and execution; they seemed generally to have been composed and painted straight off (there was one work of his that showed traces of a figure painted out, but this was very unusual); he always had a strong dark in one portion of a composition, with nearly white in the extreme lights. Steen, Metsu, and Terburg were among the great names of the school, and of these he thought Steen the greatest. With all these men the only impulse was to record in painting some appearance which had struck them as beautiful or picturesque. Franz Hals was one of the greatest exponents of this school; he was so clear and vigorous in style that the very execution of his works, his method, served to put one into the mood to sympathise with his work.

There were so many different kinds of excellencies in painting that it could hardly be said that there was any one to be followed exclusively of the rest. The modern painter ought to learn about the work of his predecessors; but to aim at following their principles rather than imitating their methods. It was a good practice to ask themselves, when struck by any particular point in the execution of a picture—"Why did the artist do that?" and to try to trace the reason. It must be remembered that they could not reconstruct the art of the past; their art must be in touch with their own time. Whether a man should aim at realistic or at imaginative painting was a question of the tendency of his own mind. Only one thing must be remembered, that to be an imaginative painter one must have imagination. Watts was our great modern example of this. All his subjects sprang from his own mind; he owed nothing to others on the imaginative side; he worked out his own thoughts in his own way, and hence there was complete accord between his subject and his treatment. Learning to paint merely would not make them artists; the training of the mind was as necessary as the training of the hand. The trivial treatment of great subjects that we sometimes saw arose from the want of mental training, from a consequent incapacity to understand the subject. It was well also to study the people one met ordinarily, out of doors, their manners and actions, as well as studying models in the schools. Experience and knowledge of the world, such as was possessed for instance by Titian, Rubens, Watts, and Millais, was of advantage to the artist. Knowledge of the world ought not to make him think less of his art, but more.

* Surely something more than this occasionally. Take that well-known Terburg, for instance (we forget his title at the moment), where the young woman stands with her back to the spectator listening to a lecture from her father; there is a real story in that, of obvious pathetic interest; it is like a chapter out of a novel.—Ed.

In conclusion, Mr. Clausen said that he could not but feel that it had been presumption on his part to critically review the works of great artists of the past, but it was necessary to adduce examples to illustrate his meaning, and if he had implied that there were shortcomings in some of them, this was not without a full recognition of their great qualities and their claims to respect. Painting was such a great subject that those who had accomplished anything in it were worthy of honour. Chardin said that art was an island of which he had only been round the coasts; and they might recall Chardin's well-known plea to Diderot, when the latter was posing as art-critic of the Salon, that if he took the worst picture in the exhibition, he would do well to remember that some two thousand men had nearly broken their hearts in trying to paint as well as that. And if they thought of all that had been accomplished in painting, those of them who would be become painters also and succeeded in their aim, might justly think that they had become citizens of no mean city.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

An ordinary meeting of the Royal Institute of British Architects was held on Monday night, at No. 9, Conduit-street, W., Mr. John Belcher, A.R.A., in the chair.

Metal-work.

Three papers on "Metal-work" were read, by Messrs. J. M. Swan, R.A., Montague Fordham, M.A., and Walter Gilbert, of which the following are abstracts:—

Mr. John M. Swan, R.A., in commencing his paper, apologised for the frequent allusions he was going to make to ancient art. He was so far penetrated by a profound reverence for the past that he felt we were but pigmies peering through the legs of the Colossus of antiquity. The thought of the Colossus of Rhodes that strode across the harbour where ships sailed out and in, and of Bartholdi's magnificent statue of Liberty at the entrance to New York Harbour, made him wonder when a statue of Britannia would arise from the waves in bronze of colossal form in the same spirit of antiquity, and emblematical of ourselves and of the sea-girt Isle to which we owe our greatness and power. Since the XVIIIth century Japan had produced a series of colossal works in bronze, the most notable being the Daibutsu, a seated figure, 53 ft. high, breadth of face 9 ft., 4 in. The processes employed by the ancients are shrouded in mystery, and so difficult to verify, that we cannot at this distance speak with absolute certainty or form a clear judgment upon them. All the varying changes of colour mentioned by the ancients are occasioned by the nature of the alloys. Many metals combine together when melted, and only remain in union within certain ranges of temperature by reason of the wide differences of their melting and solidifying points. In ancient bronze the proportions of tin mixed with brass or copper and of copper with silver seem to have been—Copper, seventy-one to eighty-seven parts; tin, three to six parts; lead, four to twenty-one parts. There are also traces of iron. With ourselves, in ordinary bronze ninety-six copper and four of tin are generally used. The Japanese are the real authorities for treatment of colour in metals to-day. They combine such extraordinary manipulative skill with artistic taste in carrying out any imaginative work. The superiority of French workmanship is doubtless due to their fine artistic instinct allied to their excellent art training. The Persian and Arabian metal work, with large plain surfaces of copper and brass, might, treated in a bas-relief manner, be well adapted by ourselves for panel treatment for interior decoration. Describing the process of casting in cera perduta, which we get from Benvenuto Cellini, the author recalled that it is now about twenty years since the first cera perduta castings were made in this country. First, an ordinary piece mould or gelatine mould is made from the plaster model. Then a wax casting is run from the mould, to which are attached the runners and gates for the flow of metal, and vents for air or gases. Afterwards the wax is cored, and an external covering-in mould covers the whole. It is then placed in a muffle or

furnace, the wax melted out, and when the mould is dry the metal is passed in that replaces the wax model. The founders' wax is made of Gambia, Italian, or native bees-wax and resin coloured with vegetable matter or vermilion. The colouring of the wax is important, as if some metallic pigment or earth colour were employed it would cause a residue in melting out that would destroy the casting. Speaking of the bronze statues of London, Mr. Swan said everybody must be struck with their uniform dull, heavy, monotonous black. It was a most unsatisfactory state of things for both public and artist. Was it not possible in metallurgy to discover an unchangeable alloy? The black coats of Landseer's lions in Trafalgar Square do not recall the orange tawny glow of the king of beasts. The author expressed his preference in many cases for gilded statues, or monuments that would better resist the action of the atmosphere and have a more decorative effect. They might appear too garish at first, but London fog would soon tone the surface and take off the glare of new gilding. Fine colour is a source of joy to us all; certain it is that a gilded statue, assuming the artist's conception a beautiful creature would appear as a sunbeam in our streets in the dull, foggy weather, and in the summer, in sunshine with blue skies overhead, would be a joy for ever. The "noble rust," the antique patina, is not naturally formed in the atmosphere of London, or our statues of malachite and copper denes would be a delightful green. The author hoped no more of their ancient landmarks in London would be removed, lamenting especially the old-time Lion of Northumberland House, and the old familiar figure of the Duke of Wellington at Hyde Park Corner. He should like to see Bobbin's statue of the Duke higher up. Whenever he took his walks abroad he cast his eyes around for fountains playing in the sun-baked square, the whirl of pigeons, the flower patches, he was always looking for them, also for some decorative groups as a relief from the historical personage on a pedestal—something to relieve the dull ache of town and the monotony of heroes in trousers. Bronze bas-relief or gilt bronze in relief on marble should be fine as a decoration—even with us. He did not see why we should have less devotion for our heroes by giving them a more beautiful decorative aspect or less feeling for our architectural surroundings. Colour would be subservient to sculpture and a glorious handmaid to architecture; the charm of mosaic is capable of wedding a beautiful monumental design; to present our monuments are barren of colour, especially deficient in treatment of the pedestals and bases. What can be more unsympathetic than the basins of the fountains of Trafalgar Square? Here is room for the sculptor as designer, and play of coloured metals and water. Gilded bronze can work in unison with black bronze, and aluminium may be looked after, so that it does not become the uniform London black.

Mr. Montague Fordham said he was anxious to draw architects down into the workshops, which would have the double advantage of giving them more knowledge of the actual treatment of metal and of creating a closer bond between architect and craftsman. With this object he gave particulars of the tools used in the ordinary working of copper, bronze, and iron, and followed with some notes on the nature of the metals and their proper treatment. Having discussed the technical side of his subject, and shown examples of the admirable work produced by craftsmen of the day, he referred to the want of encouragement the craftsman received from architects, who rarely entrust their metal-work to craftsmen, but deal with trade firms. Doubtless this was much less trouble. A trade firm employs a traveller, who is at the architect's beck and call, who will supply a design in any manner, adapt it for any metal, and cut his work down to any price. How was the designer craftsman, the master craftsman, who could turn out magnificent work under different conditions, to compete with such a system? He doubted whether any self-respecting craftsman would employ a traveller, neither should the architect expect it. If the architect would give the craftsman the slightest encouragement, he would gladly place at the architect's disposal the result of his practical study and knowledge. The

craftsman worked with the definite ideal of a revival of the crafts, and aimed at producing a really beautiful piece of work. There was no reason why the metal craftsman should not be as reliable in his arrangements as the ordinary man of business. They had got over the disease of their youth, the so-called artistic temperament, and had business organisation to support them. Again, the normal prices of the metal craftsman need be no higher than the ordinary trade price. If architects invited the craftsmen to help them in the detail of their metal-work, they would, whilst taking their share in the work of the revival of the crafts, obtain at the same time an undoubted distinction of detail in their work. This type of distinction he feared trade firms could not give, for the very essence of the difference between good work and poor work lay only partially in the design, and largely in the conditions under which it is carried out, and the spirit in which it is made. It was a question of methods of organisation and of workshop inspiration: for example, in relation to such work as altar-crozes, chalices, etc., used for a definite religious purpose, it was of the utmost importance to realise that unless the workshop and men were imbued with some element of inspired enthusiasm the work would always be an artistic failure. The matter of the revival of metal-work rested largely with the architects. It was for them to say whether the small industries now growing slowly were to be allowed to flourish; if so, he felt great hope that the present century would become famous in all time for the distinction of its metal-work.

Mr. Walter Gilbert, whose paper was entitled "Romance in Metal-work," confessed his inability to show any fresh views of the art of metal-work, but he would endeavour to explain a little of that impulse which urged the artist to find expression in those methods and materials with which he felt in most sympathy, and which had the most influence in the development of the art. Primarily it is imagination, or rather the consciousness of imagination—the ruling faculty in all art—which creates art. But real art is something more than this: it is imagination allied with skill and dexterity in the creation of beauty. Beauty is the criterion of all art, the object of all human longing, and a source of human enjoyment. It is but to the most sordid and debased the great desire and the unflinching source of pleasure, and in such measure as the intellect is trained will that enjoyment be. The perfect work of art is always the result of some emotional mood and that work is the most perfect which conveys the dream of the artist most successfully and most fully. Treating of the influence at work amongst the metal-workers of the Greeks and Romans, of the Gothic period, and the masters of the Renaissance, the author showed that the Greek metal-worker or sculptor never sought nor received inspiration from plant forms—nothing of this is found in his art, save perhaps an occasional subordinate sprig of foliage, for the perfect art must always possess the sensual element of beauty to attract and retain attention. If the Roman loved the bay and the vine it was not because of their plant form, but because the bay spoke to him of conquest, and the vine was synonymous with the worship of Bacchus, and all that revelry and riot of the Empire which succeeded the severity and serenity of the Consulate years. Studying some of the beautiful little bronzes in the Pierpont Morgan and other collections in the South Kensington Museum, the author had been amazed at the extent to which the imagination of the great Italian and other masters of the Renaissance had been stirred by the purpose of the objects they had so lovingly and carefully designed. Yet there was no original treatment. Just as Petrarch and Ariosto were inspired by the masters of Greek and Roman literature, so the sculptors of the Renaissance were indebted to the Greeks and Romans for their ideals, and the source of origin of many of their creations is not far to seek. The great art of the Renaissance, however, was not the copy of the art of the ancients, but the result of its inspiration. Just as the Renaissance *littérateur* satisfied himself with rhetoric and well-rounded and polished sentences instead of the clear and limpid words of the classic, so the metal-worker viewed his imagination through

decorative spectacles and mysteries, and from that time onward the greatest artists have been those who have felt most strongly this fascination, and have become the poets of death rather than of majesty in human shape. In the north, however, the dramatic passion, the sublimity of the imagination, the energy and earnestness of purpose, and truer sincerity of religion, together raised the ideal from what had been the result of well-polished scholarship—this in itself was the subtle influence of the vigour and robustness of the long Gothic period. Traising the influence which has inspired later times, the author came to that period in France when the kings dreamt of glory and expansion, and the love of France became manifest in the worship of its kings. Examples of this courtly impulse were afforded by the screens round the forecourt of the palace of Stanislaus at Nancy, and Adam and Girardon's Fountain of Neptune at Versailles. From the worship and adoration of patriotism in the person of their kings it was a small stride in the days of freedom and democracy to deify the republic, its progress and triumph, both in the abstract, as in the masterpieces of Dalou, and in the personages of her most distinguished sons. As illustrations the author cited the gates to the Apollo Gallery in the Louvre, the statues to Delacroix, Danton, and La Fontaine. Under all great art of the metal-worker, whether the thing to be done is great or small, there must always be the same working of the intellect, the same poetic feeling for the ideal in story, the same tenderness for material. As for the future, let us not hastily condemn any struggle for new treatment. The achievements of the past are to be learnt from, not slavishly copied. To revive art, scholarship and intellectual training are necessary. It is not debating art to sell it. What the artist requires is not too arbitrary an assertion on the part of the architect of what is good or bad, for which often an architect, owing to present-day methods of training, is not too well qualified to judge, but a stimulus to thought and energy for the artist—that the architect may gather round him a band of men working eagerly in close co-operation with him for the glorification of his building and an advancement of his fame.

Mr. Hubbard, in proposing a vote of thanks to the readers of the papers, said they had approached the subject of metal-work from three very different points of view. Mr. Swan's paper was one of the most interesting as to early history of metal-work he had ever listened to, but one point he did not understand. He would like to know if he correctly understood Mr. Swan to say that the art of casting in bronze was not known at the time of Homer. Mr. Swan said he believed there was no historical reference to any cast-work. Mr. Hubbard said there was the Early Bronze Age after the Stone Age in which they certainly cast bronze centuries before the time of Homer. What struck him most agreeably was to hear Mr. Swan's statement that the Japanese were the Greeks of the present day in the excellence of their art in metal-work. Certainly from the exhibits before them they had some extremely fine specimens, not only of Japanese art, for the casting in bronze of the cat's head was a magnificent piece of early Egyptian work. As Mr. Swan had pointed out, the Japanese, not only in the excellence of their metal-work, but in their colour-work were unapproached by any other nation, while the ivory work by Okawa could not be approached by any other nation. It was also extremely interesting to hear the description of the cera-perduta casting, which was so well described by Benvenuto Cellini, for he had never before seen specimens which made it so clear as to how the wax was got rid of and the gases allowed to escape. It was by such lectures as these that architects really got an insight into the inner working of the arts which they were supposed to practise. Mr. Fordham treated the subject from the practical point of view, and in his innocence he (the speaker) always thought that it was the smith "who's brow was wet with honest sweat," but now he found it was not the smith at all, but the striker. The tools which were used were wonderful, but one could not help regretting that the work produced to-day was far inferior to the work of France or Germany, and that the work of no country equalled

that of the mediæval art metal-workers. The beautiful set of slides shown by Mr. Gilbert were very interesting, and showed how sentiment was a necessary encouragement to any art, and especially with metal-work.

Mr. Harrison Townsend seconded the motion, and said he had been asked by Mr. Fordham to apologise for his inability to stop for the discussion. Mr. Fordham had opened to them the door of the craftsman's workshop, and showed what the craftsman did and the implements he used in his work. Mr. Swan, on the other hand, was retrospective for part of his time and hopeful for another part when he led them to dream dreams of a London where their statues might not only be washed but even occasionally gilded. He did not know whether the experiences which had been gained as to this latter treatment would lead them to repeat it when they remembered the statue at the top of Sloane-street, from which the London County Council had now removed the last sign of gilding. Mr. Gilbert finally imparted what he thought was necessary in every consideration of art, i.e., sentiment, and had pointed out what were the inspiring cause and the ideal of the beautiful works of art which had been exhibited on the screen. Mr. Gilbert had shown them, as Emerson had said, that the artist could—

"Give to barrows (trays and pans,
Grace and slimmer of routine."

The Chairman said Mr. Swan had given them a paper full of enthusiasm, and, if he might say so, full of profound knowledge modestly veiled, and they were also indebted to him for showing beautiful examples of work they had before them. He felt with Mr. Swan how terrible was the dead blackness of the statues in London, and hoped that some way would be found of keeping them clean and of a bright colour. The London County Council was, he believed, the authority which had endeavoured to keep them clean, and had covered them with something which looked to him like chocolate—there was still a shine but the colour had all gone. Various attempts had been made at gilding, and reference had been made to the Sloane-street statue. There some parts were gilded, but it did not last very long, and evidently the London County Council considered it hopeless, for there was nothing new in the way of gilt. The only thing left when he last saw the statue was a bird's nest, which did not improve the effect very much. They had also the Gilbert fountain with the top figure in aluminium. He remembered Mr. Gilbert saying he hoped it would keep its colour, but it had got as black as the rest of the statues. It had lately been cleaned, and looked as if it had been done in cement. Mr. Swan had referred to the Duke of Wellington's statue, and when he saw that last at Aldershot it had a most delightful colour, being brilliantly green in some parts. He was also glad that Mr. Swan had referred to the columns of St. Martin's Church, for the silvery grey of the washed side of the columns had a most beautiful effect. It was one of the beauties of Portland stone in London. He knew the public thought it a great mistake, and one of the faults of Portland stone that it should be grey on one side and black on the other, and the effort had been made to wash St. Paul's Cathedral and get rid of the black. He thought, however, that it was one of the beauties of Portland stone where the contrasts of silvery grey and black were to be found, for the black intensified the appearance of the grey. Mr. Fordham had given them a great deal of information which was of value to them, and there was no doubt the more they knew of the details of the craftsman's work and the limitations of his craft the better it was for them. That applied to all the arts. The more they could familiarise themselves with the methods and processes adopted by various craftsmen the better they would agree together in working. He could not quite follow Mr. Fordham in his lecture to architects. He ventured to say that if they, as architects, had a good artist they stuck to him, but if they were supplied with bad work then they ceased to employ the artist. That was really the secret of the business. It was not a question whether a man worked in the society or company or guild—so long as his work was good they respected him and stuck to him. He felt that the paper by Mr. Gilbert was most delightful, intellectual, and poetical, and his

allusion to purpose in art applied quite as much to architects as to metal-workers. They had, however, been shown in a delightful way how purpose in art assisted the artist in giving expression and character to his work.

The vote of thanks was heartily carried. Mr. Swan, in reply, said that there was evidence that stone-moulds were used in the Bronze Age and the Egyptians produced solid bronze statues long before the Homeric Age.

Mr. Gilbert said that if architects would only back up artists there would be a great deal more gilding done, but in their modesty, as Englishmen, they were afraid of making too much show.

The Prizes and Studentships, 1906.

The Secretary then read the Council's Deed of Award in reference to the prizes and studentships for 1906. The designs and drawings submitted for the prizes and studentships are now on exhibition in the Gallery of the Alpine Club (entrance in Mill-street, Conduit-street, W.). The Deed of Award gives particulars of the competitions and the results thereof as follows:—

The Royal Institute Silver Medals.

(i.) *The Essay Medal and Twenty-five Guineas*.—Six Biographies of British Architects (deceased) practising in the XIXth century were received for the Silver Medal under the following mottoes:—

1. "Our Alchemists," 4.
2. "Terra Incognita," brevis, "Ars longa vita brevis," 4.
3. "Devotio of a Voluité," 5.
5. "Gargole," 6.
6. "Shingalee," 6.

The Council have awarded the Medal and twenty-five guineas to the author of the Biography of "George Devey, F.R.I.B.A. (1820-1886)," submitted under motto "Terra Incognita" [W. H. Godfrey, Queen Anne's-gate, S.W.], and Certificates of Hon. Mention to the authors of the Biographies bearing the mottoes respectively of "Gargole" [M. S. Briggs, Oldley] and "Shingalee" [A. E. Bullock, Chiswick].

(ii.) *The Measured Drawings Medal and 10l. 10s.*—Fifteen sets of drawings were sent in of the various buildings indicated, and under mottoes as follows:—

1. "A.D. 1690"; 6 strainers (Hampton Court Palace).
2. "Aix"; 4 strainers (Château de Montirail, Saitte, France).
3. "Aus Picante Deo"; 4 strainers (Queen Anne's Orangery, Kensington).
4. "Fiat Lux"; 6 strainers (Le Grand Trianon, Versailles).
5. "C"; 6 strainers (Banqueting Hall, Kensington Palace).
6. "Mecca"; 5 strainers (St. Allege, Greenwich).
7. "Omega"; 6 strainers (St. Anne's Orangery, Kensington Palace).
8. "Qui s'excuse s'accuse"; 6 strainers (Le Petit Trianon, Versailles).
9. "Reflex"; 5 strainers (St. Stephen's, Walbrook).
10. "San Marco"; 6 strainers (Santa Maria dei Miracoli, Venice).
11. "Sansvino"; 6 strainers (Old Library of St. Mark's, Venice).
12. "Sigillu Ecclesie Trinitatis d. Toimham"; 5 strainers (Christchurch Priory, Hants).
13. "Try"; 6 strainers (St. Peter Mancroft, Norwich).
14. "VII God I Zal"; 6 strainers (Castle Menzies, Aberfeldy).
15. "Wren"; 4 strainers (Banqueting Hall, Kensington Palace).

The Council have awarded a Silver Medal and ten guineas to the delineators of Hampton Court Palace and Christchurch Priory, submitted under the mottoes, respectively, of "A.D. 1690" [A. E. Poley, Hampton Hill], and "Sigillu Ecclesie Trinitatis d. Toimham" [G. J. Coombs, Boscombe], and a Certificate of Hon. Mention to the delineator of Santa Maria dei Miracoli, submitted under the motto "San Marco" [P. Wells Lovell, Highgate].

The Travelling Studentships.

(i.) *The Soane Medallion and 100l.*—Ten designs for a realisation of the ideal mansion described in Bacon's Essay "of Building" were submitted under the following mottoes:—

1. "Comme Cl"; 4 strainers.
2. "Fraxinella"; 4 strainers.
3. "John Thorpe"; 4 strainers.
4. "Palazzo"; 5 strainers.
5. "Peruzzi"; 5 strainers.
6. "Recess"; 5 strainers.
7. "Viscount"; 6 strainers.
8. "White Lion"; 6 strainers.
9. "Zed"; 5 strainers.
10. "Devise of a Bee on the Wing"; 5 strainers.

The Council have awarded the Medallion and (subject to the specified conditions) the sum of 100l. to the author of the design bearing

the motto "John Thorpe" (W. S. George, Ashton-under-Lyne), and a Certificate of Hon. Mention and ten guineas to the author of the design with the motto "White Lion" [R. Atkinson, Lenton, Nottingham].

(ii.) *The Owen Jones Studentship and 100l.*—Five applications were received for the Owen Jones Studentship from the following:—

1. W. J. Davies; 6 strainers.
2. Matthew Dawson; 6 strainers.
3. Charles Gascoyne; 6 strainers.
4. A. R. H. Jackson; 6 strainers.
5. Arthur D. Nicholson; 6 strainers.

The Council have awarded the Certificate and (subject to the specified conditions) the sum of 100l. to Mr. C. Gascoyne, Gray's Inn-square, W.C., and five guineas each to Messrs. W. J. Davies, Thornton Dene, Sidcup Park; A. D. Nicholson, Glasgow West; and A. R. H. Jackson, Royal College of Art, South Kensington.

(iii.) *The Pugin Studentship and 40l.*—Twelve applications were received for the Pugin Studentship from the following:—

1. J. W. Carter; 5 strainers.
2. G. H. Hill; 6 strainers.
3. Walter S. George; 6 strainers.
4. Jordan Green; 6 strainers.
5. T. Gordon Jackson; 6 strainers.
6. W. H. MacLuscas; 6 strainers.
7. Oswald P. Milne; 6 strainers.
8. J. R. M. Morison; 6 strainers.
9. J. S. H. Pearson; 6 strainers.
10. G. S. Salomons; 6 strainers.
11. H. W. Simister; 6 strainers.
12. B. Cecil Westwick; 3 strainers.

The Council have awarded the Medal and (subject to the specified conditions) the sum of 40l. to Mr. G. Droydale, and a Certificate of Hon. Mention to Mr. Jordan Green, Handsworth, Birmingham.

(iv.) *The Godwin Medal and 65l.*—Five applications were received for the Godwin Bursary from the following:—

- | | |
|-----------------------|--------------------|
| 1. Alfred E. Corbett; | 4. Inbro Triggs. |
| 2. C. E. Power; | 5. A. H. Verstaag. |
| 3. F. Tomlin. | |

The Council have awarded the Medal and (subject to the specified conditions) the sum of 65l. to Mr. H. Inigo Triggs, Bedford Park, Chiswick.

(v.) *The Titie Certificate and 30l.*—Twenty-one designs for an open-air swimming-bath with an arcade or colonnaded inclosure were submitted under the following mottoes:—

1. "A.D. 1906"; 5 strainers.
2. "Ajax"; 4 strainers.
3. "Aqua"; 4 strainers.
4. "Aquatius"; 6 strainers.
5. "Aristobulus"; 4 strainers.
6. "Bo'sun"; 4 strainers.
7. "Cui Bono?"; 5 strainers.
8. "Dolphin" (white strainers); 4 strainers.
9. "Dolphin" (brown strainers); 4 strainers.
10. "Dorian"; 5 strainers.
11. "Pleuribus unum"; 4 strainers.
12. "Eclipse"; 4 strainers.
13. "Fiat Lux"; 5 strainers.
14. "Hoslen Gray"; 6 strainers.
15. "R.L."; 5 strainers.
16. "Michaelange"; 4 strainers.
17. "Pleades"; 2 strainers.
18. "Seed"; 5 strainers.
19. "Schiz"; 6 strainers.
20. "Ultra"; 5 strainers.
21. "1905"; 5 strainers.

The Council have awarded the Certificate and (subject to the specified conditions) a sum of 30l. to the author of the design bearing the motto "Dolphin" (white strainers) [A. G. Horsnell, Cheshamford], a Medal of Merit to the author of the design under motto "Eclipse" [C. B. Pearson, Lancaster], and a Certificate of Hon. Mention to the author of the design under motto "Dorian" [C. L. Wright, West Kensington, W.].

The Arthur Cates Prize: 40l.—One application for the Arthur Cates Prize was received from Mr. J. H. Markham, West Hampstead, N.W., and the Council have awarded him the prize.

Prize for Design and Construction.

The Grissell Gold Medal and 10l. 10s.—Six designs for a stone skew bridge were submitted under the following mottoes:—

1. "Bydand"; 3 strainers.
2. "Fatenary"; 3 strainers.
3. "P"; 6 strainers.
4. "Nil"; 4 strainers.
5. "R"; 6 strainers.
6. "Little Dalc"; 3 strainers.

The Council have awarded the Medal and 10l. 10s. to the author of the design bearing the motto "Little Dalc" [G. Nott, Leicester].

The Asphitel Prize, 1905.—The Council have, on the recommendation of the Board of Examiners (Architecture), awarded the Asphitel Prize to Mr. J. H. Markham, West Hampstead, N.W. The Council have further

awarded a Prize of Books, value 10l., to Mr. A. R. Myers, Edinburgh, in recognition of his meritorious work at the Special Examination, November, 1905.

The Travelling Students' Work.

Soane Medallist, 1904.—The Council have approved the drawings executed by Mr. Frederic J. Horth, who was awarded the Medallion in 1904, and who studied in Italy.

Owen Jones Studentship, 1904.—The Council have approved the work of Mr. Wm. Davidson, who was awarded the Studentship in 1904, and who studied in Italy.

Godwin Bursary, 1904.—The Council have approved the report of Mr. H. Phillips Fletcher, who was awarded the Godwin Bursary, 1904, and who visited the St. Louis Exhibition.

Godwin Bursary, 1905.—The Council have approved the report of Mr. F. R. Horns, who was awarded the Godwin Bursary in 1905, and who has reported on Municipal Administration in France.

Pugin Studentship, 1905.—The Council have approved the work of Mr. Edward Garratt, who was elected Pugin Student for 1905, and who travelled in Oxfordshire, Somerset, Dorset, Gloucestershire, Wiltshire, and Hampshire.

Tite Prizeman, 1905.—The Council have approved the work of Mr. R. Atkinson, who was awarded the Tite Prize in 1905, and who studied in Italy.

The Chairman announced that the next meeting would be held on February 5, when an address would be delivered to students, and there would be a criticism of the works submitted for the year's prizes by Mr. J. W. Simpson.

THE ARCHITECTURAL ASSOCIATION.

An ordinary fortnightly meeting of the Architectural Association was held on Friday last week at No. 18, Tufton-street, Westminster, S.W., Mr. Louis Ambler, Vice-President, in the chair.

The minutes were read and confirmed, and some nominations were made, after which the following gentlemen were elected members, i.e. —

G. W. Home, West Kensington	E. P. Cooper, Acton
R. Griffin, Southend	C. H. Rose, Balham
R. Mountford, Piggott, Wandsworth Common	E. J. Cartear, New Green.

The reinstatement of Mr. A. Dicken was also announced.

The Chairman announced further donations to the Building Fund, i.e. —

J. S. Gibson, £1 1 0	D. W. Stewart, 0 10 6
T. H. Russell, 1 1 0	ditto, 0 10 6
G. H. F. Conyn, 1 0 0	A. Stratton, do. 0 10 6
L. Ambler, double subscription, 0 10 6	H. A. Satchell, 0 10 6
W. G. R. Bousfield, ditto, 0 10 6	W. F. Ensworth, 0 10 6
W. A. Forsyth, ditto, 0 10 6	W. Henry White, 0 10 6
A. Mantley, do. 0 10 6	P. G. Yates, 0 10 6
F. E. Newton, do. 0 10 6	ditto, 0 10 6

He also stated that there was a vacancy in Bombay for a practical draughtsman, age between twenty-two and twenty-eight; three years' agreement. Particulars could be had upon application to the Secretary.

Mr. A. Maryon Watson, Hon. Secretary, announced the first spring visit, to the Central Criminal Court, Old Bailey, by permission of the architect, Mr. E. W. Mountford, on Saturday, January 27. Members to meet at the building at 2 p.m.

Mr. Tanner, jun., Hon. Secretary, proposed a vote of thanks to Mr. W. G. B. Lewis for donation of a copy of the Post-Office Directory, 1906. This having been agreed to, Mr. Tanner also announced that the Discussion Section would meet on January 31, when a paper will be read by Mr. A. C. Dickie on "Internal Steps and Stairs and their Treatment." He also stated that a students' smoking concert will be held on Friday, February 2, at the Gaiety Restaurant, Georgian Hall, at 8 p.m.

The Consideration of Sculpture by Architects.

Mr. F. Lynn Jenkins then read the following paper on "The Consideration of Sculpture by Architects" —

"When some months since I received from the Architectural Association Council an invitation to read a paper to the Association, I at first experienced some difficulty in finding a new and interesting subject. It happened, however, that early last year, as no doubt, some of you will remember, a very interesting and lively discussion took place

at one of the meetings of the Art Workers' Guild on the subject I have chosen, and I thought I could not do better than select this, and by enlarging on the paper I read then, endeavour to use it to the best of my ability. I am not sure that the title is altogether clear in its meaning. Perhaps "How Architects Consider or Deal with Sculpture" would better express the intention I have in my mind.

From the earliest times the master builder, he who conceived the design of a structure to be built, consciously or unconsciously felt that the bare constructive details which utility demanded in the edifice did not wholly satisfy him. The desire innate in man far more peculiar or personal significance in his house led him to carve on the door-post, or some similar coin of vantage, a sign, symbolic of his name, his craft, his character, or his position. Later these hieroglyphics became more pretensions, and as civilisation advanced and the cult of hero-worship grew in force, man began to memorialise his dead and to build sarcophagi, on which he sculptured a history of the deeds and virtues of the departed. Religion also brought its necessities of altars and temples, and its presentments of the deity worshipped. In studying the history of the earliest ages of civilised mankind we seldom, if ever, find the art of sculpture employed without a direct and useful purpose, the isolated statue, unless it portrayed a hero or an idol to be worshipped, being practically unknown, so that we may infer that sculptured figure or symbolical ornament, whether carved in wood or stone, marble or granite, or cast in metal, was designed and executed solely to convey an intention which could not be well expressed by any other means.

It was not until a later age, when cultured simplicity gave place to the luxury and extravagance of super-civilisation, when pompous vulgarity superseded refined taste, that man commenced to lavish ornament devoid of any real significance on his buildings. I do not propose to illustrate this fact by reference to individual works throughout the ages; I think it will be sufficiently obvious that the argument is proven by history, that whereas in the beginning sculpture was used solely for an end which rendered it a necessity, in later times it degenerated into being, broadly speaking, a means of ostentatious display of wealth and exuberant luxury, and ceased to be an integral part of the *raison d'être* of the building it adorned. In stating this I do not overlook the gradual development of the natural instinct to make the "house beautiful," nor do I aver that ornamentation may not be equally necessary in designing from the æsthetic point of view; the fact remains that a time came when the demands of beauty claimed equal, and afterwards greater, rank than those of pure utility, and that whereas in the latter case the artist was limited within set bounds, in the former the restrictions were less apparent, depending as they did on the individual taste of the designer.

Hence we may take the architecture of the Egyptian as one example of a period when sculpture was used solely because it was the only means the builder had of expressing his full intention, and, on the other hand, that of the Greeks as illustrative of the perfect, restrained, and refined consummation of the aims of the utilitarian as well as the lover of beauty and style.

There was another difference noticeable from the moment when the cult of beauty entered largely into the consideration of the architect, for, whereas in the structures of the earlier designers that elusive quality we call "style" was shown in a very marked degree, it was the unconscious emanation of the character of each particular age and people, while the Greeks, with their newer ideals, aimed at and actually achieved the creation of not one but several complete conventional orders of architecture, each replete with style, each with its corresponding detail of ornamentation, each in harmony with the requirements of its time, both æsthetic and practical, finer than which nothing has since been attained to. The architecture of that age without doubt most nearly approached human perfection in its rich simplicity, won by the wedding together of the highest ideals of beauty and practical utility.

From that culminating point onwards in

the history of architecture and sculpture the downward grade began, in some measure because of the very perfection of these ideals materialised for man's emulation.

After every exposition of genius there is always some reaction, always a host of imitators who strive to reach the same or even a higher goal of perfection without ever probing for the great secret which underlies the perfect success, and which is the mainspring of the achievement. Seizing on whatever superficial characteristic marks the work of genius from others, they endow this apparent difference with miraculous virtue, and, imagining that therein lies the straight road to the desired end, seize on this peculiarity, enlarging on it and carrying it beyond all bounds of restraint in their illogical efforts. It has ever been thus in the history of art, whether sculpture, painting, architecture, literature, or music. So, because the Greeks introduced a new note into their wonderful architecture by the use of sculptured decorative ornament conceived in the finest spirit of logical practicability, introduced not merely for the sake of utility, but because they achieved the grand secret of making utility and beauty coincide, in the ages that followed men strove to emulate their genius by attaching undue importance to this one note in the perfect chord of Greek art, and played that note loudly, with many octaves, remorselessly endeavouring to make it the dominant of other chords in lower keys. Sculpture and ornament were applied lavishly with no logical reason as regards utility of purpose, with no cultured simplicity of style, and with little or no individuality or fitness. It is true that the Renaissance for a time stimulated a noble order of things, that while it lasted a glimpse of the vital secret of the Greeks enabled the artists of that period to attain to a high standard of beauty, in which we find purity of motive, marked individuality, and yet another fresh characteristic. For while the Greeks achieved an almost godlike perfection, it was a pagan, superhumanly cold perfection, while the artists of the Renaissance, though attaining to a lower standard of success, infused a larger proportion of human nature into their productions, a sympathy with mankind born of the warmer culture of a romantic and passionate people. For this reason when the inevitable reaction again occurred the art did not sink so low, because men were striving with ideals they better understood, in which the human element responded and beckoned them on.

Another factor had also risen in Western Europe, which reached its richest, if not its purest, expression coincidentally with the Renaissance. I refer to the Gothic movement, that great style in which Christian men found outward expression for the religious fervour which possessed their souls, and which at its best conformed to the same ideals as the architecture of the Greeks. For my argument, however, I introduce it merely because of the influence it had on the work of the Renaissance, for there can be little doubt that a greater proportion of the human element instilled into the Renaissance architecture owed its origin to Gothic influence.

Since the date of the Renaissance there have been many notable architectural achievements, particularly in France and this country, periods when sculpture has played a logical and consistent *role* in conformity with the architecture it embellishes. Still, there has been no great movement to mark an epoch, and until the last few years no effort has apparently been made to evolve a style bearing the vital expression of its own time.

I have the profoundest admiration for the sublime performances of the great masters of Greek and Roman architecture for their genius and culture. I do not argue that another Doric, Ionic, or similar order may be lightly evolved, but, nevertheless, I strongly feel that, inasmuch as they were the creations of minds trained to perfection in practicability, beauty of line, proportion, mass, and silhouette, and, above all, in exquisite detail, there is no reason why the architect of to-day should not from his own inner-consciousness, his culture, and set aim produce buildings inspired by the requirements of his own day which would at least be thorough throughout, with individuality and characteristic style in the smallest detail.

When we remember that it is a simple matter for any architectural student to determine the style and date of a mediæval Gothic building merely from a glance at the ornament on it, it seems an anomaly that to-day, when a new style consistent with the spirit of our time is being surely, if slowly, evolved by some of our ablest architects, a style marked by strong individual characteristics in general, there has been little or no attempt at the evolution of a fresh and fitting style of ornament to embellish such buildings, and we find XXth century architecture ornamented with a parboiled *réchauffé* of classical Renaissance or Jacobean detail. I have often thought that one of the chief reasons why the sculpture and ornament of the Greeks and Romans, of the Renaissance, and of the Gothic buildings were so perfectly in accord with the architecture was because the architects were the sculptors and the sculptors the architects. Nowadays, unfortunately, we are specialists, and, as a rule, the architect knows little of the practical side of sculpture and the sculptor even less still of that of architecture.

This is, however, an age when there are many thoughtful, enthusiastic, and inventive sculptors who would gladly assist in the development of a characteristic and personal style of ornament, if architects could but express what they themselves really wanted. So long as ornament is handed over to business firms of architectural carvers, with their private museums of stock casts as their sole inspiration, not to get new ideas from, but from which to select and arrange, long will the neglect of this important part of the detail of many an otherwise good building appear to the historian of our time to have been unwarrantable and inexplicable in architects showing otherwise so much individuality, forethought, and enthusiasm. The over-familiar "egg-and-tongue," "bead-and-reel," and similar detail are perfect when properly applied; still, it must surely be possible to devise new ornamental members having all the degrees of light and shade which they possess, and yet with a more personal motif suitable to the modern building.

Some sculptors have felt the want of individuality in carved detail so much that they have for their special requirements evolved their own ornament. Amongst these Alfred Gilbert, R.A., and George Frampton, R.A., are notable instances. But while such ornament as modern sculptors have produced may be excellent in its conjunction with the rest of the sculptor's design, it was frankly for the personal requirements of the artists, and I mention it but to show that architects have not sufficiently exploited the latent ability of their brother artists the sculptors to strike with them that complete chord of harmony and refinement which is comparatively rare in the architecture of the present day.

One of the most notable features of the wonderful perfection of the Greek masterpieces, a fact that must have forced itself upon all who have closely studied them, is that it would not be possible to omit any minute part of the sculptured or ornamental detail without marring the perfection of the whole, and, *vice versa*, nothing could be added without procuring a similar result.

There can be no doubt that the Greeks considered the close study of the human figure above all else, making not merely drawings or models from life, but analysing the reasons which make it the most perfect design on earth, embodying themselves with the essential theory of its wonderfully constructed form rather than examining the anatomical structure. Hence they attained a thorough knowledge of the laws which govern the making of a practical and exquisitely beautiful creation by means of critical and analytical observation of nature in its most ideal forms.

Goethe wrote: "So much is certain; the old artists had as complete a knowledge of nature, and as definite an idea of what can be represented and how it must be represented as Homer had. These great works of art were at the same time supreme works of nature, produced by men according to just and natural laws. All that is arbitrary or fantastic falls away; here is necessity; here is God." And, again: "If the artist, by imitating nature, by striving to find a universal expression for it, by exact and

profound study of the objects themselves, finally attains to an exact and ever exacter knowledge of the qualities of things and the mode of their existence, so that he surveys the whole series of forms and can range together and imitate the various characteristic shapes, then what he achieves, if he achieves his utmost, and what, if achieved, sets his work on a level with the highest efforts of man, is Style."

It was this gigantic understanding of nature which endowed their great sculpture with a God-like impersonal idealism, and which when brought to bear on their architectural undertakings rendered them equally perfect in their sublime beauty and practicality.

I believe they regarded the human figure in its most ideal form as the type governing all rules of design. They realised to the fullest extent that it could in no possible way be improved by alteration, either by addition or subtraction; they knew by heart its subtle constructive values; they studied the disposition of its details, as opposed to its broad, simple masses; they understood the exquisite beauty of its proportions and its unapproachable harmony of line and silhouette viewed from any aspect; they felt the value of its wonderful variety of planes, its "local colour," and, above all, its marvellous unity and simplicity; and, with this set ideal well rooted in their minds, they strove and succeeded with consummate skill in blending these conditions into their masterpieces of architecture. I fully appreciate that modern conditions are altogether different, that the curriculum of study of an architectural student of to-day must of necessity cover a wider ground than of old, leaving little time for the practical study of the sister arts; but I feel sure that if students were given opportunities to draw and model from life to a much greater extent than they do, and were logically trained to regard this particular study as a means to a definite end in somewhat the same manner as the Greeks must have, then we should soon find an appreciable advance made towards the higher ideals of artistic architecture.

Students in architecture spend considerable time wading through a long course of study of the "orders," a course corresponding to the drawing and modelling by painting and sculpture students from the antique. I am convinced that not one in a thousand painting or sculpture student has any real comprehensive appreciation of the nobility, style, and ideal beauty of the wonderful masterpieces of Greek sculpture which they copy so laboriously, so blindly, and so mechanically. Such appreciation and understanding only begins to come long after they have passed through their apprenticeship to the art they practise. I fancy that the same remarks apply to the study of the "orders" by architectural students. In the case of the architects, they have not even the same chance of understanding the masterpieces they are copying as the sculptor or painter, who model or draw from a complete or sufficiently complete work, while the architectural students spend many a weary, some hour endeavouring to learn by heart the proportions and details of one column, a piece of architrave, and a portion of cornice, considered without relation to the whole design of which they form but a part. I doubt if 1 per cent. of the students who yearly make such exhaustive study of the "orders" ever take the trouble to make a complete scale drawing of the entire elevation of which the column, architrave, and cornice are but details. How, then, can they possibly train themselves by such means to analyse and appreciate the great principles which guided the Greeks in designing these masterpieces?

And now in what follows, if it should appear that I am unduly critical in my remarks, I would beg you to allow me the privilege of speaking less as an individual than as a logician who would carry his point with all the wordy insistence at his command.

It would generally be supposed that of all men the architect should be best equipped to understand and appreciate the art of sculpture; for he is trained to consider masses, to judge form from its plans, elevations, and sections, to realise the value of line and silhouette, and proportion, and the contiguity of happily-disposed planes of light and shade. Yet, in spite of this, we

continually hear of architects surprised at the effect of light and shadow caused by sculpture applied to their façades, even though designed to their own instructions and after their approval of the sculptor's scale models. Again, architects are apt to consider sculpture as an afterthought, to be added to the design if funds permit, or omitted if not. The average architect does not regard sculpture as an integral part of his conception from the very outset, the omission of which would inevitably mar the entire design, which would be equally impaired by any afterthought or addition. I have not studied architecture to any practical extent, but it seems to me that in conceiving his design for a building the architect to be successful must, from the start, have two definite ends in view—the planning of a practical scheme and the making, as far as lies in his power, of a beautiful shell to contain this scheme. If this is the case, then I cannot understand the attitude of so many architects of to-day in regard to the introduction of sculpture. Either it must be deliberately accounted for as a concrete part of the design, or it must be dismissed for ever, and no matter what funds should later accrue to provide for sculpture, its inclusion is rendered impossible by reason of the already complete nature of the design. I have perhaps unduly insisted on this point, because I firmly believe that its mature consideration will do much to improve the existing condition of architectural sculpture.

There is also a tendency to be too closely bound by tradition in the application of sculpture or ornament to just those parts of a façade which have usually been so filled. Possibly custom has labelled as a general rule the most fitting parts to be decorated, but it does not necessarily follow that under new individual conditions they should still be the most appropriate. Another fault is common—namely, the over-lavish distribution of small frittering ornamental detail, which sometimes completely destroys the simple dignity of an otherwise good architectural design. It would have been far better in some cases if ornament had been altogether omitted, or at most massed at one or two essential points. Such buildings remind one of men whose bodies are tattooed all over with designs having no relation whatever to the form thus masked. One may admire the fine detail and workmanship of the tattooed design and yet heartily wish it were not there.

The proper use of sculptured relief has always been one of the most difficult problems both to architects and sculptors, and I fear that too little attention is often paid to the matter of projection in relief when applied to architecture. One sees buildings where, although satisfactory as regards scale, pattern, and style, the reliefs do not seem to wholly enter into the spirit of the scheme, and it is not until one has carefully sought the reason of this that one arrives at the definite conclusion that the projection is the cause of the trouble. Either it is too high and the local colour is too marked or the case is reversed, with corresponding damage to the unity of the architect's conception. It must be borne in mind that there are two methods of obtaining strong values in relief. One is by having a high projection and making the sections rather round; the same effect can also be procured with much less actual projection by treating the planes very simply and making the edges sharp and square. It is therefore of importance for the architect to decide and instruct the sculptor as to which method he considers most applicable to his design if he wishes to ensure complete unity of feeling throughout.

I am not one of those who, dissatisfied with the conglomerate mixture of styles prevalent to-day, advocate entire rejection of all existing schools of architectural expression and a return to the primitive modes of thought, and a bland, childlike innocence of aught but natural law. I do not believe that this deliberate intention to gain originality can result in anything but eccentricity, because it is not, as is pretended, the outcome of a natural train of thought, but in reality that of affectation. I see no reason to reject any of the useful store of knowledge to be gained by study of the finest examples of all ages. At the same time, I

do firmly believe that one of the surest methods of creating a purer and more forcible expression of the individuality of our time will be found by the acquisition of such culture concurrently with a more complete familiarity with nature's own laws of beauty. This latter I contend to be the core of the whole matter.

A great deal has been written and there has been endless discussion on the subject of collaboration between architects and sculptors. For my own part, I fail to see how it is possible, under existing circumstances, for true collaboration to occur, and, although in a few isolated instances a great measure of success has been attained, it has, I believe, been more the result of accident than otherwise. Before collaboration can be thorough there must be a common ground of mutual understanding between the sculptor and architect, which certainly does not exist at present. As I have said before, there are very few architects practised in the craft of the sculptor, and fewer sculptors are there who can by looking at plans, elevations, and sections realise to any extent the entire conception in the architect's mind. How, then, under such haphazard conditions can the two minds hope to work to one accord? Is it any wonder that, for want of practical knowledge, the architect does not fully realise the intention of the sculptor's sketch models, or, on the other hand, that the sculptor is hampered by uncertainty as to whether he is really in sympathy with the architect's conception, and thereby prevented from working with the sincerity and directness of purpose which must inspire all true artistic endeavour? If, by practical means some common ground of mutual understanding can be found and adopted, then I am convinced that true collaboration, necessary in an age when artists are specialists, will become an accomplished fact, and with its practical and successful working will cease the fruitless discussion which usually ensues when the word "collaboration" is mentioned.

I venture to lay before you what I consider may be the means of providing this "common ground of mutual understanding" whereon the architect and the sculptor may start to build their ideals in unison, each with perfect freedom of sympathetic action. I refer to the use of scale models of the architect's buildings. I am convinced that in all serious undertakings where sculpture is to be employed as a part of the architectural scheme success will in the end be more surely attained by the architect's careful consideration, at an early stage of the designing, of a scale model of his conception. In this model he should express his intention as to the general planes and masses, the proportionate depths and projections of mouldings and reveals, and be himself must decide by means of suggestive bits of clay exactly the disposition, pattern, and projection, silhouette, and mass of the parts he wishes the sculptor to enrich. Then, when he has finally brought the model to the point when it realises to the best of his power the full expression of his conception, he can safely call in the sculptor whom he feels most in sympathy with the particular style of the project in hand. I venture to say that the sculptor selected, if he has any artistic imagination, will from the onset enter into the spirit of that undertaking with a mind attuned to the key of the architect's inspiration in such a manner as he never does at present. He will see shapes which he can understand, and which at once will inspire him with suggestions of beautiful detail which may be evolved therefrom. He will be in his natural element, an element in which plans, sections, and elevations play but an imperfect part, and, best of all, he will be able to realise from the commencement the most fitting treatment of each particular detail in its relation to the whole structure.

Herein, I contend, lies the chance of great success for both architect and sculptor—success for the sculptor because he will have a chance to do really decorative and monumental sculpture, and success for the architect for two reasons: firstly, because he will no longer be worried by uncertainty as to what his brother artist is going to give him or how the work will look when completed; and, secondly, because when he sees before him the model of his proposed building he will be less likely to be conventional, he will

infuse more of his own individuality into the minutest detail, and there will be less likelihood that in an absent-minded way he will label every other member "egg-and-tongue," "bead-and-reel," and so forth. I also believe that the adoption of scale models such as I have described would exercise a great educational influence on both artists. The sculptor would gain by the practical consideration of architecture in a medium that he can understand and by a fuller realisation of the needs inspired by the conception of the architect, while, on the other hand, there would be a tendency for architecture to become simpler and more monumental, and the architect, by means of his practical study of form giving broken light and shade, would widen the already large field of his knowledge and gain fresh power.

I have often thought it would be an excellent idea if students in sculpture and in architecture were taught, side by side, in classes where the decoration of architecture with sculpture should be the subject for special consideration. Architectural models should be made by the joint efforts of one sculptor and one architect, in the designing, modelling, and decorating of which both students would become intimate with the principal laws governing each branch of the art.

Such training would, I believe, bear so rich a harvest of practical result that it would soon become a definite part of the curriculum in the education of architects and sculptors. I would like to see the experiment made by enthusiastic students under sympathetic and appreciative guidance.

There are several small sketch-clubs where young practising artists, sculptors, painters, and architects periodically meet together at each other's studios to practise drawing from the living model. The idea is an excellent one, serving as it does the two-fold purpose of useful study and the creating of a bond of fellowship between the votaries of each different craft. I am sure there are many young sculptors and architects of equal professional rank who would gladly welcome the formation of similar clubs, where the particular study of decorative sculpture applied to architecture might be practically considered by means of sketch scale models. Such clubs or classes should for useful purposes be limited in membership; possibly two of each craft would be found to be sufficient. The procedure might be as follows:—Having at the outset mutually agreed upon a particular type of building giving fair scope for the joint study, the architects would evolve the plans and elevations sufficiently for the object in hand, explaining the scheme and their method of dealing with it for the benefit of the sculptors. Then, selecting such portions as would best serve the purpose, they would all proceed to the making of a clay or plaster model or models, and in this process the practical experience of the sculptors in handling plastic material should prove of value to the architects. I would, however, suggest, in order that the fullest benefit should accrue from the study, that the architects should be considered the controlling spirit of the design as regards the disposition, line, mass, and projection of the sculpture or ornament on the façades under construction. The next step would be for the sculptors to evolve from the lumps of clay suggesting merely the desired values of broken light and shade, sculpture or ornamental detail which should accentuate the intention of the architects, at the same time by choice of subject giving full expression to the *raison d'être* of the building. The study might with advantage to all be carried further by the enlargement of these details to a working scale, with practical reference to nature by the use of the living model, and, as every process would take place in the presence of all, it could but result in a better understanding of the bed-rock principles governing each other's art, elucidated by practical means in a sympathetic way, throughout the joint undertaking. I believe that this form of study would do more for the advancement of art than any number of lectures to sculptors on architecture, or to architects on sculpture.

Let there be a practical and sympathetic understanding of sculpture by architects, a closer and more analytical study of the laws of Beauty and Nature; let the individuality

of our many clever architects have full play in the thorough consideration of the smallest detail; let sculpture be introduced on buildings only to serve a definite purpose, both æsthetic and practical fitness, and at once we shall see the logical result in the more rapid growth of a school of architecture imbued with style inspired by the spirit of our own age."

Mr. T. Stirling Lee, in proposing a vote of thanks, said they had listened to a practical paper, which was full of suggestions and which started very thoroughly with the beginning of things architectural and sculptural. The author started with the idea of what the sculptor did or what he wanted to do when he commenced to ornament a building, and he carried that idea right through, *i.e.*, what the sculpture was to do, how it was to be treated, what parts of the building were to be treated and connected together, and proportion of light and shade. In looking at a building, with sculpture new upon it, one asked how far it connected the different parts of the building, how far the sculptor had grasped the fact of what the architect wanted to do, how far the architectural lines were emphasised, and how the different heights of relief were treated (they were very often not accurate in the matter of the shadows they carry). The first thing that one wanted to grasp clearly in designing sculpture in relation to architecture was the part of the scheme it was to apply to. The old men did not use sculpture without an object; they did not wish for a little enrichment here and a little enrichment there; it was all part of a definite scheme. When one saw sculpture decoration of building one ought to think how far it carried out the decorative idea. He thought every architect would agree with that, but, unfortunately, building or other committees paid no attention to this, and schemes were altered, so that frequently a building would be far finer without the ornament. Many buildings—certainly in London where there was much smoke and soot shadows to contend with—would be much more dignified if it were not for the carving put upon them. What one felt with the ornament was that unless it was of some absolute use to carry the light and shade it should not be used, certainly in London. If they did use it, it should be of the best. They should not use meretricious ornament. Buildings were often injured from the point of view of the sculpture by the use of meretricious ornament, and sculptors would rather see a fine piece of masonry than any attempt at cheap ornament. The one thing to grasp most clearly was that sculpture in connexion with architecture was only a form of carved masonry, and sculptors came to that conclusion when they found that they must try a sort of masonry treatment—that they must treat the sculpture as the mason would treat his work: if they should treat it architecturally. Another matter dealt with was how ornament grew, and that was important. In every development of style there had been this growth, and they could not take certain kinds of sculpture quite apart from the architecture and apply them to the architecture. The severance of the two arts to-day was the actual cause of the want of harmony in their work, and the more they got the academical away from the practical the more they severed the two arts. While the sculptor was trained academically as apart from the practical they would never get the two arts to come together. It was all a matter of growth; the architecture and the ornament must grow in sympathy the one with the other. To do otherwise was like mixing French and German and Italian and other languages together and expecting the result to be harmonious: the style and the vision were different. The sculptor must have the same vision as the architect, and that could not be put too strongly. In the case of a clay model—of a figure, say, for a building—if they looked at it only as a clay model, and applied the treatment to a stone building, the work could never harmonise. Many sculptured figures of to-day were developed from the actual clay construction; they were stone copies of clay models; they were not stone figures, and that showed how essential it was that sculptors who did work for buildings should see with the eyes of the architect—should see what the architect

(Continued on page 93.)

Fifty Years Ago.

FROM THE *Builder* OF JANUARY 26, 1856.

THE ISTHMUS OF SUEZ MARITIME CANAL.

The object of this extraordinary engineering work, now again occupying public attention, is to effect a direct communication between the Red Sea and the Mediterranean, by the shortest route across the narrow Isthmus of Suez. It is intended to be a ship canal of the largest size, to allow vessels of 1,500 tons burthen to pass direct from one sea to the other, without the necessity of discharging cargo. For the mere conveyance of passengers, the railway, now in course of construction, from Alexandria by Cairo to Suez, would be ample accommodation; but for the transport of merchandise, the unshipping at Suez, transport across the desert, and reshipping at Alexandria, is rather too slow work for the rapid exigencies of the present time. It must also be borne in mind that the traffic to the East is continuously increasing, and in process of time will demand greater facility of transit than the Desert Railway will be able to afford: for light goods and passenger traffic, the railway will be of infinite use; but how much more so a ship canal to admit at once the passage of a vessel with all its goods and passengers on board.

It will shorten the distance of the northern parts of Europe by 3,000 leagues; and for the Mediterranean ports by at least 3,400 leagues. It will be far the most direct route to British India—not only the shortest, but the safest, notwithstanding doubts expressed to the contrary by interested parties.

Illustrations.

SKETCH OF PALAZZO PUBBLICO, SIENA.

THIS sketch of the Palazzo Pubblico, taken from the back in the Market-Place, gives a more suggestive idea of the immense height of the tower than does a front view, in which the tower is seen from the ground upwards.

The Palazzo, built of brick and travertine, dates from 1289-1305, and has, at various times, undergone considerable structural alterations; the crenellated portion having been added by Antonio Frederighi in 1450.

The building contains a fine collection of Sienese art.

The basement story was originally an open space, the portions filled in being easily discernible in the sketch, the tops of these arches being about on a level with the ground in front of the building.

The loggia, as seen upon the top story, has a fine open-timber roof, repaired about 1876, and the view of Monte Amiata, as seen from here, is one of the finest in Italy.

The tower, built 1325-1345 ("Torre del Mangia," so named after the stone figure, now removed, which used to strike the hours), is 335 ft. high, as measured from ground in front, and the she-wolves carved upon the angles of the upper portion as gargoyles represent the arms of Siena. This tower, typical of the period, is perhaps quite the finest example. The palaces upon either side are also typical examples of this period, 1300.

L. U. G.

THE WERTHEIM WAREHOUSE, BERLIN.

The illustrations of this building, of which Herr Alfred Messel is the architect, are reproduced from the special issue of the *Berliner-Architekturwelt*, to illustrate a short article on Herr Messel's work, which will be found on another page. A plan of the building is appended.

HOUSE, No. 73, HARLEY-STREET, W.

HARLEY-STREET is fast losing its former monotonous appearance owing to the number of remodellings and rebuildings which have been carried out during the past few years.

In this instance the old house (to which some interest attached, being at one time the residence of Mr. Gladstone) and stabling were pulled down to make room for a house more suitable to the present owner's requirements, and the stables have been replaced by a motor garage.

The new house contains six large reception-rooms, central hall and staircase, eleven bed and dressings rooms, three bath-rooms, and all the usual offices, and an electric passenger "push-button" lift. The old house contained a fine "Adam" ceiling, which has been remodelled and adapted in the new house.

The elevation is built of Portland stone and Lawrance's red facing-bricks. The whole of the work has been carried out from the designs, and under the superintendence, of Mr. W. Henry White by the contractors, Messrs. Prestige & Co.

Our illustration is taken from the architect's Academy drawing (1905).

HOUSE, No. 32, CAVENDISH-SQUARE.

The house which formerly stood on this site was that of Romney, who painted many of his pictures there. It was only removed to make room for the new building shown in the illustration. A finely carved chimney-piece which existed in the studio was practically all that was interesting architecturally in the old house, and this has been carefully preserved and re-used in the dining-room of the new house.

The old house was badly planned, badly built, and ill lighted, and has now made room for one more suitable to modern ideas of planning, light, and comfort. It contains good hall and staircase, large dining-room, morning-room, library, double drawing-rooms and billiard-room, nine bed and dressing rooms, three bath-rooms, and a well-lighted basement containing all the usual accommodation. There is also an electric "push-button" passenger-lift.

The architect is Mr. W. Henry White, and the contract for the work was given to Messrs. James Smith & Sons, of South Norwood.

The illustration is taken from the archi-

tect's drawing, which was hung in last year's Academy.

DESIGN FOR TWO LABOURERS' COTTAGES.

In designing these cottages the cost of building was the chief consideration, and in detail everything is of a simple character throughout. Perhaps the cubical contents might be interesting, which at 4d. (outbuilding inclusive) come to 330l. for the pair.

Externally the materials are local bricks and tiles, with rough-cast. The arrangement of the plan shows two bedrooms on the first floor, and a third on the ground floor which it is thought might be used as a small sitting-room in summer if not required as a bedroom, as the case might be.

H. REGINALD COALES.

THAMES CONSERVANCY BOARD.—At their last meeting before the Christmas recess a report of the Lower River Committee was adopted in the matter of the scheme for dredging referred to in the Thames Conservancy Act of last year. The Board resolved to accept under certain conditions the lowest tender, being that of Sir John Jackson to remove 500,000 cubic yds. of hard material from the Lower Hope, between Gravesend and the Mucking Light, at the rate of 1s. 4½d. per cubic yd., and to invite tenders for the construction of a centre ladder bucket dredger capable of dredging 600 cubic yds. of ballast per hour and of four steam hoppers having a capacity of 800 cubic yds. apiece. The Committee stated in their report that they did not recommend the acceptance of any of the tenders received for dredging sand and silt in the Yantlet Channel in Sea Reach, between Chapman Light and the Nore, as they deemed that the work could be best carried out by the Conservators with new suction dredging plant. The Board decided to invite tenders for combined suction dredger and hopper plant for the latter work as soon as they are in a position to do so.

THE ARCHITECTURAL ASSOCIATION.

(Continued from page 91.)

wanted in the way of ornament on his buildings. Mr. Jenkins had made some suggestions as to how that should be done. Take the case of someone going to a studio and saying that he wanted a frieze and giving a sort of suggestion of it. The frieze was generally done in architectural shops without any consideration of the mouldings above or below it; the mouldings were not considered, and yet it was expected that the work would be a success on the building! What was found was that it was always necessary, if they were going to do the ornament for a building properly, to have the mouldings run so that the work itself was modelled to carry the scale through the mouldings and the harmony of light and shade. From the sculptor's point of view it was desirable wherever possible to meet the architect on the building, and make the designs, not in the studio, but *in situ*. Get the whole scheme, if possible, thoroughly set out—its proportions, planes, and lines, etc.—settled on the spot. The more he worked the more he felt that the old Greeks worked a great deal from drawings; they got the effect in their drawings, and in the case of the ornament they got the same effect in stone. The most important point was to get the scale of the work *in situ*; even then there was a great deal to do if they had to prepare models and drawings. He agreed with Mr. Jenkins that the ideal for sculptors and architects was to see the thing from the same point of view, and if they worked together in such a class as the Association class, in which Mr. Pomeroy used to teach, they would derive great benefit from doing so. Those architects who had been in the atmosphere of painting and sculpture, who worked together in the studios, were the men who had most sympathy with sculptors. They wanted to get back to first practices, and when they did that they would understand first principles and the common laws governing architecture and sculpture.

Mr. H. H. Statham, in seconding the vote of thanks, said that, in reference first of all to Mr. Lee's remarks, he thought that a remarkable point had been made as to sculpture on buildings not being masonry sculpture but a reproduction of clay modelling. But there was a difficulty, *i.e.*, that the sculptor modelled in clay first, and how was it to be got over? Would Mr. Lee like, supposing he had to carve a frieze on a building, to try the experiment of doing what Michelangelo did, *i.e.*, of going straight to the stone and cutting the sculpture out without any previous modelling? It would require a man to be absolutely certain of what he was going to do, but it might have the result of producing the masonry style of sculpture which Mr. Lee rightly wanted to secure. In considering sculpture in relation to buildings it had to be remembered that there were two possible points of view, *i.e.*, whether the sculpture was to appear as put in a frame or whether it was part of the building. They might have both. He should say that the sculptures in the Parthenon pediment were sculptures framed within the pediment free from the building; but the frieze was sculpture forming part of the masonry. The two kinds of sculpture required to be treated differently. He was amused to hear Mr. Jenkins say that the first works of sculpture were simply to express facts, because the previous day he heard the same statement from Mr. Clausen in regard to painting, in his Royal Academy lectures. Mr. Clausen said it was only later that painting was used for the expression of the beautiful. He (the speaker) should not quite agree in saying that the Greeks in their great period had combined utility with beauty, because he did not himself see the element of utility in the Parthenon sculptures. He thought that the Greeks wanted to have sculpture to contrast with their masses of stonework, and he did not know—except in the pediment which represented the combat of Neptune and Minerva for the city—that there was any particular reason in the sculpture. The *metope* sculptures represented the battle of the Centaurs and Lapithæ, but he did not think that was one of the most important Greek myths; they wanted some sculpture there, and the battle of the Centaurs served the purpose. He could not be so optimistic as Mr. Jenkins about the new style getting gradually formed at present.

He did not see it himself, and he did not think we could ever expect to see a national style of architecture grow up as it used to grow up, for the simple reason that we have so much before us; the knowledge of what had gone before, brought before us by travel and photography, etc. These facts could not be forgotten and let alone, and for that reason they could not evolve a new style. He felt much sympathy with the quotation from Goethe, and it reminded him of Johnson's literary criticism in reference to Sterne, *i.e.*, that "nothing odd will do for long." It was a remarkable fact about the Greek sculpture that there was nothing odd in it. There was that quality of completeness of style, with nothing over-emphasised anywhere. In regard to students not appreciating sculpture, what students went to schools of art for and drew from sculpture was to learn to draw more than anything else, and he heard the other day of a rather significant utterance at the Slade School, when the master said: "What are you copying that for? You are not to copy it, but to draw it." There was a great difference between the two. Mr. Jenkins said that one of the surest methods of evolving a purer and more forcible expression of the individuality of our time would be found by the acquisition of culture concurrently with a more complete familiarity with Nature's own laws of beauty, and from that it was to be supposed that Mr. Jenkins knew what Nature's laws of beauty were; he did not, and he never met anyone who did. Sculpture, perhaps, and architecture certainly, had not much to do with Nature, which was at the most only the foundation of them to a certain extent; the results were art. Just before Mr. Jenkins came to his recommendation of models, he (the speaker) had made a similar note. When an architect wished to have sculpture on a building the first thing was for him to have some idea of what he wanted the sculpture to do, for it was a poor method to leave certain places for sculpture and then to go to a sculptor and say: "I want some of your work here." An architect should have some scheme in his mind as to what the sculpture should express, and in what part of the building it should be placed. The question of where to place sculpture upon a building was important, especially on this ground, that sculpture and architecture seemed to have opposite demands. Architecturally, it was most effective to put the sculpture at the top of a building, as the Greeks did with the Parthenon frieze, which he thought the Greeks regarded as an architectural band of ornament, for they put it where it could hardly be seen, and only by reflected light from below. But if the sculpture was to be seen and understood intelligently it must be near the base of the building. These points had to be considered. Did they want an architectural ornament, with some meaning in it when they looked closer at it, or something to be studied close at hand? Mr. Jenkins referred to the two styles in sculptured relief—one to have it in low relief with square and sharp edges. He (the speaker) thought of Donatello while Mr. Jenkins was speaking. The low relief with sharp edges was distinctly the more architectural of the two methods, though there were cases in which the other might look better. He hoped it was not too personal to refer to a monument recently erected in London, *i.e.*, the Strand monument to Gladstone. The principal figure was a fine one; but there was a want of harmony between the sculpture and the architectural portion of the work, and the moment he saw the monument he concluded that the sculpture had been designed irrespectively of the architectural part. The sculpture groups were removed from the architecture, leaving great gaps between, which ought to have been filled up and connected with the architectural centre. He did not know whether an architect had been associated with the sculptor, but he thought that the part of the design he had referred to was bad in composition. He agreed with Mr. Jenkins in what he said as to the peculiar advantage of having models of buildings; it could not be done in the case of small buildings, but where they had to do with important buildings, and, more particularly, where sculpture was to be combined with architecture, it was most desirable to produce a model in order to secure the best

result ultimately. In conclusion, he desired to say how much he had enjoyed listening to the paper, which was of a very high literary character.

Mr. Hugh Stannus said the question of the connexion between sculpture and architecture was a very large one, and would take a long time to discuss adequately. In spite of what Mr. Jenkins said, he could not help thinking that lectures on such subjects were of some value. Mr. Jenkins's suggestion that young architects should study with models was most admirable, but should not young sculptors study with models of architecture? He felt that there was far more opportunity for improvement in the sculpture as was connected with the sculptural monuments up and down London and Great Britain than in connexion with the application of sculpture to architecture. He quite agreed that there was great necessity for sympathy between architect and sculptor. Let them think of all the monuments executed in London, in how many of them had the sculptor ever thought to invite the help of the architect? They did these things better in France, where, whenever a great monument was to be erected, collaboration was the rule: they had the architect to make the architecture, and the sculptor to make the sculpture. And architects who were willing to help the sculptors in London found that when sculptors got a monument to design they did not go to the architect. He could not compliment the sculptors on the architecture they produced; and so, when they advised that sculptors should be called in to help the architect and give them opportunities of introducing sculpture into architectural work, architects would like to feel that they had got hold of the sculptor who would know how to design sculpture which would be perfectly fit and proper in connexion with the architecture. He knew one man who did that admirably, and he knew others who had attempted to make monuments. Public monuments in London were not a credit as were the public monuments of Paris, and one had but to look at the monuments in Paris to see the excellent result of this collaboration. The monuments there were very good individually, but here there were very few which one could be pleased with. He could not help thinking that Mr. Jenkins had given his opinion on the architecture of perhaps twenty years ago, and he was a little pessimistic. In his (the speaker's) opinion the architecture of to-day would compare far more favourably and would take a much higher stand than the architecture Mr. Jenkins referred to. Mr. Jenkins seemed to desire that there should be more novelty; but what was wanted was not novelty so much as more harking back to the principles of the great men of the great times. All young architects as well as young sculptors would find it better if they were to hark back to these principles; the novelties would come later on; but what was desired was that there should be a good academic training which, in France, did not spoil novelty, and he felt quite sure it would not spoil it here. Mr. Jenkins said that collaboration was not possible, and that there was no common ground between the architect and the sculptor; whose fault was that? He did not think it was the fault of the architect, but of the sculptor. He knew that there were some buildings by some of our leading and successful architects that bore comparison with anything that was done twenty or thirty years ago. He thought a paper like Mr. Jenkins's should be nailed at the door of the sculptor rather than the architect. But he was sincerely thankful to Mr. Jenkins for the paper and for the opportunity it had presented of having a discussion on the subject.

Mr. H. T. Hare said that it seemed to him, as to the collaboration of architects and sculptors, that a great deal more of the blame rested with the sculptor than with the architect. He supposed that the cause of the lack of appreciation of the ordinary sculptor for architecture was due to the fact that in England the two professions or arts were divorced one from the other, and sculpture had become more or less a matter of studio work. Nearly all the sculpture works done in this country were isolated pieces intended for galleries and not for application to buildings. That, he thought, was the reason why the principal sculptors were not educated in pure architecture in the way that he thought

they really ought to be. One had only to look round London at the statues which were put up to realise how much they failed in their architectural accessories, and how much the effect of them was to a great extent spoiled through that fault. He was quite sure that some sort of school or class of the kind that Mr. Jenkins had suggested would be very much appreciated by architects, and he had no doubt, by sculptors as well, and he thought that a great deal of good might be obtained in that way. He noticed in one part of the paper the craving after a new style, which seemed to crop up so much amongst some people. He really thought that that was quite a hopeless thing to look for, and he did not think we wanted a new style at all. What was wanted was a development of the old style. It ought not to be a question of style at all. Art was art, and we did not want anything particularly new, but, instead, the old tradition carried on and impressed with the spirit of the age so far as possible. Anything which was as a rule bad, and all the visions which had arisen were, so far as one knew the history of the time or period, and they died out and were thought nothing of in after years. If one looked around London at the buildings erected years ago one would see that those which we thought highly of were those which were built on traditional lines.

Mr. Matt. Garbutt said that they had met to talk about the architects' consideration of sculpture, but that was a thing which often did not exist. And they did not get very far in such a discussion before they heard something about individuality—which was an expression he particularly hated—and something about a new style being desired. It had occurred to him that the Doric style took about 400 years to get evolved. We English had during the last 400 years run through a good many styles, had built a good deal which we did not invent, and a great many things for which we should be sorry for some time. At the time of the Glasgow Exhibition he saw in one of the Glasgow streets an erection in Dumfriesshire stone which very well illustrated one phase of present day consideration of sculpture by the architect. There were lumps of something on the building which perhaps were intended for translations of Nature, but, if so, the sculptor must have had some special kind of Nature to study from. It was some of the "new" art, and was full of "originality." Mr. Stannus said that some of these things were done better in France. He agreed by admitting that anyone who walked along the new streets in Paris would see that not only were the buildings appropriately decorated, but that the sculptors knew how to do work which looked as though designed for its purpose and as though it could not be altered without spoiling the effect, but when one came to some of the monuments one saw what the collaboration of architect and sculptor had resulted in. On the whole, collaboration was a good thing, but there was a certain stamp of work to be seen in France which was not particularly comforting—one type of it was the monument adorned with stone angels of imperfect anatomy anxiously trying to sustain themselves by obviously insufficient wings. The principles which the author insisted upon were to be seen abundantly illustrated in some of the old buildings. Take such Gothic buildings as Wells Cathedral, and there would be seen the harmony between the sculpture and the architecture, and it might be said that Gothic figures agree with Gothic architecture, but that they would clash with Classic, whereas the Classic figures were appropriate to their own buildings and not to Gothic ones.

The Chairman, in putting the vote of thanks, said that they were all indebted to Mr. Jenkins for his excellent paper, and the interesting way in which he had written it. Few of them had the opportunity of using sculpture in their buildings, but they should all make a point of studying it. They ought to be provided with the knowledge necessary to make proper use of sculpture, and he rather ventured to think that Mr. Jenkins was somewhat mistaken in imagining that architects did not study sculpture. If Mr. Jenkins were to see the sketch-books and portfolios of a great many architects he would be surprised to see how very often they sketched sculpture work. They did not as a rule act in the spirit of the man whom he heard about recently who said:

"What is the use of sketching cathedrals? I shall never get a cathedral to build." Architects studied sculpture, even though they might not have an opportunity of using it. He rather agreed with Mr. Stannus in his defence of architects against what was rather a severe attack. Mr. Jenkins seemed to be a little behind the times, or he would know that the best architects did use sculpture and did collaborate sculptors much more than he assumed. They were told by Mr. Jenkins that in the old Greek days architects were sculptors and sculptors architects, but were Phidias and Praxiteles architects as well as sculptors? Mr. Jenkins referred to the study of sculpture and the human figure and the use of the human figure in sculpture work, but he might have said a little more about the use of everything in Nature in the animal and vegetable kingdoms. Mr. Jenkins was perfectly correct in saying that architectural students made drawings of the Orders without understanding them, and it had always appeared to him (Mr. Ambler) that they ought to be taught at the same time how to apply them, that they ought to be made to sketch buildings or parts in the style or order which they were drawing out so elaborately, and that they should be made to sketch some parts by heart, including the whole Order—the column, entablature, and so on—and that they ought to be able to draw it from memory. He quite agreed that the architect was best equipped to understand and appreciate the art of sculpture, as he was so accustomed to mass and form, and he believed that architects did think a great deal more in the round or the solid than Mr. Jenkins seemed to imagine. And certainly they ought to. Some of Mr. Jenkins' remarks were very aptly put, and his point as to models would commend itself to most people; but it was difficult to apply what he said in that connexion, partly on account of cost and also because one could not reduce one's vision to the scale of a model. If one could shrink like Alice in Wonderland to the same scale as the model, and walk round it and have step-ladders at different points, one could get the right effect. One got a false effect in looking at a small scale model of a building. How would some of the fine pieces of sculpture one admires—say, Watts' "Physical Energy"—look in a small model viewed from above? It seemed to him that the proper effect was not got in models. He was glad that Mr. Lee pointed out the difficulty of working from models, and that the clay model was apt to be copied too much in the stone, instead of the stone being treated as stone.

The vote of thanks having been heartily agreed to, Mr. Jenkins, in reply, said that there seemed to be a complete misunderstanding on one or two points he had dealt with. As to his presumed desire for a new style, that was farthest from his thoughts. He did not know enough about architecture to know whether it was possible to produce a new style, but he did mean that, whereas we find architects full of individuality, whose works stood out so that we could say, "That is So-and-so's building," yet there were others whose work was quite different. Some buildings by their character seemed to be suitable for London to-day, while others did not. The Parthenon erected in London would not look suitable for London to-day, and it seemed astonishing that some architects should design the buildings they did. He agreed with Mr. Statham that sculpture on buildings should be secondary to the architecture. Whether it was framed or not it must be secondary in value; whether framed or not it must be an integral part of the design. As to the values in relief, there were two styles of buildings he had in his mind; there was the style with large square expanses, with beautifully broad wall-spaces, and on the top one often saw a relief with a poor round-edged treatment, and he thought that that style of relief was wrongly applied. A, but where the character of the architectural design was curved and circular a rounder style of relief could be used. As to Nature's own laws of beauty, he meant that the Greek studied the figure, he should have said "All Nature"; and with a view to expressing the construction of that figure and gathering together some "principle," he should have said "Principles of Nature's

laws and beauty." He did not think it necessary to copy Nature altogether. One could gain a great deal from the study of Nature, and could apply it to literature or anything else. He must stand on his own ground in reference to Mr. Stannus' remarks about collaboration between architects and sculptors. He contended, as a working sculptor who had had a small but a very thorough knowledge of working with architects who had been most sympathetic over the joint work, that it was ever a matter of difficulty to thoroughly appreciate the aims of a brother artist of whatever craft. One might be able to talk conversationally in a foreign language and yet remain incompetent to judge the values of a great literary work written in that language. He contended that no sculptor could thoroughly visualise an architectural scheme from plans, elevations, and sections. As to the difficulty of judging a small scale model, he thought that might be overcome by photographing the scale model. It had been done with wonderful effect by making the scale model and photographing it. Another method was to make a pin hole in a card and look at it some distance away at the scale level of the eye. He quite understood that architect students did study sculpture largely, but he had spoken about studying principles regarding these things rather than the actual modelling. He could not say whether Phidias was an architect as well as a sculptor, but he contended he must have been. If they looked at the finest Greek buildings they would see that they were all complete masterpieces of sculpture in themselves.

The Chairman announced that the next meeting will be held on February 9, when the Rev. G. H. West will read a paper entitled "The Differences Between English and French Gothic Art," illustrated by lantern views.

The meeting then terminated.

THE ROYAL SANITARY INSTITUTE.

The following is the list of Members and Associates elected this month—

Members:

- | | |
|---|---|
| J. A. Amyot (Director of Laboratory of Provincial Board of Health of Ontario) | P. E. H. Nobbs (Professor of Architecture, McGill University, Montreal, Canada) |
| Prof. W. F. Connell, M.D. (Kingston, Ontario) | Heaton Comyn (London) |
| W. M. Davis (Civil Engineer, Berlin) | A. H. Dungray (Camberley) |
| J. Gait (Toronto) | A. E. Swift (Belham) |
| H. B. Mathew (Dover) | J. P. Larke (Levisham) |
| J. G. McNaught (Edinburgh) | E. Middleton (Public Health Dept., Wellington, New Zealand) |
| F. Woodzambert (Director-General of Public Health, Ottawa) | E. Nugent (Balham) |
| W. Oldright (Toronto) | J. Tison (Harrow-on-Tyne) |
| C. A. Austin (Paddington) | F. G. Tuck (Sydney, New South Wales) |
| W. B. Clegg (Bradford) | J. Turner (Matlock, Derby) |

Associates:

| H. W. Harris (Weston-super-Mare) | Miss T. H. Woodridge (Stock-on-Trent) |
| J. H. Heath (Newport, Shropshire) | W. H. B. Wright (Totton, near Southampton) |
| Miss L. Hitchings (Clayton, Manchester) | |

THE BUILDERS' FOREMEN'S ASSOCIATION: ANNUAL DINNER.

The twelfth annual dinner of the Builders' Foremen's Association was held on Saturday last week in the King's Hall, Holborn restaurant, W.C. Mr. A. Bull (Messrs. Ill & Esdaile) presided, supported by captain F. G. W. Buss, Messrs. H. M. Sdaile, T. Ballantine, H. A. Bull, R. Coles, J. W. Davis, W. M. Higgs, F. Faldo, J. E. Smith, A. Stansfeld, R. Walker, J. Young, and others, the company numbering about 30 members and friends.

The loyal toasts having been honoured, The Chairman, in giving the toast of the evening, "The Builders' Foremen's Association," said that the builder's foreman was, generally speaking, a picked man in his trade—a man who after several years of apprenticeship and more years of artisanship had perfected himself in his own special branch and had also obtained a good knowledge of the many other branches of the trade. The foreman was the man who by virtue of his ability, steadiness, and integrity had won his way to the position he held of trust and responsibility; and he was looked to by his employer to help to bring a job through to the right side, which sometimes, under the cutting prices at which work had to be taken, was not always an easy matter. The foreman had also to see that in exchange for the minimum wage which the British workman received a fair day's work should be given. An Association like the Builders' Foremen's Association, which promoted social and friendly intercourse between its members by meeting together once a month, by an annual dinner and a summer excursion, deserved to succeed; and an Association which aimed at promoting the intellectual and general capabilities of its members by lectures, discussions, and visits to works must commend itself to employers; and an Association which assisted its members when they were in need of employment must commend itself to all foremen, for however good a man might be at his work there were times when employment was hard to obtain. The Association had a membership of 120, and there were only eight or nine of them out of a position, which said much for the good which the Association did for the members. They had a Benevolent Fund, and 10l. was paid on the death of a member, which was a welcome sum in some cases at such a time, and he hoped the Association would become strong enough to grant a second or third 10l. whenever necessary. A Pension Fund for aged members had recently been established, and that was a work which commended the Association not only to foremen but to the community. He desired specially to appeal to them to do all they could to support the fund, which had increased from 70l. to 170l. during the last twelve months, and that said much for the zeal with which the members carried out what they set out to do. An Association founded on such sound principles must succeed, and, being a good thing, he hoped they would push it along. He hoped that all good foremen who were not members would join the Association which, as long as it adhered to its principles, would be a benefit to its members, the employers, and the community.

Mr. W. A. Harford, the President, in response, said that a good deal of their success was due to the Past-President, Mr. Taylor, and others who had worked energetically for the Association. During the past year they had added twenty members and 120l. to the capital, which now amounted to over 500l. The Pension Fund was two years old, and they had a balance in that connexion of, including 10l. from the Chairman and recent donations, over 200l. He hoped the members would support the fund, for he did not think it was possible for any institution to succeed unless those who were likely to derive benefit from it took an active part in supplying the funds, and the appeal issued by the late President should receive unanimous support.

Mr. W. Cook, Vice-President, then proposed "The Building Trades," and remarked that the term was intended to include the kindred trades, the united efforts of which were necessary to the complete evolution of a perfect building.

Mr. A. Stansfeld (Messrs. Dove Bros.), in response, said that builders were degenerating

into merchants, he thought, and the time would shortly come when a builder need not have a yard at all, when he might order from this merchant or that merchant, this sub-contractor or that sub-contractor, and get his work done for him. Foremen had asked him sometimes: "What am I here for? Am I an ornament, or am I to look after sub-contractors?" But this all showed that the foreman should be, and was, a better man to-day than he was thirty years ago.

Other toasts were: "The Visitors," proposed by Mr. B. T. Price and responded to by Mr. J. Young; and "The Chairman," proposed by Mr. G. Thomson, the Secretary of the Association.

During the evening several donations were presented, including 12l. 12s. from Messrs. Lee & Eastwood, per Mr. Townsend, and 2l. 2s. from Messrs. Wakeley Bros., per Mr. Sullivan.

THE LONDON COUNTY COUNCIL.

The first meeting of the London County Council after the Christmas recess was held on Tuesday in the County Hall, Spring-gardens, S.W., Sir E. Cornwall, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Battersea Borough Council 5,000l. for clinker slab paving, and 2,000l. for street widening; Lambeth Borough Council 1,854l. for construction of a public convenience; Finsbury Borough Council 1,000l. for street improvement; Hackney Borough Council 1,200l. for the construction of a public convenience; Hammersmith Borough Council 4,864l. for the construction of a public convenience; Hampstead Borough Council 5,075l. for paving works, and 7,722l. for housing purposes; St. Pancras Borough Council 2,123l. for street improvement; and Southwark Borough Council 2,500l. for contribution towards the cost of acquisition of a public park. Sanction was also given to Woolwich Borough Council to borrow 1,150l. for advances under the Small Dwellings Acquisition Act, 1899.

Apprenticeship.—The Education Committee brought up the following report on apprenticeship:—

"The Council on February 7, 1905, instructed us to report upon the best method of providing apprenticeships for children attending elementary and secondary schools in the county of London. We have accordingly given this matter our careful consideration. In connexion therewith we have found it necessary to consider also the wider question of the opportunities afforded in the administrative county of London to children to obtain technical or industrial training. With a view to facilitating our inquiries into this question, we appointed a special section, of which Mr. R. A. Bray was chairman. They have submitted an interesting and comprehensive memorandum on the subject, copies of which have been circulated to the members of the Council. From inquiries which this section have instituted it appears that in London the old system of indentured apprenticeship has for many years been falling into disrepute, and that in the majority of instances it has almost entirely disappeared; while in only a few trades can it be said to be the commonly recognised way of entering such trades. It would, no doubt, be possible to arrange with a certain number of employers to take boys as apprentices provided a substantial premium were paid, but by paying such premiums the Council would not be doing anything either to increase the aggregate number of apprentices engaged, or to secure for them a better training. All that would happen would be that the employer who desired to engage a boy would naturally give the preference to one for whom a premium would be paid. We have not been able to ascertain that the payment of premiums increases the total number of apprentices. From the point of view of a board of guardians anxious to find an opening for some particular boy, it is a perfectly justifiable proceeding to offer an employer a bonus in order to obtain the privilege of placing the boy in his shop. But from the point of view of the Council, whose interest in children is of a general educational character, extending to all the children in London, who manifested in favour of some particular child, it is doubtful whether a similar preferential treatment of individuals out of public funds could be defended. From inquiries made it appears that, as a general rule, the boys apprenticed by boards of guardians are the only lads in the workshops for whom premiums are paid. The other lads, consequently, and mainly of the same advantages. Thus the result of the guardians' action serves apparently to diminish the number of such free places and in no way to increase the aggregate number of boys who are employed or who have an opportunity of picking up a trade. It would, therefore, we think, be a dangerous experiment for the Council to follow the practice of boards of guardians in offering to pay apprenticeship premiums, even if such a payment be legal.

With regard to the legal question as to the power of the Council to pay apprenticeship premiums, we are advised that, in the opinion of counsel, "the payment of an apprenticeship fee is not legal unless the employer, in consideration of the

payment, actually and effectively teaches the apprentice, and does something more than give him an opportunity to learn." If, therefore, the Council decided to pay the premiums of apprentices, it would be necessary to employ a large staff of inspectors to visit the workshops and see that the apprentices were properly taught. This would, undoubtedly, be extremely costly. In view of the difficulties and expense attending the pursuit of such a policy, and bearing in mind that large funds devoted to apprenticeship already exist, we are of opinion that the Council should not sanction the payment of apprenticeship premiums.

The adoption by the Council of this recommendation would not, however, prevent the Council from co-operating with existing apprenticeship institutions with a view to enabling the trustees of funds, applicable to this purpose, to make the most advantageous use of their income. We have therefore decided to communicate with such institutions with this object in view. We also think that it would be desirable that the elementary schools should be brought into closer touch with the various apprenticeship agencies. In many of the poorer schools of London there are children, known to the head teachers, who require assistance in finding a suitable opening. Much good could therefore be done by acquainting the head teachers of the apprenticeships which are available.

We have therefore arranged (i) that a list of the apprenticeship charities, specifying those applicable to particular areas, should be drawn up, annually revised, and sent in May of each year to the head teachers of the senior departments of every public elementary school; and that the head teachers should be instructed to report in October of each year what steps they have taken to make known to boys and girls the opportunities thus offered, and the result; (ii) that the voluntary agencies engaged in apprenticing children and willing to co-operate with the Council should be included in the list. We are also of opinion that the information regarding apprenticeships should be supplied to the managers of the public elementary schools; and that among the duties of the managers of the London County Council schools a prominent place should be given to the duty of inducing the children to enter skilled trades as they leave school.

If the old system of apprenticeship is destined to disappear in London, it is necessary to inquire what substitute for this training is to take its place. Nothing could be more unsatisfactory in our opinion than the existing arrangements. While it is impossible to obtain figures, there is every reason to believe that the number of boys who enter a skilled trade on leaving school is steadily decreasing. So far as scholarships are concerned the Council offers twenty-five scholarships to boys tenable at the day school of the London County Council Shorehith Technical Institute. The scholarships provide free instruction, and for scholars under fourteen a maintenance grant of 10l. for scholars between fourteen and fifteen of 15l., and for scholars between fifteen and sixteen of 20l. The scholarships are tenable for two years, but the Council reserves the power to extend them for a third year. The competition for these scholarships is keen, this year there were 270 candidates for the twenty-five scholarships offered. In view of the success of these experiments, we are of opinion that scholarships similar to those at Shorehith should be awarded and made tenable at trade schools in other parts of London. On this question, however, we propose to report fully at a later date.

With a view to ascertaining the need for technical or industrial training of boys and girls, we are of opinion that an inquiry should be instituted amongst employers in London. We think that the best course would be for the Council to draw up a memorandum containing a list of questions which, if answered by the employers, would supply the desired information. This memorandum could then be sent to the principals of technical institutes, who would advise the Council whether they would advise the Council concerning the best firms in the neighbourhood to whom the memorandum should be sent. If the principals could arrange that certain of the larger employers should be seen, no doubt the general value of the inquiry would be much enhanced. We think that the result of the inquiry will show that it would be advisable for the Council to extend the present system of scholarships tenable at evening classes. We also suggest that the question of part-time instruction, about which further information is desired, should be included in the memorandum referred to. We desire to ascertain also to what extent this system can be applied in the case of girls, and the amount of the hours and the period for which it should be held.

As regards the curriculum of the higher grade and higher elementary schools, we think that a definite course of elementary and unspecialised instruction, calculated to prepare boys to enter the workshop of any skilled mechanical trade, should be introduced into the curriculum of some of them, and we have this matter under our consideration. We recommend:—

- (a) That no expenditure be incurred by the Council in respect of apprenticeship premiums.
- (b) That, with a view to establishing a system of industrial scholarships and of trade schools, an inquiry be made among the employers in the skilled mechanical trades in order to discover:—(i) whether the employers would co-operate with the Council in encouraging and affording facilities for apprentices or learners to attend evening classes on technical subjects; (ii) whether they would be prepared to accept apprentices or learners to be present for part of the week at trade classes held during the day; (iii) whether they would be willing to take on apprentices or learners children, as they leave school, to attend, for part of the week, trade classes held during the day; (iv) the extent of the demand for trade schools and the most suitable industries to be taught therein in the various districts of London; (v) how far the employers would be prepared to assist the Council by their advice in the establishment of such schools, and by awarding the pupils attending them special privileges.

After discussion, all the recommendations were agreed to, but the first line of (b)

was altered by omitting the following words:—i.e., "with a view to establishing a system of industrial scholarships and of trade schools."

Schools.—The Education Committee recommended, and it was agreed, that expenditure not exceeding 5,077*l.* in respect of the enlargement, adaptation, furnishing, and equipment of the London County Council Kingsland secondary school be sanctioned.

Enlargement of Secondary Schools.—The following recommendations of the Education Committee were agreed to:—

"That the estimate of expenditure on capital account of 1,548*l.*, submitted by the Finance Committee in respect of the enlargement and equipment of the London County Council Peckham Secondary school, be approved.

"That the special maintenance estimate of 1,591*l.*, submitted by the Finance Committee in respect of the enlargement and equipment of the London County Council Peckham Secondary school, be approved.

"That the estimate of expenditure on capital account of 3,153*l.* submitted by the Finance Committee in respect of the enlargement and equipment of the London County Council Southwark Secondary school, be approved.

"That the special maintenance estimate of 2,434*l.*, submitted by the Finance Committee in respect of the enlargement and equipment of the London County Council Southwark Secondary school, be approved.

"That the estimate of expenditure on capital account of 2,077*l.*, submitted by the Finance Committee in respect of the enlargement and equipment of the London County Council Stockwell Secondary school, be approved.

"That the special maintenance estimate of 1,964*l.*, submitted by the Finance Committee in respect of the enlargement and equipment of the London County Council Stockwell Secondary school, be approved.

"That it be referred to the Education Committee to take the necessary steps for the equipment of the London County Council Peckham, Southwark, and Stockwell Secondary schools.

"That, in the event of the Works Committee agreeing to undertake the work connected with the enlargement and adaptation of the London County Council Peckham, Southwark, and Stockwell Secondary schools upon the basis of actual cost with the usual establishment charges added thereto; the work be executed without the intervention of a contractor; and that the plans and specifications be referred to the Works Committee for that purpose."

Avery Hill College.—The same committee recommended, and it was agreed:—

"That the plans submitted to the Education Committee on January 17, 1905, of the proposed adaptation and adaptation of the mansion, and land at Avery Hill, Eltham (Woodwich), for the purposes of a day and residential training college for teachers, be approved.

"That, in the event of the Works Committee agreeing to undertake the work connected with the adaptation of the mansion, out-buildings, and land at Avery Hill, Eltham (Woodwich), for the purposes of a day and residential training college for teachers, upon the basis of actual cost with the usual establishment charges added thereto, the work be executed without the intervention of a contractor, and that the plans and specifications be referred to the Works Committee for that purpose."

No. 17, Fleet-street—Works of Restoration.—The Local Government Records and Museums Committee reported with reference to the restoration of No. 17, Fleet-street. The Council accepted the tender of Mr. W. Downs for the works, which have been completed.

"The building consists of two blocks, one fronting Fleet-street and the other in the rear of it. The two blocks being connected by a neck containing the staircase. At the time the premises were purchased by the Council the fine time premises were building, had been demolished, and the tenant, to whom the premises were let, was in occupation of the front block, which was the portion containing the features of architectural and historical interest. Upon the rebuilding of the back block, which was completed by the Works Committee on November 18, 1902, at a cost of 5,570*l.* 12*s.* 11*d.* (exclusive of electric lighting), the tenant was transferred to it, with a view to the remaining works of restoration being proceeded with.

The work to be done to the front block was affected by the undermentioned considerations:—

- (1) A scheme approved by the Council on July 26, 1896, provided for widening Fleet-street, as opportunity offered, at the joint expense of the Council and the Corporation of the City of London, and for the setting back of the front wall of the ground floor of No. 17, Fleet-street, which necessitated the reconstruction of the first floor so as to provide support for the overhanging upper portion of the building.
- (2) The recommendations of Sir Caspar Pardon Clarke, director of the Science and Art department, South Kensington, for the preservation of the ceiling of the large room on the first floor, known as the "council chamber," entailed the removal of the timbers of the second floor, upon which the main timbers of the upper portion of the building, including the old front, rested.
- (3) It had been ascertained that the principal floor timbers were decayed in parts and that their ends adjoining the rear wall were insufficiently supported, and that the back wall was unstable.

It had been ascertained that the facade visible from Fleet-street was a false or screen front of comparatively modern date. About twenty inches behind this stood the original half-timbered front, some of its bay windows and mutilated, but with

portions of the essential features intact. These included six fine carved solid oak story posts and jamb mouldings of the bay windows, the story beams a carved bracket, and portions of cornice mouldings. Eight carved oak panels had been removed and fixed to the false front. The whole of this old work was thickly encrusted with paint, and in places the carving could hardly be seen. The story posts and jambs had also been cut at the time when the false front was erected. On the removal of the paint the greater part of the carved work was found to be in an excellent state of preservation, and it was necessary to do little more than to piece in the portions which had been cut away. The missing portions were reinstated from the sound portions of such of the internal oak timbers as could not be replaced in their original positions.

The ceiling of the "council chamber" is an excellent example of Jacobean enriched plaster work. It was found that the moulding was obscured by accumulated layers of paint and whitewash, and that the ceiling had suffered from the sagging of the timbers to which it was attached, and had become insecure. The ceiling was taken down in sections with the timbers adhering to it, and conveyed to the Science and Art department, South Kensington, where it was removed from the timbers, cleaned, straightened, and strengthened under the supervision of Sir Caspar Pardon Clarke, at a cost of 110*l.*

The oak paneling with its original cornice on the west wall of the "council chamber" belonged to the original building. The paint with which they were thickly encrusted has been removed, and the work can now be seen in its original condition. The fir paneling on the east and south walls is 18th century work, and includes a mantelpiece with some good carving. The staircase from the first to the third floor is also a good specimen of work of the same period, and has been repaired. The stone archway leading to Inner Temple-lane has been taken down, cleaned, and repaired, and rebuilt on the new frontage line. In connexion with these alterations, it may be mentioned that the Society of the Inner Temple have recently rebuilt the southern arch in stone to accord with that in the front.

We are considering the question of the utilisation of the "council chamber," which has been reserved for public use, and we hope to be in a position to report with reference thereto at an early date."

Houses of Historical Interest.—It was agreed to erect memorial tablets as follows:—

"To No. 33, Ampton street, W.C., to commemorate the residence thereof of Thomas Carlyle; to No. 111, Broadwood street, W.C., to commemorate the residence of William Wilberforce; to Broadwood House; to No. 4, Carlton gardens, S.W., to commemorate the residence thereof of Lord Palmerston."

Ornamental Key, etc., for Public Function.—On the motion of Captain Swinton, the following motion was agreed to:—

"That it be an instruction to the different committees of the Council that in all cases of public functions and ceremonies, where it is considered necessary that an ornamental key, model, illuminated address, or specially bound book be presented to the principal personages, where it is considered an endeavour be made to have such memorial addresses and executed by students of the Council's schools of arts and crafts; and that every such memorial do bear the name or identifying mark of its designer and executor."

Street Traffic.—Mr. Cleland moved, and Mr. E. Smith seconded:—

"That it be referred to the General Purposes Committee to consider and report whether, having regard to the fact that the work included in the references to the Highways, Cleansing, Rivers, Bridges, and Building Act Committees is intimately connected with the provision of adequate facilities to cope with the traffic problem of London, the time has not arrived when, with a view to co-ordinate the various methods of dealing with this problem, it is desirable to establish a Traffic Committee."

This was agreed to after discussion.

Paving Outside Schools.—The following motion was also agreed to, moved by Mr. Johnson, seconded by Mr. Hubbard:—

"That it be referred to the Highways Committee to consider and report whether, in carrying out works of tranway construction or reconstruction, those portions of roads on to which about schools maintained by the Council should be paved with silent materials in so far as possible."

The Council adjourned at seven o'clock.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Bermondsey.—A building on a site abutting upon the north side of New Kent-road and the west side of Old Kent-road, Bermondsey (Mr. A. Harrison for the Council of the Metropolitan Borough of Southwark).—Consent.

Clapham.—For the erection of a projecting one-story shop in front of No. 88, Clapham Park-road, Clapham (Mr. H. Smith for Messrs. H. & C. Davis & Co., Ltd.).—Consent.

Dulwich.—For the retention of porches to Nos. 7, 8, 9, 10, 11, and 12, Ruskin-walk, Herne Hill (Mr. R. E. Mayo).—Consent.

Hampstead.—For the erection of additions to a house known as "Harlestone," on the south side

of Mortimer-road, Kilburn Priory (Mr. W. Reynolds-Stephens).—Consent.

Marylebone, East.—For a building on a site between Nos. 11 and 13, Portland-place, St. Marylebone (Messrs. V. Buckland & Garrard for the Right Hon. Earl Temple).—Consent.

Norwood.—For the erection of temporary buildings at the school, Gipsy-road, Norwood (Mr. T. J. Bailey for the Education Committee of the Council).—Consent.

Strand.—For the retention of a lavatory addition to the United Services Club, Pall Mall abutting upon Waterloo-place (Mr. H. L. Florence for the trustees of the United Services Club).—Consent.

St. Pancras, North.—Projecting one-story shops in front of Nos. 123 and 125, Fettes-road, St. Pancras (Mr. T. Fraser for Mr. T. H. Hawkins).—Refused.

St. Pancras, North.—Projecting one-story shop in front of Nos. 103 to 121 (odd numbers only) inclusive, Fettes-road, St. Pancras (Mr. T. Fraser).—Refused.

Chelsea.—For the erection of buildings on the site of Nos. 247 to 267, Fulham-road, Chelsea (Messrs. Elms & Jupp for Mr. R. C. H. Sloan Stanley).—Refused.

Marylebone, West.—Raising of projecting one-story shops in front of Nos. 168 and 170, Edgware-road, Marylebone (Mr. J. W. Stevens for Mr. E. S. Burns).—Refused.

Walworth.—An iron and glass shelter in front of the South London Central Mission, New Kent-road, Walworth (Mr. A. Conder for the Rev. A. Meams).—Refused.

Width of Way.

Southwark, West.—Houses on the site of Nos. 1 to 12, King's-court, Southwark, with external walls at less than the prescribed distance from the centre of the roadways of King's-court and Prince's-place (Mr. A. Burr for trustees of the Jolly Trust).—Consent.

Limhouse.—An addition to the St. John's schools, Halley-street, Stepney, with external walls at less than the prescribed distance from the centre of the roadway of John-street (Mr. T. J. Bailey for the Education Committee of the Council).—Consent.

Islington, South.—The retention of a building at the rear of No. 35, Thornhill-road, Islington, with a forecourt boundary at less than the prescribed distance from the centre of the roadway of the southern arm of Barnsbury-square (Messrs. F. J. Eedle & Meyers for Mr. T. Heath).—Refused.

Width of Way and Line of Frontage.

Chelsea.—Artisans' dwellings on the north-eastern side of Pond-place, Chelsea (Messrs. Joseph & Smithe for the Council of the Metropolitan Borough of Chelsea).—Consent.

Width of Way, Line of Frontage, and Space at Rear.

Strand.—A block of artisans' dwellings on the north-eastern side of Marshall-street, Westminster (Messrs. Joseph & Smithe for the Council of the City of Westminster).—Consent.

Line of Frontage and Space at Rear.

Wandsworth.—A deviation from the plan approved in respect of the erection of buildings on the west side of Streatham-hill, at the corner of Drewstead-road, Wandsworth, so far as relates to the erection of an office building on the south side of Drewstead-road, and to an alteration in the space at the rear of the buildings on the west side of Streatham-hill (Messrs. Taylor & Sons).—Consent.

Uniting Buildings.

City of London.—The uniting of No. 5, Threadneedle-street, with No. 8, Finch-lane, City (Mr. T. B. Whinney for the London, City, and Midland Bank).—Consent.

Deviation from Certified Plans.

Strand.—Certain deviations from the plans certified by the district surveyor so far as relates to the proposed re-erection of No. 13, Golden-square, Strand (Mr. W. Woodward).—Refused.

The recommendations marked † are contrary to the views of the local authority.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

A MEETING of the Discussion Section of the Architectural Association was held at 18, Tuflet-street, W., on the 17th inst. Mr. E. W. Wonnacott in the chair, when a paper was read by Mr. Edwin Gunn on "The Ideal Architect from the Client's Point of View," of which the following is a summary:—

Clients, like architects, are various. Accordingly the client's point of view is not a fixed one. Generally speaking, however, its outlook is directed rather towards material than esthetic needs, and this is not solely in the business man. Bacon, in his Essays, shrewdly says:—"Houses are built to Live in and not to Look on; Therefore let Use be preferred before Uniformity: Except where

th may be had. Leave the goodly Fabriques Houses, for Beautie only, to the enchanted Pallaces of the Poets: Who build em with small Cost."

This materialistic view of things I cannot think a disadvantage. Indeed, if it were not wholly true, and the client more often willing to leave all questions relating to architectural form and expression entirely in the hands of the man who is (presumably) aimed to impart it, only good could result. Upon question of plan arrangement and details of convenience, the layman's opinion is generally interesting, if not always convincing; but his remarks, as soon as he leaves his practical ground for a higher sphere, are, as a rule, not of an edifying nature. "Styles" may bring himself to partly understand, and even to label and classify with the pride of imperfect knowledge, but the general quality described as "style" (for lack of a better word) is uncomprehended by him. Having now conveniently assumed the client's right point of view to be material (not necessarily practical), I will proceed a step further. In 90 per cent. of cases, a client's secret ideal would shape somewhat as follows:—"My ideal is the man who can embody all my ideas and requirements, and translate them to the builder, that I obtain in the result a building 'made to order,' coupled with every due economy of cost." In fact, the architect is looked on as a species of middleman between client and builder. This is not the light in which he should be regarded if good work is to result, and the client's interests are surely best served by an architect who attempts the ungrateful task of convincing him of the folly or impracticability of some of his pet schemes. I have known architects (and financially successful ones) whose extreme deference to their clients' views carried them to the extent of accepting their slightest wishes without advancing the objections which might be perfectly apparent to their professional knowledge. The man who has need for the services of a professional man should content himself with a statement of the situation in which he requires advice or help, and his adviser should be capable of taking the steps necessary to provide it. If architecture be an art, would any other artist, a painter, say, welcome suggestions as to the colours with which his palette should be charged, even though their giver had commissioned the work in hand? Assuredly not, yet a similar state of things is of daily occurrence in architecture, and the complaisant architect is undoubtedly popular with that conceited and self-opinionated type of client who knows what he likes." Another type of client is he who wishes to build he hardly knows what, and employs the architect to relieve him of the trouble. Viewed in the light of "Art for Art's sake," it is doubtless charming to work under such conditions, but practically it is awkward—it is akin to the difficulty of solving a problem without reliable data. Assume, however, that we have found our ideal client—one who is able to give clear instructions as to his needs, but remains open to reason, ready to accept modifications upon his architect's advice and does not trespass in matters of detail beyond his ken. It remains for the architect to take care that his advice so given is logical and well supported by cogent reason. As examples of the influence which an architect may legitimately bring to bear, I may instance stress laid on thoughtful planning, especially in relation to the arrangement of water services and drainage, and the avoiding of the provision of such necessities on the exposed fronts of the house. Generally speaking, I think it is well to take the client into our confidence and present to him our reasons more often than we do. How is he to know that these reasons exist, or that much thought and scheming have been devoted to such matters of detail, unless we so explain to him? In return for the disposition of sweet reasonableness, let the architect not design chimneys which smoke at the wrong end, transames at the eye line, and bedrooms minus good position for bed or wardrobe. In short, the architect must be assured that he does not forget utility or sacrifice it to any consideration. Our ideal architect will ever have both art and utility in his mind, and succeed in reconciling them. This brings me to what must be regarded as the point which I wish to make, viz., that the ideal architect, from the client's as well as every other point

of view, is he in whom the sense of proportion is best developed. By proportion, in this sense, I mean a due regard for the relative importance of all the multifarious details of modern practice. Our President, in his annual address at the commencement of this session, has put things into such true perspective that I make no apology for introducing his remarks as a fitting termination. Mr. Dawber says:—

"An architect, to a great extent, must combine two qualities, qualities that are generally considered impossible to find together in one individual; the artistic and sensitive temperament of the artist with the orderly and commonsense methods of the man of business. The latter must be ever present to restrain those fancies into the realm of reality in which the former may be tempted to indulge. Such success in most occupations depends largely upon efficient organisation and management; that is to say, on a due relation of each part to the rest. In architecture that is specially true. It is the art which is dependent for its expression on the ability of the artist to work and obtain his results through cooperation with his employer. Indeed, architecture is, to a certain extent, more capable of being judged by commonsense methods than any other art. This is doubtless the reason why commonsense people of other professions often think they would make better architects than those they employ. The general public are more apt to look upon architecture as a business than as an art; partly because it is ruled more or less by commonsense principles, and partly because the accepted method of payment is more businesslike than artistic. We associate directness and the power of quickly grasping a difficult situation and dealing with it with the qualities that go to make a good man of business, and nowhere are these qualities so necessary as in the work of an architect, which, above all things, must be practical. In the management of accounts, in keeping a constant check and supervision of expenses, it is obvious that, in his client's interests, an architect must be a careful man of business. Not only so, but in the artistic side of his work, in the management and disposal of the plans, and elevations of his buildings, the business quality will again make itself felt."

And, finally, let me add another quality necessary to peace of mind, viz., the long-suffering and patience of Job.

Mr. F. C. Mears, who proposed the vote of thanks, said the ideal architect should reduce his client to a state of docile admiration, and avoid rows. Mr. A. C. Dickie summarised the great need as "tact," added to sympathy, and Mr. A. H. Belcher defined the architect as a "diplomat." Generally, the discussion dealt more with the unideal client than the ideal architect. Mr. R. Watson, in summing up, said an architect should be frank and clear, and have his designs well thrashed out; he should be keen to consider his client's requirements and pocket. His contract plans should be full, accurate, and clear. Much of the knowledge required for sanitation, water supply, sewage disposal, and such matters can, and should, be learnt from the text-books, and then applied. A scheme should not be started with preconceived ideas, and, if the client's needs are well worked out, a successful result often ensues.

The Chairman, in concluding the meeting, announced that the paper to be read on January 31 would be by Mr. A. C. Dickie, on "Internal Steps and Stairs."

ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—At the Edinburgh Architectural Association meeting on the 17th inst., Mr. H. O. Tarbolton, President, in the chair, Mr. W. T. Oldrieve, Principal Architect for Scotland of H.M. Office of Works, read a paper entitled "What H.M. Office of Works is Doing for Historical Buildings in Scotland." Mr. Oldrieve said that all architects and antiquarians must be pleased to see a growing interest on the part of the general public in this question, for only the enlightenment and improved artistic sense of the public could enable any Government to take efficient control and enforce the necessary provisions for the conservation of such buildings. Much had been done by legislative action in other European countries for the care of ancient monuments. Almost every European country except their own was taking action in the preparation of official catalogues of national monuments, and surely every possible means should be used to take similar action in this country. Scotland was rich in historic remains of architectural monuments of the past, but the greater number of these were under no official cognisance and subject to no official control. It appeared to him that the work of the National Art Survey of Scotland deserved special notice and recognition in this connexion, and he could not imagine a more praiseworthy scheme than

that of encouraging architectural students, under proper guidance, systematically to measure and sketch the more important architectural remains. The historic buildings and remains over which their Department had direct control might be classified under two heads: (1) Buildings vested in the Department, and (2) architectural and antiquarian remains of which the Commissioners of Works were custodians under the Ancient Monuments Acts. It was now, however, recognised that other Government Departments which carried out building works referred to the Commissioners of His Majesty's Works cases which affected ancient buildings of an architectural character, as, for instance, the War Department with reference to Edinburgh Castle, Stirling Castle, etc., and the Admiralty Department as in the case of Rosyth Castle, a proposed restoration of which was contemplated. The archeological remains of a minor character, so-called ancient monuments in Scotland, of which they were custodians, comprised:—The circular walled structures called Edin's Hall on Cockburn Law, Berwickshire; the British Forts on the hills called the Black and White Catherluns, Forfarshire; the Pictish Towers at Glenelg, Invernessshire; the Stones of Callernish, Lewis; the Brough of Clickimin, Shetland; the Pictish Tower at Mousa, in Shetland; the inscribed slab standing on the road leading from Wigton to Whithorn; two stones with incised crosses on a mound in a field at Lagganair; and the pillars at Kirkmaidrie, Wigtownshire. Secondly, there were ancient monuments, to which the Ancient Monuments Protection Act, 1882, applied, but which had not yet been taken in charge by His Majesty's Office of Works. These included the Bass of Inverury; the vitrified fort on the Hill of Noath, and the pillar and stone at Newton-in-the-Garoch, Aberdeenshire; the British Walled Settlement, enclosing huts at Harefalds, in Lauderdale; the Dun of Dornadilla; the Sculptured Stone called Suenos Stone, near Forres; the Cross Slab with inscription in the Churchyard of St. Vigeans; a group of remains and pillars on a haugh at Clava, on the banks of the Nairn, Invernesshire; the Cairns, with chambers and galleries partially dilapidated, Minnigaff, Kirkeudbrightshire; the Catstane, an inscribed pillar, Kirkliston; the Ring of Brogar and other stone pillars at Stennis, Orkney; the Chambered Mound at Maeshowe, Orkney. Thirdly, there were ancient monuments not included in the schedule of the Act of 1882, but which had since been taken in charge by H.M. Office of Works under that Act by order in Council—viz., ancient Runic Crosses at Ruiswell, Dumfriesshire; St. Ninian's Cave, Wigtownshire; the Pictish Tower of Carloway, Lewis; cup-marked rock of three standing stones, Drumtroddan; the Meai Hill of Druchtug, semi-circular earthwork, Barsalloch; and the ancient chapel of Wigtownshire; sculptured stones at Essie, Forfarshire; Roman Camp at Rispan; and standing stone at Blairbowie, known as the Wren's Egg; and sculptured stones at Whithorn Priory, Wigtownshire; sculptured stones in Dyce Churchyard, Aberdeenshire. Mr. Oldrieve explained next the working of the Ancient Monuments Acts, and pointed out that while the object of the earlier Act was the preservation of ancient monuments consisting for the most part of prehistoric remains, dolmens, ancient forts, etc., the Act of 1890 had a much wider scope, as therein "monument" meant any structure, erection, or monument of historic or architectural interest, or any remains thereof. Mr. Oldrieve proceeded to show by means of limelight other important historical buildings under the charge of the Board of Works on which certain restorations had recently been made. First among them was Edinburgh Castle, the care of which, he said, had now been transferred from the Royal Engineers Department of the War Office to H.M. Board of Works. One of the first things that was done was to re-arrange, at a cost of about 1000l., the fire appliances at the Castle, and it was now on that account much safer from fire than it had formerly been. They were now considering how best to re-model the block known as the "new barracks." He was quite alive to the necessity of moving very carefully in the matter, and before anything was actually attempted upon the building itself, he should endeavour to have not only photographs and prospective sketches

from various standpoints, but a model prepared for full consideration. As to Holyrood Palace, he mentioned that, among other things, an old sculptured panel which had been removed at the time of the Commonwealth would be and-by be replaced in a recess in one of the turrets. It bore the Royal Arms of Scotland with Unicorn and St. Andrew's Cross. Another little bit of restoration work had just been done in Queen Mary's Audience Chamber by the removal of a comparatively modern partition which divided the room into two parts. Visitors would now be able to see the chamber practically as it was at the famous interview of John Knox with Queen Mary, and it would be worth while to look at the old ceiling, now that it could be properly seen, especially as it was the only ceiling at Holyrood which was part of the original building as occupied at the Queen Mary period. He also mentioned that an interesting little stair which had until recently been kept closed, between the audience chamber and the prison cells above, had now been opened to view. Mention was also made of what was being done for the restoration of the tapestries in the Palace of Holyrood and for the preservation of the grave slabs in the Chapel Royal. His next directed attention to the restoration and redecoration of Parliament Hall, which has been already described, and reference was also made to preservative work which had been executed at Linnithgow Palace, at Dunfermline Abbey, at St. Andrews Cathedral, where, in September last, stone coffins of the priors had been discovered; at Arbroath Abbey, Dundrennan Abbey, Forthrose Cathedral, and Haddington Abbey. Concerning Rosyth Castle, he said it was generally known that that old keep formed the central feature of the proposed naval base on the Forth. This was one of the cases in which the Board of Works were acting as architectural advisers to the Admiralty. It was thought that the old keep might be restored for the purpose of utilising the accommodation available in some way connected with the naval scheme. Accordingly, designs had been prepared for a restoration, one principal apartment being utilised as a reading-room for naval officers, and another for the purpose of a naval museum. The plans were now under consideration of the Lords of the Admiralty, and it was hoped the scheme might receive sanction. It would certainly be a pity to let the building fall into decay, since it was of some historical interest. Two dates were found upon the building, one 1561 and the other 1635 or 1655, along with these being some initials. On the motion of Professor Baldwin Brown, seconded by Mr. Hunter Crawford, Mr. Oldrieve received a cordial vote of thanks.

WOLVERHAMPTON ARCHITECTURAL ASSOCIATION.—The annual general meeting of the members of the Wolverhampton and District Architectural Association was held on the 18th inst. at the Law Library, Lynch Gates, when the officers and Council for the ensuing year were elected as follows:—President—Mr. Fred T. Beck; Vice-President—Mr. W. Edwards; members of Council—Mr. T. H. Fleeming, Mr. J. Lavender, F.R.I.B.A., Mr. Ashton Veall; Hon. Treasurer—Mr. Harrison Weller; Hon. Auditor—Mr. A. Eaton Painter; and Hon. Secretary—Mr. W. J. Oliver. 1, Darlington-street, Wolverhampton. The Vice-President (Mr. W. Edwards) presided at this meeting, in the absence, through illness, of the President (Mr. Beck), who was therefore unable to deliver his annual address. The meeting was of a business nature.

ARCHAEOLOGICAL SOCIETIES.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—At the evening meeting on January 17, Mr. R. H. Forster, Hon. Treasurer, in the chair, Dr. Winstone exhibited two rush-light stands brought from Llanidloes in Wales, inserted in massive blocks of oak and in perfect condition. Mr. Gould, in explaining how the rushes were applied and burned in order to produce the most light and to collect the falling tallow for re-use, said these rush-light stands were of a similar type to those occasionally found in Essex. The Chairman exhibited a coin of Carausius dredged up from the river in Putney reach with many other coins, which, unfortunately, were lost, together with the dredger almost

immediately afterwards, and could not be recovered. This coin is of somewhat rare type among the vast number of Carausius found in England. It is nearly identical with Cohen's, No. 217, "Carausius." Its description is as follows: Face of coin, bust to right, "I.M.P. CARAVSIVS P.F. AVG." Reverse, "PAX." "PAX" (the word "Pax" has disappeared from this coin) and figure of Peace, facing to left, holding an olive branch and leaning on a staff. Letters B E on either side of the figure, the meaning unknown, probably a moneyer's mark (?) at foot, "M L XXI," meaning London Mint and value (twenty-first part of a silver denarius). Mrs. Collier read a paper on "St. Clether's Chapel and Holy Wells."

The submerged ruins of a well and other buildings had long been known to exist upon the steep slope of a hill in the neighbourhood of St. Clether's Church, in the Tamey Valley, Cornwall, but it was not until 1897 that practical steps were set on foot to unearth them, with the consent of the owner of the land, by the Rev. S. Baring Gould, who was aided in the work by local subscriptions and donations. The work was not easy nor progress expeditious, as they lay in a swamp, and the water had to be drained off and diverted before excavations could be undertaken. The first discovery made was that of the upper Holy Well, which received, and still receives, its water from a spring higher up the hill, which may have been a Pagan well consecrated to Christian uses by St. Clether. Here were found stone jambs in position, an arch, but broken, and sufficient of the walls remaining to enable the size and outline to be obtained, and the trough beneath cut out from granite was found in perfect condition. A few feet lower down the slope other portions of walls were visible, which, on being cleared of the earth, under the supervision of the Rev. A. H. Malan, proved to be the remains of the chapel, or oratory, of St. Clether. Four feet of the height of the east wall was found with the altar slab in position still resting on four upright stones and fixed without mortar. Close to the south-east corner of the east wall a small recess was disclosed, and another, but larger one, at the south end of the altar in the same wall. A south-east corner a slab of granite resting on a set-off remained in position. The most interesting feature of the exploration is the fact that the water from the upper well was conducted in a channel through the north wall, flowing under the base of the altar, and emptying itself through the south wall into a lower well hollowed out on the outer side of the building. This was proved to be the case by clearing the passage with rods, when the water came running swiftly through the conduit, and does so still, as it did centuries ago. The building internally measures 19 ft. 1 in. by 11 ft. 4 in., with a door on the north and another on the west. The upper well is not square with the chapel, but is situated 7 ft. from the north-east angle. Of the date of the upper and original well discovered by St. Clether there can be only conjecture, but sufficient architectural remains of the chapel were met with to show it to be a building of the XVth century. It has been very carefully restored through the liberal donations of Mr. Spry, of Witherdon, the owner of the land, Mr. Baring Gould, and others interested in its preservation. The paper was illustrated by sketches and photographs. A second paper was to have been read by Mr. Patrick, Hon. Secretary, but, owing to his indisposition, it was read by the Chairman, contributed by Dr. Russell Forbes of Rome, on "The Curtian Lake." The natural condition of the forum, situated in the valley between the Palatine and Capitoline Hills, was a boggy hollow. It was called the Curtian Lake from a leader of the Sabines getting mired in it in the war with Romulus, and, although it was afterwards drained, it retained the name. A small part was consecrated to the memory of Mettius Curtius near the centre of the forum, represented in the present day by a shallow brick basin 15 ft. from east to west by 15½ ft. from north to south and 2½ ft. below the present level. It is over the north end of the fourth or eastern underground corridor of Caesar, and one-third down the south side of the Basilica Æmilia. A vase, some fragments of pottery, and sacrificial bones were found within it and remain on the spot. The incident of Curtius

flourishing in the marsh is commemorated in a relief of peperino stone now on the staircase of the Palazzo dei Conservatori, found in 1553 near the column of Phocas. This spot, the Curtian Lake, was believed to have been struck by lightning, and was enclosed by Cains Curtius, Consul, with the sanction of the Senate, a.c. 443, who built an altar there, the remains of which were discovered in the forum between the column of Phocas and Decian's pedestal on April 15, 1904. It is related by Proculus that, a.c. 360, the earth opened in that place, and the auspices being consulted by the direction of the Senate the response of the god demanded a sacrifice to the Manes. Then a certain Curtius (Marcus Quintus Curtius), a valiant man, armed and mounted on horseback, threw himself into the chasm, when the earth closed up, burying his body divinely. Dr. Russell Forbes asks: "Is the story of Marcus Curtius a poetical legend of self-sacrifice founded on the story of Mettius Curtius, or did Marcus open it as an earthquake, and did Marcus Curtius immolate himself?" "If he plunged into the chasm the remains of Curtius and his horse are existing, and will certainly see the light of another day in the course of further explorations. If they are not found, then the story is but a poetical legend." The Chairman, Mr. Gould, Mr. Kershaw, and others joined in the discussion which followed.

COURT OF COMMON COUNCIL.

A MEETING of the Court of Common Council was held at the Guildhall on Thursday last week, the Mayor presiding.

Shadwell Market.—In reply to Mr. Barber, who asked what was being done with the Shadwell Market, Mr. Green said that efforts had been made in the past year to establish a market there. A deputation had also been received in connexion with the project for turning the market into an open space, and if a sufficiently liberal offer were made that proposal might be carried out. The question as to whether it would be possible to have a market there of a different character was under discussion.

Strand Improvement.—A letter from the Secretary of the Further Strand Improvement Scheme Committee, forwarding a copy of a memorial to the London County Council in support of the plan advocated by the Committee, and asking the Corporation to do the same, was referred to the Finance and Improvements Committee.

Trade Union Wages.—A letter was received from the town clerk of the Borough of Lambeth inviting the Corporation to send delegates to a conference to be held at an early date at the Lambeth Town Hall, with a view to framing and bringing into existence a uniform scale of trade union rate of wages and conditions for the employees in each department of the different borough councils. The letter was referred to the Streets Committee.

YORKSHIRE FEDERATION OF BUILDING TRADE EMPLOYERS.

THE annual dinner of the Yorkshire Federation of Building Trade Employers took place on the 19th inst. at the Hotel Metropole, Leeds. Mr. Paul Rhodes (President) was in the chair.

In proposing success to "The National Federation of Building Trade Employers," Mr. S. Smeethurst (Oldham) said the organisation was growing in importance every year. Defensive in its aims, it was founded on a broad basis of representation, and was financially sound. Great hopes were entertained, he said, that the result of the new conciliation scheme that was about to be inaugurated would be that there would be absolutely no more strikes or lock-outs. The scheme had been favourably received in Lancashire, and there was reason for believing that it would be received with equal favour in other parts of the country. Under the new scheme every effort would be made to settle amicably every point that might be raised between employers and workmen, and without cessation of work. In view of the growing strength of labour it behooved masters to be well organised and to be suitably financed.

Mr. W. Shepherd (London), President of the National Federation, responded. It was true that the Master's Federation was mainly meant for defensive purposes. If it had not been for the strength of the masters' organisation, such a scheme of conciliation as had been indicated would not have been possible. It was only when two parties became organised and strong that they began to respect one another—that conciliation became possible. They stood for freedom of contract, and for equitable and just treatment. When it was realised that, taking the country as a whole, building was the largest industry in England, after agriculture, one felt

but there was very little litigation amongst employers, and very little friction amongst them. With regard to the progress of labour, it behoved that Federation to watch what was going on around them. He was ready to acknowledge that the Labour representatives who had come to the front had a high conception of their duties, and a keen sense of their responsibilities. It was for employers to watch the trend of events.

Mr. W. Nicholson, Vice-President of the National Federation, also acknowledged the toast. What the Federation now stood most in need of was a reserve fund. That reserve fund might be termed the masters' premium against labour. With regard to the conciliation scheme it was important that the conciliation board should be a strong one. One thing the trade had to be particularly thankful for was the concession that there should be no cessation of work pending negotiations.

Mr. J. Dawson (Huddersfield) proposed the toast of "Architects and Surveyors," and it was responded to by Mr. G. B. Bulmer, President of the Leeds and Yorkshire Architectural Society.—(Alderman Judge (Wakefield) gave "The City and Trade of Leeds," and this was responded to by Mr. Charles Myers.

Mr. J. H. Armitage, Chairman of the Leeds Waterworks Committee, proposed "The Yorkshire Federation of Building Trade Employers," and the toast was responded to by the President (Mr. Paul Rhodes) and the Vice-President (Mr. A. W. Sinclair).

METROPOLITAN ASYLUMS BOARD.

The ordinary fortnightly meeting of the managers of the Metropolitan Asylums District was held on Saturday last week at the offices, Victoria Street, W.C.

East Cliffe House, Margate.—On the recommendation of the Children's Committee the Works Committee were instructed to submit a plan and estimate of cost of proposed additional staff accommodation at this seaside home.

North Eastern Hospital.—The amended plan of the new boiler house, etc., at this hospital was approved and the matter was referred to the Works Committee to be dealt with.

Joyce Green Hospital.—A sketch plan, prepared by the Engineer in Chief, of a proposed goods reception station at Joyce Green Hospital was approved, and referred to the Works Committee.

A scheme for the erection of staff cottages at the hospital was referred to the same Committee.

South Eastern Hospital.—Plans prepared by Messrs. T. W. Aldwinckle & Son for structural alterations in the boiler house at this institution were approved, and ordered to be forwarded to the Local Government Board for sanction. It was agreed also, subject to the sanction of the Local Government Board, to enter into a contract with Messrs. Babcock & Wilcox for providing and fixing three multi-tubular boilers, with settings and mechanical stokers, for the sum of 2,250*l.*, and it was further agreed to apply to the Local Government Board for sanction to inviting tenders from six selected firms for the execution of engineering, pipe work, fitting, etc., in connexion with the installation of the new boilers.

COMPETITION.

SHIRE HALL, NORWICH.—In reference to the paragraph in our last issue relating to the proposed enlargement of the Shire Hall, Norwich, a mistake was made in the names of the authors of the first and second premiated designs. Mr. Tench is the author of the design placed first, and Mr. Wm. Whiddington, 71, Queen-street, Cheapside, the author of the design placed second. The mistakes were not ours.

ARCHITECTURAL "REFINEMENTS."

SIR.—The article in your journal dealing with Professor Goodyear's conclusions, and the further reference to the matter in the issue of the *Builder* for December 9, entertained me immensely. I had previously wondered what was the perusal of the reports of the Edinburgh lectures as published and commented upon in other journals, whether the time was not ripe for someone with a gift for writing to come forward and finally demolish these pseudo-scientific theories. One can but suppose that their ready adoption by an unthinking public is due to the modern tendency to invest everything ancient with a undue mysticism. In another direction the same thing is to be observed in the highly-developed faculty some people have for detecting symbolism in everything relating to the structure of a church. You will pardon what may be properly described as a pointless letter, but in a country like this, where the mental horizon of the inhabitants is bounded by the share market, it is a relief to feel oneself in touch with London. In this respect the *Builder* is a most valuable link.

FREDK. CHATTERTON, A.R.I.B.A.
Pretoria Club, Pretoria, December 30.

APPOINTMENT OF DISTRICT SURVEYORS.

SIR.—If the system advocated by "An Architect" becomes law, poor unfortunate builders would have to wait months before starting their jobs, whereas at present they can give notice to the District Surveyor and start the work in twenty-four hours.

There are architects and architects, and in some cases it is a blessing for the public that the District Surveyors are competent and experienced architects, can point out the weak spots in the construction, and save collapse and, perhaps, loss of life.

I have never met the machines named; a very difficult Act has to be interpreted, and the learned bodies agree with the public that the District Surveyors are a credit to the profession to which they belong.

Surely "An Architect" knows that "light and air" is regulated by common law and not by the Building Acts.

The Guild Court may answer for the little towns of Scotland as the district councils do for the provincial towns, but the experience of sixty years shows that the independent officer is the best arrangement for London.

DISTRICT SURVEYOR.

CHARING CROSS ACCIDENT.

SIR.—More than thirty years ago a lamp-post fell down in Marylebone-road through internal oxidation. The lamp-post was moulded horizontally and the fracture took place at a deeply-indented annular moulding. I wrote to the *Builder* at the time stating that ironwork required internal protection, especially tubular ironwork and parts of ironwork not externally visible.

Since then the lamp-posts in this town have been replaced by others moulded vertically only and fluted like columns from top to bottom, which is a much safer construction. I also suggested internal painting.

The best colour for ironwork is Prussian blue, which is made from hydrocyanic acid of iron and has, of all ferric colours, the strongest affinity for that metal. A gateway at Hardwick Hall, Bury St. Edmunds, was painted with this colour before 1836, and when I saw it in 1889 it had kept its colour ever since and probably has continued so to this day.

WALTER SCARBILL.

Colechester.

ARTS AND CRAFTS EXHIBITION.

SIR.—Referring to your notice of a chair in the Arts and Crafts Exhibition, while admitting the justice of your remark, "seems rather a small matter to have occupied the resources of four designers," may we be allowed to say that the chair in question forms only one item in a complete scheme for the decoration and furnishing of a house on which we are at present working.

Had it been possible, we should have been only too pleased to have exhibited the whole scheme.

For the "Guild of Four Designers,"

LANSYAP P. BUTTERFIELD, Secretary.

CONGREGATIONAL CHURCH, NEWLAND, HULL.—A new Congregational church has been erected in Boverley-road, Newland. The building is of brick, with terra-cotta facings. The interior is original with a chancel, and the pitched roof covers the entire body of the church. Mr. J. H. Fenwick was the builder, the architects being Messrs. Moulds & Porritt, of Bury, Manchester, and London.

GENERAL BUILDING NEWS.

ST. JOHN'S CHURCH, WAKEFIELD.—The new chancel of this church, which has just been completed, was erected from the designs of Mr. J. T. Middlethwaite at a cost of 4,000*l.* In addition to the chancel proper, an organ chamber and vestry have also been provided.

BOYS' SCHOOL, BARRY.—On the 6th inst. the new boys' department of the Council schools in Romilly-road, Barry, was opened. The building provides accommodation for 346 children. There are several classrooms, each communicating separately with an assembly hall 62 ft. long by 32 ft. wide. Mr. G. A. Birkenhead, architect, prepared the plans for the work, and the contractor was Mr. W. Britton. The total cost of the work, including furniture, amounted to about 4,800*l.*

CHURCH EXTENSION, GLASGOW.—The Catholic Apostolic Church in Catherine-street, Glasgow, has been enlarged by the addition of a north aisle, south and west porches, baptistry, and a ladies'-room. The work has been carried out from designs prepared by Messrs. Salmon & Son & Gillespie, architects, of Glasgow, at a cost of about 3,500*l.* The original church was built under the supervision of the late Bailie Salmon from sketch designs by Pugin.

CHURCH-ROOM, HEATH END.—On the 4th inst. the Bishop of Winchester opened a new church-room at Heath End. Mr. A. J. Stedman prepared the plans and Messrs. Cesar Brothers were the builders.

PARISH ROOM, MARKET DRAYTON.—A new parish room, which has been erected on the old bowling-green, Market Drayton, was opened on the 8th inst. by the Duchess of Sutherland. The building was designed by Mr. G. A. Craig, architect and surveyor, of Market Drayton, and contains a hall 53 ft. by 30 ft., a stage 21 ft. by 20 ft., and a reading and recreation room. There is also a kitchen, and the entire premises are heated throughout with hot water and artificially lighted by electricity. The cost was 1,500*l.*

DISTRICT LIBRARY, GLASGOW.—The new Dennistoun District Library, which has just been opened in Craigpark-street, makes the sixth district library opened by the Corporation since the adoption by the city of the Public Libraries Act, all having been built from designs by Mr. Rhind. The lending department is situated in the centre of the ground floor, in front being the ladies'-room, and in the rear a general reading-room. On the upper floor are reading-rooms for boys and girls. The general reading-room provides accommodation for 330 readers. The cost of the building, exclusive of site, is estimated at a little over 7,000*l.*

BROADSTRAK INN, SCENE, N.B.—The Broadstrak Inn, on the estate of Leddach, Skene, has just been reopened after having been rebuilt. Messrs. Jenkins & Marr were the architects for the work, the contractors being as follows:—Messrs. George Duncan, Inverurie (mason); Moir, Inverurie (plasterer); Calder, Cults (slater); Stewart, Blackfriars-street, Aberdeen (plumber); Hall, Mile-End, Aberdeen (joiner); Watt & Sons, Aberdeen (painters).

LIBRARY, WINDHILL, SHIPLEY.—The Carnegie Library at Windhill, in the Shipley district, was opened recently. Situated at the junction of Leeds-road and Fountain-street, near the bottom of Carr-lane, the building occupies a central position. Passing through the vestibule and a hexagonal entrance-hall, the visitor reaches the lending library, on each side of which are the reference library and the reading-room. Accommodation has been provided for about 8,000 volumes in the lending department and for fifty readers in the reading-room. The librarian's room is placed between these two, the floor being raised to afford full supervision. Upstairs is a students' room, a ladies' room, a patent journal room, and lecture-hall, with anteroom and public lavatories for both sexes. The lecture-hall affords accommodation for 150 persons nominally, but by the adoption of the sliding partition system the whole of the accommodation on this floor has been made available for one room in case of necessity. In the anteroom provision has been made for the preparation of tea. The elevations are carried out in local stone, and the whole of the interior woodwork is in pitch-pine, varnished. The floors are constructed of steel and concrete, the vestibule, entrance-hall, and landing being laid with terrazzo mosaic and the remainder with pitch-pine boards. The furnishings are of pitch-pine and teak. The building is warmed on the low-pressure hot-water system and lighted by electricity. Mr. Ahm, Sharn, Bradford, was the architect, and the work has been carried out under his superintendence by the following contractors:—Masons, Messrs. Wilks & Ingham; joiner, James Deacon; plumber, Mr. Samuel Jackson; plasterers, Messrs. J. & W. Bates; slater, Mr. Thomas Thornton; scaffolders, Ahm, Fulman & Sons, Ltd.; heating, Mr. S. Rushworth; ventilating, Messrs. P. H. Walker & Co.; carver, Mr. S. Charnock; tiling, T. & R. Boote, Ltd.

KENT AND CANTERBURY HOSPITAL.—The Kent and Canterbury Hospital has just been

re-opened after renovation and partial rebuilding. The result of the restoration has been the provision of a new ward (the Blackman Ward), the erection of a new mortuary and post-mortem room, a reorganisation of the out-patient department, the substitution of hard wood for the worn-out deal flooring, and a general putting of the institution into hygienic and sanitary condition. In addition to this work in the hospital proper an enlargement of the Nurses' Home has been carried out by the provision of seven additional bedrooms at a cost of about 350. The walls of the corridors and walls of the hospital have now been finished with terrazzo to a height of 4 ft. 6 in. and above that with hard plaster. New heating and ventilating arrangements have also been introduced and certain alterations made in the internal structure. An anaesthetising room has now been provided adjoining the operating theatre, and this latter has been practically rebuilt upon modern principles. The lighting has been improved, the walls and ceiling finished with opaline lining throughout, a terrazzo floor provided, and new fittings put in. The drainage of the hospital was remodelled some few years ago, but new sanitary fittings have been put in throughout. Mr. W. J. Jennings, of Canterbury, architect and Diocesan Surveyor, was the architect, and the work has been carried out by Messrs. Gann & Co., of Whitstable.

SOCIETY FOR THE PROPAGATION OF THE GOSPEL.—At the last monthly meeting of the Society, held on January 19, it was officially announced that Sir William Emerson had been appointed architect of the new premises to be built for the Society, and that the new scheme would be prepared forthwith.

NEW PAVILION AND CAFÉ FOR THE BRIDLEINGTON CORPORATION.—Contracts have been settled this week for a new pavilion to hold 3,500 persons, designed by Messrs. Mangnall & Littlewoods, architects, Manchester. The building will have an inclined floor, gallery round three sides communicating with outside balcony, and proscenium with stage thoroughly equipped for theatrical performances, artists' retiring-rooms, etc., also a large café communicating with pavilion.

WORKING MEN'S COLLEGE, LONDON.—On Saturday last week, Sir William Anson, M.P., opened the new buildings of the Working Men's College, which have been erected in Crowndale-road, N.W. The architect is Mr. W. D. Carie, and the builders are Messrs. V. Johnson & Co. (Limited). The accommodation is sufficient for over 1,000 students, comprising, besides the ordinary class-rooms, three laboratories (physical, biological, and chemical), art-room, hall, library, museum, coffee, common, and club rooms, and a gymnasium. The cost of the site was 6,600, exclusive of expenses; the estimate for the building was 22,475, and for furnishing and equipment 1,000.

APPOINTMENT.

MR. MARCUS HOSKINS, of Mumbles, has been appointed the Estate Agent and Valuer to the Swansea Corporation.

SANITARY AND ENGINEERING NEWS.

PROPOSED RESERVOIR, STANDISH, WIGAN.—Colonel A. J. Heywood, F.S.O., R.E., Local Government Board Inspector, recently attended at the Council Offices, Standish, and held an inquiry into the application of the Council to borrow 2,900, for the purposes of constructing a reservoir on land adjoining Green-lane, Standish. Mr. W. Lees (Law Clerk) said the only place available for the site was the top of Prospect Hill, and the Council proposed to lease a plot of land containing 444 sq. yds. The capacity of the reservoir would be 300,000 gallons. Mr. George Heaton, the engineer for the scheme, was called, and in answer to the Inspector stated that the bottom of the reservoir was to be made of cement and concrete.

WATER SUPPLY TO TENEMENT HOUSES.—The Public Health Committee of Holborn Borough Council reported on Monday that in March last they instructed the Medical Officer of Health to take steps wherever necessary for the serving of notices with a view to securing the provision of a proper and sufficient supply of water for the tenants of every floor of all tenement houses in the borough. A number of notices had from time to time been served since, and in the majority of instances the owners had complied with the local authorities' requirements. In some cases, however, the Committee had been satisfied if one additional water supply was provided about midway between the basement and the top floor. In two cases it had been found necessary to take legal proceedings, and in both orders were made by the magistrate for the provision of a proper and sufficient water supply. The Committee were informed that similar proceedings which had recently been instituted by the Councils of other boroughs at the Marylebone and Paddington Police Courts had been unsuccessful. In the Paddington case, which was dismissed with costs, the magistrate held that the words

of the section of the Public Health (London) Act, 1881, "proper and sufficient supply" referred to the sources of the supply and not the provision of taps within the house. The matter having been brought before the Parliamentary Committee of the London County Council, that Committee stated they were advised that it was by no means clear that the present law was sufficient to meet the case. Having regard, however, to the adverse decision above referred to, the Committee of the Holborn Borough Council was of opinion that it was desirable that the existing law should be amended with a view to enabling local authorities to enforce the provision of an adequate and accessible supply of water to floors in tenement houses, and they had decided (subject to the usual sanction) to urge the London County Council to take the necessary steps to obtain an amendment of the existing law.

FOREIGN.

FRANCE.—The Société des Artistes Décorateurs have organised at the Galleries Museum an interesting exhibition of art applied to the furnishing and decoration of rooms. A marble tablet in memory of David d'Angers has been placed on the house, No. 85, Rue d'Assas, where d'Angers had his studio and where he died. A collection of 85 copper plates engraved by Rembrandt has been found in Paris, belonging formerly to the Collection Mariette. The plates, which represent, among other subjects, The Descent from the Cross, and Raising of Lazarus, the Death of the Virgin, Doctor Faustus, etc., have been purchased by the proprietors of *L'Artiste*, and by them presented to the Ryks Museum.—M. Tony Robert-Fleury has been elected President of the Société des Artistes Français (Old Salon), and M. Félix de la Société Nationale (New Salon). The Ministry of Public Education has authorised the marriage of a young artist who is a pensioner student at the Villa Medici. This is an unheard-of privilege, as heretofore celibacy has been obligatory on students of the Ecole Française at Rome.—The work of restoration at the Chateau of Saint-Germain-en-Laye, commenced 43 years ago under the Imperial Government, is now to be taken up again and completed.—The Municipality of Dijon have voted 740,000 francs for various architectural work, among which is the restoration of the Salle de Flore in the Palais des Etats de Bourgogne.—The works for a new museum and school of drawing have been commenced at Mentone.—A monument to the memory of Gérôme is to be erected at Vesoul by public subscription, M. Grosjean is the architect of the monument, and M. Fevrier the sculptor commissioned, and M. Fevrier has been elected a member of the Conseil Supérieur des Beaux-Arts, in place of M. Bonnat.—The Conseil-Général des Alpes Maritimes has voted a sum of 237,000 francs for the enlargement of the Hotel of the Prefecture at Nice.—The Municipality of Paris has purchased a fine statue of Madame de Sévigné, by M. Massoule.—The annual Art Exhibition of the Cercle Volney has just opened. It includes pictures by MM. Jules Lefebvre, Cormon, Gabriel Ferrier, portraits of children by M. Vollen, portraits by MM. Chabas and Raphaël Collin, landscapes by M. François Cachon, and sculpture by MM. Sicard and Delays Fuchs.—It is announced that a Conseil Supérieur des Arts Décoratifs is to be established, the first business of which will be to organise, for 1907, an international exhibition of Applied Art.—M. Emile Friant has been appointed professor of drawing at the Ecole des Beaux-Arts, as successor to M. Olivier Merson.—A large prison building is to be erected at Brives (Corrèze).—The work will be shortly commenced for deepening the channel of the navigable portion of the Loire. These works, which will cost 22 million francs, will be completed by improvements of the Port of Nantes, at a cost of 23 million francs.—The Municipal Council of Loudun has voted a credit of 612,000 francs for the construction of a new college.—It is announced that important excavations are shortly to be commenced at Périgueux, a town already so interesting for its archaeological monuments.—M. Joannès Mallet has been elected President, for the present year, of the Union Architecturale de Lyons.—The municipality of Digne have voted a sum of 800,000 francs for the erection of a thermal establishment at Chauchets.—The works for the enlargement of the Carnaval museum are to be commenced shortly. The scheme includes the two stories of galleries surrounding a court, at right angles to the front on Rue Sévigné, reproducing the architectural style of the old Hotel of Mme. de Sevigné. This first portion of the work will be ultimately completed by the addition of new galleries surrounding a second court which will be prolonged to the Rue Pavenne.—The death was announced a few days ago, at the age of fifty-seven, of M. Louis Labbé, architect and "Inspecteur des Edifices" for the diocese of Bordeaux. He was also professor at the Ecole des Beaux-Arts of that town, and President of

the Société des Architectes Bordelais. M. Labbé was especially distinguished for the work carried out under his supervision at the Cathedral of St. André, in the course of which he brought to light the "Porte Royale," for a long time hidden by old houses. He built, in collaboration with his brother, M. Albert Labbé, the fine General Hospital in Rue Pellegrini at Bordeaux.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. F. C. Moscrop-Young, architect and surveyor, has removed his offices from No. 2, Lancastrian-place, Strand, to Waldorf Chambers, Aldwych, W.C.—Messrs. Chambers & Martin, architects and surveyors, have removed their offices from No. 2, Lancastrian-place, Waterloo Bridge, to Waldorf Chambers, Aldwych, W.C.—The firm of "Sheppard & Harrison," architects, of Bargate, Newark-on-Trent, was also altered to Sheppard & Lockton.

EVERY HILL, ELSHAM.—The London County Council have resolved to devote not more than 10,250, in adapting and equipping the mansion at Every Hill, with its stabling and machinery house and about four acres of land, for purposes of a women's training college to accommodate 60 residential and 200 day students—being, we believe, the first of its kind to be established by their Education Committee. The house is chiefly remarkable for the great sums of money which were expended, though by no means always in the best taste, upon its decoration and fittings. The original house was altered and enlarged, in red brick with Portland stone dressings, for the late Colonel J. T. North, who was known as the "Nitrate King," and for the most part under superintendence and directions of Mr. T. W. Cutler. Our readers will remember that some differences which arose between the late owner and his architect became the subject of litigation. The best feature of the house were the marble Turkish bath-room fitted with fixtures having a Moslem character in design, picture gallery and ball-room, winter garden 100 ft. square, fernery, and conservatories. Of the beautiful materials so lavishly and yet, as it seems, somewhat hurriedly employed, the Mexican onyx presented some of the finest specimens known of that marble. When the whole property, extending over 143 acres, was offered for sale in July, 1896, the auctioneer stated that from 250,000, to 300,000, had been spent on the house, stabling for twenty-four horses, stud farm, etc. On that occasion only one bid, for 50,000, having been made the reserve, 100,000, was declared. In 1902 the London County Council bought the house and 84 acres of the grounds as an open space, for 25,100, and the grounds were opened to the public on May 23 in the following year.

DALLING THEATRE AND LYRIC RESTAURANT.—The Dalling Theatre was closed on the night of December 29, the block of buildings of which it forms part, in the Broadway, having been purchased for nearly 50,000, with a view to the conversion of the theatre into a music-hall. The theatre, restaurant, and "Perceval" and "Montague" assembly rooms were erected six or seven years ago, upon the site of the old Lyric Hall, from the plans and designs of Mr. Walter Emden (who was the consulting architect for the theatre portion) and Mr. G. H. Pargeter. The block, built by Messrs. Beer & Gash, contractors, extends over an area of nearly half an acre, and comprises a masonic temple, shops, administrative offices, etc. The property was offered for sale in May, 1902, and withdrawn at a bid of 30,000.

ST. PETER'S CHURCH, MAIDSTONE.—This old structure, which has lately been returned to its former uses, after a long period of desecration, was originally the chapel of a hospital founded in the West Borough, and dedicated to SS. Peter, Paul, and Thomas the Martyr by Boniface of Savoy, Archbishop of Canterbury in 1240-70. The hospital was devoted to the use of travellers and of pilgrims to the shrine at Canterbury; the foundation was known as that of the New Work of Presens Helle. The chapel was restored and enlarged about sixty-five years ago.

THE LATE MR. H. C. RICHARDS, K.C. M.P.—The testamentary dispositions of the late Mr. Richards comprise a bequest of either 5,000, for the rebuilding and up-keep of Paul's Cross on the original site near the north side of St. Paul's in acceptance of two of his relatives, or, failing the acceptance of the bequest by the Dean and Chapter, of 1,000, for a stained glass window in the nave of the cathedral in memory of himself and two relatives; a bequest of 500, with a further 50, if nine others will contribute that amount, towards the provision of a swimming-bath and gymnasium at the Redhill Philanthropic School; 200, for the purchase of a pair of silver altar candlesticks for the Temple Church; 300, for a set of tubular bells and the completion of the tower, St. Peter's, and a memorial window to himself and his late brother in St. Andrew's Mission Church, Newlyn; his books upon London topography, legal subjects, etc., with 200, for the cases, of the City of London College; 1000, apiece to the churches of St. John, Hackney, and

St. Luke, Old-street, for memorials of his associations with the two parishes; and 200*l.* to the Society of Gray's Inn, of which he was Treasurer, for a Bishop Andrews memorial window. Mr. Richards presented to Gray's Inn Chapel the two panels commemorative of Laud and Thomas à Becket, and the Sir Thomas More window (designed by G. Ostrhan) in the church of St. Lawrence Jewry.

SHIRE HALL, BEDFORD.—Plans and designs for additional offices to form an extension of the Shire Hall, Bedford, have been prepared by Mr. W. H. Leete, county architect. The former Sessions House (1753) in St. Paul's-square was rebuilt in 1878-82 after Alfred Waterhouse's designs, at a cost of 20,000*l.*, as the Shire Hall for the assizes and sessions and headquarters of the county constabulary.

CHURCH BUILDING SOCIETY.—The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels held its usual monthly meeting on the 18th inst. at the Society's house, 7, Dean's-yard, Westminster Abbey, S.W. The Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects:—Building new churches at New Somerby, S. Anne, near Grant-ham, 125*l.* for the first portion, and South Bed-dington, S. Michael and All Angels, Surrey, 200*l.* for the first portion; towards rebuilding the church of S. Michael, Cottenham, near Crewe, 125*l.*, making in all 225*l.*, and towards enlarging or otherwise improving the accommodation in the church of St. Martin, S. Andrew, near Peterborough, 20*l.*, making in all 45*l.*; Great Iford, S. John-the-Evangelist, Essex, 100*l.*, making in all 250*l.*; Keelby, S. Bartholomew, near Brockesby, Lincs., 15*l.*; Skirbeck, S. Nicholas, near Boston, Lincs., 75*l.*; and Stanton Harcourt, S. Michael, Oxon, 65*l.*, in lieu of a former grant of 35*l.* Grants were also made from the Special Mission Buildings Fund towards adapting a building as the Mission Church of S. Martin, Woolwich, Kent, 25*l.* The following grants were also paid for works completed:—Iford, S. Alban, Essex, 200*l.*, making in all 700*l.* on account of a grant of 1,000*l.*; Clydach, S. Mary-the-Virgin, near Swansea, 175*l.*; Southgate, S. Andrew, Middlesex, 100*l.*; Crewe, S. John, 25*l.*, making in all 100*l.*; Haverfordwest, S. Mary, 120*l.*; Thurstone, S. Saviour, near Penistone, Staffs., 130*l.*; Rushall, S. Matthew, Wilts., 20*l.*; and Hackett, S. Paul, near Thornbury, Glos., 20*l.* In addition to this, the sum of 222*l.* was paid towards the repairs of nineteen churches. The Society has been elected to the Society. The Society likewise accepted the trust of a sum of money as a repair fund for the church of S. Michael and All Angels, South Barnet, Herts.

RESIGNATION OF A LEADS ENGINEER.—Mr. Thomas Hewson, jun., Deputy City Engineer, has sent in his resignation, after twenty-two years' service with the Corporation. The Improvements Committee accepted the resignation with regret, and passed a resolution placing on record their appreciation of the valuable services rendered by Mr. Hewson during the long time he has been in the service of the Corporation. The committee also expressed their best wishes for his future career. Mr. Hewson is about to start in private practice as a civil engineer and surveyor.

ELECTRIC DESK LAMPS.—The Concordia Electric Wiring Company send us an illustration of their "Flexible Arm" electric lamps for placing on writing-desks, etc. There is a short stand with a broad circular base, from which branches a flexible arm which, as we gather, will remain in any position in which it is placed, so that the light can be brought exactly over the spot where it is wanted. The electric glass shade with its filament projects horizontally from the end of the flexible arm, with a green shade, lined with white enamel, on the upper side of it. The Company make a lamp of the same type with two flexible arms, one at each side.

LONDON COUNTY COUNCIL AND THE BUILDING LINE.—The General Purposes Committee of Camberwell Borough Council reported on Tuesday that in October last they decided to ask the London County Council why the provisions of the London Building Act were not being complied with as regards the Victoria-road school, inasmuch as the boundary wall of the site was not 20 ft. from the centre of the road. The London County Council replied, claiming that the provisions of the Act did not apply to the school in question. The Borough Council thereupon asked the County Council to apply the same rule as was applied in the case of a private owner. On December 6 the County Council wrote asking if the Borough Council would be prepared to bear the cost of pulling down the portion of the wall already erected and erecting it on the new line, and would also pay the *pro rata* cost of the land surrendered. The Borough Council, in reply to this, sent a letter asking the County Council not to adhere to its rights, but to carry out the building in the spirit of the Building Act, especially in view of the narrowness of the thoroughfare. A communication had now been received from the County Council, stating that as no definite

reply had been sent by the Borough Council the architect had been instructed to proceed with the erection of the boundary wall.

LIBRARIES FOR ST. PANCRAS.—On Tuesday the Libraries Committee of St. Pancras Borough Council reported having received a letter from the President of the Royal Institute of British Architects submitting the following list of architects whom he suggested should be invited to send in competitive designs for the Central Public Library:—Mr. Edmund Wimperis, Mr. J. S. Gibson, Messrs. Wills & Anderson, Messrs. Mallovs & Cross, Mr. Maurice B. Adams, and Messrs. Russell & Cooper. The President asked to be furnished with a plan of the site, showing the positions of the surrounding buildings and the levels of the same, also the depth and position of the sewer, and particulars of any rights of lights which must be respected in connexion with adjoining premises, and also any special requirements which the Council might wish to have embodied in the conditions for the competing architects. The committee had decided that as regards the question of the rights of light which must be respected, the President should be informed that it was desirable that the competing architects should inspect the site and judge for themselves. Instructions had been given the Borough Engineer to prepare a plan of the site showing the positions of the surrounding buildings and the levels of the same, and also the depth and position of the sewer. This, when ready, will be forwarded to the President of the Institute. The committee are considering the number and size of the rooms to be provided and also other special requirements which it may be desirable to have embodied in the conditions for the competing architects. The committee hoped to be able to report shortly with regard to sites for branch libraries in Camden Town and Euston-road, also on the desirability of erecting another branch library in the Regent's Park-road and Gloucester Gate district. Up to the present a suitable site had not been found for the proposed branch library in the Gospel Oak district. The committee had decided in favour of carrying out the work of erecting the branch library at Chester-road by direct labour as far as possible.

BRITISH VERSUS INDIAN GRANITE.—It is announced that the Bombay Port Trustees have resolved to use Indian in preference to British granite, not only for parts of the new docks entrance, but also for the piers of the dock walls, in place of the ordinary blue trap used in the older docks. It is intended, however, that some of the larger stones requiring very fine dressing to complicated patterns shall be obtained from Great Britain.

NEWFOUNDLAND SHALE.—Mr. H. W. Le Messurier, Assistant Collector of Customs at Port St. John's, Newfoundland, has sent to the Board of Trade a sample of shale, which he writes, occurs in large deposits in Newfoundland, adjacent to limestone. The analysis shows—silica, 54.72; oxide of iron and alumina, 28.76; magnesia, 4.22; sulphur, 0.41. "Five parts of limestone and one part of the shale make the very finest of cement."

CASES AT THE INSTITUTE OF ARCHITECTS.—In our brief notice of the President's "At Home" last week, we mentioned the interesting collection of casts of ivory carving which were exhibited on the occasion, observing that we could not ascertain how they came into the possession of the Institute. Mr. Dircks, the Librarian, kindly writes to inform us that the casts in question were the gift of former Fellow of the Institute, the late J. M. Lockyer.

ROOD SCREEN, KILHAMPTON.—A rood screen has been placed in Kilhampton church as a memorial to the late Mrs. Trynne. The screen is the design of Mr. G. Fellowes Pryme, Messrs. Heins & Sons, Exeter, executing the work.

CAPITAL AND LABOUR.—Employment in the building trades continued dull in December. It showed no marked change as compared with a month or a year ago. Returns received through the trade correspondent from 59 London employers showed that in the last week of December they paid wages to 9,399 workpeople of all classes, as compared with 9,311 in November and 10,672 in December, 1904. The state of employment was much the same as in the previous month, but compared unfavourably with a year ago. Bad weather interfered somewhat with outdoor work. Returns were received from employers' associations for 84 districts outside London. In the great majority of districts there was little alteration. The following are the more important towns in which employment showed some improvement:—Ashton, Blackpool, Chester, Ipswich, Bath, and Portsmouth. In Bradford, Halifax, Birmingham, Norwich, Croydon, Newport, and Swansea there was some decline, and in the great remaining districts there was little alteration. Compared with a year ago, employment was reported worse in 39 of the districts; in 37 it was about the same, and in 8, including Oldham, Bury, and Blackpool and the Potteries, it was better.—*Labour Gazette.*

Legal.

TRIBUNAL OF APPEAL CASE:

ROY v. LONDON COUNTY COUNCIL.

The Tribunal of Appeal sat at the Surveyors' Institution on Tuesday to hear an appeal made by Messrs. Hilder, Thompson, & Dunn, solicitors, on behalf of Mr. Robert Roy, against the certificate of the Superintending Architect of Metropolitan Buildings, under sections 22 and 29 of the London Building Act, defining the general line of buildings on the western side of Fulham Park-road, between Fulham-road and Landridge-road. Mr. Bartley Dennis appeared for the appellant, and Mr. Godfrey represented the London County Council.

Mr. Godfrey raised the objection that both the Superintending Architect and the London County Council had been made respondents to the appeal. The Superintending Architect had been called upon to define a line, and had done so, and issued his certificate, and the appellants appealed against that, and cited the London County Council. He suggested that it would be a hardship if the London County Council had to come in to support the Superintending Architect on every certificate he gave when called upon by a person to give such a certificate. He wished to have nothing to do with the appeal. He submitted that the Superintending Architect was the court of first instance, and it would be an undignified position for the Superintending Architect to come there and argue that what he had done as a judge was the proper thing.

Mr. Dennis asked if it was contended that he had no right of appeal.

Mr. Hudson said at present it appeared to him that the appellant had the right to appeal, and if no one appeared he would be in the happy position of having no evidence against him, but at the same time there would be no one from whom costs could be obtained.

Mr. Dennis asked if it was to be supposed that if the Superintending Architect made a gross error he was simply to stand aside, and that, after the appeal had gone to all the expense of the appeal, there was to be no jurisdiction as to costs. They were bound to serve notice on the County Council.

Mr. Hudson said the serving of a notice did not make the London County Council parties. If no one appeared to oppose, then the appellant would have to satisfy the Tribunal as to his case.

Mr. Godfrey then withdrew from the case. Mr. Dennis asked that the Tribunal should hear the appeal and then adjourn the question of costs so that he might look up the matter.

The court accepted the application.

Mr. Dennis said the estate with regard to which the appeal was made was the Herriage House Estate in the Fulham-road. There were four old-fashioned suburban villas with large gardens on the estate, and it was proposed to pull these houses down and erect modern residences. The Superintending Architect was asked to define the general line of building and to determine the street or streets in which the property was situated. The appellant now appealed against the decision of the Superintending Architect that the land was in Fulham Park-road, and also against the building line, which cut off 25 ft. of his land. There was no general building line at present, for these were only suburban villas standing in their own gardens. He asked the Tribunal now to fix a line. Subject to any other regulations to the contrary, he contended that they were entitled to build up to the boundary of their property.

Mr. C. Botterell, surveyor to the appellant, stated that he had prepared the plans attached to the appeal, which were correct.

Mr. Hudson said that whatever might be the legal question with regard to costs, the Tribunal felt that it was a great pity they had not the assistance of the London County Council in this matter.

Mr. Godfrey said he would convey the remarks of Mr. Hudson to the proper Committee.

After considering the plans, the Chairman said the Tribunal had decided to reverse the decision of the Superintending Architect, and they found that there was no general line of building on the north-eastern side of the site coloured pink on the plan accompanying the application.

On the application of Mr. Dennis, it was decided to adjourn the question of costs to allow him, if he thought fit, to make a further application.

DISPUTE AS TO A BUILDING ESTATE.

In reference to the case tried in the Chancery Division of the High Court, before Mr. Justice Swinfen Eady, in our report last week, page 73, we gave the names of the litigants as Gurney v. Packman & Sons; it should have been "Gurney v. J. Parkin & Sons, Ltd., of Blackpool and Newcastle."

The action related to a sale of the late Dr. Gurney's estate at Gosforth. Mr. Duker, on behalf of Dr. Gurney's executors, stated that matters had been settled between the parties, and he had to ask his lordship to stay all further proceedings. The defendants had paid the sum for

which the estate had been sold to them. He quite agreed that they had made the trespass under a mistaken view of their legal rights.

Mr. Gatey, for the defendants, said that the purchase was only delayed by reason of a question of duty which the vendors had to pay. The defendants had the money ready to pay the whole time, and, knowing that it could be paid at any moment, they thought they were entitled to act as they had done. It was done perfectly bona fide, without the slightest intention of trespassing.

His lordship made an order staying all further proceedings.

COMPENSATING WORKMEN.

In the City of London Court on the 8th inst, a case was tried under the Employers' Liability Act before His Honour Judge Lumley Smith, K.C., when James Bunce, labourer, sued Messrs. Turnbull & Son, builders, Fenchurch-street, for damages for having had his thumb torn while working for them.

Mr. Doughty appeared for the plaintiff, and Mr. Lever for the defendants.

The plaintiff, who was removing concrete and bricks from a warehouse, was holding a chisel 4 ft. long while it was being driven into the ground by another man. Suddenly a large mass of concrete gave way and took the chisel with it. As a result his thumb was torn to the bone. For twelve weeks he had been unable to follow his occupation. He admitted that the defendants had sent him some money under the Workmen's Compensation Act, but added that it had been returned by his solicitor because the allowance under that Act was insufficient.

The defendants said the plaintiff had no case under the Employers' Act as they had not been guilty of any negligence.

The jury found for the defendants, and judgment was given for them, with costs.

The plaintiff then proceeded under the Workmen's Compensation Act, and was awarded £1.

The Judge said £1 must be deducted to go towards the costs under the Employers' Liability Act, which ought never to have been brought.

—City Press.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

28,017 of 1904.—SIEMENS BROTHERS & Co., LTD. (SIEMENS SCHUCKERWERKE, G.m.b.H.): Safety Device for Lifts and Hoisting Apparatus.

This relates to a safety device for lifts, which consists in so arranging the cage rests of the shaft in connexion with the lift mechanism that all the rests at those stages of the shaft at which the lift cage is not intended to stop are automatically withdrawn or are prevented from being protruded by giving the signal for starting the cage, while the rests at those points where the cage is to stop are automatically withdrawn if the cage approaches them at an excessive speed.

28,834 of 1904.—A. ENGLEFIELD: Dovetail Slide Support for holding Frames, Boards, Book Rests, and the like, in sloping positions upon Tables or Desks.

This relates to a means of supporting detached frames, boards, book rests, and the like, upon tables or desks, at varying angles, and so that either of the two larger surfaces of the frame, board, book rest, or the like may be available for the purposes of reading, writing, or drawing, and consists of a fillet of a dovetail section, working freely in a groove or slot of a corresponding shape cut out or constructed upon one end of a bracket or arm, the fillet being cut upon or attached to the whole length of one or more of the sides of the frame, board, book support, or the like.

29,349 of 1904.—C. BRADER: Heat Insulating Coverings.

This relates to an insulating covering having the form of an elastic and flexible strip, and consists of reels arranged in layers and woven, bound, or otherwise attached to a flexible heat-conducting material such as asbestos, peat fibre, felt, cloth, or the like, so as to form a continuous band, which may be easily applied to the objects to be protected against heat or cold.

29,505 of 1904.—H. DANMLAN: Construction of Flooring.

This relates to a method of connecting or bonding the boards employed in the construction of the elements of wood flooring, and is characterised by the foundation in the under part of the element of grooves, the sides of which are parallel at the centre part and diverge at the outer parts thereof, and by the combination with said grooves, of cross pieces or members having parallel sides split at their extremities, which extremities are opened outwardly after the cross pieces are laid in place by the action of wedges, which thus serve to lock such extremities in the diverging parts of

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

the grooves, and thereby effect a sure and rigid connecting or bonding of the boards constituting the element.

165 of 1905.—J. G. BUCHANAN, (A. B. PRICE): Piston Tap for Preventing Waste of Water Supplied to Water-closets and other Apparatus.

This relates to a water-waste-preventing apparatus in the form of a tap, comprising a rotatable plug provided with two internal chambers, one for the piston to work in and the other for the valve to move in to seat itself alternately, upon one or the other of two seats in the said chamber, thus alternately opening the opposite sides of the piston to pressure and exhaust when the plug is operated.

4,927 of 1905.—W. S. GOWIN: Machines for Moulding Various Materials, to form Bricks, Tiles, Briquettes, or the like.

This relates to a machine for moulding various materials to form bricks, tiles, briquettes, or the like, and consists in the combination of a rotatable table intermittently moved in known manner, feed hoppers of known form mounted above the table, and adapted to feed material to moulds in the table as they are successively brought under the compression on plungers operating to compress the material in the moulds, ejector mechanism operating to eject the formed blocks downwards, means for operating the feeding, block forming and ejecting mechanism at each stoppage of the table, and means for transferring the ejected blocks to conveyors for removing them.

7,238 of 1905.—A. MANNINGTON: Unfastening and Opening of Doors, Gates, or the like.

This relates to an apparatus for unfastening and opening gates, doors, or the like, by means of foot pressure, and consists of the arrangement of lever mechanism connected to the door handle adapted to be operated by the downward pressure of the foot on one side of the door in such a manner as to unlatch the said door and push it open, by the upward pressure of the foot on the other side of the door in such a manner as to unlatch said door and push it open.

7,955 of 1905.—W. S. DENNIS: Means for Securing Gutters and the like to their Supports.

This relates to roof gutters and the like, formed or provided with a boss or thickening for each screw hole, and consists in the boss being adapted to be filled with putty, red lead, or the like.

7,987 of 1905.—J. GASTEIGER: Apparatus for Drying Walls.

This relates to an apparatus for drying walls, the distinguishing feature being the employment of a movable stove to which is attached a flat box which is open at the rear for the purpose of forcing the products of combustion to pass over the whole surface of the wall to be dried before escaping into the open air.

11,024 of 1905.—W. T. MORRIS: Casement or Hinged Windows.

This relates to casement or hinged windows, and consists of a hinge comprising an arm rigidly fixed to the style, mullion, head, or stationary frame, and a link hinged to said arm and to the casement, in combination with means for locking the arm and link together.

3,332 of 1905.—M. KRAUS: Mixing and Washing Machine for Concrete, Gravel, and the like.

This relates to a rotating drum for a mixing and washing machine for concrete, gravel, and the like, and consists of radially and upward slanting discharge channels, which channels are provided, near or immediately on the circumference of the drum, with openings so that the concrete, gravel, or the like is, on the drum being rotated, conducted to the channels and is, after rising in the same, automatically discharged into barrows placed under the drum.

3,783 of 1905.—THE ASSOCIATED PORTLAND MANUFACTURERS, LTD., AND A. BROOKS: Manufacture of Cement.

This relates to a hard slow-setting cement to which a green colour is imparted by the use of chrome, alum, or of a mixture of potassium bichromate and ammonium sulphate.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. The Editor cannot undertake to read and consider articles offered for acceptance unless they are typewritten.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

MEETINGS.

FRIDAY, JANUARY 26.
Junior Institution of Engineers (Westminster Palace Hotel).—Honorary members' lecture of the 25th session. "Notes on Boiler Trials," by Professor J. D. Cornack, B.Sc. 8 p.m.
Institution of Civil Engineers.—(Students' meeting.) 8 p.m.

SATURDAY, JANUARY 27.
Junior Institution of Engineers.—Visit to the engineering laboratories of University College, during which Professor Cornack will demonstrate the methods of conducting a boiler trial. 3 p.m.

MONDAY, JANUARY 29.
London Institution.—Paper by the Rev. Canon W. Benham, E.S.A., entitled "A Walk through Westminster," illustrated. 5 p.m.
Surrey's Institution.—Mr. F. Marshall, K.C., on "The Valuation of Machinery for the Purposes of Rating," 8 p.m.

TUESDAY, JANUARY 30.
Society of Arts (Applied Art Section).—Professor J. M. Thomson on "The Chemistry of Artillery Explosives in Relation to their Composition and Permanence." 8 p.m.
Institution of Civil Engineers.—Mr. F. R. Epcott on "The Railway-Gauges of India." 8 p.m.

WEDNESDAY, JANUARY 31.
Architectural Association Discussion Section.—Mr. A. C. Dickie on "Internal Steps and Stairs and their Treatment." 7.30 p.m.

Institution of Civil Engineers.—Students' visit to the Greenwich Generating-station of the London County Council Electric Tramways. Assemble at the works. Train from Cannon-street Station to Maze Hill, 2.9 p.m.

THURSDAY, FEBRUARY 1.
Civil and Mechanical Engineers' Society.—Mr. F. L. Watson on "Destructor Bye-Products." 8 p.m.

Society of Arts (Howard Lecture).—Professor Silvanus Thompson on "High Speed Electric Machinery, with special reference to Steam Turbine Machines." Ill. 8 p.m.

Birmingham Builders' Exchange.—Mr. H. Browning Norton on "The Underground Slate Quarries of North Wales," illustrated by lantern slides. 8 p.m.

Junior Institution of Engineers.—Mr. K. Edgcombe on "Some Recent Electrical Engineering Measuring Instruments." 8 p.m.

Saturday, February 3. Sanitary Inspectors' Association.—Twenty-third annual dinner, Holborn Restaurant. 6 p.m.

The Clerks of Works Association.—The twenty-third annual dinner, at the Criterion Restaurant. 6.15 p.m.

PRICES CURRENT OF MATERIALS.

* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

BRICKS, &c.

Table listing prices for various types of bricks and building materials, including Hard Stocks, Rough Stocks, Facing Stocks, etc.

STONE

Table listing prices for various types of stone, including Portland Stone, Bath Stone, and Ancaster in blocks.

STONE (continued).

Table listing prices for Hopton Wood (Hard Bed) in blocks and other stone types.

SLATES.

Table listing prices for various types of slates, including In. In., 20x10 best blue, etc.

TILES.

Table listing prices for various types of tiles, including plain red roofing tiles, hip and valley tiles, etc.

WOOD.

Table listing prices for various types of wood, including Deals, Battens, Foreign Sawn Boards, etc.

JOISTS' WOOD.

Table listing prices for various types of joists' wood, including White Sea, Third yellow deals, etc.

WOOD (continued).

Table listing prices for Joists' Wood (continued), including Dry Walnut, American, etc.

Prepared Flooring, etc.—

Table listing prices for prepared flooring, including 1 in. by 7 in. yellow, planned and shot, etc.

JOISTS, GIRDERS, &c.

Table listing prices for Rolled Steel Joists, Compound Girders, etc.

METALS.

Table listing prices for various types of metals, including Common Bars, Staffordshire Crown Bars, etc.

LEAD, &c.

Table listing prices for Lead, Sheet, English, 3lb. and up, etc.

ENGLISH SHEET GLASS IN CRATES.

Table listing prices for English Sheet Glass in crates, including 15 oz. thirds, 2 1/2 oz. fourths, etc.

OILS, &c.

Table listing prices for various types of oils, including Raw Lined Oil in pipes, etc.

PRICES CURRENT.—Continued on page 105.

The Cyprus Museum of Prehistoric and Ancient Pottery.

In recent years a great deal of popular interest in the study of the primeval world has been encouraged by discoveries in various parts of the world, in fact, wherever the surface soil or the mountain caves have preserved the traces of the first men. Amongst other famous early sites of human origin Cyprus must always be of paramount interest to the student, but Cyprus also exhibits the curious fact that in matters archaeological there is a tide of what may be called a certain popularity, which spreads over certain provinces—a tide which has its ebb. For a quarter of a century Cyprus was a quite extraordinary field of research; it was perhaps one of the first portions of the Levant to be studied to some extent scientifically. But the earlier efforts at exploration were most disastrous. Its ancient tombs were dug up by contract at so much a hundred, and its temple sites, after being the battlegrounds for consular agents and Turkish pashas, were sifted over by women and children under the supervision of Turkish zaptehs. The brothers Di Cesnola regarded the speculations they entered into more with the idea of making their fortunes in the antiquity trade than with any scientific purpose in view—they were mere "treasure-seekers."

The scientific exploration of Cyprus dates from after the English occupation of the island. The British and Berlin Museums employed certain archaeological students to excavate tombs and the sites of Salamis, Poli, and Paphos, during the seventies and eighties; but since 1897 no one has visited the island on exploration or excavation bent, and, indeed, it is about fifteen years since any important remains have been exhumed. In 1889 the last, and perhaps the most important monument of extreme antiquity in the form of the Royal Tombs of Tamassos (Politico) was discovered under the auspices of the Berlin Museum. About the same time the British Museum cleared some part of the site of Salamis from its sand-drifts.

Very few archaeological districts have ever been exploited by the "digger" in the same manner or on the same scale as Cyprus. Di Cesnola claimed to have turned out the contents of more than 2,000 tombs of different sizes near Larnaca, and about 1,500 tombs at Dali. Then after the passing of Cyprus into the English control came vast excavations of burial places all over the island by the British Museum (Sir C. Newton and many others), South Kensington Museum (Hake), and the Berlin Museum (Richter). In the early nineties 312 tombs were dug up near Limassol, 300 at Amathus, and smaller collections elsewhere by the British Museum. We may perhaps imagine without fear of much exaggeration that during the quarter of a century succeeding the period of Di Cesnola's early ventures

more than 10,000 graves of a remote antiquity were rilled of their contents—and these contents now go to form the treasures of prehistoric museums all over Europe and America.

During the quarter of a century above referred to much excavation of an illicit or surreptitious character has gone on, because certain more or less inoperative old Turkish laws and customs have tended to check the open exercise of this comparatively modern system of treasure-seeking. The quantity of pottery which has been exhumed since the natives of Cyprus overcame a somewhat natural prejudice against disturbing dead bodies, which they could not be expected to distinguish from those of their actual ancestors, must have been enormous. This remarkable ware, with its concentric ring decoration and bands of chessboard ornament suggestive of some comparatively modern savages, is to be found in all the archaeological collections of the world. It has been carried across the Atlantic by tons weight; the museums of France and Italy are full of it; and, considering how it is piled up in the remarkable museums at Constantinople, there is very little doubt of its having found its way into Russian and German archaeological circles through the Bosphorus. It is commonly reported that much of the ware, together with other Cyprus antiquities of greater intrinsic value, has been exported within barrels of Cyprus wine and brandy to European ports by the little Greek polaccas and feluccas of the Levant.

Although so much of this pottery has been exported from the island, immense quantities of it still remain, heaped up in disused prison-yards, quarantine sheds, and other places where Government lumber tends to accumulate. There is also the nominal museum in the Victoria-road, Nicosia, which is almost entirely composed of the "thirds" left behind by successive excavators who, according to Turkish law, are obliged to divide their "finds" into three portions, one to belong to the fuder, one to the owner of the land, and one to the Ottoman Government. This remarkable system, dating probably from the times when the Turks were made aware of the value of "antikas" by the removal of the Elgin marbles to London, is certainly the best method for obstructing scientific archaeology ever invented by human ingenuity. As a consequence the contents of tombs, which lose all their historical interest by being scattered, are divided in such a way that part may be in New York, part in Constantinople, and part left for sale by some Greek priest in Cyprus. The destruction of the temple enclosure groups in this way has, of course, been especially deplorable. Some of these temple groups, if they had been preserved in the style of the modern excavations of Pompeii, would have been amongst the most curious remains in the world. We should have been able to appreciate with realism the appearance of a temple with its furniture of so long ago as the Bronze Age, or at least of an age antecedent to the Ptolemaic. Now, unfortunately, the sites have been swept of their crowds of votive figures, and an opportunity of receiving an impression of a remarkable antiquity has been for ever lost.

The market for Cypriote antiquities has very much weakened at the present day, but still a considerable amount of enthusiasm remains amongst the peasants for what must have been twenty years ago a very considerable and lucrative trade. The visitor is still viewed as a possible prospector for "antikas," and the natives point out with eagerness such places as they think will reward a search. Anxiety to be employed on digging contracts suggests, however, that the value to be discovered no longer reaches the standard of twenty years since, or the interested persons would doubtless do the work on their own account, instead of soliciting the introduction of capital in the form of wages.

Within the last few months, however, a very marked revival of local archaeological interest in Cyprus has taken place. A popular law has been passed by the Legislative Council of the island (a sort of Parliament) founded to a great extent on the Italian "Uffizio Regionale" regulations. It is more especially framed with a view of arousing the dormant interest of the people in the past history and archaeology of their native land. Under this law and the patronage of the English Administration several Cypriote gentlemen have been induced to form a new committee of management for the building of a museum in Nicosia, and for the suitable upkeep of the many national monuments. Towards the new museum a sum of 600*l.* has already been collected, but, of course, such a sum will

go but a short way towards a suitable building, even in Cyprus, where building is still cheap. There are also the expenses of furnishing and classifying the museum. The new committee is, therefore, appealing for public subscriptions towards the fund now started.

The upkeep of the national monuments, a subject which will appeal still more perhaps to the outside world than the building of the museum, is one which calls for an immediate expenditure of money. The magnificent Gothic churches are all now used for Mohammedan purposes, and the ancient Byzantine convents, etc., are, of course, in the hands of the Orthodox Church; these two classes of buildings are, therefore, outside the pale of any antiquarian control. But the classic remains of Salamis and other sites, the prehistoric ruins of Tamassos and Larnaca, would well repay being cleansed and rendered presentable to visitors now that travellers are visiting the island in greater numbers since the formation of the new port of Famagusta, and the railway into the interior of the country.

It is perhaps considered by many people—and with some reason—that the archaeological interest in Cyprus was exhausted in the eighties and nineties of the past century. At the same time, although Mr. J. L. Myer's "Catalogue" of the museum may be considered a final word on the prehistoric pottery of the island, there still remain many ancient monuments of great interest which cannot be transported along with all the best of the antiquities to New York or other places. For the purpose of preserving these often unique objects it is to be hoped that the new committee will receive abundant support. Hitherto the natives of Cyprus have not been in a position to realise the importance and evident advantages to their country which these antiquities confer. Now they are sufficiently educated in such matters to perceive that the Tombs of Tamassos or the ruins of Salamis, if properly cared for and exhibited to the public, may become as attractive to tourists as Baalbek or the monuments of Egypt.

The few English residents in Cyprus cannot be expected to show very much interest in archaeology. They are merely government officials who have certainly not been attracted to the island by any particular affinity for such studies. The Cypriots must, therefore, rely upon themselves and their friends amongst the antiquaries of Europe or America for the funds necessary to enable the Committee of the Cyprus Museum to carry out its mission and achieve a real success.

A COMPENSATION AWARD.—Mr. Daniel Watney, a Past-President of the Surveyors' Institution, has awarded a sum of 25,116*l.* in compensation to the London and North-Western Railway Company, who claimed about 45,000*l.* in all, in respect of a compulsory sale of their parcels and booking-office near Oxford-circus, W. The premises, known as the "Green Man and Still," covered an area of 718 sq. ft. at the corner of Oxford and Argyll streets and were required by the Baker-street and Waterloo Railway Company, whose valuer, Mr. G. A. Wilkinson, estimated the amount at 20,830*l.* Mr. James Boyton, President of the Auctioneers' Institute, Mr. Leslie R. Vigers, and Mr. A. R. Stanning, F.R.I.B.A., gave expert evidence on behalf of the defendants; the claimants' experts were Mr. J. H. Townsend Green, Mr. W. H. Ewell, and Mr. B. F. Anson Beach, Fellows of the Surveyors' Institution.

A WIDE OUTLOOK.

By PAUL WATERHOUSE, F.R.I.B.A.

THINK it sometimes happens to those who are engaged in daily contact with the realities of building craft that, labouring in a restricted field of expression, they practically come to ignore the existence of other fields. Indeed, now that I have put this down in black-and-white it reads as a *banal* truism; but perhaps, after all, it is a fact in human dynamics which is worth restating, if only for the reason that these platitudes sometimes cover truths so obvious as to be practically unnoticed.

It is not merely inertia that prevents a productive architect from taking stock of styles or manners other than those in which he finds his own expression. I do not mean to imply that any architect worthy of the name is incapable of self-realisation except in one manner. The necessities of his duty compel every conscientious architectural worker to exhibit an ability, if not a facility, in more methods than one. But if evidence were wanted of the fact that the nimblest faculty of pure expression can co-exist with a certain almost noble indifference to the idiom of alien methods (methods alien to the brain of the particular artist), we have only to think of some great names among those who have achieved high deeds in architecture during the past fifty years. To look further back would be to enter the period in which blind partisanship and limitation was a matter not of choice only but of conscience.

In truth the architect who strives for purity of expression must often feel of his particular sphere of manifestation what Patmore felt of woman; that it (or she) is

"A foreign land
Of which, though there he settle young,
A man can ne'er quite understand
The customs, politics, and tongue."

Not, indeed, that he is for ever fumbling with an inability to turn thought into idiomatic bricks and mortar—there never was an age so quick in expression as ours—but that he is ever realising more and more the wealth of medium that lies before him—the inexhaustible depths and intricacies of his vehicle of expression. In the same way a thoughtful writer may, one imagines, sit spell-bound before his own mother-tongue, realising that to become perfect in the use of that single language is a task so vast as to preclude any wish for flights in the speech of other lands. Such a shrinking is no sign of timidity but of a great reverence for language in general—a reverence focussed by reason of the shortness of life and the length of art on one single phase of speech.

But if he limits his expression to one tongue this enthusiast will take his reading in others, and here I have brought myself at last to my subject. Mr. Spiers' volume of collected writings* is a book of the kind that is good for those whose self-imposed limitations keep them gazing down a single avenue of architectural intelligence. Mr. Spiers is

* "Architecture East and West," a collection of essays written at various times during the last sixteen years by B. Phéné Spiers, F.S.A., F.R.I.B.A. Published for the Spiers Testimonial Committee by B. T. Batford, London, 1905.

architectural cosmopolitan, a true zen of the world. Architecture is hitherto to him (not archaeology), whether it bleaches on Syrian sands or grows under the sunshine of Spain. What more, he approaches his architectural duties with the warm heart of a water-colour artist, and when he leads you by hand to Persepolis, Cairo, or Ctesiphon on the Tigris you have a pleasant sense that your companion is no mere dry-as-dust antiquarian, but one in whose eyes the laws of building are laws of beauty, to whom a piece of architecture is the true sense a work of art. Mr. Spiers is, in fact, an amateur, if that be the best name that we can give to the unlearned appreciator.

It would, of course, be unfair and unreasonable to judge this book either as a composite whole or as an efficiently representative effort. It is, and pretends to be, nothing more than a gathering together of stray essays prepared at various dates during the more recent literary career of a well-occupied man. But, as I have studied its pages in moments of leisure, I have been struck not merely by the well-argued conclusions which the individual articles severally afford, but perhaps even more by the easiness derived from the largeness and variety of outlook which the volume in its entirety affords. That Mr. Spiers could disprove "the cherished belief that painted architecture was brought from the East by the Crusaders," or convince his readers that the connexion between Greece and Persia was the exact reverse of the relation assumed by Fergusson, is important enough from a historical point of view, but I admit that to me the pleasure of these after-dinner musings has come from the realisation that I was, so to speak, in a watch-tower, the window of which gave on Echatana, while others looked towards Vicenza, Jerusalem, and Delhi. It is well to be reminded not merely that art is long, but also that art is wide. And our great art is the longest and the widest of them all. Again, if we begin thinking, as we read, on the possible connexions which make a unity of the apparently separate elements of this widespread human activity, we can find in Mr. Spiers' essays, distinct though they be, many a suggestion as to links and chains of causation. How pregnant, for instance, are the reflections to which the study of Mahomedan art gives rise. In Mahomedan architecture you have the entrancing, astonishing spectacle of a school of building craft controlled in its unity not by clime or race (which we so often proclaim to be the governing factors of style), but purely as it seems by identity of religious purpose. That Spain, Persia, and India should exhibit outbursts of splendid (if somewhat disordered) architecture which owe their impetus and their comparative identity to a religious impulse in Arabian Asia is at least a historical fact which points urgently to the conclusion that a community of spiritual interest is a stronger element in the formation of prevailing architectural manner than any local tradition or instinct of race. Mr. Spiers, judged by this volume, takes little heed of these modern theories that look to the guild or *collegium* as the mainspring of

architectural activity. For as he is to the theory of Byzantine origins at St. Front at Périgueux, he does not go with Rivoira the length of seeing in Ravenna nothing but indigenous art, nor does he concern himself (with Merzario and Leader Scott) in tracing the paramount influence of Masonic *Magistri* in European craft. Yet for all this I rise from the reading of his book with a renewed sense of the unwillingness of our art to be tied by the bonds of geography, or even chronology; a renewed hope that some day or other we shall discover that in the chaos of the dark ages there was at work an ordered unity of craftsmanship which was, perhaps, among a turmoil of unsettled monarchies and seething nations, the most enduring, the most unflinching of human forces.

These essays cover so wide a field that it is difficult to pick out isolated points for comment, but there are some examples and some theories that stand out with special force. The clever illustration (taken no doubt from a water-colour by the author) of the palace or mosque at Diarbekr is enough to remind us how ingrained is our appreciation of the customary proportions and use of the Classic orders, and how horrible is the result of any fantastic derangement of these academic elements. Those belted Corinthian columns, surmounted by a second order of stunted Composite breed, and separated from one another by arches which are sometimes pointed and sometimes haunched, form a nightmare to which even the Cufic inscriptions hardly give artistic respectability, though no doubt the Eastern sun and Eastern colouring would soften the shock. For some reason (perhaps Alberti's skill) the pointed arches in the classical scheme of the Tempio Malatestiano at Rimini are no outrage upon our sense; but this building at Diarbekr is like, let us say, the combination of a frock coat with knickerbockers. After all, this is only an offence against the custom of the eye, but the custom of the eye is everything in architecture.

Then there is that mosque at Ibn-Tooloon, a building about which Mr. Spiers says enough to make us wish that he had said more. As a problem in architectural causation it is astonishing, perhaps unique. Up to 877 Mahomedan architects, finding the world well supplied with second-hand materials, had used such columns and capitals as were within reach, and with them had incorporated in their buildings at least a strong *souçon* of previous style. But the architect at Ibn-Tooloon made a stand for pure originality, as other men have done since. The other men have failed, but at Ibn-Tooloon there exists, as a contradiction to all theory, a really successful and (to judge from the photograph) a really beautiful building, every feature of which is a startling innovation on previous methods. "With the building of Ibn-Tooloon," says the writer, "a new era commenced, and henceforth the new style takes its independent position." It were well if this mosque were more truly the start of a new style as well as the abandonment of an old one, but I fear there were many buildings of the subsequent years that owed little to its example. In truth, the Mahomedan

style is a very uncertain performance. Perhaps its inequalities are explained by the theory that it is good in detail (or even in whole features), but bad in composition. Certainly it is difficult to believe that the genius that could produce the "doorway of a private house" in Cairo, which Mr. Spiers gives as one of his illustrations, could also design the minaret of the mosque of the Emir Yakhor.

Mr. Spiers is often very reticent as to his own travels and personal researches. One of the most interesting buildings that he describes is the Great Mosque at Damascus, and it is only from a footnote to an illustration that we realise that forty years ago the author sat beneath its central dome to make a water-colour sketch of the north transept. It is, or has been, a magnificent building, and the fact of its partial destruction by fire in 1893 and subsequent restoration on unduly vigorous lines renders a history of its previous condition and past history specially interesting and valuable.

Of the remaining sections of the book the most important are some interesting notes on the churches at Jerusalem, a review of Dieulafoy's investigations at Susa, a chapter on Sassanian architecture, and an essay on stalactite (or honey-comb) vaulting.

The necessity for hurried publication led, perhaps inevitably, to a good many misprints, and the compiler of the table of corrigenda has omitted to note that the heading "Saint-Front at Périgueux" is lacking on page xvii. of the list of illustrations. The heading "Jerusalem Churches" is also missing.

NOTES.

THE Report of the Finance Committee of the London County Council on the proposal to pay District Surveyors by salary is printed in full in our report of the proceedings of the last County Council meeting. We are glad to see that an amendment that the subject should be referred back to the Building Act Committee was carried, though not by a very large majority. The Council have been on the eve of initiating a change in the administration of District Surveying of which it does not appear that they have realised all the possible consequences. The Report of the Finance Committee appears to us to be conclusive against it in regard to the probability of any public saving being effected by such a measure, and the idea of saving money seems to have been at the root of the proposal. The requirements of staff and offices for the salaried surveyors have obviously been quite underestimated. There is something to be said in favour of the payment of a fixed sum to a District Surveyor, as it relieves him from the odium of being supposed to be prowling for the discovery of infractions of building law in order to increase his fees (which is what many of the outside public wrongly imagine); but on the other hand it would render the position a less honourable and independent one, and there would be less inducement for a good class of men to take it

mp. Our own opinion is, and always has been, that the County Council made a serious mistake when they decided not to appoint practising architects any longer as District Surveyors; nor have we ever heard any good reason in favour of that step. Under the old conditions, the County Council could and did secure the services, as District Surveyors, of men in a high position in the architectural profession, whose name and position commanded respect; and we have never heard it asserted that these practising architects did not carry out their District Surveying efficiently. Forbidding the District Surveyors to carry on private practice was one step towards reducing them to the position of subordinates of the Council; the substitution of salaries for fees would be the next and final step, and would certainly not tend to render the District Surveyors either more respected by the public or more efficient in carrying out their duties. If the London County Council were wise, they would make this an opportunity of returning to the old system, and appointing practising architects as District Surveyors: but we have no hope that they will do so.

Breaking-up Streets. THE decision of the Divisional Court in the case of the Commercial Gas Company v. the Poplar Borough Council should be noted by those who have to take up the roads for private purposes. The Gas Company, for the purposes of laying, altering, or repairing their gas pipes, had broken up certain streets in Poplar, and the Borough Council, under sect. 114 of the Metropolis Management Act, 1855, had themselves undertaken to reinstatement and make the streets up. The parts of the roads taken up were of three descriptions—in portions stone setts were placed upon concrete, in portions stone setts were placed on the earth, and in others there were no stone setts. To avoid subsidence in the road the Council made the existing concrete 3 in. thicker than it was before along the line of excavation, and where there was no concrete a course of concrete was laid along the line of excavation. The Gas Company asserted that under sect. 111 and 114 of the Metropolis Management Act they were not liable to repay the Council the cost of this extra concrete. The Court held that the Act contemplated the street not only being made as good as it was before, but being placed in a state to remain as good, and to attain this object the use of the concrete was reasonable and necessary. Sect. 82 of the Metropolis Management Amendment Act, 1862, provides that the liability to make good shall extend to those parts affected which were contiguous to the portion of the streets broken up, and this obviates fine distinctions being drawn as to the exact limits of the work necessary to be carried out.

Collapsing Strength of Tubes. UNTIL quite recently the only extended and systematic experiments made as to the collapsing strength of tubes were those of Sir William Fairbairn instituted half a century ago at the

suggestion of the Royal Society and the British Association. Therefore considerable interest attaches to the paper read by Mr. A. P. Carman, of Illinois University, before the American Physical Society, describing the results of an investigation undertaken for the purpose of testing the formula deduced by Fairbairn from his experiments, and particularly for fixing a limit on the length of tube to which that formula is applicable. From this paper it appears that the narrow limits and the inadequacy of Fairbairn's formula were soon shown. Consequently, attention was next drawn to the purely theoretical formula proposed by Mr. A. E. H. Love about 1892. Inspection of the tables and diagrams given in the paper suggest that there is a minimum length for every tube, beyond which the collapsing pressure is constant, that this minimum length is quite definite, and that for lengths less than the critical minimum length the collapsing pressures rise rapidly. Mr. Carman's experiments were made upon seamless brass tubes of small diameters, which were responsible for a certain amount of error due to inevitable differences in annealing, but arrangements are now being made for a second series of tests upon steel tubes of diameters such as are used in actual boiler construction with the object of further testing the reliability of the new formula.

The New Croton Dam, New York. It may be remembered that since the construction of the Croton dam was commenced, some important changes were decided upon as the result of the report by a board of experts, and were due in the first instance to recommendations made by Mr. W. R. Hill, the chief engineer, to the effect that the Embankment section of the dam at the south end, about 275 ft. in length, should be removed and replaced by an extension of the masonry section of the main dam. This change was authorised by the Aqueduct Commissioners in 1902, and occasioned considerable discussion in engineering circles at that time. Mr. Charles S. Gowen, who was resident engineer in charge of the works from the beginning until their practical completion, took the opportunity of expressing his opinions on the subject in a paper read last month before the American Society of Civil Engineers. The author does not agree with the conclusions formed by the board of experts, and believes that the city of New York have been induced to waste nearly 200,000*l.*, and at least two years of valuable time, in carrying out unnecessary alterations. The grounds for these opinions are fully stated in the paper, upon which there will probably be a somewhat lively discussion. American views as to what is safe and what is unsafe in engineering construction do not always accord with British views on the same subject. In this case we have no reason to doubt the wisdom of the recommendations made by the expert engineers to which this important matter was referred, and to whom every credit must be given for admitting and rectifying what we regard as a serious original error.

Emptying Cesspools. In the case of Wandsworth Borough Council v. Baines, commented upon by us in a recent issue, the liability of the Local Authorities as to the removal of house refuse was the subject of decision, and now in Stainland Provision Society, Ltd., v. Stainland Urban District Council a question has been decided as to the liabilities of cleansing cesspools. The local authority had given notice to the appellants, the owners and occupiers of certain premises which had been erected before the year 1890, to empty and cleanse their cesspool. This notice was given pursuant to certain by-laws made by the local authority in 1890. In the year 1894 the local authority had passed a resolution that they themselves would in future undertake "the scavenging of privies, closets and ashpits, and that dry earth closets be emptied and cleansed monthly, privies and ashpits every three months." The appellants contended that by this resolution the local authority were bound to undertake the cleansing of the cesspools by virtue of sect. 42 of the Public Health Act, 1895, but the Court held that the local authority could undertake only part of the duties specified in sect. 42, and that this was all that they had done. The by-laws as to cesspools therefore remained in force, and the appellants were bound to empty their own cesspool.

The Papal Palace, Avignon. In our Notes of July 18, 1896, and January 12, 1901, we commented upon the demolition of the Porte Lambert, a part of the old fortifications, and of the ancient gateway facing the modern suspension bridge across the river, which constituted salient features of the walls around Avignon—a notable relic of mediæval France. We now learn that steps are about to be taken for completing a restoration which was begun in the early years of the last century of the Popes' Palace at Avignon, and for converting the buildings for purposes of a museum of religious art. After the Revolution the palace was taken for a prison and soldiers' barracks, the great hall, wherein the groning and shafts remain, being divided into floors for dormitories. In 1309 Clement V. (Bertrand the Goth) removed his Court from Rome to Avignon, which Phillip III. had ceded to Gregory X. in 1273; Benedict XII., also known at Rome as Nicholas V., began the erection of the palace in 1336, and, by one account, his successor, Clement VI., bought the land from Joanna of Sicily for 80,000 florins. Until Gregory XI. restored the papal chair to Rome, in 1377, Avignon formed the seat of seven occupants of the papal throne. During the schism of 1378-1447 it was the seat of several of the Anti-Popes, and it continued in possession of the See until the deposition in 1798 of Pius VI. The palace, which covers more than 1½ acres of ground, and combined the structural features of a monastery and a feudal castle, was surrounded with high walls and towers. The Tour de Tronillas in the northern block was built by the architect Pierre Orberri for Benedict XII.; it was used as a state prison and there, it is said, Rienzi was incarcerated. Giotto decorated

the lower chapel for Clement V.; the frescoes in the "Salle de l'Inquisition" are attributed to Spinello Arefano; but the greater portion of the mural paintings and decorative work have suffered irreparable injury. The grand tribune has a continuous groin; the walls of the "question-chamber" were built so as to contract above in the shape of an inverted funnel in the belief that they would prevent the passage of sound.

The members of the London Municipal Council who visit Paris next week will have an opportunity of seeing a great deal of the best that is to be seen of Paris architecture and art. On the 6th the list of places to be visited includes the Bourse, with its recent architectural additions; the Palais de Justice, one of the finest buildings of its kind in Europe, to which an eminent architect devoted for years his whole time and care; and the two saloons of art on the Champs Elysées, the smaller one of which is one of the most noteworthy and individual architectural creations of our day. On the 7th they are to see the Sèvres porcelain factory, and on the 8th the Natural History Museum, with its remarkable sculptured and pictorial decorations, the Gobelins tapestry works, the Panthéon, and the Sorbonne. The succeeding days are to be devoted to seeing schools. It seems odd that no mention is made of the Carnavalet Museum, the Municipal Museum of relics of Old Paris, the study of which might perhaps have prompted steps towards the formation of a similar museum here for relics of Old London.

LETTER FROM PARIS.

As the French Constitution requires that the Ministers in office should send in their resignation to the new President on the 18th, M. Dujardin-Beaumetz will have to abandon the office of Under-Secretary of State for Art, which he has occupied for a year with great distinction. It is hoped that this gentleman, who is a true artist in spirit and thoroughly acquainted with his subject, will, in virtue of his special qualifications, find a place in the new cabinet. Among the last acts carried out in the exercise of his functions, we may especially mention his re-organisation of the Conseil Supérieur des Arts Décoratifs. Occupied as he was with the development of our national collections, M. Dujardin-Beaumetz had also projected the erection of a new and much larger building for the Luxembourg Museum, in the gardens of the Seminary of St. Sulpice; and it is thanks to the impulse which he has given that the Malmaison Museum is now in great part organised. With the funds acquired by a special vote of Parliament, the Salon Doré on the ground floor, the former bed-chamber of the Empress Josephine, the Library of Napoleon, and other rooms in the Château, have been restored to their original condition, and will be opened to the public in the course of the summer. It is to the same influence that we owe the project of the monument in the Cours-la-Reine to the memory of the great French landscape-painter.

A committee has been formed in Paris for the erection of a monument to Bouguereau by public subscription. This monument will be a testimony both of appreciation of his artistic acquirements and also of gratitude for the services which he rendered to French art and artists by his work in connexion with the professional institutions which he presided over and administered.

The Municipal Council has instituted an architectural competition for the façades of houses for the portion of the Rue Réaumur comprised between the Place de la Bourse and the Rue Palestro. The jury have

awarded premiums to MM. Walwein, Montarnal, Bousson, and Heinant.

The gallery set apart at the Petit Palais for the works of Henner will shortly be opened, and in the same museum and at the same time will be opened the room containing the collection of drawings presented to the City by M. Harpignies, who has also presented to the Luxembourg a fine collection of views made by him between 1850 and 1860, principally in the Roman Campagna and in the south of France.

During its coming session the Municipal Council will be largely occupied in the consideration of various schemes of decoration, foremost among which is the completion of the decorative scheme of the Petit Palais. Externally this will consist in the addition of a number of statues, and internally there will be a division of the galleries into separate salons connected by long galleries, in order to give more hanging space for the constantly increasing collection of paintings. Large skylights are also to be formed above the different rooms in order to improve the lighting, which is not all that could be wished. The Council will also be occupied with the final arrangement and treatment of the large basin in the Place de la Nation, in the centre of which stands Dalou's group of the Triumph of the Republic. According to Dalou's idea, this group was to be accompanied by figures of fabulous animals spouting up water; and it is this scheme, for which the sculptor had left sketches, which the Council intend to carry out, giving a commission to some eminent animal sculptor, such as M. Gardet, to execute models to be carried out either in bronze or lead, in the same manner as the decorative groups in the fountains at Versailles. As in addition to this there are to be commissions for memorial busts of Cernuschi, the Duchesse de Galliera, and Paul Meurice, and statues of Theodore Roussel and Baron Taylor, it will be seen that the Municipal Council is doing its part in the encouragement of French sculpture.

The next of the series of exhibitions of applied art at the Musée Galliera will be an exhibition of silk in its various applications to art and industry, which will be open in the spring. This exhibition, which is specially to present a kind of analysis of the work of the last ten years, will include also a retrospective exhibition of XIXth century wares and also of silk textiles of earlier dates.

The use to be made of the Château de Bagatelle seems to be at last decided on. The Municipal Council will authorise the holding in it of a series of historical or retrospective art exhibitions, of the same kind as that which was attempted last summer by a group of amateurs, whom the authorities made the mistake of not encouraging.

NOTES ON NEW BUILDINGS IN LONDON.—VI.

At the corner of Bond-street and Piccadilly is a new building, fronting to both streets, which is rather typically representative of the new London architecture. Where there is anything more than mere building, nowadays, we see generally the attempt at the picturesque; at gables and skyline, and piquant varieties of detail. There is something restless and wanting repose in this, but there is at any rate a certain life and interest in it. The Bond-street front of the building in question illustrates a feature which we have observed in various other quarters to have become rather a favourite one—that of carrying a kind of angle post in stone the whole, or nearly the whole, height of the angles of a bay or other feature. Where, as is generally the case, this apparent post of stone does not start from the ground but from a bracket or corbel, and still more in some cases where it starts from a visible support at all, but its lower end finishes in the air, it is an un-pleasant form of stone design; and we see instances (perhaps to be noticed hereafter more specially) where it becomes absolutely an imitation of joinery construction, and the stone angle post looks like the newel of a stair. In the building we are now considering this has been avoided so far that the bay towards Bond-street, projected over an arched opening on the ground floor, has a sufficient

corbel to carry it, and the post-like angle feature resolves itself in the upper story of the bay into an angle colonnette, thus at any rate returning to a masonic form at the finish. The front towards Piccadilly, with its large gable, is effective; so also is the manner in which the projections of the two lofty bays on this front are connected by balustraded balconies flush with the outer faces of the bays. The fault of this building is the want of unity of style and scale in the details. Some are too heavy for the general style of the building; others too light. For instance, the new practice has been adopted of leaving the stone mullions and transoms of the windows with a plain square section, with no moulding. There is no beauty in this treatment of mullions, which have come across lately in many places; its sole recommendation over a moulded mullion is its novelty, moulded mullions being apparently regarded as "played out"; but it assimilates very well with a building of plain, solid, and massive character. In the case of a building like this, treated mostly in a light and rather playful manner, the square section mullion is too heavy for its surroundings. In fact, the architect does not seem to have been sure what architectural character he was aiming at; window dressings are decorated with flimsy little floral pendants, put there from an idea that something ornamental was wanted, but which have no accordance with anything else in the design, any more than the simously-curved heads of the top windows of the angle bay, which do not look well. Both in the roof balustrade and in the balustrades of the balconies towards Piccadilly a form of balustrade much lighter in proportion than usual has been adopted, coupled with a very massive balustrade section, which is quite out of keeping with the proportions of the balustrades; this is especially noticeable in the balustrades of the balconies, where the balustrades are in themselves of a graceful and pleasing design, but are quite crushed by the massive proportions of the balustrade rail over them, which they seem inadequate to support. The worst mistake in the building is, however, one which the architect probably considered to be a virtue. The ground floor at the angle is a shop, as usual nearly all glass, but the architect has endeavoured to remind us that the upper part of a building ought to stand upon something solid, by introducing very narrow thin apparent piers of masonry, just enough to hide the iron supports. It would have been far better and more architectural to have candidly shown the iron standards and treated them with paint or in some other way which would not have disguised their existence. As it is, we look at these thin stone uprights, rather than piers, which make believe to carry the building, and at once expect to see them crack to pieces. This is certainly not architectural treatment.

We have only to walk down St. James's-street to realise the contrast between what may be called the tentative picturesque and the certainty and unity of true architectural style. Here, at least, in the Alliance Buildings at the south-west angle of St. James's-street, is a piece of real architecture—solid, severe, all composed with one definite aim, and with no tricks of detail anywhere. Of course, it must be conceded that the architect has had an immense advantage here in not having a shop on the ground story, and in being able accordingly to erect his building on a solid ground story of masonry; but apart from this, the remainder of the design forcibly illustrates the power of reserve and subordination of detail in architectural design, and the effect to be obtained by simple and well-chosen treatment of masonry and mouldings, with hardly any ornament at all. The ground story is not merely solid, it is almost Cyclopean in treatment, at least on the east front facing Pall Mall, with rustication of the holdest character, and great semicircular arches of more than 2 ft. reveal. As in the building next to the Gaiety Theatre (which we may take to be essentially the production of the same designer,* whether carried out by him or

* We have purposely obtained, in these notes, from giving the names of architects, and even from inquiring them where we were not aware of them; our object being simply to consider how a building strikes the spectator, apart from any personal considerations.

not), the ground floor arches show a subtle inference to the spacing of the openings above them, and are quite massive enough to do this: though here, as in the Gaiety building, we feel that we would rather not have seen the keystones directly quarrelling with the sills of the windows above them.

The form of rustication employed (sketched here) is not one that we are fond of, and, as will be seen on the return of it round part of the south front, when it comes to voussoirs over a comparatively small arch, it is apt to cut up into rather awkward-looking lumps. It works quite well, however, for the large arches on the east front, and is undoubtedly a very powerful form of mural expression. Above the ground story the main range of upper windows (really the second story, though on the east front it appears externally as the first story) is treated with pedimented heads and consoles, which consoles form the only exterior detail that does not seem quite satisfactory, as they strike us as somewhat too thin and light in proportion for the character of the other details; but it is a small point, and there may be two opinions on it. This range of windows is decorated with iron balconies of rich design and sufficiently massive character, designed with a fine sweep outwards from the base, falling in again to the top rail; these balcony grilles form almost the only detail on the building which can be classed as ornament; the rest is simple masonry and moulding, crowned with a plain modillion cornice. The treatment of the top-story windows, square-headed openings with a keystone carried up to the soffit of the cornice and the wall between finished with a small moulding returned into the window-jamb, is particularly refined and well studied.

The large arched windows on the ground story form really, as already hinted, two stories of windows, at least over a part of the building, the first floor being a mezzanine floor level with the springing of the arch, and consequently having semi-circular windows starting from the floor level—not a convenient form of window internally. But externally we have a building which in dignity and coherence of architectural style is worthy of the best traditions of the Florentine Renaissance. Young architects may have the opportunity of adding to the street architecture of London should study this building, and learn to see how much may be done by real solid building and by well-considered masonry design and moulding, without bedizening a front with what is often falsely called ornament.

POINTS FOR THE CONSIDERATION OF MUNICIPAL COUNCILS.*

THERE is a point which is of great importance in the general appearance of a town, and that is the position of public buildings. How many of our great halls and handsome buildings are hidden in out-of-the-way corners, just as so many of our great thoroughfares lead to nowhere and nothing? I do not want to seem unpatriotic in continually quoting other countries, but we cannot blind ourselves to the fact that in most Continental cities great attention has been paid to these points. Public buildings are always well placed. If you go down a great street or avenue on the Continent you are practically certain to come to an architectural feature of the town. Similarly, if you find the town hall you are equally sure of finding the main thoroughfares converge thereto. We find too often here that economy is almost the prime factor in securing a site, and cheap sites are not usually the best for such a purpose. You may, of course, save a few hundreds in purchase money, but when you are putting up a public building to cost 50,000, to 100,000, and to last for generations, it is foolish to grudge even a few thousands extra if by spending you get an ample site and a commanding position—two qualifications that should be secured in the erection of all our public buildings. Cheap

* Part of an address by Mr. T. T. Rees, President of the Liverpool Architectural Society, delivered on Monday, January 22.

and nasty may exist even in the matter of sites.

One department in which municipalities could with advantage exercise control is that of advertisement hoardings, the necessity for supervision of which is glaringly instanced in every town. As a beginning they might have the power to define areas in each town where alone hoardings should be erected, and if a few private owners anxious to let their land for advertisement purposes were slightly prejudiced they must remember that in this, as in other things, the desires and interests of the community take precedence. One rule I should suggest is that under no circumstances should it be permissible to deface the gable ends or fronts of buildings with advertisements. Nor would I permit buildings that have been damaged by fire or fallen into decay to stand like ugly skeletons plastered over with posters, eyesores to all that pass and a disgrace to the town in which they exist. Power should be obtained to compel the owner to raze such buildings to the ground; better to have an unoccupied piece of land than a nightmare of a building. There is, further, the desirability of censorship over the nature or character of the posters themselves. It is really distressing to see the class of thing with which most posting stations are decorated, and the evil effect of some ultra-sensational picture has been definitely traced in more than one instance. The Continental authorities have a censorship of the kind suggested, and, indeed, they have large powers in other directions as to the size and construction of advertisement designs. We might follow the example of Continental towns and cities in their restrictions, or the lead of Chicago, where no bill-boarding may be erected in a residential street unless by consent of three-fourths of the frontagers. Edinburgh has been the pioneer in securing for the Council as representing the community the right to say where advertisements may be placed, and probably they were roused to energetic action by the threatened disfranchisement of their lovely and beloved Princes-street. At any rate, they were actuated by the desire that their beautiful city should not be injured in its attractiveness, a quality by no means profitless to the city. Of course, for really objectionable posters we may rely to some extent upon the common law and the police authorities; but, from the aesthetic point of view, we do undoubtedly need more power. Glasgow, the most go-ahead of British cities, sacrificed a solid financial advantage of 4,000, a year by deciding to abolish advertisements on their tramcars.

Take, for instance, the hoarding around the monument in Liverpool to the late Queen; it got on one's nerves, and really it was up so long that we wondered if it was to remain for ever. Why should buildings be enclosed by tall, unsightly palisades? Personally, I see no reason why a hoarding should not be made, say, 4 ft. solid from the ground, and above have spaces left between the boards, with a capping on top, no hoardings to be higher than 8 ft. to 10 ft. If the work is good, there is no necessity to hide what is going on behind.

The Manchester Improvement Committee have decided to keep free from advertisements all hoardings placed round buildings which are in progress of erection or where alterations are being made. In Leyden they go still further, the municipality managing all advertisements of the poster class. I would, before leaving this part of my paper, like to say how much one appreciates the efforts of such firms as Pears', Bovril Company, Nestlé's Milk, Vernon's, and others in their attempt—and, I think you will agree, successful attempt—to produce pleasing posters. The Brussels Municipal Art Society have gone to the extent of instituting competitions for tradesmen's signs, which were most successful, the result being that many of those who competed received orders to decorate shops with suitable signs and name-boards. Such a competition might easily be got up in Liverpool.

Perhaps the most degrading kind of advertisement known to modern towns is the sandwichman, the employment of whom is a disgrace to any civilised nation, while to take advantage of the necessities of women to put them to such an occupation needs stronger condemnation than I care to put

into words. There must be something wrong somewhere when men and women turn themselves into walking sign-boards. It is at least something to the credit of the community that in London there was such outcry against the employment of girls in this capacity that the employers were compelled to cease this degrading style of advertisement. This is what we want—so to rouse public opinion on the question generally by the actions and speeches of spirited citizens that a pride will be taken in their city and a jealousy for its fair name excited.

Still another nuisance that ought to be modified is the smoke, which so pollutes our atmosphere, and, according to the opinions of all experts and every thinking man, exercises so evil an influence on the health of a town. One result which proves the effect is the London fog, the density of which is admittedly due to the enormous quantity of smoke poured forth by the hundreds of thousands of houses which form the congeries of towns. I do not think that our municipalities exercise their full power over offenders, and, personally, I would like to see still more stringent regulations in force, for not only is it a menace to health, but also causes destruction to the plant life of a city. It is difficult to persuade some people of the injury that the smoke issuing from tall factory chimneys, which a city suffers to float over it like so many black flags, does because they believe that smoke means industry, and industry wealth. Personally I believe that it means defective stoking of the furnace.

Now, what do all these things lead us to? They are the approach, in my opinion, to a city wherein the inhabitants shall have beautiful things to help them in mind, and healthy conditions to maintain the vigour of the body. People desire to live in a good, clean, and beautiful town, and if you give them such surroundings you will not only benefit the inhabitants, but you will attract new residents from other places. Your houses will be well occupied, their number will increase, and, so long as the increase goes on proper lines, you will have unending possibilities of increasing the rateable value and thus keeping your rates at a desirable level. Visitors coming into the town will covet the privilege of being residents there, and your municipality will have a good name throughout the land. Manufacturers, too, will be attracted both by the population and the conditions of life; in fact, the pleasanter you make your town the greater will be the probability of its becoming a self-contained community, possessing all the means of ministering to the needs—physical, intellectual, and moral—of those within your borders.

This is done in many Continental towns, indeed, a body of gentlemen composed of architects, artists, and engineers is recognised as a necessary part of the municipal body, and, personally, I consider it would be a very great honour to any member of this and other societies if they were asked to attend a committee and assist in formulating an improvement scheme; not that I believe officials are incapable, for I would be the first to give them every credit, but I believe they in years get into an official groove, which it is almost impossible for them to get out of.

We hear often of architects complaining, and read continually in our journals of building surveyors designing and carrying out public buildings. I see no reason why they should not if they are able; but if the members of our profession want to put a stop to the practice, then let them make their influence as a society felt, and I believe recognition will be the result.

I fancy I can hear some say, Why read such a paper to an architectural society. It is unsuitable for an audience of professional men; it would be all right for a number of town or city councillors. We know all these things and see them every day, and agree that a remedy is needed. Quite right; I understand such a point of view, but are architects not the proper people to awaken civic pride? Ought we not to condemn in season and out of season these flagrant eyesores? Ought we not to do all we can to educate the tastes of the people? Personally, I think we ought.

I am sorry to say that I have a grievance against the City Council of Liverpool, and it

this—that it does not recognise a Society for ours as it ought to be recognised; and, on the other hand, I am of opinion that our Society does not make its influence felt. Councilors want education as well as those outside the Council chamber. How can this be done? One way I would suggest is this, that when any paper touching upon city affairs is being given—and we ought to have one at least every year—the Councilors ought to be invited to attend our meetings. Another way is that we ought to form a committee of this and kindred societies, whose duty it is to watch what schemes are being brought forward, whether it be buildings, laying out streets or parks, and report; and, if as a Society, when necessary, ought to make such recommendations to the Council as will help them to properly carry out such schemes. If this were done I believe that before long the Council would ask our President, and perhaps some of the senior members, to meet the Council committee and discuss matters relating to the city improvements.

THE PHENE SPIERS TESTIMONIAL.

We have received the following statement from Mr. Schultz, the hon. secretary for the Spiers Testimonial Fund, which we have pleasure in making public:—

"The executive committee of this testimonial have now wound up the matter and closed the accounts. After paying all the costs in connexion with the various items of the testimonial, it was found that there was a balance to the credit of the fund of 79s., and that only 124 copies of the volume 'Architecture East and West' remained unsold at Christmas, 1905. The committee have handed over the balance of 79s. to Mr. Spiers to deal with in any manner he thinks fit, and have instructed Mr. Batsford to transfer the remainder of the edition of the book to Mr. Spiers's account.

This settlement of the matter may be looked upon as highly satisfactory to all parties concerned. When it was decided to publish the volume, it was not anticipated that after paying the costs of publication there would be any appreciable balance to deal with. The success of the publication is largely due to the zeal and energy of Mr. Batsford, who gave a great deal of personal time and trouble to the matter, and also, of course, to the excellence of the matter in the work itself, which caused the volume to be well received and taken up.

We understand that Mr. Spiers is going to devote the sum of money which has been handed over to him to a useful architectural purpose, and we may expect from him shortly an announcement on this subject.

The statement of accounts and balance-sheet, which has been signed by Sir Austen Webb, and the other members of the executive committee, is open to inspection by any subscriber who may wish to see it, at the office of the hon. secretary and treasurer, Mr. R. Weir Schultz, 14, Gray's In-square, W.C."

It is rather a singular coincidence that the above statement, which only reached us on the morning of going to press, should, quite accidentally, have been sent in for publication in the same issue in which we had already arranged for the publication of Mr. Paul Waterhouse's article on "Architecture East and West," which will be found on another page.

A PAGEANT AT WARWICK CASTLE.

MR. LOUIS N. PARKER has prepared the libretto of a historical pageant which will be held in July at Warwick Castle, and of which he will act as "master of the ceremonies." A tableau representing the history of Warwick will form the closing scene; amongst the episodes that will be illustrated are the state visit in 1502 of Queen Elizabeth, with Robert Dudley, Earl of Leicester, on her progress to Kenilworth, the capture (at Northampton) of Henry VI. by Richard Nevill, the "king-maker," the trial and condemnation, at Blacklow Hill, of Piers Gaveston, the siege of Kenilworth Castle when held by Simon de Montfort, and the legendary slaying of the Dun Cow by the redoubtable Guy, Earl of Warwick, who, we may mention by the way, is commemorated by a bas-relief in Warwick-lane, Newgate-street, where was the London inn of the earls of that house. King Alfred's daughter, Ethelfleda, Countess of Mercia, reinstated, after its destruction by the Danes, the fort which Rons of Guy's Cliffe (*obit* 1491) the historian of the county ascribes, with Camden and Dngdale, to the British King Cunobelin. Now represented by Warwick Castle, had been rebuilt as one of those established by Ostorius Scapula, in the later province of *Flavia Caesariensis*, along the line of the Fosseway from Bath to Lincoln.

Warrenmunde, father of Offa, King of Mercia, rebuilt the town, calling it Warre-wyke—a name which appears as Werhica upon a coin of Hardiknut. An area of nearly three acres is encompassed by the outer walls of the subsisting Castle, which constitutes the perhaps finest example of a feudal fortified residence in England, remarkable for the great interest of its gatehouse and system of military defence, enhanced by the beauty of its position upon a rock by the Avon. A road winding upwards from the riverside leads to the main gatehouse, flanked by two towers, and having a barbican or outer fortification. In the north angle of the enceinte stands Guy's Tower, 128 ft. high, and duodecagonal on plan, with an embattled parapet resting upon corbels, built at the close of the XIVth century by Thomas Beauchamp, Earl of Warwick, who renewed the curtain walls and some of the minor towers, and made the large vaulted substructures beneath the Castle. In the opposite angle is the earlier Caesar's Tower, quatrefoil on complete plan, and having a machicolated parapet with an upper battlement rising above, as at Pierrefonds and Chateau d'Elampes, and at Craigmillar—the last-named being a rare example after that kind in Scotland. On an acclivity to the south-west was erected Ethelfleda's keep, replaced, probably in the late XIIIth century, with a shell keep of stone; on the south-east lies the range of private apartments. The great hall and the domestic apartments in the eastern wing were restored by Anthony Salvin (who had done some work there in 1863-6) after their destruction by fire in July, 1871. In a greenhouse, erected for its reception, was deposited the Bacchic vase, or bathing basin, of Lysippus, discovered in 1770 in the bed of the old lake Pantanello, near Hadrian's villa at Tivoli, and brought to England by Sir William Hamilton—confer Piranesi's "Vase e Candelabra." The present house of the Earls of Warwick and Brooke derives from William Greville, citizen of London, *tempo* Richard II., who, in 1398, purchased the manor of Milcote, co. Warwick, from Sir Walter Beauchamp; his epitaph at Campden describes him as "the flower of woolstaplers." His descendant, Fulke Greville, of Milcote and Alcester, and of Brooke House, Holborn, the learned and accomplished courtier, obtained from King James I. a grant of Warwick Castle with its dependencies, and expended large sums of money there. He was elevated Lord Brooke, Baron Brooke, of Beauchamp's Court, co. Warwick, on January 18, 1621. The stately monument which he erected for himself in the chapter-house of the formerly collegiate church of St. Mary, Warwick, bears the inscription:—

"Fulke Greville, servant to Queen Elizabeth, counselor to King James, and friend to Sir Philip Sidney, Trophaeum Pectati."

William I. made Hyde de Newburgh castellan with the title of Earl of Warwick, and surrounded the town with walls and a ditch, whereof some vestiges remain, and which gave the name of Wall-dyke to a part of the town. Roger de Newburgh, second Earl, made the parish church collegiate in 1123, incorporating with it the Collegiate Church of All Saints, which then stood within the castle precincts. The fire of September 5, 1694, consumed more than one-half of the town, and the tower, nave, and transepts of St. Mary's as rebuilt in the latter half of the XIVth century by the eleventh and twelfth Earls of Warwick (Beauchamp). Sir William Wilson, of Leicester, architect and builder, rebuilt the nave, jointly, it is said, with Wren, whose drawings of the church and some sketches of proposed new works are at All Souls' College, Oxford. Mr. J. A. Chatwin restored the fabric in 1896. On January 31, 1891, we published Mr. Harold Brakspear's set of measured drawings of Richard Beauchamp's Chapel of our Lady (1443-64) on the south side of the chancel of St. Mary's: some sketches of the town and Castle will be found in our Volumes LVIII., p. 65, and LXXV., p. 129, for 1890 and 1898.

ROOD SCREEN, ST. PAUL'S CHURCH, BEDFORD.

A new rood screen of English oak has been placed under the chancel arch of this church. The work was carried out by Messrs. Rattee & Kett, of Cambridge, from designs by Mr. G. F. Bodley, R.A., and the cost was about 650*l*.

THE SURVEYORS' INSTITUTION.

An ordinary general meeting of the Surveyors' Institution was held on Monday evening at No. 12, Great George-street, Westminster, S.W., when a paper, by Mr. Frederick Marshall, K.C., on "The Valuation of Machinery for Rating Purposes," was read.

The author said that, during the last thirty years, a feeling of uncertainty as to the application of the principles as to the rating of machinery had been gradually growing until it had developed into something like two rival views, having little in common with each other. It was agreed that machinery could not be directly rated, and that the only way in which the parish could put it under contribution was to regard it as enhancing the value of the hereditament with which it was connected, and which was the direct subject of assessment. But how to do this was the problem which had given rise to so much difference of opinion. On the one side, it was contended that the only practical way of measuring the enhancement was to consider what the machinery was worth as it was and where it was, and to put on such a percentage as a landlord could afford to let it at and a tenant would be reasonably likely to pay, as representing the addition that should be made to the rent of the building for the purpose of assessment. On the other side, the argument was that capital values and percentages were entirely beside the question, and that what the valuer had to find was the additional amount which a tenant would be willing to pay for the convenience of having the machinery *in situ*, and the building adapted to it as a going concern. Unfortunately, the course of law had not given much assistance to the valuer of late years in deciding between the rival contentions, viewing it rather as a question of fact for him to settle with the help of his experience and good judgment than as a matter of law upon which any definite rules ought to be laid down for his guidance. Incidentally, however, some light was thrown upon the subject by the cases which had been from time to time decided, and especially the earlier ones.

The author then dealt with a number of legal cases bearing on the subject, mostly subsequent to the year 1840, when the Act for exempting personal property from rateability was passed. In the case of the King *v.* Lord Granville, in 1823, a lessee of a coal mine, who was also the occupier, had erected a steam engine and laid down a railway for the working of the mine. His royalties amounted to 80*l*., and he was rated at 98*l*., the difference of 18*l*., being charged in respect of the engine and railway. He was held to have been properly rated at the larger sum; the court remarking, in reference to one point raised in the case, that it was immaterial whether the engine and railway had been put in by the tenant or the landlord. In that case, however, the additions were pure fixtures, and became part of the realty by their physical attachment to the soil, so that the case did not help with regard to the debatable articles of machinery which formed the chief subject of contention at the present time. The case of the Queen *v.* Guest, though decided before 1840, proved that personal property was not charged to the poor rate in the parish where it arose, so that it stood on the same footing as the cases after the passing of the Act of 1840. The important part of the judgment was that Lord Denman said that "real property ought to be rated according to its actual value, as combined with the machinery attached to it," drawing no distinction whatever between the method of valuing the building and the machinery, although the latter was not built into the walls or floors, but only secured to fixed frames, and was easily removable. In the Queen *v.* the Southampton Dock Company (1851) the question was, whether a percentage on the whole value of the machinery in dispute should be deducted on the ground of its being part of the tenants' capital, and the effect of the judgment was that the deduction was not allowed. As 25 per cent. was allowed for tenants' profits, the result was that the assessment on the freehold was increased by 25 per cent. on the existing value of the machinery in dispute, less repairs. This was, in effect, making the machinery rateable, and rateable to the full amount of its value. In 1860, in the North Staffordshire

case, the judgment in the Southampton case was confirmed, and the well-known division of machinery, etc., into three classes was made by the court. First, things movable, such as the furniture; then, things so attached to the freehold as to become part of it; and thirdly, things which, though capable of being removed, were yet so far attached as that it was intended that they should remain permanently connected with the railway or the premises used with it, and remain permanent appendages to it as essential to its working. This classification had never since been disturbed. The effect of the decision was to exclude the machinery in question from tenants' capital, and the percentage allowed upon its entire existing value would therefore be added to the amount at which the property was rateable. In the *Queen v. Lee*, one might fairly come to the conclusion, in reading the judgment, that if a machine, though attached to the building where it was found as part of the plant, was attached for the enjoyment of the thing itself, that was to say, for its better working, it would not be rateable, and should not be taken into consideration by the rating valuer. And this was the decision of the same court in the following year, in the case of the *Queen v. Halstead*. Up to this time there had been no distinction drawn between machinery which was to be taken as part of or combined with the freehold and that which was to be regarded as merely enhancing its value for rating purposes. There had been a classification in the terms he had quoted, but, if the court held that the debated articles were rateable or the contrary, they were transferred bodily from one category to the other, and the premises as such were rated accordingly. In *Chidley v. West Ham*, however, Mr. Justice Blackburn used an expression which, repeated as it had been in various subsequent cases, had given rise to the existing divergency of views among rating surveyors and text writers. The question there was as to the rating of certain tanks, mash tuns, and similar articles in a distillery; and Mr. Justice Blackburn, in giving judgment, said: "Whatever is fixed to the realty so as to pass as landlord's fixtures in a demise of the premises must be taken to be part of the premises for the purpose of ascertaining its rateable value. . . . I am not prepared to say that the various articles described in the present case may not be taken into account as enhancing the value of the premises, but that question is not asked, and we are only to say whether the things are rateable." He added that all the items in that case were nothing more than chattels which steadied themselves by their weight or with the slight assistance of a screw, and that they were not fixtures, and not rateable as part of the premises. The question therefore arose whether, in similar cases, though the disputed articles were not fixed into account as enhancing the value of the premises, and, if so, on what principle. As already stated, except where fastenings and connexions were mentioned, all the things in dispute were retained in their places by their own weight merely, and all of them were bought and sold as separate articles. It was not clear whether these things would have been held rateable under the previous decisions—he was inclined to think not. For it was to be remembered that, in all the previous cases but one, the articles in dispute were in fact attached to the North Staffordshire, where there were certain electrifying and weighing machines which were unattached. It was not quite clear from the judgment whether these were held rateable or not; but as "things movable, such as office and station furniture," were held exempt, probably these were included in the exemption. It was perfectly clear that Mr. Justice Blackburn would have called them chattels, and he was a member of the court by which the North Staffordshire case was decided. If that be so, we had a distinction, observed at any rate down to the year 1874, when the West Ham case was decided, that machinery fixed to the freehold, so as, in intention and in fact, to form part of it, was held rateable, while machinery unfixed and movable was held not rateable, though in Mr. Justice Blackburn's view it might be taken into account as enhancing the value of the premises for rating purposes. And the fact that

the latter had pipe connexions, or was worked by gearing, or was fixed for the purpose of steadying it, made no difference.

The author then dealt with the cases of *Laing v. Bishopwearmouth*, and the Tyne Boiler case (1886), which last case did not purport to extend the principles already laid down, and it scarcely touched the question as to the mode in which the machinery in question was to be taken into account. Other cases dealt with were—*Gifford v. the Chard Union*, and *Kirby v. the Assessment Committee of the Hunslet Union*, decided last year. The Recorder in the Kirby case would not adopt the 20% given by the respondents as representing the value of the machinery, but halved it; but in the rider finally explaining his judgment, he said:—"I held that, in inquiring what was the gross estimated rental and the rateable value, the basis of the problem was to ascertain what was the rent which a hypothetical tenant would give for the engineering works as a combination of land, buildings, and scheduled machines on a demise which included the right to use the scheduled machines, that is to say, on the assumption that the hypothetical tenant would get as part of the consideration for his hypothetical rent the right to use such machines upon the premises during his tenancy, and that in this way the scheduled machines were being properly taken into account as enhancing the rental and rateable value of the freehold. I also hold that the value of the user of the machinery was not necessarily to be arrived at by taking the cost or value of the machinery and putting a percentage on such value, as had been done by the respondent valuers. . . . Not necessarily," of course, but as the most obvious way, he (the author) suggested in the majority of cases. The Recorder did undoubtedly take the value of the user of the machinery as representing its rent, and that was something tangible, which there was not much difficulty in getting at. The naked words of the judgment of the Divisional Court would seem to leave the whole matter to the discretion of the valuer, but the affirmation of the Recorder's decision must be taken as an affirmation of the principle he adopted.

In the Court of Appeal Kirby's case was fully argued for the appellant, but the respondents' counsel was not called upon, the court holding that they were bound by the Tyne Boiler case. In the House of Lords, Lord Halsbury said:—"The overseer has a comparatively simple problem to solve, although it is difficult enough sometimes; he sees the place being conducted as a brewery or an iron foundry, or what not; he looks at the premises, he looks at the furniture which is necessary for carrying on the business as a brewery or foundry . . . and he says to himself, 'Well, looking at the whole of the place, such and such is the rent that would probably be paid by a tenant from year to year for such an establishment as this.'" It was a question of the rent which the hypothetical tenant would give for the combination of land, buildings, and machines.

As a whole, it was almost impossible for any impost to be in a more unsatisfactory position. It was not only levied with uncertainty where the law purported to be carried out, but, owing to the tendency of the impost to put a fetter upon industry, there were in many localities the strongest reluctance to levy it at all, amounting in a large number of instances to a positive refusal. Hence the practice as to the rating of machinery in different places was of the most divergent kind.

A hearty vote of thanks was accorded to the author.

THE EDINBURGH BUILDING TRADE.—At the Edinburgh Dean of Guild Court on the 25th ult., Lord Dean of Guild Wilson presiding—plans were passed representing in all about 40,000. There were twenty-seven cases on the roll, and twenty warrants, including several permits to the Barrh Engineer, were granted. Warrant was given to J. & G. Cox, Ltd., glue and gelatine manufacturers, for new buildings at Gorgie Mills. This is an addition to the present works of the company, and it is estimated that the cost will be about 10,000. There will be two three-story buildings, and these will cover about three-quarters of an acre of ground, while the footage over the water will extend to 1½ acres. The buildings will be constructed from the designs of Messrs. Geo. Beattie & Son of brick and steel, with timber roofs.

THE ARCHITECTURAL ASSOCIATION SPRING VISITS.

I.—NEW SESSIONS HOUSE, OLD BAILEY, E.C.

THE current series of spring visits commenced on Saturday, January 27, when a large body of members inspected the new buildings of the Central Criminal Court now nearing completion. This is the second occasion upon which the Architectural Association has been privileged to examine the work. An account of the first visit was given in our issue of February 25, 1905, and at the time the absence of the architect, Mr. E. W. Mountford, from reasons of health, was much felt, and it was further regretted, upon the present occasion, that similar reasons prevented the author attending. In his absence Mr. F. D. Clapham described the design and materials, and explained the various difficulties contended with.

The recent removal of scaffolding affords a good general view of the façade, and we find, on comparing the building with the competition design, published in the *Builder*, June 30, 1900, that a great deal of architectural freedom has been introduced.

We see, for instance, that the pediments on the Old Bailey front now have their horizontal members broken and stopped short above the pilasters. Into the tympanons some florid work arising from the fenestration has been inserted. The allegorical figures which predominate have little to do with the space, their low relief is unsatisfactory, and the work is sculpture not in relation to architecture. The pediments themselves have too flat a projection. The tower and dome, although hidden from the street by scaffolding, appear to have been subjected to the same free application of current popular detail when compared with the original proposal. The restraint and feeling for tradition in the original design are lost.

The elevations show that the solids and voids are not happily managed. The "rustication" scale is too small, but it is perhaps owing to the re-using of the stones from the old building that there appears to be an absence of harmony with the new features. The blocks in the architraves to the windows are disturbing to the play of surface, which is felt to be required, and the lead glazing of the windows is not suitable.

Internally the foregoing remarks are applicable, and we see the important semicircular arches of the first design replaced by features of segmental form with a corresponding coarseness of detail. It is safe to say, however, that the effect of the main halls, corridors, and staircase, although not overburdened with light, will be very fine indeed. Ample space is provided in and about the entrances to the courts such as a building of this importance should receive. The decorative aspect of these parts will have a strong character. Marble is used for wall linings in a broad manner and in good choice; for the execution of this Messrs. Leas Brothers, of Bristol, are to be complimented. Some good specimens of Scagliola work are supplied by Messrs. Bellman, Ivey, & Carter, while the vaulted ceilings have been finished in "Stonueville," an interesting stone-like material well worked by Mr. Seale. Other marble linings and floors are provided by Messrs. Anselm, Odling, & Co.

The interiors of the four courts, although far from completion, do not give promise of great architectural conceptions. There is a coarseness of detail in the plaster-work of the domed ceilings and barrel-vaults. This is particularly felt in the pendives of the ceiling in the large court, where the prominence given to the inlet gratings of the plenum ventilation system is unpleasant.

Some excellent design is to be seen in the judges' rooms, library, barristers' smoking-room, etc., which have coved ceilings and oak panelled walls. A number of good ornamental ceilings have been supplied by the Bromsgrove Guild.

The structure generally is the work of Messrs. Holloway Brothers, whose conduct of the great undertaking is seen to be very thorough and well performed.

EXHIBITION AT NUREMBERG.—The Bavarian Jubilee Exhibition of Trades, Industry, Arts, and Crafts is to be held at Nuremberg from May to October, 1906, under the patronage of the Prince Regent.

THE LONDON COUNTY COUNCIL.

The ordinary weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Sir E. Cornwall, M.P., presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Poplar Borough Council £1,058, for paving and channelling works, and to sanction the borrowing by Finsbury Borough Council of £6,000 for repairing works.

Payment of District Surveyors by Salary.—A long discussion took place on the report of the Building Act Committee on the payment of District Surveyors by salary. The report was printed in our issue for December 16 last. The Finance Committee have since submitted the following report on the same subject:—

"The Building Act Committee have forwarded to us particulars of a proposal which they are about to submit to the Council for the payment of district surveyors by salary, and for the substitution of the existing system of remuneration by fees which the district surveyors collect from builders and others. The Building Act Committee in their report, which is set at large in the Council's report, express the opinion that it is desirable to substitute fixed salaries for the present system of remuneration, and, as the adoption of this course would involve expenditure on the part of the Council, they recommend that the Council would be entitled to receive, it devolves upon us, under standing order No. A 150, to report upon the matter.

sect. 138 of the London Building Act, 1894, provides that "the Council may at any time by order cause such fixed salary as they may determine to be payable to the district surveyors by way of remuneration instead of fees, so that the amount of such remuneration be not less than the amount of the average of the fees for the last seven completed years." The Council have accordingly determined that the fees which would have been payable to such district surveyors in pursuance of this Act shall be paid to the Council, and carried to the credit of the county fund.

The return submitted by the Building Act Committee of the fees received during the seven years ended 1904 shows that the average annual receipts of district surveyors from fees amounted to 50,748*s.* 6*s.* 6*d.*, with the exception of one year, there was a continuous increase in the fees received, and that in 1904 they amounted to 52,331*s.* 15*s.* 6*d.*

It would therefore appear that, in the event of the Council deciding to exercise the powers conferred by the section, the salaries to be paid to the district surveyors would average the figures for the year 1905 shall be found to follow the upward tendency of recent years, result in a balance in favour of the Council of upwards of 2,000*s.* a year.

The proposal of the Building Act Committee, however, is not limited to the substitution of salaries for fees on the basis above referred to. The more important part of their proposal is to institute a model scheme to be brought into operation gradually as circumstances permit, under which the Council instead of paying salaries covering all the expenses of the district surveyors for assistance, office accommodation, etc., should pay to the district surveyors the salaries of the salaries of any necessary assistants, the cost of offices, etc. The committee state that owing to the fact that there are now several vacant districts, and that others are likely to occur in the near future, the present time is opportune for the Council to make any such change of system as is proposed.

The Building Act Committee state that, in the event of the model scheme being adopted, the total annual cost of the service would ultimately be reduced to about 40,245*s.*, and that there would thus be an increased margin to be set aside for the payment of a surcharge on fees, etc. The model scheme provides for the division of London into thirty-three districts instead of fifty-seven, as at present, and it is indicated that the salaries of the district surveyors would be 1,000*s.*, 800*s.*, or 500*s.* a year, in accordance with the importance of the district. It is proposed that in all but two of the sixteen districts where the salary is to be 1,000*s.* there shall be one or two professional assistants, and, in one case, three assistants, at a uniform salary of 200*s.* each. In the other two districts and also in the eleven districts at 800*s.*, and the six districts at 500*s.*, no assistant is proposed. Every surveyor is to be provided with a boy clerk at the rate of pay of 15*s.*, rising to 25*s.* a week, and allowances for office expenses are suggested at 150*s.* or 200*s.* a year, according to the district.

We do not find ourselves in a position to judge whether the suggested amount of professional and clerical assistance is sufficient, but having regard to the fact that it is proposed that the district surveyors shall collect the fees which will in future be receivable on behalf of the Council, it will be necessary for their accounts to be kept in such a manner as to be easily examined and audited by the Council. We have therefore considerable misgivings whether the provision for staff will be found to be adequate.

With regard to office expenses, we feel that so soon as district surveyors become the salaried officers of the Council there would be a tendency to regard many of the present offices as unsuitable, and to secure more expensive accommodation in prominent positions. We are, moreover, advised that, in the event of district surveyors being paid by salaries, the Council will probably have to provide them with more legal assistance than at present, and the cost of taking any necessary proceedings for recovery of fees would also fall upon the Council, the increase of expenditure for this additional legal work being estimated at 200*s.* to 300*s.* a year, for which no provision has been made in the above-mentioned estimate of 40,245*s.* We are informed by the Building Act Committee that of existing thirty-three offices comprised in the model scheme

would involve additional expenditure not included in the estimate of 500*s.* but this, of course, would only occur once, viz., on the establishment of new offices.

We are very doubtful whether the model scheme could be carried out except at a cost considerably in excess of the estimate of the Building Act Committee.

As regards the receipts, we are of opinion that the mere adoption of a salary system would remove some of the incentive at present existing to the discovery by district surveyors of cases under the Building Act in respect of which fees are payable, and would probably lead to a diminution in the total fees recovered; and we are by no means satisfied that, when all the available vacant land in the county shall have been built upon, the present upward tendency of the total fees received might not, in the normal course of events, be replaced by a downward tendency.

We have felt it our duty to urge, from a financial standpoint, the above misgivings as to the benefits to be anticipated from the adoption of the proposed scheme, but it rests with the Council to determine whether the scheme submitted is best calculated to secure the objects in view, and whether the risk which we anticipate in certain eventualities of a possible charge upon the rates from which, under the present system, the Council is secured.

The Building Act Committee now recommended—

(a) That as from and including April 1, 1906, all district surveyors be paid a fixed salary by way of remuneration instead of fees; that the amount of salary to be paid to each of the present district surveyors be equal to the amount of the average of the fees received in his district during the seven years ended December 31, 1905, as provided in sect. 138 of the London Building Act, 1894, and that the Building Act Committee do submit the necessary recommendations to give effect to this decision.

(b) That the model scheme submitted by the Building Act Committee for the ultimate reorganisation of district surveyors' districts and for the payment of district surveyors by salaries be adopted, and that with regard to the existing and all future vacancies the Building Act Committee do submit to the Council such recommendations for filling the vacancies as will be most in accord with the model scheme.

Captain Hemphill, Chairman of the Building Act Committee, in moving the adoption of the Report, said that it was true that the District Surveyors' Association were opposed to the scheme, but he did not think that the reasons they put forward should induce the Council to reject it. At present many district surveyors devoted much of their time to private work, and it was desirable that this time should be given to the public service. As to the suggestion that the scheme, if carried out, would not attract men of the highest capacity, the salary proposed would be from 500*s.* to 1,000*s.* clear of expense. The Council had long ago decided that it was undesirable for architects in practice to act as district surveyors, and all new district surveyors were forbidden to practice, and the salaries proposed under the scheme would compare favourably with those obtaining in other similar occupations. There were, of course, those who did not like the committee's proposals, but those proposals, if carried out, would be an improvement in the general condition of affairs. It was not a perfect scheme, but the Council had a definite opportunity of deciding that district surveyors should be paid by salaries instead of by fees, and that the districts of London would be remodelled and reconstituted in accordance with the requirements of to-day.

Mr. Goldsmith moved that the matter be referred back to the Building Act Committee. He said that the Report was carried only by the casting vote of the Chairman. The calculations of the Building Act Committee were quite misleading. Under the present arrangements the district surveyors paid for assistance and office expenses, etc., and there was no charge on the ratepayers in such matters, whereas under the proposed scheme assistants and office expenses would be no longer paid by the surveyors. Moreover, the surveyors would want better office accommodation under the Council. In seventeen districts it was proposed to give the district surveyors no assistance beyond a boy clerk, and how was it to be expected that the surveyors could carry out all their duties under the Act? It was impossible for the work to be carried out efficiently. How could one man look after an enormous district like Lewisham? A much larger staff would be wanted by the surveyors, and a larger staff would be required at the central offices. The scheme was based on the assumption that the fees would remain the same, but in the future it was probable that the amount of the fees would be reduced when the whole of the

land in the county was built upon; and it was possible, when the surveyor no longer worked for fees, that there would not be quite the same zeal in their collection, though he did not say that the surveyors would not carry out their professional work with zeal. Again, the position would be an absurd one if this scheme were carried. Under the last Act the surveyor could collect and retain fees; under the 1904 Act he would collect fees and hand them over to the Council; and under the Dangerous Structures Act the fees would be paid over to him by the Council, who would collect them.

Mr. Goodman seconded. As an old London contractor who knew district surveyors he felt sure that it would be impossible to carry out the scheme. If a surveyor had an enormous district to look after, and assistants had to be left to look after builders, and say how the Act was to be carried out, he wondered what sort of buildings would be put up in London. Surveyors under the proposed scheme would not feel the same responsibility as they do now. As to the collection of fees, he had known a surveyor wait for two and a half hours for the fees, which the builder had had to obtain from a solicitor who financed him. Would a surveyor under the proposed scheme be as zealous in the collection of the fees? In Islington there were 47,700 assessments, and if one surveyor was going to look after that number of buildings he did not know how it was going to be done. He felt sure that the cost to the Council would be considerable, and he hoped the scheme would not be agreed to, especially as the surveyors did their duties well, and any difficulties were occasioned by the assistants to the surveyors.

Mr. J. Lewis said he was opposed to the scheme, and he regarded it as a dangerous one. What was proposed was more drastic than appeared at first sight. It would undoubtedly involve an immense amount of cost, though in the first year that might not be the result. Under the present system there were some very excellent men, and the Council would not get these men to take up the work at a fixed salary. More than that, under the new scheme there was the danger of a system of patronage which might be put in the hands of these officers, and the Council did not want to repeat the maladministration of the Metropolitan Board of Works.

Mr. Phillimore said he thought the scheme ought to be carried out. The Council had set up the standard that, as far as possible, they should employ their officers direct, and pay them by salaries, and not by fees. The scheme would be found to be more economical than the present system. The advertisement canvasser to the Tramways Department was paid by salary, and not by commission, although that was the usual method of payment. It was said that the present system worked well; it worked fairly well, but that was because there was strict supervision, and in the past the system had not worked particularly well. The Council had really extraordinarily little control over surveyors and their assistants. It was said that it was doubtful whether the fees would be collected as well under the proposed scheme as they were now, but if the Council put that confidence in the surveyors which they thought they were entitled to put in them he believed that they would do their duty towards the Council in the matter. Even now the collection of fees was not very efficiently done, and he knew of a surveyor who had not troubled to collect all his fees. As to the anomalies mentioned by Mr. Goldsmith, it would be quite possible to pass an amending Act if surveyors would not voluntarily come into line. The reason for the increasing fees was that London was being built upon more and more, and as the view that fees would diminish in amount as soon as the remaining land of London was built upon, the rapid decay which went on was such that, even if the whole of London were built upon, in a very short time it would commence to be rebuilt.

Mr. Stuart Sankey said that sometimes, when small alterations were carried out on buildings, the surveyor's legal fees were greater than the cost of the work, but under the present arrangement those fees were rebated by the surveyor. If the proposed scheme were carried, would the Council

have the same power to rebate absurdly disproportionate fees as the surveyor had? At present for a little alteration costing 4l. the fees might be 40l.

Sir Melville Beachcroft said that the question of the status of the district surveyor and his fees had been under discussion for over thirty years, and surely the time had come when the whole question should be considered. The Council had the power of making a very drastic reform, and he hoped they would deal with the question not with the idea of making the surveyor a paid officer, but of deciding what those duties are. The position was peculiar, for the power of the surveyor was of a very arbitrary character. On the one hand, a settlement of the difficulty seemed to be that the work of the district surveyor should be carried out by the borough surveyor; but, on the other hand, it seemed desirable for him to be in an independent position. Would the proposed scheme result in greater efficiency and economy? As to economy, he was not at all convinced, and, as to efficiency, he had yet to learn what would be the actual effect on the district surveyor if they converted him into a salaried officer. The Council ought to have a report from the superintending architect as to whether this divided responsibility in regard to the supervision of building in London was good for London, and a report from surveyors also. By the proposed scheme the Council ran the risk of getting an inferior class of men and inferior supervision.

Mr. R. A. Robinson said that the question was a very difficult one, which wanted full consideration. In the provinces the work of the borough surveyor and the district surveyor was carried out by one authority. He was opposed to the proposed scheme.

Colonel Rotton said that the present arrangement was a fairly satisfactory one; would the proposed scheme prove equally satisfactory? He had his doubts. The staff of the Architects' Department would have to be largely increased if the scheme were carried.

Mr. Howell J. Williams said he was in favour of the payment of district surveyors by salaries as a consequential step to the alteration made in the status of the district surveyor some time ago. As the London County Council was responsible to London for the administration of the Acts, payment by salaries would make the district surveyors the real agents of the Council, as they should be. But no scheme should rob the surveyor of his independent authority so long as he properly administered the Acts. The objection to the present scheme was that it would set up another district surveyors' system, and result in a lot of duplicating and overlapping work at headquarters, and the tendency would be for the clerks at headquarters to interfere with and destroy the authority of the surveyor. For that reason he should vote against the scheme.

Mr. Davis said that if the scheme were carried it would be an evil day for London. If, as they had been told, a surveyor could neglect to collect his own fees at present, how much more likely was he to neglect to do so when the fees were for someone else? At the present time the responsibility of seeing that the law was carried out rested with the surveyor, but under the new scheme the superintending architect would have the responsibility. He hoped that the present arrangement would continue.

After further discussion, the amendment was carried, on a division, by fifty-five votes to forty-nine.

Sites for New Schools.—The following recommendations of the Education Committee were agreed to:—

(a) That the estimate of expenditure on capital account of 9,725l., submitted by the Finance Committee in respect of the acquisition of the sites named in the subjoined table, be approved.—
Table A.—Site for new school: Norwood, Craster-road. Table B.—Sites for J.M. school, schoolkeepers' houses, etc.—(a) Clapham, Home for Little Boys, King's-road (land at rear); (b) Fulham, Horwood-road (house for schoolkeeper); (c) Lambeth, N. Walnut-tree-walk (house for schoolkeeper); (d) Lewisham, Hither green (land for J.M. school); (e) Lewisham, Silkenes-road (house for schoolkeeper); (f) Newington, W. Beresford-street (house for schoolkeeper); (g) St. George-in-the-East, Gloucesters-street (house for schoolkeeper); (h) Southwark, W. West-square (house for schoolkeeper); (i) Stepney, Baker-street (house for schoolkeeper); (j) Stepney, Senabers-street (1. use for schoolkeeper); (k) Woolwich, Ansona-road (1. use for schoolkeeper).

(b) That expenditure on capital account not exceeding 9,725l., in respect of the acquisition of the sites named in resolution (a), be approved; (c) That the Education Committee be authorised to take all the necessary steps in connexion with the acquisition of the sites named in resolution (b); that the valuer and the surveyor do complete the purchases, and that the seal of the Council be affixed to the necessary documents when ready.

(d) That the estimate of expenditure on capital account of 8,550l., submitted by the Finance Committee in respect of the acquisition of the sites named in the subjoined table, be approved.—Deptford, Arden-road (site for new school); Kennington, N. Mary-place (site for school for mentally defective); St. Pancras, S. Manchester-street (site for laundry and house-keeping centres, etc.); Wandsworth, Fountain-road (additional land); Woolwich, Mulgrave-place (house for house-keeping centre).

(e) That expenditure on capital account not exceeding 8,550l., in respect of the acquisition of the sites named in resolution (d) be sanctioned.

Tramways.—The following recommendations of the Highways Committee were agreed to:—

(a) That the estimate of expenditure on capital account of 12,200l., submitted by the Finance Committee, in respect of the reconstruction (excluding miles) of the existing system of tramways in Goswell-road, between Cierkenwell-road and Upper Ashby-street, for the underground conduit system of electric traction, be approved; (b) That the capital estimate of 6,600l. approved on March 1, 1904, in respect of the reconstruction of tramways in Goswell-road, be cancelled.

Acetylene and Cinematograph Regulations.—The following recommendations of the Theatres and Music Halls Committee were agreed to:—

(a) That the unalterable alterations be made in the regulations made by the Council on January 28, 1902, with regard to the use of acetylene gas in theatres and premises licensed by the Council;—(1) That the following regulation be substituted for the present regulation No. 1: "(1) Under no circumstances will the production or use of highly compressed or liquefied acetylene in theatres and premises licensed by the Council be permitted." (2) That the following regulation be inserted as regulation No. 2, and that the necessary consequential alterations be made in the numbers of the remaining regulations: "(2) In the case of gas generated and stored, its pressure must not exceed that necessary for driving it through the burner. This pressure shall not be greater than 20 lb. in the generator or 5 lb. in the holder or service pipes." (3) That the words "or starting" be omitted from regulation No. 3 (old number).

(b) That the following words be substituted for the words "The use of acetylene gas will not be permitted" in No. 5 of the regulations made by the Council on October 16, 1900, with regard to the use of cinematograph lanterns, etc., in theatres and premises licensed by the Council: "The use of acetylene gas, other than 'dissolved acetylene,' will not be permitted. When 'dissolved acetylene' is used the conditions set out in order No. 6 of the Secretary of State, made under the Explosives Act, 1875, must be complied with, and the gas must not be allowed to come into contact with copper or copper alloys."

Fall of Parapets, etc., in Akerman-road, Brixton.—The Building Act Committee brought up the following report:—

"We have to report that on January 24, 1906, portions of the front parapets and cornices of Nos. 47 to 53, Akerman-road, Brixton, fell on the pavement below, with the result that one person was killed. The premises were subsequently inspected by the district surveyor, who condemned as dangerous other portions of the front wall, and statutory notices have accordingly been served. The parapets and cornices of the adjoining premises, Nos. 35 to 45, Akerman-road, which were also condemned as dangerous, have been taken down. In view of the fact that the matter is being considered by the coroner, we do not propose to make any observations thereon at present, but we are of opinion that the Council should be reminded that in most cases they are the results of faulty construction."

New Post-Office Building, Hanover-street, Peckham.—The Building Act Committee reported that in August, 1905, Mr. J. Wager, on behalf of His Majesty's Office of Works, forwarded for the information of the Council copies of the plans of a new sorting office on the north side of Hanover-street, Peckham. The plans, which showed a building having a one-story projection about 15 ft. in advance of the building line in the street, were not such as the committee could have recommended the Council to sanction had an application for permission been made by a private individual. By sect. 202 of the London Building Act, 1894, any building, structure, or work vested in, and in the occupation of, any Government department is exempted from so much of the provisions of the Act as relate to buildings and structures; but the committee reported that it had been decided to accede to the wishes of the Council in the matter, and to keep the new building back to the line of the adjoining cottages.

Inspection of Theatres.—The Theatres and Music Halls Committee brought up recommendations to the effect that, on and after April 1, the chief officer of the Fire Brigade should be responsible to the Council for the inspection of the electric lighting installations and heating and other mechanical arrangements of theatres and other places of public entertainment licensed by the Council, and that for the purpose an electrical and mechanical engineer, at a salary of 400l. a year, and an electrical engineer, at a salary of 200l. a year, be appointed in the brigade.

Mr. H. R. Taylor said this was an important matter, which members had had very little time to consider, and he asked that it might be held over until the next meeting.

Mr. Yates said he had no objection to that course being followed.

The report was accordingly adopted.

Tube Railway Dangers.—Mr. Lewin Sharp, the chairman of the Fire Brigade Committee, in reply to a question put by Mr. E. Smith, said the Fire Brigade were not called to an alarm of fire on the City and South London Railway. The Council had absolutely no control over tube railways; the Board of Trade had sole control, and consequently the committee had no report to present on the matter. The Board of Trade had, however, approached the Council, with the view to promoting certain regulations dealing with new tube railways. The committee had cooperated with the Board of Trade on the subject, and had formulated a model set of by-laws, and now all promoters of new tube railways would have to carry out those regulations.

Suggested London Improvements.—Captain Swinton asked the chairman of the Improvements Committee whether his committee had ever seriously considered the following schemes, which bear on the improvement of London:—(1) A suggestion which a private citizen had published and put before His Majesty's Board of Works that the entrance to Hyde Park at the Marble Arch should be remodelled, with the view of doing away with the constant congestion of traffic at that point? (2) The opening up of the Mall into the Strand through a narrow opening alongside of Drummond's Bank, which will have the result of causing a continuous stream of east and west traffic to be carried across the north and south traffic on a dangerous slope in the neck of the Whitehall bottle? (3) The proposal of the Traffic Commission that an elevated road should be constructed from Blackfriars Bridge nearly to the Holborn Viaduct, to carry the cross traffic over the junction of the Embankment and Queen Victoria-street, over Ludgate-circus, and so enable the South London tramways to be joined on to the North London tramways?

Mr. E. J. Horniman, in reply, said the Marble Arch matter had never been before the Improvements Committee, but when it was brought forward as a concrete scheme by somebody in authority the committee would consider it. The opening of the Mall on a dangerous slope had also not been before the committee, because no actual plans had been published as to how the Mall was to be taken into the Strand. He promised, however, to make inquiries as to whether the intention was only to have a very narrow entrance. With regard to the Blackfriars elevated road scheme, the Improvements Committee would, without fail, consider any suggestion that was brought forward by any person in more than a tentative form.

The Council then adjourned until February 13.

ARCHITECTS IN PARLIAMENT.—Mr. T. Ball Sibcock, of the firm of Messrs. Eacock & Reay, architects and surveyors, of Bath, was returned as member for Somerset (Wells). He is a director of Bath College, a governor of the Grammar School, a member of the Bath City Council, Chairman of the Housing Committee, Vice-Chairman of the Technical Education Committee, and a member of the Bath Education Committee. He has served as Mayor, member for Cleobury Morton (Sutherlandshire), member for Peterborough in 1889-95, and a Common Councillor of the City of London, is an architect and surveyor practising in London. Mr. John Tudor Walters (Sheffield, Brightside) is an architect and surveyor in that city, and formerly practised in Leicester, and has served as Mayor, Bath, K.C. (Taunton), is a Fellow of the Surveyors' Institution, and practised as an architect before he was called to the Bar twenty years ago.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontages and Projections.

Lewisham.—Five shops on the south-east side of Staplehurst-road, two houses on the south-west side of Leahurst-road, and one house on the north-east side of Fernbrook-road, Lewisham (Mr. F. Roche).—Consent.

Bethnal-green, North-east.—One-story shops and a one-story addition at the rear of No. 379, Bethnal-green-road, Bethnal-green, to abut upon Teccdale-street (Mr. C. M. Shiner for Mr. W. A. Balls).—Consent.

Wandsworth.—That an order be issued to Mr. R. G. P. Gordon sanctioning the formation or laying out of two new streets for carriage traffic on the Durnsford park estate, Merton-road, Wandsworth, in continuation southward of Ravensbury-road and Acuba-street (for Mr. A. Wise).—Consent.

Dulwich.—That the application of Mr. A. Keen, for Miss J. Bechlin, for an extension of the period within which the erection of buildings with bay windows and one-story shops on a site abutting upon the west side of Peckham-rose and south side of East Dulwich-road, Camberwell, was required to be commenced and completed, be granted.—Consent.

Islington, North.—That, at the request of the Leicester-square Society, Limited, the Council do permit the retention of a showcase on the forecourt of No. 451, Holloway-road, Holloway.—Consent.

Hammersmith.—The retention of two two-story shops in front of Nos. 2 and 2A, The Grove, Hammersmith (Mr. L. V. Hunt for Mr. J. Bedford).—Refused.

Marylebone, West.—An iron and glass shelter in front of No. 20, Upper Hamilton-terrace, Marylebone (Mr. G. A. Sexton for Mr. J. Peters).—Consent.

Marylebone, West.—Retention of a projecting sign in front of No. 392, Oxford-street, Marylebone (Messrs. W. Castle, Limited).—Consent.

Norwood.—The retention of a conservatory at the flank and a summer house at the rear of No. 20, Wyndham-road Camberwell, abutting upon Elmwood-road (Mr. A. E. Percy).—Consent.

Strand.—Alterations to the iron and glass shelter at the entrance to the Empire Theatre, Leicester-square (Mr. F. T. Ventry).—Consent.

Watwich.—Bay windows to Nos. 34 and 40, Glenhouse-road, Eltham (Mr. J. J. Bassett for Mr. A. Cameron-Corbett).—Consent.

Westminster.—A projecting one-story shop in front of No. 131, Victoria-street, Westminster, and a projecting one-story shop at the rear to abut upon Ashley-place (Mr. W. Woodward).—Consent.

Lewisham.—A building on the northern side of Elmer-road, Catford (Mr. E. Wright for Mr. H. Amey).—Consent.

Rotherhithe.—The retention of two showcases in front of No. 233, Southwark Park-road, Rotherhithe (Mr. E. Hoad).—Consent.

Strand.—Retention of an iron and glass shelter at the entrance to Nos. 37 and 38, Savile-row, St. James (Messrs. H. Poole & Co.).—Consent.

Fulham.—A building at the rear of No. 431, North End-road, Fulham, to abut upon Eustace-road (Mr. T. J. Evans for Mr. A. Dell).—Refused.

Hampstead.—Buildings on the west side of Burgess-hill (late Belle Vue-crescent), Finchley-road, Hampstead (Messrs. Brown & Barrow for the trustees of the Burgess estate).—Refused.

Kennington.—A projecting one-story shop in front of Nos. 151 and 153, Upper Kennington-terrace, Kennington (Messrs. J. A. J. Woodward & Sons for the executors of the late George Broom).—Refused.

Kennington, North.—Bay windows and porches to twenty-six houses on the south side of Oxford-gardens, Kennington (Messrs. Traut, Brown, & Humphreys for Messrs. Daley & Franklin).—Refused.

Newington.—That the council do not accede to the application of Mr. H. Harris, on behalf of Mr. H. Samuel, for permission to retain a sign-board in front of No. 11, Walworth-road, Newington.—Refused.

Strand.—Projecting piers and oriel windows in front of Nos. 59, and 60, Pall Mall, Strand (Mr. E. G. Dawber for the London and Lancashire Fire Insurance Company).—Refused.

Wandsworth.—One-story shops in front of Nos. 170 to 182 (even numbers only) inclusive, Putney-bridge-road, Wandsworth (Mr. W. Barthelmev for Mrs. Bell and Mr. J. A. Graham).—Refused.

Hammersmith.—Projecting one-story shops in front of Nos. 338 and 340, King-street, Hammersmith (Mr. J. F. Ward for Mrs. Masterson).—Refused.

St. George, Hanover-square.—Enclosing of the portico in front of No. 21, Hill-street, Berkeley-

square (Messrs. Keeble, Limited, for Captain H. S. Clay).—Refused.

Width of Way.

City of London.—Buildings abutting upon Rod Lion-court, Fleet-street, City, with external walls at less than the prescribed distance from the centre of Rod Lion-court (Messrs. Griffin & Woodard for Mr. A. Rust).—Consent.

Southwark, West.—A building on the south-eastern side of Barron's-place, Southwark (Mr. A. E. Chasemore for Mr. W. Sumpton).—Refused.

Woolwich.—A one-story shop on the south-west side of Cross-street, Woolwich (Mr. W. C. Poole for Mr. J. T. Smith).—Refused.

Width of Way and Lines of Frontage.

Hammersmith.—A coal store on the western side of Illey-road, Hammersmith (Messrs. J. Dorey & Co., Limited, for the trustees of the Godolphin and Latymer Girls' school).—Consent.

Lewisham.—An addition and a wing at the "Hanover Arms" public house, No. 32, Wells-road, Sydenham, with external walls at less than the prescribed distance from the centre of the roadway of such street (Mr. A. J. Stylo for the Dartford Brewery Company, Limited).—Consent.

Wandsworth.—An addition to No. 90, St. Ann's-hill, Wandsworth, abutting upon the western side of Allarthring-lane (Mr. W. West for Mr. F. B. Turtle).—Refused.

Kensington, South.—Retention of an iron and glass covered way to the entrance to No. 3, Douro-place, Victoria-road, Kensington (Miss F. A. Lee).—Refused.

Width of Way and Space at Rear.

Greenwich.—Two buildings on the east side of Georgette-place, King George-street, Greenwich, with external walls at less than the prescribed distance from the centre of the roadway of Georgette-place, and with an irregular space at the rear of the northernmost of the two buildings (Mr. H. Adams).—Consent.

Lines of Frontage and Construction.

Hammersmith.—Retention of a building at the rear of a stable on the west side of No. 93, Goldhawk-road, Hammersmith, abutting upon the east side of The Grove (Mr. W. B. Eyre).—Consent.

Strand.—An iron and glass shelter in front of the hotel "Maison Jules," Jermyn-street, Strand (Mr. G. D. Martin).—Refused.

Formation of Streets.

Whitechapel.—That the application of Mr. R. Plunbe, for an extension of the period within which the widening and adaptation as a street for carriage traffic of the northern portion of Romford-street, Mile End Old Town, was required to be clearly defined throughout by posts and rails or so otherwise as the Council might permit, and thrown open to the public as a highway, be granted.—Consent.

Norwood.—That the Council accede to the request of Mr. J. Wilson, with regard to the formation of proposed streets on the Highview-park-estate, Canterbury-road, West Norwood, for permission to define the roadways of the proposed streets (where not already defined by the erection of buildings or by a cutting 4 ft. in depth) by posts 10 ft. apart and a trench 1 ft. in depth between, and in a line with, such posts.—Consent.

Space at Rear.

Kensington.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to No. 2, Charles-street, Kensington, with an irregular space at the rear, and with a portion of such building extending above the diagonal line (Mr. A. B. Rumball).—Consent.

Space at Rear and Alterations to Buildings.

St. George, Hanover-square.—A deviation from the plans approved for the erection of an addition at the rear of a building on the north side of Farm-street, St. George, Hanover-square, so far as relates to the substitution of a iron's mess-room on the first floor for the dwelling rooms shown on the approved plans and the construction of the flat roof of such mess-room of wood, covered externally with lead, in lieu of iron and concrete (Mr. J. W. Bradley for the Council of the City of Westminster).—Consent.

St. George, Hanover-square.—Additional rooms over the stables at the rear of No. 81, Eaton-square, St. George, Hanover-square (Messrs. G. Trollope & Sons for Mr. H. D. Brecklehurst).—Refused.

Buildings for the Supply of Electricity.

Fulham.—A deviation from the plans approved for the construction and erection of iron, brick, and concrete additions to the generating-station, Townmead-road, Fulham, so far as relates to the formation of an opening in the wall of the stove building, the removal of the brick partition in the boiler house (the ground floor over the opening formed being supported by steel beams) and an alteration in the steel construction of the roof of the stove building (Mr. A. J. Fuller for the Council

of the Metropolitan Borough of Fulham).—Consent.

Dwelling-houses on Low-lying Land.

Peckham.—A dwelling-house on low-lying land situated at Colmore-road, Peckham (Mr. S. Bryant).—Consent.

Woolwich.—A shop and dwelling-house, with stable and coachhouse at the rear, on low-lying land situated at the corner of Abbey-wood-road and Bostal-lane, Woolwich (Mr. Patterson).—Consent.

Southwark, West.—Two blocks of dwellings on low-lying land situated at the corner of Webber-street and Barron's-place, Southwark (Mr. W. Sumpton).—Consent.

The recommendations marked † are contrary to the views of local authority.

ARCHITECTURAL SOCIETIES.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—At the rooms of this Society, on Thursday, the 25th ult., Mr. A. Needham Wilson read a paper on "The Architecture of Southern France," Mr. H. S. Chorley in the chair. The lecturer said:—"I propose to deal with the influences which governed the production and development of architecture after the withdrawal of Roman domination in the south of France, and particularly Provence. A student visiting the south of France for the first time cannot fail to be struck by the examples of Romanesque architecture more than by anything else, and in Provence he will be bewildered by the impression that no intermediate styles seem to bridge the gap between the degenerate Romanesque and the late Gothic, or even the Renaissance. To deal with the subject as a whole would hardly come within the scope of a single paper, and, with your permission, I will deal in particular with the Romanesque in Provence. May I be pardoned if I dip briefly into history, but a rough outline is necessary on which to base the other aspects of the subject." The lecturer then dealt with the occupation of Provence by the Romans, the influence of the Franks, and the rapid advancement of learning and arts under Emperor Charlemagne, and the permanent state of civil war. "There remains the ecclesiastical aspect. I will not stay to dwell upon the part that Arles has played in the history of the church, on Constantine, or on the church councils; rather let me emphasise the noble part played by the church during the horrible centuries which preceded the Renaissance of the 11th century. Having now sketched the conditions and influences under which these isolated religious communities existed, we must glance at the architecture which they produced. As Viollet-le-Duc says:—"The fragments of architecture which remain to us of the VIth and VIIIth centuries are but pale reflections of the Roman art, often of debris thrown together haphazard by unskilful workmen executing masonry and brickwork with much difficulty."

In Provence, as well as in its vicinity, many buildings appear to incorporate Roman fragments—we are told that these are slavish copies, but it would be wrong to jump to too hasty a conclusion on the point. There are some typical examples, as the porches at Notre-Dame, at Avignon, and at Aix en Provence, which appear to bear the stamp of Roman work, and a little consideration will tell us that they are not slavish copies; but, coming nearer, we find a delicacy of execution which seems to indicate that they are either genuine Roman fragments or copies by craftsmen who were certainly not ignorant of traditional training; also the positions occupied by these fragments frequently indicate an incongruity of treatment quite incompatible with original work. One of the first problems which confronted the Provincials was the covering of their buildings. The country produced no suitable timber, but stone in plenty. The School of Provence contented itself with the simple pointed barrel-vault over narrow, low naves only, trusting to the massiveness of the wall to resist the thrust, or, where aisles were adopted, formed a kind of continuous flying buttress, and raising the walls over the arcades sufficiently to be pierced with windows." The lecture was illustrated by numerous sketches. Mr. Butler Wilson, in proposing a vote of thanks to the lecturer, said that he noted with pleasure the individuality of the architecture of Provence, and the way they had overcome the difficulties by purely local materials. Mr. A. E.

Kind seconded, and Messrs. Chorley and Hope supported the resolution, which was carried.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—At a meeting of the Sheffield Society of Architects and Surveyors which was held on the 25th ult. Mr. C. F. Innocent delivered a lecture on "English Renaissance Architecture, 1550 to 1700." Mr. W. J. Hale presided. The lecturer first explained the smaller local buildings of the period, and showed that they were still in their details Jacobean, with mullioned and transomed windows and label moulds and strings. It was only in a certain stiffness and formality in the arrangement of the parts that there was a difference from the work of the preceding period. Walkley Old Hall was an example of this. In remote districts, such as the Little Don Valley, Gothic details still lingered on, even until the early years of the XVIIIth century; and the porch of Mithope Church was an example of this. There was thus less than half a century in this district between the last of the Gothic work and the first building of the Gothic revival: the Ravenfield Church, designed in 1756 by John Carr, of York. During this period English garden design attained its greatest perfection under the influence of the great French garden designer, Le Notre, and the period was interesting as being that of the transition from the formal to the landscape school of gardening. The walled-in gardens and courtyards of Eyam and Derwent Halls were examples of the earlier idea; and the spacious garden at Sprotbro' Hall, which was built in the reign of Charles II., and was a fine example of the Restoration period. The great houses of the neighbourhood were naturally much purer in their style than the smaller, and Chatsworth House, designed by Talman, the rival of Wren, and the most important building erected in the neighbourhood during the period, was pure Renaissance, and exhibited no trace of Jacobean design. It was difficult to realise that Eyam Hall was only a few years earlier in date than Chatsworth, but such is the case. At the end of the XVIIIth century the people of Sheffield indulged in a new Town Hall. The accounts had been preserved by the Town Trustees, and the cost of the building appeared to have been about 500l. The hall stood at the church gates, across what now is the bottom of Church-street, and was pulled down a century ago. The doorway now preserved in Weston Park had been supposed, without any evidence, to have been the entrance of the hall. In this district during the period the use of timber-work for outer walls was given up, and in the south, where good building stone was not so plentiful, great advances in the use of brick-work were made under the influence of Sir Christopher Wren. The necessary rebuilding of London after the Great Fire of 1666 gave Wren his opportunity, and, in addition to St. Paul's Cathedral, halls of the City companies, and other buildings, Wren rebuilt fifty of the burnt churches. The lecturer concluded with a general description and analysis of these most interesting buildings, in which for the first time and with complete success the requirements of Protestant worship were met. The lecture was illustrated by lantern slides. At the conclusion, a hearty vote of thanks was accorded, on the proposition of Mr. E. M. Gibbs, seconded by Mr. J. B. Mitchell-Withers, and supported by Messrs. H. I. Paterson, J. W. Green, and the Chairman.

ENGINEERING SOCIETIES.

THE JUNIOR INSTITUTION OF ENGINEERS.—On Friday, January 26, Professor J. D. Cormack, B.Sc., delivered the hon. member's lecture before this Institution, taking for his subject "Notes on Boiler Trials." After pointing out the objects and uses of such trials, he set forth the requisite balance-sheet, and indicated the measurements, etc., necessary, and the chief statements to be made, proceeding to deal with the methods of starting, stopping, and conducting. Observation sheets and analysis of flue gases followed, and special reference was made to the system of conducting trials recommended by the Committee of the Institution of Civil Engineers. As a supplement to the lecture, a visit was paid on the following afternoon to the engineering laboratories of University College, Gower-street, where Professor Cormack

demonstrated the methods of conducting a boiler trial, one being in progress at the time. All the various observations, measurements, and analyses necessary were shown. An interesting collection of calculating machines, etc., was exhibited by Professor Pearson, and Professor Fleming's electrical laboratory was also open to inspection. In the mechanical engineering laboratory the whole of the apparatus was on view and in operation. Although about one hundred visitors were present, the arrangements made by Professor Cormack were so admirably conceived and carried out that each member was enabled to see everything to great advantage. The thanks of the Institution to Professor Cormack for all that he had done to render the occasion so interesting were expressed by Mr. Geo. H. Hughes (member of Council).

WESTMINSTER CITY COUNCIL.

The usual fortnightly meeting of this Council was held on Thursday last week, at the City Hall, Charing Cross-road, W.C. **Trade Union Rate of Wages for Employees.**—The General Purposes Committee submitted a letter from the Lambeth Borough Council inviting the various borough councils to send delegates to a conference to be held at an early date at Lambeth Town Hall "with a view of framing and bringing into existence a uniform scale of trade union rate of wages and conditions for the employees in each department of the different borough councils." It was agreed to acknowledge receipt of the letter.

Subways at Charing Cross.—The Works Committee reported having had before them detailed plans of the subway for foot-passengers proposed to be constructed by the Baker-street and Waterloo Railway Company between the south side of Charing Cross, opposite the Phoenix Fire Office, and the company's station in Trafalgar-square. The Committee stated that the Council were to remove and reconstruct their underground public conveniences at Charing Cross to the west of their present site at the expense of the company. The plans were approved.

Street Improvements.—The Improvements Committee submitted a lengthy report dealing among other matters with the setting back of the building line in Horseferry-road (south side). It was agreed to purchase for a sum not exceeding 1l. per foot super, about 882 ft. of land, the property of the Ecclesiastical Commissioners, to provide for a widening of 45 ft. It was further agreed to ask the London County Council to contribute towards the cost.

The Committee also reported having received a letter from Mr. Mark H. Judges Hon. Secretary of the "Further Strand Improvement Committee," forwarding copy of a memorial to the London County Council advocating a revision of the planning of the Strand, so that the roadway might have its natural course from St. Mary-le-Strand Church to the Law Courts, and requesting that the Council and the individual members of the Council should join in the memorial. It was agreed that no action should be taken in the matter.

Correspondence.

APPOINTMENT OF DISTRICT SURVEYORS.

SIR,—Referring to the letter from "District Surveyor" in your last issue, there are some points in it that I should like to be allowed to reply to.

If "District Surveyor" will trouble to read my letter again he will find nothing to indicate that I suppose "light and air" is regulated by the Building Acts; on the contrary, I refer to the overlapping of Acts. There are many conditions which under the Building Act might be allowed to exist, and to which a district surveyor would have no right to object, but which the law relating to "light and air" and the Public Health Act could prevent; this position I consider to be an unsatisfactory condition of affairs and not as it should be. In my letter I was considering matters from the architect's point of view, and I submit that his position is the better one of the two, to allow an accurate opinion to be formed of the value of existing arrangements, than that of a district surveyor. An architect has to keep in view the requirements of his client as well as the Acts relating to building, light and air, public health, and the requirements of local authorities. The district surveyor has to attend only to the part relating to the Building Act, which is often of far less importance than is generally supposed, and in the same way the sanitary authorities have only to deal with the points governed by the Public Health Act, and so on. The architect may have six jobs in as many districts and finds that in each the officials have their own ideas as to how the various Acts should be interpreted, and it is quite pathetic at

times to view the mental gymnastics they go through to try and support their pet fads, and aware that these are architects and not architects, but there are also district surveyors and district surveyors. When writing I had in my mind that an "architect" would be a man of experience in his profession and not of the "house-agent" type. May I remind your correspondent that the architects existed before district surveyors, and it was the fact that a large and increasing number of buildings were being erected by builders and others without the aid of an architect that brought about such an undesirable state of affairs that it became necessary in the interests of the public at large that this condition should be altered—hence the appearance of district surveyors. If architects had in all cases been employed the reason for having district surveyors would never have arisen, and I consider the reasons apply now. There are many things about a building which, outside all artistic considerations, add to its improvement, about which neither the district surveyor or sanitary inspector has a voice, and it was not for the architect's work not to be done.

With regard to the "blessing" to the public of having "district surveyors" who "are competent and experienced architects," all I can say is that no architect who is worth his salt depends on the district surveyor or sanitary inspector for help, as there is an occasion for him to do so. He is in a much better position to know what is necessary than either of them; and I can only liken it to a physician inquiring of a chemist and dentist for their opinion as to the right treatment for a child suffering from the innards, as for the architect to be guided by the "blessings."

I am glad that "District Surveyor" admits the fact that "a very difficult Act has to be interpreted"; it is for that reason I advocate "a clear, simple, but thorough system" to take its place.

The system I suggested would not require the "poor unfortunate builder" to wait two months, as consent would be obtained before he would be invited to tender; there would be no reason for him to wait twenty-four minutes a ter signing a contract. Architects do not prepare their drawings after the work is started, so the supposed advantage of not having to wait more than twenty-four hours counts for nothing, to say nothing also about it being a very misleading line of argument. "District Surveyor" does not seem to recognise the amount of work that has to be done through by the architect before the matter comes under the notice of the district surveyor.

In Scotland it takes about ten days to settle all questions relating to the Building Act, sanitary requirements, and the rights of the adjoining owners; this can all be done while the quantity surveyor is at work. There a two-months' notice is not required for party wall matters, nor a month for party fence walls; light and air questions, as we understand them, do not exist, as there is not allowed to touch on his neighbours' rights. Having obtained consent, no power exists that can prevent the building being completed as approved. Think of that, ye architects in the first City of the world! and reflect upon the advantage it would be to you, to your clients, and to the appearance of London if such a state of affairs existed here; soon would London cease to be the place of mutilated conceptions. I have had a good many years' experience of this system and its workings in the "little towns" of Edinburgh, Glasgow, and other parts, and it leaves nothing to be desired.

It is the attitude taken up by "District Surveyor" and others of his way of thinking that accounts for the public being saddled with "a very difficult Act"; and I appeal to "District Surveyor"—if his mind is sufficiently open to admit that it may be possible (however remote) that places other than London exist where things may be managed better—to look into the question and become familiar with the subject.

I apologise for the length of this letter, but interest in my native city makes me anxious to see it sharing some of the improvements to be found in other parts. AN ARCHITECT.

Books.

Residential Flats of All Classes. By SYDNEY PERKS, F.R.I.B.A., author of "Party Structures," etc. London: B. T. Batsford, 1905.

While the illustrations (209 in number) are undoubtedly the principal feature of this book, the text also is distinctly interesting and useful. The author has taken pains to gather together a representative collection of plans and views of British and foreign residential flats, and has redrawn nearly all the plans which have been reproduced. The first chapter is "Mainly Historical," and forms an appropriate introduction to the work. It is followed by chapters on "The Plan," "Artisans' Dwellings," "Different Classes of Flats—Comparison of Plans," "Practical

Notes, "Foreign Flats," "Financial Matters," and "Agreements." The last chapter might have been termed with greater propriety "an appendix," as it is merely a reprint of eight forms of agreement "in use for well-known buildings in London."

The fourth chapter, on different classes of flats, is the most important, and contains upwards of eighty illustrations of large and small flats, nearly all of which have been built in London. The author's notes respecting the plans are very brief, and adverse criticisms have been carefully avoided, for the obvious reason that, with the exception of one design by the author, all the plans of modern English flats have been lent to the author by other architects. The author's views can, however, be indirectly ascertained from the favourable remarks which are made in certain cases, and more directly from the chapter on "The Plan." The information on "Financial Matters" is useful and to the point.

Surely the entrance to the kitchen in Fig. 84 is not "through the larder," as stated on page 110, but through a lobby adjoining the larder, and in Fig. 87 the pantry is shown without a window, although one of the walls is an external one. The plan of the flats in Sloane-square (Fig. 112) is lettered "Amos F. Faulkner, architect," and the view (Fig. 112A) is given as the work of Mr. Mountford, but nothing is said in the text as to this collaboration. These, however, are trifling details, and we have pleasure in congratulating the author on having produced an interesting and useful book on an important subject. The publisher has carried out his part of the work with equal success.

The Law of Compensation, with Appendices of Forms, Rules, and Orders, etc. By ALFRED A. HUDSON, Barrister, assisted by H. E. MILLAR, W. A. PECK, and S. HUMPHRIES, Barristers. Two Vols. (London: The *Estates Gazette* Office and Sweet & Maxwell, Ltd. 1906.)

THIS book, one of great size—the two volumes contain, without the index, 1,597 pages—is interesting and valuable from its design; for the authors have endeavoured to place their subject before the reader to a certain extent in the form of a digest with illustrative cases. While the work has unquestionably been well and accurately done, the subject scarcely lends itself to this form of treatment; still it is work in the right direction, and if not wholly successful in making the subject matter clear in places, no one can say that this new book on Compensation is not excellent. It may perhaps be useful to illustrate the character of the work. Under the Lands Clauses Act, 1845, on the subject of notice to treat we find the head—"When Notice to Treat is Unnecessary." This is followed by (a) "as to yearly tenants," as to whom a cross-reference is given, and then by (b) "No notice to treat need be given when the promoters of the undertaking and the owners of the interest in the lands have entered into an agreement to refer the question of compensation for determination by an arbitrator." This statement of the law is made clear by an illustration embodied in the case of Collins v. R. the South Staffordshire Railway, the facts of which are concisely stated in small type. Unquestionably, so far as cases are concerned, this illustrative method is more satisfactory than the usual practice of placing at the foot of a page a number of decisions as authorities in an unselected state. On the other hand, the difficulty of obtaining true legal dicta out of a mass of technical statutes is very difficult. But though, as we have said, the result of the courageous attempt is not altogether satisfactory, this arises not from want of knowledge or ability on the part of the authors but, from the inherent difficulty and intricacy of their subject.

Axel Herman Haig and His Work. By E. A. ARMSTRONG. (London: Fine Art Society, Ltd. 1905.)

TO SPEAK truth, the appearance of this work comes rather as a surprise to us, seeing that the popular artist himself is alive, his works still in request, and that they are not of a nature to require a learned critique for their exposition or appreciation. The Fine Art Society, we remember, organised, not so

long ago, a special exhibition of Mr. Haig's now well-known etchings, and the result of this exhibition has doubtless prompted the Society to issue a popular book on the etchings and the etcher.

As a biography Mr. Armstrong's book is not enthralling; for Mr. Haig's life has not been so full of incident, nor the artist himself so celebrated as to make it so; indeed, his training was just what any intelligent student of his work would suppose it to have been; but he has been widely appreciated, and to both dealer and collector he has so far proved to be a commercial success.

As an artist Mr. Haig is rather difficult to place. He can draw "mighty well," as Peypys would have said. His water-colours are agreeable, his pencil studies charming, his etchings interesting, and, at the same time, perplexing. Yet all his work lacks that "something" which, because indefinable, it seems nowadays almost affectation to allude to. As etchings, we confess to preferring (among the moderns) those of Whistler or of Mr. Brangwyn. Nevertheless, Mr. Haig produces—it cannot be denied—many admirable effects. He has a fine, if somewhat theatrical, sense of black and white and of composition; but we think that his aims would have been better expressed in mezzotint, and we are fortified in our opinion by observing how often his actual methods are those of the mezzotinter rather than of the etcher.

After all, Mr. Haig's reputation will probably rest on his skill as an architectural draughtsman, and this skill seems, to our mind, to be more charmingly displayed in his pencil drawings and studies than in either his water-colours or his widely-circulated etchings. Of the pencil drawings illustrated in Mr. Armstrong's book that of "Rheims Cathedral Under Repair" is the best. It is certainly finer and shows more concentration in black and white than does the pretty drawing of an old Hamburg street (reproduced opposite p. 38). Compared to either of these drawings however, that of Leon Cathedral (p. 137) appears excessively dull, hard, and lifeless, besides exhibiting, as do most of the Eastern studies, that worst of engraver's faults—a tiresome, unrestrained record of the pettiest detail, irrespective of its place and worth in the whole composition. The drawing of the Piazza San Marco, however, captivates us in spite of this defect, and is a good example of Mr. Haig's treatment of figures as a real part of his picture, and not as a finishing touch to an academic builder's drawing.

We have only to add that Mr. Armstrong's book is well printed, and that its descriptive list of engravings should prove useful to collectors of Mr. Haig's work.

The Writers' and Artists' Year Book: 1906. London: Adam & Charles Black.

THIS is a small kind of directory "for writers, artists, and photographers." Its chief value is in its list of magazines and periodicals, with brief indications of the nature of their contents, and (in some cases) of the kind of articles from outsiders which may have a chance of consideration. There are also lists of publishers (English and American), colour printers, and literary agents. The advice to would-be contributors, added in the case of several periodicals, "a preliminary letter is advisable," should have been added also in the case of the *Builder*. We do not accept any contributions without knowing something about the writers first, and correspondents have often given themselves unnecessary trouble by sending us articles, good in themselves, on subjects which had already been fully treated in our pages.

Dilapidations: a Text-book in Tabulated Form. By PROFESSOR BANISTER FLETCHER. Sixth Edition. Revised and largely rewritten by BANISTER F. FLETCHER, F.R.I.B.A., and H. PHILLIPS FLETCHER, F.R.I.B.A., Barrister. (London: B. T. Batsford, 1906.)

THE fact that this book has reached a sixth edition renders comment on its material or form unnecessary. It contains a great amount of information, accurately stated, in a very small compass. We suggest, however, that in the next edition an extract from an article in the *Saturday Review* (p. 67) might be left out. We have some doubt also whether it is desirable to include

in this book such parts of the Agricultural Holdings Act as apply to purely agricultural details.

Fifty Years Ago.

FROM THE *Builder* OF FEBRUARY 2, 1856.

ON THE PAST AND PRESENT CONDITION OF THE THAMES.

INSTITUTION OF CIVIL ENGINEERS.—At a meeting on January 22, Mr. Robert Stephenson, M.P., President, in the chair, the paper read was "On the Past and Present Condition of the River Thames," by Mr. H. Robinson.

Some of the principal statistical facts connected with the river having been enumerated, the numerous shoals now exposed at low tide, the mud-banks covered with putrefying matter and animalcules, the disgusting state of the water itself, the numerous crazy wood-propped wharfs, the numerous crazy still serving for steam-boat piers, were referred to, as justifying the opinion that, were it not for the noble bridges spanning it, the Thames, within the limits of the metropolis, would be a disgrace at home and a reproach abroad, and it was remarked that in no town in the world was there a noble river so neglected and deformed.

The various schemes for embanking the shores were then alluded to, and the partial good already effected was noted. Among the larger designs were those of Sir Christopher Wren, Mr. Martin, Messrs. Walker & Burgess, and others. The removal of the obstruction of Old London Bridge had seriously altered the condition of the river at or near low tide, not only by exposing shoals, which impeded the navigation, and, by leaving a very large surface of mud, giving off exhalations dangerous to health, but also by so quickening the current as to enable it to scour away the bottom near to the foundations of structures built in the channel, and thus seriously endangering several of the bridges and wharfs.

The various causes which had induced the present polluted condition of the Thames were described to be, first, the demand made upon it to serve as a town sewer as well as a land drain. This would, however, have been of little moment if London had been beyond the influence of the tide, so that the stream could have run always in the same downward direction; but, exposed as the river was to the ebb and flow of the tide, the impurities and sewage, which had been discharged into the ebbing tide, were again brought back by the flood. Nor was this all: in consequence of the low level of a considerable part of the London sewers, the sewage was necessarily stopped back for many hours, and egress could not be afforded until the water had fallen considerably; the consequence of this was, that it was only during a portion of the ebbing tide that the sewage was enabled to travel down the river, but it was returning upwards during the whole period of the flood tide, so that the impurities not only returned to the place whence they started, but were even carried higher up; and it was asserted that some of the putrefying matter, exhalating pestilential odours on the mud-banks in Westminster, was actually discharged from sewers at Bermondsey or Southwark.

Illustrations.

SEDILIA, SIENA CATHEDRAL.

THIS carved walnut screen upon the right side of the altar in Siena Cathedral dates from about 1670, and is used only by the officiating clergy during the ceremony of singing mass. The figures surmounting the upper portion are all represented as singing, with the central figure holding a chalice; the lower panels being filled in with carving representing various vestments and utensils used during this ceremony. The central coat of arms is, I believe, that of the Piccolomini.

The walnut has become a particularly rich colour with a fine polish. The central perforated carved panels are in rosewood.

An original sketch for these sedilia, very black and partly wanting, is still to be seen in the museum connected with the cathedral.

L. U. G.

WORKING MEN'S COLLEGE, CAMDEN TOWN.

These buildings have been erected to form a new home for the college, which has just celebrated its jubilee since its foundation, by Frederick Maurice, in Great Ormond-street, in 1854. The old premises, which are fine examples of Queen Anne work, and which, it is hoped, may be preserved as such, have passed to the Children's Hospital.

The new building has been designed of a very simple character, fitted to its purpose. It contains a great hall, common-rooms, club-

rooms, gymnasium, science schools (for simple teaching), classroom, museum, and library.

As an education on the literary side is a feature of the college teaching, special attention has been devoted to the library. This and the hall form the block seen on the right-hand side of the illustration.

The general contractors were Messrs. W. Johnson & Co., of Wandsworth; for the heating, ventilation, and electric lighting, Messrs. Wippell Brothers & Row, of Exeter. Mr. W. D. Caroe is the architect.

Should there be any intention of demolishing

No. 44, Great Ormond-street, it would be most valuable that a record should be kept. It contains many features of beauty and interest. W. D. C.

GRAMMAR SCHOOL, LINCOLN.

The new buildings for the Lincoln Grammar School, illustrated this week, are being erected on a large open site to the east of the cathedral, Mr. Charles Wright, of Leicester, being the contractor. Ancestre stone is being used in conjunction with some specially-made local facing bricks of a greys

our, with red brick dressings to the master's house instead of stone, the latter being used as dressings to the school house over only.

The illustration was exhibited in last year's Royal Academy. Mr. Leonard Stokes is the architect.

SCHOOL AND HOUSES, BRISBANE.

Of the buildings illustrated, the school is, I believe, built to a great extent from the materials of the old church, which has been pulled down to make way for the new cathedral, to be erected from the designs of the late Mr. Pearson. The three houses are examples of the type of suburban house of the neighbourhood. One of them appears on the drawing to be tiled or slated; the other two have iron roofs, which we understand are necessary in view of the tremendous hailstorms experienced there, where the hailstones are large and heavy enough to crack slates with their impact.

The architects are Messrs. Hall & Dods, Brisbane. Mr. Dods, the younger partner, is working in London offices for two or three years recently, and may be remembered by some of our readers.

COMPETITION.

BRANCH LIBRARY AT WEST GREENWICH.—The report of the assessor (Mr. A. W. S. Ross, M.A., F.R.I.B.A.) on the competitive designs sent in for the Branch Library at West Greenwich to be erected by the Borough Council was made known on Monday. The assessor stated that he had carefully weighed the merits and demerits of each design with regard (a) to its plan, (b) to its architecture, and (c) to its probable cost of construction. The first premium of 25*l.* was awarded to Messrs. Wills & Anderson, the second premium of 15*l.* was awarded to Mr. Henry Oldsmith (Manchester), and the third premium of 10*l.* went to Mr. Henry A.rouch. A design sent in by Mr. Albert L. Guy was placed next in order of merit. The designs will be placed on public exhibition in the lending library for a limited period. With the designs will be exhibited a critical report by Mr. Cross.

LAXTON'S BUILDERS' PRICE BOOK FOR 1906. Eighty-ninth Edition. (Stimpkin, Marshall, & Co. 4*s.*)

TRADE CATALOGUES.

The Titan Lift and Electric Company send us a pamphlet describing electric lifts worked on the Titan push-button system. As practically all forms of lift makers have now adopted this method of control, there is obviously nothing new in this particular example, except the details of construction. Before us, as these are not detailed in the pamphlet, it is impossible to pronounce any opinion upon their merits. We may mention, however, that the Titan lift is stated to be provided with all the latest and best safety devices, including automatic safety locks for landing and cage doors, a powerful brake on the motor shaft, and a special type of circuit breaker attached to the gear, which comes into operation if the descending cage is stopped by any hindrance, if the speed exceeds a certain limit, or if the cage passes the normal highest or lowest point. The illustrations in this pamphlet, being of popular character, are not of particular interest to technical readers.

The New Expanded Metal Company send us the fifth edition of their handbook of

practical tests and tables relating to the employment of expanded steel in concrete and plaster work and in fire-resisting and building construction generally. We have referred on many previous occasions to the distinctive qualities and varied uses of expanded metal, and for this reason it is not now necessary to discuss these points. The handbook contains 170 pages, with numerous drawings and photographic views illustrating the application of expanded metal in architectural and engineering practice. A noteworthy feature is the extended use that is evidently being made of the material as a constituent of concrete-steel, a purpose for which it is admirably adapted. Much of the matter in this edition has come before the notice of our readers in previous issues, but several newly-executed works are now described, and much additional information is given in the letterpress. One thing lacking is a more complete index, for the solitary page allotted to this detail does anything but justice to the comprehensive collection of useful information presented in the book, which ought to find a place in the office of every architect and engineer.

Messrs. Gittins (Birmingham and London) send us a small pamphlet of designs for gas and electric fittings, which we have pleasure in being able to praise unreservedly. They are in the best possible taste; there is none of the effort to be "ornamental" which we see in so many of such illustrated lists; they are all quite simple in line and detail, but the forms are graceful and well considered, and such as to be satisfactory to the eye of an artist. We may commend especially the electric light bowl fitting (E 101A); the electric light pendant in wrought brass (E 89); the outside lantern (G 112); the bronze gas pendant (G 131); the wrought brass bracket lamp for incandescent gas or acetylene (G 126); and the electric light lantern pendant (E 105). Judging from this booklet, those who wish to furnish their houses with electric light or gas fittings in good taste, without going to the expense of getting them specially designed, could not do better than select from Messrs. Gittins's stock.

The General Electric Company send us a small illustrated catalogue of their electric glow radiators for domestic heating. We have every sympathy with this method of warming rooms, which is almost an ideal one where expense is not a first consideration; not that the radiators here shown are expensive in themselves, as first cost, but the expense of keeping a house warmed by electricity is at present prohibitive except for the wealthier classes. But why do not the General Electric Company employ someone who is an artist in metal work to design radiators for them? They show one, for instance, described as "a very ornamental type" (No. 1,500), which we can assure them no artist would have in his house at a gift; it is the worst thing in the collection; and some others—1,280 and 1,292, for instance—are nearly as bad. Nos. 1,542, 1,545, and 1,553 are much better, and seem to have been designed by someone with a feeling for the treatment of metal work; it is a pity they do not all show these characteristics. The two in fire-proof wood (1,524, 1,530) are suitable and pleasing, at least there is nothing in them to offend the taste; but such a design as No. 1,500 is enough to frighten architects off at the first glance.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—IV.

Numerical Definitions.

HAVING dealt sufficiently with the general nature of numbers and systems of notation and numeration, we will now define and consider briefly the different kinds of numbers frequently occurring in arithmetic, and other numbers to which reference is made by mathematical writers.

For the convenience of students we deal with the present section of our subject in the form of an alphabetically arranged series of definitions, which will be available and suitable for subsequent reference.

After each of the definitions such illustrations and examples are given as appear necessary to

make clear the nature and use of the numbers included in the category.

Numerical Definitions.

Abstract number.—Any number whose properties are considered without application to or connexion with any concrete quality or thing. The same as *numerical number*, and the converse of an *applicate, concrete, or numerate number (q.v.)*.

Example: When used without qualification, as 1, 5, 7, 20, numbers are regarded as *abstract*.

Abundant number.—A number, the sum of whose aliquot parts is more than the number itself.

Example: 18 is an abundant number, as the sum of its aliquot parts (1 + 2 + 3 + 6 + 9) = 21.

Algebraic number.—A root of an algebraic equation having whole numbers as coefficients.

Example: 2 + $\sqrt{2}$ is a root of the equation $x^2 - 5x^2 + 6x - 2 = 0$.

The height of an *algebraic number* is its position in any arrangement of such numbers.

Aliquot part.—A number forming part of a larger number and capable of measuring it without remainder.

Example: 3 is an aliquot part of 24.

Alternate numbers.—(1) The even and odd numerals form two series of *alternate numbers*.

(2) The term is also applied to units such that the sign of the product of any two is changed if the order of the factors be reversed. These units are not really numbers, but algebraical symbols, sometimes called *Hankel's numbers*.

Example: $ab = -ba$.

Amicable numbers.—Any pair of numbers each one of which is equal to the sum of the aliquot parts of the other.

Example: The aliquot parts of 220 are: (1 + 2 + 4 + 5 + 10 + 11 + 20 + 22 + 44 + 55 + 110) = 284; and the aliquot parts of 284 are: (1 + 2 + 4 + 71 + 142) = 220.

Antilogarithm.—The *natural number* corresponding to any *logarithm* (see *artificial number*).

Applicate number.—A number applied or used with reference to some concrete quality or thing. The same as a *concrete* or a *numerate number (q.v.)* and the converse of an *abstract* or *numerical number (q.v.)*.

Example: 1 house, 5 tons, 7 yards, 20 inches.

Articulate number.—A power of ten or a number consisting of tens.

Examples: 10 (= 10¹), 40 (= 4 × 10), 100 (= 10², or 10 × 10).

An *article* is the number 10, or any number ending with 0.

Artificial number.—A number derived from the series of ordinary numbers. Among *artificial numbers* are *logarithms, Bernoullian numbers, diametral numbers, Euler's numbers, figurate numbers, etc. (q.v.)*

Bernoullian numbers.—A special series of numbers originated by Jacob Bernoullian. (Only used in abstract mathematics.)

Binary number.—One composed of two units.

Cardinal number.—Any one of the series 1, 2, 3 and upwards in contradistinction to 1st, 2nd, 3rd and upwards, the latter being *ordinal numbers (q.v.)*.

Cipher.—The symbol 0, denoting *ought quantity*, and occupying a neutral position between positive and negative reckoning. Having no value when standing alone the cipher increases or diminishes the *relative value* of other symbols according to its position. Thus each 0 placed after a whole number increases its value 10 times, or placed before the numbers in a decimal fraction decreases its value to one-tenth of the original value.

Circular number.—A number which occurs as the last figure in all powers of the number itself. The numbers 1, 5, 6, and numbers ending with these numerals are *circular numbers*.

Example: 6² = 36, 6³ = 216, 6⁴ = 1,296, 6⁵ = 7,776, 6⁶ = 46,656, and so on.

Coefficient.—(1) In algebra a number or other symbol representing a fixed quantity placed before and multiplying any quantity expressed by a letter or letters.

Example: 2a, 3 (b + c), 2xy.

(2) In physics, a numerical quantity constant for a given substance, and employed to measure any one of its properties.

Example: E = the coefficient of elasticity. (See definition, p. 43 ante.)

Complementary number, or Complement.—The difference between any number and 10 or the next higher power of 10 above the number.

Example: 2 is the complement of 8; 23 of 77; 450 of 550, and so on.

Composite number.—Any number that can

be exactly measured by a number exceeding unity.

Example: 12 is measured by 2, 3, 4, or 6.

Concrete number.—A number applied or used with reference to some concrete quality or thing. Same as an *applicate* and a *numerate* number (*q.v.*). The converse of an *abstract* or a *numerical* number.

Notes.—(1) It is important to remember that concrete numbers cannot be multiplied into each other. That is to say, six shillings cannot be multiplied by six shillings. This statement may appear to be contradicted by the fact that dimensions are multiplied one by another. Thus inches \times inches = square inches, and square inches \times inches = cubic inches. In reality, however, these processes do not constitute exceptions to the rule as the appellations are purely conventional and simply intended to express in a convenient way the product of two or three dimensions.

(2) A concrete number, however, can be divided by another concrete number, but the result is an abstract number.

Example: 120 lb. divided by 6 lb. = 20, not 20 lb., meaning that 6 lb. is contained twenty times in 120 lb.

(3) When a concrete number is divided by an abstract number the result is a concrete number.

Example: 72 ft. divided by 6 = 12 ft., meaning that 72 ft. has been divided into 6 parts, each consisting of 12 ft.

(4) A concrete number cannot be used as the divisor of an abstract number.

Congruent number.—A number is described as congruent to another number relatively to a third number called the *modulus*, when the first two numbers give the same remainder on division by the modulus.

Constant.—(1) A quantity known or assumed to be invariable; (2) a fixed numerical quantity denoting some physical property of any substance.

Decimal.—An expression used to denote a decimal fraction, or a part of unity whose denominator is a power of 10 however it may be written. Thus $\frac{1}{10}$ and 0.1 are decimals or decimal fractions.

Deficient number.—A number, the sum of whose aliquot parts is less than the number itself.

Example: 15 is a deficient number as the sum of its aliquot parts (1 + 3 + 5) = 9. (See also *abundant* number and *perfect* number.)

Denominator.—A number constituting the lower term of a vulgar fraction, and indicating the value of the fractional part of unity to be taken.

Diametral number.—(1) A number equal to $\frac{1}{2}(1 + \sqrt{2})^n + \frac{1}{2}(1 - \sqrt{2})^n$, where n is any integer or whole number.
(2) A number that can be resolved into two factors, the sum of whose squares is a square.

Example: 120 is such a number, of which 15 and 8 are factors, and $(15^2 + 8^2) = 17^2$.

Digi.—Any one of the nine numerals 1, 2, 3, 4, 5, 6, 7, 8, 9. Some writers include 0 among the digits, but this is wrong because the term — derived from the Latin word *digitus* (a finger)—means one of the single numbers which were formerly indicated by the fingers.

Dividend.—A number that is to be divided into parts.

Divisor.—A number by which another number is divided.

Euler's numbers.—The numbers E_2 , E_3 , and upwards, only used in abstract mathematics and occurring in the development of sec. x by Maclaurin's theorem.

Factor.—One of the numbers, in a mathematical expression, which when multiplied together make a given product, also an expression or quantity by which another expression or quantity may be divided without a remainder.

Examples: In the expression $(9 \times 5) = 45$, 9 and 5 are factors giving the product 45. In the expression $45 \div 9 = 5$, 9 is a factor by which 45 can be divided without a remainder.

Factorial 9, or 9!—The number which is the product of all the natural numbers up to 9 inclusive.

Example: $9! = (1 \times 2 \times 3 \times 4 \times 5 \times 6 \times 7 \times 8 \times 9) = 362,880$.

Feminine number.—An even number, as 2, 4, 6, 8, in contradistinction to a *masculine*, or an *odd* number.

Figure.—In arithmetic any one of the characters or symbols used to express numbers (see *cipher*, *digit*).

Figurate numbers.—A whole number belonging

to a series having unity for its first term, and for its first difference another series of figurate numbers or a constant number.

The nature of figurate numbers is explained by the following table:—

<i>Natural.</i> —	1, 2, 3, 4, 5, 6, 7, etc.
<i>Triangular.</i> —	$\left\{ \begin{array}{l} a. 1, 3, 6, 10, 15, 21, 28, \text{ etc.} \\ b. 1, 4, 10, 20, 35, 56, 84, \text{ etc.} \\ c. 1, 5, 15, 35, 70, 126, 210, \text{ etc.} \end{array} \right.$

Here the natural numbers in the top line are taken as the basis of each of the three series of figurate numbers, which are formed by successive additions, in series (a), of the natural numbers, and, in series (b) and (c), of the figurate numbers in the lines immediately above the series to be formed. Instead of using a series of natural numbers whose difference is 1, we may take any other series whose differences are 2, 3, 4, 5, and upwards, and from any such series we can form a series of figurate numbers. Figurate numbers of the first order are termed *polygonal* numbers, and the terms *triangular*, *square*, *pentagonal*, etc., are given according as the difference of the basis is 1, 2, 3, and upwards. Figurate numbers of the second order are termed *pyramidal* numbers, and are said to be *triagonally*, *quadragonally*, or *pentagonally* *pyramidal*, according to the difference of the basis.

Fractional number.—A part or a number of aliquot parts of unity, or of another quantity, as $\frac{1}{5}$ (of 1); $\frac{3}{5}$ (of 80).

Galilean number.—The quantity g or the acceleration of gravity. (For values of g see Art. II., p. 49.)

Gradual number.—The ordinal number of a term after the first term in a geometrical progression.

Haarlem's numbers.—The same as *alternate* numbers (*q.v.*).

Hendecagonal number.—A number of the form $\frac{n}{2}(9n - 7)$, where n is any integer. Among such numbers are 1, 11, 30, 58, and upwards.

Example: Where $n = 1$, we have $\frac{1}{2}(9 \times 1 - 7) = 1$; and where $n = 2$, we have $\frac{1}{2}(9 \times 2 - 7) = 11$.

Heptagonal number.—A number of the form of $1 + \frac{7}{2}n + \frac{7}{2}n^2$ where n is any integer. Among such numbers are 1, 7, 18, 34, and upwards.

Example: When $n = 0$ we have $(1 + 0 + 0) = 1$; where $n = 1$, we have $(1 + 3\frac{1}{2} + 3\frac{1}{2} \times 1) = 7$; and where $n = 2$, we have $(1 + 7 + 7 \times 2) = 18$.

Heterogeneous numbers.—Numbers having opposite signs.

Example: +3, -5, +1, +6, -7.

Heterogeneous number.—A number consisting of a whole number and a fraction.

Examples: $6\frac{1}{2}$, $14\frac{3}{4}$, $7\frac{5}{8}$, $15\frac{1}{6}$.

Homogeneous number.—A number consisting of a single figure or unit.

Icosahedral number.—A number of the form of $\frac{1}{2}(5n^2 - 5n + 2)$ where n is any integer. Among such numbers are 1, 12, 48, 142, and upwards.

Example: Where $n = 1$, we have $\frac{1}{2}(5 - 5 + 2) = 1$; and where $n = 2$, we have $\frac{1}{2}(20 - 10 + 2) = 12$.

Imperfect number.—A number, the sum of whose aliquot parts is a number either greater or less than the number itself. In one case it is termed an *abundant* number (*q.v.*), and in the other case a *defective* number (*q.v.*).

Incomposite number.—Another term for a prime number (*q.v.*).

Integer.—A whole number in contradistinction to a fraction or part of a number.

Integral part.—The integer or whole number in a mixed number.

Example: In the mixed numbers $69\frac{3}{8}$ and $54\frac{5}{6}$, 69 and 54 are integral parts or integers, and $\frac{3}{8}$ and $\frac{5}{6}$ are fractions, respectively.

Irrational number.—(1) A number whose root cannot be expressed in *rational* numbers, or by an ordinary fraction and can only be denoted approximately by the aid of a continued fraction or an indeterminate decimal fraction.

Example: $\sqrt{2} = 1.41421 +$

(2) A quantity that cannot be expressed in rational numbers.

Example: $\pi =$ the ratio of the circumference to the diameter of a circle = 3.14159 +; ρ or $\rho =$ ratio of the circumference to the radius of a circle = 6.2832 +.

Linear number.—A number relating to length, as, for example, a number representing one side of a plane figure. If the plane figure be a square the linear side is termed a *root*. (See definition, p. 24 ante.)

Logarithm.—An artificial number representing

the power to which a number (constant for each system of logarithms and called the *base* of the system) must be raised in order to produce the natural number, or *antilogarithm*.

Ludolphian number.—Another name for π , or the ratio of the circumference to the diameter of a circle; an irrational quantity, so called because its value was determined to 36 places of decimals by Ludolf van Ceulen. (For value of π see definition, p. 49 ante.)

Masculine number.—An odd number in contradistinction to a *feminine* or *even* number (*q.v.*).

Measure of a number.—A number which is exactly contained in another number two or more times.

Minuend.—The number from which another number is to be taken away in the process of subtraction.

Mixed number.—A number consisting of an integer or whole number and a fraction. The same as *heterogeneous* number (*q.v.*).

Modulus.—A positive number serving as a measure of a function or effect. In one sense the term is synonymous with *coefficient* (*q.v.*).

Multiple.—A number produced by the multiplication of another number by a whole number, as 40 is a multiple of 4, the latter being a *sub-multiple* or aliquot part of 40.

Multiplied.—A number which is to be multiplied by another number.

Multiplier.—A number by which another number is to be multiplied, also termed *multiplicator*.

Natural number.—One of the series of ordinary numbers commencing with 1, in contradistinction to *artificial* numbers (*q.v.*).

Number.—An arithmetical figure, character, or series of such figures denoting a quantity, magnitude, or measure.

Number.—One of the series of arithmetical figures used to express a number.

Numerate number.—The same as *abstract* number (*q.v.*).

Numerical number.—The same as *concrete* number (*q.v.*).

Numerator.—The number in the vulgar fraction indicating how many parts of unity or of another quantity are to be taken.

Example: In the fraction $\frac{5}{16}$, the figure 5 is the numerator, showing that five one-eighth parts of 1 are to be taken; in the expression $\frac{1}{16}$, the numerator shows that five one-eighth parts of 16 are to be taken.

Ordinal number.—Any one of the series 1st, 2nd, 3rd, and upwards, in contradistinction to 1, 2, 3 and upwards, the latter being *cardinal* numbers (*q.v.*).

Perfect number.—A number that is equal to the sum of all its aliquot parts. For example, 28 is a perfect number as the sum of its aliquot parts (1 + 2 + 4 + 7 + 14) = 28.

Prime number.—A number which only can be divided without remainder by itself and by unity.

When two or more numbers have no common measure greater than unity they are said to be prime to each other, although not prime numbers themselves. Thus the numbers 4, 49, 81 are prime to each other.

Product.—The number obtained by multiplying one quantity into another.

Proportional part.—Numbers representing parts of magnitudes such that the corresponding parts taken in their order are also proportional.

Quotient.—The number obtained as the result of division, or the number of times one number is contained in another.

Rational number.—A number whose root can be expressed as an ordinary fraction. The term *rational* is applied to expressions in which no extraction of a root is left, or none indicated that cannot be actually performed by known processes.

Reciprocal.—A number which is the quotient obtained by the division of unity by any number of which the quotient is said to be the *reciprocal*.

Example: The reciprocal of 5 is $\frac{1}{5}$, and conversely, the reciprocal of $\frac{1}{5}$ is 5.

Remainder.—(1) That part of a number which remains after the subtraction of another number.

(2) That part of a number which remains over after the division of one number by another.

Subtrahend.—The number to be taken from another number in the process of subtraction.

Square numbers.—Numbers which represent the squares of the natural numbers consecutively. These numbers are 1, 4, 9, 16, 25, and so on.

Surd.—The same as *irrational* number (*q.v.*).

Significant figures.—The succession of figures in the notation of a number. In a decimal fraction the ciphers coming after the decimal point are not considered, and the first digit after the first significant figure.

Example: In the number 123, the digit 1 is the first significant figure, and in the decimal fraction 0.0023, the digit 1 is the first significant figure.

Triangular numbers.—Numbers that begin in unity and increase by additions of the arithmetical numbers respectively, as 1, 3, 6, 10, 15, 21.

Unit.—(1) A single thing; the lowest whole number.

(2) A single group of things or numbers in plurality of similar groups.

OBITUARY.

MR. WENTWORTH-SHIELDS.—Mr. Francis Webb Wentworth-Shields, M.Inst.C.E., died at his residence at Sholing, near Southampton, on an illness, aged 85 years. He was born in Kilbeg, Co. Meath, and, after having served his articles to Charles Vignoles, went to Sydney and constructed the first railway in New South Wales, where he was appointed inspecting-Engineer to the Government. On returning to England, he was appointed resident engineer for the building of the Crystal Palace at Sydenham, and in 1860 he began to practise in Westminster as a consulting engineer. In the following year the Thames Embankment Commissioners gave their preference to a scheme propounded by Mr. Wentworth-Shields for a subway and culvert under Westminster Blackfriars with a sewer beneath the roadway. The main features of his project were ultimately adopted. In our issue of August 3, 1861, we published the text of the report with illustrations of his two alternative sections, and on January 6 last, p. 19 ante, we briefly described his share in the preliminary measures for that project. Mr. Wentworth-Shields was associated with Sir G. G. Scott in laying the foundations of the Albert Memorial, Kensington Gardens, and in other works; he drew up a report upon means of transit across the Straits of Dover, and prepared designs for a Channel bridge. He was employed upon several important sewerage schemes, including those at Itchen, and elsewhere in the vicinity of Southampton. He was the author of some professional books, one of them being a treatise upon "Strains in Ironwork."

MR. W. REID.—Mr. William Reid, architect and surveyor, Fraserburgh, has just died there from peritonitis. He was born forty-one years ago in Aiton, and his last public work at Fraserburgh, where he commenced business some seven years ago, was the Infectious Diseases Hospital for the burgh. Prior to setting up in Fraserburgh, Mr. Reid had been estate architect on Wharfedale, Forfarshire, and on Haddo, Aberdeenshire, and factor on Dunsinnane, Perthshire.

GENERAL BUILDING NEWS.

ROMAN CATHOLIC CHURCH, EDINBURGH.—Plans were passed in the Edinburgh Deacons' Guild Court on the 11th ult., on the application on behalf of Mr. John Murray for a church and presbytery at Falcon-avenue, Morningside. The church will be known as St. Peter's, Edinburgh, and will occupy a site of 140 ft. at the north-east corner of Falcon-avenue. Only part of the building is to be proceeded with at once, and it will accommodate a congregation of 300, but the completed building will seat about 700. The church, which is designed to be east and west, will be in the shape of a Latin cross, with shallow sanctuary and transept. The nave, measuring from the floor to its highest part 48 ft. and 32 ft. in breadth, will be flanked by narrow aisles which, with the narthex or vestibule, allow a freeway for processions round the church. The whole interior will be whitewashed. The outside will have a small bellry on its south side, and at the north-east a turret containing a stairway to the organ gallery in the north transept. The church will be entered from a courtyard on the south, from which a covered cloister will lead to the porch. There will be a second entrance at the north-east. The design was designed by Mr. R. S. Home, A.R.S.A.

CHURCH, NORWICH.—The new Church of St. Barnabas, North Heigham, was consecrated recently by the Lord Bishop of Norwich. The new church, which is designed to serve the eastern end of the thickly-populated parish of St. Bartholomew, stands in an angle between Russell-street and Dechan-road by either Mancroft-street or Old Palace-road and Devonshire-street. St. Barnabas church consists of nave, north and south aisles, and large chancel. A choir vestry and organ-chamber on the south side of the chancel will be added when funds permit. The architect is Mr. Arthur J. and Thomas Buswell. The general contractor is Mr. C. S. Tinkler, of Sandringham-road. The estimated cost of the building and its fittings is 5,536l.

CHURCH, SWANSEA.—The new Church of St. Michaels and All Angels, at Manselton, Swansea, was consecrated by the Bishop of St. David's on Wednesday last week. The nave of the church is 72 ft. long by 25 ft. wide; north aisle and south aisle each 72 ft. long by 20 ft. 6 in. wide; and chancel 36 ft. by 25 ft. The accommodation is for 700 people. There are also an organ chamber, clergy and choir vestries, and a room for parish meetings under the chancel, all approached by a stone staircase in a small turret. The nave and chancel roofs are barrel shaped. They are divided by moulded ribs carried on carved and decorated angels from the studio of Mr. William Clarke, of Llandaff. These angels are carved in teak wood taken from the old battle-ship *Exmouth*, the ship that Admiral Togo was in. The aisle roofs are also barrel shaped, and all the timbers are left clean from the plane. The east window of the chancel is a five-light, richly-traceried window, and so is that at the west end, and the gables of the aisles and the sides of the windows are four-light, traceried windows, all of a late character. The chancel has a tiled pavement, with seven steps leading to the altar. The material used in the building is local stone, with St. Aldhelm stone dressings to the doors and windows, and the wall facing is rubble work. The dossal and side hangings were designed by the architect (Mr. Bruce Vaughan). The portion of the church already completed has cost 5,000l., and the contractors were Messrs. Lloyd Bros., of Swansea.

NEW CHURCH, HARROGATE.—Plans have been prepared by Mr. Temple Moore, architect, of Westminster, for the erection of the Church of St. Wilfrid in Duchy-road. The building will be in the Early English style, providing accommodation for 400 persons. It is to consist of nave and two aisles, with north and south transepts and choir. The entire length will be 187 ft.; nave, 104 ft.; width of nave and aisles, 54 ft.; length of transepts, 112 ft.; length of choir, 80 ft., and width, 56 ft. The approximate cost, exclusive of tower and spire which will be erected later, is 24,000l.

GREAT GEORGE-STREET CONGREGATIONAL CHURCH, LIVERPOOL.—This church has been resited throughout with American oak seats and re-lighted, reheated, and decorated throughout. The organ, a large and fine instrument, has also been renovated and decorated. The work has been carried out by Messrs. S. R. Henshaw & Son, under the superintendence of the architect, Mr. J. Francis Doyle.

WELSH CHAPEL, BARRY DOCK.—The opening of Carmel New Welsh Wesleyan Chapel, Pyke-street, Barry Dock, took place recently. The new chapel is 55 ft. long by 21 ft. 6 in. wide, and contains seating accommodation for 270 worshippers. The main entrance is from Pyke-street. The building is of Northbridge stone, with Bath stone dressings, in the Gothic style, with open timber roof. The screens, with rostrum and seating, are in pitch-pine. The architect was Mr. George Thomas, of Cardiff and Barry; and the contractors Messrs. Lloyd & Tape, builders, Barry Dock. The new building cost 1,000l.

SCHOOL, DUNDEE.—A new school is to be erected by Dundee School Board from plans prepared by Mr. J. H. Langlands, architect.

The site, which was secured from the Parish Council, has a fall of 9 ft. towards the south, and this enables the architect to arrange for the workshops being located underneath the first-class flats, with entrances and lighting from the south. Accommodation will be provided for 1,110 pupils, and there will be eight classrooms for 45 pupils each, and 15 for 50 pupils each. The rooms for teaching cookery, laundry, and housewifery will be on the upper flat, while there will be necessary accommodation for cloakrooms, lavatories, and teachers' rooms on the respective floors and landings.

CATHOLIC SCHOOLS, SUNDERLAND.—On the 22nd ult. the pupil teachers' centre and secondary schools, erected upon a site of the convent schools in Green-street, Sunderland, were opened. The building has been erected from the plans of Messrs. W. & T. R. Milburn, architects, Sunderland, the contractor being Mr. W. B. Cooper, of Sunderland.

ST. HELEN'S SCHOOL, ABINGDON.—A year or two have passed since Princess Christian laid at Abingdon the foundation-stone of a new school, dedicated to St. Helen. In the interval the work of education has been carried on in a temporary home, while a school building has been raised, about a mile north of the central point of Abingdon, on the Shippon-road. The expense has been some 30,000l., and Mr. F. L. Pearson was the architect.

NEW SCHOOLS, DAWPOOL, CHESHIRE.—These schools, which were opened on the 27th ult., are built to accommodate 100 children, with a master's residence attached. There is a spacious entrance with hat and cloak room for boys and also girls and infants. The main schoolroom is 50 ft. by 22 ft. and 20 ft. high, classroom 20 ft. by 19 ft. and 16 ft. high. The building is faced with red brick and terra-cotta facings and red

tiled roofs, made by Edwards, Raebon. Messrs. John Thomas & Sons, of Oxtow, were the builders, and Mr. J. Francis Doyle, of Liverpool, the architect.

SCHOOL, SOUTH SHIELDS.—A new infants' school has been erected in Gilbert-street, South Shields. The premises provide accommodation for 450 or thereabouts. The school is designed in accordance with the building regulations for planning new public elementary schools as issued by the Board of Education. It consists of a central hall with seven classrooms, arranged round three sides of the hall, and separated therefrom by glazed partitions. The central hall is 71 ft. long, 26 ft. wide, and 19 ft. high. It is lighted by mullion windows along one side. There are four classrooms, each 23 ft. 6 in. square, and each allowing for sixty scholars and a superficial floor area of 9 ft. per child. There are two other classrooms each 27 ft. 10 in. by 19 ft. 6 in.; and another 21 ft. by 23 ft. Cloak rooms are provided in close proximity to the entrances, and included also is a teachers'-room, 15 ft. by 11 ft. 6 in. The floors of the central hall and classrooms have been laid with pitch-pine wood blocks. Internally, the walls have a cream-coloured glazed tile dado. The walls above the dado are distempered. The playground is finished with tar paving; and there is a covered play-shed with seats and drinking fountain. The sanitary fittings were supplied by Messrs. Adams, Ltd. The buildings are heated and ventilated on the Plenum system, and are of brick with red brick facings and stone dressings. The contract price of the building is 5,516l. 4s. 6d., and the heating and ventilating, carried out by Mr. Wm. Key, of Glasgow and London, has cost 581l. The school has been erected from the designs, and under the superintendence of Mr. J. Walter Hanson, architect, South Shields, by the contractors, Messrs. Glen & Moffet, of Jarrow. The sub-contractors were:—Plumbing, Messrs. J. Dagless & Sons; slating, Mr. Digby Nelson; plastering, Mr. T. Anderson; painting and glazing, Mr. Dixon; tiling, Messrs. Emley & Sons, Newcastle; block flooring, Messrs. Nichols & Co., London; furniture, Mr. J. D. Bennett, Glasgow. The electric lighting and the arrangements for the electrically-driven ventilating fan, have been carried out under the supervision of the Borough Electrical Engineer (Mr. Cawthra), by Mr. J. T. Dagless.

CHURCH SCHOOL, Huddersfield.—The cornerstone of new day and Sunday schools for the parish of St. Paul's, Huddersfield, was laid on the 27th ult. by Lady G. Ramsden. The building will provide accommodation for 300 scholars in the mixed department and 150 in that of the infants. Mr. W. Cooper is the architect of the work, the cost of which will be about 5,600l.

GRAMMAR SCHOOL, BRIDLINGTON.—The Bridlington Girls' High School was formally opened on the 29th ult. by Lord Wenlock, Chairman of the East Riding County Council. The building was formerly known as The Elms, and was owned by the Bridlington Corporation, but it has recently been acquired by governors, and remodelled and enlarged to suit the purposes of a school by Mr. J. Wilson, architect, of Hull. A school hall has been added, consisting of an assembly hall on the ground floor, while overhead there is a science lecture-room, store-room, and science laboratory. Attached to the school are grounds and gardens.

SCHOOL, BARROED.—Glamorgan County Council have erected a new boys' school at Barroed, built of Penarth stone, with Forest of Dean and brick dressings, the school has accommodation for 350 children, and in addition to a large marching hall, there are six classrooms, cloak-rooms, and two teachers' rooms. The area of the site is about three-quarters of an acre, and the cost of the work was 6,200l. Mr. John Lewis, Caerphilly, was the builder, and the architects were Messrs. Morgan & James, of Cardiff.

SCHOOLS, OAKLANDS-ROAD, HANWELL.—The Oaklands-road Council Schools, Hanwell, was opened on the 27th ult. The buildings have been erected on a site purchased by the late School Board, the department being arranged as follows: A two-story building for mixed classes and a separate building for infants, each department having a central hall and classrooms. The lavatories, teachers' rooms, storerooms, etc., being arranged on mezzanine floors. The schools afford accommodation for 1,143 scholars, viz.:—Senior mixed, 388; junior mixed, 388; and infants 367. Each department has duplicated entrances, cloak-rooms, and lavatories, and the senior mixed has two staircases. The buildings are heated by hot-water radiators and open ventilating fireplaces. The ventilation is that known as the "Natural" system, having fresh warm and cold air inlets, and the extraction of vitiated air is effected by ceiling ventilators and extract fans. All classrooms in the mixed block have stepped galleries and throughout the buildings the classrooms have left-hand lighting. The floors are fireproof, being constructed of steel girders and concrete, and are paved with wood blocks. Glazed brick dados are provided throughout, and all joinery and exposed timbers are stained and varnished. Covered playsheds are provided

in the playgrounds, as well as a house for the caretaker. Externally the walls are built with stock bricks from the Cowley district, and the roofs are covered with Welsh blue slates. The floors, which the caretaker's cottage is covered with Broseley tiles. The gable copings, sills, strings, cornices, etc., are executed in Stamford stone. The amount of the contract was 18,250*l.* The general contractor was Mr. F. G. Minter, of Putney, whose firm is the firm for the work. The whole of the works have been carried out under the superintendence of Mr. William Pywell, the architect, whose son, Mr. W. J. Pywell, acted as clerk of works.

HOTEL, SHEFFIELD.—Work has just been commenced on a new hotel in Leopold-street, Sheffield. The building will have sleeping accommodation for more than 200 guests. Messrs. Cannon & Chorley, of Leeds, are the architects for the work, the contractors being Messrs. Fidler, of Sheffield.

NEW BATHS, MANCHESTER.—Mr. H. P. Boulnois recently held an inquiry on behalf of the Local Government Board at the Town Hall, Manchester, into the application of the City Council for permission to borrow 39,715*l.* for the erection of public baths at Bradford and 19,144*l.* for the completion and equipment of the Victoria Baths in High-street. Mr. Hudson, the Deputy Town Clerk, said it was proposed to erect three swimming baths, 28 wash baths, and 40 washing stalls. The building would be erected with the best substantial ordinary materials, with plain brick elevation and terraced roof facing. Mr. H. Price, the City Architect, described the plans and stated that, as far as it was possible to ascertain, the estimate of 39,715*l.* would cover the whole of the expenditure and contingencies. The Commissioner next received evidence respecting the Victoria Baths. Mr. Price said there had been no alteration of importance in the plans of the buildings, but certain changes had been made in the materials used. It was proposed to build a laundry in connexion with baths, and his estimate of the cost was 2,100*l.* The City Surveyor, Mr. T. de Courcy Meado, also gave evidence.

FREE LIBRARY, LURGAN.—The free library which has been erected in Carnegie-street, Lurgan, was opened on the 8th ult. The structure has been erected by Mr. Wm. Callaghan, Marafin, from plans prepared by Mr. Henry Hobart, C.E., Drogheda. It is built with brick, and faced from the front with red brick, and Aspatia red sandstone dressings, the latter supplied by Mr. McCornick, Belfast. The building occupies 100 ft. frontage. On the first floor is a vestibule entrance leading to a hall, which communicates through swinging doors with a recreation-room, 25 ft. by 25 ft., and a reading-room, 25 ft. by 40 ft. Leading from the hall is a staircase in three flights, which is lighted with a cathedral glass window bearing the Lurgan town coat of arms. This window and the several stained-glass windows throughout were supplied by Messrs. Campbell Brothers, Belfast. On the top floor is the lending library, 25 ft. by 40 ft. A men's lavatory has been provided on the ground floor, and convenient to the lending library is a cloak-room and lavatory for ladies. The building is heated by a low-pressure hot water system, supplied by Messrs. John Long & Sons, Lurgan.

FREE LIBRARY, STAMFORD.—A new free library has been erected at Stamford, from designs prepared by Messrs. Hall & Phillips, London (whose plans were selected in an open competition), by Messrs. Hinson Bros., builders, Stamford. The site was provided by the Corporation, and occupies a central position in the town, having a frontage on the main street.

FREE LIBRARY, BERMONDSEY.—St. Olave's Library, Bermondsey, has just been opened for the Borough Council. The library was originally St. John's Girls' School, Tooley-street, but the building has been adapted to the purposes of a library. To effect the alterations necessary to adapt the school to the purposes of a library the whole of the walls and partitions which formed the classrooms were swept away, and about 15 tons of steel girders were fixed in forming the various floors, etc. The accommodation in the building as altered consists of a large dry book store and heating chamber in the basement. On the ground floor there is a magazine and news room, 34 ft. long by 24 ft. wide, in which 50 or 60 readers can be accommodated at the newspaper desks and magazine tables. The room is entered directly from the street. There is also a reading room for ladies and a separate one for boys. The first floor is utilised as a lending library, and a reference reading room. Accommodation is provided for the present stock of 8,580 volumes, with expansion room for a total stock amounting to 12,000 volumes. A feature of the lending library arrangement is the long counter with polished mahogany top and an unusually large provision of drawers and cupboards. The reference reading room adjoins the library, and through the glazed dividing partition the reference library books may be inspected by the readers, at the same time securing easy and quick service. The counter already mentioned serves to carry the two indicator frames, containing

numbers representing 10,000 volumes. Apartments have been provided on the upper floor for the use of the librarian in charge. For recreation of the librarian there has been arranged a large room which may be formed into a roof garden overlooking the Tooley-street recreation grounds. The whole of the various rooms forming the library have been divided with ornamental wood screens glazed with plate-glass, and the interior of the building has been decorated in Duresco colours. The building is warmed by hot-water pipes and by electric light. A feature has been made of the angle doorway, which forms the main entrance to the building, and which is constructed in stone, and has a carved representation of the borough coat-of-arms in the pediment. The alterations have been designed by the Borough Surveyor, Mr. R. J. Angel, M.Inst.C.E., in conjunction with Mr. John Frowde, the chief librarian, and carried out by Mr. B. E. Nightingale, Albert Embankment.

FREE LIBRARY, HARGREAVE.—A new free library has been erected at Hargreave facing Victoria-avenue and Raglan-street. It is the first portion of the proposed Municipal Buildings, and is constructed in a way which will readily join up with them when the extension works begin. The entrance is from Victoria-avenue into an entrance hall, which also forms the space for borrowers from the lending library. Leading direct from this entrance hall is the news room, 50 ft. square and lighted both by windows and from the roof. This room will afford accommodation for about 200 readers. The lending library will provide shelving for about 40,000 volumes. In the half basement are a large boys' reading room, 30 ft. by 22 ft., book stores, heating chamber, etc. On the first floor there are a reference library and magazine room, 44 ft. by 22 ft., book stores, and librarian's room. The floors and staircases throughout are of fireproof construction. The heating is by low-pressure hot water. The lighting throughout is by electricity, which will also be used for working a fan for ventilation purposes. The architect is Mr. H. T. Hare, of London. The total cost of the building and furnishing has been a little over 8,000*l.*

THE HOLBORN EMPIRE.—The new theatre of varieties in Holborn is to be known as the Holborn Empire. The new building, which stands on the site of the old "Royal," has been constructed from the plans of Messrs. Frank Matcham & Co. at a cost of 30,000*l.* The old building was a one-tier house, but by taking in the basement and utilising the space hitherto occupied by cellars room has been provided for a circle with a balcony over. The stage, which was originally on the left of the main entrance, now faces it. The main space has been provided with a stage large enough to accommodate any musical production. The theatre has total seating accommodation for 2,000 persons. There is a foyer 40 ft. in length. The decorations of the auditorium are designed in a free treatment of French Renaissance, the colour scheme being white, cream, and gold. The ground floor is divided into fauteuils, stalls, and pit stalls. There are foyers, lounges, and retiring rooms in all parts of the house.

NEW NORTH RIDING COUNCIL BUILDINGS, NORTHALLERTON.—New buildings for the North Riding County Council have been erected at Northallerton close to the railway station. The entrance gates, about a hundred yards from the railway station, open up an extensive piece of ground lying between the front of the building and the road. The front elevation is Renaissance in style, the red brick facing being relieved by white stone dressings. The iron screen gates bear the County arms in the form of shields, beyond which the swing doors lead from the outer vestibule to the arched entrance hall, which is divided into bays by Hopton Wood stone columns. The pillars have black marble caps and bases, and the same materials are used in the grand staircase which faces the main entrance, and the balustrade is of fossil Frosterley. Across the top of the main staircase extends an ante-room or corridor, which, like the rest of the corridors, has a floor of black and white marble, the former Belgian and the latter Sicilian. The Council Chamber is 45 ft. square, and lies at the rear of the building, the ante-room forming the connecting link between the two. To a height of 25 ft. from the floor, which is laid with wooden blocks, rises the domed ceiling of fibrous plaster, light being obtained through four lunettes. On each side is a semi-circular window at a considerable height from the floor. The interior has pilasters and columns of the Corinthian order, and the wall space between them is treated with raised panels of fibrous plaster. A Cuban mahogany paneled dado runs round the room, and on each side of the dais, the paulling is carried to a height of 8 ft. and enriched with carving. The heating and ventilation are on the Pleum system. The Grand Committee-room is approached from the ante-room by way of the second flight of the chief staircase. It is 46 ft. by 28 ft. and has fluted Corinthian columns carrying the cornice. Three other committee-rooms *en suite*, the chairman's room, and members' smoking-rooms complete the

accommodation on the south half of the first floor, the other part being reserved for the county surveyor and clerk of accounts. Coming back to the entrance hall, corridors to right and left gives access to suites of offices occupied by the clerk to the Council, the Education Department, the architect, and building inspector, whilst provision is also made for storage, ammunition, and search rooms. Electric light from the local mains is provided in all parts of the new hall. The estimated cost of the building, including the caretaker's cottage, boundary walls, entrance gate, and railing, laying out of grounds and fore-courts, etc., formation of roads, and the furnishing of the entire building was 33,000*l.*, and it has been carried out within that amount. The building contractors were Messrs. J. Howe & Co., of West Hartlepool. The furnishings were carried out by Messrs. Goodall, Lamb, & Heighway, of Manchester; and the electric light fittings, designed by the architect, were manufactured by Messrs. Singer, of Farnley. The architect is Mr. Walter H. Brierley, F.S.A., of York.

APPOINTMENTS.

BRITISH MUSEUM.—The King has nominated Lord Esler as Royal Trustee of the British Museum vice the late Sir Monstantuar E. Grand-Duff.

CORPORATION OF THE CITY.—Mr. Alexander Ritchie, Common Councillor and J.P., has been elected Chairman of the City Lands Committee of the Corporation of London.

LONGBRIDGE URBAN DISTRICT COUNCIL. The appointed Surveyor and Engineer at Longridge Urban District Council is announced by Mr. James Marshall, Chief Assistant-Engineer to Preston Corporation.

METROPOLITAN MUSEUM, NEW YORK.—Mr. Roger E. Fry has been appointed Curator of the collection of pictures. Mr. Fry is a member of the New English Art Club and a contributor to the *Burlington Magazine*; some years ago he succeeded Mr. F. G. Stephens as art critic to the *Athenaeum*.

FOREIGN.

CAPE TOWN.—The result of the competition for the new Law Courts is as follows:—The first premiated design is that by Messrs. Hawke & McKinlay, the design placed second is that by Messrs. Milne & Sladdin, the third being by Messrs. Baker & Masey, all firms practising in Cape Town. The adjudication of the designs was entrusted to a special committee, appointed by the Government, consisting of Sir Henry de Villiers (Chief Justice), Sir John Graham (Secretary to the Law Department), Mr. Advocate Searle, K.C., and Mr. C. H. van Zyl, with Mr. Mervyn Macartney as assessor. The premiums given were 500*l.*, 300*l.*, and 200*l.* The estimated cost of the building, exclusive of fittings, is 175,000*l.*

SOUTH AFRICA.—The monthly statistical returns compiled by the Johannesburg municipality show that 127 buildings were approved by the Town Council during the month of November last within one mile of the Market-square, 177 from one to two miles, 191 from two to three miles, and 65 from three to six miles, while on the mines 35 were approved. The total estimated cost of the buildings was 320,102*l.*—Tenders are called for by the Lorenzo Marques Construction Department for the erection of sanitary buildings at the wharf. The estimate of the department is 1,350,000*rs.*

TOWNS AND BUILDINGS IN EGYPT.—In the last published report of the Egyptian Public Works Ministry, Mr. Arnold Perry gives a large amount of useful information relative to the work of the Towns and Buildings Department for 1904, although the interest of his account is considerably diminished by the fact that it consists chiefly of statistics. Mr. Perry's duties as Director-General of this branch of the Public Works Ministry are so important and so varied, and the difficulties with which he has to contend are so great, that the annual record of his experience would certainly be more interesting if accompanied by a larger proportion of descriptive matter and comment. Two particularly interesting notes, however, will be found in his last report, one relating to the removal of a large mass of rock which threatened the safety of the Mosque of El-Magnani at Cairo, the other describing the failure of the reinforced concrete roofs of the quarantine cattle-sheds at Mex. The failure of these roofs is shown to have been entirely due to the inferior quality of the concrete, which was neither airtight nor watertight. After the collapse had been investigated by a Commission appointed for the purpose, it was conclusively established that the chief cause of the observed deterioration, in the concrete and iron alike, was the adulteration and partial replacement by local limestone of the cement, which is the only constituent of concrete that affords any guarantee of impermeability, and, we may add, of durability and strength.

BAVARIAN GLASS INDUSTRY.—Reporting on

subject, Mr. Buchmann, H.M. Consul at which, observes that the manufacture of glass is impeded in 1904 by dry weather and lack of horsepower, especially in the Firth district, the centre of the industry. The United States market, once all-important, is being spoilt by the competition and high duties, whilst the Canadian market has been lost entirely by the glass war; the duty on Bavarian blown glass is formerly 20 per cent. *ad valorem*, the duty on German glass has been raised to 26 per cent., and the duty on Belgian glass has been reduced to 10 per cent. If this state of affairs continues, the Bavarian glass industry will soon be a thing of the past, having besides to fight against the keen competition of the Rhine provinces, Silesia, Belgium, and Bohemia. Fifth (Nuremberg) exported in 1890 to the United States glass of the value of 470,000*l.*, which sum fell to 15,533*l.* in 1903, and to 62,834*l.* in 1904. The same place exported up to 1904 mirrors to the value of about 12,500*l.* per annum to Canada, but the new tariff and surtax amount to 26 per cent. of the total value the export trade to Canada is almost killed. Some works have turned to decorative manufactures, others have turned to paper manufacturing entirely. The raw materials necessary to the glass industry have also considerably increased in price—acids, arsenic from 15 to 20 per cent., shellac even 300 per cent., whilst the increase of the sale price was only 10 per cent. This increase was partially due to the depression caused by the strike in Belgium, by which the Bavarian glass industry profited temporarily. The competition, however, of the United Kingdom and Belgium made itself felt in those countries having lost their markets to the East through the war in Africa and seeking new outlets. Stained glass, one of the chief art industries which Munich is famous, suffered in 1904 on account of a decrease in orders. The chief cause of this depression is said to be the order of the Ministry of Education and Worship (Kultusministerium), by which stained glass in modern styles is no longer to be admitted in Bavarian churches. New markets have, therefore, to be sought in North Germany, prices having risen in consequence. The new Order creates a great deal of dissatisfaction, and it is anticipated that the staffs of numerous Bavarian glass painting establishments (there are thirty-six in Munich alone, employing some 2,000 English artists) will have to be reduced, and the establishments will have to be moved to foreign countries, where wages of artists have risen, and the export to Canada and the United States suffers on the surtax and the heavy duty of 45 per cent. the value respectively.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENT.—Mr. Bernard Dickson, the District Surveyor for Nottingham and District, of St. George the Martyr, has resigned his district office to Nos. 14 and 16, New Kent-road, S.E. (over the London and Westminster Bank).

A LONG-LIVED STOVE.—The Carron Company send us an extract from a letter from one of their correspondents in Canada, the interest of which to them is obvious, but which we agree with them in thinking is not of interest to our readers. It was on a business trip this fall in the north-east part of Saskatchewan, and saw a box stove of what I thought was a new design in box stoves. On inquiring where the man got it, he said it was his great-grandfather's, and that it was made by the Carron Company 150 years ago. I thought that length of time. The stove belongs to the early settler's family that came out with Lord Selkirk.

ROYAL ACADEMY EXHIBITION.—The sending-in days for the next Royal Academy Exhibition are: For water-colours, miniatures, black and white drawings, and all other works under glass—until Friday, March 30; for oil-paintings—Saturday, March 31, and Monday, April 2; for sculpture—Tuesday, April 3. The hours for the reception of works are from 7 a.m. to 10 p.m.

No. 11, DOWNING-STREET.—The new Ministry have departed from the time-honoured custom whereby they have formed the official residence of the Chancellor of the Exchequer. Mr. Herbert Gladstone, the Home Secretary, has taken up his abode in the house, where some necessary repairs were recently made, and is thus installed in his birthplace, for he was born there during his father's tenure of office as Chancellor of the Exchequer.

DISAPPEARING SURVEYORS' FEES.—The Baths and Washhouses Committee of Wandsworth Borough Council, in a report circulated on Monday, stated that they had addressed a letter to the London County Council calling attention to the excessive fees for small additions to large buildings made by district surveyors. In relation thereto they had received a communication from Mr. I. R. Ford, District Surveyor, offering to reduce his

fee in regard to the new pump-house recently erected at the baths from 18*l.* 2*s.* 6*d.* to 10*l.* 10*s.* The Committee had accepted this offer and had passed a resolution directing that a further letter be addressed to the London County Council and that Mr. Ford be also informed that the object of the Committee had been to call attention to the general question of the excessive fees charged in respect of small additions which, under the London Building Act, are calculated upon the area of the entire building. The Committee had recently decided to postpone carrying out certain work on account of the excessive fee which would be chargeable, amounting to nearly half the amount of the Surveyor's estimate of the cost of the work.

A QUESTION OF PAVING.—The Works and Highways Committee of Lewisham Borough Council reported on Monday having been in communication with the Building Acts Department of the London County Council with regard to the paving of strips of land given up as a condition to plans being passed for the erection of buildings. The Building Acts Committee expressed the opinion that in all cases where a condition is attached to a consent under the Building Acts requiring the surrender of land to the public way, the owners of such land should not be put to the expense of paving it. Under these circumstances the Borough Council Committee had directed their surveyor to carry out the necessary paving work with regard to the land given up.

THE OLD BRIG, Ayr.—The Ayr Town Council, after being in communication with Mr. Oswald and a deputation representing persons interested in the preservation of the Auld Brig, and after considering the best methods of preserving the bridge without rebuilding it, as suggested by Mr. Hall Blyth, have unanimously agreed to the following resolution:—“(1) Mr. Oswald is, as soon as possible after the General Election is over, to convene a public meeting in Ayr, when resolutions will be submitted and a committee appointed to take all steps considered expedient to obtain subscriptions for executing the works necessary for the preservation of the bridge; (2) should the committee, not later than August 1 next, succeed in raising the funds required for the work (which it is presently assumed may cost about 10,000*l.*) the Town Council will allow the committee to carry out the necessary preservative works on the bridge at the sight, and to the satisfaction of an engineer of eminence, to be selected by the committee; (3) the work will be proceeded with without delay, so soon as the necessary funds are raised, and the whole work is to be finished not later than August 1, 1906, when, or at the completion of the work if of earlier date, the committee will cease to have any further connexion with the bridge, the Town Council thereafter resuming full control over it; (4) should the committee find it necessary to rebuild any portion of the bridge, they shall submit plans and specifications of same to the Town Council, along with the offers for the execution of the work, and if the Council approve of same they will bear the cost of such rebuilding out of the Templeton bequest fund. Should the Town Council consider it necessary that a temporary wooden bridge be erected while the structure is being repaired or rebuilt, they shall be at the expense of erecting and maintaining it,” etc. Another important condition laid down was that “the plans and specifications of the whole works to be executed by the committee shall be submitted to the Town Council, that he may assure the Town Council that the proposed works will make the bridge secure for public traffic for the future, and until this assurance is given the work shall not be proceeded with.” It was stated that in the event of Mr. Oswald's committee being unable to fulfil their part of the arrangement the Council would take up the question of rebuilding the bridge where they had left off.

A NEW WINDOW SASH.—Messrs. Recorders, Ltd., have shown us a model of a new window sash entitled “The Magic Window Balance,” which, in spite of a rather absurd name, has much to recommend it. It appears at first sight, when closed, like an ordinary sash window, but there are no hollow casings, lines, or pulleys. The sashes are balanced, and when the lower one is raised the upper is lowered correspondingly—so far it is not new; what is new is that the two sashes are connected by a hinged and pivoted arm, and after being opened perpendicularly for a short distance, the upper edge of the lower sash can be drawn inward, the upper sash following it in a parallel line, so that the two swing pointing downwards and the ceiling, giving the best form of air passage for an upcast current of air into the room. The whole construction is perfectly solid; there is nothing to get out of order, and the outside of both sashes can, by a simple arrangement, be cleaned from the inside. The only drawback, or which may be regarded as such by some people, is that the vertical rise of the lower sash, before it is canted, is limited; it cannot be raised high enough, for instance, to allow one to lean out of the window; but then it may be replied that leaning out of windows is a bad practice. At all events, that seems the only drawback

to what is, on the whole, one of the best and most workmanlike special forms of window sash that we have seen.

BRADFORD MASTER BUILDERS' ASSOCIATION.—The annual dinner of the Bradford Master Builders' Association was held on the 26th ult. at the Royal Hotel, Darley-street. Mr. August Moulson presided, Mr. B. Hanson, in proposing the toast of “The National and Yorkshire Federations of Building Trade Employers,” referred with gratification to the arrangement arrived at last year with the employees for the avoidance of strikes. Mr. Paul Rhodes (President of the Yorkshire Federation of Building Trade Employers), in responding to the toast, said that the employers' federations had not been formed with the object of reducing wages or of fighting the trades unions. On the contrary, the existence of such federations was the best guarantee of industrial peace. He hoped that something might be done by competition to put a stop to the senseless cutting of prices in contract work. Mr. John Dawson also responded to the toast. Mr. A. Gadie, replying to the toast of “The City and Trade of Bradford,” which was proposed by Mr. Archibald Hope, said that for a long time trade in Bradford had been as the builders were concerned, had been deplorable and the reason was that the staple trade had not been prosperous. Builders were always the first to feel bad trade, and the last to benefit by a revival. Should the staple trade improve, building would begin again, and the unemployed difficulty would vanish very soon. Mr. W. Cryer gave the toast of “The Bradford Master Builders' Association,” which was acknowledged by the President. Referring to the retirement of his predecessor in the office, Alderman Holdsworth, the President said that no one in the country had done more to promote the welfare of the building trade, and it was a matter for great regret that he should be laid aside. Continuing, he expressed regret that some of the leading builders in Bradford did not show sufficient interest in the Association. Combination amongst employers was more necessary now than ever it had been before. Labour members had been returned to Parliament in large numbers, and they would have much to say of rights and privileges that had hitherto been denied. Nobody wished to assert that labour had not its rights, but the duty of organizations such as the Bradford Master Builders' Association to see that they were not infringed. Mr. T. E. Taylor also responded to the toast. The toast of “Kindred Associations” was submitted by Mr. R. Raper, who responded to Mr. T. Hillington (President of the Bradford Master Plasterers' Association) and Mr. G. Spencer (President of the Master Painters' Association).

FALL OF COPING.—On the 29th ult., at the Brixton Coroner's Court, Mr. G. P. Wyatt held an inquest concerning the death of Arthur William Moscrop, aged eight years, whose parents, William and Akerman-road, Brixton. The child was fatally injured as a result of the coping of four houses—47, 49, 51, and 53, Akerman-road—falling upon him. Mr. Percy Hunter, District Surveyor to South Lambeth, stated that on visiting the four houses in question the day following the accident he found that the parapet of the front wall to the extent of 72 ft. by 2 ft. 10 in. to 3 ft. had fallen. The weight of the material that had fallen he calculated at about 10 tons. The cement covering of the parapet was cracked, the brickwork rotten through being sodden by water, and there was no proper bond for the party walls. The vibration caused by the traffic, the weather influences, and the defective mortar had each probably contributed to the accident. The frost on Tuesday night had undoubtedly also tended to disintegrate the mortar, and thus played its part in causing the structure to collapse. There was no outside indication that the brickwork was defective, and the actual cause of the accident was the weight of the cornice causing the brickwork to give way. He had served dangerous structure notices upon the owners of the premises, and also upon the owners of the adjoining property, and had also had the remaining portion of the copings removed. A verdict of “Accidental death” was returned.

APPOINTMENT OF SANITARY OFFICERS.—The Local Government Board has sanctioned the appointment of Dr. G. F. McGilvary as Medical Officer of Health for the Metropolitan Borough of Hampstead. They have sanctioned the appointment of the undermentioned persons as Sanitary Inspectors in Metropolitan boroughs as follows:—Islington—Mr. T. H. Hancock, as from January 15, 1906. Lambeth—Mr. J. S. Matthews, as from January 1, 1906. Miss L. M. H. Pearson, as from January 1, 1906. St. Pancras—Miss B. Gardiner, as from November 23, 1905. Stoke Newington—Mr. T. Topping, in the place of Mr. G. F. Taverner.

BUILDING TRADES EXHIBITION, MANCHESTER.—A Building Trades Exhibition is announced to be held at St. James's Hall, Manchester, from April 25 to May 5. From the announcements that “no medals or diplomas will be given,” and that “every likely buyer will receive invitation

with free ticket direct from the management," it would seem that it is rather in the nature of a sale than an exhibition in the more important sense of the word.

THE GROWTH OF COVENTRY.—The number of houses erected in Coventry during the past seven years has averaged nearly two per day. Since 1899 4,063 houses and other buildings have been erected. Seven years ago the record for the twelve months was 117 new buildings completed. In 1904 the figures had grown to 746, whilst last year 426 new buildings were put up. It is interesting to note that at the beginning of the XVIIIth century there were under 2,000 houses inhabited in the city, whereas now there are about 17,000 houses tenanted.

"A.A." OLD DAY STUDENTS' CLUB.—The fifth annual dinner of the Architectural Association Old Day Students' Club took place at the Florence Restaurant on January 26. The number of those present was thirty, including Mr. E. Guy Dawber who presided, and Mr. H. Tanner, jun., the Hon. Secretary of the Architectural Association who was present as a guest of the Club. After the usual loyal toasts had been proposed by the Chairman, Mr. H. Tanner briefly proposed the "Architectural Association and the Day School." Mr. Maule, in replying, remarked that he always thought that this annual gathering was an admirable opportunity for taking stock of the position of the School. He briefly ran over the history of the School from its inception in 1901, paying special attention to the numbers working there at different periods down to the present, and remarked that in the year 18 in the second year. He drew attention to the fact that the scheme of work now followed was almost identical with that planned by Mr. A. T. Bolton at the beginning (Mr. Bolton's name being received with general applause). He applauded the feeling of *esprit de corps* present in the School and fostered by the Club, and remarked that every activity should be welcomed as long as it led up to the "larger policy" of the Architectural Association itself. But he would warn the Club against ever intruding intentionally or otherwise upon the work of the Architectural Association itself. All members of the Architectural Association should be proud of their membership of that Society, and he noted as an additional reason for such pride that in the Institute Studentships just awarded seven out of the eleven had been made to Architectural Association men. Mr. Dawber then proposed the toast of "The Club," wishing it every success on his own behalf and on that of the whole Architectural Association Council. In his opinion the Club was an excellent institution, as it helped to keep those fellow-students together in after life who had worked side by side in the School. He reminded those present that they could do much as a Club towards helping the spirit of good fellowship in the Association. Mr. Travers, the Hon. Secretary of the Club, in replying, noted the fact that, although the Club was, and had always been, an unofficial body composed of past students of the School, and not necessarily all members of the Association, yet it had, when opportunity offered, devoted its energies towards the furtherance of that "larger policy" to which Mr. Maule had referred.

THE T SQUARE CLUB.—The first meeting of this Club as newly constituted was held on Tuesday, the 23rd ult., in the International Hall, Monico Restaurant. The proceedings opened with an invitation supper followed by a concert. The chair was taken by Mr. E. G. Rivers, who, in proposing the toast of "the Club," asked for an announcement as to the exact position of the Club. The Secretary, in reply, stated that as now constituted it consisted entirely of members of recognised professions who were solely engaged in professional practice, and the object of the Club was to provide social evenings during the winter months. The entertainment which followed, carried out under the direction of Mr. J. Harry Pitt, was provided by Mr. Arthur Grover, Miss Marie Schulz, Lieut. Col. W. H. Allen, Mr. Fred Curtis, Mr. Harry Vincent, Mr. J. Harry Pitt, Mr. Spruell Groom, and Mr. Wingrove Ives. All information regarding the Club may be obtained from the Hon. Secretary, Mr. W. H. Webber, 7, Great James-street, Bedford-row, W.C.

GLASGOW ARCHITECTURAL CRAFTSMEN'S SOCIETY.—A meeting of the Architectural Craftsmen's Society was held on the 26th ult. in the Technical College, Glasgow. Mr. Colin Sinclair presided. Mr. J. Campbell Reid read a paper on "Architectural Censorship." Mr. Reid showed by numerous lantern views architectural mistakes, due to the want of proper supervision of architectural schemes, plans, and references to the relation of new buildings to their surroundings, which were often of real architectural or historical value, and were thrown out of scale by the new structures. The lecturer advocated the appointment of small committees for each district of large towns, who would form an Architectural Court, before whom all plans for proposed buildings would be submitted after having been sanctioned by the Dean of Guild Court. These committees would refer any schemes opposed to

architectural principles to the censor, who would be an architect or artist of repute appointed by the Government, and whose decision would be final. Mr. Reid also advocated the laying out of new streets by architects, who would introduce more varied lines than those laid down by engineers, and thus relieve the monotony of many of our thoroughfares. A vote of thanks to the lecturer was proposed by Mr. C. Ernest Monro and carried.

CHURCH OF ST. JAMES, LOWER CLAPTON.—Sitting in the Consistory Court of London on January 22 Dr. Tristram, K.C., Chancellor of the Diocese, granted a faculty for authorising the vicar and churchwardens of St. James to carry out certain alterations and improvements of the church which was built in 1841 after contributions in the Gothic style, of A. W. Hakerill. The church contains about 800 sittings, whilst the population of the parish amounts to 10,000. The proposed works comprise the building of a chancel, clergy-vestry, and choir-vestry, with an organ chamber above, the re-arrangement of the seats in the nave and transepts, new seating throughout, and the re-lighting of the entire edifice. The alterations will increase the accommodation by about 60 sittings and the vestries will be erected upon part of the ground originally conveyed for the site of the church, no intentions having been made therein. Towards the estimated cost (4,500*l.*) the Ecclesiastical Commissioners have contributed 1,000*l.*, and 2,250*l.* have already been subscribed.

DIRECTORY OF AMERICAN ARCHITECTS.—We have received "The Architects' Directory and Specification Index," being a Directory of names and addresses of architects in the United States, together with a list of manufacturers (material or appliances used in American building. The latter can hardly be of any use to English architects, but the Directory may be useful to those who wish to communicate with architects in the United States. It is published by Mr. W. T. Comstock, 23, Warren-street, New York.

ASPHALT FROM BUENOS AIRES.—Samples of asphalt from Los Garrapatales have been forwarded through the Foreign Office to the Board of Trade by Mr. A. C. Ross, C.B., H.M. Consul at Buenos Aires, and have been placed on view at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, E.C.

THE LOCAL GOVERNMENT ANNUAL.—The fifteenth yearly issue of the Local Government Annual and Official Directory (Farringdon-street, E.C.) has been sent to us. The main portion of this excellent little work is devoted to the Directory, which gives the names and addresses of the chief officials of all corporations, London borough councils, county councils, boards of guardians, urban and rural district councils, county and borough asylums, etc., throughout the kingdom, as well as the public libraries, public parks, and City companies of London. A feature which will be found useful is the insertion of the names of the chairmen of committees in the metropolitan boroughs, also the chairmen of the London County Council committees. Readers will find the telephone numbers of all those London boroughs which have adopted them. The names and addresses of the Metropolitan Water Board are also included, and accompanied by a complete scale of charges in every district supplied by the Board. The other section consists of a list of the various education committees in England and Wales. In addition to the directory there is information relating to the public libraries, baths and washhouses, and electric light undertakings in the boroughs of London, and the work includes an abstract of the local government legislation of 1904. There is also a complete list of all the parks and open spaces of the Metropolis, with the local authorities controlling them. The price of this handy and useful publication is 1*s.* 6*d.*

Legal.

ACTION BY AN ARCHITECT.

The case of Neill & Sons v. Worthington & Co., Ltd., came before the Court of Appeal, consisting of Lords Justices Vaughan Williams, Stirling, and Sir Gorell Barnes, on the 25th ult., on the application of the defendants for judgment or new trial on appeal from verdict and judgment at trial before Mr. Justice Grantham and a special jury in the King's Bench Division.

Mr. Scott Fox, K.C., and Mr. Montague Lush, K.C., appeared for the appellants; and Mr. Tindal Atkinson, K.C., and Mr. Compton for the respondent.

It appeared from the statement of Mr. Scott Fox that the action was brought by the plaintiff, Mr. Neill, an architect, trading under the style of Neill & Sons at Leeds, against the defendants, the well-known brewers of Burton, to recover 56*l.* 8*s.* for work and labour done as it was alleged on the employment of the defendants. The defence was that there was no contract of employment between the plaintiff and the defendants at all and that the people whom the plaintiff

really looked to for payment were Cartell & Gale, Ltd., spirit merchants. The work in respect of which the action was brought was that of making alterations at the Royal Exchange Restaurant, Leeds. At the trial the jury returned a verdict for the plaintiff, but the judge, on being asked by the plaintiff for judgment, returned accordingly. The grounds of the present application were that the verdict was against the weight of the evidence, and that the learned judge had misdirected the jury.

In the result Lord Justice Vaughan Williams gave judgment, said he saw no evidence of any authority being given by the plaintiff to the defendants to pledge their credit in the matter, and he saw no evidence to support the verdict of the jury. He thought the appeal must be allowed and judgment entered for the defendants.

Lord Justice Stirling and Sir Gorell Barnes concurred.

ACTION BY A QUANTITY SURVEYOR.

The case of Clarke v. Brooker and others came before Mr. Justice Walton and a common jury in the King's Bench Division on the 30th ult., an action by Mr. Edmund Thos. Clarke, a quantity surveyor, against Priscilla Anne Brooker, J. W. J. Brooker, and A. E. Brooker, of Darlington, Brockley Park, Forest Hill, the executors of the late James William Brooker, an architect, for 170*l.*, the alleged agreed amount for work and labour done by the plaintiff for and at the request and by the order of Mr. J. W. Brooker.

It appeared that the work in question was done in relation to the Imperial Hall, East Dulwich, together with the erection of the order for the employment was verbally given to him by the late Mr. Brooker on November 13, 1901, and again at the Imperial Hall on November 14, 1901.

The defence was a denial that Mr. J. W. Brooker appointed the plaintiff as alleged or at all, or that he requested or ordered the plaintiff to do the work, or that he agreed to pay him 170*l.*, or any sum whatever. Defendants also said that Mr. Brooker acted as sole agent for the Hall Finance Syndicate and not otherwise. Defendants also alternatively pleaded that it was an implied term of the employment that the plaintiff should perform his work within a reasonable time, and that plaintiff failed to perform his work within a reasonable time and his work was consequently of no value to Mr. Brooker.

Mr. J. F. P. Rawlinson, K.C., and Mr. Rittir, appeared for the plaintiff, and Mr. Clavell Saltor, K.C., and Mr. L. Davies for the defendants.

Mr. Rawlinson, having opened the case, called the plaintiff, who, examined, said that he was a quantity surveyor of twenty-three years' experience. He had acted both independently as quantity surveyor and as assistant to architects. He had known Mr. Brooker since 1886 and had had many previous dealings with him. He always acted as assistant so far as Mr. Brooker was concerned. At the end of 1901 he received a message asking him to call on Mr. Brooker, and on November 13, 1901, he called at his office. Mr. Brooker then told him that he wanted the job in question done, indicating what the job was by the plans on his desk. Witness said he would do it, and the arrangement was to meet on the works the following day, so that he could take Mr. Brooker's instructions—that was at the Imperial Hall, the job being measured up extras and omissions under the contract. The building was not then complete, but was approaching completion. Witness met Mr. Brooker at the Hall, when the latter pointed out each item he required adjusted. Mr. Brooker gave him nothing but verbal instructions. From that time he proceeded to get on with the work. He measured up from day to day as much as they could get through. That went on until about April 1, at which date the whole of his account was done except the last four items which appeared in the summary. He went through the accounts with Mr. Brooker, but on April 23 Mr. Brooker said it appeared to him that witness had made out the account more in the interest of the builder than of his clients, the Hall Finance Syndicate. Witness felt very upset. Mr. Brooker then took hold of the papers, threw them up in the air, and told witness to take them away, and he did so. He saw Mr. Brooker from time to time after that and also Hopkins, the builder.

By his lordship: When he was employed in November, 1901, nothing was said about his remuneration. All he was told was that he was to get on with the work.

Examination continued.
His charges were fair and reasonable—2*l.* per cent. also 1*l.* per cent. for pricing would bring the amount to 186*l.* and then the amount for copying brought it to 190*l.* Witness only asked for the work 170*l.* Mr. Brooker thought that 150*l.* was enough, but the price was afterwards finally settled at 170*l.* Some time in 1903 he had a conversation with Mr. Brooker with reference to the creation of the Finance Syndicate accepting debentures instead of cash payment. Witness consented to accept debentures for the amount of his fees, but he never got the debentures.

Cross-examined by Mr. Davies, he did not at the time he undertook the work know that the (all) Finance Syndicate were the building owners, and Mr. Hopkins the builder. Mr. Brooker's position was that of architect.

Can you point to anything in writing showing that you made any claim on Mr. Brooker personally during his life?—There was a letter of June 23 in which I said I wanted 170*l*.

At this stage of the case Mr. Salter took up the cross-examination of the witness.

He soon found out that the building owners were the Syndicate. He thought the contract price for the building was about 8,000*l*.

What would be a reasonable amount of time or a competent quantity surveyor to measure up variations bill such as this to the extent of about 6,000*l*?—Provided that all the work was done and you could get all your appointments kept it would take from two to three months—that is, on such work as this.

Mr. Salter informed his lordship that the ordinary practice was to add the total amount of the quantity surveyor's charges to the builder's total and the result was that the whole amount was paid by the building owner.

Cross-examination continued.

He had always looked to Mr. Brooker as being liable to pay for the building. He did not look to the Syndicate to pay him.

Plaintiff, in reply to further questions by Mr. Salter, said he always thought he would have to wait for his money until Mr. Brooker got paid. As Mr. Brooker would not pay him and neither would Mr. Hopkins, he applied to the Syndicate.

Did not Mr. Brooker say he should not have a penny, because of your delay in the matter?—No, it was in consequence of the remarks I made about this business.

Then, if you were entitled to the money from Mr. Brooker, why did you apply to the Syndicate?—I tried it as a last resource. In 1903 I repeatedly applied to Mr. Brooker for the money.

When you sent a letter to the Syndicate for the money did you consider yourself a creditor of the Syndicate?—I must have done, by the tone of the letter.

His lordship: When a quantity surveyor is employed by the building owner, according to the usual practice, from whom does he get his money?—The common practice is to have these fees added to the account of the builder and paid to the builder by the building owner, and the builder sends on his cheque to the quantity surveyor.

Mr. Fredk. Henry Hopkins, a builder and contractor, employed in the building of the Imperial Hall, examined in April, 1902, personally to Mr. Brooker, he said he wanted to settle up the plaintiff's account, but he declined to do it without plaintiff's figures. He then saw the plaintiff and got his figures, and these he communicated to Mr. Brooker.

This being the plaintiff's case, Mr. Salter, on behalf of the defendants, submitted that there was no evidence of any contract by Mr. Brooker personally to pay the plaintiff's account.

His lordship said it would be safer not to withdraw the case from the jury.

Mr. Salter, saying he had no evidence to call on behalf of the defendants, Mr. Ritter summed up the plaintiff's case to the jury.

Mr. Salter, in addressing the jury on behalf of the defendants, submitted that their verdict should be for his clients. He said it was clear that Mr. Brooker had never taken upon himself the responsibility of personally paying the plaintiff his account. On the plaintiff's own evidence he knew at an early stage that the Syndicate were the building owners, and the financial position of the Syndicate was well known to him. The correspondence clearly showed that plaintiff had looked to the Syndicate, and to the Syndicate alone, for his fees. The plaintiff had asked Mr. Brooker whether it was through him that the Syndicate were resisting his claim, and Mr. Brooker had replied that it was, as the plaintiff had been guilty of such delay in getting on with the work it was useless. The plaintiff had not dared to set up such a claim against Mr. Brooker during his life, and he confidently asked the jury for a verdict.

His lordship having summed up,

The jury found a verdict for the defendants, and his lordship entered judgment accordingly.

DAMAGE TO PROPERTY BY FLOODING.

On Saturday, the 27th ult., the Official Referee, Mr. Muir Mackenzie, delivered his judgment in the actions brought against the Ilford Gas Company by the Corporation of East Ham and the Ocean Accident Guarantee Corporation; actions brought by the respective plaintiffs against the defendants for damages for having negligently, as it was alleged, caused a large quantity of flood water to overflow the plaintiffs' property in June, 1903, from the River Roding and a stream called the Aldersbrook.

In the action brought by the Corporation of East Ham against the defendants the facts were these:—At the time of the commencement of the

action the East Ham Urban District Council was the urban sanitary authority of the district which comprised the parishes of East Ham and Little Ilford, and by a charter granted in 1904 the district was incorporated as the borough of East Ham, and the property of the district devolved upon the plaintiffs. The defendants owned and occupied certain lands in the urban sanitary districts of Ilford and East Ham abutting upon the River Roding, the Aldersbrook passing through the defendants' lands on which they had erected gas works. Both the Roding and the Aldersbrook were crossed by the Romford-road, which ran east and west on a high bank to the north of the gas works and was carried over both channels by the bridges. There was also a channel between the Roding and the Aldersbrook parallel to Romford-road and immediately to the north of it. By their special Act, defendants were empowered to fill in part of the channel of the Aldersbrook inside their grounds, provided that if they closed any part of it southward from the Romford-road bridge within three years from the passing of the Act (1899) they should maintain, until the Barking-road bridge was reconstructed, a culvert having a diameter of 4 ft. 6 in. from the Aldersbrook to the River Roding through their own lands. The defendants made some changes in the channel of the Aldersbrook within their own grounds, leaving the culvert which was required by the Act, but in August, 1902, they closed up the culvert but did not close the arches of the bridge carrying the Romford-road over the Aldersbrook. Defendants also, for the purpose of laying gas mains, cut and reinstated, with an additional height of 1 ft., the river bank inside their grounds. They also raised the height of the island between the Roding and the Aldersbrook thus forming a sort of pit where any water would collect that might come under the Romford-road bridge along the Aldersbrook. In June, 1903, in consequence of a heavy rainfall, the water rushed along the Aldersbrook and collected on the defendants' ground by the bank of the Roding, the result being that the bank burst, which caused the damage complained of. The case for the East Ham Corporation was, that defendants were liable to maintain in repair the river bank inside their grounds as a protection against flooding, and that it had been weakened by the defendants carrying the gas mains through it and not properly reinstated, and, therefore, that they were liable for the damage caused by flooding. Defendants denied that they were liable to maintain in repair the river bank and that they had failed to keep their portion of the bank in repair. They also said that if any damage was caused to the plaintiffs it was through the overflow of the Aldersbrook, due to an act of God. At the trial, which took place before the Lord Chief Justice and a special jury in the King's Bench Division (reported in *The Builder* of July 15, 1905), the jury found that the defendants were guilty of negligence or want of reasonable care in closing the Aldersbrook and in reinstating the bank, and that the flooding was caused by both. They also found that the flooding could have been prevented by reasonable care, and on these findings his lordship gave judgment for the plaintiffs and directed that the amount of damages should be assessed by the Official Referee.

The action by the Ocean Accident Guarantee Corporation arose out of the same set of circumstances, it being an action by these plaintiffs, who were mortgagees of a number of houses erected near the defendants' works and which had been damaged by the flooding. These plaintiffs also secured a verdict in the King's Bench Division, and the question as to the amount of damages to be paid by the defendants to them was also referred to the Official Referee.

The Official Referee, in giving judgment in the first case, having stated the facts, said that after hearing all the evidence that had been given he was clear that his judgment must be for the plaintiffs. He did not intend to award a sum in respect of each item claimed for by the plaintiffs, but a lump sum to cover the whole. Plaintiffs claimed some 345*l*, in respect of damage done by the water to five roadways and the footways. They said that was the amount they had expended in repairs. Plaintiffs claimed for cleansing sewers and many such minor things, but in his opinion one must take a broad view of the matter and see if the plaintiffs were put to an unusual expense in consequence of the floods. In his opinion the plaintiffs' claim was altogether unreasonable and was founded upon a wrong principle. In view of all the circumstances, the total sum he should award the plaintiffs was 120*l*, with proportionate costs. In the second case the learned Official Referee said the plaintiffs claimed some thousands of pounds for damage done to their property and depreciation in value. He found that the houses were built upon marsh land, unsuitable for houses unless special precautions were taken, and those precautions were not taken. He held that there had been no depreciation, and he assessed the sum to be paid by the Gas Company to the plaintiffs at 15*l*. 15*s*. as sufficient to satisfy their claim for damages.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

408 of 1905.—J. E. NELSON and C. G. NELSON: *Stove Pipe Ventilators.*

This relates to a stove pipe ventilator, consisting of an open-ended tube provided at its forward end with an external annular flange set obliquely upon it, an elastic hook which projects from the flange, and a damper for the flanged end of the tube.

810 of 1905.—P. W. LOCKWOOD and G. J. WEIR, LTD.: *Couplings and Fastenings for Steam Heating Tubes and the like.*

This relates to a steam heating tube and the like, and consists of a cylindrical metal coupling, comprising three separable parts—namely, a barrel part with closed ends having perforations therein, an integral shoulder with mechanical face, and an open screwed end and tubular screwed extension piece therefor, also a solid screwed neck and fixing nut therefor.

1,387 of 1905.—L. ANIDJAH and D. D. REES: *Apparatus for Lowering Persons or Goods from Buildings and chiefly Designed for Use in case of Fire.*

This relates to an apparatus for lowering persons or goods from buildings, and comprises two bars joined together at one end, one of which is pivoted to the sill of the window frame whilst the other is designed to engage with a hook or its equivalent on the said frame, and a block carried by the bars and supporting a rope for lowering the persons or goods.

1,799 of 1905.—W. A. MOORE: *Siphon Flushing Apparatus for Water-closets, Urinals, Sewers, Drains, and the like.*

This relates to a siphon flushing apparatus having a tank or cistern for holding the water or other fluid, and a vertically arranged discharge or outlet pipe fitted therein, and consists of a ring or cylindrical piece fixed round the upper end of said discharge pipe, a plurality of annular grooves round said ring, a short concentric pipe slidably mounted on said ring, a further concentric pipe surrounding the discharge pipe and forming the annular space round the inner concentric pipe and a cover fitted to the upper end of the outer concentric pipe in such a way that the annular space between the concentric pipes communicates with the interior of the inner concentric pipe at the top.

5,025 of 1905.—W. H. FITTON: *Machinery for Sawing Stone, Slate, Granite, Marble, and the like.*

This relates to sawing machinery for stone and the like, comprising a circular saw, mounted at or close to one end of a spindle and carried in bearings fixed to a travelling carriage or saddle, which is adapted to slide on a bridge slide, bed, or way parallel to the plane of the saw, and is characterised by said travelling carriage or saddle carrying an electric motor on said spindle, or geared to said spindle, and geared to the feed mechanism, which is also carried on said carriage or saddle, for moving said carriage or saddle along said bridge slide, bed, or way.

5,209 of 1905.—A. W. BAXTER: *Solution for Rendering Combustible Materials Fire-resisting.*

This relates to a solution for rendering combustible materials fire-resisting, and consists of an impregnating solution obtained by dissolving phosphate of ammonia with boric acid in water.

9,620 of 1905.—G. T. WINNARD and J. BEDFORD: *Pulley Blocks.*

This relates to a pulley block and consists of an arch-shaped grooved rope support, carried by the lower block, either alone or in conjunction with a second grooved rope support carried by the upper block.

12,046 of 1905.—E. G. FERROT: *Reinforced Concrete Constructions.*

This relates to means for reinforcing a concrete or cement construction, comprising a plurality of bars, each having a series of main elements united by web portions integral with said bars, said web portions being partially separated at intervals, by shearing or other means, from said elements, the separated portions being bent at an angle to the main elements to form stirrups.

15,162 of 1905.—A. SENK: *Roofs for Hot-houses.*

This relates to roofs for hot-houses and consists of a girder with channel irons for the insertion of glass plates, and removable wood back, covering the inwardly projecting part of the girder.

17,846 of 1905.—J. MITCHELL: *Air-tight Covers and Frames for Inspection Chambers.*

This relates to air-tight covers and frames for inspection chambers, and consists in the employment of T-shaped nuts fitting into similarly-shaped slots or recesses in the frames, in combination with bolts passing through rebated holes in the covers and screwing into such nuts.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

1,922 of 1905.—N. JOHNSON: Apparatus for Cutting or Excavating Trenches.

This relates to an apparatus for cutting or excavating trenches, and consists in the combination of a motor-driven carriage, a suspended frame adjustable vertically thereon, a rotary boring head mounted in a carriage so as to be slidable upon the said frame, and an elevator and means for adjusting the position of the said suspended frame and for automatically and vertically feeding and rotating the said boring head.

4,218 of 1905.—W. M. DUCKER: Roofs for Portable Houses.

This relates to a portable house roof having independently covering the respective roof sheets of metal, covering the respective roof sections, and secured thereto prior to the sections being placed in position on the roof, each of said sheets having marginal lips to retain a batten, and flanged sheet metal battens engaging said lips and covering the joints between the sections.

5,711 of 1905.—F. W. MAXWELL: Construction of Fire-proof Curtains for Theatres and like places of Amusement.

This relates to the construction of fire-proof curtains for theatres and the like places of amusement, and consists in the combination of an open metal frame filled in with "plate wall slabs" or other like fire-proof material and provided at each side with trolley tracks running in vertical grooves made in the side walls of the proscenium opening.

8,104 of 1905.—L. P. FRIESTED: Construction of Sea-walls, Breakwaters, and the like.

This relates to a sea-wall, and comprises a series of metal piling sections consisting of channel beams arranged alternately so that their damaged edges interlock, each beam section being provided with Z irons rigidly secured thereto so as to prevent lateral displacement when the piling sections thus assembled are driven into the earth to a solid foundation, the upper ends of the sections extending above the water line.

8,105 of 1905.—L. P. FRIESTED: Construction of Cofferdams, Caissons, and the like.

This relates to coffer-dams and other structures of similar character composed of metal sheet piling sections, and consists in the employment of channel beams arranged alternately so that their flanged edges interlock, each alternate beam section being provided with interlocking Z beams for loosely locking the said sections together and preventing separation when the said sections are driven into place, the arrangement being such that a continuous wall structure is formed.

172 of 1905.—A. BRUCE: Siphon Cisterns.

This relates to a siphon cistern, and consists in the combination of an air inlet valve which is operated automatically by means of a ball or float lever, said valve being connected by means of a pipe with some place outside the lavatory so that the noise caused by the rush of air shall not be heard loudly within the lavatory or water-closet itself.

173 of 1905.—A. BRUCE: Siphon Flushing Cisterns.

This relates to a siphon flushing cistern, which is provided with a water tap or seal whereby the air can be locked in the short leg of the siphon or in a chamber connected therewith. An air escape valve is also provided and this valve is operated by means of a ball or float lever or its equivalent thereto.

451 of 1905.—R. CROSTWHAITE: Stoves for Heating Rooms and the like.

This relates to stoves for heating rooms and the like, and consists in the mode of operating the canopy and the arrangement of parts in connexion therewith in which the said canopy valve which is in a chamber connected therewith. An air escape valve is also provided and this valve is operated by means of a ball or float lever or its equivalent thereto.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

Table listing property sales including items like 'January 16.—By ORRILL, MARKS, & BARBEY at Mr. On's Hall, Oxford-st., "The Woodstock" p.h., ut. 34 yrs., yr. 115s., with goodwill. 25,000' and others.

Table of advertisements and notices including 'January 23.—By M. HOLMES & SONS. Cricklewood.—51, Ashford-rd., ut. 87 yrs., p. 5l. 8s., cr. 84l.' and 'January 25.—By CHESTERTON & SONS. Westminster.—Vincent-sq., ut. 554 yrs., g.r. 11l., yr. 68l.'

Table of advertisements and notices including 'January 26.—By MAY & PHILPOT. Streatham.—106 to 120 (even), Wellfield-rd., ut. 63 yrs., cr. 42l. 16s. 300l.' and 'CONTRACTIONS used in these lists.—F.R.G. for freehold ground-ten; L.G.R. for leasehold ground-ten; I.G.R. for improved ground-ten; G.R. for ground-ten; R. for rent; L. for freehold; C. for copyhold; L. for leasehold; P. for possession; etc.'

TERMS OF SUBSCRIPTION. 'THE BUILDER' (Published weekly) is supplied DIRECT from the office to residents in any part of the United Kingdom at the rate of 19s. per annum (42 numbers) PREPAID. To all parts of Europe, America, Australia, India, China, Ceylon, etc., 25s. per annum.

MEETINGS. 'FRIDAY, FEBRUARY 2. Junior Institution of Engineers.—Mr. K. Edgcombe on "Some Recent Electrical Engineering Measuring Instruments." 8 p.m.'

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Seventh General Meeting (Ordinary) of the Session. (1) To announce the names of the persons the Council propose to submit as a fit recipient of the Royal Gold Medal, 1905; (2) The President, Mr. John Belcher, A.R.A., to deliver an address to students; (3) Mr. J. W. Simpson to read a criticism of the works submitted for the prizes and studentships, 1905-6; (4) presentation of prizes by the President, 8 p.m.'

Table of notices including 'WEDNESDAY, FEBRUARY 7. Society of Arts.—Mr. Leon Gastor on "Progress in Electric Lighting." 8 p.m.' and 'FRIDAY, FEBRUARY 9. Royal Institution.—Mr. H. P. Newall, M.A., F.R.S., on "Electric Problems and Observations." 9 p.m.'

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

PRICES CURRENT OF MATERIALS.

BEOCKENHAM.—For erecting a school for defective children with rookery classes, the Arthur-road School, for the Urban District Council. Mr. John A. Angell, Surveyor, Beekenhall—
Wright & E. Nightingale £1,990 0
Emmott Bros. 2,193 0
Hall & Jacobs 2,152 8
H. Hesthfield 2,070 0
Wallis & Sons 1,956 0
Ltd. 2,043 0
F. W. Green, 1,994 15
J. Smith & Sons, Ltd. 1,903 0

CARDIFF.—For erecting new Sunday schoolroom, Fitzhugh-embankment, for Rev. H. A. Coe, Mr. A. Groves, architect, 15, Clifford-st., London:—
G. Beames £1,175 0
McMush Bros. 1,097 0
J. S. Shepton 1,043 10
G. Hallett 1,020 0
J. Gibson 880 0
D. Davies & Sons 650 0

FOLKESTONE.—For constructing a shelter, with ladies and gentlemen's conveniences in the Marine Gardens, for the Corporation. Mr. A. E. Nichols, Borough Engineer, Corporation Offices, Folkestone:—
S. T. Binfield £2,378

FOREST HILL.—For new sorting-office:—
W. A. Coombs £3,482 0
F. W. Green 3,000 0
T. R. Roberts & Co. 3,228 0
A. Black & Son 3,119 0
W. Mills 2,995 0
J. Garrett & Son 2,940 0
H. Loney & Son 2,840 0
J. D. Ling 2,800 0
J. E. Saunders 2,774 0
J. H. Groves 2,766 0
J. S. Shepton 2,758 0
J. & C. Boyter 2,739 0

FORDOUN (Scotland).—For erecting hall and janitor's house at Fordoun public school. Mr. G. Gregory, architect, Stonehaven:—
Masonry: J. Murray, Stonehaven } £744 12 6
Carpentry: A. Hendry, Auchincloch }
Slating: J. Lindsay & Son, Montrose }
Plumbing: R. & W. Peter, Bervie }
Plastering: A. Clark, Bervie }

GOSPORT.—For bathrooms and hot-water works at Workhouse Park-road, for Alverstoke Guardians. Mr. H. A. F. Smith, architect and surveyor, Star-chambers, Gosport. Quantities by architect:—
C. Wright £361 0 0
Southey, Ltd. 298 0 0
R. W. Lowe 397 0 0
J. Hunt 390 15 0
R. M. Middle 350 0 0

GRIMSBY.—For erecting a house on the Scarth-road. Mr. E. Goodhand, architect, Osborne-chambers. Grimsby:—
R. G. Kitching £520
J. H. Thompson & Sons 486
G. & J. Smith 478

KEHELLAND (Cornwall).—For erecting a Sunday Schoolroom, etc., at Khehelland, Camborne. Mr. Edwin H. Crispin, architect, Trevelyan-road, Camborne:—
Ford & Son, masons £260
S. Richards, carpenter £346
J. Berryman 350
Ireland & Jory 320
W. Richards 265

LONDON.—For making-up, etc., roadway in front of Nos. 1 to 11, Carlow-gardens, Carlton House Estate, Horse Hill, S.E. Mr. H. E. G. S. Smallman, architect, 8, Queen-street, Cheapside, E.C.:—
Hoffman £609 18 2
J. Tremaine 538 0
S. Kavanagh & Co. 497 0
T. Robinson 479 10
W. Neave & Son 468 0
J. Shelbourne & Co. 405 0
H. Woodham & Sons 393 0
E. Hes, Senr. 377 0

LONDON.—For the construction of additional staging at Belgrave Wharf, Westminster, for the Westminster City Council:—
T. Coultard £214 0
Wright & Son 194 15
Love & Co. 188 10

LONDON.—For means of escape in case of fire at the Upton House Training school, Hackney, S., and the erection of a manual training room for sixteen boys, for the London County Council:—
E. Lawrence & Sons 2,845
L. H. & R. Roberts 844
W. Lawrence & Son 824
C. R. Price 815
J. Stewart 780
J. Grover & Son 777

LONDON.—For the construction of workmen's dwellings on the site of Nos. 20, 21, 22, and 23, Marshall-street, Westminster, for the Westminster City Council:—
Sabsy & Son, Ltd. £3,700
Plastering £540
J. Bickley* £540

LONDON.—For constructing an iron and slate roof over part of the yard at the Destructor Depot, Georgian-street, Camden Town, for St. Pancras Borough Council. Mr. W. N. Blair, Borough Engineer and Surveyor:—
W. Taylor & Co., Lower Mall, Hammersmith, W.* £471

LONDON.—For erection of new Wesleyan East-end Mission Centre, Commercial-road, Stepney, E. Mr. W. Weir, Burrows, & Weir, architects and surveyors, 17, Victoria-street, Westminster:—
Portland Stone. Shop Fronts.
T. Pader & Son £35,056
G. Trollop & Sons 33,100
Colls & Sons, Ltd. 560
F. G. Minter 32,687
J. Canfield 32,648
W. Johnson & Co. 32,308
G. Parker 31,387

LONDON.—For road-making, etc., Adley-street, for Hackney Borough Council. Mr. N. Scorgie, Borough Engineer and Surveyor, Town Hall, Hackney:—
A. T. Catley £278 0 6

MERTON.—For constructing roads and sewers on the Merton Abbey Estate. Mr. H. R. G. S. Smallman, architect, 8, Queen-street, Chesham, E.C.:

Table with columns: Roads and Sewers, Old Materials, Net Total. Lists contractors like Wallace & Lums, Hewett & Sons, W. A. Sheppard, etc., with their respective costs.

† Withdrawn.

NEWCASTLE-UPON-TYNE.—For new pavilion, nurses' home, etc., at City Hospital for Infectious Diseases, Walker-gate, for the Sanitary Committee. Mr. F. H. Balfour, City Architect, Town Hall, Newcastle-upon-Tyne. Quantities by Mr. J. Parrell Allen, 21, Cranage-street West, Newcastle-upon-Tyne:

Table listing contractors and their costs for the Newcastle-upon-Tyne project, including W. Hall, Glen & Moffett, W. Ross, etc.

PRESTON.—For levelling, paving, flagging, channeling, etc., Lincoln-street from Barling-street to Peel Hall-street, for the Corporation. Mr. Thomas Cookson, Borough Surveyor, Preston. Quantities by architect—

Table listing contractors and their costs for the Preston project, including J. Mexham & Sons, Preston.

RIVER.—For erecting an infants' school at Common-lane, for the Dover Town Council. Mr. H. E. Stilgou, M.Inst.C.E., Malson Dieu House, Biggin-street, Dover:—

Table listing contractors and their costs for the infants' school project, including J. S. Overton, J. Moran, etc.

SHEPHE.—For the construction of about 4,800 lineal yds. of 12-in., 9-in., and 6-in. earthenware pipe sewers, with the necessary manholes, lamp-poles, ventilators, flushing valves, and storm overflows connected therewith, also for the receiving, sedimentation, and sand tanks, percolating and storm filters, sludge areas, storehouses, road to works, boundary walls, etc., for the Urban District Council. Messrs. J. Drake & Son, engineers, Queensbury, near Bradford:—

Table listing contractors and their costs for the Shephey project, including F. Robinson & Son, Thornton, Bradford.

SHEPLEY.—For sewerage works at Shepley, near Huddersfield, for the Urban District Council. Mr. T. Aird Murray, C.E., independent-buildings, Sheffeld—

Table listing contractors and their costs for the Shepley project, including J. Long & Sons, Stephens, Baslow & Co., etc.

WOODHALL SPA (Hines).—For constructing a sewer in Spa-road, for the Urban District Council. Mr. E. E. T. Bolton, Surveyor, Woodhall Spa:—

Table listing contractors and their costs for the Woodhall Spa project, including C. Kirk, J. Walling, etc.

W. H. Lascelles & Co. LIMITED, 121, BUNHILL ROW, LONDON, E.C. Telephone No. 1365 London Wall.

HIGH-CLASS JOINERY, LASCELLES' CONCRETE. Architects' Designs are carried out with the greatest care.

CONSERVATORIES, GREENHOUSES, WOODEN BUILDINGS, Bank, Office, and Shop Fittings. CHURCH BENCHES & PULPITS.

ESTIMATES GIVEN ON APPLICATION.

The BATH STONE FIRMS, Ltd., BATH.

For all the Proved Kinds of BATH STONE. FLUATE, for Hardening, Waterproofing, and Preserving Building Materials.

HAM HILL STONE. DOULTING STONE. The Ham Hill and Doulting Stone Co., Limited (incorporating the Ham Hill Stone Co. and C. Traak and Son, The Doulting Stone Co.). Chief Office:—Norton, Stoke-under-Ham, Somerset. London Agent:—Mr. E. A. Williams, 16, Craven-street, Strand.

GREEK MARBLE.

White and Blue Pentelikon at Low Prices for BUILDING PURPOSES. Beautiful Colours for Interior Decoration. Full Particulars and Samples:—MARMOR LIMITED, 18, Finsbury-square, E.C.

Asphalte.—The Seyssel and Metallic Lava Asphalte Company (Mr. H. O'Leary), Office, 42, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. Asphalte Contractors to the Forth Bridge Co.

SPRAGUE & CO'S, Ltd., "INK-PHOTO" PROCESS, 4 & 5, East Harding-street, Fetter-lane, E.C.

QUANTITIES, etc., LITHOGRAPHED accurately and with despatch. METCHIM & SON, 12, CLEMENTS LANE, E.C.

JOINERY Of every description and in any kind of Wood. CHAS. E. ORFEUR, LTD., COLNE BANK WORKS, COLCHESTER.

PILKINGTON & CO (ESTABLISHED 1838.) MONUMENT CHAMBERES, KING WILLIAM STREET, LONDON, E.C. Telephone No., 6319 Avenue.

Polonceau Asphalte. PATENT ASPHALTE and FELT ROOFING. ACID-RESISTING ASPHALTE. WHITE SILICA PAVING. PYRMONT SEYSSSEL ASPHALTE.

MOULE'S PATENT EARTH CLOSET COMPANY, LIMITED.

This Business, having been ESTABLISHED 40 YEARS, has all the experience that time and thought can give and ingenuity can devise in producing the

Most Perfect Earth Closet.

Where used there is no danger of typhoid fever. The Company has obtained

A NEW PATENT, 1905,

For further improvements, making its apparatuses

The Perfection of Earth Closets

Without increase of prices. They have been awarded Gold Medals and other Highest Prizes ever given for Earth Closets.

BEWARE OF INFERIOR AND UNRELIABLE IMITATIONS.

They are also especially suited for buildings and places below the level of drains and outfalls, and also where there is difficulty in obtaining a water supply. Testimonials of their value in these respects can be seen at the Company's Offices. They are well made and finished, in plain and in elegant woods, and can be fitted in any position inside or outside Mansions, Cottages, Schools, Hospitals, and Workshops. They are supplied to Camps, and for use on board ship. They have been supplied to Windsor Castle and Sandringham. Over twelve thousand have been supplied to Departments of H.M. Government. When they are required temporarily the Company will contract for lending a quantity, and will fix them if necessary.

On view at the Company's Address. Descriptive illustrated pamphlets and particulars sent post free.

MOULE'S PATENT EARTH CLOSET COMPANY, LTD., 5A, GARRICK STREET, LONDON, W.C.

The Builder.

Mr. Holman Hunt and Pre-Raphaelitism.

It is quite fair to the present generation to say, as Mr. Hunt does in the opening words of his preface—"Art is generally regarded as a light and irresponsible pursuit,

entailing for its misuse no penalty to the artist or to the nation of which he is a citizen." Among fairly intelligent persons at the present day, we think it is understood that art is a pursuit requiring very arduous study, and which is serious in its aims, and a person who maintained the contrary would be thought uneducated. The indictment was no doubt true when Mr. Hunt's career began, but English society has learned something since then. The words however furnish in a way the keynote of the book, which is a record of serious study, one might say struggle, after the attainment of an artist's ideals. A second question is, why was it entitled "Pre-Raphaelitism and the Pre-Raphaelite Brotherhood"? One object of the author, we gather, was to remove some popular misconceptions as to the real origin and the real aims of the Pre-Raphaelite Brotherhood, and in particular to upset what were supposed to be Rossetti's claims to have been the founder of the sect; in regard to which it may at once be said that whether or not Rossetti was the initiator of the movement, his pictures (all but the

earliest) show conclusively that he very soon deserted its standard. But though this subject occupies a few pages here and there, in rather a desultory manner, the book is essentially the autobiography of a painter, and in that sense a most interesting one, as the record of the life-work of one with whom art was nothing if not serious, and who spared no labour and sacrifice to attain his ideals.

Considering the title of the book,* however, we may turn first to the chapter in which the subject is first formally introduced. It may be thought by some that Pre-Raphaelitism is "ancient history" now, but the movement left its mark on English painting too decisively to allow it to be forgotten, besides that it influenced the author of this book throughout the whole of his life's work. The first reference to the expression occurs in the previous chapter, where it seems to have been used in joke by a fellow student after Mr. Hunt and Millais had been, though not irreverently, condemning Raphael's "Transfiguration" "for its grandiose disregard of the simplicity of truth, the pompous posturing of the Apostles, and the unspiritual attitudinising of the Saviour," and agreed that this picture was a signal step in the decadence of Italian art: to which their companions replied, "Then you are Pre-Raphaelite. Millais and I laughingly agreed that the designation must be accepted." But, as it is explained in the following chapter, Pre-Raphaelitism is not Pre-Raphaelism. Raphael in his prime

* "Pre-Raphaelitism and the Pre-Raphaelite Brotherhood." By W. Holman Hunt, O.M., D.C.L. London: Macmillan & Co. 1905.

was an artist of the most independent and daring course as to conventions." The author's view is that the prodigality of Raphael's productiveness, and his training of many assistants, compelled him to lay down rules and manners of work, and his followers accentuated his poses into postures.

"They caricatured the turns of his heads and the lines of his limbs, so that figures were drawn in patterns; they twisted companies of men into pyramids, and placed them like pieces on the chess-board of the foreground. The master himself, at the last, was not exempt from furnishing examples of such conventionalities. Whoever were the transgressors, the artists who thus servilely travestied this prince of painters at his prime were Raphaelites. And although certain rare geniuses since then have dared to burst the fetters forged in Raphael's decline, I here venture to repeat, what we said in the days of our youth, that the traditions that went on through the Bolognese Academy, which were introduced at the foundation of all later schools and enforced by Le Brun, Du Fresnoy, Raphael Mengs, and Sir Joshua Reynolds, to our own time, were lethal in their influence, tending to stifle the breath of design. The name Pre-Raphaelite excludes the influence of such corrupters of perfection, even though Raphael, by reason of some of his works, be in the list, while it accepts that of his more sincere forerunners."

The object of the Pre-Raphaelite Brotherhood was to get behind this conventional posturing and to base everything on the study of Nature; and hence Mr. Hunt says he objected to the habit Rossetti had contracted of speaking of their new principles of art as "Early Christian." There was not to be, in his opinion, any profession of antiquarianism; the principle was to go to the study of nature instead of adopting classical conventionalisms. It was on this head that the Brotherhood considered that they were persistently misunderstood and misrepresented in the press; they were taunted with taking their models

in art from a period when execution was imperfect, and were told that the greatest and best teachers were those who painted when the mastery of the technique of art was complete. The criticism was true in the abstract; it was absolutely misapplied with regard to much at all events of the work of the Brotherhood. The odd thing is that Rossetti's "Annunciation," one of the few Pre-Raphaelite pictures which received favourable notice from the first, really did give countenance to this view, and is a picture which might justly be considered to represent, in Rossetti's own words, "early Christian art"; it has the naïveté and childlike character of that art, both in its conception and in its rather stiff drawing. Millais' "Isabella" and "Christ in the House of his Parents," on the other hand (as we can all see now), had nothing whatever to do with either early Christian art or immature technique; they were works of a master in drawing; their sin, to the critics of the time was, that they represented a simple naturalistic treatment, figures just as they might be in every-day life, of a class of subjects which that generation had been accustomed to see treated in a conventional manner of composition. The "Isabella" especially was the result of an endeavour to show the characters, costumes, and expressions of the dinner company as they might have been in reality. It can still be seen to be a little too flat in its aerial perspective, the background figures come up to the front plane a little too much, in a way in which Millais would not have painted them in later life; a result of the desire to neglect nothing, to make every figure a complete study; for it was against slackness of execution that the Brotherhood also took up arms, and not without good reason. Millais' "Christ in the Home of his Parents," as it is now called, is also a picture entirely free from antiquarianism; it represents the best possible execution of a painter who was to become, if he was not already, the greatest of his day; it is one of his works now most admired by artists especially, who can fully understand the technical mastery displayed in it; that it is "Pre-Raphaelite" in the sense of resembling the works of Raphael's predecessors there is not a pretence for maintaining. But no production of the Brotherhood excited such fierce outcries as this picture. It was stigmatised as "mean, odious, and revolting." It is surprising that even those who were supposed to be art-critics do not appear to have recognised its beautiful technique. But from another point of view the outcry against it was not only not so surprising, it was not without reason. The original title, "Wounded in the House of my Friends," had probably a good deal to do with this. It was felt that the painter had taken a poetical and symbolical sentence from one of the prophets, supposed by the biblical criticism of the day to refer to Christ, and had reduced it to the plain prose of an accident with a carpenter's tool. There was reason in the outcry, though it was expressed in too violent language. A great ideal had been reduced to the most matter-of-fact prose of every-day life. Even now, with the more sober title

which does not appeal to an ideal, does it add anything to our conception of the childhood of Christ? It is a beautifully composed and executed genre picture, with a little touch of domestic pathos in it; that is all. And this consideration touches on the whole question of the pictorial treatment of the story of Christianity. Ruskin was contemptuous about the unreality of Raphael's picture of "Christ's Charge to Peter," and its total want of agreement with the facts of the fishermen's life of the apostles. The answer is that the subject was regarded by Raphael as one which had become a great symbolical church legend, and he treated it symbolically, and made it thereby a greater and more elevated subject for painting than it could ever have been if treated realistically. Millais, by his picture, coupled with its original title, flew in the face of the whole religious feeling of his day, which regarded the life of Christ as a sacred mystery; he reduced it from the ideal to the commonplace (as far as the conception of his picture went); and the outcry against it, from that point of view, was not by any means so unreasonable as the painter and his friends supposed.

The point is of importance in connexion with the work of Mr. Hunt in his search in the Holy Land for materials for realising the life of Christ in painting, which is described in so picturesque a manner and is such interesting reading. No one can feel anything but respect, almost reverence, for a painter who took his art in so serious and thorough a spirit as to undergo all the discomforts which he subjected himself to in the effort to obtain studies which would render his work more perfect according to the ideal he had before him; not only discomforts, but on several occasions serious danger of violent death at the hands of lawless Arabs and other marauders of the waste—dangers only escaped on one or two occasions by his own resource, courage, and coolness. To say that this portion of his autobiography has all the interest of a novel is, in fact, to pay rather too high a compliment to the ordinary run of novels. At a time when pictures are supposed too often to be things to be dashed off under a facile inspiration of "impression," this self-sacrifice and labour to achieve perfection and truth is a quality to be held up to admiration as an example to younger artists. Paintings worked at in this spirit are likely to live, for their technical qualities at all events; and time is not wasted in obtaining realism of surroundings and local colour; they are so much help towards truth of effect. The note of questioning comes in when we think, not of the accessories but of the main object of the painter. Mr. Hunt wished, in a thoroughly earnest and reverent spirit—of that there can be no kind of doubt—to make his art a medium for bringing the life of Christ more fully home to us. The correctness of the surroundings assists towards this, no doubt; but the main thing after all is the conception of the sacred personage in the story; and for that what is needed is not realism but imagination. To find a Syrian model and paint him with the most careful realism helps us little. Does the principal figure in "The Shadow

of the Cross" help us in any way towards a perception of the personality of Christ? Surely not; we should be inclined to add, we hope not. The real beauty of that picture is the figure of the kneeling woman, so admirable in its lines; but it is the only element of beauty in the picture; and then the symbolism of the shadow, and still more that of the "instruments of the passion," as they are called in ecclesiastical language—represented by the tools hanging on the wall, is (if we may be pardoned for saying so) such a poor and perilous kind of symbolism, so far inferior in its nature to the abstract symbolism of Raphael's "Charge to Peter" before referred to. Fortunately there are other and more satisfactory results from Mr. Hunt's labours in Palestine; the "Finding in the Temple" is a masterpiece, but it is so not on account of any probability that the figure portrayed resembles what the youthful Christ may have been, but because of the masterly drawing, composition, and character of the central group; it is a successful and powerful work of art, and "The Shadow of the Cross," whatever its religious intention, is not.

It is singular to consider, in contrast with these efforts after realism, that what has been certainly Mr. Hunt's most popular religious picture, "The Light of the World," is a purely symbolic one: though here again some part of the symbolism—i.e., the different shapes of the openings in the lantern, which (so we are told) are to suggest that spiritual light comes into the world in different shapes though from the same source—is of a rather childish order; and what is the artistic value of a symbolism that requires explaining? The text which has been popularly attached to the picture, "Behold, I stand at the door and knock," which it is understood that the painter did not intend, and objected to, really gave the picture a much broader and better symbolism than the rather far-fetched one of the lantern. One great value of the original picture, the unhappy destruction of which through carelessness is described in the book, was in its remarkable colour; the robe of the figure especially was one of those inspirations in colour which it is impossible to define in words. In its religious aspect we have always thought the work over-rated, and still more do we think so of "The Scapegoat," a most remarkable piece of painting, especially in the distant hills; as a picture of desolation it is admirable; but the popular ideas as to its spiritual significance are only suitable to amuse children with.*

As far as we can gather, it would appear that Mr. Hunt means us to understand that he more than any one else was the real originator of the Pre-Raphaelite movement, or he and Millais together, and that Rossetti was more an adherent than an originator. It is certain at all events that Rossetti very soon abandoned their principles of painting, and that Mr. Hunt is the only painter of note who has adhered to it resolutely throughout his career; so

* Last time we saw the picture exhibited (somewhere in Bond-street), we noticed with some surprise, in the case of a painter usually so accurate in detail, that the markings on the face of the moon are not represented correctly, and appear to be carelessly put in. It makes no difference to the picture, of course, as a whole, but we were surprised to find this detail neglected.

that he furnishes to some extent a kind of test as to the permanent value of those principles in their influence on painting. One regards the result with rather mingled feelings. He is undoubtedly a great painter; the question is whether he would not have been a greater one had he somewhat relaxed the severity of the early Brotherhood tenets or practice. On the one hand painting of such conscientious and thorough finish must always have its value on that account, and can never appear common-place; on the other hand the expression of his subject is often marred by the hardness and want of balance arising from the effort to paint up everything to the same standard of finish. "The Awakened Conscience," for instance, is a powerful work in its main expression, and would in any case always compel interest from its extraordinary minuteness of realism of detail; but it can never be a pleasing picture; it is too hard and violent; every detail seems to fly in your face; the colour is harsh and inharmonious; and the design really looks much more attractive in a small black-and-white reproduction than in the "original" picture. In "Valentine and Silvia" there is real dramatic power, as also in "Clandio and Isabella"; the hardness of detail is less insistent in these, and they are admirable renderings of Shakespeare. The "Strayed Sheep" is a pride of execution which will be the pride of one collection or another as long as it lasts; and Mr. Hunt's pictures are so thoroughly painted and with such knowledge of his materials that they may be expected to last for centuries. Among his larger pictures it is pleasant to feel that the last one completed, "The Lady of Shalott," is perhaps the finest thing he has ever done; the detail, though exhaustively studied and full of meaning and interest, is not so fiercely insistent as in some of his earlier works, and the principal figure is beautiful and fully dominates the whole; it is a really great picture both in conception and execution.

Among the many interesting points to be noted in what, as we have said, is really an autobiography, one is the catholicity of Mr. Hunt's recognition of the merits of painters quite outside of the movement with which he was specially associated; a catholicity which contrasts agreeably with the narrow prejudices and jealousies of Rossetti, of which many examples turn up in the course of the book. Mr. Hunt can recognise fully what was noble and great in poor Haydon's aspirations and efforts. It was to Haydon, he says, that we owed the retention in our country of the Elgin marbles, and the Government invitation to English artists to compete in the decoration of the Houses of Parliament; it was he who originated the idea of the establishment of Schools of Design to improve the deteriorated taste of our manufacturers; "yet he received no sort of recompense or reward, though rewards were given to his adversaries." He has words of appreciation for what was admirable in the work of Landseer, Eddy, Leslie, and MacIse, artists so far removed from himself in principles and practice; and he praises (justly) the quality of "good common-sense" in Ward's "Dr. Johnson

at Lord Chesterfield's." "Many of the Royal Academy Associates of the time," Mr. Hunt observes, "have fallen into unmerited disregard, although their ingenuity in invention will not fail to be observed and appreciated when some of the travesties of art at present in vogue have been condemned as wearisome folly." These are much larger and more tolerant views than we have been accustomed to associate with the fellowship of the P-R. B., and we are heartily glad to find them put on record here. Of Mr. Hunt's life-long friend Millais there is much in the book that is of the greatest interest as to his personality and his ideas on art. It is noted of Millais as a youth, that "he dressed with exact conventionalism so as to avoid in any degree courting attention as a genius"; it would seem that Millais all his life was a gentleman first and a painter afterwards; he had no sympathy with Bohemianism. In the second volume there is a long record of a curiously frank declaration by Millais, late in his life, in defence of the changes in his own art. He did not agree with those who told him that if he painted for the passing fashion his reputation would be the less some centuries hence than if he painted more ambitious subjects of his own choosing. "A painter," he said, "must work for the taste of his own day. How does he know what people will like two or three hundred years hence? I maintain that a man should hold up the mirror to his own times. I want proof that the people of my day enjoy my work, and how can I get this better than by finding people willing to give me money for my productions, and that I win honours from contemporaries? What good will recognition of my labours hundreds of years hence do me? . . . I let the artists of the future work for the future, they will see what's wanted." And on another page—"Why, I have just sold a picture done in two weeks which will pay the expenses of all my family, my shooting and fishing too, for our whole time in Scotland." Dreadful, isn't it? But it was pretty much on the same principle that Titian worked, and does not seem to have wrecked himself with posterity. All this is given by Mr. Hunt without a protest; he obviously thought (and quite rightly) that any opinion of Millais on art was worth something to the world; and whether we agree with it or not, we are very glad to have it; it is the good, honest, healthy opinion of one who, both as man and artist, was healthy to the backbone.

Some expressions of opinion on the French art of fifty years ago, in the account of the author's visit to Paris with Rossetti, are of considerable interest. Delacroix was then the master most in vogue, but Mr. Hunt did not like him, and after years confirmed his impression. Flandrin's paintings in the Church of St. Germain des Prés he notes as admirable for their complete fulfilment of their artist's purpose; Ingres's "La Source" as a great picture notwithstanding its deadness of colour; of Millet he says that "the defect of grace in the figures he portrayed much marred the perfection of many of his designs," a judgment which will probably be the ultimately accepted one. More

interesting for the present moment is the author's summary, in the final chapter, of his opinions on Impressionists and Impressionism, and his indignant contempt for the noisy and almost obscene Bohemianism of some of the younger generation of French artists. "In England, whatever misleading spirit has exercised itself, no such corrupting influence has hitherto been poisoning the art-students' ideals." As to Impressionism as representing a paramount end in art, we may quote the following:—

"Many of the works classified by the public as Impressionist have no evidence of sober common sense; they are without perspective, correct form, or any signs of patient drilling and scholarship. They suggest suspicion that the workman never duly submitted himself to persistent tuition or patient practice, and not seldom on inquiry it will be found that he took up the pursuit of art so late in life as to prove that he had no natural call for her; and he covers his inability to conquer the besetting sins, which every tyro must eradicate from his unactivated disposition, by fine names and theories." And he concludes that such work is "a standing peril to honest and honourable art."

We have only been able to touch on a few of the points in a book which is full of interest to everyone interested in art, and which no one, whatever his views on the objects and principles of painting, can well lay down without a feeling of respect and gratitude to its author.

NOTES.

For years past controversy ^{The} Panama Canal, has raged around the question of the Panama Canal. Many schemes have been brought forward since the project of the French engineers was first formulated, but, speaking generally, all of these come into one of two categories, according as they provide for a sea-level or a lock canal. In itself a sea-level waterway is certainly preferable for very evident reasons, and the difference of level existing in the Atlantic and Pacific oceans does not present any practical difficulty. The chief objections to a canal of this kind are the heavy cost and the length of time required for construction. Americans are particularly anxious that the canal should be completed at the earliest possible moment and at the least possible cost. Consequently it is not surprising to learn that the recommendation of the International Commission in favour of a sea-level project has been virtually set aside by a second commission of American engineers appointed by Mr. Roosevelt. We do not yet know which of the several lock-canal schemes will be adopted. The decision of this point is a matter of some importance, as the merits of the projects vary to a considerable extent and their essential features differ with regard to the exact route to be followed, the height of summit level, the character of impounding dams for water supply, capital expenditure, and time for construction. The most recent proposals were those of Mr. Lindon Bates, which have already been briefly described in our columns, and as these were accompanied by a definite offer to construct the canal at a lower cost and in less time than would be possible under other published schemes, it is probable they will form the subject of careful inquiry.

The International Congress of Architects. IN connexion with the Seventh International Congress of Architects, to be held in the Grafton Galleries, London, in July next, there will be a chronological exhibition of English architecture from the Norman conquest to the death of Sir Charles Barry in 1860. In addition there will be shown a collection of oil-paintings and water-colour drawings by known painters, which treat of architectural subjects. Many of these are scattered throughout the country in private collections. It is hoped that all those who know the whereabouts in private collections of any such paintings or drawings will communicate with the secretary of the executive committee, the Institute of British Architects, 9, Conduit-street, London. Such an exhibition of purely British work should be made as representative as possible, in view of the forthcoming visit of numerous foreign architects.

British School at Athens. WE may draw the attention of our readers to the proposal of the British School at Athens, announced in a letter to the *Times* of Tuesday last by Mr. G. A. Macmillan, to undertake a systematic survey and archaeological exploration of the site of ancient Sparta. Excavations are to be made to ascertain the existence and extent of remains, their character and state of preservation, and what prospects are held out for excavation on a larger scale. Attention will be given also to the remains of the Frankish and Byzantine periods, which are numerous in the province of Laconia, and this portion of the work will be put under the direction of an architect, Mr. Ramsay Traquair, of Edinburgh. Funds are required to assist the management of the British School in this undertaking, which is on new ground, and may turn out to be of the greatest value and interest. We hope that those of our readers who can afford to contribute anything in assisting such a work will keep it in mind.

Powers of Tramway Authorities. A POINT of considerable importance has been decided in connexion with municipal tramways in the case of *The Attorney-General v. The Lord Mayor etc., of the City of Manchester*. The Municipality last April announced their arrangements for the conveyance of parcels and traffic from Manchester to all parts of the United Kingdom and abroad, and for acting as agents to the railway companies, and the action was brought on the relation of a ratepayer to restrain them from so doing, on the ground that it was in excess of their Parliamentary and other powers. The Court, after a very careful consideration of the question, came to the conclusion that the Corporation has power to convey and to deliver parcels and goods on their systems, even employing horses and carts in the delivery, but that it must be restricted to goods which travel or are conveyed along some part at least of the tramway system, that is to say, it must be incidental, or accessory to the tramway undertaking, and not carrier's business independent of it, as long as an expenditure of the borough funds is involved

in carrying it out. The same limitation applies to the Corporation acting as railway agents. This question of goods traffic on tramways is one likely to be heard more of in the future, and it would appear desirable that some limit should be placed on the powers of municipalities in this direction. As long as tramways occupy the public thoroughfares it is obvious that their freights should be limited to passengers, and that goods traffic is entirely unsuitable. It not only would obstruct the roads, but would seriously injure house property abutting on those thoroughfares.

Purchase of Building Land. IN *Hollivell v. Seacombe* a small point of interest to purchasers of real property has recently been decided in the Chancery Division. A certain property was sold by auction under an order of the Court, and one of the lots which was described as building land ripe for development was bid for by the applicant in this case. When the abstract was delivered it was discovered that in 1887 the land had been conveyed to one of the vendor's predecessors in title subject to a covenant that only almshouses should be erected on the land. The purchaser then applied to the Court to be discharged from the purchase and for a return of the deposit, and for the costs incurred in bidding and in investigating the title. The vendor subsequently obtained leave to rescind the contract under clause 7 of the conditions of sale, which provided that when a contract was rescinded the deposit was to be accepted in discharge of all claims, but without prejudice to the rights of the purchaser. The Court held that in sales under the direction of the Court when the purchaser is entitled to be discharged from the contract, the condition as to rescission does not affect his rights, and he is entitled to the costs and expenses which he has incurred. Here there was misrepresentation which entitled the purchaser to be discharged from the contract.

Fires in Public Conveyances. IT is by no means reassuring to hear of occasional fires in tubular railways, where passengers have very little opportunity of escaping from the immediate neighbourhood of flames and smoke, and, even if they are able to get upon the permanent way, can only walk thereon at the risk of their lives. The fire which took place last Thursday week in a train on the City and South London Railway comes as one more hint that the use of non-combustible railway carriages ought to be made compulsory, especially on all underground lines. We are very glad to be able to mention that the Board of Trade have already framed a model set of by-laws with which promoters of new tubular railways will have to comply. But there must also be stringent regulations with respect to existing undertakings of the same kind. We have repeatedly pointed to the necessity for the adoption of fire-resisting carriages on open-air railways, and the recent fires on motor omnibuses show that these vehicles, too, ought to be of fire-resisting construction. It is absurd that any motor omnibus carrying a quantity of highly inflammable spirit should be

provided with a wooden body, and in these times of enlightenment we really cannot understand why any vehicle so built should have been licensed as a public conveyance. If the authorities have no discretionary powers as matters stand, it is to be hoped that the new Parliament will rectify the deficiency at the earliest possible moment.

"Quiet Enjoyment." THE case of *Williams v. Gabriel* (Current Law Reports) is one of importance to lessees of house property. The plaintiffs were lessees of certain portions of a large block of buildings on a lease for twenty-one years terminable at the lessees' option at the seventh or fourteenth year, and the lease contained the usual covenant for "quiet enjoyment." During the currency of this lease some portion of the buildings became out of repair, and an order was made by the County Council under the London Building Acts, ordering the structure to be taken down. The lessor had assigned his reversion in the whole of the buildings, and this operation was being undertaken by the persons on whom the reversion had devolved. The lessee's part of the premises became exposed, and he was compelled to vacate the premises, and he proceeded against the executors of the lessor, who had died, for breach of the covenant for quiet enjoyment. The Court held that there had been an interruption, but held that the plaintiff could not recover, since the acts complained of were not such that the reversioner had the right to do as claiming under the lessor. This is an important limitation on the covenant, as it becomes limited to those acts which can have been contemplated by the lessor, and it does not extend to wrongful or negligent acts on the part of the person to whom the property has been assigned. This raises a serious question since it seems to leave a lessee in a far worse position than he would be in if the property remained in the possession of his lessor. [7]

Destructor By-Products. ALTHOUGH the use of the refuse destructor has been forced upon public authorities as a sanitary necessity by the exigencies of modern social conditions, the residual products possess distinct value as materials of construction, and there are other by-products which can be employed so as to reduce the cost of refuse disposal. At the meeting of the Civil and Mechanical Engineers' Society last Thursday week Mr. F. L. Watson summarised in a useful manner the various directions in which destructor by-products can be utilised, and gave some data relative to the residual products of combustion in furnaces of the kind. The first by-product is obviously heated gas, which is available for drying sewage sludge or other materials, and is largely used in the generation of steam for driving mechanical and electrical machinery, and for heating water to be employed in baths and washhouses. It is worthy of note that the real difficulty in connexion with the utilisation of steam generated at a destructor station is not fluctuation of the supply but irregularity of the demand. For this

reason the most remunerative results can be obtained in places where the generation of electricity is not the only outlet for steam produced by waste heat from the furnaces. Clinker is the chief residual product, whose uses in the manufacture of mortar and concrete flags are already familiar to our readers. Mr. Watson pointed out that the purpose appearing to offer the greatest profit was in making bricks on the system patented by Dr. Schulthess, of Paris. The weight of clinker-lime bricks so made was stated at about three tons per 1,000, and from tests made by Professor Goodman at Leeds University the crushing strength appears to range from 110 tons to 185 tons per square foot. Flue dust is another residual product which finds some use in plastering work and also as a basis for disinfecting powder. Notwithstanding the usefulness of such by-products the authorities owning destructor plants are not always able to sell or to use them so fully as could be wished. The paper to which we refer may be of some service in directing attention to the suitability of the residual products in construction.

THE enormous fall of rock Cheddar Cliffs, from the face of the Cheddar Cliffs, variously estimated at from 70,000 tons to 500,000 tons, should at last arouse the local authorities to the necessity of taking action with the view of curbing the anxiety of quarry owners to destroy this famous landmark. At the same time we are by no means certain that the recent fall is entirely due to quarrying operations. There have been heavy falls of chalk in the neighbourhood of Dover quite lately, where nothing but natural causes can be held responsible. Nevertheless, while the mischief wrought at Cheddar may be chiefly the result of climatic influences, it is highly probable that quarrying has had a large share in the disaster by establishing conditions distinctly favourable to disintegration of the rocks by natural agencies.

THE fire which broke out at an early hour of the morning of January 31 speedily destroyed the interior of the church, and the greater part of the roof, which was lined with match-board and covered with felt. Captain Hamilton's official report states that the fire was caused by "overheat of the furnace flue." It appears that the fire originated in the north-west corner of the building, over the grating above the furnace of the hot-air apparatus which had been lighted on the night before in readiness for a mid-day service upon the next day. The pecuniary loss is computed at 20,000*l.*, but the fabric and its contents had been insured in the Ecclesiastical Office. The church, which stands at the corner of Down and Brick streets, was built in 1864-5 after Francis's designs in the Early English style, upon a three-sided site, the walls being of granite and the plan embracing a nave with a small north transept. It contained sittings for a congregation of about 650 persons, and was enlarged in 1872, when it was fitted with an organ built by Bevington. The vestry, with

the Communion plate, records, and registers, have escaped uninjured, but the organ and the stained glass in the east window above the altar are damaged beyond repair. The window, which represents the scene of the Crucifixion, was set up, at a cost of 1,000*l.*, as a memorial by members of the Hope family of Deepdene, Dorking. In October of last year a window was inserted in the north wall in memory of the late J. T. Wimperis, architect, by his sisters—the glass was executed by Messrs. Bell & Beckham. Christ Church narrowly escaped from a fire on the morning of February 26 last year, when it suffered damage to the extent of nearly 700*l.*

WE have received a print of the plate issued this year to subscribers to the Art-Union of London, which is an etching by Mr. W. L. Wyllie from his large painting "Trafalgar," exhibited at the Royal Academy last year. We have in many cases objected to the large size and sometimes rather coarse execution of the engravings or etchings annually issued by the Art-Union, the tendency of which was to encourage the un-taught in art in the idea that a work in black and white was valuable in proportion to its size. In the present case, however, one feels that the amount of detail in the picture, in which there are no large-scale figures, could hardly have been done justice to on a smaller scale, and the etching moreover is the handiwork of the painter himself, and not of a copyist. Trafalgar, too, is so momentous an event in modern English history that a large etching commemorative of it is a fitting trophy to frame and hang up in any English household; and it is in this sense rendered more valuable by the short account of the battle written by the artist, who of course entered into every investigation before painting the picture, and who, from his pictures and other writings is no doubt enough of a practical sailor to understand the position and the contemporary accounts of the engagement. As an etching it is a very fine production, full of suggestion of colour and atmosphere.

AT Messrs. Dowdeswell's Gallery is a collection of landscapes—a good many of which might be rather termed studies and sketches for landscapes—by Mr. Grosvenor Thomas. Such sketches as "Waves Breaking" (2) and "A Grey Sea" (32) are rather what might be called artist's memoranda than works for exhibition; they are among other examples that we have seen lately of an inclination to treat the sea rather as a subject for experimental sketches than for serious painting. The majority of the works, however, are landscapes, some of the smaller ones very sketchy, but containing fine suggestions of composition and effect; and among the more important works, such as "The Canal" (12), "The River" (24), and "Morning" (30), we may conclude that as much detail is given as the artist thinks compatible with the breadth of effect, and the indication of the poetry of the scene, which are his chief aims; and after all

there is as much detail in these as in many of Constable's works. There are various principles of translating landscape, and this is one of them, though perhaps the tendency to treat landscape as composition in masses of tone, with an ignoring of detail, may be carried too far. However, "Morning" is an unquestionably fine landscape, and "The River" also, though rather too shadowy in treatment. Among the smaller works may be noticed especially "Landscape" (13), a vertical composition with masses of dark trees; "Sketch for Morning" (18); "Sunset" (21); "Marigolds" (23), a fine bit of colour and texture; and "Landscape" (31). In "The Canal," before referred to, the reflection of the light in the house window, considering the apparent distance of the house from the water, could not be seen as low down as it is shown on the water, unless the eye were supposed to be at the water level; a kind of oversight often made in painting. It is a simple question of angles, easily demonstrable by a sectional diagram. The reflection of the light in this case, if seen at all in the water, would be close up under the bank. Painters would do well to study, on this subject, Sir Montagu Pollock's valuable book on "Light and Water" (reviewed in our issue of July 23, 1904).

At the Baillie Gallery, in Baker-street, are two collections of pictures; water-colours by Mr. Oliver Hall, and an exhibition of paintings by what is called "The Liverpool School of Painters." Mr. Hall's water-colours are mostly slight in execution—sketches rather than pictures, but are masterly in their sense of composition and distances in landscape. Among those especially good are "Tower Farm" (101), "Waste Land, Cumberland" (108); "Spring" (113); "Uplands near Silloth" (114); "Along the Shore towards Silloth" (114); and a powerful foreground picture of old ruins, under the title "Abbey in North Wales" (99). As to the "Liverpool School," there is no such thing, as indeed is almost admitted in the first sentence of the preface to the catalogue; but there were, during the middle portion of the last century, several exceedingly clever artists natives of Liverpool (only two of whom, W. Davis and J. W. Oakes, can be said to have obtained a general reputation), whose aims and practice were, however, as different as possible, and who therefore could not possibly be grouped as a "school." Oakes, who moved to London and became an associate of the Royal Academy, is not represented here by his best work, though there are some good small pictures by him. William Huggins, who in his lifetime had no reputation beyond his own neighbourhood, was really one of the finest animal painters of England, as no one can question who looks at his "Cattle Drinking," No. 23 in this collection, which in its way is unsurpassable, and his brilliant paintings of fowls (7 and 11). W. Davis was a landscape painter allied to the pre-Raphaelite school, and produced some most beautiful works in a careful and highly finished manner, but was surpassed in original

genius by Tonge, who belonged to a rather earlier period (1822--1855). Tonge was a most powerful and original landscape artist; his large picture here, "Ormskirik" (53) is worthy of De Wint, whom it a good deal recalls. He made many fine water-colour studies of landscape treated on rough brown or grey paper in a manner of his own; there are no examples of them in this collection, but they were known to and prized by those acquainted with his work. Even in his own neighbourhood, however, Tonge never had a reputation except among a limited circle of amateurs who understood his merits, which were not for the popular taste of that period. Had he lived now, when landscape painting is somewhat better understood, he would have made a reputation. The proprietor of the Baillie Gallery has done well to collect some of these works of little-known painters of genius, which should not be overlooked by those who are interested in painting.

Photographs At the Royal Photographic Society's House in Russell Square is a collection of photographs by Mr. A. Langdon Coburn, one of the photographers who seeks to use photography as a means of producing artistic effect and not for mere mechanical reproduction. This is nothing new of course; Mrs. Cameron started it long ago, and her pictorial effect in portraits has not been surpassed, if equalled, since. Many of Mr. Coburn's portraits are very successful in giving character and avoiding hardness; the portrait of a lady smiling for instance (9); another of a lady (19) in which a charming *espièglerie* of expression has been caught and fixed; those of Mr. Hedley Fitton; Mr. Dobson, Mr. Mark Twain among others; the last named is excellent. In photographs of architecture, as in most of the Roman subjects, the want of sharp definition may be thought picturesque, but it does away with one of the chief values of photography in connexion with architecture—the power of giving clear definition of detail. Some of the photographs of bits of old streets, etc., make very effective pictures, and are well chosen as composition; though in one of the best of these "Via Fonte Marcella, Assisi" (95), with the figure in the foreground, the old houses in the rear ought to stand out much more sharply in the strong sunlight than these do. That is the difficulty in these artistic applications of photography; what suits one portion of a scene does not suit another; a painter has the matter in his own hands.

We record with great regret the death of Mr. J. P. Seddon, an architect of genius who never had a full opportunity of doing justice to what was in him. The remark of the Hon. Secretary of the Institute of Architects, that Seddon was a follower of Pugin, is a misconception; he was an architect of much wider and more original ideas than Pugin; he treated Gothic in his own way, not according to precedent. Though not an actual "P.K.B.," Mr. Seddon was closely associated with the Brethren, and was for some time an intimate friend and

co-worker with Rossetti. Though he carried out many minor buildings (a list of which will be found in our *Obituary column*), his only executed building on a large scale that we know of was his picturesque Aberystwith Hotel, never finished, and afterwards turned into a college. He was one of the twelve invited competitors for the Law Courts, and his wildly picturesque design had a great deal more practical character than appeared at first sight: the conception for a great London Record Tower was a grand one, and a more remarkable idea than anything embodied in the present Law Courts.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

An ordinary general meeting of the Royal Institute of British Architects was held on Monday, at No. 9, Conduit-street, Regent-street, W., Mr. John Belcher, A.R.A., President, in the chair.

The minutes having been taken as read, Count Plunkett, Hon. Associate, was admitted for the first time since his election.

The Late Mr. Seddon.

Mr. Alex. Graham, hon. secretary, said he had to announce—and did so with great regret—the decease of an old and distinguished member of the Institute, who was known to nearly all of them, and who had left behind him a very pleasant memory—i.e., John P. Seddon. The deceased was elected an Associate in 1852, a Fellow in 1860, and was for many years a member of the Institute Council, while, from 1862 to 1867, he acted as one of the hon. secretaries. Mr. Seddon, whose work was known to many of them, was one of those who followed strictly in the old Pugin school, and made a special study of mediæval architecture. They would all regret the departure from their midst of one who fought the battle of professional and artistic life with considerable success. They all sympathised with the widow and family, and he moved that a letter be sent to Mrs. Seddon sympathising with them in the great loss they had sustained, and recording, at the same time, the appreciation of the Institute of the work and merits of their deceased colleague.

The motion was agreed to in silence.

The Royal Gold Medal.

The Chairman announced that the Council had nominated Sir Lawrence Alma-Tadema, R.A., for the Institute Gold Medal this year.

Students' Drawings.

Mr. J. W. Simpson then read a criticism of the works of students submitted in the recent competition for prizes and student-ships.

Mr. Simpson said that the duty laid upon him of criticising the students' work was an honourable one not to be lightly undertaken. It was evident that for criticism to be useful it must be sympathetic; unless the critic could divest himself of personal bias, and regard the work under review from the author's standpoint, he could neither appreciate how far it was successful in attaining the ideal of its creator nor usefully indicate in what respects it might be improved. It was of no help to a student struggling with an imperfectly expressed conception of a XIIIth century church, having a tower at the crossing, to advise him to adopt a plan based upon that of a Grecian temple, and employ a *Systyle* Doric Order. He must be led to an intelligent comparison of his own design with those of the great Gothic masters—to consider the proportions of his tower and the manner in which it would combine with the other features of his building. His mouldings must be criticised in relation to their positions in the work and their effect in emphasising its horizontal and vertical lines respectively; the voids and solids, the sky lines and projections, scrutinised in relation to the general mass and grouping under various aspects.

Before considering the work of the students he would venture a criticism upon

that of the sub-committees who had reported upon the drawings submitted for the several prizes. It had been their duty to examine and discuss them in detail—a duty involving long and anxious consideration of the work by experience was fulfilled with the greatest care and thoroughness. The reports made to the Council by these committees were placed in his hands for the purposes of this paper, and he was struck by the fact that a great part of their labour was, in almost every case, lost to the Institute by reason of their referring only to those designs recommended to the Council for distinction. If the respective secretaries were instructed to embody in the reports some notes of their committee's views upon each design which would be of great value for the instruction and guidance of future competitors.

In regard to the Measured Drawings Medal, Mr. Simpson said—"Messrs. Coombs and Poley well deserve their triumph, and the Council had great satisfaction in awarding the medal to each. The drawings of Christchurch are an excellent and beautiful rendering of a fine subject, and the value of such a study to its delineator is incalculable. . . . The choice of a subject is of great importance to the student who proposes to undertake its measurement, for the ultimate object of the enterprise is not the mere preparation of a set of drawings, but that intimate knowledge of and familiarity with the work which can be acquired only by a patient and detailed analysis. It is to this end that the Royal Institute encourages such studies by the offer of its medal. The opportunities which the architect-student has for dissecting the entire anatomy of an important edifice must be limited by the time at his disposal; and this time becomes, in the natural order of things, more and more difficult to obtain as the other duties of his life increase. Few of us can hope to achieve the complete description of more than one or two subjects of the first class, before other claims compel us to restrict our studies to the work and detailed memoranda of their essential points. We in Great Britain who desire (and who does not?) to acquaint ourselves with the subtle beauties of classic art are under the disadvantage of living remote from the great masterpieces of Greece and Rome. We must be content to study them at second-hand by means of books, or must spend time and money in travel that we may see them ourselves. But we have at our very doors a profusion of the most excellent Gothic work that the world can show, and I commend its study to you, not only as affording the finest possible technical exercise in draughtsmanship, but as tending to great flexibility and freedom in composition. I have troubled you with this disquisition because, in some cases, the subjects illustrated are quite unworthy of the time spent upon them; unless, indeed, as I hope may be the case, they have been measured for discerning patrons who desire the candidates to make 'alterations and additions.' The mechanical delineation of surfaces of brick wall and repetitions of sash-bars can never give the power that comes by attacking and mastering intricate and beautiful detail; and, though I yield to no one in my appreciation of the picturesque qualities of the Renaissance, I hold that, regarded as an aid to the study of classic architecture, it is somewhat worse than useless."

In regard to the Soane Medallion, it was the custom, and rightly so, to set great subjects in this competition as pegs for the students to hang their most magnificent ideas upon. Youth attacks heavy problems with a light heart, and Heaven forbid that "the Soane" should ever fall to a set of practicable working drawings. This year a most happy suggestion by Mr. Statham was adopted, and designs were invited for the realisation of the perfect palace described in Bacon's "de Edificiis." The result was more than satisfactory, and the winner, Mr. W. S. George, had his hearty congratulations on his fine production. It was imagined in a properly grandiose vein, and executed in a way which indicated artistic qualities of a very high order. The "View" was especially meritorious, showing, as it did, a riotous fancy with an admirable sense of pictorial arrangement. This design was, he thought,

the most learned parody of style which he had had since his brilliant colleague on the Council, Professor Pite, startled them with his ideas as to what a West-end club would be like. Mr. Atkinson, who took second place, had sent a capital set, the plan in detail especially well conceived; but he had somewhat lost sight of that domestic quality which differentiates the palace from the public building. The effective and careful execution of the drawing merits special mention.

Next in order came the Owen Jones Studentship, for which the competition had been very keen. Mr. Gascoyne, who was successful in taking the 100 guineas for foreign travel, gave admirable and delicate renderings of Italian work. His water-colour interiors showed a good sense of the pictorial, though not without a certain inclination to a trick effect in lighting, which should be guarded against. Mr. Dawson had sent most meritorious drawings, which would have taken the studentship in any ordinary year. Mr. Davies had a remarkably beautiful set. The clean, straightforward drawing and legitimate effects of his sketches were admirable. There was to be remarked, however, a tendency to hot brown tones in his collected work, which he had emphasised by the warm brown mounts he had adopted. A white or cool grey mount would have cleared and given transparency to his colour. Mr. Nicholson, too, another prize-winner, had not paid sufficient attention to his mounts, a point which it was a great mistake to neglect in a colour competition. Mr. Jackson, the third of the "bracketed second" men, had sent very careful and excellent colour studies of the Santuario at Soronno, and Santa Croce at Florence.

The "Pugin" drawings were in no way below the general standard of excellence. Mr. Drysdale took the silver medal and 40*l.* prize with delightful and effective sketches well worth study by other competitors. His detail was carefully and conscientiously given without unnecessary repetition. The rendering of Bishop Bridport's tomb, and the John Draper chantry screen at Christchurch were quite masterly. His combination of brown ink writing with pencil and colour drawing was very pleasant and characteristic; he had done a great deal of good work, and thoroughly earned the prize he had gained.

The Godwin Bursary was very worthily won by Mr. Inigo Triggs. The only doubt in the minds of the Council was whether the proposal of the author to study the "Laying out of Public Squares and Open Spaces" fell strictly within the terms of the trust deed. Their decision in the affirmative he had learned with relief.

For the "Tite" Certificate and 40*l.* there were no less than twenty-one competitors, the subject set being "An Open-air Swimming Bath." Mr. Horsnell was placed first with a really fine conception. His plan was thoroughly artistic, and the design was naturally and unaffectedly that of an enclosed space and not of a covered building. The pencil perspective was coarse, and did not adequately express the enclosing of the bath, and the $\frac{1}{2}$ -in. detail was unfinished. The merits of the design were so great that it was deservedly placed first; but he would warn future competitors that this success was not to be taken as a precedent for unstudentlike finish in their work. Mr. Pearson took a Medal of Merit for a vigorous and good attempt to deal with a difficult elliptic motive. His outer colonnade, though effective, required more thoughtful planning, to justify it, and the entrance blocks occurred too abruptly, and did not quite wed with the columnar treatment. The drawings were very admirable. Mr. Wright, who received an "honourable mention," had a design marked by refinement of detail. His treatment of the projecting staircase blocks showed want of consideration of their side returns, the projections were not in quite good proportion, and the perspective, as was so often the case, rather revealed defects than unsuspected merits. Those neglected returns in a façade formed fatal traps to those who design in plane geometry instead of cube masses. "Cui Bono" had a vigorously-drawn set showing a really fine sense of massing. The interior was, however, rather "thin" in design, and hardly carried on the solidity of the exterior. The author had destroyed the scale of his perspective by filling in the circular openings

with black, which forced them into undue prominence, and was fatal to all suggestion of aerial perspective. He mentioned this design for its merits, but it was clearly disqualified as not complying with the conditions of the competition.

The Arthur Cates prize of forty guineas had produced only one competitor, and Mr. Markham, to whom it fell, had thoroughly earned it by honest and good work. It was curious that this prize had not attracted more attention, as a great part of the work required was already done by every candidate who passed the Final examination at the first attempt.

The Grissell Gold Medal and ten guineas was given this year for the best design for a "Stone Skew Bridge." The prize was awarded to Mr. Nott, for an excellent and simple scheme thoroughly well worked out. His design for the pylon piers would be better if the niches and brackets in the lower portion were omitted. The upper parts were too thin in proportion, and rather slab-like when viewed from the side. Although this prize was primarily one for construction rather than for beauty of design, it must not be forgotten that construction which results in unlovely form was architecturally bad.

Mr. Simpson concluded:—"Ladies and Gentlemen.—Here is the younger generation knocking at the door, as Ibsen says; and we hear their vigorous strokes for the prizes of the year without any of Harvard Solness' misgivings. The better the students' work the better is the prospect for British architecture; and we welcome all such as are worthy within our portals. I offer my congratulations to the Royal Institute upon its students, and to the students upon their fine performance, commending to them Ben Jonson's description of 'The True Artificer':—

"... He knows it as his only art, so to carry it as none but artificers perceive it."

Prizes and Studentships.

The President then presented the prizes and studentships to the successful candidates in the recent competitions. For a full list of prize-winners and others, see our issue for January 27.

President's Address to Students.

The Chairman then read the following address to students:—

Fellow-students, ladies, and gentlemen,—I propose to put before you this evening a few suggestions as to the methods—or rather I should say method—of constructive thought in design. As a matter of fact, there is only one such method for any artist, whatever be the vehicle he chooses to work in. The arts are all closely allied—at any rate in their methods—and the order of thought-development in each is one and the same. My friend Albert Gilbert the sculptor once insisted that there was another way, called the "fluke," and that he was sure from his observation a great many more designs were produced in that than in any other way. But surely this must be a libel! I won't venture on the statement that I have had no experience of that sort, but I am not anxious to talk about it, and it wouldn't help you if I did. For the one thing the youthful aspirant needs most to have rubbed into him—in season and out of season, if necessary—is that without hard study and adequate thought he will never do anything really good.

The intelligent study of mental processes in design, and the knowledge of the order of thought to be observed, is not unimportant; for, though many follow this order instinctively and unconsciously, yet, seeing that our mental faculties are our armoury, it is good to know what weapons we have at our command, and how and when to employ them.

I am not a philosopher—not even a psychologist; but I have observed and analysed mental processes both in myself and others; I have also gathered light from the analogy that exists in the arts generally—and so I hope that I may be able to say something on this point that will help you in your work. First of all, then, and as a preliminary, a suitable environment must be found. Not necessarily a literal environment of persons, places, and things, but at any rate of thought and mood. Environment is nowadays more a matter of character and temperament than of locality. Whithersoever

a man betake himself, it needs powers of self-government and mental concentration to escape the insistent shouts of commercialism and the prosaic business claims which are so apt to usurp an undue share of our attention. Yet, if the imagination is to be free for visions of beauty or even of dignity, if thought is to rise to the expression of noble purpose, the soul of the man must be able to take flight on occasion into the "serene" of the summer sky, leaving the earth and its cares to look after themselves for a time.

Psychologists tell us that moral education is dwarfed, or even impossible unless a man has a certain amount of leisure time for the free play of his moral faculties. Certainly, too, the soul of the artist will perish within him unless he learn to withdraw himself at will into the higher realms of imaginative vision, where no sordid purpose or ignoble thought can live.

Given the right conditions, we may now proceed to analyse the working of thought in design. Let us remember, in the first place, that architecture "speaks." The power of speech—the noblest of gifts to man—is seen in all true art. In language words are symbols, and by their combination into sentences thought is conveyed; the punctuation of such sentences into primary and subordinate clauses, together with other qualities of proportion and rhythm, determining the value and relation of the several ideas expressed therein. Exactly the same in architecture—forms are combined to appeal to the imagination and express purpose. One form of opening in a wall will convey the idea of ingress or egress, another the means of looking out or receiving light. This may be called the "simple sentence," or, if you like, the prose statement of architecture; but when we proceed to the higher forms of combination, to the moulding of these symbolic forms into sequences and rhythmic order, then we begin both to express and to appeal to the higher kind of poetical and imaginative thought. The same laws or principles hold good for the work of the painter and sculptor, both these arts in their higher qualities possessing the power of conveying to and impressing upon the imagination much more than they actually portray.

In music we have the most ethereal medium for speaking to the heart of man. Just as poetry can convey more than prose, just as there are musical sounds too high-pitched for the ear of man to catch them, so there are thoughts and emotions "too deep for words"—for which music provides the only adequate vehicle of expression. Architecture has been termed "frozen music." Like both music and poetry, it is subjective in its appeal; for the same arrangement of lines and colours will suggest fifty different things to fifty different persons. A fine and imaginative work will reveal to each individual some vein or mood of his own, and this above and beyond what was actually present in the mind and purpose of the architect. Every true work of art possesses an inherent energy which will sway the imagination of others and discover to them meanings of which the artist himself is unconscious. The imagination, then, must be allowed a definite place, both in the production of a design and in that reflection which it induces in the beholder.

A good design usually has a definite origin in a germ idea, from which, as from a bud unfolding itself, must be slowly and patiently evolved the true position and relation of the several objects and parts. In connexion with this process of evolution it is worth noting that in architecture as in language the most powerful effects are sometimes gained by the simplest means. That statement is strongest which is given in fewest words—provided the words be adequate and suitable. Why? Because the mind is quicker than the lips; because the imagination can picture more rapidly than words can paint. So in our art there are occasions when the dignified and simple statement is not only the most appropriate, but also the most effective. Not that this kind of statement affords a ready escape from toil; dignity and simplicity come with experience and thought.

An essential element in the production of a design—whatever the idea and purpose of the work—is "feeling," by which either

sympathy or repugnance is called into play. It is by feeling that an architect makes his selection and develops and encourages definite tastes of his own. Feeling is his own private artistic assessor, to judge in the competition of the many ideas and suggestions that present themselves before his mind's eye, as it were.

In the projection of a design on paper, mental perspective plays an important part. Projected as it is on a plane surface, the relative distances of the several parts of a design can only be distinguished and appreciated at their proper value by an effort of thought. Time was, as you are doubtless well aware, when designs were produced in a kind of geometric perspective, that the author might see all round his subject; now we do this mentally, or by developing each side simultaneously.

During the whole process of development and selection the purpose of the work must be kept constantly in view, with the object of bringing out in stronger relief every feature and detail by which this purpose is to be conveyed. The first "idea" relating to the purpose brings with it resemblances which stimulate the imagination. The interest thus awakened, hacked by knowledge, provokes to further effort, in which original thought is both checked and stimulated by association and comparison, memory and imagination acting and re-acting on one another—both of them under the control of knowledge and recognised principles. The expansion of the initial thought will resemble the circling ripples produced by the stone thrown into still water—every advance leading on to some fresh development, some more extended idea. With these expanding thoughts enter other considerations, such as questions of material and proportion of parts to the whole. Secondary causes also claim our attention as we proceed—viz., incidental local features and surroundings, contrasts, ornamentation, colour, texture, etc. These are the means which the thought of the designer marshals and controls to give expression to such intangible qualities as purpose, character, manner, and disposition.

Architecture furnishes posterity—unconsciously perhaps—with the picture of the prevailing manners, customs, and conditions of life. More than that, it reveals, or, it may be, betrays, the emotions and sentiments which have made each age famous or notorious. These are thoughts formulated ages ago which, having found expression in the work of the architect, are living forces to-day. The student should be impressed with his responsibility, and so systematise his thoughts as that his work may be a fitting and representative expression of the best thought of his day; for if he suffer his work to be infected with the haste and self-assertive methods of modern life, these are bound to betray themselves in every line and detail of his design.

There is something much more subtle and mysterious in an architectural work than a mere orderly arrangement of materials. There is life and speech in it. If a man's character may be read in his hand, certainly it may in his handiwork. The life may be noxious, like that of a poisonous plant, or sweet and beautiful, like that of a flower; or, again, it may resemble that of a noble tree—but life there is. The speech may be that of a Shelley or a Milton, or, on the other hand, of the most blatant type of "yellow" journal, but speak the architect's work must and will. It has a music, too, of its own—whether it be the music of one of Beethoven's sonatas or of the latest comic song. When you realise this—and no one can be indeed an architect who does not realise it more or less—you will approach your work with that due sense of its dignity and importance in which alone you will be able to rise to the "height of the (proposed) argument"—if I may adapt one of Milton's phrases to my own purpose. A clear perception of the possibilities both of good and of evil that open before us when work is entrusted to us—in other words, a proper feeling of reverence for our task—is indispensable if we would accomplish something noble or beautiful, or even suited to its purpose.

If an architect is to speak truly—indeed, if he is to be coherent in his message—he must follow the recognised forms, the articulate

phrasing, the grammatical order proper to his art. Thought-symbols, of whatever kind, are arranged in groups of rhythmic form like musical phrases in relative keys. In architectural design this is effected by divisional lines and grouping of parts, such divisions being regulated on principles akin to those which govern musical progression and a harmony built up of sounds. Again, contrasts are obtained in music by the use of loud and soft passages, and effects by gradations of sound from pianissimo and fortissimo. So architecture makes use of "strength of tone," gradations being secured in this case by the measure or greatness of projections of the different parts; also by the varying plainness or delicacy of surface and detail.

I will not carry these analogies and definitions further. What I have already said is sufficient, I hope, to convince you that there are laws and principles governing good architecture, and that as nobody expects a harmony from a haphazard arrangement of musical notes, so neither will you do good work in your profession by chance combinations or random methods. We have now come to a point when we can indeed analyse no further, for there is always an element of mystery in the best architecture—a sort of haunting personality that, ghostlike, vanishes just when we think we have it in our grasp. This quality of "mystery"—so pre-eminent in Oriental buildings—is one to conjure with. Veiled under symbolic forms which hide as much as they reveal, it continually draws us on and as continually eludes us. The screening of parts provokes the mind to search further and deeper for that which is beyond the immediate range of vision. Given the element of mystery—which is perhaps the "personal equation" of artists but the trained mind can make effective use of it. The personal element is of little avail if we have not painstakingly learnt the methods and principles of our handicraft.

One of the commonest of pitfalls for youthful designers lies in certain fanciful ideas of originality. It is easy enough to be original after a fashion. Any mere novelty will serve to astonish or startle; but if we wish to appeal to the higher faculties we must be content to let our originality find expression within the lines on which those faculties themselves work. The great German poet Goethe relates it as perhaps the greatest lesson of his early manhood—a sort of discovery that he made for himself apparently—that if he would "find himself" and enter upon his inheritance, he must recognise and submit to limitations. Originality does not involve a subversion of all that is orderly. In music the gamut remains the same for one man as for another; certain combinations of sounds are pleasing, certain others displeasing, and will not change their character for anybody. So the architect can neither create new elements nor alter the conventional effects of combinations of elements; his hope lies in so training his powers of perception as that he can move freely and with a sure tread amongst the almost infinite variety of paths that open before him. Then he will find plenty of scope for originality without violating the canons of art or wandering into the realms of the unpleasing.

Sir Joshua Reynolds considered that "excellence is the direct result of trained perceptions." Certainly such perceptions are the foundation; any special powers or qualities that a young architect may be conscious of will find their place and expression at a later stage. You may rest assured they will not be thrust out or obscured; they will only shine all the more brightly for having submitted to limitations. As I have said before, the character and mind of the designer will always reveal themselves in his work. The scholarly treatment of one man will appeal to the intellect, while the grace and charm which distinguish another's work will rather sway the affections. The highest achievement, seen only at intervals, lies in a combination of qualities well balanced and under absolute control.

I have endeavoured this evening to show you that there is a certain order and development of thought in the evolution of a design. Mere knowledge will not suffice. Something more is needed than a reproduction of the past or a mere application of mathematical

formulae. If a student labour with but little thought, he may attain to a dazzling skill, but he will neither stir the heart nor convince the mind. The search for the ideal lies ever upwards and onwards by the way of severe mental discipline. Let us remember, in the words of Philip James Bailey: We live in deeds, not years; in thoughts, not in feelings, not in figures on a dial. We do not live by heart throbs; he lives most who feels most, thinks the noblest, acts the best.

Mr. Edmund Gosse, LL.D., said he had been asked to propose a vote of thanks to the President, and he did so with pleasure. It seemed to him that the world was divided, as regards architecture, into three very unequal divisions. There was the enormous majority of persons who knew nothing about architecture at all—who did not know a good building from a bad one, and who had not the smallest desire to know. Then there was the unimportant division who had a great love and taste for architecture, but who had no practical knowledge of it at all, and to that small and singularly unillustrious body he belonged; and, thirdly, there was the division consisting of the fellows, associates, and students of that Institute who knew everything that there was to be known about architecture.

He came to that meeting in a very humble state, and that humility was turned to absolute depression of spirits when he listened to the brilliant essay which Mr. Simpson had read—an essay written with a pen alternately dipped in viridian and in honey. He knew that one of the functions of the Institute was to insist on the relation of architecture to the other arts, on the fact that architecture was itself one of the fine arts. The present President of the Institute was not merely a brilliant observer of the rules of the art of architecture, but he had been singularly happy and sympathetic in linking it with the kindred arts, and specially with the kindred art which came nearest, surely, to architecture, namely, sculpture. Therefore, he had listened with particular emotion to the very ingenious and striking address which the President had delivered—an address which was fitted to raise their thoughts to a high level. It was a metaphysical address, the keynote of which was sounded in the words which insisted on the importance of order in the development of thought in the evolution of a design as the central ambition which an architectural student should hold before him. He took the whole address to inculcate this lesson, that the student should always aim at purity, dignity, and freshness of design, and should not give way to the incongruous and fantastic. Well, did not they think that we live in an age when the incongruous and the fantastic were very prominent? And was it not really a great blessing for architecture that it could not go into those realms of incongruity and fantasy that painting and even sculpture sometimes allow themselves? It seemed to him that there was an enormous work for architects to do. When he received the invitation from the Council to be present to hear the President's address he happened to be staying in a little coast town in the south of Devonshire, and in that little town there was a good deal of work which the Institute might attend to. That little town was mainly in the hands of one proprietor, and he an absentee proprietor, and it was filled with dull, stupid little houses all exactly like one another, all looking as ugly outside as they were probably uncomfortable inside. The contrast with old times was curious, for what remained of the old town consisted of charming little houses in most exquisite taste. He was told that the modern houses were all built by one gentleman, the surveyor-architect, who had only one set of designs. That did not seem to be enough, seeing that it could never have been a good set of designs. The President had spoken of two kinds of life in architecture, and had said that the life might be noxious, like the poisonous plant or the latest comic song. He (Mr. Gosse) would like to ask them as an Institute whether there was not a third thing, and whether it was not worse even than noxious life, namely, to have no life at all? It seemed to him that so much of the architecture that one saw was of that

tirely dead order—dead and dismal and fit only to be blown-up. The Institute was fighting a difficult and dangerous fight against this universal poverty of design, and here was no end of work to be done throughout the country—not merely in building good buildings, though there was a great deal of work to be done there, but in raising and developing public opinion. Bad taste was being fought by the Institute, to whom they owed a debt of thanks for its effort, in the face of all sorts of difficulties and discouragements and want of appreciation, in directing public taste persistently to the claims of architecture as one of the fine arts.

Professor F. M. Simpson, in seconding the vote of thanks to the President for his thoughtful and thought-creating address, said that in the first paragraph the President struck the keynote that ran through the address *i.e.*, that without hard study and adequate thought no student could hope for success. The President further emphasised the fact that architecture speaks, and that according to the way in which the work speaks, so one could determine the character of the man who designed it. It was not only the good work that lived after one, but the bad work as well, and often it survived longer than the other. It was by a man's work that one judged the character of a man. To take one instance, that of Cockerell. The best idea of the character of Cockerell was not to be had from the accounts of his life or the portrait hanging in that room; neither really gave anything like the same idea of the man himself as his buildings; it was in these that one saw his refinement and scholarly skill, and, above all, the enormous amount of work he did in the shape of study long before he achieved success. The President had ably sketched the evolution of a design, and showed the game of battledore and shuttlecock that went on in a man's mind between his imagination and his knowledge. Those two things were both necessary; one was of little or no good without the other. Imagination was a gift, and knowledge was the result of grind, and it was the mixing of the two things which made for success. It was not enough for a man to possess imagination; he had to work in order to train that imagination so that it should be directed into right channels and not run riot. The President's remark: "It is easy to be original after a fashion" was perfectly true. In an old play there is the character of a would-be wit who, speaking of a friend, says: "His want of knowledge gives him the more opportunities to show his natural parts." Natural parts were pretty crude things as a rule, and it was in the educating and polishing of these that a man's life had practically to be devoted if the result was to be a success. A student was to be congratulated if he possessed the gift of imagination; it was the one thing he could not acquire if he did not possess it in the first instance. They owed their thanks to the President for laying such stress on the fact that two things were necessary—first, the imagination in order to conceive, to obtain, the idea; and, secondly, the educated taste that would enable the student to work it out thoroughly.

The vote of thanks having been heartily agreed to,

The Chairman briefly replied, and said that as to Mr. Gosse's remarks about dead architecture, he had relegated that to the past. They might think he had laid too much stress on building thoughts and castles-in-the-air, and that there was not much 5 per cent. to be got out of castles-in-the-air; but it was necessary to give thought to these matters in order that one's imaginative thoughts might be materialised.

The New Premises.

The Chairman announced that the next meeting would be held on the 19th inst., when Mr. E. Guy Dawber would read a paper on "Furniture."

The Chairman also stated that a special general meeting will be held on Tuesday, the 20th inst., when the following resolution will be moved from the chair: "That the Institute do purchase the freehold site between Nos. 11 and 13, Portland-place, London, at the price of 19,500*l.*, and do erect thereon a building to include the offices and

hall of the Institute at a total cost, including the purchase of the said site and the erection of the said building, of 53,000*l.*, and that the Council be authorised to raise this sum by the sale of stock belonging to the Institute and by mortgage of the said site and building on terms to be approved by the Council, such money not exceeding in the aggregate the sum of 53,000*l.*, as may be necessary for the purchase of the site and the erection of the building.

The meeting then terminated.

ROYAL ACADEMY LECTURES.

MR. JACKSON commenced on Monday last his series of four lectures to Royal Academy students on "Reason in Architecture." He said that architecture had been much talked about and written about, from several points of view. There were the numerous practical works on building construction, which however had not much relation to architecture as an art. There were the pictorial illustrations of architecture, from the mere drawing-room table views to the drawings of Piranesi and other artists in architectural subjects. Then there were the learned treatises of men like Palladio, Serlio, and Vignola, who reduced all architecture to rules founded on the precepts of Vitruvius. There were the numerous illustrative and descriptive works of the men of the Gothic revival. Lectures on architecture had been given at the Royal Academy from time to time for many years past: those by Soane and Cockerell, the leaders of the Greek revival; those by Scott and Street, who dealt with Gothic architecture, and those by his immediate predecessor, Professor Aitchison, on Roman architecture and on Vitruvius. With all this, did anything remain to be said? The observation of the architecture of the past had been so complete, everything had been illustrated so fully, that to have been exhausted. But architecture had another side than the archaeological; we might study ancient architecture not merely in regard to its external facts, but in regard to the principles on which it was developed. Architecture was on a different footing from the other arts in the manner in which its ancient productions were used for study. Sculptors and painters studied ancient work in order to learn from it, not in order to imitate. Canova, Thorwaldsen, and Flaxman, it was true, produced imitative forms of sculpture of the classic type, and Chantrey condemned his portrait statues of eminent modern men to the doubtful clothing of a blanket, in deference to the classic spirit; but in the present day sculpture was essentially modern—it might be said in some cases too modern.

In painting there had never been quite the same temptation to reproduce classic work as existed at one time in sculpture. But with architecture it was different; modern architecture was very largely imitative of the architecture of the past. In excuse for this it must be remembered that an architect was differently placed from other artists, in that he was bound to consider utility; he must combine art with practical convenience, suited to the requirements of his day. Every Englishman, for instance, expected to have in his house a dining-room, a drawing-room, a study, and various other usual rooms, and the usual sanitary appliances and provisions, and this fact tended no doubt to set limits to the architect's invention; for the habits of life changed very slowly, and as long as they remained the same architecture had to accommodate itself to them. The general requirements in churches, as well as in habitations, were very much the same as they had been for a long time past; and hence a certain conservatism, and a reference to the work of his predecessors, was more or less forced on the architect. The difference was that in the present day an architect learned from his predecessors; in the Middle Ages he learned from his contemporaries. But from Brunelleschi and the Renaissance down to Scott and the Gothic revival the eyes of architects had always been turned towards the past. There was another important difference between an architect and other artists; that he did not, and could not, carry out his work with his own hands, as a sculptor or painter did. Sculpture, it was true, had become now-a-days very much a matter of modelling, and the sculptor did

little work on the marble with his own hands; but a painter at all events did his own work with his own hands; whereas the modern architect worked out a design on paper in an office, and could not realise his design without the assistance of a crowd of workmen; and even before the days when the modern architect arose—when the architect was a master mason or chief builder living on the work, though he might have worked with his own hands on the building, it could only have been on a small part of it; some special details of sculpture decoration perhaps. The time was long past when the architect lived on the work, chose the stone, and saw to everything with his own eye; it was a seductive picture, but one impossible to realise in the present day. And that was one reason why there was a paucity of invention in modern architecture; for new suggestions arose in great measure out of experience of difficulties met with in handiwork. The smith who carried out a piece of metal-work came across difficulties in the execution of it which suggested a new treatment to him, but this kind of suggestion from the actual work did not reach the architect who made the drawing for it. Much of the charm and interest of ancient buildings lay in the evidence they gave of the special means taken to meet difficulties arising from accidental or unexpected causes; such difficulties were occasionally the foundation of a change of style; but they were only realised by the architect who was on the spot. Apart from this direct influence of the facts of building, architecture tended, as at the Renaissance, to resolve itself into formulae, such as were represented by the Classic orders. The Gothic revival was in the first instance a reaction against the Classic formula; but while setting themselves free from the Classic fetters, the Gothic revivalists proceeded to forge new fetters for themselves. Batty Langley had even attempted to resolve Gothic architecture into five orders, in imitation of the Classic division; and though his influence did not count for much and his "orders" were not adopted, a new tyranny of precedent was soon developed, not less rigid than the old tyranny of the Classic orders. Forty years ago precedent was everything with the Gothic revivalists; religion even was called into the field; Classic architecture, in defiance of the evidence of history, was branded as "Pagan"; and the nearest possible approach to the reproduction of old work was the test of excellence. A good deal of this influence still survived in Gothic as now practised, more especially in ecclesiastical work; and it must be recognised that the force of historical association was stronger in connexion with architecture than with any other art. We looked at the Elgin marbles as sculpture simply, without being moved to consider too closely who and what were the men who made these; but with buildings it was not so; they were too strongly associated with national history. As Ruskin had said, "we want to know not only how men thought but what they handled" (and, it might be added, how they handled it). So with the pictures of Raphael, for instance; we looked at them for their own sake as pictures, not as history; but with a Perpendicular building, which was of the same date, we could not dissociate ourselves from history in the same way; we could not separate it in our minds from the memory of its founders and of the generation which erected such buildings. As architects therefore we stood so rooted in the past that we could not pluck it away; but let us draw the true lesson from it, and not mistake external forms for principles. Architecture, like history, might be looked at in two ways. There was the old way of writing history—getting up facts and dates and names of kings; but that did not satisfy us now; the modern historian aimed at getting into touch with the people of the time he wrote about; at understanding not only what they did but why they did it—how much was due to individuality and how much to social custom. Thus in like manner there was a true and false way of studying architecture; and unfortunately the false way was the most common. The study of architecture to many was only the study of outward phenomena and dates; a method which was no use for the present day, nor for the true understanding of the past. Architecture was the most reasonable and logical of the

arts; for every change in it there was a reason traceable. To understand the expression of the men of past times in architecture, we must know what it was they were trying to express. Outward forms in architecture were not the suggestion of mere fancy, they arose from special needs and circumstances, from the desire for economy of material. To make beautiful things was different from representing them, as in painting. Architecture did not imitate nature, but it was subject to natural laws. There had been instances, no doubt, of adoption of certain forms for artificial reasons; but apart from such, at the root of every change in architecture had been a change of circumstance. We saw this most clearly when considering buildings in a broad sense; it must not be pushed too far into detail; yet even in tracing the history of a detail in architecture we could sometimes realise this influence of circumstance very clearly. Take the Corinthian capital, for instance, which had been stated by Vitruvius to have been suggested by a basket of foliage with a tile laid on the top, and some of the leaves escaping through the interstices of the basket. Whether that were true, or only an invention after the fact, we discerned plainly in the Corinthian capital certain distinct elements—the abacus on the top, with its concave line, the rounded bell beneath the foliage, the two tiers of leaves, and the *caulicoli* or stalks which emerged from behind them and turned over into scrolls beneath the projecting angles of the abacus. Now it was observable that the strength of that capital lay in the bell, not in the abacus; the angles of the abacus and the scrolls under them could not really carry weight; consequently it was a rule that the entablature was not thicker than the centre diameter of the column, or practically, in other words, not thicker than the bell, which really carried the weight of the superstructure. In a capital from Spalato they would see that the *caulicoli* had altered their form, but the angle was still weak, though the capital was strong enough for what it was required to carry. When the classic column was employed in basilicas with a thick and lofty wall above it carrying a heavy timber roof, the classic capital was not strong enough for its position, and though its form was retained, the Byzantine builders solved the difficulty by placing their peculiar feature of the impost block over it, which spread sufficiently to take the springing of the arch, and was solid enough to carry it. In some later examples, as at St. Sophia and Parenzo, they would see that the main capital had changed its form and become convex in line, and would have sufficed to carry the springing of the arch; but the second capital was still retained as a matter of habit. In an example of a capital from Trieste it was seen that it had been abandoned as a separate feature; it was still really there, but it became part of the main capital, and appeared as a very thick and solid abacus. In an example from the vestibule of St. Mark's, the Byzantine impost was carried over two columns, on the capitals of which it rested. Several other successive variations from Noissac, St. Germain des Prés, and Le Mans were shown; and in an example from Sens it was seen that the old concave abacus line of the classic capital was still visible, but only as a kind of ornament, under the soffit of the real mediæval abacus. In an example from St. Leu d'Esserent the ornamental concave Corinthian abacus had disappeared altogether, and the classical angle volutes had become leaves; all trace of the classic capital has disappeared except only in the still recognisable form of the bell. The well-known Early English form of heavy-lobed foliage was finally an entire departure from the Renaissance of the Classic form of leafage. In England, and in Normandy also, we did not find all the tentative stages of change which had been illustrated. The Norman cushion capital was an easy and natural development out of a plain circular bell like an inverted frustum of a cone; the arch springing above it being rectangular, it was easy to see that there was wasted material between it and the upper circumference of the bell, each face of which was cut down vertically, leaving the cushion capital with its four faces, which was complete in itself; the abacus moulding above this was

only an ornament. At Canterbury, where French influence prevailed, the square form of the Classical abacus remained, but in English Gothic generally the preference for a circular abacus, and the consequent removal of all reminiscence of the angle volutes, did away with the last vestige of the Classic capital; while in such examples as the caps from Southwell chapter-house, later in the style, even the conventional character of the leafage had disappeared, to be replaced by naturalistic foliage so beautifully and delicately executed that it only wanted the colour of nature to make it look real, while it still preserved the supporting character proper to its position.*

The examples of capitals shown on the screen, more numerous than we have been able to mention, afforded a most interesting opportunity of comparative analysis of the growth of the mediæval from the Classic capital.

DEVELOPMENT OF SCULPTURE IN GREECE AND ROME.

At the London Institution, on Monday evening, Mrs. E. Burton Brown lectured on "The Development of Sculpture in Greece and Rome." She said the subject was a large one, but she did not intend to take up every statue to be found in Greece and Rome, but only to deal with the development of the spirit of Greek art and a little with that of Rome, and she would illustrate the general principles on which one system and style of art grew into another. The characteristic of Greek art was generally described as being ideal, and that of Roman art of realism, and these words were right if they understood what they meant, but they each raised so many interpretations that one had to be careful about them. What it really came to was that the Greek artist was a great creator, and the Roman artist was not. The Greek artist never sat himself down before a single man's or woman's form, or before any scene or front of people with the intention of copying or imitating them. That to him was not the nature of art at all. He was a creator and an originator, and he was always working from within upwards, and he made a new thing every time he set out to make a statue or relief. He earnestly watched the moving figures of men and women in order that he might know what attitudes and what beautiful lines each one of them took, and then he made something which was more beautiful than what he had actually seen. If one did not do that it was difficult to say what was the use of having art at all. As Whistler put it, "All the elements of beauty are already existent in the world outside; the artist is born to select and choose." Greek art was ideal, therefore, because it deals with ideals, and strove to create types, and was not merely a copy of existing forms. Roman art was exactly the opposite to that. The Roman was a great maker of history, but he was never a great artist, and perhaps the two hardly ever went together. The Roman was content to imitate actual forms; to make a speaking likeness of the people he saw. In the difference between the two lay the whole difference between two opposite ways of looking at art. They saw in the very beginning, when the Greeks had bad tools and hard stone, and no knowledge of anatomy, and the greatest difficulty in mastering their materials, how they were then striving to make something that, of their own inherent consciousness, was really beautiful. In the period after the Persian wars they began to make very beautiful but still rather stiff and broad, solemn, strong figures, and the 4th century was one when the ideal was strength and dignity. In the 15th century they had greater command, and then tools and materials and the far greater knowledge of anatomy enabled them to make statues with far more effect in repose and freer in line, and, as it were, less dignified, less solemn, and less finer perhaps. They were equally ideal, but the ideal was a new one, and was an ideal of delicate beauty and grace rather than of majesty and solemnity. Then they got to what were called Hellenistic times, and there they found that the old Greek model was

changed, and the old Greek style was modified by various infusions of different foreign ideas. Lastly, they came to Rome itself, where the Roman sculptors, living in a city crowded with splendid masterpieces of the old Greek days, longed to imitate Greek forms, but were themselves always filled, more or less, with their own realistic tendencies, so that Roman art was Hellenistic in a sense. Mrs. Burton Brown proceeded to illustrate by means of lantern slides the different styles. Commencing with views of statues of priestesses, dating probably about 520 B.C., she showed how they were practically only upright stone pillars with just a few lines indicating the drapery. The Greek began by worshipping a tree or trunk, and being an artistic person, immediately began visualising his god or goddess, and tried to turn the pillar into a man or woman, as the case might be. In these early figures they saw the archaic smile which was their only way of showing expression and life. Then in the pediments of Ægina, they found the figures still stiff and rigid, and still with the archaic smile, but there were signs that the Greeks were getting on. In the work of Myron, Polydeus, and Phidias, they got the representation of movement; Myron represented life and movement but no soul; Polydeus represented beauty in pose; but Phidias combined the two, and represented absolutely perfect pose and beauty of line and form combined with soul. In the 5th century men had been drawn together by the Persian war in a great patriotic struggle, and their triumph was expressed in the art of the Parthenon by Phidias and others. In the 15th century men had learned to make sculpture. In the early struggles they believed they owed their victory to the gods, but in the 15th century they began to speculate about the gods, and they found that, in the work of Praxiteles, the treatment of the gods was different. His statue of Apollo, the Lizard Slayer, was very beautiful and delicate, but it was not Apollo, the sun god. It was an ideal, not of strength and dignity, but of beauty and delicacy. Here they began to have dreamy eyes almost closed, and little open lips from which the breath seemed to come and go—the expression of the face and the treatment of the features was quite different. Scopas, his great contemporary, was subject to the same influences, but, whereas Praxiteles was always dreamy, Scopas was full of fiery movement. Then they came to Lysippus, the court sculptor of Alexander, and they began to feel that the end was coming. Next came the school of Pergamon, and they saw how the art had gradually fallen from the desire to represent something noble and fine, and got to be more and more exaggerated. In Rome much the same story had to be told. They excelled in clever realism, but there was no desire to idealise. The connexion between Greek and Roman art belonged to the time of Augustus, when a strong effort was made in Rome to imitate the beautiful Greek models of which the city was full, and in the great relief for the altar of peace they could have nothing more Greek than some of the figures. It was a curious Hellenistic art which combined local feeling with that influence of Greek models which was really what Hellenistic art meant.

RURAL HOUSING.

At the meeting of the Central and Associated Chambers of Commerce held on Tuesday at the Society of Arts, under the Chairmanship of Mr. Courteney Warner, M.P., the Rural Building By-laws Committee presented a report on the reference made to them to consider the whole subject of the Building By-laws as drawn up by the Local Government Board. Having given a brief review of the legal difficulties with which the local authorities are confronted, the Committee said that the problem with which they were confronted was to suggest means by which cheap and healthy dwellings might be erected for agricultural labourers in purely rural districts, and at the same time not to disregard the just claims of local authorities for protection against the jerry-builder, and to preserve the health of the areas over which they exercised jurisdiction. As matters now stood, it seemed almost hopeless to reconcile these conflicting claims. The position at the present moment was that

* With this we cannot agree. The Southwell carving, beautiful as it is, suggests to us to have the defect, in an architectonic sense, of looking as if it were applied round the bell of the capital instead of developing from it.—Ed.

the majority of rural authorities who had adopted by-laws were working under those of 1877, which were really only suited to urban districts. If it were only a question of drawing a sharp dividing line between urban and rural districts there would be no difficulty, as the by-laws of 1877 were quite suitable for urban districts, and those of 1901 fairly met the case of the purely rural neighbourhoods. The difficulty really was that a rural district could rarely be said to be wholly rural. Out of the 668 rural authorities there were seventeen whose by-laws were not based on any model series, and were made before the issue of the first model in 1877. There were 285 who had adopted the 1877 by-laws; 138 were working under those of 1901; and there were still 246 who had adopted no by-laws at all. In the Committee's opinion this was not a desirable state of things, and they could see no reason why the whole country should not be administered under one uniform system, provided such a system were made sufficiently elastic. They considered that the present condition of affairs was not satisfactory, and that no possible readjustment, either by amending Acts or by the exercise of administrative powers, could ever place the matter on a permanently satisfactory footing. An entirely new building code was necessary. They therefore suggested the appointment of a Royal Commission or Departmental Committee to inquire into the subject, which body might consist of an official from the Board of Agriculture and the Local Government Board and representatives of the Royal Institute of British Architects, Institution of Civil Engineers, Surveyors' Institution, Central Chamber of Agriculture, Land Agents' Society, and the Rural District Councils' Association. The Commission should be directed to frame one comprehensive code of by-laws, as to make them equally and automatically applicable to the following classes of buildings: (1) Isolated buildings, (2) buildings partly isolated, (3) buildings in villages, and (4) buildings in towns. Special powers in a new building code should be given to local authorities with reference to exemption, and the principle of a Court of Appeal, such as was to be found in the London Building Act, should also be embodied.

Colonel H. Le Roy Lewis, in proposing that the report be received and sent to the local chambers for consideration, said he felt there was really a chance of some legislation being passed this session, especially as they were not asking for money.

The resolution was adopted.

THE INCORPORATED CLERKS OF WORKS' ASSOCIATION.

The twenty-third annual dinner of the Incorporated Clerks of Works' Association was held on Saturday last week at the Criterion Restaurant, Mr. Henry T. Hare presiding, supported by Messrs. H. Brown (Herts County Council), F. L. Dove, C. G. Hare, E. T. Hall, C. Harrison Townsend, J. Hill, J. Pain (President of the Association), R. Kellond, J. Brady, J. Davies, A. Fincham, and a numerous company of members and friends.

The loyal toasts had been honoured, Mr. Joseph Davies proposed the toast of "The Architects and Surveyors," and in the course of his remarks he referred to the kindness he had received as a clerk of works from the architects and surveyors he had served. It made all the difference to a man and his work whether he received a little appreciation or did not. As to the future of business, times had been hard and bad enough, and he hoped that there would be an improvement in the near future. What the country wanted was land reform, which would give greater employment all round.

Mr. E. T. Hall, with whose name the toast was coupled, in response, said that architects were intimately associated with surveyors, and he could express his gratitude to them for the help they had rendered to him. A good quantity surveyor was of very great assistance to an architect. As to the relations between clerks of works and architects, he had found his clerks of works not only efficient, honourable, and straightforward men, but he had always been on friendly relations with them. Everyone liked to receive a little appreciation when trying

his best to do his duty, and it was but a slight thing for the architect to show his appreciation. As to the work of architects, there were a great many public buildings rising up which he hoped did credit to those who designed them. There was one work—the Queen's Memorial in London—by one of our greatest architects, which would be, when finished, of immense importance to this city, and it was one of the few imperial works which we had undertaken in recent years. In India there was another Queen's memorial, by an architect well known to them, which would be a credit to the time. There were also the War Office, by the late William Young, which he regarded as an admirable building, and the fine block of buildings on the other side of the road, designed by the late James Bryden; and it was to be regretted that in both those great works the architects died before they saw the fruits of their energy and ability. With Mr. Davies, he hoped that the present year would bring plenty of work. It might be said that everyone in that room represented the employment of perhaps many hundreds of men in the course of the year. Military men said that there were two officers in a regiment—i.e., the colonel and the sergeant-major—and in the building trade it might be said that the colonel was the architect and the clerk of works was the sergeant-major, and there was no doubt that as the position of the sergeant-major was one of great responsibility, so was the position of the clerk of works, who really "ran the show" and saw that the work was done. He believed that better work was never done in England than that which had been done in recent years and was being done now, and this work must be continued, to the credit and glory of our generation and country.

Mr. John Davies, in proposing the toast of "The Worshipful Company of Carpenters," referred to the excellent work of the Company in the matter of technical education. The classes and lectures of the Company were very good of their kind and were well attended, and the Company's library had been of much help to him and others. The Association was specially indebted to the Company for finding them a room in which to meet and for housing their small library.

Mr. J. Aitchison said they had hoped to have a representative of the Company present to respond to the toast, but he had pleasure in doing so. As Mr. Davies had said, the classes and lectures held by the Company were specially useful to young men connected with the trade, and he hoped that these classes and lectures would be attended by young men in greater numbers.

The Chairman then proposed the toast of the evening, "The Incorporated Clerks of Works' Association," coupled with the name of the President, Mr. J. Pain. It had been said that the essentials of successful building operations might be classed under the first three letters of the alphabet—i.e., the architect, the builder, and the client; but, while these three were very important component parts, he ventured to think that building operations would in many cases, if not in all, not go on very well without the assistance of the clerk of works. He was almost inclined to think that the client, important as he was in one respect, had no right to occupy the third position in that trio, to the exclusion of the clerk of works, and that a good clerk of works was the third essential to a successful building work. A clerk of works required to have a great many qualifications, and ought to be a sort of Admirable Crichton: he must know everything about the operations of building and building material; he must be a sort of policeman during the carrying out of the work; and, thirdly, he must be a man of tact. If the clerk of works had no tact, it did not matter what his knowledge of building operations might be, or what his firmness might be in the case of inferior work or material; without tact there would be continual trouble in the carrying out of a work. He had been very fortunate in getting clerks of works to carry out his buildings, and he had not been troubled by that friction which sometimes occurred in carrying out building contracts. The clerk of works who had tact was generally regarded by the builder as one of his best friends, for he saved the builder a great deal of trouble and made the work go on

smoothly. The Association had been in existence for twenty-three years, and he was quite sure that it must have exercised a very beneficial influence over the whole of the members. The Association tended towards social intercourse, and gave members an opportunity to exchange views and bring their difficulties and troubles before their friends, and it must be very helpful to all of them. He did not know whether the Association provided any system of training or a curriculum for the education of clerks of works, but they had heard that such classes as were instituted by the Carpenters' Company were largely attended by young clerks of works, and were found very useful. Classes of that sort must be very beneficial, but he did not think that they could take the place of practical training, and any man who was going to be a really useful clerk of works must serve his time at a trade and be at a bench. The best men he had known had gone through a trade and all the phases of it, and had become general foremen and then clerks of works. Those were the best men he had had to do with.

Mr. John Pain, in response, said that the first instance of a clerk of works occurred in 1241, in connexion with certain works at Windsor Castle for Henry III. At those times the clerk of works was attached to the household of the monarch, that being the case in 1641 (Edward III.) and in 1610, when one Ed. Carter held such office in the household of Prince Henry. In those days, however, the engagement of a clerk of works was a rare occurrence, and only in the case of large undertakings; but he thought that a clerk of works should be employed in the case of any building of the value of 5,000. As to the Association, the advantage to any clerk residing in London or the suburbs of belonging to it was obvious. Modern requirements rendered necessary a closer and more intimate acquaintance with sanitary, electric, and other matters than was formerly the case. A clerk had to be well up in these matters, but it was obvious he could not be an expert, and therefore membership of the Association was of great advantage to him.

Mr. J. Brady then proposed the toast of "The Press," coupled with the name of our representative, who replied. In the course of his remarks Mr. Brady referred to the excellent little journal which he edits—i.e., the *Clerks of Works' Association Journal*, which is issued monthly.

The toast of "The Visitors" was then proposed by Mr. R. Kellond and acknowledged by Mr. J. Hill, of the London Brick Company, who remarked that next to the architect the clerk of works was the most important person on a building that the merchant had to deal with. He also referred to the extensive character of the knowledge necessary to make a good clerk of works and to the classes of the Carpenters' Company, which had had a great deal to do with the position occupied by the clerk of works.

The last toast was that of "The Chairman," ably proposed by Mr. A. Fincham, who said that two or three architects had just been returned to Parliament, and the question had been asked: "Why have not more been elected?" He thought the answer was that architects were too busy to be engaged in Parliamentary work. There were to-day architects who were responding to the demands made upon them as well as, if not better than, had ever been the case. Some twenty or thirty years ago most of the buildings erected were a sort of debased Gothic, and architects were twitted for want of originality, but during recent years there had been a development of what might be called civic and municipal architecture, and the architects of these buildings would in time to come be regarded as pioneers and remembered as we remember Pugin, Barry, Scott, and Street.

The Chairman, in response, said it was quite impossible for anyone living now to say whether the architecture of to-day would in the future be considered equal to the architecture of the past. We could not look upon these works with the perspective which was necessary to be able to judge them, but there were a number of architects living who were doing, according to their lights, their level best, and no man could do more than that. Whether their work lived or did not time would decide; but any failure on their part would not be due to lack of effort, for

he knew how honestly and sincerely they tried to carry on their profession.

The proceedings then terminated.

THE SANITARY INSPECTORS' ASSOCIATION: ANNUAL DINNER.

The twenty-third annual dinner of the Sanitary Inspectors' Association was held on Saturday last week in the Venetian Salon of the Holborn Restaurant. The President, Sir James Crichton-Browne, was in the chair, supported by Sir William Broadbent, Sir Wyke Bayliss, R.A., Sir Shirley Murphy, Dr. J. C. Thresh, Mr. Andrew Clarke, and others.

The loyal toasts having been honoured, Dr. J. M. Rhodes, in proposing "Local Government," remarked that the public did not realise what a great amount of work city councillors did, and frequently overlooked the fact that their services were purely gratuitous.

The Mayor of Battersea, in response, said that he thought the difficult and arduous labours of local governing bodies were beginning to be recognised. The civic spirit was being revived, and he attributed this in no small degree to the creation of borough councils. There was much yet remaining to be done by citizens for the improvement of the neighbourhoods in which they resided, and in many places there was a great amount of work for the sanitary inspector yet to do. They needed a broader and more sympathetic system of local government. With all our disadvantages, however, we were far in advance of many other towns.

Sir William Broadbent then proposed "Science and Art." Sanitary inspectors were, he said, in the forefront of the battle against disease, and discharged their duties with zeal and intelligence. He hoped the time would soon come when they would join the medical profession in the battle against tuberculosis, and fight it with as much success as they had fought fevers and similar diseases. It was upon medical officers of health and sanitary inspectors they would have to rely in dealing with that disease.

Sir Wyke Bayliss said, in response, that art and sanitation were not so widely apart as many people supposed. One of the loveliest things in the world was a drain—when it was consecrated by art in the form of a gargoyle on a cathedral. Art was the science of beauty, and sanitation was the science of health, and what were beauty and health if they were not the same thing? A motto of his was: "However old the world may be, art is always young." Might it not only be young, but healthy?

Dr. Thresh also acknowledged the toast, and said there was a good deal of connexion between science and art, and there ought to be more. In a great city they made the difference between beauty and squalor. It was in the mean streets and the hack streets that their work awaited them.

The Chairman then proposed the toast of "The Sanitary Inspectors' Association." He thought the beneficence of the work of sanitary inspectors was now generally recognised, even by those who winced under it. There was, he felt sure, a growing appreciation in the public mind of the value of their services, an appreciation which must take shape one of these days in the granting to sanitary inspectors that security of tenure which was requisite to enable them to do their work without fear or favour, in the provision of adequate means of education, training, and official certification for those who were desirous of entering their ranks. It was satisfactory to note that there was now a steady, intelligent, and sustained interest in sanitary matters throughout the land, and an improved comprehension of them. It was to be hoped that, in the future, with a well-organised intelligence department composed of medical officers of health and sanitary inspectors in every town and county, they would not be caught napping or wait for the scourge of pestilence before putting their house in order, but they should practise that prevention which was better than cure. Diseases that had no business to be about would be caught up and exterminated when they had a thoroughly efficient sanitary police, invested with full authority, and working under a Minister of Public Health with a

sent in the Cabinet. What they had to do was to convince the public of the power and potency of sanitation, and of its pecuniary advantages, and they had, he thought, an opportunity of pressing that lesson home on them in connexion with a disease that was at present attracting much attention—namely, phthisis or pulmonary consumption. An interesting point to note was that the sanitary reforms by which those affected by consumption had benefited were not specially directed against consumption but had other objects than the reduction of consumption in view. Land drainage on a large scale was undertaken in the interests of agriculture, but it abolished malaria in the Fen districts, and caused a heavy fall in the mortality from consumption. The laying of main sewers and house drains and the abolition of cesspools in towns were intended to prevent other diseases; and it was a surprise when it was discovered that they had, no doubt by increasing the dryness of the houses and the purity of their atmosphere, been followed by a marked decline in the fatality of consumption. The window-tax was abolished on fiscal grounds, but by admitting to dwellings that sunlight that was destructive to bacilli and by permitting improved ventilation it also still further restricted the ravages of the disease. The improvements effected in houses, especially those of labourers and artisans in the thickly-populated parts of towns, undertaken mainly on ethical grounds, had largely helped in the suppression of consumption by the clearing away of infected areas. It was clear that every sound sanitary advance had far-reaching and wide-spreading effects, and might accomplish more than was anticipated when it was undertaken.

Mr. W. W. West, Chairman of the Central Executive Council, responded. They had worked during the last year, he said, under great depression on account of attacks which had been made upon them in some of the newspapers. It had been stated that sanitary inspectors, with very few exceptions, were corrupt and failed to do their duty, but such an accusation was entirely without foundation.

The toast of "Kindred Associations" was proposed by Mr. Baldwin Latham, and, in acknowledgment, Dr. Parkinson said that, unless sanitary inspectors and medical officers of health worked together, the health of the country must suffer. He was afraid that their endeavours to secure a Bill for the security of tenure would, in view of the change of Government, have to be put forward again. They had been told that the municipalities would be averse to giving them what they asked for, but he did not see how this could be, as they asked for this protection so that they might do their duty fearlessly, without the risk of not being reappointed on that account.

Other toasts were "The President," proposed by the Venerable Archdeacon Sinclair, and "The Press."

During the evening a presentation was made to Mr. Isaac Young on resigning the chairmanship of the Executive Council, and the Chadwick Medal, with a cheque for fifty guineas, was awarded to Mr. James Lord, of Failsworth, near Manchester.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

At a meeting of the Discussion Section of the Association, held on January 31, Mr. E. W. Wonnacott being in the chair, Mr. A. C. Dickie read a paper on "Internal Steps and Stairs and Their Treatment," the substance of which was briefly as follows:—

The general principles of stair planning, given in my paper of last session on "External Steps," apply equally to internal steps and stairs. No stair can be considered perfect in which comfort and ease have not been studied, together with propriety and fitness in scale. The judgment of comfortable going in a stair is largely affected by length of leg and strength of heart. Tredgold's rule of tread and 2 risers = 24 is a safe proportion. Barry put the perfect proportion at 5-in. risers and 16-in. treads. Palladio gives the minimum of tread at 12 in., with 6-in. riser, and the maximum at 16 in., with 4-in. riser, thus supporting Tredgold's rule. The

minimum width of stair has been fixed at 4 ft., allowing two persons to pass comfortably. Palladio states that no flight should have more than thirteen steps. Barry defended long flights when called to question regarding the flight of twenty-six steps which he designed for the House of Lords, citing Italian examples of much greater number, whose proportion of 16 and 5 made them "as easy as walking on a floor."

The lecturer then read extracts from Palladio on the subject, who laid down certain principles as essential to success.

In domestic work it is never agreeable to expose the stair too soon, as its traffic is usually of a private nature, and needs a certain degree of privacy. On the other hand, the grand staircase of a public building must affect a generous liberality, expressive of publicity, and its position accord with its character. In this class, too, may be included certain palaces and great mansions. In the baronial castles, prior to Elizabethan times, the spiral stone stair was in common use. It was often narrow, inconvenient, and typical of warlike times, and not till the Elizabethan period did the stair give evidence of a more peaceful time. In the châteaux of the Loire valley the spiral stair attained great proportions. In general, the castles in Scotland show great similarity in the management of the plan. A stair should be in character with its building, and sober treatment and proportion apply specially to small domestic examples. In these days of overcrowded gatherings, the hall fills a very honourable position if designed properly, with a well-placed stair. In houses of a fair size, therefore, we may primarily declare for a hall which aims at being something more than a passage, and recess our stair. This may be a newel or geometrical stair; but, perhaps, even better, a close stair house between walls. It is a simple straightforward method. A stair with two flights and a half-landing is always right.

For want of space quarter-landings and two steps between are often substituted—an ill-advised makeshift. The dimensions of a stair are much less elastic than in the other parts of the house. If thoughtfully introduced, winders can often be well used. They should occur near the commencement of the stair, and not at its finish. Head-room requires careful consideration, and for the small house stair should not be less than 7 ft. 6 in. The trimmer of the floor above should not be placed directly over the first riser, but advanced slightly. In our anxiety to avoid cramping the stair we must avoid the other extreme. Dog-legged stairs are not usually happy in effect, as it is difficult to avoid an awkwardness at the meeting of the return flight; however, it is preferable to the contracted well type. The geometrical stair is graceful and pleasant, especially when planned in a complete segment or ellipse, but is really a stone type developed in wood construction. For an open stair the newel and string principle of the Elizabethan period is the most charming. Short, wide flights with quarter-landings find much favour; some have long flights with half-landings, or arched gallery landings, all direct and simple on plan. Newels, strings, handrails, and balusters were all alike massive and richly treated.

Mr. Dickie then described certain types of this work from examples shown on the screen. Continuing, he said he thought the spiral stair might well be used more frequently, and instanced Street's stairs at the Law Courts, as also the various forms shown in Palladio.

Wren's geometrical stair at St. Paul's was a fine example, ninety-two steps in one flight, of 16-in. tread and 6-in. riser. The Château d'Amboix has a fine circular staircase surmounted by a corridor. The way in which the staircase dominates the whole external expression of these French examples was very noticeable.

Turning to Italy, the stairs in the Villa di Papa Giulio were very happy, double segmental flights on either side leading down to a lower hall. A common Italian type was the simple straight flight seen in the arched quadrangle, as at the Gondi Palace.

S. Giorgio Maggiore had a fine and broadly-treated stairs with central flight and landing and flanking flights of thirteen steps each. Palladio showed a simple square staircase of four flights of eleven steps each, and

four landings within a close wall. Another great example was the stair of the Corsini Palace, of fifty-three steps, approached through an arcade. The staircase measured about 75 ft. by 46 ft., with flights 11 ft. 6 in. wide. The Barberini Palace had a beautiful elliptical stairs, rising to a height of about 80 ft. in a continuous helical curve; the intralipse being treated with an order and balustrade carried in twin columns. Stairs must be sufficiently lit throughout, with special care for the lighting of the turnings. The solution, or otherwise, of the lighting problem might make or mar the stair. The works of the great masters formed our guide, and our study would be fruitful only in proportion to our ability to read the works in which their thoughts were so fully expressed.

Mr. Trant Brown, in opening the discussion, pointed out how interest and success in planning revolved on the stair question, instancing the want of interest of the flat or bungalow types. Seeing that stairs were used by people of all ages and sizes, comfort must be sought, not only in proportion, but in frequent landings and suitable surfaces to the stairs themselves. Flights ought not to exceed twelve steps in private houses, preferably nine or ten. A staircase leading to a blank wall is disappointing and depressing. Top lighting needed to be supplemented by side light. The working width of staircase was sufficient if 6 in. wider than the doorways. Winders were to be avoided if occurring only as an occasional surprise, mixed with long and short flights and landings. The single step was to be avoided absolutely.

In the ensuing discussion a good many small practical points were brought out, such as the adoption of a minor flight from kitchen quarters to main half-landing, thereby gaining much of the advantage of a complete servants' stair.

Mr. Lishman mentioned a practical method of determining head-room, by describing an arc from any point of the nosing line at a radius of 5 ft., which should clear all soffits.

Mr. Gerald Horsley, summing up the discussion, emphasised the importance of town staircases where they act as an approach to the reception-rooms, as compared with those in country houses. A stair within walls should be 5 ft. wide. A house of Mr. Shaw's, in Queen's-gate, was instanced as another excellent example of stair within stair. A house staircase with a well could hardly be placed in a space less than 9 ft. square. England was the best place to study the "string" types of stair, and Genoa or Rome the palatial approach stair.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—The first ordinary meeting of the Society of Engineers for the present year was held on Monday, the 5th inst., at the Royal United Service Institution, Whitehall. Mr. Nicholas J. West, the President for 1905, first occupied the chair, and presented the premiums awarded for papers read during that year, viz.:—The President's Gold Medal to Mr. Sherard Cowper-Coles for his paper on "The Metallic Preservation and Ornamentation of Iron and Steel Surfaces"; the Bessemer Premium of Books to Mr. Ernest Rounney Matthews for his paper on "The Parade Extension Works at Bridlington"; a Society's Premium of Books to Mr. Benjamin Laurenson Bradley for his paper on "The Grindiford Stone Quarries and their Working"; and a Society's Premium of Books to Mr. William Pollard Digby for his paper on "Statistics of British and American Rolling Stock." The thanks of the Society were also accorded to Mr. E. H. Thwaite for his paper on "The Transport Possibilities of our Inland Navigable Waterways"; to Messrs. C. S. Meik and Walter Beer for their paper on "The Improvement of London Traffic"; and to Mr. A. H. Smith for his paper on "Machine Drills for Hard Rock." Mr. West then introduced the President for the present year, Mr. Maurice Wilson, who then proceeded to deliver his inaugural address, in the course of which, reminding the members that he had for a number of years been engaged in the early education of engineers, he expressed his opinions as to the training of youths preparatory to their engineering education. He stated that a boy during the

latter part of his school life should be prepared, as far as possible, in the direction that would be most likely to benefit him in after life. He was certain that, at any rate, in reference to engineering, that was not done in the majority of cases. Pointing out that it was fair to take the average boy as an example, he asked how was a boy at one of our public schools taught his mathematics. A boy was not likely to become a good mathematician unless he learnt to follow up with intelligence the various stages of his mathematical training. Many youths began their engineering education, having taken no possible interest in their mathematics at school. He then referred to the bad spelling and execrable handwriting of the youth of the present day, and was emphatic as to the desirability of boys being refused admission to public schools unless they had been properly taught those subjects elsewhere. It was a fact that a large number of youths left school without the slightest idea how to reason out quite simple matters, and whose powers of exercising their common-sense was of the crudest description. A boy was never too young to be taught to think for himself, and problems and other mathematical matters should be placed before him from a common-sense point of view. He did not wish to reflect on the masters, who were a splendid and capable body of men, but on the present condition of rush and hurry, and the necessity for taking boys through a vast quantity of matter in preparation for the many examinations which were held during school life. Taking it broadly, it was not the boy from the large public school, but rather the one from one of the smaller public schools, or from a private school, who was a reasonable being. That pointed to the fact that the forms at many of our large public schools were too big, and that in consequence a master could not give anything approaching to individual attention to the boys under him. The general effect of that state of things was that, on leaving school, a youth usually found himself so woefully ignorant that he was obliged to spend a considerable time in working up all those necessary matters for his engineering education which he ought to have learnt at school, and that without any reference to higher mathematics. As, at any rate, a partial remedy for that, the President suggested that the large forms should be divided, and, if necessary, subdivided, so that a master should not have more than from fifteen to twenty boys to teach at a time. The Institution of Civil Engineers were moving in the matter, and as theirs was the opinion most likely to carry weight, they should be cordially supported by all engineers.

ARCHITECTURAL SOCIETIES.

MANCHESTER SOCIETY OF ARCHITECTS.—The eighth meeting of the students of this Society was held on Tuesday last week, and presided over by Mr. Henry Goldsmith, who, after a few preliminary remarks, called upon Mr. James Norquoy to read a paper entitled "Hints on Quantity Surveying." The lecturer, previous to giving the "hints," dealt very fully and ably with the merits of the different methods of taking off quantities. He also showed and gave instances how words had unnecessarily been inserted in the description, to the detriment of the quantities. One special case he quoted was where the word "soil" had been inserted after "excavating and removing," the result being that the contractor refused to remove the clay which underlay the soil unless an additional price was paid him. The Chairman in his concluding remarks corroborated a number of the statements made by the lecturer, and illustrated them with instances which had come under his own observation. He strongly advocated the dividing of each trade bill into heads, as, for instance, the placing of all items in connexion with floors under a heading of "Floors."

LIVERPOOL ARCHITECTURAL SOCIETY.—We were mistaken in mentioning the address of Mr. T. T. Rees last week ("Points for the Consideration of Municipal Councils") as that of the President of the Liverpool Society; Mr. Thicknesse is the President. We were under an impression that the paper from which we made the extract was an address from the chair; it appears that it was an ordinary Sessional Paper.

Fifty Years Ago.

FROM THE BUILDER OF FEBRUARY 9, 1856.

REMOVAL OF TENANTS UNDER THE NEW METROPOLITAN BUILDING ACT.

AT Worship-street the other day Mr. Charles Reeves, the Surveyor to the Commissioner of Sewers, attended before Mr. Haunwell to obtain from him a peremptory order for the expulsion of the occupants of certain houses at Mile End, under the following circumstances:—

Mr. Reeves stated that the prosecution was the first of the kind which had been instituted under the 18th and 19th of the present reign, cap. 122, and which only came into operation on January 1 last. The section of the statute under which he made the application was the 80th, the terms of which enacted that, in all cases where any structure had been certified by a competent surveyor to be dangerous to its inmates, a justice of the peace might, if satisfied of the correctness of such certificate, upon the application of the Commissioners, by order under his hand, direct any inmates of such structure to be removed therefrom by a constable or any peace officer; and if such inmates had no other abode, he might require them to be received into the workhouse established for the reception of the poor of the place in which such structure was situated. In pursuance, therefore, of an intimation he had received from the police authorities, he had that morning proceeded to inspect a locality called Spring-gardens, at Mile End Newtown, where he found a number of houses, consisting of twenty-one in all, the whole of which were in such a state of ruinous dilapidation, as not only to place the lives of the inmates themselves in imminent danger, but also those of any persons passing through the street. It was manifest such a state of things could not be allowed any longer to continue; and he had, therefore, forwarded a certificate to that effect to the Commissioners, who had at once directed him to take the necessary steps for the removal.

After some conversation, the magistrate affixed his signature to the order, and it was handed over to the officers that it might be carried into execution forthwith.

Illustrations.

SCULPTURE MEDALLIONS, INGRAM HOUSE.

THE oval medallions, illustrated in the plate, were modelled by Mr. Broad, of Messrs. Doulton & Co., and are originally burnt in terra-cotta at the Lambeth Potteries, casts being only taken in the case of one pair, the "Youth" and "Age," which were further reproduced in salt glaze, green on a deep blue ground, as points of colour to decorate the spandrils of the main arch of the entrance bay. The terra-cottas, as used internally, are unglazed, and have been coloured with the decoration of the walls. They are placed in pairs, grouped with the large Venetian windows which form the end feature of the principal club-rooms, "Spring and Summer" in the dining-room wing, "Autumn and Winter" in the smoking-room, and "Youth and Age" in the library. These ovals are 2 ft. 6 in. in height, and are burnt in one piece.

The figure of Apollo is a casting in lead, reproduced by Italians in London by the "cira perduta" process, from the clay model by Mr. W. Fagan, of Chelsea. This spandril is about 63 ft. from the ground, and the figure is half as large again as life-size. The photograph was taken from the scaffolding by Mr. Goldsburgh, of the architect's office, and shows some of the surrounding brick detail of the main cornice, etc.

The quatrefoil plaster panel, "Hercules," is the centrepiece of the deeply-coffered ceiling of the middle portion of the dining-rooms at Ingram House. It is about 4 ft. 6 in. square, and was modelled and cast at the building as part of the decorative plaster work carried out by Messrs. Aubrey & Co., of Woking. The design is based on an old French example at Toulouse, which is curiously cut out of the solid planks of the

"Apollo": Cast-lead Figure, Exterior of Ingram House.

ceiling. The treatment has been adapted to the difficult lighting of its position described above. A. T. BOLTON.

PULPIT AND SCREEN, SAN MINIATO, FLORENCE.

The marble screen dates from XIIIth century, and is one of the most beautiful specimens of marble inlay work to be seen in Italy. The screen is of cream marble and the inlay in ebony black, with very small portions of red, as, for instance, the demon's tongue. The columns to the pulpit are of red marble.

The font in Pisa Baptistery is of exactly similar design, although of much later date.

The niello pavement in the nave of the church, according to an inscription, was executed in 1207.

The church has lately been restored. The exterior is in keeping with the original work, but the interior has been greatly disfigured by painted imitation marble walls and string mouldings. LIONEL U. GRACE.

DESIGN FOR MUNICIPAL OFFICES, TORQUAY.

In this competition, held last year, the varying levels of site were such as to warrant consideration in the lay out so that the due advantages of the site could be obtained, and at the same time bearing in mind the dominant idea of concentration of departments, coupled with easy working arrangement. The principal entrance to the municipal offices was arranged from Marychurch-road, with entrance to the town hall and library from Castle-circus and Leamington-road respectively.

The plans being sufficiently explicit, detailed description is unnecessary. A crescent-shaped front, with forecourt bridged across to main entrance, was adopted, as it was considered a solution of the difficulties of levels. The library was purposely planned as a separate building capable of erection and being complete in itself, this being one of the conditions of competition. The architectural treatment is an attempt to depict a restrained monumental and solid dignity conceived to be best adapted to the use of local material, which is blue-grey limestone, and to this class of building. The frieze surmounting the whole building was intended to be of Ham Hill stone.

The drawing was exhibited at the last Royal Academy. E. VINCENT HARRIS.

HOUSE AT MASSINGHAM, NORFOLK.

This house has recently been completed at Massingham, Norfolk, from the designs of Messrs. Edmund Wimperis & Best.

It is faced with red brick and Ancaster stone, the roof being Brosley tiles.

The contract for the house, lodge, and stables was 7,624l., and the contractors were Messrs. Cubitt & Gotts, of Ipswich, the clerk of works being Mr. Chas. Stacey. The Gilmour Door Company supplied the hardwood doors, and the carving was done by Mr. Jago, of London.

The plan and elevation were both largely

influenced by the owner's wish to reproduce the design and character of an existing Georgian house in the same county.

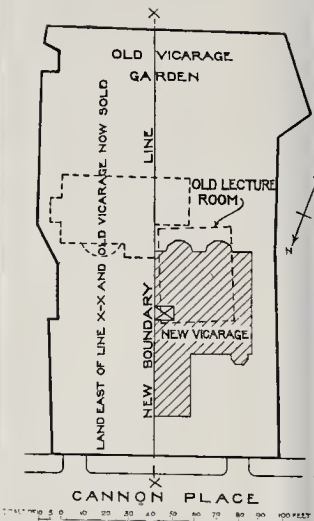

CHRIST CHURCH VICARAGE, HAMPSTEAD.

The main problem to be solved in the design of this house was how to get the accommodation required on a somewhat restricted site without altogether ruining the garden. Half the garden of the old vicarage, together with the house itself, having been sold it was necessary to place on the remainder of the site, whereon had stood a large one-storied lecture-room, the new vicarage, which was to contain, besides the ordinary accommodation, a vicarage-room, where meetings and classes could take place without disturbing the household of the vicar.

The garden is situated on the heights above London; the southern rooms therefore have a commanding view over roofs and spires to the Surrey Hills beyond. No lighting (except by the area over pantry and service lobby) was to be obtained along the eastern boundary. The above were the conditions which suggested the disposition of the plan.

There is a drawing-room on the first floor over the dining-room. Seven bedrooms (including two attics), dressing-room, and bathroom complete the accommodation.

The outside facings are of red pressed bricks, supplied by the Heather Brick and Terra-cotta Company, Leicestershire. The copings and chimney bases are of Campden

Christ Church Vicarage, Hampstead. Block Plan.

stone. The roofs are covered with Brosley tiles.

The contractor was Mr. John Bentley, of Waltham Abbey, Essex. Our illustration is from a drawing exhibited last summer at the Royal Academy by Mr. A. Maryon Watson (Messrs. J. H. & A. M. Watson), the architect of the house.

COMPETITIONS.

HACKNEY CENTRAL LIBRARY.—The Baths Committee of Hackney Borough Council reported on Monday having granted an application by the Public Libraries Committee for the use of the gallery of the King's Hall on February 26, 27, and 28 for the purpose of exhibiting the architects' designs for the proposed Central Library.

FREE LIBRARY, CROMPTON.—Mr. G. H. Willoughby, F.R.I.B.A., of Manchester, has been appointed assessor by the Crompton District Council in connexion with the Carnegie Free Library, for which about fifty sets of drawings have been received.

Correspondence.

APPOINTMENT OF DISTRICT SURVEYORS.

Sir.—It is said that the scheme devised by the Building Act Committee of the London County Council was carried by one vote, and it is rather remarkable that the three builders who must have had long experience of the Act and of the District Surveyors were opposed to the report; in fact, one made some very sensible remarks against it. The Chairman seemed anxious for the change; he is an Irish officer without practical experience of building.

Most of the surveyors would benefit by having a salary, and as there is no doubt that building in London will decrease instead of increase, the next ten years will produce about 10,000, less per annum in fees than the past ten years.

One member mentioned that a large fee could be charged for a small alteration to a large building; this is true as the Act stands, but it is well known that the surveyors in such cases make a very large abatement and charge a nominal fee, when, if the fees were collected on behalf of the Council, no such abatement could be legally made.

For more than sixty years the present system has worked well. Men of experience would not care for the appointments under the new scheme, and after many attempts to destroy the position of the District Surveyor they should now be left in peace to pursue their useful work.

The present system of appointment since 1900 is not satisfactory, as a man may be insolvent during his term of office, or if he struggles on with fees varying from year to year, there is no pension at the end, and after giving the best years of his life to the work, he may end his days in the workhouse.

Both the professional societies are in favour of the old system, and there is nobody at the County Hall with any practical experience of the working of the Building Act.

The "Architect" who wrote last week mixes up surveyors and sanitary inspectors, and seems to ignore the fact that District Surveyors know all the troubles of architects, having themselves been actively engaged in the practice of the profession. His ideas are clear as a very small proportion of jobs have an architect, and even experienced architects are glad to have the assistance of an expert in the building laws.

Your "Note" is excellent; worthy of the journal so long conducted by a District Surveyor—the late Mr. George Godwin, who was so highly esteemed by the profession and the public.

FAIR PLAY.

USEFUL WORK FOR THE UNEMPLOYED.

Sir.—Having regard to the serious depression now existing in the London building trade, and the large number of men connected with it who are at present out of employment, may I be allowed to suggest to those property owners who are able to afford the expense, that the most effectual way of relieving the prevailing distress is to put in hand all necessary repairs, painting, etc., with as little delay as possible.

It needs no argument of mine to prove that money spent in this way does far more good than much larger sums given in the form of charity, or as subscriptions to funds for the relief of the unemployed.

One cannot go about London without being struck with the state of despair into which so many houses are allowed to fall; if only a tithe of the work that is required were undertaken, very much of the distress that at present exists would quickly disappear.

I ought perhaps to add that I have no personal interest in the building trade, either direct or indirect.

JOSIAH PRICE NEWTON.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—V.

SHORT CUTS TO MULTIPLICATION.

SOME knowledge of the properties of numbers is most useful, because it facilitates the simplification of various calculations performed by the ordinary rules of arithmetic. It would be inappropriate in the present series to devote attention to such properties, as a special subject for discussion, but a few of them will be mentioned in places where their employment suggests the abridgment of arithmetical processes. This article and its immediate successors will deal with such of the primary and derived rules of arithmetic as lend themselves to the adoption of time-saving methods likely to be of service to the busy professional man.

As a matter of convenience our notes are classified under the heads adopted in ordinary text books.

Contracted Method of Multiplication.

Rule.—Reverse the multiplier so that the units place comes under that figure of the multiplicand which is the lowest place of the required product.

This method is of much assistance in the multiplication of numbers containing or consisting of decimal fractions, or vulgar fractions that can be converted mentally to decimal equivalents. It is particularly intended for use in calculations where the number of decimals in the product need not be so great as the number in the multiplicand and multiplier. To multiply into each other two numbers containing several decimal figures and afterwards to strike off several decimals from the product obviously involves useless expenditure of time, and does not add to the practical value of the result.

For the purpose of comparison the following examples are worked by the ordinary method as well as by the contracted method. It should be noted in connexion with the latter that when a figure, rejected from any of the individual products has the value of 5 or more, the figure next to it should be increased by 1.

Example (1).—Multiply 87315 by 87341 and bring out the product to three places of decimals

Contracted Method.	Ordinary Method.
58645	58645
14378	87341
490160	58645
41052	234580
1759	17595
236	410645
6	490160
	512112945 = 512.2114

In working upon the abridged method we proceed as follows:—

Line (1).—Multiply by 8 to obtain the product 469160.

Line (2).—Multiply by 7, thus: 5 × 7 = 35, the figure 5 being rejected and the figure 3 carried to the next product; but, as the rejected figure has the value of 5, we carry 1 as well as the 3, and add 4 to the product of 4 × 7 or 4 + (4 × 7) = 32, writing down the 2 and carrying 3, and so on for the rest of the line. In this way the product 41052 is obtained.

Line (3).—Multiply by 3: first 5 × 3 = 15, the 5 being rejected and the 1 carried mentally, together with 1 to make up for the 5 rejected; next 2 + (4 × 3) = 14, the 4 being rejected and the 1 carried on; then 1 + (6 × 3) = 19, the 9 being set down and the 1 carried, and so on for the rest of the line, until we get the product 1759.

Line (4).—Multiply by 4: first 5 × 4 = 20, reject the 0 and carry the 2 mentally; next 2 + (4 × 4) = 18, reject the 8, but, as this is

more than 5, carry 2 instead of 1; then 2 + (6 × 4) = 26, write down the 6 and carry the 2, and so on to the end of the line, giving the product 236.

Line (5).—Multiply by 1, and here, as the figure 8 preceding the figure to be set down is more than 5, we carry 1 and write 5 on this line.

The sum of the various products is 512213, and by inserting the decimal point in the correct position we get 512.213.

Example (2).—Multiply 675941832 by 9315764 and bring out the product to three places of decimals.

Here we can abridge the multiplicand to 67594 and the multiplier to 93158, without leading to sensible error, and, working out the result by both methods as in example (1), we have

Contracted Method.	Ordinary Method.
67594	675941832
83158	9315764
608345	270367328
20278	405585092
676	473158224
338	337979160
54	675941832
	202785406
629692 = 629.692	608347648

6296914581639618 = 629.6914

Inspection of the results in the preceding examples shows that the differences are quite unimportant, and that the product given by the contracted method may be regarded as sufficiently accurate for all practical calculations based upon data that are themselves approximate, and for many others that have to be made in every-day practice.

The contracted method can also be employed for the multiplication of large whole numbers in cases where absolute accuracy is not essential in the units, tens, hundreds, or thousands places. Thus if we have to multiply a number of eight figures by another number of four figures, two, three, or even four figures in the product may be replaced by ciphers without seriously invalidating the general result.

For instance, take the number 83641258, which consists of:—

8 × 10,000,000
3 × 1,000,000
6 × 100,000
4 × 10,000
1 × 1,000
2 × 100
5 × 10
8 × 1

These figures show how insignificant are the quantities represented by the digits at the right hand in comparison with those at the left hand, and, as a matter of fact, the collective value of the four last numerals 1258 is only $\frac{1258}{10000000}$, or about $\frac{1}{8000}$ of the whole number. Hence it is obvious that the collective value of the last three, or of the last two, numerals is of little practical account, as shown by the following example:—

Example (3).—Multiply 83641258 by 4657, expressing the last seven figures of the product in ciphers.

Contracted Method.	Ordinary Method.
8364 (1258)	83641258
7564	4657
33457	5854888 6
5018	41820260
418	50184748
59	334587032
38952	389517338056 = 389,517,338,506

which, after adding the necessary ciphers = 389,520,000,000.

For the purpose of comparison we have worked out the exact product by the ordinary method and the approximate product by the abridged method. It will be seen that the difference is 2,661,494, which involves an error of only about $\frac{1}{143,000}$ in excess of the exact product.

Of course, discrepancies of the kind might be of importance if the units were pounds, shillings, or even pence, or if they represented quantities of materials to be bought or sold. But in approximate calculations and estimates such a discrepancy would constitute no disadvantage, and the same would be the case if the two numbers multiplied into each other formed the numerator of a fractional term in a formula so that the product had to be divided by some other large or comparatively large number.

Multiplication by Factors of Composite Numbers.

Rule.—Multiply successively by factors of the multiplier.

This is a method that will be found very

convenient for mental calculations if the multiplier is a number that can be divided readily into factors.

The following are simple illustrations:—

Example (1): Multiply 521 by 64.

Here 64 = 4 x 4 x 4, or 8 x 4 x 2, and the process is—

Arithmetic multiplication table for 521 x 64, showing intermediate steps for (a) and (b) methods.

Example (2): Multiply 432 by 135.

Here 135 = 3 x 5, or (3 x 9) x 5.

Arranging the factors in different orders, we have

Arithmetic multiplication table for 432 x 135, showing different factor arrangements.

Multiplication by Incomposite Numbers. Rule.—Multiply by the factors of the nearest composite number, and add to or subtract from the last product the product of the multiplicand and the difference between the nearest composite number and the multiplicand.

Example (1): Multiply 109 by 67.

Here 67 = 64 + 3 = (8 x 8) + 3 and the process is—

Arithmetic multiplication table for 109 x 67, using the nearest composite number method.

Example (2): Multiply 181 by 47.

Here 47 = 48 - 1 = (6 x 8) - 1 and the process is—

Arithmetic multiplication table for 181 x 47, using the nearest composite number method.

The method of subtracting a multiple of the multiplicand from a tentative product can be applied very conveniently (1) when the multiplier consists entirely of nines, or (2) when the multiplier ends with the figure 9.

Multiplication by Any Number of Nines.

Rule.—Place as many ciphers at the end of the multiplicand as there are nines in the multiplier, and subtract the multiplicand from the result.

Example (1): Multiply 83 by 9.

Here 83 x 9 = 830 - 83 = 747.

Example (2): Multiply 824 by 99.

Here 824 x 99 = 82400 - 824 = 82566.

Multiplication by Any Number Ending in Nines.

Rule.—Multiply by the whole number next above the multiplier, and subtract the multiplicand from the result.

Example (1): Multiply 45 by 19.

Here 45 x 19 = 45 x 20 - 45 = 855.

Example (2): Multiply 334 by 39.

Here 334 x 39 = 334 x 40 - 334 = 19,706.

The same principle can also be applied to multiplication by any numbers conveniently near in value to multiples of 10.

Multiplication by Any Number Near to a Multiple of Ten.

Rule.—Multiply by the multiple of ten next above or below the given multiplier, and subtract or add the product of the multiplicand and the difference between the given multiplier and the multiplier actually used.

Example (1): Multiply 35 by 28.

Here 35 x 28 = (35 x 40) - (35 x 2) = 1,330.

Example (2): Multiply 68 by 31.

Here 68 x 31 = (68 x 30) + 68 = 2,108.

Multiplication by Components of the Multiplier.

Rule (1).—Divide the multiplier where possible into components produced by multiplication of one or more parts of the multiplier.

Example (1): Multiply 67832 by 9612.

Here it is evident that 9612 = 9600 + 12 and 9600 = 800 x 12

Hence the process is as follows:— Multiply the number by 12 and the first product by 800.

Arithmetic multiplication table for 67832 x 9612.

Example (2): Multiply 573688 by 196284.

Here the multiplier consists of— 196,000 = 280 x 700

Hence the process of multiplication is as follows:— Multiply the number by 4, the first product by 70, and the second product by 700.

Arithmetic multiplication table for 573688 x 196284.

Example (3): Multiply 573688 by 392567.

Here the multiplier consists of— 392,000 = 560 x 700

Hence the process of multiplication is as follows:— Multiply the number by 7, the first product by 80, and the second product by 700.

Arithmetic multiplication table for 573688 x 392567.

There are many other numbers besides those given in the last three examples that can be divided into parts bearing definite relations one to another such as enable the process of multiplication to be abbreviated.

Rule (2).—Add to or subtract from the last digit or the last two digits of the multiplier such a number as will make it possible to divide the modified multiplier into components produced by multiplication of one or more other parts.

Example (4): Multiply 678432 by 9609. Add 3 to the multiplier, making 9612, and proceed as in Example (1).

Example (4): Multiply 678432 by 9615. Deduct 3 from the multiplier, making 9612, and proceed as in Example (1).

Arithmetic multiplication table for 678432 x 9609.

Arithmetic multiplication table for 678432 x 9615.

To the product so obtained add 678432 x 3 = 2,025,296. Thus: 652108834 2025296 652313880

To the product so obtained add 678432 x 3 = 2,025,296. Thus: 652108834 2025296 652313880

THE SURVEYORS' INSTITUTION: STUDENTS' PRELIMINARY EXAMINATION.

Of the candidates who presented themselves at the Preliminary Examination of the Institution, held concurrently in London and Manchester on January 17 and 18, the following satisfied the examiners:—

- C. Abbott (Malton); A. P. Brown (Tunbridge Wells); R. E. Abbot (Malton); G. M. Brown (Tring); G. H. Butterfield (Waltham-on-Dearne); F. Bacon (Snaresbrook); H. E. Carrington (London); E. V. D. Castiglione (Carlisle); P. R. Chanin (Taunton); *J. Batstone (Wandsworth Common); D. O. C. Beale (Tunbridge Wells); R. W. Beken (Crouch Hill, N.); F. O. Bemberon (West Hampstead, N.W.); G. Bolsover (Whitburn, Sunderland); A. W. Davson (Notting Hill, W.); G. E. Bond (Thame, Oxfordshire); A. E. Dickson (Preston);

- S. J. Dimmock (Watlington, Oxon); B. R. Mills (London); F. H. Moore (Barnet); M. Dixon (Liverpool); H. F. North (Mortimer); A. B. C. Duke (Maen, Dorchester); W. Oldham (Eton); J. B. Pascoe (Swansea); G. W. Edwards (Stoke-upon-Trent); E. G. Patching (Worthing); J. Escolme (Morecambe); F. W. Pear (Plymouth, Devon); H. F. Pegg (Woodbridge, Suffolk); G. V. Evans (West Marton, Yorkshire); P. L. Pemberton (Mortimer, S.O.); W. D. Everett (Alton, Hants); S. C. Radburn (Wandsworth Common); R. M. Ewen (Camberley); R. H. Richards (Powis Castle, Montgomery); C. A. Fentum (Upper Norwood, S.E.); A. M. Ridley (Richmond); H. O. Foster (Loughton); J. P. Risdon (Wivelston, Lincoln); P. C. Cambell (Leighton Buzzard); J. J. V. Roberts (Haunton); E. B. Gillett (Streatham, S.W.); N. P. Russell (Lordship Park, N.); H. G. F. Goddard (Taunton); J. W. Scarlett (Ramsgate); W. Griffin, jun. (Battersea, S.W.); L. Stevens (Newton); H. S. Griffiths (Putney); Abbot; T. H. Grimm (London); J. E. Stokes (Cannock); C. Gude, jun. (St. Margaret's-on-Thames); A. H. B. Talbot-Ponsonby (West Milton, Melplash, S.O.); R. F. Hankins (Finchley, N.); A. B. Taylor (Fulwood, Preston); M. M. Harrison (Aspatria); E. Taylor (St. Albans); R. O. Harrison (Carlisle); W. Tibbits (Warwick); W. A. Travers (New Brighton); W. H. Hayward (Broadstairs); R. J. Trollope (London); R. T. F. Hedley (Finchley, N.W.); R. H. Tucker (Totnes); P. C. Henderson (Clapham Common); A. S. Tyler (Walthamstow); R. T. Hower (Abingdon, Berks); G. L. Vigers (London); N. H. Hibbs (Bourne-mouth); S. M. Voy (Hammer-smith, W.); J. B. Hingley (Cradley Heath, Staffs); G. N. Warbrick (Kendal); A. H. Hopley (Cheltenham); L. H. Weaver (Kensington, W.); R. B. Holson (Hampstead, N.W.); M. F. Welsh (Heaton, Newcastle-on-Tyne); E. P. Horne (Hounslow); H. Willett (Bedford); B. E. Hornor (Norwich); W. E. Williams (Ashington-Lynde); M. M. Wilson (Woburn); F. J. Hoskins (Swansea); S. F. Wilson (Manchester); C. S. J. Howe (Leeds); F. J. Wise (Bury St. Edmunds); H. C. James (West Ham, E.); E. J. Wonnacott (Exeter); E. H. Jones (Bristol); A. F. Wood (Lea, S.E.); A. Kirk (Withington); C. R. Woodcock (Aldersburgh-on-Sea); F. H. Lloyd (London); R. B. Woodham (Frinton-on-Sea); E. Ferry (Cheshire); W. E. Woodham (Frinton-on-Sea); L. L. Loveridge (Sutton Coldfield); R. M. Woolley (Salisbury); W. S. May (Chislehurst); R. M. Wootley (Salisbury).

* Passed at head of list.

COURT OF COMMON COUNCIL.

THE Lord Mayor presided at a meeting of the Court of Common Council at the Guildhall on Thursday last week.

Bishopsgate-street.—In answer to a question, Mr. Livesidge said that the Improvements and Finance Committee had been in negotiation with the London County Council for some time past on the subject of the widening of this street, and though they had so far been unsuccessful, as the conditions of the Council were untenable, they hoped soon to come to a new arrangement by which the County Council would bear an equitable share of the cost. The improvement was too costly to be carried out by the Corporation alone.

Milan Exhibition.—A letter having been received asking the Corporation to take the lead in arranging for an exhibit of the municipal services of London at the Milan International Exhibition, 1906, Sir Thomas Brooke-Hitching gave notice of motion that some of the departments of the Corporation should be instructed by the Court to prepare such an exhibit. He thought that plans and models of the Tower Bridge and the markets would be of great interest.

Appointment of Surveyors.—Reporting on the death of Mr. H. H. Collins, the Dangerous Structures Surveyor for the eastern and southern divisions of the City, the Streets Committee recommended that Mr. Edmund Woodthorpe (the present surveyor of the northern division) should be appointed to act as surveyor for the eastern division, and Mr. Martin F. Saunders (the present surveyor for the western division) should be appointed to act as surveyor for the southern division. This was agreed to.

Heavy Motor Traffic.—On the motion of Mr. party Pearce Morrison, it was agreed to refer questions relating to the passage of heavy traffic through the City to the City Purposes committee for consideration and report.

THE ROYAL SANITARY INSTITUTE.

A public meeting was held at the Crown Court, the Gu Jhall, Bristol, on Saturday last week, the purpose of making preliminary arrangements in connexion with the Congress of the Royal Sanitary Institute, which will meet in that city in July next. The Lord Mayor (Mr. A. J. Smith) presided, and explained that the object of the meeting was to make arrangements for the reception of representatives of the Royal Sanitary Institute at the Bristol Congress, to be held from July 9 to July 16. When Mr. J. W. Wintle considered the importance of the objects of the Institute, and of the business to be transacted, he thought the citizens should do what they could to support the Institute. There is no doubt that a great deal of trouble in the city had been brought about by people not having any sanitary knowledge, and from a sanitary point of view. One of the highest objects they had in municipal matters was to cure the cleanliness of the city in which they lived. Dr. Wintle (Chairman of the Health Committee) said the meeting was a sequel to that held in August last when he had unanimously decided to invite the Royal Sanitary Institute to hold their next Congress in Bristol. That invitation had been accepted, and he was pleased to say that Sir Edward Fry had become President of the Congress.

Colonel Lane Notter, who was then asked to address the meeting, said he hoped the Lord Mayor would be pleased to accept the honour of becoming a vice-president. The annual congresses were held in provincial towns of England for the purpose of bringing forward different views and educating people both by speeches and by the exhibition of most recent appliances adapted for sanitary purposes. It was the aim of the Institute to diffuse healthy knowledge of sanitation, and try and lead people in their own interests to adopt the best measures for safeguarding their health. The Institute had been established some thirty years, and at the present time there were about 3,000 members. He could not over-estimate the valuable help it had received from municipal authorities who had thoroughly reported on the sanitary condition of their districts, and who lent their aid in the congress meetings. Another important branch was the training and examination of sanitary officers. The Institute was the first body to undertake this important duty, and there was no more important phase of sanitary work than the duty of the sanitary inspector. The work required that, such an officer had to be judicious and judicious if he was to carry on his work to the satisfaction of those over him and with that peace and harmony that should exist among his clients. This was not a metropolitan association. It was cosmopolitan, and sought to diffuse knowledge through many centres in the country. The Institute had been held in provincial towns, and they had been the means of diffusing information and helping in the elucidation of questions that had proved difficult to local officers. In addition, they had the Parkes Museum in London; he hoped at no far distant date it would be removed to a more suitable building than that at present occupied. With the aid of the people of the country the Institute might show at the exhibition the principles of sanitation adapted to all kinds of dwellings. If they could infuse a knowledge governing these things they would lengthen life, increase happiness, and make the country more prosperous.

Mr. W. Whitaker, Chairman of the Congress Committee, spoke of the usefulness of the Congress in affording the opportunity of ventilating matters of public interest. The lecturer on the occasion of the Bristol visit would be Professor Lloyd Morgan, Principal of the Bristol University College. Bailie Anderson, Chairman of the Glasgow Health Committee, would deliver the opening lecture on July 13.

Mr. H. D. Soarles Wood spoke of the exhibition, which would be one of the features of the Congress. It was a valuable object-lesson, inasmuch as matters referred to in the papers and discussions were to be seen in concrete form in the exhibition. Already they had that support of five county councils, fifteen county boroughs, and a like number of urban councils, besides school authorities, port sanitary authorities, and fifteen societies.

Mr. Moss Flower explained that at a meeting in August he told them that the provisional subscription list showed that about 150 guineas had been obtained. He also told them that he had in the name of the committee secured the option of certain public halls. Since the acceptance of Bristol's invitation he had in the name of the committee engaged the Victoria Rooms as the reception rooms and the Rifle Drill Hall.

The governors of the University College had kindly offered to place at the disposal of the committee their large hall and other rooms, and had written to say they would be pleased to help forward the meetings and make them a success. The lecture room of the Museum and the Blind Asylum Hall would be required, and thus they would be fixed up with halls within a reasonable distance of each other, so that members could easily go from one to the other.

Mr. A. P. I. Cottrell moved that a local general committee be formed to make the necessary arrangements in connexion with the Congress, the committee to consist of those who formed the Invitation Committee, together with those whose names had been read out that day, with power to add to their number.

Mr. J. Baker seconded the resolution, which was carried unanimously.

Mr. Boyd moved—"That a fund be raised for the purposes of meeting all local expenses."

Mr. Levy Langfield seconded, and the resolution was carried.

The High Sheriff moved the appointment of Dr. Colston Wintle as Chairman of the General Committee.

Mr. D. Irvine seconded the resolution, and it was carried.

The appointment of Hon. Treasurer was left to the committee, and the nomination of Dr. Wintle, seconded by Mr. Moxey, the position of Hon. Secretary was conferred upon Mr. T. J. Moss Flower.

Dr. Shingleton Smith proposed the appointment of an Executive Committee, with power to add to their number, and this was seconded by the Rev. W. B. Cooper, and agreed to.

METROPOLITAN ASYLUMS BOARD.

The usual fortnightly meeting of the Managers of the Metropolitan Asylums District was held on Saturday last week, at the offices of the Board, Victoria Embankment, W.C.

Lauesden Asylum.—The Asylums Committee submitted a report regarding a letter, received by the managers some two months ago from the Local Government Board, respecting a proposal to construct iron bridges between certain of the blocks of this Asylum, in the course of which the Local Government Board pointed out the costly character of the proposal. In their report the Committee stated that the estimated cost was 5,000l., and, as showing the necessity for the proposed bridges, quoted some observations of the Commissioners in Lunacy. It was agreed to send a copy of the Committee's report to the Local Government Board.

Northern Hospital.—A report was submitted by the Hospitals Committee respecting the sewage disinfecting chamber at this hospital. There is at present a formal agreement between the Managers and the Southgate authorities, by which the Managers bind themselves to disinfect all the hospital sewage by an admixture of chemicals before it is passed into the local Board's sewers. On account of the cost, and for certain other reasons set forth by the Committee, they recommended that application should be made to the Southgate Local authority to terminate the agreement and to connect the drain direct to the public sewer. This was agreed to.

Stables at Belmont.—The Works Committee reported having received plans prepared by Messrs. T. W. Aldwinckle & Son, in consultation with Professor Sims Woodhead, and Dr. Cartwright Wood, for the stables and other buildings proposed to be erected at Belmont in connexion with the preparation of anti-toxin serum. On the recommendation of the Committee the plans were approved, and it was directed that they should be forwarded to the Local Government Board for sanction. The buildings are estimated to cost 4,600l.

Among the motions down on the agenda was the following, moved by the Chairman of the Board:—

"That no plan be submitted to the Board or to any Committee for approval unless and until the same shall have been deposited for the inspection of the Managers or members of the Committee concerned, in some convenient part of the Office of the Board at least two full days before the meeting at which it is proposed that such plan shall be submitted; and that on the agenda paper for any such meeting shall appear a notice stating the plan or plans have been so deposited, and in what room."

This was agreed to unanimously, the Chairman remarking that he thought the arrangement would work very satisfactorily.

DISTRICT SURVEYORS' ASSOCIATION.—

The election of officers for 1906 has resulted as follows: Mr. Edward Dru Dry, President; Mr. Frederick Waller, Vice-President; Mr. John Clarkson, Hon. Treasurer; Mr. Henry Lovegrove, Hon. Secretary. The retiring President, Mr. Thomas H. Watson, has given careful attention to his duties during a very busy year, and his unvarying courtesy increased, if possible, the esteem in which he is held by the London District Surveyors.

YORK MASTER BUILDERS' ASSOCIATION.

The York Master Builders' and Contractors' Association and friends assembled in the Old George Hotel, Pavement, York, on the 30th ult., under the chairmanship of Mr. Geo. Sharp, President of the Association, on the occasion of the annual dinner. The loyal toast having been honoured, Mr. F. Raney proposed the toast of "The Yorkshire Federation of Building Trades." He said that one of the objects of the federation was stated to be the promotion of equitable dealings with architects and others in relation to quantities and contract agreements. Speaking as regarded architects, he felt he might say without fear of contradiction that the great majority of architects were fully in accord with the federation on this subject. As regarded quantities and contract agreements, the society with which he was identified had lately given a considerable amount of consideration to this question, and more especially to the conditions of contract which had been adopted by the Royal Institute of British Architects, and the National Federation of Master Builders. Whilst they agreed in toto to the principles laid down in that document, there was some slight difference of opinion as to the most suitable form which could be adopted for local requirements. Some of them felt that the agreements were drafted to meet the requirements of a section of the building trades who did not probably carry on their business on methods the same as was done in that locality. Locally, he and his colleagues would like to see a revision of that so as to have the conditions more adapted to local use, and he thought there should be a conference between them and representatives of the Association of Master Builders. One of the things that architects were agreed upon was that the clause for quantity should be part of the contract. If it was not out of place he would like to express the wish that all representatives of the building trades could be drawn into an association of that kind. Another object which the federation had in view was the promotion of boards of conciliation on disputes between employer and employees. That he considered a most laudable object.—Mr. P. Rhodes, in acknowledging, said he ventured to assert that anyone who looked through the agreement between the National Association of Master Builders and the Royal Institute of British Architects with reference to architects' agreements calmly and judiciously would see that it was a most equitable arrangement as between architect and builder and between the builder and his employer. In the old days the builders did not appreciate the importance of their position. "We want to remember that next to agriculture we are the largest, oldest industry in this country, and when you come to consider that 50,000,000l. of money is paid annually in wages to employees of the building trades you should feel proud to belong to a craft which is of the highest and of the utmost importance." They should not worry their minds about reducing men's wages. Let the men have a fair, good wage, and let the masters themselves be content with a fair day's work for it. They had the right to demand a good profit. During the last two or three decades the men had banded themselves into influential and powerful bodies, having a great influence in members and money. A number of years ago the masters had no federated feeling with masters in other towns, and the consequence was that when they came into contact with the men in a trade dispute they found that they had to fight not the local organisation of the men, but the whole national body. And so the Yorkshire Federation was formed, and as it grew it was connected with the North of England Federation, which was associated with the National Federation. As to the result of that alliance what better evidence was there than the institution of the conciliation rules, which were an accomplished fact?—Mr. A. W. Sinclair submitted the toast of "Success to the York Association," and said that during the last five years they had had no disputes of any moment, and the reason was that builders had become strong and powerful. There were something like 8,500 builders in the Northern Counties Federation, and when occasion arose and the cause was a just one they acted in concert for their own rights.—The Chairman, in responding, said their Association would in four months' time have been formed sixteen years. During their career they had had five strikes and only one serious lock-out.—Mr. B. Dent proposed "The Town and Trade of York," and said there were few towns which could boast of such treasures as they in York had—the walls, its bars, and the Minster—and the citizens ought to be proud of these treasures. He paid a tribute to the Dean and Chapter for the way in which they kept the Minster in repair, and hoped that they kept the Minster would be kept in good repair to last another thousand years. He regretted that trade was not better in York than it was, and that the Ouse was not made more use of.—Councillor Mansfield, in acknowledging, said he believed that in 1885 or 1886, as far as the building trade was concerned, there were more men out of work in York proportionately than there were in the

city-to-day. Mr. W. E. Biscorn proposed "The Architects and Surveyors," and Mr. E. T. Felgate and Mr. S. Neelham briefly responded, expressing themselves in sympathy with the aims of the Federation. Mr. J. W. Biscorn gave the toast of "The Visitors," and Mr. Goodwill replied.

OBITUARY.

MR. J. P. SEDDON.—We regret to announce the death at St. Thomas's Nursing Home on February 1, after an operation, of Mr. John Pellard Seddon, aged seventy-eight years, of No. 62, Albany-mansions, Albert Bridge, S.W. Mr. Seddon was elected an Associate in 1852, and in 1860 a Fellow, of the Royal Institute of British Architects; he served as member of Council, and some thirty to forty years ago he acted for a period of ten years as Honorary Secretary of the Institute, in conjunction with the late C. Forster Hayward. In 1847 he was elected one of the original members of the Architectural Association; he acted as Honorary Secretary of the Association in 1850-51, and was reinstated in membership on November 6, 1903. He attended the Jubilee Banquet of the Association in 1897. Mr. Seddon was partner of the former firms of Messrs. Prichard & Seddon, of Llandaff, and Messrs. Seddon & Carter, of Cardiff. He was born on September 19, 1827, at London House, Aldersgate, where his father Thomas Seddon, whose biography he wrote, carried on business as a cabinet-maker. Having received his earlier education at Bedford Grammar School he was articled, in 1848-51, to Professor Donaldson. He then, on returning from a professional tour upon the Continent, settled in practice in London. Having been appointed architect of an hotel at Southend-on-sea, in Glamorganshire, he made acquaintance with the late John Prichard, who was then the cathedral and diocesan architect for Llandaff, with whom he entered into partnership at Llandaff in 1852, and whom he succeeded as diocesan and cathedral architect. The partnership lasted during ten years. Mr. Seddon taking London offices at No. 6, Whitehall, and Mr. Prichard practising at Llandaff. On the dissolution of the partnership Mr. Seddon married and took up his residence and offices at No. 12, Park-street (since No. 1, Queen Anne's-gate), Westminster, and there he continued to live until 1888. Messrs. Prichard & Seddon won a premium of 200l. with their designs, after the Gothic style, for the proposed War Office, 1857; their premiated designs, and their unpremiated designs for the proposed Foreign Office with Secretary of State's official residence are illustrated in the *Builder* of August 22, 1857. In the course of their extensive practice the firm were employed as architects for the restoration of Llandaff Cathedral and for a great number of churches, parsonage-houses, schools, and other public and private buildings in the southern counties of Wales and in Monmouthshire. They were the architects of Christchurch College, Brecon; Eastington Park, near Shipston-on-Stour, Warwickshire, for Mr. E. P. Shirley; and the enlargement of Beckford Hall, near Tewkesbury. Leaving for the moment the work carried out by Messrs. Seddon & Carter, we may mention the following as being amongst Mr. Seddon's more important architectural works, denoting with an asterisk those of which plans and illustrations have been published in the *Builder*:—Lambeth Palace Chapel; the bishop's and chapter-choir stalls, Rochester Cathedral; restoration and stall-work, St. Nicholas parish church, Yarmouth; the churches of St. James, Yarmouth; St. Barnabas, Swindon, to which he added the north aisle eight years ago; St. James, Redruth; Hoarwithy, Herefordshire (July 5, 1884*); and with the prayer-desk, and (1904) designs for the five stained-glass windows in memory of the late Rev. W. Poole, vicar; designs for a People's Palace on the Savoy site, Victoria-embankment, in conjunction with the late E. W. Godwin, to whom the river-side façade was due (February 12, 1887*); design for a proposed Ecclesiastical Art Exhibition building on the Savoy site, where is now the Medical Examination Hall, he having been appointed architect to the projectors of the undertaking (August 21, 1880*); the parish-church of St. Paul, Hammersmith, 1882-89, in conjunction with Mr. H. Roumie Gough (December 2, 1882, with interior view, elevations, sections, etc.); a design for decorating the dome of St. Paul's Cathedral, based upon Sandro Botticelli's painting in the National Gallery and elaborated and drawn by Mr. H. G. Murray, artist at Messrs. Belham's, of No. 155, Buckingham Palace-road, S.W. (January 31, 1885*); his suggested arrangement upon the Commutation-row site, Liverpool, of the Cathedral of Notre Dame, Paris, as tentatively restored with its spires by Viollet-le-Duc, with an article by Mr. Seddon upon the site and building (February 14, 1885, a drawing by the late H. W. Brewer*); competitive design for the Baptist Memorial Church, Paisley (August 8, 1885, interior view*); the D. G. Rossetti memorial fountain, Choyne-walk, Chelsea, the bust by P. Madox Brown (April 17, 1886*); Christchurch Vicarage, Westminster (November 17, 1888*); the Dean Goulbourn

testimonial pulpit in the choir of Norwich Cathedral (September 5, 1891*); the Canon Edwards, of Llandaff, memorial gateway, St. David's Welsh Church, Paddington (October 29, 1904*); the restoration of the upper portion of the tower of the XIIIth century church of All Saints, Chalgrave, Bedfordshire (July 8, 1905*); country seats at Abermaide, Co. Merioneth, Rosdolan, Co. Kerry, Oxted, Surrey, Roughwood, Chalfont St. Giles, Bucks, with many others; the North and South Wales branch bank, Birkenhead; St. Peter's Orphanage and Sanitarium, Isle of Thanet, for the late Archbishop and Mr. Tait; churches at Llanbadarn, near Aberystwyth; Adforton, near Ludlow; Chigwell Row, Essex; Ayott (St. Peter's), Herts.; Ullenhall, near Hoxley-in-Ardlen; and Llandogo, Red-Brook, and Wye-sham, Co. Monmouth; St. John's, Lacey Green, Wyecombe; Holy Trinity, Fishponds, Stapleton, Gloucestershire; the restoration of many churches, comprising those of Convil, near Carnarvon; Camrose, Co. Pembroke; St. Nicholas, Great Kimble, Bucks.; St. Mary, Barfrevston, and SS. Peter and Paul, Eythron, near Dover, Kent; St. Peter, Isle of Thanet; St. Leonard, Stanningwell, near Abingdon; St. Mary, Uplawston, near St. Mary, Arminghall, near Norwich; and Holy Trinity, Ingham, near Stalham, East Norfolk. The Dean and Chapter engaged Mr. Seddon to report upon the condition of the west front of Norwich Cathedral, and fifteen years ago instructed him to advise them upon the general arrangements of the interior of the cathedral, he proposing that he was the architect of University College of Wales at Aberystwyth (first built as a hotel), and on July 29, 1886, after the fire, was appointed architect for the rebuilding on the old site, as in his report, at a cost of 17,500l. In conjunction with Mr. Murray he prepared the scheme for the decoration, after the Italian Renaissance manner, for a bay on the north side of Christ Church, Bristol (1905); he superintended the execution (1893) of the W. H. Smith memorial window, St. Margaret's, Westminster, of which the cartoons were drawn by Mr. Murray from Miss Maud Seddon's studies for the figures, and for Sir Edward and Lady Hall, of the Crucifixion window in the Teormine convent, Sicily; he prepared the designs for the organ screen, executed in teak, Llandaff Cathedral, 1903, for a new church at Walton-le-Dale, Lancashire, and the restoration, at a computed cost of from 8,000l. to 9,000l., of St. Leonard's Church, near Preston, 1902-3. Mr. Seddon presented to Llandaff Cathedral five years ago the two side-light windows of the triplet in the west front, which he had designed, being memorials to the late Dean Williams and the late Jonas Watson, of Llandaff, respectively. In our number of March 26, 1904, we illustrated, with a four-page drawing, and plan, and with Mr. E. B. Lamb's drawing of the building as from near the end of Westminster bridge, the design prepared jointly by Mr. Seddon and Mr. Edward B. Lamb for a suggested Imperial Monumental Hall at Westminster for the Heroes of the Empire. Mr. Seddon was one of the twelve architects who were nominated to compete for the Royal Court of Justice, for which he produced a very remarkable and original design. Mr. Seddon was awarded the bronze medal for Architecture, Paris International Exhibition, 1878; and made the designs for and superintended the execution of a large number of stained-glass windows, carried out by Messrs. Belham, of Piccadilly. He was the author of "Memoirs and Letters of the late Thomas Seddon, Artist," 1859; "Progress in Art and Architecture," 1852, illustrated with his own lithograph drawings; "Rambles in the Rhine Provinces," 1858; "King René's Honey-comb Cabinet," 1858; a book describing and illustrating a cabinet which he originally designed for his professional drawings, 1862, and of which Sir E. Burne-Jones, D. G. Rossetti, and Madox Brown painted the panels in oil with a series called "King René's Honeycomb"; and of "A Casket of Jewels," 1902, a work descriptive of the contents of the Royal Architectural Museum in Tufton-street, S.W. In July, 1900, Mr. Seddon was elected a Vice-President and member of Council, and in June, 1901, was re-elected a Vice-President of the Museum and the Westminster School of Art, to which he made a liberal donation. On December 11, 1902, silver bowls were presented to him and Mr. Maurice B. Adams in recognition of their services to the Museum during a period of twenty-five years and as honorary secretaries at the time of the transfer of the museum and school in 1902-3 to the Architectural Association. In November, 1901, Mr. Seddon was elected a member of the Committee of the Church Crafts League; his paper upon "Church Fittings," read to the Institute, is reported in our columns of April 19, 1890. He was one of the many honorary consulting architects to the Incorporated Society for Promoting the Enlargement, Building, and Repairation of Churches and Chapels; in April,

1904, he retired from the appointment of Surveyor for the Archdeaconry of Monmouth, twenty-one years ago. Mr. Seddon took as his partner Mr. John Coates Carter, of Cardiff, for a long time, and he was one of the few who understand architectural work in South Wales, Monmouthshire, and the neighbouring districts; the partnership was dissolved on April 12, 1904. Messrs. Seddon & Carter, of Cardiff, were employed for the reparation and restoration of Chepstow Priory Church, of which they practically rebuilt the greater portion of the fabric in 1890; the firm prepared the plans and designs of new churches and additions, in Windsor, Hove, and at Adamsdown (All Saints), with schoolroom underneath, 1902, in Cardiff; the Mission Room, Blaona, Mon., 1902; a new church, the Conservative Club (May 16, 1885*), and the enlargements of the Albert-road Board Schools, Penarth; some houses built at Penarth and Dinas Powys; improvements and additions, in Marine Hotel, Southend-on-sea, 1899; and in 1903 the restoration, with addition of a north aisle, vestry, etc., of the interesting parish church of Rogiet, Monmouthshire. In conjunction with Messrs. James & Morgan, of Cardiff, they were architects of the Dinagat Church, Newydd, Tregear, the designs being by Mr. Carter, 1893. In the early part of March 20, 1886, we illustrated Messrs. Seddon & Carter's competitive designs, being one of the three acts jointly submitted by them for the Birmingham Assize Courts. At the funeral service on the 6th inst. the Architectural Association was represented by Mr. G. H. Fellowes Pryne and Mr. D. G. Driver, the Secretary.

MR. INGLEY WOOD.—We regret to record the death, in Edinburgh, on the 30th ult., of Mr. Lindsay Ingley Wood at the early age of thirty-three. Mr. Wood was an architect by profession, but he was perhaps better known to the public on account of his resolute articles in the field of art and matters of antiquarian interest. Mr. Ingley Wood was one of the best-known and recognised authorities upon old pewter, and recently published a book of much historical and literary value dealing with the old Scottish pewter industry under the title of "Scottish Pewter Ware and Pewterers." He was a frequent contributor to *The Connoisseur* and other art journals upon old pewter and kindred subjects. One who knew him writes—"He was an artist of no mean order and his work in black and white had a striking individuality, as was shown in his sketches of Vanshising Edinburgh and Leith."

MR. WILLIAM VAUGHAN.—The death occurred on the 29th ult. at the age of fifty-five years, of Mr. William Vaughan, of Lilycroft-road, Bradford, the architect to the Bradford Education Authority, after an illness extending over several months. The eldest son of the late Rev. William Vaughan, he was articled with Mr. Samuel Jackson. Afterwards he was for ten years in the office of Messrs. Milnes & France, and in 1832 he was appointed assistant architect in the Borough Surveyor's department of the Corporation, a position he held for over nineteen years. In September, 1891, he was appointed architect to the Bradford School Board, and had held the same position since the institution of the Education Authority.

MR. HANNEN.—The death, on January 29, is announced of Mr. Benjamin Hannen, of No. 4, Penbridge-place, Bayswater, and Oselsey, Highgrave, Berks., aged seventy-six years. Mr. Hannen was a brother of the late Lord Hannen, President of the Probate, Divorce, and Admiralty Division, High Court of Justice. In 1858 Mr. Hannen joined the firm of Messrs. Holland & Hannen, builders and contractors, then of No. 17, Duke-street, Bloomsbury, and Belvedere-road, Lambeth, in whose offices he had previously served during a term of ten years. In 1883 the firm acquired the business of Messrs. Wm. Cubitt & Co., of Gray's Inn-road and Cubitt Town, Poplar, nearly all the partners of that firm having then retired, and Mr. Hannen eventually became the principal of the firm in Gray's Inn-road. At the time of the first great strike in the building trade he was member of the Council of Builders, and on the second occasion was Chairman of the Builders' Committee.

GENERAL BUILDING NEWS.

CHURCH, SWANSEA.—The Bishop of St. David's recently consecrated the new church of St. Michael and All Angels, at Manston. Mr. Bruce Vaughan is the architect. The portion of the church above is completed at a cost of 5,000l.

SCHOOLS, MISSION-GROVE, WALTHAMSTOW.—These schools, which were opened on the 31st inst., consist of a two-floor block accommodating 400 infants on the ground floor and 400 girls on the first floor, on the 9 and 10 square feet basis respectively. The site has an area of 2,900 sq. yds., and the school is completed by a breadth of 87 ft., and a depth of 33 ft. 6 in., and a frontage of 27 ft. 9 in., and the hall of the upper floor 63 ft. 10 in. by 28 ft. 6 in. Each department has eight classrooms accommodating fifty each, which are lighted from the left hand. Owing to the narrowness of the site six of the classrooms in each department are in line and over each

* At the close of the Exhibition, 1882, the South Kensington Museum authorities applied to purchase that work. Mr. Seddon, however, retained it, and in 1887 presented it as a wedding gift to his daughter, Mrs. Birch.

er at the back, and one at each end of the halls. The building is faced with "Redbank" redressed bricks, gauged arches and aprons, with Portland stone dressings. The front elevation is treated plainly in a free Renaissance character. Those of classrooms, halls, and teachers' rooms are laid with pitch-pine blocks, the galleries classrooms being formed to a slope of 1 in 10. All rooms have separate inlets and outlets for ventilation, with ridge ventilators on roof, and heating, which is on the low-pressure system, is provided by Messrs. Boyd & Sons. The lighting throughout is by electricity. The offices (with separate trapped pans) and playsheds are at the west end of playgrounds. The latter will eventually be tar-paved. The contract amounted to 9,965*l.*, and has been carried out by Messrs. Rowley Bros., of Tottenham, from plans prepared by Mr. H. Prosser, Architect to the Education Committee.

PARISH HALL, EGHAM.—The new parish hall, which has been erected in connexion with the old Trinity Church at New Etkham, was opened in the 1st inst. It will accommodate about 400 people and has been built from plans by Mr. Whistler.

ASSEMBLY HALL AND LIBRARY, IRKLEY.—The main stones have just been laid of this building, which is being erected from the designs of Mr. William Bakewell, of Leeds, which designs were selected in competition. The total estimated cost, exclusive of furnishing is 13,000*l.*

HALL, OSWESTRY.—The new Memorial Hall, erected at Oswestry, has just been opened. The building, which is used by the local friendly and trades' societies as a club-house, etc., and also by a ladies' committee as a restaurant for the use of people attending the Oswestry Smithfield, the building is situated at the corner of Smithfield-street and Smithfield-road. On the ground floor is a restaurant, 40 ft. by 18 ft., with cloak room, etc., adjoining. The main hall measures 27 ft. by 27 ft. On the second floor there are four club-rooms. The architect was Mr. Frank B. Smith, and the contractors were Messrs. Jones & Evans, of Oswestry.

NEW NORTH RIDING COUNCIL BUILDINGS, NORTHALLERTON.—We gave a brief description of these buildings last week, but we omitted to state that the asphalt of the flat roofs was carried out by Clarendon's Patent Asphaltic Company, Ltd., of Victoria Embankment, W.C.

APPOINTMENT.

SWAFFHAM RURAL DISTRICT COUNCIL.—Mr. W. V. Thwaites has been elected, out of 127 candidates, as Surveyor to the Swaffham Rural District Council.

SANITARY AND ENGINEERING NEWS.

DRAINAGE BY-LAWS.—On Monday the Public Health Committee of Paddington Borough Council reported having asked the London County Council to define by-law No. 5 of their code, relating to intercepting traps, so as to make it clear that a manhole is to be provided in connexion with every intercepting trap. In reply, it was stated that the effect of the by-law suggested, as regards intercepting traps, should be noted for consideration when any general amendment of the by-laws under section 292 of the Metropolitan Management Act, 1855, was contemplated.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. Marshall & Bradley, architects, have removed their offices from 31, Old Queen-street, Westminster, to Parliament Mansions, Victoria-street, S.W.—Mr. W. A. Scott, architect, has removed his offices from 74, Holly-bank-square to 45, Mountjoy-square, Drumcondra, Dublin.

MANCHESTER INFIRMARY.—At the meeting of the Board of Management of the Manchester Royal Infirmary on the 29th ult., it was stated that, with the exception of the out-patients' block, the whole of the ground floors of the new infirmary buildings at Stanley-grove are practically completed. The granite basins and finished work on the architects' stone, and the builders are waiting for the stone to carry it round the administrative and teaching blocks. The contracts for the erection of the three-storey buildings fronting Oxford-street will be let in April next.

THE LATE ASSISTANT LIBRARIAN AT THE INSTITUTE.—Mr. Lawrence J. Gomme, assistant librarian at the Library of the Royal Institute of British Architects, has recently resigned his position in order to take up new work in Montreal. All architects who have been in the habit of frequenting the Library during the past five or six years will miss Mr. Gomme, for he made a friend of everyone with whom he came into touch, and his ready sympathy and interest were always at the service of those who sought them. His genuine desire to assist all who wished to see intelligently the splendid resources of the Library, added to his own considerable knowledge, won him immediate confidence, and he has been of

great service to students and others who were seeking information. Mr. Gomme sailed for Canada on the 25th of last month, and will, therefore, by this time have reached his destination, where we may be sure he will meet with deserved recognition and ultimate success.

GLASGOW UNIVERSITY.—The Senate will confer the honorary degree of Doctor of Laws upon Sir James Guthrie, President of the Royal Scottish Academy, and upon M. Auguste Rodin, President of the International Society of Painters, Sculptors, and Gravers, at the graduation ceremony on April 17 next.

THE TEACHING OF MATHEMATICS TO TECHNICAL STUDENTS.—A meeting of the Association of Teachers in Technical Institutes will be held at the Regent-street Polytechnic, London, on Saturday evening, February 17, commencing at 7.30 p.m., when the following papers will be read and discussed:—(1) "The Teaching of Mathematics to Engineering Students," by Mr. G. E. St. L. Carson (Head of the Mathematical Department, Battersea Polytechnic); (2) "The Teaching of Mathematics to Building Trade Students," by Mr. Harold Bustridge (Lecturer on Building, etc., London County Council Paddington Technical Institute). All teachers and others interested in mathematical teaching are cordially invited to attend and take part in the discussions.

THE BUILDERS' EXCHANGE, BIRMINGHAM.—On Thursday, the 1st inst., a large audience attended the first of the series of lectures being given at the Builders' Exchange, Birmingham. Mr. W. Sapote, President of the Advisory Council, took the chair at 6 p.m. The lecturer, Mr. H. Browning Button, took for his subject "The Underground Slate Quarries of North Wales." The lecture was illustrated by lantern slides which showed the enormous difficulties to be surmounted in obtaining slates for building purposes. Among other things slides showing the workings, milling operations, and means of transit, together with illustrations of the methods employed for examining the roofs of the huge chambers from which the slate has been extracted.

The lecturer claimed for Welsh slates their absolute superiority on geological grounds; the Welsh slates veins being in a strata of rock of considerably greater age than those of France and America. The slates from neighbouring quarries used in roofing houses in Blaenau-Festiniog 80 to 100 years ago were as good as the day they were put on. The shipment of Welsh slates from Penryn to London averages 115,000 to 120,000 tons per annum. Statistics were quoted showing the development of imports in foreign slates. The lecturer stated these were unfit for use in districts where the atmosphere is charged with chemical fumes, and buildings on which they had been used had had to be re-roofed with Welsh slates. The Chairman suggested that, in addition to the lecture, it would be of great interest if it could be arranged for a visit to be made to the slate quarries, and preparations are now being made to give effect to this suggestion.

SCULPTURE.—Before the members of the Bradford Philosophical Society at the Bradford Church Institute on the 1st inst., Mr. M. H. Spillmann lectured on "British Sculpture of To-day." The lecturer said, should primarily represent ideas, and not things. The well-accepted anything pictorial, and it was not strange that so subtle an art as sculpture was little understood in this country. Almost anyone could mould clay into the resemblance of a man, but in the result must be commonplace. Chief amongst the characteristics of the modern school was the effort towards such realism as did not detract from the dignity of conception. Until Alfred Stevens no one thought of instilling life and blood into clay and marble. He infused into his work not only life but dignity of form and movement. The lecturer proceeded to outline the chief characteristics of the work of the leading sculptors of the modern English school. The lecture was illustrated by lantern slides.

BRISTOL MASTER BUILDERS' ASSOCIATION.—The annual general meeting of this Association was held at the offices, Guildhall, Small-street, Bristol, when the chair was occupied by the President, Mr. E. L. Neale. The annual report was presented and adopted, as also were the audited accounts, presented by the hon. treasurer. The annual report for the year 1905 stated that:—Not for many years past has the building trade of this city been under such a cloud of depression as during 1905.

Your committee, however, trust that the downward tendency has reached its lowest ebb. In fact, there is every indication to lead them to believe that in the near future trade will open up, and the work of the builder will be in request.

Much time and attention have been devoted to the charges made by the Bristol Water Works Company to builders for water used in constructional operations. The terms and conditions obtaining in many industrial centres were procured and tabulated, from which it appeared that the charges in Bristol were unfavourable. The directors were urged to receive a deputation from the Association, but they did not see their way to acquiesce.

Accordingly, representations were made to the Board through their secretary, and much correspondence took place, your committee strongly urging their claims for more liberal treatment. . . . Your committee granted interviews to deputations from the Masons' Society, Carpenters' Society, and the Bricklayers' Society, when very friendly discussions took place in respect to matters arising particularly out of the working rules. The societies promised to submit their cases in writing; however, only the carpenters carried out their promise, and they wrote to the effect that at the present time members of the Masters' Association were somewhat guided by the clauses which were inserted by the architects, to the effect that "certain firms shall do particular work." What their Society required was that such clauses should be deleted by the architects from their specifications, and that the whole of the work in connexion with the preparing and laying of wood block floors should be done by the builders, and that it should be considered the same as any other work, which belonged to the trade of a carpenter and joiner. The question was very fully considered, when it was resolved:—"That the members of this Association will use their best endeavours to comply with the request of the United Trade Council of Carpenters and joiners in securing the work of laying wood block floors for local men. Further, that a copy of the letter received from the Society, together with this Association's reply, be forwarded to the Architects' Society."

For some time past your committee have considered that some alterations were necessary in the winter working hours, as set forth in the existing working rules. After very mature deliberation it was decided to give notice to the various operative societies, in December next, viz.:—(1) It is proposed to substitute the following in place of rule 1, sections A and B: That from the third Monday in October to the third Saturday in March the working hours for the first five days of the week shall be from 8 a.m. until 12 noon, and from 1 p.m. until 5 a.m., and on Saturdays from 8 a.m. to 1 p.m., with the exception of the month of December, when work shall cease at 4.30 p.m. on the first five days of the week; that the working hours for the remainder of the year be as at present; (2) It is proposed to amend rule 10 to read as follows: "That any alteration of these rules shall require six months' notice from either side, such notice to expire on the first day of January in each year. During the year many questions have arisen in relation to forma of contract and tender. Without exception your committee have advised their members to adhere strictly to the rules of the Association, and it is with satisfaction they record their appreciation of the unanimity with which their recommendations have been adopted from time to time.

The report also referred to the death of Mr. John Bastow, Mr. A. E. Denby and Mr. W. Podger and Mr. H. J. Spear, their late secretary. The Chamber of Commerce having organised a testimonial fund in recognition of the services rendered by the late Mr. Spear to the trade and commerce of the city generally, the Association actively supported the scheme, and were the means of raising a sum of 150*l.* 7*s.* 6*d.*, which sum has been handed to the trustees for investment. The President moved the following resolution:—"That Mr. R. F. Ridd be elected President of the Association for the current year." This was seconded by Mr. E. Walters, supported by Mr. George Humphreys, and carried by acclamation. Mr. Ridd suitably acknowledged his election. Mr. R. F. Ridd moved, Mr. Geo. Humphreys seconded, and it was resolved unanimously:—"That the best thanks of the Association be conveyed to Mr. E. I. Neale for the large amount of time and attention he has devoted to its work, and for the able manner in which he has conducted the affairs of the Association." Mr. Neale returned thanks for the vote. Mr. R. F. Wilkins was elected as Vice-President of the Association, upon the motion of Mr. R. F. Ridd, seconded by Mr. George Downs. It was resolved upon the proposition of Mr. Neale, seconded by Mr. Downs, "That Mr. Geo. Humphreys be re-elected hon. treasurer of the Association for the coming year, and that the best thanks of the Association be tendered Mr. Humphreys for his past services." Upon a ballot, Messrs. E. I. Neale, Frank N. Cowlin, W. Foster, E. Walters, A. Dowling, J. Lovell, F. Chown, and E. A. Love were elected members of the committee for the ensuing year.

Legal.

THE WIDENING OF PICCADILLY: IMPORTANT DECISION.

In the Chancery Division on the 7th inst. Mr. Justice Buckley gave judgment in the cases of J. L. Denny & Co., Ltd. v. the Mayor, Aldermen, and Councillors of the City of Westminster, and J. C. Cording & Co. v. the same defendants.

In these cases the plaintiffs claimed injunctions to restrain the defendants from proceeding upon notices to treat whereby plaintiffs were required to treat for the sale to the defendants of certain hereditaments adjoining Piccadilly for the

purposes of widening Piccadilly, and, if necessary, a declaration that the adjudication of the Council of the defendants referred to in such notices was *ultra vires* on the ground that only a small portion of the land and premises comprised in the notices was required for such widening.

The facts of the case sufficiently appear from the following judgment.

His lordship said that on the north side of Piccadilly a short distance west of the Circus was a block of land bounded by Piccadilly, Air-street, Regent-street, and Piccadilly-place. The freehold was in the Crown. The plaintiffs in the first action, Denman & Co., Ltd., were the Crown lessees of Denman House, being Nos. 19 and 20, Piccadilly, which stood at the south-east corner of the block, with a frontage of 44 ft. and a depth of about 57 ft. to Air-street. Denman House was an important building erected by the plaintiffs two or three years ago under a building agreement with the Crown at a cost of 25,000. Their lease was dated November 9, 1903, the rent 950*l.* per annum, and the term extended to October 10, 1922. These plaintiffs occupied the shop in the western half of the house and some other parts of the premises. The plaintiffs in the second action, J. C. Cording & Co., were the under-lessees of Denman & Co., and occupied the shop in the eastern part of the house and also some portion of the basement and the whole of the mezzanine floor. They paid a rent of 1,200*l.* per annum, their tenure was thirty-nine years from October 10, 1903, as to one part of the premises, and as to the other twenty-one years from October 10, 1903. Both plaintiffs had carried on business on the site for many years, the first plaintiffs for more than fifty years and the other plaintiffs for more than thirty years. The premises were very important to them, the site being one of the best in London, and the London County Council and the defendants had in contemplation a public improvement, viz., the widening of Piccadilly by throwing into the street a strip of land which at the eastern end of Denman House would be about 27 ft. wide, and which might not be more than 25 ft. There was no question that the defendants were entitled to use their powers under Michael Angelo Taylor's Act as, and for the purpose of, acquiring such land necessary for that purpose. On June 10, 1905, the defendants served on Denman & Co., and on June 26 on the other plaintiffs, notices to treat for the whole of their interests in Denman House. The question in the case was whether these notices to treat were valid. The St. James's Hall and Restaurant occupied a large part of the block of land in question. The Piccadilly Hotel Company were desirous of erecting on the plot of land a large hotel, and they held an agreement from the Crown for a lease of the whole block subject to Denman & Co.'s existing lease. The Hotel Company were desirous of obtaining possession of Denman House, pulling it down, and extending their hotel over so much of the site as was not thrown into the widening of Piccadilly. The plaintiffs, on the other hand, were desirous of retaining so much of the property as was not required for the widening of the street.

His lordship then went through the agreements entered into between the Crown, the London County Council, and the Hotel Syndicate, dated respectively October 26, 1903, and March 4, 1904, and said that the Syndicate had acquired the ground leases of a large part of the premises upon the block which they contracted to surrender to the Crown. The Crown was not a party to any arrangement by which any part of Denman's property was to be acquired otherwise than by agreement, except so far as it was to be acquired for the purpose of the strip. As between the County Council, the defendants, and the Hotel Company the contractual rights were determined by three agreements dated respectively June 1, 1904, July 11, 1904, and June 6, 1905. His lordship said he thought these agreements intended a contract by the local authority, that they would, at the request of the Syndicate, use their statutory authority for the purpose of acquiring other and additional land for the purpose of throwing it into that which, under the bargain with the Syndicate, was to be subject to a new Crown lease in their favour for the purposes of the hotel. On April 6, 1905, the Westminster City Council passed the resolution in exactly the form submitted by the London County Council.

In his opinion they passed because they had contracted to pass it. He found no evidence that they exercised any independent judgment of their own in the matter. The local authority had no right to seek to reduce the expense to the rate-payers by straining their powers in the interest of persons who desired to acquire the adjacent land from those who were the owners of it. He went on to consider whether upon the facts of the case the house was such that the defendants, who unquestionably were entitled to take part of it, were entitled to take the whole. He came to the conclusion that upon the 30 ft. of depth which was not wanted for the widening there was no difficulty in preserving with the certain amount of re-construction so much of the building as stood on that 30 ft. Upon the facts of the case he arrived at the conclusion that the local authority were not entitled to take more than

was wanted for the widening of the street, and that the 30 ft. depth which would remain after the widening was not wanted, but was a building which could be and ought to be left as a house which the plaintiffs as the owners desired to retain and from which the defendants had no right to dispossess them for the purpose of putting the hotel company into possession. He thought that the plaintiffs were entitled to injunctions restraining the defendants from proceeding upon the notices to treat, and the defendants must pay the costs of the actions.

ACTION BY A QUANTITY SURVEYOR FOR FEES.

MR. JUSTICE SUTTON, in the King's Bench Division, on the 2nd inst., delivered a considered judgment in the case of *Elsmore v. Vallerie*, an action by the plaintiff, a quantity surveyor, to recover from the defendant, Mr. Ernest Vallerie, of Westcliffs-on-Sea, Essex, 1,164*l.*, charges for preparing bills of quantities for the proposed building of a hotel pursuant to the instructions of Mr. W. L. Griffiths, an architect, being 14 per cent. on the estimated cost of the building.

The defence set up was that Mr. Griffiths had no authority to pledge the defendant's credit in the matter. The defendant further said that he, Mr. Griffiths, and a solicitor named Goldring, were joint speculators who were to promote a company to carry out the erection of the proposed hotel and that they were not to receive any fees unless the promotion was successful, and as the promotion has not been successful the fees were not payable. The facts sufficiently appear from the following judgment.

His lordship said the plaintiff brought the action to recover a large sum for preparing bills of quantities on the instructions of Mr. Griffiths, an architect, for a proposed hotel at Westcliffs, which was never built. The action was brought against the defendant, and as against him the plaintiff must fail unless he could show that he (the defendant) authorised Mr. Griffiths to give the facts as given to his lordship. Mr. Griffiths said that the defendant instructed him to prepare plans and specifications for the hotel, and particularly that he was to get out bills of quantities. Plaintiff knew there was a scheme with regard to the hotel, but Mr. Griffiths said it was an independent scheme. Mr. Goldring, a solicitor, was called, and he said the scheme was a joint speculation. Then he had the evidence of the defendant, who said he never employed Mr. Griffiths as architect and never gave him any instructions as to the preparation of the bills of quantities. But his lordship had to look at other facts in the case. Defendant, in the contract for the purchase of the necessary land, appeared as the purchaser, but he did not find any part of the money, and as nominee his name appeared on the prospectus of the proposed company which was going to work the hotel. But the prospectus was never issued. Therefore the conclusion he came to was that the defendant was the mere nominee in the matter and had selected for that purpose on account of his knowledge in the management of hotels, Mr. Goldring was a partner in the scheme, and he was to give his services gratuitously unless the scheme proved a success. Mr. Goldring said that the defendant was to take the contracts in his own name as nominal owner. Mr. Griffiths, he said, was to prepare the plans and specifications of what was necessary and was not to look for payment unless the scheme succeeded. Under the scheme Mr. Griffiths was to have 5 per cent. on the contract price if it succeeded, and that would have amounted to a very large sum. Viewing all the circumstances of the case and the evidence given, his lordship came to the conclusion that the scheme was a speculation only on the part of the three gentlemen, viz., the defendant, Mr. Griffiths, and Mr. Goldring. To his mind that was clearly shown to him to be the case. He thought there must be judgment for the defendant with costs. Order accordingly.

Mr. Pyke Glasgow appeared for the plaintiff, and Mr. C. A. Russell, K.C., and Mr. Chester Jones for the defendant.

ACTION ON AN OAK FLOORING CONTRACT.

MR. JUSTICE KENNEDY, sitting in the Commercial Court last week, concluded the hearing of the case of *Johnson & Son v. The Lumber Company*, an action by the plaintiffs to recover from the defendants damages for alleged breach of contract and alternatively for breach of warranty.

It appeared that in September, 1905, plaintiffs received a large quantity of oak flooring, and it was said that defendant's agent had supplied them with 90,000 superficial feet of prime clear white oak flooring carefully grooved and tongued, etc., at 21*s.* 9*d.* per square, c.i.f. London, the lengths to be 8 ft. to 16 ft., with not over 20 per cent. of the lengths under 8 ft. finished. The plaintiffs said that in May and June, 1905, they paid to the defendants in respect of oak flooring 904*l.* 13*s.* 11*d.*, but that when it was delivered it was totally unfit for the purposes for which it was required, and

boards being twisted, warped, split, and sappy. 30,531 of the boards were red instead of white oak, and 24,229 pieces were shorter than the minimum length of 6 ft.

Mr. Montague Shearman, K.C., and Mr. Eustace Hills appeared for the plaintiffs, and Mr. Pickford, K.C., and Mr. Cautley for the defendants.

Mr. Hills said that the main points of the plaintiffs' contention were that the lengths were far shorter than the contract arranged for, and that the wood was knotty, sappy, and of the wrong colour and twisted. Every care was taken of the parcels delivered, a special building being erected to receive and store them. The timber was tested by laying down a sample floor, which proved its unsuitability. On that the plaintiffs decided they could not use it, and they had to buy other timber, for which they paid 31*s.* 6*d.* per square as against 21*s.* 9*d.*, the contract price. That amounted to 618*l.* 5*s.*, and for cartage and other expenses 180*l.* 12*s.* 10*d.*, a claim for 798*l.* 17*s.* 10*d.*, in addition to the payment of the wood rejected.

Mr. J. F. Johnson gave evidence as to inspecting the wood and its assignment. He said it was very knotty and twisted, and he quite a green state. About 50 per cent. of it was red, and the rest white oak. He laid a sample floor with the wood and it was found to be unsuitable.

Mr. Wm. Douglas Cargo, Architect to the Ecclesiastical Commissioners, gave evidence that he had examined the wood as unsuitable.

Mr. E. F. Whitford, general measurer, said he had examined and measured the contract in question. Out of 491 squares 244 were white and 247 red oak. He found 12,420 pieces under 6 ft. in length, or 251 per cent., and 23,215 pieces over 6 ft., or 471 per cent.

This being the plaintiffs' case, Mr. H. Brown, defendant company's general manager of the office that he inspected the goods in question on their arrival in the Victoria Dock and was satisfied with the delivery. He afterwards saw the building in a building in course of construction, and in a room where plastering and the mixing of mortar was going on, places damp and quite unfit to store it in. He did not think there was an unusual number of short pieces, and said it was an advantage to have a selection of shorts in laying flooring. He thought after a careful tally that there was about 11½ per cent. of red oak in the parcel.

Other evidence was given that the wood was of good quality, but was inadequately protected from wet and not properly piled.

In the result his lordship, in giving judgment, said he felt sure from the evidence that a cargo which ought never to have been tendered was tendered. Part of it was red oak, it was not of prime quality, and it fell short of the specification in many respects. Something like half of it was red oak and not white oak, and there were short lengths, though that was one of the least important points of the claim. He was also quite clear that a good deal was very badly prepared, badly sawn, and not jointed and grooved. He did not fix the damages on the basis claimed by the plaintiffs, but on a basis of 6*s.* per square, which worked out at 270*l.*, for which amount he gave judgment for the plaintiffs with costs. Order accordingly.

ACTION AGAINST A BUILDER.

MR. JUSTICE FARWELL, sitting as an additional judge of the King's Bench Division, on the 7th inst., heard the case of *Pennington v. Drake*, an action by the plaintiff, an estate agent, of Richmond, against Mr. C. A. Drake, a builder and contractor, of Teddington, claiming commission on 7,800*l.*, being the purchase money of twelve houses on the Udney Park Estate, Teddington.

Mr. Heber Hart appeared for the plaintiff; and Mr. Dickens, K.C., and Mr. Mears for the defendant.

The plaintiff's case was that he entered into a bargain with the defendant to introduce a purchaser for the twelve houses, and that he did so, but that it turned out that there was something wrong with the title, and the purchase was not completed. It was contended on behalf of the plaintiff that if a sale did not come off through the title, in the title, which the owner did not disclose to the agent at the time of his employment, the right of the agent to his commission was not affected thereby.

On behalf of the defendant it was submitted that, in trying to extract from a series of letters a contract, plaintiff could not stop at a particular point and say "there is a contract final and conclusive," but the correspondence must be looked at as a whole, and it would be found that a contract, whatever the terms of a preceding agreement might be, there was no ultimate agreement. It was said that the defendant employed the plaintiff to procure a purchaser who was ready and willing to enter into a contract to buy on such terms as the defendant was prepared to sell, and commission was to be payable in the event of such a sale. But the defendant and the

...the purchaser were never at one, and the plaintiff could only recover if it were shown that he had procured a purchaser and bound that purchaser so that in the event of any action against the vendor the vendor would have succeeded...

to the roof. A notice of irregularity was served upon the defendant. Nothing had been done in regard to seven of the houses, and with respect to the other the District Surveyor was not satisfied with what had been done.

NOTICE BY THE UNITED BUILDERS' LABOURERS' UNION.

The case of the United Builders' Labourers' Union v. Stevenson came before Mr. Justice Russell sitting as an additional judge of the King's Bench Division on the 6th inst.

Mr. Justice Russell appeared for the plaintiffs; and the defendant in person. Mr. Disturnal, in opening the case, said that the defendant up to October, 1904, was General Secretary of the plaintiff Union, and the action was brought to recover from him £771, odd, which various branches of the Union collected from its members, some of which was utilised for expenses and the remainder was sent to the General Secretary in London for the general funds of the Union.

The defendant addressed his lordship. He admitted that he had been guilty of the charge made against him, but would not have contested the action. For some time past he had been obliged, owing to the refusal of the members of the Union to allow him proper assistance, to keep the books in a manner unsatisfactory to him.

His lordship, in giving judgment, said he was not trying a charge of criminality. It was obvious from the defendant's own accounts that there was an answer to the claim and there must be judgment for the plaintiffs for the amount claimed with costs.

Order accordingly.

THE LONDON BUILDING ACT.

At Lambeth Police Court recently, Mr. W. Goddard, a builder, of Ellindale-road, Herne Hill, was summoned for failing to comply with a notice of irregularity served upon him under the provisions of the London Building Act.

Mr. W. C. Williams, who supported the summons, said it was issued at the instance of Mr. Ellis Marsland, the District Surveyor, under sect. 61, sub-sect. 2 of the London Building Act of 1894, which provides that wholly or in part as a dwelling-house there should be provided proper means of access to the roof.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

1,105 of 1905.—A. SAYERS: Kitchen Ranges. This relates to a kitchen range comprising in combination a fire grate provided with movable fire bars which can be raised or lowered as desired, means arranged below the grate for regulating the admission of air thereto, and a deep boiler which is arranged in a downwardly projecting flue in such manner that the hot gases first pass down in front of the boiler and then up at the back thereof.

29,551 of 1905.—G. C. MARKS (V. J. KERHUEL): Flying Bridges, Traversing Bridges, and the like.

This invention relates to flying bridges, traversing bridges, and the like, the object being to adapt a flying bridge or traversing bridge so that at certain intervals it may be used for continuous traffic. This is accomplished by providing, in addition to the traversing car, two platforms or large cars arranged to be moved away from each other when the bridge is used for its normal purpose, but towards each other at other times so as to provide, in conjunction with the traversing car, a continuous track for pedestrian, ordinary vehicular, or railway traffic to the purpose required.

7,247 of 1905.—C. A. JONES: Folding Framework Suitable for Tents or Screens, with or without Roofs, or for other such purposes.

This relates to folding framework suitable for tents or screens, with or without roofs, or for other purposes, and consists in the use of supports which connect the horizontal rails at three points, and thus control the entire action automatically and symmetrically in all positions.

7,471 of 1905.—A. G. GRICE: Cranes of Tubular Construction or otherwise.

This relates to cranes of tubular construction, and consists in the arrangement of parts whereby the axes of the jib barrel and of the heaving harrel are in line with the axis of the jib—that is to say, with the plane in which the jib can vibrate.

18,730 of 1905.—J. NISBET: Supports for Concrete or Composite Blocks for Fireproof Floors, Ceilings, Columns, Walls, or Foundations.

This relates to supports for concrete or composite blocks of fire-proof floors, ceilings, columns, walls, or foundations, said supports being composed of lengths of light metal corrugated and grouped together.

22,797 of 1905.—BAKER & CROCKETT, LTD., and E. BENNETT: Stock or Plate Locks, in Part Applicable also to other Locks.

This relates to a stock or plate lock, and consists of a plate which carries the mechanism and is let into a cavity, preferably circular in shape, formed in from the back of the stock and surrounded by the material of the stock, the said plate being bedded against the back of the cavity.

23,516 of 1905.—D. DOYEN: Suspension Support for Sliding Gates, Doors, or the like.

This relates to a suspension support for sliding gates, and consists in supporting the gate by its upper part by means of a horizontal bar upon which there slides a tube provided at each end with a stuffing box upon which the gate or door operates, this arrangement enabling a person to obtain a sliding guide for the motion longer than the width of the door or gate and in suspending the same upon stuffing boxes in which can be placed materials of any kind, which facilitates the guide sliding softly and without noise and which do not require attention.

23,808 of 1905.—J. SWARTZ: Apparatus for Automatic Closing of Doors and the like.

This relates to an apparatus for automatic closing doors and the like, and consists in the combination of one or more springs between the door and the door post, friction blocks secured to the door and the door post, and hook-shaped projections on the said friction blocks.

21,095 of 1905.—H. AEM: Method for the Production of Hollow Poles of Concrete with a Metal Insertion forming an Inter-connected Framework for Electric Conductors and the like.

This relates to a method for the production of hollow poles of concrete with a metal insertion forming an inter-connected framework for electric conductors and the like, and consists in placing

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

the metal framework, with a suitable interval, on a conical-core, and pressing same together with the core into a horizontal jacket forming a semi-cone of the same length as the pole, and containing concrete mortar, thereupon applying concrete mortar also to the metal framework of the upper frame half, striking off said mortar with the aid of templates and striking board according to the outer shape of the pole, and after setting of the mortar, finally withdrawing the cores.

5,516 of 1905.—J. G. McPHAIL, M. A. McPHAIL, AND R. SHEANE: Fire Grates.

This relates to a rotatable grate, and consists in the combination with a cage rotatably mounted in standards and provided with a door for the introduction of the fuel, and means for securing the said door, of a handle attached to said standards whereby the grate may be transported by hand.

PUBLISHER'S NOTICES.

Nat. Tel., 612, Gerrard. Telegrams, "The Builder, London."

THE INDEX (with TITLE PAGE) for VOLUME LXXIX. (July to December, 1905) was given as a supplement with the issue of January 13th. CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each; also BRADING CASES (Gilt), with Strips, price 5d. each. THE EIGHTY-NINTH VOLUME of "The Builder" (bound), price Twelve Shillings and Sixpence. SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 2s. 6d. each.

CHARGES FOR ADVERTISEMENTS.

COMPETITIONS, CONTRACTS, ALL NOTICES ISSUED BY CORPORATE BODIES, COUNTY AND OTHER COUNCILS, PROCEEDINGS OF PUBLIC COMPANIES, SALES BY TENDRE, LEGAL ANNOUNCEMENTS, &c., &c. Six lines or under 6s. 0d. Each additional line 1s. 0d. SITUATIONS WANTED, PARTNERSHIPS, APPRENTICESHIPS, TRADE AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under 4s. 6d. Each additional line (about ten words) 0s. 6d. Terms for series of Trade advertisements, and for front page and other special positions, on application to the Publisher. SITUATIONS WANTED (Single-handed-Labour only). Four lines (about thirty words) or under 2s. 6d. Each additional line (about ten words) 0s. 6d. PREPAYMENT IS ABSOLUTELY NECESSARY.

* Stamps must not be sent, but all forms should be remitted by Postal Order, payable to J. MORRIS, and addressed to the Publisher of "THE BUILDER," Catherine Street, W.C.

Advertisements for the current week's issue are received up to THREE o'clock p.m. on THURSDAY, but "Classification" is impossible in the case of any which may reach the Office after HALF-PAST ONE p.m. on the same day. Those intended for the Outside Wrapper should be in by TWELVE NOON on WEDNESDAY.

ALTERATIONS IN STANDING ADVERTISEMENTS or ORDERS TO DISCONTINUE same must reach the Office before TEN o'clock on WEDNESDAY MORNING.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c., left at the Office in reply to advertisements and strictly recommends that of the latter COPIES ONLY should be sent.

ADVERTISERS in "THE BUILDER" may have Replies addressed to the Office, Catherine Street, Covent Garden, W.C., free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage. Unanswered queries are returned to advertisers the week after publication. N.B.—The Reply Boxes are not intended for trade lists, circulars, and the like; should these be received, they cannot (if noticed) be forwarded.

AN EDITION Printed on THIN PAPER, for FOREIGN and COLONIAL CIRCULATION, is issued every week.

READING CASES {By post (carefully packed) 1s. NINEPENCE EACH.

Excavation.

EVERY few forms of constructional work can be executed without rendering necessary the excavation and removal of earth or rock. In large engineering contracts, excavation frequently forms the most considerable item of the total cost, and demands the adoption of extensive plant for the accomplishment of the work within the prescribed limits of time and expense. Even in operations such as some within the jurisdiction of the architect, the excavation of material for the formation of foundations, the construction of subways, drains, and other conduits, sometimes assumes a sufficiently formidable character.

In many cases no difficulty occurs in detaching the material from its natural bed; in others considerable trouble is experienced, and adequate knowledge of the most economical methods becomes especially desirable. We may add that in either event the architect ought to make himself acquainted with the nature of the strata immediately below the surface. This is necessary so that he may adequately protect the interests of his client, for contractors occasionally profit by the free acquisition of most valuable building material in a totally unexpected manner. As an illustration of this we may mention that in connexion with a city improvement scheme of some magnitude

in the North of England the contractors, who were also builders, obtained a gratuitous supply of building stone which resulted in a net gain to them of several thousand pounds, and conversely an equivalent loss to the proprietors. Similarly, the contractor ought, if possible, to obtain some information as to what there is below the surface, or it may be his turn to suffer. An example of the kind was furnished during the building of a public institution in the city to which reference has been made, where the contractors who had tendered on the assumption that the subsoil would be easy to deal with, were put to considerable unforeseen expense in breaking up and removing a portion of the foundations of an ancient and most substantially-built city wall. We have reason to know that the firm in question considered that the knowledge gained concerning the cohesion of early masonry was somewhat dearly purchased.

On large engineering works, involving the excavation of earth and rock in huge quantities, it is still more important that the engineer and the contractor should ascertain, as far as possible, the character of the material to be dealt with. At the same time most careful estimates have to be made of the quantities, although it must be pointed out that there is no absolutely accurate method of calculating earthwork. In many situations little difficulty is experienced in forming a reliable opinion as to the nature of the strata underlying the surface; in other places trial borings may be necessary, and the results, considered in connexion

with local geological data, may enable the engineer to obtain a very good notion of the prevailing conditions.

Earthwork in general includes two operations—the cutting down of material projecting above the level of the proposed surface level, and the filling of depressions lying below the same level, these two operations being shortly described as cutting and filling. The first duty of the engineer is to prepare plans and sections representing the area and depth of excavation in all parts of the intended works, the next is to compute the total volume of material to be dealt with by cuts and fills, and, if need be, to analyse this total so that the cost may be separately calculated for the different kinds of earth or rock shown to exist on the site.

The mensuration of earthwork is fully discussed in several well-known standard works, and numerous earthwork tables have been published for the purpose of facilitating calculations. The most recent contribution on the subject is to be found in the introductory chapters of a treatise on the subject of excavation* by Mr. Charles Prelini, who is widely known as the author of a classical work on "Tunnelling." These chapters contain a brief review of some methods practised by European and American engineers, and although the references are by no means complete they indicate the superiority of the methods adopted in the old world. As an instance, we may refer to the author's admission that while British, French, German, and

* "Earth and Rock Excavation." By Charles Prelini, C.E. New York: D. Van Nostrand Company; London: Crosby Lockwood & Son, 1905.

Italian engineers carefully determine the distribution of the volume of earth along the profile of the work by algebraical or by graphical methods, in the United States no attention is paid to such distribution, either in public or in private works. "As a consequence," the author adds, "the mean distance of haul is not known, and earthwork is never calculated on scientific principles in the United States." In view of this criticism British engineers need not expect to learn much that is useful from the examples of American practice quoted by Mr. Prelini. The mention of Continental practice ought to be accompanied by specific references to the source whence the information was obtained, and, considering the claim of the author that he has produced the only book in the English language covering the field chosen, it is strange that English methods of computation should have been overlooked. So far as the preliminary portion of the treatise is concerned, we cannot avoid the impression that the author has not done full justice either to himself or the important details discussed.

While excavation includes the breaking up and removal of earth or rock from its natural bed, excavation proper may be defined as the breaking up of material in readiness for removal. Loosely compacted earths, such as gravel and clay, can easily be separated by means of a spade; others, such as agglomerated sand and hard clay, have to be broken up by a pick, and the excavation of rock requires the use of crowbars and wedges, or of blasting agents, according to the formation and hardness of the mineral. Of course, the simple tools here mentioned are frequently replaced by powerful machinery in which their essential functions are represented, and it is often the case that comparatively soft rock is broken up by blasting as an economical substitute for mechanical appliances.

The tools and machines used in the excavation of rock and earth constitute a most interesting series, and some of them combine the performance of operations belonging to the transport of excavated material. Among elementary tools for dealing with rock, the pick, the crowbar, and the wedge differ little from those used in the earliest ages. A useful modern appliance mentioned by Mr. Prelini for the mechanical excavation of rock is a channelling machine consisting of a track travelling on rails and carrying a vertical boiler and engine, the latter imparting a reciprocating motion to the cutting bar. Machines of this type are capable of cutting slots from 1 ft. 6 in. to 10 ft. deep, the most satisfactory depth of cut being from 6 ft. to 10 ft., but for separation of the rock in horizontal planes, wedges must be used. The capacity of the channelling machine depends upon the character of the rock to be worked. It is said that on the Chicago Drainage Canal the length of channel ranged from 50 ft. to 500 ft. daily. According to the *Engineering News* the cost of operating the machine on that canal was about 42s. a day. Other figures quoted by the author as to the performance of the Ingersoll-Sergeant channeller employed on the same works seem to show that, including all charges, the cost of channelling amounted to

about 1½d. per cubic yard of material excavated.

Blasting constitutes the more general method of separating rock in the execution of engineering works. The process involves the use of various tools for drilling holes into which the explosive is afterwards inserted. In the present day machine drilling has almost entirely displaced handwork. Power drills are made in considerable variety, those employed as auxiliaries to excavation being usually of the percussion type operated by steam, compressed air, or by electric motors communicating power through flexible shafting. Two specific types of such machines are noticed by Mr. Prelini, who gives full particulars as to rotary drills, which are rarely used by engineers and contractors except in trial borings. The only form of the rotary drill that has been employed on an extensive scale for excavation is Brandt's hydraulic drilling machine, but this has found application in tunnelling rather than in work of the kind described in the author's treatise.

The introduction of blasting by gunpowder in the XVIIth century effected a complete revolution in methods of rock excavation. Gunpowder continues to be used to the present day, although to a smaller extent than the different combinations of nitro-glycerine constituting dynamite and known under various fancy names.

If we may judge by the author's work, the engineers of the United States are not usually able to ascertain the composition of the explosives supplied by manufacturers. In this respect British engineers have an advantage over their American *compères*, for the composition of all explosives in the permitted list of the Explosives in Coal Mines Order is clearly specified, and any departure therefrom involves the penalty of removal from the list. Readers in this country need not expect to gain information of practical utility from American sources with regard to the transport and storage of explosives, but they will find in Mr. Prelini's book a few useful notes on the manner in which gunpowder and dynamite are applied in blasting operations.

Turning now to the excavation of earth, and passing over the use of such tools as the spade, pick, and wedge, there remain four distinct methods of work. The first is by blasting, an operation only suitable in open country for breaking away and disintegrating large masses or hillocks of earth. The second is that of hydraulic excavation, which Mr. Prelini says has been much employed on the Pacific Coast in mining and railway work, water under pressure being applied through a hose to break down the soil and wash it away along open conduits of timber. A third method is rendered possible by the pneumatic dredger, which can be utilised with much advantage in the excavation or deepening of dock basins without exposing the walls to risk of failure. The fourth method is to excavate by the aid of the numerous types of mechanical appliances for ploughing, digging and scooping up the earth to be removed. Machines of this class are of much importance in civil engineering work, and the chapters which

Mr. Prelini has devoted to their description form a useful contribution to existing records of apparatus for the mechanical handling of materials.

Apart from one or two appliances which attack the earth in thin layers, most excavating machines operate against the earth in banks, digging downwards from an upper level, or against the face of a bank from the level of the proposed excavation. In Great Britain the usual type of digging machine is that commonly described as the steam navy, but machines provided with heavy gears also receive a fair share of attention. It seems rather strange that so little favour should be shown in this country to continuous excavating machines of the Continental type—we mean those having an endless chain with buckets on the principle of a dredger.

One very useful type of continuous digging machine made in the United States is the Austin trench excavator, forming trenches in which pipes and drains are intended to be laid. This machine somewhat resembles a traction engine having combined cutters at the scoops upon an endless chain belt. The trench need only be cut to the actual width required for pipe-laying, the disturbance of road and other surfaces kept down to a minimum, and another meritorious feature is the rapidity with which work can be executed. The description given by Mr. Prelini is taken from the American technical press, and as an indication of the economy and rapidity with which the excavator performs its work it is mentioned that at Glencoe, Ill., where some 6,000 ft. of trenching was dug by its aid in hard clay, as much as 500 ft. run from 13 ft. to 15 ft. deep has been excavated in working day of ten hours. By employing a sufficient number of men to lay pipe as fast as the machine prepares the way the work of completing a pipe line can be got through with wonderful celerity. The introduction of such an appliance would be greatly appreciated by those in this country who suffer so much from the dilatory methods adopted by municipal and other authorities when laying drains, water and gas pipes, and electric cables.

An instructive portion of Mr. Prelini's book is that wherein appliances for hauling, hoisting, and transporting excavated material are described and illustrated. The bulk of the matter may justly be characterised as a really welcome addition to a branch of literature which has been somewhat neglected, and the information conveyed appears quite as much to constructive work as to the destructive process of excavation. In a previous article on "The Mechanical Handling of Materials,"* we have already discussed in general terms some of the apparatus described in detail by the author. Therefore it is not necessary to add more than one or two brief remarks. In the first place we may point out that the scope of the chapters now in question includes the consideration of horse-drawn vehicles for use on ordinary roads, contractors' railways and rolling stock, mechanism for haulage along inclines, belt conveyors, cranes of different types, aerial cableways and by

* *The Builder*, Vol. LXXIX., p. 433.

electric telpherage systems, and some practical notes on chains, ropes, buckets, and motive power. The valuable assistance offered by traction engines and beam and petrol waggons has entirely escaped the attention of the author, his inference being that mechanically-propelled vehicles of these types have not yet made much headway in the United States. On the other hand, the complete particulars given of the telpherage system deserve full commendation.

In conclusion we must point out that the direction of excavation work on a large scale is a matter which always vests to a very considerable extent, if not entirely, in the contractor. Upon his appreciation of the distinctive characteristics of the work to be undertaken, and upon his capacity for scenting probable difficulties, the commercial success of his operations depends very largely. Moreover, it is essential that the most appropriate types of machinery and plant should be selected for the kind of work to be performed, and, above all, that the controlling mind should have a genius for administration. These things cannot be learned from any book, nor even by experience in the absence of the requisite mental capacity. Nevertheless, books are helpful in their way, and the hints given by Mr. Prelini near the end of his treatise deserve the careful attention of young engineers who may be called upon to take part in the conduct of works such as those contemplated by the author.

Although earthwork upon a scale of great magnitude occurs chiefly in the construction of canals and docks, where the most perfect machinery and organisation are absolutely essential, the building contractor is frequently called upon to carry out works that are as important to him as are more extensive operations to the millionaire engineering contractor. For this reason the study of the most modern appliances and of the best methods of procedure ought by no means to be neglected.

NOTES.

LAST week under this heading we commented upon a case where a sale having been

made under an order of Court the purchaser was discharged from his contract, where there had been a misdescription of the property, and allowed costs other than those defined in the contract for sale. In *re Jackson and Hadens Contract* the Court of Appeal have now decided a case where the purchase of a dwelling-house was being effected by private contract. The contract contained no reservation of mines and minerals, but when the abstract was delivered it appeared the vendors could give no title to the mines and minerals. The purchaser, therefore, offered either to purchase without the mines and minerals at a reduced price, or to permit the contract to be rescinded on payment of damages. The vendors then claimed to rescind the contract, but on repayment only of the deposit. They relied on article 13 of the conditions of sale, which provided that where the purchaser insists on any objection or

requisition which the vendors should be unable to comply with, the contract may be rescinded on repayment of the deposit. The Court, however, held that there having been a misdescription, article 14 applied, which provided that any error, misstatement or omission should not annul the sale, but should form the subject of compensation. The lesson to be learnt from these cases is that vendors cannot be too careful in giving accurate particulars in matters that affect title, since in the event of misdescription the contract will be construed strictly against them.

House Property and Street Widening.

THE case of *Denman & Co., Ltd. v. Mayor, etc., of Westminster*, already reported in our columns, turned upon Michael Angelo Taylor's Act, which we have had occasion to comment on in recent issues. In our comment on the case of *Pescod v. Mayor, etc., of Westminster* (August 19, 1905) and *Thompson and Jackson v. Hammersmith Corporation* (January 6, 1906) we have drawn attention to the law on this subject. In the present case the Court held that the Westminster Corporation had allowed other considerations to weigh with them, and had not come to a judicial consideration or conclusion under section 80 of the Act that the whole property was necessary for the statutory purpose in the street widening, and therefore the Court itself considered the facts, and applying the test—can the portion required be taken away, leaving the house capable of being enjoyed as a house?—came to the conclusion that the house standing on the remaining 30 ft. could easily be retained as a house, and that the defendants were only entitled to acquire the necessary strip to be thrown into the street. The judgment contains some very important observations on how far the wishes of the owner are to be regarded in connexion with property so acquired; his wishes are by no means disregarded, they can in certain cases be disregarded, and the whole property be acquired. The real question in each case is, will the house cease to be capable of retaining its character as a house? but the fact that the owner is willing to make it good as an effectual house will also be taken into consideration. The question where interests in the freehold are divided still remains in abeyance.

London Building Act and Party Walls.

A QUESTION of considerable importance under the London Building Act, 1894, has been decided in the case of *Lewis and Salone v. Charing Cross, Euston, and Hampstead Railway Company*. The railway company, in pursuance of their powers, which incorporated certain sections of the Lands Clauses Consolidation Act, 1845, had acquired 21, Cranbourne-street, and were pulling down the house in order to erect a station upon the site. The plaintiffs were the lessees of the adjoining house, and they alleged that the railway company had affected a party wall without giving the notice required by the London Building Act. The defendants contended that they were exempt from giving the party wall notice by virtue of a clause in their Act which provides that any buildings acquired for extraordinary purposes under

the Lands Clauses Consolidation Act, sect. 45 (as the house in question had been), "except such buildings or parts of buildings as may be used for the purposes of a station," shall be subject to the provisions of the Acts relating to buildings in the Metropolis. The Court construed this provision as being directed to remove the exemption contained in sect. 201 of the London Building Act of structures erected upon the railway or within the railway or station premises from Parts 6 and 7 of the Act, but as in no way affecting Part 8 of the Act which refers to interference with party structures. In such circumstances, therefore, the party wall notice is necessary, the company being in the position of an ordinary "owner" desirous of doing work affecting "a party wall or structure." In this case the Court came to the conclusion that in fact the wall had not been affected, and the plaintiffs therefore failed in their action, but the decision on the question of law is an important one.

The Rating of Land Values.

IT is probable that in the next, or at any rate in an early, session the question of the rating of land values will take a prominent place. There can be no objection to the rating of actually valuable pieces of land at their true value; the difficulty is to arrive at it. Lord Balfour's local Taxation Commission considered this subject, and the Chairman, Lord Kinross, Sir E. W. Hamilton, Sir G. H. Murray, and Mr. Stuart agreed that it was possible to make a valuation of sites, as distinguished from buildings. The other commissioners came to the conclusion "that although it cannot be said that it would be impossible to assign separate values to site and structure . . . such a system would certainly be attended with considerable uncertainty, complication and expense." The subject is a technical and troublesome one, and the recent publication of the reports of the commissioners, together with notes on the proposals to levy rates in respect of site values under the title, "The Rating of Land Values," by Mr. Wilson Fox, C.B., Secretary to the Commission (London: P. S. King & Sons) is very opportune, and will enable the point of the approaching discussion to be kept clear.

Publishers' Liabilities.

THE case of *Bullen v. The Swan Electric Engraving Company* is one of general interest to publishers and literary and artistic men. The plaintiff had entrusted certain plates from original paintings to the defendants for the production of book illustrations. After the illustrations had been produced the plates remained in the defendants' keeping. Subsequently, when the plates were required for other editions they could not be found, and the plaintiff sued the defendants for their return or for damages. The plates were left in the custody of the defendants for the convenience of both parties. No evidence was forthcoming as to what had become of the plates, but the defendants proved that they could not be found and assumed they must have been stolen. The defendants, however, gave evidence as to

the care taken in the custody of the plates, and on this evidence the Court held that, as gratuitous bailees they had satisfied their obligation, and, though with some hesitation on account of some conflict in the reported cases, the Court gave judgment for the defendants. In this case it is to be observed that the plaintiff was unable to give evidence of negligence, whilst the defendants were unable to prove the cause of the loss, and the decision turns upon the fact that they took proper and reasonable care of the property, such as could be expected from a careful owner in the custody of his own goods.

Concrete in Building Construction. VARIOUS phases of concrete construction were considered by the speakers in a discussion on "Reinforced Concrete in Building Construction" at a meeting of the Franklin Institute, and reported in the current issue of the journal of the same institution. The first speaker, Mr. E. G. Perrot, presented what was really a paper on concrete-steel, and although recapitulating a good deal that is already well known, this communication contains some practical data which deserve examination, notably the results of load tests made on full-size beams having a clear span of 20 ft. between supports. These tests confirm the substantial accuracy of the assumptions and formulae stated by Mr. Perrot, the latter being based upon the formula employed by M. Paul Christophe, the eminent French expert on reinforced concrete. Mr. W. L. Webb devoted attention chiefly to the design of dams, a type of construction which affords opportunity for one of the most remarkable applications of concrete steel. The special advantages of a dam built of this material are that it is designed with a comparatively flat up-stream surface, so that there is no tendency for it to overturn; that the method of hollow construction can be adopted with great saving of labour and materials; and that a work of the kind can be made absolutely watertight at the start and so to remain. A deviation from the subject indicated by the title of the discussion was made by Mr. F. P. Cowell, who brought forward some notes on the use of hollow concrete building blocks. This speaker argued with some reason that this form of concrete was more suitable than mass concrete for architectural construction, and he gave as an appendix to his remarks the rules and regulations drawn up by the city authorities of Philadelphia governing the manufacture, and use of hollow concrete building blocks.

The Soudan Railway. A GRATIFYING circumstance in connexion with the recent completion of the new railway from the Nile to the Red Sea is that the line has been built within the short period of sixteen months. That this is by no means an insignificant achievement is made clear by the fact that the route—312 miles in length—traverses country of a most unfavourable kind, consisting of a sandy desert, diversified by numerous hills and hollows. In summer time the heat was particularly trying to the English engineers

in charge of the works, and in the autumn and winter months floods frequently swept away bridges and portions of the permanent way. The arduous nature of the task was further increased by the necessity for importing the bulk of the material from this country and for its transportation across the desert to the required points. At the Red Sea end the new line divides into two branches, one terminating at Suakim and the other at Port Soudan, formerly the fishing village known as Sheikh-el-Bargût. The superiority of the harbour at this place over that of Suakim was so evident to the Technical Commission, appointed in 1904 by the Egyptian Government, that it was decided to bring the new railway to the port and to commence the construction of harbour works and Government buildings without delay. By the opening of the railway and the development of a new port on the Red Sea a considerable impetus will be given to the agricultural development of the Soudan, and for the moment it is certain that the facilities in question are of greater value than the irrigation works in contemplation for the benefit of the same region.

Electric Measuring Instruments. THE paper read by Mr. K. Edgcombe on "Some Recent Electrical Measuring Instruments" to the Junior Institution of Engineers is of general interest to all users of electric light and power. The extending use of the electric motor has given rise to a demand for a cheap and accurate gauge for measuring the current taken by the motor. In an instrument of this type made by the author the scale is calibrated directly in horse power, and this will be appreciated by the average attendant, who is, as a rule, ignorant of the meaning of the electrical units. A novel form of street photometer invented by Mr. H. T. Harrison is also described. It is exceedingly compact, and should prove useful in helping gas and electric lighting engineers to agree as to the relative values of the "illumination" produced by their street lamps. The question, however, of the quality of the light emitted is still left untouched. The author points out that one effect of the stringent Board of Trade lighting and tramway regulations has been to encourage the perfecting of recording instruments for pressure and current. In other countries recording instruments are only to be seen in well-equipped laboratories, but in this country there are several in every electric lighting station. The author describes an ingenious form of "inkless" recorder which he has invented. It eliminates the difficulties due to the ink in the ordinary recording pen and the friction of the pen on the paper. In conclusion various forms of frequency indicator are described. The paper would be more interesting if some hint had been given as to the percentage accuracy of the various instruments described.

Crane Motors and Controllers. MUCH useful information is contained in the paper by Mr. C. W. Hill on "Crane Motors and Controllers," which was read to the Institution of Electrical Engineers

last week. The proper rating of a motor for intermittent use is a problem of considerable complexity, and some of the tables and diagrams given will be helpful in obtaining a solution. It is usually specified that the temperature rise of any part of the machine in ordinary working must not exceed the temperature of surrounding objects by more than 75 deg. Fahr. Unfortunately the testing of a motor of this type is both troublesome and expensive. The author has, therefore, carried out a series of tests to see the degree of accuracy obtainable by the ordinary formulae. We had occasion last year, when commenting on Mr. Goldschmidt's paper, to refer to the limitations in the formulae used. Newton's law of cooling on which they are based only applies very roughly when the temperature of the machine is 50 or 60 degrees hotter than its surroundings, and so in those experiments where the calculated and observed values are almost the same, other causes, not taken into account in the calculations, must have produced an appreciable effect. Several of Mr. Hill's results prove that in many cases the rough engineering formulae are quite useless. The tables given of tests made on a shunt motor devised by the author for use on an overhead travelling crane are very instructive, and will well repay study. The use of the phrase "power factor," however, in a new sense, is objectionable. We should like to know the author's justification for giving 0.38 as the specific heat of cotton insulation, and also what he took as the specific gravity of this insulation material in constructing Fig. 3.

Site of the Institute's New Premises, and Langham House. THE freehold site which it is proposed to purchase at the price of 19,500l. for the new premises of the Institute, lies between Nos. 11 and 13, on the west side, south end, of Portland-place. The land has, we believe, never been built upon; it forms part of the grounds of (old) Foley House, which should not be confused with the present Foley House, No. 8, on the opposite side of the street. When Nash prepared his plans for laying out the upper end of Regent-street (Langham-place) and for opening out a road northwards to Regent's Park, the southern end of Portland-place was quite blocked by (old) Foley House, of which the north garden-wall extended along a line drawn from No. 68, now No. 13, to No. 1, now No. 20, Portland-place, the garden extending southwards to the rear of the houses on the north side of Mortimer-street (west), since re-named Cavendish-place, Foley House, where is now the Langham Hotel (1863-5), had been built by S. Leadbeater, or Leadbetter, in or about 1740 for Thomas, second Lord Foley. Nash acquired the property for 70,000l.; on a portion of the north garden, along its west side, he built Langham House for Sir James Langham, Bart., and some adjoining houses to the south. Langham House gave way some years ago to a block of residential flats, No. 11, but the garden-ground in part has remained, whilst another piece of it still exists in front of the later Foley House which James

built in or about 1786 for his own occupation.

At Messrs. Agnew & Sons' gallery is an exhibition under the title, "Some Examples of Independent Art of To-day." What is independent art? In too many cases means art which is independent of her beauty or finish; and some of this sort of independence finds place here, such as Mr. Wilson Steer's painting of a pasty-faced lady on a garden-seat, presenting "Summer," and devoid of charm either of colour, design, or expression; and Mr. McTaggart's "Emigrants Leaving the Hebrides," which it is difficult to make out either as emigrants or anything else. But as a whole it is an interesting exhibition, more especially in the further examples given us of Mr. Strang's new and unexpected development as a colourist. His painting of "The Bathers," a kind of pendant to his picture at the New Gallery, quite Titianesque in colour; his larger painting, "Supper Time," though too large for the slightness of its subject, a masterly work both in design and colour; such works place this Mr. Strang, hitherto known mainly as an engraver, in an entirely new category among contemporary artists. The tendency of "independent art" to indulge in what are really sketches on a large scale of rather trivial subjects is shown in Mr. Mackie's "Musical Moments," a large sketch of a family gathering, never enough, but this kind of thing is really worth doing on a small scale as a cabinet picture; there is a total want of proportion between the subject and the scale of the work. To a lesser extent the same might be said of Mr. R. Burns's "The Window," a life-size figure of a lady seen against the light of a window through which we look out on a river; this is a production of really pictorial quality, but its interest is evanescent; we can hardly imagine any one making room in a permanent collection for a mere study of lighting on so large a scale. At the other end of the room, to emphasize this, is a really complete work of art in Mr. Lavery's very fine portrait under the title "Violet and Gold." Though, at first sight, the two girls in the foreground of Mr. Tonks's picture, "The Lost Path," look like bundles of logs, at a safe distance it resolves itself into a landscape composition of fine and open effect; and Professor Brown, in "On the Wye," has got a real effect of sunlight. Among other things Mr. Hos. Hunt's "A Galloway Pastoral" is a beautiful little bit of landscape composition; Mr. Hone, in "Coast of County Clare," has made a powerful composition out of black rocks, surf, and stormy sky; and Mr. James Paterson's "An East Lothian Village" is a perfectly admirable example of a landscape in which buildings are predominant and are made to blend with the whole without losing their texture and structural quality. Too often, in modern paintings of this class of subject, we find the buildings reduced to a structureless and pulpy appearance in order to blend (as is supposed) with the landscape. This is the fault of Mr. Anneson's "Eglise St. Vulfran, Abbeville," where the effect of the dark tower

seen against a sky mottled with white clouds is fine, but the architecture is sacrificed to it in a manner quite unnecessary; the general effect would have been just as good, and the picture more truthful if the details of the tower (which fills the greater part of the picture) had been better drawn and expressed.

The Fine Art Society.

At the gallery of the Fine Art Society is an exhibition of watercolours by Dutch artists of the present day. Two of these, "Ostend" (10) by A. Le Comte, and "A Quiet Corner" by Bernard Schregel, caught our eye the moment of entering the room, as two works each showing in its way a remarkable individuality; and these two artists are, we found, two of the best represented. Herr Le Comte is an admirable painter of sea and harbour pictures, with a way of his own of treating the sea; and Herr Schregel has a faculty of his own of representing sunlight flickering through trees on to white buildings, which becomes a little mannered by repetition, but is always effective and in a style of handling completely his own. His charmingly composed little landscape, "The Last Rays of the Sun" (15), and also "A Creek in the Dunes" (22), show however that he has powers beyond those exhibited in his favourite scheme. Herr Gruppé's large drawing, "Clearing up the Wood" (12), is an admirable study of a wood in winter, with the bare trunks of trees forming the principal incident; it is in a pure watercolour style, which indeed may be said of the majority of the works exhibited. Herr Gruppé's "Pasture" (4) is also a beautiful small landscape, delicate without losing breadth. The figure studies do not interest us so much; the most artistic is Herr Haverman's "Mother and Child" (7), a woman in a yellow dress with her back to the spectator; one or two others of his are good but rather sloppy in execution, and in "After the Bath" (13) the aspect of the infant certainly suggests that it ought to be "Before the Bath." The landscapes are the best part of the exhibition, and they are very interesting. The collection of bronze statuettes of peasants by Herr Van Wyk, who seems to be a kind of Dutch Constantin Meunier (in intention at least) are too ragged in style and treatment to quite merit the title of sculpture.

The Carfax Gallery.

WE cannot feel much enthusiasm over the pictures of Mr. Graham Robertson exhibited at the Carfax Gallery. He has a manner of his own in the treatment of figures by thin painting of surfaces without elaboration of texture effect, and a feeling for colour harmony, which produces its effect in the half length portrait of a girl under the title "Daisy" (1), and in one or two others, such as the portrait entitled "Grey and Black" (14); but a good many of the other figure pictures are very crude and flat in effect, and the landscapes have the appearance of being cut out in flat pieces and put together like a puzzle-map. The black and white drawings in line for book illustrations for "Old English Songs and Dances" and "French Songs of Old Canada" are very

good in their way, and show the artist as a master of this kind of work, and the child figures in the drawings for "A Year of Songs for a Baby in a Garden" are charming. Mr. Robertson shows also some experiments in colour prints "in search of the lost manner of William Blake," some of them treating designs of Blake's, which are of some interest.

The Goupil Gallery.

At the Goupil Gallery there is a second exhibition of landscapes by Mr. Leon Little, whose first exhibition we noticed three years ago, and who has progressed further in developing his feeling for the poetry of composition and colour in landscape. "The Close of a Day" (13), a scene looking up a small river or canal between trees, is a beautiful work; some of the smaller studies—"Setting Sun" (8), "Sunny Afternoon" (9), and "Rainy Day" (12) are noteworthy for truth and poetry of effect; and the large painting "The Thaw" (39) is a most powerful picture of desolation in landscape. "Twilight" (13), a little reminding one of Corot, and "The Brook" (47) are two others worth special mention. "Pond at Moonlight" (19), though a fine little picture, shows (as is often the case in this class of subject) too much light for moonlight. But the whole collection is full of interest and talent.

WE have before referred to the Marble Arch, a proposal by Mr. Speaight to have a crescent-shaped place formed in the rear of the Marble Arch, leaving the arch standing alone in the centre of the semi-circle. As a convenience to traffic it may be worth doing, but it is hardly to be recommended in an architectural sense. The arch now stands as a gate to the park, though one not generally used; in Mr. Speaight's scheme it would lose that appearance entirely, and would merely be an erection standing apart, without any meaning. Mr. Speaight says he took the idea from the position of the Arc de l'Etoile at Paris, but unfortunately the Marble Arch is not a grand structure like the Arc de l'Etoile, and in the second place the great Paris arch actually stands over the centre of the main line of avenue, and although the traffic is made to circle round it, it stands on the axis of a long vista of road, and is, or might be, used as a state entrance to Paris from the west. The Marble Arch is no such monumental work; it is a small and rather insignificant specimen of a triumphal arch, originally meant as the gateway to Buckingham Palace, and now standing as one gateway to Hyde Park. It looks reasonable in that position, but it is not adequate for a central position in an open space, and would only look absurd.

THE KING'S SANATORIUM, MIDHURST.—The designs of Messrs. Heal & Son, of Tottenham Court-road, have been selected in competition for the furnishing of King Edward's Sanatorium. GREY'S MONUMENT, NEWCASTLE.—This monument, which stands on a site at the junction of Grey-street, Grainger-street, and Blackett-street, and was erected in 1838 to commemorate the life and services rendered to the cause of parliamentary reform by the great Earl Grey, has recently been renovated. The work was carried out under the supervision of Mr. C. H. Neuper, sculptor, of Newcastle.

ROYAL ACADEMY LECTURES.

In his second lecture on "Reason in Architecture," delivered on Thursday the 8th, Mr. Jackson, after briefly recapitulating the argument of the first lecture (see page 141 *ante*), observed that the whole change from Romanesque to Gothic architecture arose out of practical circumstances, and even was influenced by the social life of the times and the character of the men who built. This had been followed out in the last lecture in reference to one detail, the capital, which as an illustration of development on a small scale was taken first; they would now carry out the same analysis on a larger scale. If they stood under one of the great cavernous portals of a French cathedral, such as Bourges or Amiens—portals far finer and more impressive than anything of the kind in English cathedrals, for the English cathedral builders had never attempted to make the most of the possibilities of an entrance porch—they would see, if they looked carefully at the array of sculpture which decorated the deeply recessed arch, that it was arranged on a system of receding planes; differing in this respect essentially from the Classic arch, which was built in one plane. How did this come about? Did anyone invent it? No: like all other architectural features, it was the result of a slow development; and the characteristics of this great cavernous sculptured portal, strange as it might seem, were traceable in the first instance to the influence of poverty and a desire to economise material and labour. Going back to Roman times, the Romans built with large stones, which could only be obtained and handed by people possessing wealth and the best engineering appliances. But those who attempted to build on a large scale in the IXth and Xth centuries possessed neither wealth nor engineering appliances except of the simplest kind. They could neither have obtained and transported the large blocks by the Romans, nor raised them into their places if they had them. They were compelled to build with small stones. Instead therefore of attempting an arch in one order for a thick wall, they commenced with a sub-arch in smaller stones, and a second arch above it in similar stones projecting on each side of the first arch, the space between these second courses being filled in with small stones in the middle, and the label or archivolt moulding over the arch could again be formed of quite small stones projecting beyond the face of the second arch. Thus was started the idea of an arch in successive "orders," one recessed within the other. The stones might even be of quite irregular sizes; all that was necessary was to have efficient bonding. Another economy obtained in this way was in the temporary centering for building the arch on. Even the Romans had found the centering for their large arches a very heavy charge on a building; but with the system of recessed arches the first or lower arch only required a small and light centering, and the arch itself formed the centering for building the next order on. But this arrangement of receding arches affected the plan of the pier also. The Roman pier might be a simple square (a), but with two recessed arches it was obvious that the square plan did not fit the section of the arch above it.

there was a waste of material at the angles of the pier; accordingly the early Romanesque pier took the form (b), in which, as they could see at St. Albans, the section of the arch was carried down to the ground. This simple change of the arch into one of recessed orders was momentous to architecture; it came to play a part in every feature of design. The attempt was soon made to render it decorative by inserting shafts in the angles of the pier; and the introduction of a third order in the arch suggested the further modification of the pier by a half round column on each face, as at c. This kind of treatment of the pier was necessary to make it correspond sufficiently with the section of the arch, unless in the cases where

the members of the arch were intercepted by a square capital carried by a cylindrical pier. One result of this treatment of the pier at c was, as they would see, that the main outline of the pier was no longer a square, parallel with the main line of the arcade, but assumed a diamond shape diagonal to it; and this general shape the plan of the pier was maintained throughout the whole course of Gothic architecture. Then followed the device of giving more effect and expression to the orders of the arch by mouldings and by the introduction of carved ornament, but the distinction of receding orders was still preserved, as was shown in an illustration of a Norman archway from Durham Cathedral, which was very richly decorated, but the effect of receding in successive planes was perfectly obvious. Each of the orders of the arch had its own shaft in the pier below, the capitals with diversified ornament, some of them of the convex Byzantine type, some with leafage carving; but a point worth notice was that the shafts were no longer part of the pier; they were detached: and this change led to the frequent practice of making the shafts of a different material, such as Purbeck marble, the best material of the kind which this country afforded; for the English builders seldom attempted the importation of the more fine and costly foreign marbles. The section of the arch, with the multiplication of orders, was, like the plan of the pier, changed from the square flat section of the Roman arch to a diamond-shaped section, as was very obvious in an illustration of an arch from the south-west transept of Ely Cathedral. Among other examples shown were the portal of Vézelay; that of Rochester, in which there seemed to be something of French influence in the employment of sculptured figures in the place of shafts in the jambs; and the Prior's door at Ely, in which there was only one sub-order, but which was characteristic as showing very clearly the retention of the general square section of the receding, in spite of the mouldings and enrichments. And here it was to be observed that, in spite of the multiplication of mouldings in later Gothic, the recollection of the original square form of the recessed arch orders was never lost sight of, except occasionally in very late Gothic; the mouldings, as was shown on some typical sections, were still cut out of the square forms of the original arch rings, and fell into groups distinct for each order of the arch; even where the plan of the caps was circular, as at All Saints, Stamford, the square form of arch order was retained over them; and if they looked at the view of the interior of Worcester nave, they would see arches with a great elaboration of mouldings, which might seem at first glance to be without rule, but if they were examined carefully it could be found that they fell into groups, each referable to the original square section of the arch ring. This elaboration and variety of mouldings was peculiar to English Gothic; the French mouldings were poor and monotonous in comparison; but in all this multiplicity the order was preserved, and each group of mouldings threw its own shadow. Coming now to an illustration of the great west doorway at Amiens, the richness and profusion of which was almost overpowering, those who had followed out his argument would be able to recognise that the whole of this ornament followed constructive lines. The sculpture on each order of the arch was probably carved first, before being placed in position. The statues in the jambs of the doorway, which replaced the shafts often found in that position, were not spaced at random, but each occupied the precise position which a shaft would have occupied, beneath the arch-order which belonged to it. The west portal of Notre-Dame at Paris, a little later and somewhat more severe in character, showed the same characteristics. Thus these examples justified the apparent paradox with which the lecturer had started, that all this richness of detail developed in the great building adopted on account of poverty and on grounds of economy. The early mediæval builders, whose desire was to imitate Roman work, failed to do that—it was beyond their resources; but they had ended by doing something better. For fitness was a prime condition of architecture. An artistic people would have got no suggestions out of

the practical difficulties that had been referred to; the mediæval builders accepted and made the best of the position, and thus developed a true architecture on the lines of reasonableness.

If this reasonable characteristic of architecture were better and more generally understood, people would derive a new pleasure from the study of the subject. There was no great mystery about it; the general constructional problems, the only ones about which amateurs need trouble themselves, were really simple enough. The elementary principles of construction were obvious to all, people were in the habit of judging by them almost without knowing it. Slight thin walls, for instance, pleased nobody; but a plain wall solidly built was satisfactory to the eye; when buttresses had to be added to strengthen it there was an additional interest. The constructive test was what we really judged by. Many large engineering structures—railway bridges, aqueducts, as long as engineers abstained from treating them (as they thought) "architecturally," were very interesting objects; King's Cross Station was the best and most expressive railway station front in London, simply because it expressed the actual construction of the station, and it was worth note that the effectiveness of the large arches was derived from the very detail they had been considering in mediæval work—the employment of the recessed orders of arches. Even Charing Cross railway bridge, though one would hardly call it beautiful, was satisfactory to the eye in its way; it was a piece of plain practical structure suited to its special purpose. There were many worse bridges than that between Charing Cross and London Bridge. So the Kew and Putney bridges, solid masonry structures with little ornament, were satisfactory; and London Bridge, the plainest of all, was still more so. As an example in another form, of the satisfactory effect of simple and suitable construction, was shown an illustration of the old timber-built Market Hall at Ledbury, an unornamented structure in which the whole effect depends upon the suitable employment of timber in a constructive manner. Even the over-sailing of the upper story, which was the most picturesque incident in the building, arose, it was pointed out, from practical considerations; the ground floor was necessarily restricted in space from the conditions of the site, but these did not operate at the higher level, so the joists were carried out beyond the lower wall line to give a more rooey floor above. After this was shown the interior of a large mediæval barn, a large piece of plain timber construction based on a three-aisled arrangement of supports, and forming a most picturesque interior; there was not a feature in it of what was generally called architecture, yet it was in the true sense architecture. Forms of simple construction sufficed in themselves to give pleasure; construction in its broader sense was intelligible to all persons of intelligence; more elaborate forms, like those of the mediæval portals which they had been considering, no doubt required explanation, but they were not to be fully enjoyed without some knowledge of construction. Architects, no doubt, had to study more difficult problems of construction in order to learn how best to create works of beauty; but the unprofessional spectator was not concerned with these more special and complicated studies; all that need be asked of him was that he should endeavour to look a little below the surface of things. Then he would have a reason for his preference in architecture; whereas too often people knew only that they "liked" this and "disliked" that, with no reason for either feeling; or they liked what they were told they ought to like. Enjoyment to be worth anything must be sincere and must be reasonable; yet they were told sometimes that to dwell on the constructive quality of architecture was to make it "uninteresting" to the amateur. Did some knowledge of astronomy or of botany render the stars or the flowers less interesting? They only asked of the man outside the profession that he should endeavour to understand how the forms of architecture were based on laws and principles. Construction was not a dull subject; it only needed to be understood to be found full of interest. The Forth Bridge was interesting as a piece of mere construction. It was the

ness of architecture to carry things a step further than mere construction; but other in the nave of a Gothic cathedral, the dome of St. Paul's, the effect was not on construction, and the constructional effect was in fact felt by the spectator even if not fully understood. Why should a pier be built with a slightly diminishing line, either by lessening the buttresses or setting the successive stages slightly? Experience taught us that otherwise we tended to look larger at the top than at the base. And why should we object to a tall object to be steady and to look steady it must be somewhat widened at the base. Columns were diminished upward for the same reason, and entasis was given to them, as it often was to mediæval broach spires, because it was found that otherwise they tended to look hollow in line, and a hollow line in such an object tended to give an appearance of weakness, and to do away with the character of stability. In Classic architecture, such as Wren's, where the buttresses in themselves were vertical, this fulcrum of the line of sight was obtained by the production of such decorative additions as astragals and vases at the different stages, filling up the gaps to the eye, and giving a general convex outline which the eye desired. The design of the western towers of St. Paul's was a notable instance of this; its weakness or hollowness of the general line there would have seemed doubly weak in contrast with the prominent convex outline of the dome in the rear. The stronger line was preferred by common sense, and it meant that we instinctively felt its constructional character. Why did people admire the "crown" termination to a steeple as at Newcastle; St. Giles, Edinburgh; and other examples? Because, even by those who did not know exactly how it was done, it was felt to be a piece of rather daring architecture. Amateur lovers of architecture might not therefore be satisfied with the mere outward forms of things; they should link of the construction; there was no mystery about it; it was only what they had seen practically applying, in one way or another, all their lives. When this point was rightly understood, there would be more understanding of and more demand for good architecture on the part of the public. It is as important they should have that demand, or in art supply and demand stood in a constant balance; as Leighton observed, "what the public want in art, that they will have."

That an interest in art had become fashionable—that there was an increasing number who were interested in it—that was something; what was wanted in regard to architecture was that the public should be more enlightened in regard to its constructive basis, and to the students whom he was addressing this recognition of the constructive basis was still more essential. He would exhort them to consider the construction as the basis and support of all their design, just as the skeleton was the basis and support of the outward human form. Let them settle the underlying constructional motive of a building, and build up their design round it. Good architecture was the expression of good construction.

In his third lecture, given on Monday last, Mr. Jackson followed on the influence of construction on design as illustrated in the instance of the vaulted roof. The mediæval builders had always desired to have stone vaults to their buildings; they had the remains of the great Roman vaulted structures before them, and such buildings as the Pantheon. The Roman tradition of the dome was carried on in the Eastern Roman Empire, where the invention of the pendentive revolutionised dome architecture; but in Western Europe the skill to carry out such works was wanting, and Charlemagne's tomb at Aix-la-chapelle, which was an obvious copy of San Vitale at Ravenna, was built by Eastern workmen sent for the purpose. The Western builders, however, would have vaults; they could not afford to build them in the Roman way, but they found their own way. What was the difference? Compare the plans of the octagonal temple at Spalato with that of the chapter house at York: two buildings nearly the same size, but the one showed a huge mass of walling; the other, though

rather the larger building and also covered with a stone roof, seemed to have very little wall, and what it had was arranged in quite a different manner. The Romans were content to meet the thrust of the arch by an immense dead weight of thick wall; what might be called passive resistance; the Gothic builders met it by an opposition of pressures, and only by many failures did they find the means of so using these pressures or thrusts as to neutralise each other. They commenced with wagon vaults, at first of semi-circular section; subsequently a pointed section was adopted both because it exercised less thrust and because it agreed better with the exterior line of the stone roof, and left a smaller mass of material, and therefore less weight at the apex. They could see these solid stone barrel-vaulted roofs in some of the Channel churches of South Wales and the Channel Islands, and also in some minor portions of English churches, such as porches, they could still see barrel-vaulted roofs of solid stone. With side aisles, however, there was no room for the amount of buttressing required, except by the employment of successive barrel vaults over the aisles, from pier to pier, at right angles to the line of the nave. This made, however, a heavy and dark interior, and was succeeded by the employment of cross-vaulting in the aisles, which occupied less material and let more light into the church; but with this was lost the requisite abutment to the nave vault, which accordingly was for the time abandoned and the nave roofed with timber, as we still saw it at Peterborough. One of the difficulties when the attempt was first made to vault the nave was, that though the aisle bays of vaulting were built over a square, the nave, being wider than the aisles, fell into oblong compartments. The Roman vault, with its mere edge groins, did well enough over the square bays of the aisle, but with a nave wider than the length of the bays, as they could see at Vézelay, the two semi-circular arches would not work out in the same way, and they had the coal-scuttle (sometimes called the Welsh) vault, the narrower transverse vault only cutting into the haunches of the longitudinal vault. The employment of the pointed arch, which was introduced purely for constructional reasons (for the round arch was often retained afterwards in merely decorative arches), made it possible to adapt the lines of the groins to the different heights and widths required, and this being perceived, there followed the system in which the groins were built first, as an independent construction with their curves set out to the heights and widths required, and the surfaces were filled in between them; instead of the groins showing twisted lines from the meeting of unequal arches as in the Roman system, the groins made the design, and any inevitable twisting or accommodation was made in the surface filling, where it was not noticeable. Most of the difficulties of the vault itself were got over now; what remained was to fortify it sufficiently at the points where it abutted on the wall. But for the side aisles it would have been easy, but they stood in the way of the necessary buttresses. Hence arose the idea of building massive buttresses outside of the aisles, and carrying the thrust of the nave vault across by flying buttresses. Here they saw the real principle of Gothic building; the balance of thrusts one against another. Without the flying buttresses the nave vault would push the walls out; but without the nave vault the flying buttresses would thrust the walls in. Between the two the thrust of the vault was resolved into a dead weight pressing vertically on the walls. Thus in a cathedral they were surrounded by mighty unseen forces struggling for the mastery. The massive exterior buttress was the only passive portion of the construction. The section of Westminster Abbey was shown as an illustration of this, and attention called to the double system of flying buttresses adopted to carry the thrust over the cloister walk on the south side.

These were the main causes that had shaped the Gothic style as a whole. Thus reason again had led up to the architectural result. In the treatment of the eastern termination of the cathedral they could trace again the influence of reason. Aboard, the favourite termination eastwards was on the plan of the apse, which the Normans had

brought over to England, most of our cathedrals having been built in their first form with an apsidal termination to the choir, though this was abandoned later in favour of the square termination which was preferred in England, and which gave opportunity for what was one of the great glories of the English cathedrals and churches—the large traceried east window. Now the cross-vault was not easy of application to an apsidal plan. At Autun the choir was barrel-vaulted, with a semi-dome over the apse; and at Leon also they found the same arrangement. One defect inherent in this was that the windows had to be kept low; they could not be carried above the line of springing of the semi-dome. At Vézelay, where cross-vaulting was introduced and the plan took the peculiarly French form known as the *chevet*, they could see how the effect was improved by the ability to carry the windows up beyond the springing of the vault. At Beauvais this effect was pushed to its utmost limit; the choir became a kind of lantern with the spaces between the piers entirely pierced by windows; even the triforium was pierced on the exterior and glazed. Theoretically, at all events, all this wall-veil and window might be removed without affecting structural stability. Yet even for these effects the Gothic builders only reluctantly abandoned the round arch. It was found persisting in buildings where all the structural portions were built with pointed arches; in Italy especially, where the Classic tradition was naturally the strongest; in Dalmatia the round arch persisted even up to the time of its revival at the Renaissance. This fact was an indication that the increase in the height and verticality of effect in the later Gothic buildings was not really due, as was often popularly supposed, to a religious sentiment of aspiration; it was simply a matter of the most convenient way of building; and it was noticeable that this increase of loftiness arose just at the time when, in the XIIIth century, the work of church building passed out of the hands of the clergy into those of lay corporations. The increase in height was in fact inevitable with the pointed arch. The aisles had to be lofty in order to obtain light enough from the aisle windows; and the upper line of the aisle roof fixed the sill of the clearstory windows, and from these again it was desired to get as much light as possible. The effect of aspiration was produced; but reason, not religion, was the motive power.*

BRITISH SCHOOL AT ROME.

THE second open meeting of the British School at Rome for the present season was held in the library of the School on Friday, February 2. Mr. Thomas Ashby, jun., Assistant-Director of the School, read a paper on "Excavations at Caerwent, Monmouthshire," in the supervision of which he has taken a considerable part. The village occupies the site of the Romano-British city of Venta Silurum, and excavations have been in progress there since 1892. The city walls have always been in evidence, but they have been carefully studied; the inside of the north gate has been cleared, and the south gate discovered. Both gates have been blocked up in ancient times—no doubt in the later days of the city. Within the city wall, which was a revêtement wall, have been found the traces of an earlier mound, to which perhaps belonged the ditch which runs along the outside of the wall.

Of the houses which have been discovered within the city, three are of a type hardly found elsewhere in England, having rooms on all four sides of the central courtyard. This, the normal arrangement in Italy, was, as a rule, abandoned in northern climes, the south side being left open to the sun, and one large house found in 1904 followed the usual Romano-British plan, a fact which may have been due to its proximity to the south wall.

In some of these buildings mosaic pavements of elaborate design, though somewhat inferior in execution, have been found, and a considerable quantity of painted plaster

* We quite agree that the popular idea about religious aspiration is a mistake, but it may be suggested that a kind of building ambition—the desire to show how high one could go safely, and to out-do other builders, had some influence in increasing the height of cathedrals, as in such a case as Beauvais; and at Beauvais, as we know, "vaulting ambition overreached itself."—Ed.

from the walls—sometimes *in situ*—has been discovered.

Two inscriptions of considerable importance have also come to light, one of them a dedication to a former Commander of the Second Legion, and Governor successively of Gallia, Narbonensis, and Lugdunensis—possibly *Fiberius Claudius Paulinus*, who was Governor of Britain in the time of *Elegabalus*, and who was also at one time Governor of Gallia and Lugdunensis. The other inscription is upon the base of a statue of Mars, attended by a web-footed bird—either a swan or a goose—though only the feet of the figure are preserved, which was dedicated by one *Nonius Romanus* on August 23, 152 A.D.

Reports of the work are regularly presented to the Society of Antiquaries, and published in *Archæologia*.

Mr. A. J. B. Wace, Librarian of the School, read the next paper, on "A Historical Relief in the Palazzo Sacchetti." This relief, which has not received the attention it deserves, dates by its style from the time of *Septimius Severus*. On the right is the *suggestus*, on which sits the Emperor—headless—surrounded by four standing figures. Before him are eleven senators, one of whom is beardless. The background is formed by a Corinthian portico, and on the extreme left a triumphal archway. It is uncertain what buildings are here represented. Nor is it known where the relief was found, or what building it decorated; it must, however, have been at a considerable height, since the upper parts of the figures are rather roughly washed. Of the figures round the Emperor, one, whose head is still preserved, is almost certainly *Caracalla*, since it has great likeness to his busts. The relief probably shows the Emperor presenting his son to the Senate in 197 after the defeat of *Clodius Albinus*, when he proclaimed him *Imperator destinatus*. Two other points are noticeable about the relief. It shows that in the reign of *Severus* the group style, and not only the birdseye perspective style, was used. Also the front of the *suggestus* has three small knobs. These either point to a platform of wood, or to a more solid construction retaining some of the peculiarities of woodwork. Similar knobs occur also in some of the Aurelian panels in the arch of *Constantine* representing incidents at the front and in Rome. They are also visible on a relief in the Villa Albani commemorating the foundation of the *pulla Faustianæ*. But they do not occur in the *Trajanic* plaques in the Forum on the base, which *Comm. Boni* believes shows the tribunal he has recently excavated. Therefore the base is probably a statue base, and not a *suggestus*.

A third paper was also read by Mr. Wace on "Greek Patterns in Italian Embroidery, Drawn-Thread, and Tambour Work." The usual patterns in Greek work is a frieze consisting of trees of life, sirens, cocks, and double-headed eagles. Of these elements, all or only some may occur. They will degenerate gradually and become conventional. The tree of life becomes a vase with flowers. The siren appears as a castle, with birds perched on the towers. The cock turns into a deer, a lion, a horse with or without a rider. The double-headed eagle—under the influence of the tree of life—becomes a vase with flowers, with birds perched on them, and also a mannikin. As the patterns degenerate they lose their Greek geometrical style, and become natural, free, and Italian. In their degeneration the usual result appears to be that what is an animal produces animals. A *primæ facie* case has been made out that these patterns are Greek in origin; but further information and research is badly needed to help to solve this interesting problem.

There were present at the meeting, which was very well attended by foreign scholars and British residents, Sir E. H. Egerton, British Ambassador; Baron de Bildt, Swedish Minister; and Professors Körte and Hulsén, of the German Institute.

COMBINED DRAINS.—The Islington Borough Council are to ask the President of the Local Government Board to introduce a Bill to provide that the cost of repairing or reconstructing combined drains in the Metropolis shall be borne by the owners of property using such means of drainage.

GREENWICH BRANCH LIBRARY COMPETITION.

THE competition for the new Branch Library for West Greenwich, promoted by the Greenwich Public Libraries Committee, resulted in the sending in of 172 sets of designs.

Mr. A. W. S. Cross was the assessor, and in his report he states that after carefully weighing the merits and demerits of each design with regard (a) to its plan, (b) to its architecture, and (c) to its probable cost of construction, he picked out the designs numbered 11, 14, 17, 19, 22, 26, 43, 45, 55, 95, 103, 106, 112, 138, 140, and 147 as being those from which the final selection must be made.

It was suggested in the conditions that the lending library should be placed between the reading-room and the reference library, entailing the arrangement of the staff and work-rooms in juxtaposition with the lending library. As the site was a very narrow one, with practically no right of lighting on either of its long sides, but only at the back and front, this arrangement of the principal rooms inevitably made the suitability of all the plans submitted turn upon the question of how best to make these staff-rooms conveniently accessible without spoiling any of the principal rooms.

The set numbered 140, by Messrs Wills & Anderson, which receives the first premium, is clearly the best all-round design sent in. The plan is simple and most compact, and offers in one important respect from nearly all the others in that there is no corridor divided off from the reading-room and leading to the lending and reference libraries. The access to these rooms is directly through the reading-room, along one side—an arrangement which is quite justified under the circumstances.

The committee-room is placed on the first floor over the front portion of the site and has separate entrance and staircase direct from the street.

The three principal rooms are to be covered with concrete flats, asphalted, with large central domes for lighting purposes. These domes each stand upon four columns, which are worked in so as not to interfere with the tables and other fittings. The internal effect of this treatment will no doubt be quite satisfactory. The elevation to London street shows a quiet and pleasing Georgian design, to be executed in Portland stone and brick, with Westmorland slates on the roof; there are two low wings and a pedimented central portion. The transoms to the two doors are rather clumsy, and will no doubt be modified in execution.

The estimated cost of this design is reckoned at the rate of 9d. per foot cube. The second premiated design, No. 14, is the work of Mr. Henry Goldsmith, of Manchester.

The plan is one of the best submitted, well-arranged, and economical. A corridor is provided to give access to the lending and reference libraries without passing through the reading-room, thus losing the effect of spaciousness so apparent in the first premiated design. The entrance lobby is cramped, and the elevation is rather dull. No. 11, the third premiated design, by Mr. Henry A. Crouch, has a compact plan, and an attempt has been made to get some kind of architectural effect from the planning and arrangement of the entrance and corridor: the counter is not recessed, making the space for borrowers rather small.

The elevation is a little ambitious. The stone bay, with plasters carried up on two floors and a somewhat elaborate entrance feature, would prove expensive.

In none of these three designs is any special provision made in the reference library for book accommodation beyond wall shelving, nor are there any internal areas. Design No. 95 was specially mentioned by the assessor for the general excellence of the plan.

It is impossible to take more than the most cursory view of the unsuccessful designs, the bulk of which show a lamentable mediocrity, both in planning and elevation. No. 26 has a sensible, yet original, elevation; the plan is also better than the average, though there is a large and wasteful hall nearly the whole width of the front. No. 22 has a large area to light the lending library, and in some respects is a sensible

(though rather expensive plan. Similar in plan is No. 27, with an elevation which would probably look well, circular windows occurring on the first floor.

A quiet and interesting elevation is shown in design No. 51, but the plan has the reference room on the first floor—a fatal defect. A corridor, about 123 ft. long, is a feature of No. 68; the whole scheme, too, could not possibly be done for the money; this is a pity as the elevation is good. No. 84 is a very well-drawn set; so is No. 99, but its plan is much too cut up. The elevation is imposing—long panels with shields at their tops, swags, drops, and complicated architraves, all in the most correct "municipal" style. Other designs noticeable are Nos. 60 (one of the best elevations), 103, 106, 115, and 142. No. 155 has a borrower's space which is also a passage to the reading and reference rooms, and is only 6 ft. 6 in. wide!

The results of this competition are not very inspiring, as far as the designs as a whole are concerned, but the assessing has been done well. Though but a draughtsman's point, it is worthy of note that in all the 172 designs there is not one on which a really good style of printing has been employed.

THE VISIT OF THE LONDON COUNTY COUNCIL TO PARIS.

(FROM OUR PARIS CORRESPONDENT.)

The members of the London County Council arrived at the Gare du Nord on Monday, 5th inst., at a quarter to five. They were warmly received, the people plainly showing that they were happy once more to celebrate the "entente cordiale" between two nations, who though separated by the sea, are yet united in many interests and tastes.

That evening the eighty-eight members (who were lodged in the Grand Hotel) attended a banquet given by the Municipality in the Salle des Fêtes, in the Hôtel de Ville; after which there was a reception, when several of the principal singers and actors from the Paris theatres were heard.

The next morning a visit was paid to the Halles Centrales, which were decorated with English and French flags, and triumphal arches. The representatives of several branches of what may be called the "Alimentation de Paris," in their picturesque costumes, were grouped along the road through which the visitors' carriages passed, escorted by mounted guards. After they had gone through the large iron galleries, the work of the late M. Baltard, they arrived at the Bourse du Commerce, built by M. Blondel. The central Rotunda is ornamented with allegorical paintings by MM. Lucas Clairin, Luminais, Langée, and Mazerolle. From there a visit was paid to the Palais de Justice, the Sainte Chapelle, and the Mint, where some commemorative medals were then struck—after which a Déjeuner was held at the Palmarium in the Jardin d'Acclimatation. The afternoon was given up to visiting the Hôpital Boucicaud, Rue de la Conception, the Hôtel des Invalides, and attending a reception at the English Embassy.

In the evening there was a gala representation at the opera of "Samson and Dalila," and "Le Ballet du Cid."

On Wednesday morning the visitors, in spite of a thick fog, drove in motor-cars to Sèvres to see the manufactory, after which the drive was continued to Versailles, where they had déjeuner at the Hôtel des Réservoirs. They then saw the Palace, the park, and the two Triansons. On their return to Paris they were received by the President of the Republic at the Palais de l'Élysée, and then by M. Rouvier, the Minister of Foreign Affairs. A ball was given at the Hôtel de Ville in the evening, for which 1,500 invitations had been sent out.

On Thursday a visit was paid to the Ecole Professionnelle Jacquart, Rue Bouret, where girls are taught to make dresses, corsets, embroideries, lace, and artificial flowers. From there the visitors were taken to the cattle markets, and abattoirs of the La Villette. Déjeuner was partaken of at the Gare de Lyon, the artistic decoration of which the *Builder* has already mentioned; after which visits were paid to the Museum d'Histoire Naturelle, the Manufacture des Gobelins, the Asile Clinique Sainte Anne, the Panthéon,

and the Sorbonne. In the evening a large reception was held at the Ministère de l'Intérieur, Place Bureaux.

The last day's sightseeing began by a visit to the Gymnase Municipal Voltaire, where 1,000 school children, conducted by the principal instructor of singing, M. Chapuis, organist of St. Roch, sang with much spirit "God Save the King," and several other songs. The visitors then went on to the Ecole "Professionnelle d'Aménagement de l'habitation," Rue de Reuilly. In the afternoon visits were paid to the Ecole Supérieure de jeunes Filles Edgar Quinet, Rue des Martyrs; the Ecole Maternelle; the Collège Municipal d'habitation; the Ecole Primaire de la Rue Fontroy, also to the fire station in the Rue Carpeaux, where some fire drill was exhibited, and finally to the Ecole des Epinettes.

An evening at the Alhambra and a supper at the Grand Hotel ended the day, and on Saturday the members of the London municipality left Paris, accompanied by the same enthusiastic ovations as had followed them everywhere during their stay in Paris. All classes of the community have shown their sympathy with the visitors, and have a very pleasant memory of this past week.

MAGAZINES AND REVIEWS.

THE *Quarterly Review* contains an important article by Mr. H. Stuart Jones on "Art Under the Roman Empire," being ostensibly a review of various recent works, more especially Wickhoffs "Die Wiener Genesis" and Messrs. Richter and Cameron's "The Golden Age of Classic Christian Art." The article sums up our present knowledge of the art of the Empire period, which is very different, and leads to very different conclusions, from those generally entertained ten years ago. In the first century a.c., we are told, the Greek genius, which served the Roman connoisseur, though it had spent its creative force, had acquired a wonderful mastery of technique, especially in silver work; the silver plate found in the Bosco Reale Villa, near Pompeii, contains masterpieces of technical perfection and grace of form; and the author urges that there is no reason to suppose that we have here accidentally stumbled on an exceptional work. There are some fine illustrations of portrait sculpture of the Flavian period, remarkable for its power of realism. We have not space to follow out the argument of the article, which touches on many different subjects, but we may mention two points connected with architecture which are of interest. One of these is the change in the latter part of the Augustan age in regard to interior decoration of buildings, the flat treatment by slabs of marble giving way to a treatment by perspective illusion, the dominating idea of the decorator being "an indefinite extension of the horizon by an illusory system of perspectives." There is no worse form of art, to our thinking; but the reviewer does not seem to think it worth while to reprobate it. Certainly, it is not a convenient fact to bring forward in an article the main object of which is to show that Roman art was better than we had been accustomed to think it. A remark at the end of the article, in regard to Roman architecture, has something in it, "So long as Hellenism was dominant," it is observed, "architects had no feeling for internal spaces. The building was a mass to be regarded externally; and its claim to beauty rested on the harmony of its stereometric proportions. Roman builders were the first, as Riegl has acutely remarked, to treat space as a material, with what consummate effect the interior of the Pantheon would suffice to show." This is a true remark, and accentuates the distinction between the architectural spirit of Greece and Rome.

In the *Burlington Magazine* Mr. Claude Phillips writes on "Dramatic Portraiture," his aim being to draw attention to instances in which portraiture has gone beyond mere likeness-making and has achieved something like a record of the most dramatic element of the life and character of the sitter. The article is far too long for us to follow out in its argument here; but we agree entirely with it in its main lines, and recommend it to the attention of young portrait painters. Mr. Herbert Cook contributes an account of "Some Venetian Portraits in English

Possession," with illustrations; and "The Picture-Windows at New College" are the subject of an article by Mr. H. J. Powell. In a review of Mr. Holman Hunt's work we observe that there is an attempt to make out that his and Sir E. Poynter's denunciation of the ultra-Impressionists represent only the same kind of violent prejudice which was formerly directed against the early works of Hunt himself and of Millais, and that this kind of history repeats itself; and we do not think the cases are parallel; and, as we have already said, there was more reason in the objection to Millais' "Christ in the House of His Parents" to his rendering of the subject, than is—than is quite realised now.

The most interesting article in the *Art Journal* is that on "Art Handiwork" (a continuation), on account of the numerous illustrations of interesting work which accompany it. Among these some of the work representing "Russian Peasant Industries" (of which there was an exhibition in London lately) is unusual in style, and the specimens of lace-work are charming. The frontispiece is a fine etching of Cheapside and Bow Church, by Mr. W. Monk. "Portraits of the Henleys" hardly seems to us an important enough subject for treatment in an art magazine, and is probably only included because one of these portraits is a bust by Rodin.

The *Magazine of Fine Arts* opens with an article by Mr. Frederick Wedmore on "The Norwich School of Painting: Crome and Cotman," in which he at once admits the apparent incongruity of grouping these two names together. They are no doubt bracketed, in a sense, by the term "Norwich School," as they were both Norwich painters of about the same period; but here comes in the question, which we suggested the other day in regard to the so-called Liverpool School, whether painters are to be called a "School" of this or that place merely because they were natives of it. There is somewhat more excuse for it in the case of Norwich, for Stark and Vincent and Crome had some analogies, but Cotman stands out quite distinct from all the other Norwich set, in his freedom and breadth of style and his power of colour. Mr. Wedmore groups them as being the two chiefs of the Norwich set, standing above all the others, as they undoubtedly do; but the two do not belong to the same school; Crome, as Mr. Wedmore says, was a simple realist; Cotman was a poet in landscape. The illustrations of Cotman come out remarkably well in black and white; a coloured print from his "Bishopsgate Bridge" does not seem so successful, though one cannot judge very well without comparing it with the original. The number has a successful piece of chromolithography as a frontispiece; a reproduction of Van der Meer's "Lady at a Spinnet," the precise and clear-cut style of the Dutch painters of this period lends itself rather well to colour-printing. M. Arsène Alexandre contributes an article (translated probably) on "The Pantomime and Expression in the Paintings of Poussin," wishing to show—as he does to some extent—that there is more dramatic element in Poussin than is generally recognised. In England our judgment of Poussin is perhaps unconsciously influenced by the rather pointless classicism of his two pictures in the National Gallery; but he was capable of more human expression and character than are indicated in these performances. Mr. Walter Crane contributes an article on "Early Italian Gesso Work."

The *Architectural Record*, New York, has a long article by Mr. Montgomery Schuyler on "The New York House," that is, the street house, of which there are a number of illustrations showing "excellent differences." There is an amusing bit of history in the illustration called "Isolating the Brown Stone House"; there was a sad time when the brown stone house in New York was the be-all and the end-all of street architecture; here two new houses in a brighter and more attractive style are pushed out in front of it on each side (what about building line legislation?) to leave it out of notice as much as possible. There is a good deal of humour in the titles appended to the various elevations—"Late of Paris," "Late of London," "Going back to Grandma's," etc., etc. Mr. Russell Sturgis contributes an article on "Parisian Doorways of the

Eighteenth Century," which looks rather like a suggestion from our old friend M. Daly's monumental book on the subject.

The *Berliner-Architektur-Welt* contains illustrations of the "Königliche Oper" at Berlin, by Herr Biberfeld, the ground plan and arrangement being by MM. Lachmann and Zauber. The building contains a great deal of curious sculptured detail in a rather bizarre style; the principal centre feature over the entrance forms the subject of a special drawing as a frontispiece to the number. The trail of "Art Nouveau" is over it all, but it is not uninteresting. The Kohn warehouse at Berlin, by MM. Hoffmann and Kolo, of Vienna, is a very clever piece of treatment for a commercial building in which the object is to have as much window as possible.

In the *Nineteenth Century* Mrs. Arthur Strong, in a good and earnestly written article on the preservation of and acquisition by this country of great works of art, instead of letting them be sent abroad, proposes "An Official Registration of Private Art Collections," so that the public and the Government may know what are the treasures of art existing in this country (which is still immensely rich in them), and be on the watch to secure any which are likely to be offered for sale. It would also, we may observe, have the advantage of enabling those who wish to study any particular work to know where it is to be found, and would perhaps encourage some owners of private galleries to make better provision for allowing the inspection of works by students with a serious object in view. Many owners are already very liberal and obliging in this way, but there are others who are not. We do not think any objection would be raised by owners to the compiling of such an official list, which would be useful in many ways. We cannot agree, by the way, with Mrs. Strong's remark that it is a "strange prudery" to leave the "Leda," by or after Michelangelo relegated to the basement of the National Gallery. We confess that we had forgotten that it was there; but it is most certainly not a picture to exhibit in a public gallery, and there would be a not unjustifiable outcry if it were.

In the *Monthly Review* an article by Mr. Reginald Hughes, "A Pilgrimage to Canossa," though occupied rather with the historical than with the archaeological associations of the place, gives an interesting account, in very picturesque language, of a place little visited but full of memories. The *Pall Mall Magazine* contains a good short article by Mr. Kempfert on "The Life of a Star," and the possible (or probable) relation between spiral nebulae and the development of stars and planetary systems. As a short article putting the subject in a popular manner it is very well done.

To *Harper* Professor Henders Petrie contributes a short article on "The Egyptians in Sinai; an account of recent discoveries."

Public Works includes an article by Mr. C. E. Eldred on the Admiralty works at Devonport—"A Naval Dockyard in the Making"—and one by Mr. Arthur H. Diamant, assistant engineer to the Aqueduct Commissioners of New York, on "Pneumatic Pumping Plant at the Harlem River, New York."

The *Art-Worker's Quarterly* includes an article by Mr. G. W. Eve on the interesting subject of "The Lion in Heraldry."

The *Antiquary* contains an article on "The Egyptian Hall, Piccadilly, 1813-1873," a building with a curious and chequered history, which was quite worth recording and preserving in the pages of a magazine dedicated to the past. Dr. W. E. Ball continues his article on "Old Heraldic Glass in Brasted School."

School contains an article by Mr. Sydney F. Walker on "The Engineering of School Buildings," an introduction to a series of articles on this important subject, to which we shall give further attention as they appear; the opening article is only a general summary of the subject.

The *Purple Patch* has put in another appearance, and contains some very good things; notably the offers of some foreign correspondents to act as translators to the International Congress; a mediæval account of the jerry builder, with a delightful mock-mediæval head-piece; and a learned disquisition on the reasons for crooked buildings.

which have resulted from a shifting of the earth's centre of gravity, as shown in a learned diagram, and it is suggested that "Mustard Good o' ye" and the *Builder* are therefore both wrong. Very likely; 'tis a puzzling world!

THE ARCHITECTURAL ASSOCIATION.

An ordinary general meeting of the Architectural Association was held on Friday last week at No. 18, Tufton-street, Westminster, S.W., the President, Mr. E. Guy Dawber, in the chair.

The minutes and nominations having been read, the following gentlemen were elected members of the Association, i.e.:—Messrs. E. Dickens, D. W. Rowntree, H. R. Levy, P. M. Stratton, F. W. Edge, G. Robb, J. Dovaston, R. S. B. Wylde, G. S. H. Bradford, E. S. Petch, J. G. Alder, B. J. Boothroyd, C. P. Wade, G. Fitzgerald, F. E. Harris, and E. Petre.

Building Fund.

The Chairman said he had pleasure in announcing the following further donations to the Building Fund:—Messrs. Charles Morrison, 50*l.*; Ernest George & Yeates (second donation), 10*l.* 10*s.*; Leslie W. Green (second donation), 3*l.* 0*s.*; H. L. Anderson (second donation), 2*l.* 2*s.*; A. Durst (double subscription), 1*l.* 1*s.*; Maurice E. Webb (double subscription), 1*l.* 1*s.*; A. Crow (double subscription), 10*s.* 6*d.*; C. W. Ferrier (double subscription), 10*s.* 6*d.*; W. Curtis Green, 10*s.* 6*d.*; F. T. W. Millar, 10*s.* 6*d.*; John Murray (double subscription), 10*s.* 6*d.*

The Late Mr. Seddon.

The Chairman said he had to propose that a vote of condolence be sent from the members of the Association to Mrs. Seddon and the family of the late Mr. Seddon, who died last week. Mr. Seddon was one of the oldest and most valued members of the Architectural Association, having joined as far back as 1847. He was hon. secretary in 1850-51, and for many years he was hon. secretary of the Royal Architectural Museum, with Mr. Maurice B. Adams. Mr. Seddon always took a deep interest in the Association, and especially in the Royal Architectural Museum, and he attended the Jubilee Dinner of the Association in 1897. At the funeral they were represented by Mr. G. H. Fellowes-Pryne, a former President, and Mr. D. G. Driver, the secretary.

The motion was agreed to in silence. Mr. Tanner, jun., hon. secretary, announced that the third spring visit, to the Ritz Hotel, Piccadilly, by kind permission of the architects, Messrs. Mewes & Davis, would take place on Saturday, February 24. Members to meet at the building at 2 p.m.

He also announced the following lectures, commencing:—February 20, "Ventilation, Lighting, and Heating" (lecturer, Mr. F. J. O. Smith); February 21, "Perspective" (instructor, Mr. W. G. B. Lewis).

It was announced that the Camera and Cycling Club would meet on February 20, when the subject would be "A Chat on Renaissance Architecture," by Mr. J. A. Goth, 7.30 p.m.

The Differences between English and French Gothic Art.

The Rev. G. H. West, D.D., A.R.I.B.A., then read the following paper on "The Differences Between English and French Gothic Art":—

"The manifestations of art, like all other manifestations of creative energy, physical or mental, human or divine, seem subject to a periodic law, and show themselves in outbursts, separated by times of comparative calm or stagnation. And in the case of art these outbursts seem chiefly to arise either under the impulse of a strong single personality, or amongst a community so small and so uniform in the conditions and ideals of its existence as to almost possess an individual personality in its capacity for being moved by a single impulse or a strong emotion. Thus some of the greatest developments of art are to be found under despotic dynasties, like the Pharaohs, the Cæsars, the Arab Kings of Spain and India, or under a Solomon, an Attalus of Pergamum, a Louis XIV., or else in societies such as those of Athens, Rome, and Florence, which, having just passed through a great national crisis, have entrusted their destinies and the artistic

expression of their ideals to a single representative, a Pericles, an Augustus, or a Lorenzo de Medici.

There are, of course, infinite differences in the capacity of various races for expressing themselves in art, but, as a rule, when a mixed race is in process of being kneaded together, or when it is beginning to disintegrate, we shall find its art fragmentary or illogical and superficial, for in the one case the individuals have not as yet found any single expression of their common aspirations, and in the other, the stream is either spreading abroad into the marshes of decay or has been drained off into countless channels to irrigate each man's separate plot and produce there whatever harvest seems best to him.

Nowhere is the working of these laws more clearly seen than in the history of mediæval art, its origins, progress, and decay, from its rise in the Royal Domain of France in the XIth century, when the people, having been welded together by their resistance to the Normans, found in the communes the expression of their newly-attained national life, or in England when Norman and Saxon had just become one under the firm rule of Henry II.; and later in the rise of the peculiarly English Perpendicular style after the great war with France—a proof of national vigour which finds no echo in the distracted misery of her vanquished foe. Again, no art so clearly as French Gothic shows artistic genius running to waste during the splitting up of the great guilds into the runnels of the separate branches of architectural art, when each worker, instead of joyfully co-operating in the beauty of the whole, became anxious only to show his own individual skill in the technical perfection of his own work—his stone cutting, his lead work, or his storied glass.

Of the four great divisions of architecture—religious, military, civil, and domestic—each during the Middle Ages comes to perfection in succession, each represents a separate period and state of society, and each generally possesses a distinctive style. But of these four, time will not suffice to speak of more than religious architecture, the one which, having its roots planted furthest back in the past, is the first to attain anything like maturity.

When the Roman empire began to fall into decay a special officer had to be appointed to protect the poorer classes against the intolerable exactions of the bankrupt municipalities impoverished by reckless expenditure on unprofitable public works, a state of things not altogether unknown in later times and countries nearer us. When the empire became Christian, the Bishop was generally selected as this "Defensor Populi," and gradually, as the last links with the Imperial Government were broken, he succeeded to the position and palace of the Prætor, whose judgment-hall or basilica became his cathedral. In all cities, therefore, of Roman origin—and they were the great majority in France—the cathedral was not merely a place of worship, but the immemorial abode and symbol of justice and liberty for the poor and oppressed.

And in the north, where the Kings of France had already formed the kernel of the nation by driving back the Normans, when in the early XIIth century the rise of the Communes bound the people finally into one, their joy and enthusiasm found visible expression in rebuilding their ancient basilica. The King was delighted to use this new vigour of popular life against his too powerful vassals, while the Bishop seized the opportunity to win back to himself and his cathedral the religious fervour of the people, which during the two preceding centuries had been somewhat turned away towards the great outlying Benedictine monasteries by their peaceful energy and active goodness. Thus at Amiens in 1115 we find the Bishop preaching a crusade against the Sire de Coucy, the King bringing an army of his own men, and the citizens turning out *en masse*, even with their wives, eighty of whom were wounded in an assault on de Coucy's stronghold of Castillon. And by the end of the century we find in every city of the royal domain, which was also a free Comté, the rise of a Bishop's seat, a new cathedral being built by the various guilds of lay workmen, and rising amidst the wildest enthusiasm; men, women, and

children harnessing themselves to the carts to bring materials for those wonderful shrines—Noyon, Soissons, Laon, Chartres, Paris, Rheims, and Amiens.

The French cathedral, then, like the Parthenon, is the material expression of a new-born national life. It proclaims the reliance of the people on their King as the dispenser of justice to all, their trust in their Bishop as the administrator of the sacraments of God, their confidence in themselves as the inheritors of the past; and, rising from the very midst of the crowded dwellings, and appealing with countless raised fingers from earth to heaven, it proclaims itself the palladium of the city's loyalty, of her faith, her love of liberty.

The plans also of these buildings, while deriving from that of the basilica, show that they are not meant only for the common worship; but they are also great assembly-halls, open to all from end to end, with generally a comparatively small choir, and no solid screen between clergy and people.

Now in England our cathedrals tell a very different tale. From quite early Saxon times the great Benedictine monasteries of the Continent had founded missionary daughter-houses in our land, and even when after the conquest great churches and cathedrals sprang up in every direction they were all monasteries or in the hands of monks, generally Benedictines, so that, as a rule, the Bishop was abbot of the monastery whose church became his cathedral. Our cathedrals, therefore, generally stand apart from the cities to which they belong, nestled amidst the elms of their quiet close side by side with the chapter-house, where the monks transacted their business during life, and with the peaceful cloister where they slept at last, two buildings hardly ever found now in connexion with a French cathedral; for though so-called cloisters did exist in some cases in France, yet they were the dwellings of the secular clergy of the church, and very early became a tangled mass of tortuous streets surrounded by a wall, not a cloister in the usual sense, and if any of them had still existed—there are remains of something of the sort at Rouen—they would only have marked still more the contrast between the people's cathedrals of the French and ours, which were missionary churches, houses of prayer, telling no story of past popular struggle, no tale of bloodshed, save at Canterbury. Such contrasted views as those of Chartres and Lichfield, Wells and Rouen, sum up completely the stories of the two national churches, and anyone who can remember Rouen as it used to be, with the old houses built against its walls, will be able to realise how completely the French cathedral is the centre of the life of the city. There can indeed be no more telling contrast than the view of Rouen, with the fortified palace of the archbishop adjoining the cathedral, in the very centre of the town, and that of Exeter from the quiet Bishop's garden, with the large windowed Elizabethan house. Perhaps the only thing like it in France is St. Owen, which was a monastery, not a cathedral.

The same story is told by the plans as by the views, perhaps even more clearly. Instead of the great assembly-hall of the French cathedral we find in early Norman times the purely basilican plan, single or triple apsed, very slightly modified.

But when the churches become cathedrals also, and cease to be merely abbey, they have to serve a double purpose—the Norman apse gives way to an enormously extended choir, which, with the eastern transept and chapels, formed the church of the monks, with a special approach from the cloister; while the western transept, with its chapels and the inner nave, were the cathedral and parish church, cut off from the monks' church by a heavy stone screen, almost an iconostasis, which carried the roof, as at Gloucester and York. This monkish plan is well shown at Lincoln, which when first built by the Benedictine St. Hugh was an almost exact copy of that of the great mother church of Cluny, while later the apse was removed and the eastern portions added.

We shall also find that, whereas the great lay guilds built the French cathedrals and handed down as craft secrets their learning and traditions, so that the constructional development of French Gothic is the result of the severest logical reasoning from first

o last, the English cathedrals were frequently built under the direction of the monks, if not actually with their own hands, as at Gloucester, and there is consequently a comparative absence of scientific tradition, much less coherence in purpose and expression, but more individuality and local originality, and while French traditions grow stronger and more binding as the art falls more and more into the hands of a small professional class, and becomes less and less the expression of popular feeling, till it dies stifled by the swathing bands of invariable formulae, English architecture, less popular at first, but freer in its efforts and expression, comes always more and more into touch with the national sentiment, and finally develops an entirely new form, which never really died, but, adapting itself to the social evolution of the nation, gradually ceased to be chiefly ecclesiastical, and, deserting the cathedral and the monastery for the village church and the crenellated manor, at last, under the Tudors, gave rise to the domestic architecture of that sturdy middle class which has always been the backbone of the English nation; so that while France was rearing Renaissance châteaux for her wealthy nobles, the English squire and his tenants, still side by side as at Crecy, were going on building their country houses and farms on the old lines, adding a new aisle to the parish church, raising a grammar school in the village street, or providing a new college at Oxford or Cambridge to receive its boys.

Thus much as to the influence of the history of the two nations on their art. Let us now turn to its constructional development in each case, beginning with France.

From the time when Christian art began to revive after the fall of the Roman empire the efforts of all builders in the ancient imperial provinces of Western Europe had been centred in the attempt to do with small materials and a limited supply of unskilled labour what the Romans themselves had never even attempted with building resources such as the world has never seen before or since—to cover the three-aisled basilica, which by long use had become the recognised form for the Christian church, with the stone or concrete vault of the great halls of the Roman baths. The intersecting vault could be managed over the small square compartments of the aisles, but was quite beyond the power of these early builders for the high vault of the nave, while the continuous thrust of a barrel-vault, unless the three aisles were kept of equal height as at Champdeniers, brought all to ruin before long.

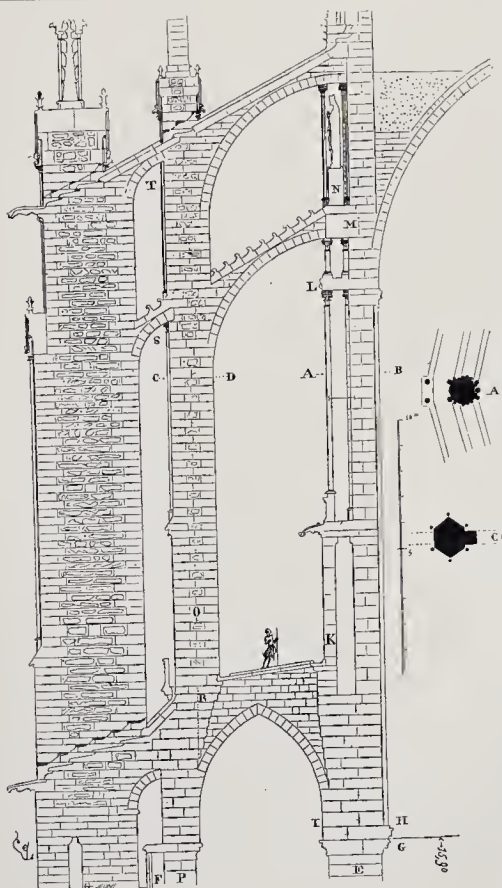

By the beginning of the XIIIth century it had become obvious that if the problem was to be solved some means must be found for concentrating the thrust upon certain points, preferably upon the corners of a square, either, as at Perigueux, by a series of domes on pendentives, or, as at Vezelay, by the regular Roman intersecting vault. This was the form which ultimately prevailed, for it was a fairly obvious step to work from centrings placed under the angles of the intersecting cylinders, and to get over the difficulty, insurmountable to these early builders, of getting the proper ellipse given by the intersection of two semicircular vaults in one of three ways—either by making the intersecting centrings semicircular and then building a dome round them, as in Aquitaine; or by piling earth on the top till the vaults themselves also became nearly semicircular, though still domical, as at Vezelay; or, as at Durham, by making the centrings segmental. It was at Durham, in England, and a little later at St. Denis, in France, that the great step was made which gave birth to Gothic of making these centrings of stone and leaving them as a permanent support to the vaulting panels, and letting each panel be separately supported by the centrings or ribs. But undoubtedly this intuition was in the air when Flambard and Suger used it, just as printing was when Gutenberg began to work, the steam engine when Watt and Stephenson took up the ideas of Newcomen and Trevithick, as the electric light and the telephone were in our own day. In it lies the key to the history of all later medieval architecture. After St. Denis all French churches exist by and for the vault, the plan of which is in the mind of the builder from the moment when the first stone is laid. It took some time for it to be found out how

great the thrust is even of this form of vault, but that abutments are needed only at the springers. This abutment was given at first in the simplest way, as at Durham, by a complete arch over the triforium carrying its roof, and later by a quarter arch butting against the springing, as at Gloucester and the Abbaye aux Hommes at Caen. But it was soon found that these arches should abut higher, and when the triforium became a mere passage they were left outside the roofs and became continually more complex, passing from the simple forms of Chartres to the extremely elaborate and beautiful ones of Amiens and St. Owen. The principle once admitted of allowing all the constructional parts of a building to be exposed to the weather, nothing can be more perfectly thought-out than the French cathedral, where the walls have formed "fours deep" and the thrust of the great vault is carried down to the main buttress by an arch. All the intermediate spaces are mere screens of storied glass, and nothing can be more perfect in its beauty. But, as always in human work, only for a moment did these stern reasoners and perfect artists rest on the summit, and Beauvais is a literal example of that "vaulting ambition which o'erleaps itself." The chiefly passive rôle of the buttresses of Amiens in transmitting the vault thrust must needs be exchanged for an active one, which shall enable the main buttresses to be smaller and the whole building lighter, though even higher, than Amiens. Let us examine this supreme but splendid folly of Beauvais. In the section,* E are the piers; on G, their capitals, stand the vaulting shafts; K is the buttress of the

triforium, corbelled out somewhat towards the aisle, but leaving the aisle vault quite free; A are two colonnettes, replacing the single one of Amiens, carrying a lintel L, on which are two more short colonnettes, increasing the size and weight of the *tas de charge* or horizontally-coursed springer of the vault, and carrying the head of the flying buttress, which butts against a huge stone, M, heavily weighted by a cornice, pedestal, and enormous statue, in front of which are two more columns carrying the great pinnacle above the upper buttress, which charges its head. The more settlement there is towards the interior, where the chief settlement always takes place, the more will these long, stiff columns push up the heads of the lintels L and M and resist the thrust of the vault, provided the columns are strong enough not to break under the strain. To add to this passive counter thrust the architect of Beauvais boldly—too boldly—added an active resistance. The intermediate buttress pier O carried by the aisle pier P is corbelled out half its thickness towards the interior, so that, if it were not for the two flying buttresses above, it would fall against the cathedral wall, and it is finally stiffened by the two small buttresses S and T joining it to the main buttress pier. But the colonnettes cracked, the lintel L gave, and the blocks M pressing against the flying buttress made it buckle, and nearly the whole had to be rebuilt differently.

Such is the extreme expression of French XIIIth century Gothic, but while the vault thus dictated the exterior forms of the building, it affected the interior hardly less. The monocylindrical columns, with great voluted capitals derived from Classic times, were soon felt to be unsuitable, as so much of

* F. Viollet-le-Duc. Dict. Art. Construction.

The Buttresses of Beauvais. From Viollet-le-Duc.

their upper surface was left unused and the arrangement illogical. So in the later columns of Notre-Dame the pier arches have their own column, with a capital of one course, and the main vaulting shaft is the continuation of another column rising from the ground, and having its capital at the vault, and the original main column, with a capital of two courses, appears behind these. We thus have the principle of continuity distinctly formulated—that every arch must have its own column, that every column must have its base on the ground and its capital at the springing of its arch. Soon it was felt that every colonnette should have members corresponding to the mouldings of its arch, and so by a gradual transition, which may be well traced at N. D. de l'Épine and St. Ouen, it came to be felt that the capitals had lost their meaning, and that all mouldings of all arches should run down to a common base without a break, sometimes dying into one another on the way, as at St. Maclou, but reappearing below, even if their reappearance was marked only by the corners of their imaginary bases supposed to exist inside that of the main pier, but to have been turned round so that their corners project from the faces. Though often ugly and wearisome in its latest examples, the better specimens of this last French style are many of them singularly beautiful, as is St. Wulfram, at Abbeville, and the smaller details of these churches are often exquisite, like the organ staircase of St. Maclou and its wonderful porch.

To turn now to English architecture. We have already seen how different its history is from that of the French, and its aim and final results are not less different. The two follow divergent paths except during a portion of the XIIth century, when French influence here was considerable, though not easy to define. First of all is to be noticed in the plan the tendency to bold, square projections and the square east end, both of which may safely be attributed to the persistence of Saxon traditions. We have several stone Saxon churches left, but the great majority were undoubtedly of wood, and in a wooden building, especially if large timber was used, as was sure to be the case in a land so covered with primeval forest as England then was, the projections would naturally be much bolder than in a stone one. Such a church as Borgunds, though itself of late date, doubtless represents older buildings, which, to judge from the Bayeux tapestry, must have been very similar in England. For a time this Saxon tradition was obscured by the Lombardic or Basilican plan, with three parallel apses or one single one, used by the Normans in Italy, and possibly derived by them from the remains of the Roman building guilds, such as that at Como. English tradition, however, soon reasserted itself, and was finally fixed by the great influx of Cistercians in the XIIth century, whose churches invariably had square east ends. One other peculiarity of the English plan, the great length of the nave, is probably due to the narthex of Cluny, the influence of whose plan we noted at Lincoln, being taken into the church. We have only one instance—Ely—of its persisting in its original form, the Galilee of Durham being hardly a case in point.

It may be well to notice here some other points in which the Saxon love for wooden construction persists, such as the cushion capital, which probably had its origin in squaring off the four sides of a tree-trunk where it is mortised into another timber; and the extreme fondness for arcaded and panelled decoration, much more natural in wood than in stone. There is also this to remember. When the Normans came to England they had already learned to build in stone probably from their Italian masters, but their predecessors, the Scandinavian invaders of the eastern counties, were, like the ancient Greeks, essentially a ship-building race, accustomed to the use of large timbers and of plankings on curved surfaces. In the eastern counties, therefore, we find in several cases, as at York and Ely, stone vaulting imitated in wood, and very elaborate open timber roofs made of large timbers, an original development to which there is nothing corresponding in France. They are almost confined to the eastern counties. Of the thirty-five examples in Brandon, only

one belongs to Gloucestershire and four to the Midlands. While in the French roof the tie-beam is a mere light tie often suspended from the main trusses by braces, as at St. Ouen, these shipbuilders use a heavy tie-beam carrying the king post, and when it sagged took to bringing forward the sole piece into the church and connecting it by long, curved struts like ship ribs with the rest of the roof, and so developed the hammer beam roof.

But with the Norman conquest a most energetic impulse was given to stone construction. The Normans had by that time become far the greatest builders in Europe, and English mediæval art never even attempted to escape from the influence of the great churches which were founded or rebuilt at the Conquest. The English cathedral is always the Norman abbey church modified or imitated. The three nearly equal, sharply marked horizontal divisions of the Norman design, with little or no expression of vertical continuity, persist almost to the end; the vaulting shafts seldom run down to the ground, but end sometimes on the abacus as at Lincoln, or just above it as at Exeter and Ely, halfway up, as at Salisbury; at the clearstory, as at Wells; the clustered columns are arranged and designed not in various groups and sizes, as at Bayeux or Coutances, so as to mark distinctly their various purposes, the arches, mouldings, or ribs which they represent or carry, but so as to bring in the greatest number of detached or semi-detached shafts, some of which may even have nothing to carry, as at Durham and Lincoln, and, since these were whenever possible made of Purbeck marble, which could only be got in short lengths, circular bands had to be introduced, and the abacus also became circular and uniform. That the pier should indicate and lead the eye up to the vault was the French ideal; that it should be beautiful in itself, the English one—so much so that, as in the very beautiful example of Exeter, the arch mouldings are even adapted to the pier, instead of the pier to the arch. The arch mouldings themselves soon become less grouped, smaller, and much more deeply cut than in France, more like mouldings in wood, more in keeping by their strong contrasts with the black and white of the columns, well suited to our grey climate, and at their best, as at Lincoln and Durham, exquisitely beautiful. But as the use of marble in the piers ceases the mouldings become shallower and more arrangements in grey, frequently worked on the chanfer, in striking contrast to those of late French work, which become deeper cut and more wire-drawn in order more clearly to distinguish the different ribs as they run down, and make the verticality even more marked. On the other hand, the English mark the horizontal division even more by the introduction of the hood-mould over the pier arches, an outside feature by rights, a sort of bolection moulding in stone marking off the arch with a sharp dark line. Again in contrast with the French, the wall, which disappears with them, till the incessant vertical lines give a sense of irritating restlessness to their later styles, is in English work everywhere visible, and its restful suggestion of strength and quiet repose most grateful, while the long drawn-out perspectives of aisles and arcades give the special character to the whole which in France is found in the soaring elevation of each separate vaulting bay.

But the real glory of our English art is to be found in its latest form, due to the way in which the English mason when left to himself, and deprived during the Hundred Years' War of all French influence and help, reasserted his own originality and worked out a completely new system of vaulting, which gives to our Perpendicular a stately life and vigour almost lacking in late French Flamboyant. The early French vaults were so largely influenced by the domical vaults of South-west France, such as that of Poitiers, that the builders hardly got rid of the idea that each vaulting bay ought to be a separate entity, by preference a square, as in hexapartite vaulting, and at least domical, if not a dome.

This feeling never influenced the Normans, but from the very first, as at Durham, they tried to keep the ridge level, using segmental ribs and stilted wall arches. But these level-crowned vaults are weaker as a whole than

the domical ones, and each panel in itself is weaker in construction, because in the French vault the half wall arch or half transverse arch, as the case may be, is divided into the same number of parts as the half diagonal rib, which, of course, is the longer, and each row of stones is laid as an arch from one to the other on a movable sliding centring or "cerce," and as each course becomes of necessity broader towards the diagonal than whole panel rises with a twisted or plough-share curved surface, as at Amiens, to straight-arched joint joining the top of the wall arch or transverse arch to the intersection of the diagonals. But if the mason is unskilful and does not distribute the difference in length between the ribs evenly over his courses he gets some of them wedge-shaped and ends with a joggle instead of a straight joint along the crown. This may be well seen in several bays of Westminster cloisters. To the Englishman, accustomed to curved planking on his ships, it seemed much simpler to treat the courses like planks of the same width all along, and dividing, therefore, the half diagonal and half arch into an unequal number of equal parts, instead of, like the Frenchman, into an equal number of unequal ones, he got, not a straight joint, but a dovetail along the ridge, and his vaulting panel ceased to be curved and self-supporting and became flat and weak. So an interstitial rib, or lierne, was inserted to strengthen this, and then other ribs were passing through the stage of Lincoln, we reach such a beautiful form as Exeter. But a difficulty arose with these liernes. They varied greatly in length, according to their position, and were all much shorter than the diagonals. Either, therefore, the ridge could not be kept level, or the curves of the shorter ribs must be "fudged," as at Minster. Where the curve of the lierne changed a short cross rib, or tierceron, was put, and a star or lozenge pattern obtained with the ribs, as in Worcester cloister and at Christchurch. Then bosses were put where the ribs intersected, as at Lincoln and Canterbury, and all sorts of fanciful arrangements of the ribs indulged in, till the practical result was a ribbed wagon vault with intersections, as in Winchester nave and Gloucester choir, while from the number of ribs of similar curve springing from one capital and meeting a flat ceiling arose the fan vaulting of the cloister, where the curves are simple. Then from changing the curves to make them meet a level ridge where there was no flat ceiling arose the four-centred arch, the form usually adopted in fan vaulting, and which naturally, as the pointed arch had done previously, descended through the wall arch and window heads into all the rest of the building. Having thus got the idea of this cone of spreading ribs, it was ingenious to bring it out from the wall and spring it from a pendant as centre, as at Christchurch and Oxford Cathedral, or even to bring it out so far as to quite complete the cone and let it meet another half cone springing from the wall, as in the Divinity School, Oxford, and that final masterpiece of Henry VII.'s Chapel, so easy to criticise, so impossible not to admire. The important point to notice is that in these latest vaults the true function of the multiplied ribs has entirely disappeared, and they and the intermediate parts are all cut out of large blocks of stone, and we have returned to the Roman wagon vault, with its continuous thrust, a strange result to follow from a slight alteration of the arrangement of the stones in the vaulting panels, and yet inevitable from rigidly following artistic reasoning. It is rendered all the more striking by the fact that the French, who strictly adhered to their original system, never arrived at these rich vaults. Here and there, as at Caudebec, we find a pendant taking the place of a central column, but it is a *tour de force*, and in late French vaults, as at Abbeville, pendant bosses are quite common and lierne vaults, as at St. Riquier, not uncommon; but when we meet with anything like elaboration, as at Rue, it is a piece of fanciful decoration, not a natural artistic development.

Time will not allow of our following out fully the development of window tracery in the two countries. France got ahead of us in the earlier stages, owing chiefly to our

* T. V. de D. "Construction"; also Willis, R.I.B.A.

adherence to the long, narrow lancet, a singularly beautiful form, especially in the triplet and in larger groups, as at Salisbury and York. Its origin is a little puzzling. I believe it was simply the translation into a pointed form of the triple arch of the Norman clearstory, with the centre opening higher than the others. Our specially English perpendicular seems too have sprung from reticulated tracery, itself a development and modification of our flowing decorated, our English, but much more beautiful, version of the French Flamboyant. St. Mary, Redcliff, a very striking example of our later style, shows us a reticulated and a perpendicular window almost precisely similar at the east end. It is worth while to compare this interior with that of Abbeville. On the whole I think the English example is the finer, beautiful though the other is. Although the English example is a good deal the earlier, yet they may be taken as the last word of the art of the two countries before absolute decay began. We have no church of the first rank as late as Abbeville, perhaps St. Michael's, Coventry, comes nearest.

Let us now glance back at the results of our study. In spite of some resemblance, there can hardly be a greater contrast than that between the French and English cathedral. In the exterior of the former, which is generally obviously the result of one great effort, the walls are standing in slices at right angles to the building which they support but do not enclose, towering high above it, and seeming to push and thrust with all their power to keep up its enormous height. It is very wonderful and very beautiful, but leaves a sense of constant effort to overcome difficulties, after all only partially vanquished. What a difference is there in the peace of the long, low English cathedral, with its insignificant buttresses and unambitious lines, with no traceried canopies or wealth of sculpture, and except for the upward pointing of its central spire, seeming content to remain on earth, and telling in its unequal parts and varied styles not of a mighty impulse which faltered all too soon, of a lofty enthusiasm which died down to mere mechanical dexterity, but of successive generations of commonplace yet earnest men, each bringing its little stone and saying,

"Add this to the rest."

Take it and try its worth: here dies another day."

And in the interior also the story is the same. In the English church we trace the stolid acceptance of existing facts, which preserves all that has gone before, however imperfect, and, adding here and changing there, makes up a building, humble-minded, as it were, with a wooden roof perhaps, content to suffice for the needs of the present, telling in every corner of the makeshifts of the past, with no sign of anxious, unrealised ambition for the future, incapable of perfection, because begun and ended incessantly, and always without continuous design, yet breathing out an indescribable charm of sympathy almost human in its loving reverence for the results of all past human effort. But in the other the soaring lines which guide the eye upward ever to the vault of stone poised miraculously on its walls of painted glass seem to tell of master minds of long ago, of those

"Few whom God whispers in the ear,

For whom earth had attached to Heaven, there was no more far nor near."

who, greatly daring in their implacable logic, swept ruthlessly away all that had gone before, had planned to raise a structure complete and harmonious all through, the absolute expression of one overmastering ideal of future perfection, bound to remain incomplete at the last from the weakness of all human aims and means, for they had aimed at

"The high that proved too high, the heroic for earth too hard."

Yet therein lies its undying power. While our cathedrals tell of the strong consciousness of the historical continuity of the nation which has made of the English a governing and imperial race, the mediæval architecture of France is the expression of that logical and artistic nature which has made the French through all European history the originators of the noblest social ideals, the exponents of their highest expression in art. And here it is that the French art towers far above the English. It is far

more the expression of the nation's soul. So far as building only makes use of its materials dexterously, appropriately, beautifully even, with limbs and fingers only, it falls short of the highest; so far as it lays open the soul of the man or of the race, it reaches it. The expression of closely-reasoned design in admirable construction and suitability to its purpose is perfect in such a building as Notre-Dame, or Amiens, or Rheims. No more marvellous temples for the worship of God can be imagined. Yet it is not in that that their chief glory resides, but in that artistic sense which made of the French cathedral a perfect combination of all the arts, more complete than even the Greek temple, because not only are its parts inseparable and even more perfectly coordinated, but because it is the expression of a fuller ideal as belonging to a later, more complex civilisation, the work of a race as highly struck as the Greek. This artistic expression is found most in that part of the cathedral which was the least fully worked out—the great west front. There is not one which is not open to the severest criticism as to proportion, adaptation to its purpose, disposition of lines and parts. Yet there we find the full expression of that indefinable quality, the artistic sense which all the Latin and Greek races possess, but which is lacking more or less, so far as regards the material arts, in almost every race of Teutonic origin. Just compare Notre-Dame with Wells, Amiens with Salisbury, Chartres with Peterborough, York with Abbeville. The sculpture of Wells is a work of a genius, full of life and expression and high qualities of execution, but what a poor and monotonous design, with moss-holes for doors and tall columns like scaffold-poles all up the front. Then take Notre-Dame. Its horizontal lines are too strong, and it is too much cut into squares, but what restfulness in the wall spaces, how beautifully the statues on the piers carry on the line of sculpture, what noble proportion and sense of scale! Why, the Arc de l'Étoile is exactly the same size, and looks about half, and, above all, what wealth of marvellous imagery! Then put Amiens and Rheims by the side of Salisbury, with its meaningless jumble of petty disconnected parts, or of Lincoln, with its senseless screen, or Lichfield, with its shopful of squat statues on brackets. Amiens had its towers cut in half for want of funds; Rheims was set back for the same reason. Both lack the repose of Notre-Dame, yet, with all their defects, which are many, especially the bringing forward of the door jambs at Rheims in front of the buttresses, how wonderful they are! And remember each of these fronts has a complete system of iconography, which I cannot explain to-night. The main point to note is that all French sculpture from the very earliest period shows the artistic genius of the race. Take the statues from the west front of Chartres, which date from about 1140. Their excessive elongation, which strikes us as archaic, is not entirely so, but due to a naive, artistic feeling that, placed as they are amongst columns, their lines ought to harmonise. Then if we look at the faces, they are studied from nature, and are of a thoroughly frankish type, but idealised. Indeed, they are much more individual than those of the end of the XIIIth century, when there is a tendency to adopt a definite generalised ideal. When we come to XIIIth century work, such as that of Notre-Dame, note the calm and breadth of the work, especially of the angels and the double row of heads and the wonderful figures from Rheims, all as fine as any Greek art, far more a part of the building to which they belong, and full of what Greek art in its search for perfect physical form generally lacks—the sense of living humanity and of humanity conscious of its power to rise above itself.

Then with the wild confusion, the rush and whirl of the other side. Note especially the Horsemen of the Apocalypse, Fame, and, most of all, Death. I know nothing to equal it. He who rides on the pale horse is shown here as a woman with blindfolded eyes. She has leaped in front of a man, exultant in his strength, and stabbed him with a huge knife so that his bowels are pouring out, and he has fallen backwards over the horse dead and limp, while she, clinging tightly to the

creature's neck, is making him rush on with outstretched head in an agony of terror. The whole is the most awful drama of human life and death. I might go on to compare the grand triple porch of Peterborough—and it is very impressive—with the great porches of Chartres, and we should find the same difference in artistic quality. But, leaving this work of the best period, let us take some of the latest, and even there we shall find the same. Even now, worn down as it is, there are few more exquisite things than the great porch of St. Maclon, and its tympanum of the Last Judgment is almost as fine as that of Notre-Dame. Hear what Ruskin says of it:—"The sculpture of the inferno side is carried out with a degree of power whose fearful grotesqueness I can only describe as a mingling of the minds of Orcagna and Hogarth. The demons are perhaps even more awful than Orcagna's, and in some of the expressions of debased humanity in its utmost despair the English painter is at least equalled. Not less wild is the imagination which gives fury and fear, even to the placing of the figures. An evil angel poised on the wing drives the condemned troops from before the judgment seat; with his left hand he drags behind him a cloud, which he is spreading like a winding sheet over them all; but they are urged by him so furiously that they are driven not merely to the extreme limit of that scene which the sculptor confined elsewhere within the tympanum, but out of the tympanum and into the niches of the arch; while the flames that follow them, bent by the blast, as it seems, of the angel's wings, rush into the niches also and burst up through their tracery, the three lowermost niches being represented as all on fire, while, instead of their usual vaulted and ribbed ceiling, there is a denon in the roof of each, with his wings folded over it, griming down out of the black shadow." Then put Abbeville by the side of York. The latter in its cold precision of rule and triangle and perpetual perpendicular panelling is only not dead because it has never really lived, not dumb because it never was taught to speak; while the other, though that saddest of all earthly things, an unfinished ruin, yet speaks all over with a thousand tongues. Though one of the latest buildings in France, a mass of prisms, of interlacing curves, scientific and geometrical from base to summit, it is full of an artistic feeling and poetry almost entirely absent from the other.

I do not say that either the science or the art of the Middle Ages, English or French, is a thing for us to imitate nowadays. On the contrary. But I do say that it is deserving of all our study and all our admiration. It belonged to the men of those times; it was the result of their need, the fulfilment of their history, and its expression in their lives; it tells us of the ideal at which they aimed and how they strove to reach it. It sprang from their heart, was part of their life. Can we say as much of our art of to-day?

Pardon me if before I conclude I rapidly review the main results at which we have arrived.

I have tried to bring before you not mere differences of style founded on details of moulding or tracery, things of no real importance, but to show you how English and French mediæval architecture are each of them the outcome of the character of the race, the result of the history of the nation, the expression of the people's ideal.

The same national characteristic of "drift" which is ours to-day, and which takes us muddling along with no definite aim or plan for the future, and which led Edward III. in his blundering rush across Northern France till he was brought to bay on the hillside of Crecy, led also the workmen of his time to close their vaulting panels just anyhow, provided they got them closed; the same sturdy commonsense and determination to stand shoulder to shoulder in whatever they undertook, which made the King dismount his knights and place them side by side with the peasants, row over row, on that gentle slope, and which gave to them all when thus united the power

"To turn to flight on that famed Picard field
Balaon's plume and Gebon's bow and Cesar's eagle shield."

made them also build their walls always thick enough to carry the vaults or else rest

satisfied with a wooden roof, and caused them to be content to mend and patch their heritage from the past rather than sweep it all away in the hope of replacing it by some marvel of quite unattainable perfection in the future, till in the end the gradual blending of all classes and of their aspirations made itself felt in their art, as in their social life, and the architecture of the cathedral, the monastery, and the castle found its last expression in the village church, the manor-house, and the farm. In art, as in empire, the English race has ever been the same—opportunist of ever forming an ideal much above the Here and Now of daily life, yet blundering unconsciously, in spite of themselves, into marvellous results in both art and empire.

And so with France. It was the same chivalrous devotion to an ideal which drove to death the knights at Crecy and Agincourt, which also inspired the burghers of the Communes with their wild enthusiasm for liberty and with their determination to find for their thankfulness a visible expression in their vast cathedrals. It was the same pitiless logic and thirst for an ideal which dictated the unswerving policy of Louis XI. and of Richelieu, which later made the nation sweep away all its past in a torrent of blood in the vain hope of bringing back the golden age, and which also in art inspired the reasoning and the artistic sense whereby the builders of Vezelay and of St. Denis were led on from Notre-Dame through the perfection of Amiens and the lovely folly of Beauvais and the ruins, unfinished beauty of Abbeville to the last wire-drawn skeleton of a XVth century church. Through it all, up to the very end, these builders were true artists, aiming at expressing a something higher than themselves which should draw up into sympathy with them all that was best and noblest in those around them. Which of the two nations did best? It is an old question, which each artist—each man—must answer for himself. Whether it is better to aim at a lofty ideal which, proving beyond our reach, may become a mere dream of Heaven, or to be content with a lower one within our grasp, even though it may keep us bound to Earth."

Mr. W. H. Seth-Smith said he had great pleasure in proposing a vote of thanks to Dr. West for his admirable lecture. They must all of them have been delighted with the paper, which was one of the most perfect in its combination of the artistic, the structural, and the historical that he had ever heard. Dr. West had given them a sketch of the historical reasons for the contrast between French and English work, and had gone into the structural reasons most thoroughly as well. The reason why the paper had been such a brilliant one was probably because Dr. West was thorough, trained as an architect both in England and France, and had had the special privilege of being under and associated with Viollet-le-Duc for some years, so that he had had the run of the French churches while Viollet-le-Duc was restoring them. That, added to Dr. West's literary and other qualifications, had given him special facilities for producing such a paper. He remembered reading and enjoying a paper Dr. West read on "Vaulting" before the Institute of Architects a good many years ago, and from his treatment of the present subject they saw that Dr. West had studied the question of vaulting very deeply. Perhaps the lecture that evening was of most value because of the tendency nowadays to set aside Gothic in favour of Classic study. He had such a warm sympathy for Gothic, which was his first study, that he was always pained when the Association students had the opportunity of hearing lectures like the present, which emphasised the beauty and the logical development of Gothic work, and which impressed them all once again with the enormous importance of that study, especially in their younger days, as giving greater freedom in designing and planning. It was impossible to criticise, except in the most general way, such a paper, and he would say no more, except to propose a very hearty vote of thanks to Dr. West.

Mr. Hugh Stannus said it would be consonant with the ideas, the impressions, of all of them that evening if he just seconded the

vote of thanks and then kept silence. The truest compliment to Dr. West was for them to feel and act like students sitting at his feet. He was old enough to remember when Dr. West was a pupil in London, and he remembered the great advantage Dr. West had of going to Paris and studying under Viollet-le-Duc with M. A. de Baudot—a man who had all the grand traditions of the grand old Frenchman. The paper that evening had been so perfect in its way that it was impossible for any one of them to criticise it; they could only study it and work it into their artistic education and their artistic conscience.

The Chairman then put the vote of thanks, remarking on the excellence of the paper and the many lantern views which had been shown, and expressing regret that the illustrations could not accompany the lecture when published.

The vote of thanks having been very warmly carried,

Dr. West briefly replied.

Next Meetings.

The Chairman announced that a special general meeting will be held on February 25 to add to by-laws 21 and 31 after the word "librarian" the words: "and editor of the A.A. Journal." They propose to make the editor of the Journal a member of Council.

After the special meeting, the ordinary meeting will be held, when Mr. F. T. Baggallay will read a paper on "Porches and Approaches," illustrated by lantern views.

The meeting then terminated.

ARCHAEOLOGICAL SOCIETIES.

GLASGOW ARCHAEOLOGICAL SOCIETY.—The council of the Glasgow Archaeological Society have issued their report for the past year. After reviewing the work of the session, they state that seventeen new members were enrolled, bringing the number up to nearly 300. A correspondence is given in the report as between the Society and Sir Hugh Shaw Stewart with reference to the preservation of Newark Castle. In reply to the Society's representations, Sir Hugh says that sums have been laid out periodically in keeping the roof watertight and preventing the building from falling into greater ruin than it is now. He regrets he is unable to do more without starving other buildings, which are a source of livelihood to those who occupy them as farm tenants, etc. So far from being indifferent to the value of the building from a historical and architectural point of view, he had lately refused a tempting sum for the purchase of the ground on which it stands in order that a shipbuilding yard might be erected there. If, he adds, the Society could see its way to provide funds for the thorough repair of the castle, he would place no obstacle in the way. The council further report that through the intervention of the Society the Lanarkshire County Council had given instructions, which would prevent any more injury to the prehistoric fortification or mote between the public road and the River Clyde about a mile north of Abington village. With regard to the rebuilding of Glasgow Royal Infirmary, regret is expressed that the managers seem determined to proceed with their scheme, without modification, with the result that the huge "Jubilee Block" to front Cathedral-square, will destroy the appearance of the cathedral.

Fifty Years Ago.

FROM THE *Builder* OF FEBRUARY 16, 1856.

THE CLOCK AT THE HOUSES OF PARLIAMENT. The proceedings connected with the intended clock at Westminster are not regarded complacently by some of our correspondents; all sorts of unfairness are complained of, but we are not in a position to say that the case is made out. One remarks that "the faces are so arranged (although of immense size) as to be perfectly useless for the purpose of distinguishing the time (even to a person standing in Palace-yard)," and asks "if it be true that the clock is made of cast-iron?" He further complains that the matter is now wholly in the hands of one gentleman, Mr. Demison. Another writer says all the English bellfounders have been insulted in connexion

with this clock, and is surprised they should be so quiet under it. Are we to believe that we are travelling backwards on all roads?

Illustrations.

DESIGN FOR BACON'S IDEAL PALACE.

Our readers are aware, the subject set for the Soane Medallion this year was a realisation of the Institute of Architects, described as being "quite the most learned parody of style which they had had since his brilliant colleague on the Council, Professor Pite, startled them with his ideas as to what a West-end club should be like." Entirely agreeing with this, we have thought it worth while to devote our plates this week to illustrating the whole set of these drawings. Bacon's description of the mansion which he would have liked to see built has often attracted attention and comment; and to have illustrated in a concrete form this architectural speculation of a great intellect of the Elizabethan era is an achievement of considerable interest.

We have asked the author to contribute any remarks he wished to make on his idea in working out the design, and he writes:—"The subject set being 'The Realisation of the Ideal Mansion as Described by Bacon in his Essay 'Of Building,' that essay becomes the first object for consideration, and on being carefully and thoughtfully read, though stimulating to the imagination, it is found to be in parts obscure and even seemingly contradictory, forcing one to the conclusion that Bacon did not conceive his palace as an organic whole, but allowed his imagination to expand and contract, describing in turn parts only of the large houses of the period.

This makes it necessary to study the houses with which Bacon must have been familiar, and these, together with the large collection of Elizabethan plans in Thorpe's book, throw considerable light on the more difficult parts of the essay.

But Bacon's philosophy, having so strong a practical bias, suggests that a merely antiquarian restoration of his 'perfect palace' would be neither useful nor desirable, so an attempt has been made to combine the grandiose ideas of living which were so characteristic of the Elizabethan era with the more modern ideas of comfort and privacy.

In this particular attempt at realisation Bacon's semi-literary semi-technical description has throughout conditioned the design, but the imaginative nature of the subject seemed imperatively to demand that the design itself should possess an imaginative quality, and that the same imaginative quality should dominate its setting forth.

Although modern habits and ideas have been considered, and separate suites of rooms are provided which could readily be arranged for State functions of the largest kind, for entertainments on a smaller scale, or for the private life of the family, yet the design is by no means offered as an attempt to plan a palace as it should be, but from the first was considered as merely an unusually interesting and useful exercise."

SELL'S TELEGRAPHIC ADDRESSES.—We have received from Mr. Henry Sell (165, Fleet-street, E.C.) the 1906 volume of Registered Telegraphic Addresses, which contains the names and addresses of 70,000 firms. The Directory is complete to the end of 1905, and contains every new telegraphic address or alteration registered at the Post Office up to December 31, 1905. It also contains the names of the 70,000 great firms of the United Kingdom, and a complete list of our Consuls in foreign countries classified under the towns in which they are resident. Special articles on the World's Industries, Post Office information, etc., will also be found in the book. We have found the work the present issue is the "Coming of Age" number very useful and reliable, and it deserves to be well known and used.

THE BUILDER, FEBRUARY 17, 1906.

Plan of the Second Story

This building is to be built with a view to the fact that it is to be used as a residence for a family of some size. It is to be built with a view to the fact that it is to be used as a residence for a family of some size. It is to be built with a view to the fact that it is to be used as a residence for a family of some size.

The plan will be open to the public and a copy will be sent to the architect on a copy of the building plan to the architect.

John Sharp

1906 17/2

"The main wing measures 137 ft 8 in. broad to a grade, or plan of levels as indicated, and only such openings and windows remain as the original architect intended."

On the other side, which is the house side
of wall, is a garden, the front into a hall and a
loggia with a veranda between, side of road
and loggia, but to the left, the garden end is wider
and a summer parlour, with loggia, and under this
from the loggia, either with inner garden, and become
some garden with a veranda on the side

I would have on the side of the banquet
the "banquet" as only party room of some
size, but "high" and under the a room
a dining or a gathering place of times of triumph

The main part of the wing

Base Court - Syd.

These galleries are built over the rear wall of arcade.

At both corners of the farther side, by way of return, let there be two distinct or rich cabinets, handsomely paved, richly hang'd & glazed with crystalline glass, and a rich cupole in the midst, and all other elegance that may be thought on. In the upper gallery, do I wish that there may be some few rooms running in divers places from the wall. . . . and upon the third story likewise an open gallery upon pillars, to take the prospect and freshness of the garden.

The two Inward Courts.

Beyond this court let there be an inward court of the same square and height: and in the inside cloistered on all sides upon decent and beautiful arches, as high as the first story: on the under side, towards the garden, let it be turn'd to a grove, a place of shade or retirement: and only have opening and windows towards the garden, and be level upon the floor, no whit sunk under ground, to avoid all dampness.

the water which ran down from the water-bearing stratum above. That might happen sometimes after a really good water-bearing stratum had been reached, and many wells were abandoned because the supply had been lost in that manner. It seemed rather absurd that such wells should be abandoned for that reason. It would obviously be easy enough to fill in the bottom of the well and to put in some puddled clay over the lower sand formation to hold up the water.

Speaking of the construction of wells, the lecturer said there could be no doubt that for deep wells, where it was of importance to exclude any water, and where treacherous strata had to be passed through, iron cylinders should be used for the lining, and would probably be cheapest in the end. Shafts were generally to be preferred to borings for wells in this part of the country. A shaft had a much better chance of striking a good supply of water in the chalk, upper greensand, or the Wealden beds than a boring, which might miss the fissures, or get clogged with sand, or fail to obtain a sufficient supply from sandy beds owing to the small area it touched. Well-sinking must, however, always be a matter of risk. No man could possibly tell to an exact certainty what existed in the ground 200 ft. or 300 ft. below, and the engineer could only say it was probable that a permeable water-bearing strata existed at a certain depth. There could be no absolute certainty that it existed at all. In conclusion, he urged the point that, while it was often best to go deep for a water supply, much expense and trouble might often be saved if the water ready to hand near the surface were not overlooked.

A discussion followed the paper, and the meeting terminated with a vote of thanks to Mr. Stanton, proposed by the Chairman and seconded by Mr. H. Capsey.

THE SURVEYORS' INSTITUTION.

An ordinary general meeting of the Surveyors' Institution was held on Monday at No. 12, Great George-street, Westminster, S.W., Mr. C. Bidwell, President, in the chair.

The minutes of last meeting having been read and confirmed, and some donations to the Library and Library Fund having been announced.

The Chairman moved that the Right Hon. Lord Justice Fletcher Moulton be elected as an Hon. Member. The Chairman said that the right hon. gentleman had been a Professional Associate of the Institution for some seven years, and they would all be glad that he had been raised to the high position of Lord Justice.

The motion was heartily agreed to.

The Secretary (Mr. A. Goddard) then read the list (printed in our last issue) of candidates who have passed the preliminary examination and have been enrolled as students.

The Rating of Machinery.

Mr. W. P. Payne then resumed the debate, opened by Messrs. E. J. Castle, K.C., G. Humphreys Davies, E. J. Harper, and E. M. Konstam, on Mr. F. Marshall's paper on "The Valuation of Machinery for Rating Purposes," an abstract of which appeared in our issue for February 3.

Mr. Payne said that Mr. Marshall's paper showed what a large amount of difficulty a surveyor had in carrying out the law in regard to the rating of machinery. What values required was that the judges should tell them what was the meaning of the words, "enhancement of value," and how to measure that enhancement. The carrying out of the rating of machinery was a great difficulty. In some parts of the country the rating was carried out in its entirety, everything being valued; but in other parts, nothing was valued at all.

Mr. W. B. Brodric said that the present state of the law on the subject had not been arrived at by what might be called natural evolution so much as from dire necessity.

The rating of machinery had been brought into prominence during the last fifteen to twenty years more particularly by the necessity which local bodies had found of increasing the yearly amounts required by them; and the assessment committees or those who instructed them had been anxious

to discover new sources of revenue so that the increased expense should not tell so heavily on the ordinary ratepayer. He ventured to question the correctness of the decisions in the House of Lords in the case of Kirby v. Assessment Committee of the Hunslet Union on December 19 last. A great deal of the machinery in Kirby's factory was personal property, and the House of Lords had decided that it was correct to rate that. It appeared to him that there was a conflict between the Act of Parliament passed by both Houses in 1840 and the decision of the House of Lords in the case of Kirby v. Hunslet. Surveyors and valuers must find themselves in a difficulty, and the only way he could see out of the chaos was for an Act to be passed—an Act such as the Machine Users' Association had promoted for the last twelve years—and that would remove many of the difficulties which exist.

Mr. E. Page, K.C., said that there was no doubt that the present condition of the law was absolutely unsatisfactory. The difficulty was not as to fixed machinery, which would go with the hereditament as part of it; the difficulty was in regard to such machinery as was not. But for legal decisions, one would have felt that such chattels would be affected by the question as to what extent was the value of the hereditament enhanced by being available for the use and erection of such machines. As to the way to deal with the matter, the only plan was to endeavour to get the law altered on the lines of the Report of the Commission of 1900, i.e., that a Bill should be passed that should enact that there should be excluded from the assessment any increase of value arising from machinery, tools, or appliances which were not fixed, or were only so fixed as that they could be removed without the removal of any part of the hereditament. On those lines the Scotch Act of 1892 was passed, which in Scotland removed the grievances of the owners of machinery. Some such Act was required in England, and until such an Act had been placed upon the Statute-book it was no good doing anything but obey the decisions of the Courts and agitators for an alteration in the law, which was very necessary if one place was to be rated in the same way as another place and if the rateable value of factories was to accord with the annual value as found by the ordinary laws of supply and demand.

Mr. D. Dimwiddy said that the subject divided itself into two heads—i.e., first, the economic question of whether machinery should be rated, and secondly, how it should be rated. No surveyor could go into a factory on behalf of the assessment committees and ignore the machinery. It was their duty so long as the law was in its present state to treat it as they found it; they could not do otherwise after the Kirby case.

Mr. G. Beken having spoken,

Mr. J. H. Sabin said he could not see why machinery, for instance, which would do the mortising for forty doors in one day should be assessed differently from a building in which forty men, with forty chisels, etc., did the work on those forty doors in one day; or a wash-house, with tubs for women, as against machinery for washing. What was wanted was the removal of restrictions on trade. Was a building increased in value, or was it not, by the use to which it was put? A house was built with the intention of its being inhabited, and could it be said that it was enhanced in value by the fact that it was going to be inhabited? A building was erected as a factory, and could it be said that its value was further increased by the fact that machines were going to be put into it? He did not feel that it was, any more than he felt that the house was increased in value because people were going to live in it; and houses would not be built if people were not going to live in them, and many factories would not be erected unless machinery was going to be put into them. The matter might be put in this way: When is a hereditament not a hereditament? And the answer was: When it was a machine. And when was a machine not a machine? And the answer was: When it is a hereditament.

Mr. Sturge, of Bristol, and Mr. A. Harston having spoken, the Chairman made

a few remarks on the subject, during which he expressed the hope that the Government would do something in the matter in the near future.

In the course of a brief reply, Mr. Marshall said he had been much struck by Mr. Sabin's illustrations. If brewers' vats were to be rated, one could not see why wash-tubs should not be. But the whole matter was in an anomalous state, and legislation was needed.

It was announced that the next meeting would be held on February 28, when a paper by the late J. Leaning on "The Assimilation of the Practice of Quantity Surveyors" would be read by Mr. H. J. Leaning.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Sir E. Cornwall, M.P., Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Hackney Borough Council 2,985*l.* for paving works; St. Pancras Borough Council 1,965*l.* for street lighting; and Woolwich Borough Council 2,000*l.* for electrical fittings.

Inspection of Theatres, etc.—The following recommendations of the Theatres and Music Halls and Fire Brigade Committees were agreed to after discussion:—

(a) That as from and including April 1, 1906, the chief officer of the fire brigade be responsible to the Council for the inspection of the electric lighting installations and heating and other mechanical arrangements in theatres and the other places of public entertainment licensed by the Council.

(b) That Mr. G. Heys-Jones, an assistant in the lower section of the fire brigade, in the electric lighting, etc. section of the engineer's department, and Mr. E. S. F. Cooper, an assistant in the fire brigade, of the first class, in the mechanical section of the engineer's department, be transferred to the fire brigade as from and including April 1, 1906.

(c) That an electrical and mechanical engineer, at a salary of 400*l.* a year, and an electrical engineer, at a salary of 300*l.* a year, be appointed to the fire brigade, and that applications for the appointments be invited by public advertisement.

Exhibition of Sculpture.—A petition was presented by the Vice-Chairman from the Society of British Sculptors asking the Council to grant a temporary site and building where an exhibition of the art of sculpture can be properly seen. The petition was referred to the Improvements Committee.

Marble-hill—Adaptation of Mansion for Refreshment and Shelter Purposes.—The Parks and Open Spaces Committee recommended, and it was agreed:—

(a) That the estimate of expenditure on capital account of 1,567*l.* approved on August 1, 1905, in respect of the adaptation of the mansion at Marble-hill, be cancelled to the extent of 500*l.*; and that the resolution of that date sanctioning expenditure for the purpose be rescinded so far as it relates to expenditure exceeding 975*l.*

(b) That the offer of Messrs. Chambers Brothers to provide for 150 seats of service in the mansion at Marble-hill be accepted.

Putney School of Art.—It was agreed to accept the transference of this school to the Council.

School, Dawes-road, Fulham.—The Education Committee reported as follows in reference to the new secondary school proposed to be erected on the Dawes-road site (Fulham) for the accommodation of 316 scholars:—

In the letter accompanying these plans the attention of the Board of Education was invited to the extremely expensive character of their requirements in respect of the building and equipment of new secondary schools, and it was stated that, in the opinion of the Council, considerable economy could be effected without appreciably diminishing the efficiency of the school as a whole.

The Board on December 5, 1905, approved the plans as submitted for a total accommodation of 316 girls, and added that it had been decided to modify the regulations of the Board for the building of secondary schools, as follows:—

(1) The minimum allowance of 8 sq. ft. per scholar will be reduced to 6 sq. ft. where the Board are satisfied that the larger provision is impracticable.

(2) Classrooms: The minimum allowance of 18 sq. ft. (with the alternative provided by the existing regulations) will be reduced to 16 sq. ft., provided that the Board are satisfied with the arrangement proposed.

These important concessions on the part of the Board will enable the Council to effect considerable saving in the erection of this and other secondary schools. In view of the pressing need for secondary school accommodation in Fulham, we are of opinion that the school as planned for 316 scholars will be hardly large enough to meet the requirements of the district, and the plans have accordingly been redrawn for a school to accommodate 510 girls. The total cost of erecting the school in accordance with these amended plans, including supervision, quantities, and lithography,

equipment, etc., is estimated at 35,956*l.* The cost of the building only is estimated at 28,558*l.*, equivalent to about 56*l.* a place. It may be mentioned for information that the cost of the building as originally planned for 316 scholars was estimated at 20,000*l.*, equivalent to about 63*l.* a place. As it is the first school of this character for the Council's approval before sending them to the Board of Education. We recommend that the proposed sketch plans, submitted to the Education Committee on January 31, 1906, of the secondary school proposed to be erected on the Dawes-road site (Fulham), be approved, and that they be forwarded to the Board of Education.

Mr. Whitaker Thompson moved, and Mr. Buxton seconded, that the recommendation be referred back. The cost should not be so high as 56*l.* a place.

Mr. Barnes said it was impossible to do the work at a less cost while the present rules of the Board of Education applied.

Canon Jephson said that if they were free to carry out the work in the best way they could the cost would be very much less. The Council had to comply with rules which were as rigid as the laws of the Medes and Persians, but they endeavoured to do the work as inexpensively as possible.

Sir William Collins said that one impression more definite than any other which he had brought back from Paris was that the adequate school provision, and the natural sequence of secondary education following the primary school. He expressed the wish that the Board of Education would relax their requirements still more, but the cost of 56*l.* a place was not excessive in comparison with the cost of other similar schools erected in London and the country.

The amendment was lost, and the recommendation of the committee agreed to.

Hildrop-road Site, Islington, N.—The following recommendations of the Finance Committee were agreed to:—

(a) That the claim of Messrs. Grezar & Son, the contractors for the erection of the pupil teacher centre on the Hildrop-road site (Islington, N.), be settled at 4,832*l.* 5*s.* 2*d.* exclusive of legal expenses.

(b) That expenditure not exceeding 200*l.* be sanctioned in respect of the legal costs incurred by Messrs. Grezar & Son in connexion with their action in regard to the erection of the pupil teacher centre on the Hildrop-road site (Islington, N.); that the sum of 200*l.* be allowed to Messrs. Grezar & Son.

Lists of Contractors Selected to Tender.—The Education Committee recommended, and it was agreed:—

That the name of John Wainwright & Co., Ltd., of 173, Mark Lane, be added to the selected list of contractors for tar-paving playgrounds of Council schools.

That the name of A. E. Podmore & Co., of 33, Charles street, Hatton-garden, be added to the selected list of contractors for the provision of gas services and fittings in schools.

That the name of J. Harrison & Co., of Station Works, Denmark-road, Camberwell, be added to the selected list of contractors for supplying and erecting iron buildings, as far as small contracts are concerned.

That G. J. Lynn, formerly one of the partners of Staines & Son, builders, Gt. Great Eastern-street, who is continuing the business under the old name, be added to tender as heretofore.

List of Rates of Wages and Hours of Labour.—The Works Committee reported as follows, the recommendation being agreed to:—

"The hours of labour of plumbers inserted in the Council's list of rates of wages and hours of labour are not in accord with the provisions of the working rule agreement between the Plumbers' Association and the London Master Builders' Association. We recommend:—

That the Council's list of rates of wages and hours of labour be amended by the substitution of '50' for '47' as the hours of labour in summer of plumbers and plumbers' mates, and that the rate of pay of plumbers and plumbers' mates for overtime on week-days (except Saturdays), inserted in the list be as follows: "6 p.m. to 8 p.m., time and a quarter."

Vauxhall Bridge—Provision of Lamp Standards, etc., for Bridge.—The Bridges Committee brought up the following report:—

"We have considered what arrangements should be made for lighting the new Vauxhall Bridge, and we are of opinion that the best system of lighting will be the incandescent high pressure gas-lighting system. We have been in communication with the Gas Light and Coke Company with a view to ascertaining to what amount it would be prepared to supply and erect suitable standards with the requisite lamps, service mains, etc., and also the amount to be prepared to supply and erect the lamps, etc., for a sum of from 650*l.* to 700*l.* The exact amount will depend upon the settlement at a later date of certain details of the work. This amount would cover the cost of any lighting arrangements which may have to be made provisionally pending the completion of the permanent installation. It is proposed, however, to consider at a later date what course shall be adopted for lighting the watermen's stairs at the bridge. Sixteen

standards will be erected, twelve of which will be on the bridge itself, and four on the approaches, and two dwarf lamps and standards on the southern approach. The lamps will be of the incandescent type in use in Kingsway and Aldwych, and will each contain two burners with a combined power of 660 candles and fitted with apparatus for automatic intensification. The standards of the lamps have been designed by the architect and will be in keeping with the architectural features of the bridge. It will be necessary for an agreement to be entered into with the company for the supply and fixing of the standards etc., and for the requisite expenditure is included in the estimate of 170,000*l.*, approved on November 25, 1902, for the construction of the superstructure of the bridge.

The committee recommended accordingly, and it was agreed.

Bridges.—The Bridges Committee reported as follows:—

"We report that the work of the partial reconstruction of four bridges carrying the Albert Embankment-road over certain dock entrances, and the reconstruction of Mill Pond Bridge in Nine Elms-lane, has been completed. The work has been executed by Messrs. Faise & Son, whose tender therefor, amounting to 3,444*l.* 18*s.* 3*d.*, was accepted on August 1, 1905.

Dangers of Fire.—The Fire Brigade Committee recommended that the brigade should periodically inspect (in addition to theatres and other premises licensed for public entertainment and common lodging-houses) buildings belonging to the Council and other rate or tax supported buildings within the county of London, subject to requests for such inspection being made by the committee or authority concerned, and that the chief officer of the brigade should advise on the fire arrangements of such buildings.

After discussion the matter was referred back on the motion of Sir Melville Beachcroft.

Paris Tramways.—Mr. Allen Baker, the chairman of the Highways Committee, in reply to Mr. Waterlow, said he had noticed one or two matters regarding tramway administration on the occasion of the visit to Paris. In the first place, he noticed that trams were allowed over several of the bridges crossing the Seine, and further, that the adoption of the conduit system by the Council had been amply justified by the experience of Paris. He had also learned that the tramway companies paid to the municipality a small tax on each fare collected towards the cost of keeping up the streets through which the trams passed.

The Council shortly afterwards adjourned.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Deptford.—A one-story shop adjoining No. 118, Manor-road, Brockley, abutting upon Brockley-road and Manor-road (Mr. J. Webster for Mr. P. Verschooten).—Consent.

Hampstead.—An iron and glass porch in front of No. 13, Marefield-gardens, Finchley-road, Hampstead (Mr. H. Carpenter for Mr. S. Baer).—Consent.

Hammersmith.—Retention of a building to be used as a watch-box on the eastern side of Wood-lane, Hammersmith (Mr. W. Weaver for the Council of the Royal Borough of Kensington).—Consent.

Strand.—A deviation from the plans approved for the erection of a building for the United Universities Club, Suffolk-street and Pall Mall East, so far as relates to the substitution of two smaller balconies for one large balcony at the first floor level on the Pall Mall East frontage (the projecting portion of the front being also kept back to the main front of the building), and an alteration in the projection and length of the two balconies at the first floor level on the Suffolk-street frontage (Mr. R. Blomfield, A.R.A.).—Consent.

Hampstead.—Retention of a projecting clock in front of No. 118, West-end-lane, Hampstead (Mr. R. Cornish).—Consent.

Lewisham.—Bay windows above the one-story shops in front of Nos. 23, 24, 25, 26, and 27, Crofton-park-terrace, Brockley-road (Messrs. Tonkins & Connew).—Consent.

Paddington, South.—An iron and glass conservatory at the first floor level at the rear of "Keith House," Bayswater-road, Paddington (Mr. L. H. Isaacs for Sir Clifton Robinson).—Consent.

St. George, Hanover-square.—An oriel window and balconies in front of a proposed extension of the Berkeley Hotel, Berkeley-street, Piccadilly

(Mr. R. Griggs for the Berkeley Hotel Company, Ltd.).—Consent.

Lewisham.—A one-story shop in front, and at the flank, of No. 14, Brownhill-road, Catford (Mr. A. W. Osborn for Mr. B. Walker).—Consent.

Wandsworth.—An addition to a building at the rear of No. 1, Mitre-terrace, Mitcham-road, Tooting, to abut upon Vant-road (Mr. E. Bates for Messrs. Welfords Surrey Dairies, Ltd.).—Consent.

Westminster.—An alteration to a porch in front of No. 87, Victoria-street, Westminster (Messrs. Griffin & Woollard for Mr. J. B. Martin and others).—Consent.

Strand.—Two oriel windows in front of Nos. 59 and 60, Pall Mall (Mr. E. G. Dawber for the London and Lancashire Fire Insurance Company).—Consent.

Fulham.—The retention of a wood and iron motor-house at the rear of No. 219, New King's-road, Fulham, abutting on Coniger-road (Dr. F. J. Ayre).—Consent.

St. Pancras, North.—Deviation from the plan approved for the erection of a building, with a one-story portion in front, upon the site of No. 73, Highgate-road, St. Pancras, so far as relates to the construction of two skylight windows over the one-story portion next the wall of the main building, and to the erection of an iron and glass covered way over the front portion of the cartway entrance to the premises (Mr. S. P. Rees).—Consent.

Islington, East.—A building on a site abutting upon Prabh-road and St. Thomas-road, Finsbury-park (Messrs. F. Matcham & Co.).—Refused.

Hammersmith.—The retention of a wooden signboard in front of No. 47, King-street, Hammersmith (Mr. F. T. Harris for Mr. H. Samuel).—Refused.

Norwood.—An iron and glass shelter in front of No. 26, Vaughan-road, Camberwell (Mr. G. G. Rogers for Mr. F. J. Westcott).—Refused.

Rotherhithe.—Buildings on the site of No. 247, Lower-road, Deptford (Mr. J. H. Bethell for Mr. H. Bellsham).—Refused.

Width of Way.

City of London.—A building on the site of Nos. 75 and 76, Lombard-street, City (Mr. M. E. Collins for Messrs. Slazenger & Son).—Consent.

Hackney, North.—Permission to retain wooden enclosures at the rear of No. 34, Newington-green, Hackney, abutting upon Church-path (Mr. R. Manley).—Refused.

Width of Way and Lines of Frontage.

Dulwich.—Buildings on the west side of Vestry-road, Camberwell (Messrs. E. Crosse & Co. for Mr. C. Pedley).—Consent.

Camberwell, North.—A dwelling-house and a one-story shop on the west side of Harvey-road, Camberwell, southward of No. 6 (Mr. W. Smith).—Refused.

Hammersmith.—A building at the rear of No. 243, Uxbridge-road, Hammersmith, to abut upon Askew-crescent (Messrs. Prickett & Ellis for Miss Acton).—Refused.

Space at Rear.

Brixton.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of buildings on the southern side of Camberwell New-road, next Denmark-hill, with irregular spaces at the rear (Mr. R. L. Pearce for Mr. A. A. Carter).—Consent.

Southwark, West.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a two-story stable building on a site at the rear of warehouses on the south-east side of Barron's-place, Southwark (Mr. A. E. Chasemore for Mr. W. Sumpson).—Consent.

Formation of Streets.

Kennington.—That an order be issued to Mr. C. Barker sanctioning the formation or laying-out of a new street for carriage traffic to lead from Lower Kennington-lane to Denny-street, Lambeth (for the Duchy of Cornwall).—Consent.

Lewisham.—That an order be issued to Mr. E. E. Leach sanctioning the formation or laying-out of a new street for carriage traffic to lead from Perry-hill to Castlans-road, Lewisham.—Consent.

Wandsworth.—A deviation from the plans sanctioned for the formation or laying-out of new streets for carriage traffic out of the western side of Thrale-road and northern side of Nimrod-road, so far as it relates to the omission of the footpath on the northern side of the road adjoining Tooting Graveney-common (Messrs. D. Young & Co. for Messrs. A. W. Gosden & H. F. Crunden).—Consent.

Wandsworth.—That an order be issued to Mr. J. C. Radford sanctioning the formation or laying-out of new streets for carriage traffic out of the south side of Hazlewell-road and in continuation westward of Chartfield-avenue, Putney (for Lord Westbury).—Consent.

Paddington.—That at the request of Mr. A. T. Stewart the Council do permit the retention of wooden fences or barriers across Biddulph-road

and Ashworth-road, on the Paddington Estate, Sutherland-avenue, Paddington.—Agreed.

Wandsworth.—That the Council do consent to the application of Messrs. Holloway Brothers for permission to retain barriers across Ellerton-road, Wandsworth.—Agreed.

Whitechapel.—A deviation from the plans approved for the formation or laying-out of streets for foot traffic only on a site on the west side of Backchurch-lane and east side of Gower's-walk, Whitechapel, so far as relates to an alteration in the position of buildings on the western side of Backchurch-lane (Messrs. Crickmay & Heath).—Consent.

Hackney, South.—A deviation from the plan approved for the formation or laying-out of a new street to lead from Morning-lane to Chatham-place, Hackney, so far as relates to an alteration in the position of the boundaries of such street (Messrs. Hodson & Whitehead).—Consent.

Cubical Extent.

Rotherhithe.—The erection at Messrs. Peek, Frean, & Co.'s biscuit works, Drummond-road, Keeton's-road, and Storks-road, Bermondsey, of additions to Blocks B, C, L, M, N, and N1, whereby such blocks will exceed in extent 250,000 cubic feet (Messrs. Stock, Page, & Stock for Messrs. Peek, Frean, & Co., Limited).—Refused.

Deviation from Certified Plans.

Holborn.—Deviations from the plans certified by the district surveyor, under section 43 of the Act, so far as relates to the proposed erection of a building on the site of Nos. 240 and 241, High Holborn (Mr. H. T. C. Newton-Mason).—Consent.

Working-class Dwellings.

Camberwell, North.—Five intended dwellings to be inhabited by persons of the working class, and proposed to be erected on a site at the rear of dwellings in Preton-street, Camberwell (Messrs. J. A. J. Woodward & Sons for Mr. J. Dennis).—Consent.

The recommendations marked † are contrary to the views of the local authorities.

ARCHITECTURAL SOCIETIES.

SHEFFIELD SOCIETY OF ARCHITECTS.—At the usual monthly meeting of the Sheffield Society of Architects and Surveyors, held at the Literary and Philosophical Society's rooms, on the 8th inst., Mr. G. C. Snaith delivered a lecture on "An English Monastery in the Middle Ages." Mr. T. Winder presided in the absence of the President. Mr. Snaith said monasticism dominated the Middle Ages. The ideal life was monastic; all that made for progress up to the dawn of the Renaissance came from the monasteries. Learning survived only within their walls; education was possible in the art of the monks; schools; agriculture was the art of the monks. They cleared the forests, ploughed the fields, made barren wastes into fruitful farms. Monasteries were the refuge for the oppressed in a world where force reigned otherwise undisputed. Monastic life was not an institution peculiar to Christianity, and he instanced the surprise of the Spaniards who, in the XVth century, discovered among the Aztecs of South America convents above which glittered the gilded cross. The lecturer dealt principally with the Benedictine Order and its reformed branch, the Cistercian Order. The causes leading to the foundation of Fountains Abbey, a house of the latter order, were instanced as typical of those which led to the erection of so many of the beautiful abbeys of Yorkshire. By means of a plan and views the various parts of a monastery were illustrated, and a description was given of the daily life of the monks. The lecture was illustrated by lantern slides, and at its conclusion a vote of thanks was proposed by Mr. H. Wilson, seconded by Mr. E. M. Gibbs, and supported by Messrs. C. Pawson, C. P. Innocent, W. J. Hale, J. R. Wigfall, and the Chairman.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—At the 8th inst., Mr. H. Percy Adams delivered a lecture on "Sanatoria, Mr. W. H. Thorp in the chair. Mr. Adams, in dealing with the general principle of a sanatorium, remarked that such institutions should serve two purposes: the healing of patients suffering from lung diseases, and also that they should act as schools where people were systematically taught the value of fresh air and cleanly habits, so that when the patients left and were distributed among the community they should spread the knowledge so acquired as well as practise it in their homes. Therefore, such an establishment should be a model of hygienic requirements. Sanatoria might generally be divided

into two classes—the American or cottage type and the concentrated or hotel type. He expressed the opinion that for the accommodation of anything like one hundred patients the hotel type of sanatorium was a practical necessity, but for small establishments of about twenty beds the cottage type was probably the best from a purely medical point of view. No sanatorium built in England on the cottage plan had more than twenty beds, but on the Continent they sometimes had more than fifty patients. He argued that there was no economy in erecting buildings of a purely temporary character, because there was so much in common between such structures and those of a permanent character. Speaking of the Germans as having been the pioneers of these institutions, many of which had been erected by the insurance companies, Mr. Adams showed views and plans on the screen of a number of these institutions, many of which he had visited, and gave many details of their arrangements. He then proceeded to give the history of the movement which resulted in the conception of the erection of the King Edward VII. Sanatorium, of which he is the architect, and gave many details of the structural features and arrangements of the establishment now approaching completion at Midhurst. Mr. E. R. Dolby, engineer, of Westminster, who has been associated with Mr. Adams in the erection of King Edward VII. Sanatorium, described details of the heating, hot-water service, and electrical arrangements of the Midhurst Sanatorium.

ENGINEERING SOCIETIES.

THE INSTITUTION OF CIVIL ENGINEERS.—At the ordinary meeting on Tuesday, the 6th inst., Sir A. Binnie, President, in the chair, it was announced that fifteen Associate Members had been transferred to the class of Members—viz., Messrs. Robert Adam, J. W. Anderson, John Cowan, Michael Elliot, C. N. Goodall, John Halliday, W. A. Harper, C. M. Herdman, E. P. Hooley, A. J. Knowles, Albert de Linde, F. H. Lives, G. T. Lynam, P. le J. de Segrain, George Watson. It was also reported that eighteen candidates had been admitted as students. The monthly ballot resulted in the election of thirteen Members—viz., R. A. Dawbarn (Sidcup), R. M. Deeley (Derby), H. E. Gwyther (Rio de Janeiro), J. L. Harrington (Kansas), H. C. Kidd (London), W. W. Lackie (Glasgow), J. B. Lewis (Melbourne), Magnus Maclean (Glasgow), C. T. Purdy (New York), F. P. Purvis (Tokio), Frank Rigby (Alsager, Cheshire), M. D. Robinson (Indwe, Cape Colony), A. M. Sillar (London); and twenty-four Associate Members—viz., M. McC. Biddler (Bangkok), T. W. K. Clarke (London), H. S. Coppock (Wales), B. D'O. Darley (India), F. T. Ercoyd (Manchester), W. P. Gauvain (Wahai, N.Z.), C. H. George (Ashton-under-Lyne), H. S. Giles (Oswestry), John Haddin (Glasgow), William Hawthorne (Kircubbin), W. C. Houston (Edinburgh), H. O. Johnson (Ystad, Sweden), H. F. Kerr (London), R. T. McKay (New South Wales), D. R. MacLachlan (Leeds), E. E. Mann (Victoria), C. H. Mitheli (Toronto), James Muirhead (Rugby), Geoffrey Parker (Alexandria), F. B. Robinson (Skipton), W. H. Stacey (Birmingham), J. N. Stirling (Govan), Gillis Svensson (Waltham Cross), P. C. Young (Baluchistan). There were elected two Associates—viz., Julio Brandão (Brazil), C. E. Hawkins (London).

COMPETITIONS.

CARNEGIE LIBRARY COMPETITION, CROMPTON.—The assessor appointed in this competition has given his awards as follows:—First (premium of 30l.), Mr. Jesse Horsfall, F.R.I.B.A., 4, Chapel-walks, Manchester; second (premium of 20l.), Messrs. A. E. Dixon, A.R.I.B.A., & Chas. H. Potter, 65, King-street, Manchester; third (premium of 15l.), Mr. Thos. J. Hill, 55 Cross-street, Manchester; fourth (premium of 10l.), Messrs. John Eaton, Sons, & Cantrell, Stamford-street, Ashton-under-Lyne. There were forty-six designs submitted. The awards were unanimously approved by the Free Library Committee, and, on the arbitrator's recommendation, it was decided to give an additional premium (30l., 20l., 15l., and 10l.,

instead of 30l., 20l., and 10l. as originally intended).

LUTON SECONDARY SCHOOL AND TECHNICAL INSTITUTION.—The design of Messrs. Spalding & Spalding, of 15, Queen-street, Cheap-side, London, for the Luton Secondary School and Technical Institution has been selected by Mr. H. Percy Adams, the assessor. The whole of the designs submitted will be publicly exhibited at the Town Hall, Luton, on the 26th and 27th inst., between the hours of 10 a.m. and 4 p.m.

BOOK RECEIVED.

BRASS AND IRON FOUNDING. By Joseph E. Dangerfield. (Dawbarn & Ward. 6d.)

Correspondence.

R.I.B.A. FELLOWSHIP.

SIR,—I am sorry that it should again be necessary to ask your assistance on this vexed question. Is it not time that the Council settled the real function and purpose of the Fellowship? Is it (1) a means of providing money for the exchequer? or is it (2) a means of keeping in check the Associates? or is it (3) a means of recognising eminence in professional work?

The recent nomination and election of the group of really leading men might imply that (3) was the motive, and that the Institute wished to honour men of power and eminence, but many of us wish to know whether the Secretary informed these gentlemen how the members of the profession have been implored and entreated to become Fellows (not, be it noted, Associates), and what a brilliant company of colleagues in the Fellowship have been and are being provided for them.

I should like to have an opportunity of expressing the wide-spread disgust and scorn with which the action of the R.I.B.A. is regarded by all whom I meet; and as showing that this is not a merely personal expression of opinion, I may state that I hold letters from most of the leading provincial allied societies strongly endorsing the protest of the Leeds and Bradford Associates, which I was instructed to forward to you and to them.

If the Institute sees fit to flout the strongly-expressed protest of the allied societies in this way, and if the London men are content to be ignored, it will become necessary, and not for the first time, for the provinces to lead; and I think I can promise them an opportunity of voting by ballot on some of the nonentities who are rushing into what was once thought to be the more honourable class of membership.

There are, of course, other methods still possible of bringing our views before the members of the Institute; and our members here feel so strongly on the matter that we intend to make the matter a test question in voting at the forthcoming Council Election.

FREDK. MURRO.

Leeds.

* * * We print the above as it appears to express the feelings of a certain number of persons; but in our opinion the wrath expressed in it is due to persons on one side, and on the other we feel quite clear Fellowship of the Council cannot be regarded as a recognition of men of eminence merely. Every competent, well-instructed, and honourable architect who has been in practice the required number of years, though he may not be an architectural genius, has in our opinion a right to election as Fellow. Fellowship of the Institute cannot be taken as the reward of genius; it is the enrolment of a competent professional man—that is all. The men who possess exceptional talent will always make their influence felt without any question whether they are doctored as Fellows or not.—Ed.

THE LATE MR. J. P. SEDDON.

SIR,—In your obituary notice of the late Mr. J. P. Seddon in last week's *Builder* it is inadvertently stated that the deceased was joint Hon. Secretary with me at the time of the transfer of the Royal Architectural Museum to the Architectural Association. Permit me to point out that owing to my absence in the year Mr. Seddon had retired from office long before the time referred to; and after attending occasionally as a member of the Council for some while, in the interval, he was elected to the honorary position of Vice-President in recognition of his past services to the Museum. It was for this reason that the Council of the Association elected Mr. Seddon as Mr. Seddon with a silver bow on the occasion to which you allude, when I also was honoured by a similar recognition (for my twenty-six years as Hon. Secretary) before the Council dissolved. I had acted alone for many a long day, and when I contemplated the gift of the Tufton-street property to the Architectural Association, Mr. Seddon as my old valued colleague, was the first person to whom I submitted the project after having obtained the approval of our President, Sir William Emerson. Mr. Seddon at once

gave the matter his warmest support, and, notwithstanding the state of his health, immediately be heard of my proposal came over specially to my house one very cold inclement Sunday to discuss the details. Subsequently under date of May 13, 1904 (when circumstances arose which I need not mention here), he wrote to me, "I never, to my knowledge, heard of any proposal to make over the Architectural Museum to the Architectural Association till you suggested it to me, and then it came quite as a novelty."
At the funeral, Mr. W. D. Caröe and Mr. G. H. Fellows Fryant were present at the church service on behalf of the Council of the Royal Institute of British Architects, and I attended as late Hon. Sec. of the late Museum. Mr. Francis Ford, the curator, also was there, but the only representatives of the profession present at the grave side when the interment took place at Fulham were Mr. D. G. Driver, the Secretary of the Architectural Association and Royal Architectural Museum, and myself.

MAURICE B. ADAMS.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—VI.

SHORT CUTS TO MULTIPLICATION (continued).

Multiplication by Certain Numbers.

To multiply any whole number by 11.

Rule.—Write down the right-hand figure of the multiplicand, and for the other figures of the product in order from the right-hand write down in succession the sums of the first and second, the second and third, the third and fourth figures of the multiplicand, until the last figure is reached. The respective sums are to be increased by any numbers carried over from the preceding additions, and the last figure of the multiplicand is to be written down with the addition of any number carried over from the preceding sum.

Example: Multiply 46257 by 11.

46257	Ordinary Method.
11	46257
508827	46257
	46257
	508827

To multiply any whole number by any number from 12 to 19 inclusive.

Rule.—Starting from the right-hand multiply the first figure of the multiplicand by the first figure of the multiplier; multiply the second figure of the multiplier, adding in the first figure of the multiplicand; continue the process until the last figure of the multiplicand has been so dealt with. Then (1) if the last-obtained figure of the product is under 10, write to the left of it the last figure of the multiplicand; or (2) if the last multiplication and addition give a number of two figures, add to the left-hand figure of that number the last figure of the multiplicand.

Example (1): Multiply 20657 by 14.

Here the process is as follows:—
7 x 4 = 28, write down 8 and carry 2; 2 + (5 x 4) + 7 = 29, write down 9 and carry 2; 2 + (6 x 4) + 5 = 31, write down 1 and carry 3; 3 + (0 x 4) + 0 = 0, write down 0; and finally (2 x 4) + 0 = 8, which is also written down.

Thus the product so obtained is 89198, and writing to the left-hand of it the left-hand figure of the multiplicand we get 289198, which is the required product.

Example (2): Multiply 24657 by 17.
Here the process of multiplication is performed as in Example (1), giving 219198, the last-obtained number being 21. To the left-hand figure of this add 2, the last figure of the multiplicand, making the final product 419198.

To multiply by 11 any whole number of two figures whose sum does not exceed 9.

Rule.—Write down the sum of the two figures between the two figures themselves.

Example: Multiply 54 by 11.
Here 5 + 4 = 9, which placed between 5 and 4 gives the product 594.

To multiply by 11 any whole number of two figures whose sum exceeds 9.

Rule.—Write down the sum of the two figures between the two figures themselves, and increase the left-hand figure of the product by the number carried over from the addition of the two figures.

Example (1): Multiply 64 by 11.
Here 6 + 4 = 10, which placed between 6 and 4 gives 6(10)4 = 704.

Example (2): Multiply 96 by 11.
Here 9 + 6 = 15, which placed between 9 and 6 gives 9(15)6 = 1056.

To multiply by any multiple of 11 not exceeding two figures any whole number of two figures.

Rule.—Write down the sum of the two

figures after multiplication by the number representing the multiple of 11 between the two figures after similar multiplication.

Example (1): Multiply 34 by 22.
Here twice 3 and twice 4 = 6 and 8 respectively and their sum = 14, which placed between 6 and 8 gives 6(14)8 = 748.

Example (2): Find the square of 22.
Here the two outer figures of the product are evidently 4 and 4, and as the sum of these figures is 8, we get 484, which is the required square.

Example (3): Multiply 33 by 22.
In this case twice 3 and twice 3 = 10 and 6 respectively, which can be written down or mentally noted as the two outer figures of the required product. The sum of these figures = 16 gives 6 as a figure of the product, the two last figures being 69, while the first two figures will be 10 + 1 carried from 16, and the required product of 726 is thus obtained.

Example (4): Multiply 19 by 33.
Here the products of 1 and 9, multiplied by the figure representing the multiple 33, are 3 and 27 respectively, and the sum of these = 30. Therefore, we can write down or mentally note, 3, 30, and 27, giving the clue to the required product, which, commencing at the right-hand side, obviously includes:—In the first place, 7; in the second place, 2 carried over from 27; and in the third place, 3 plus the 3 carried over from the 30. Thus we get 627 as the product.

Example (5): Find the square of 33.
Here the outer figures of the product are evidently 9 and 9, and as the sum of these figures is 18 we get 9(18)9, which obviously gives 10, 8, and 9, or 1089 as the required square.

It is unnecessary to give further examples of this simple rule, which can evidently be applied with great readiness to any of the lower multiples of 11.

To multiply any whole number by 11·25, 112·5, 1125, and so on.

Rule.—Add to the multiplicand one, two, or three, or more ciphers, according as the multiplier represents tens, hundreds, thousands, and so on. To the number so obtained add one-eighth of that number, and the sum will be the required product.

Example: Multiply 1872 by 11·25.

1872
2340
21060

To multiply any whole number by 12·5, 125, 1250, and so on.

Rule.—Add as many ciphers as there are figures in the integral part of the multiplier. Then one-eighth of the number so obtained will be the required product.

Example: Multiply 1872 by 12·5.

187200
23400
210600

To multiply any whole number by 13·3, 133·3, 1333·3, and so on.

Rule.—Add to the multiplicand one, two, three, or more ciphers according as the multiplier represents tens, hundreds, thousands, and so on. To the number so obtained add one-third of that number, and the sum will be the required product.

Note.—This rule is also useful for rough approximations where the multiplier is between 13·25 and 13·5, or between higher decimal values of the same figures.

Example: Multiply 1872 by 13·3.

187200
62400
249600

To multiply any whole number by 14·2857, 142·857, 1428·57, and so on. (Approximate.)

Rule.—Add to the multiplicand as many ciphers as there are figures in the integral part of the multiplier. Then one-seventh of the number so obtained will be the required product.

Note.—This rule is also useful for rough approximations where the multiplier is between 14·25 and 14·5, or between higher decimal values of the same figures.

Example: Multiply 1872 by 14·2857.

1872000
26742857

To multiply any whole number by 15, 150, 1500, and so on.

Rule.—Add to the multiplicand one, two, three, or more ciphers, according as the multiplier represents tens, hundreds, thousands, and so on. To the number so obtained add one-half of that number, and the sum will be the required product.

Example: Multiply 1872 by 15.

187200
93600
280800

To multiply any whole number by 16·6, 166·6, 1666·6, and so on.

Rule.—Add to the multiplicand as many

ciphers as there are figures in the integral part of the multiplier. Then one-sixth of the number so obtained will be the required product.

Example: Multiply 1872 by 16·6.

6)187200
31200

To multiply any whole number by 17·5, 175, 1750, and so on.

Rule.—Add to the multiplicand one, two, three, or more ciphers according as the multiplier represents tens, hundreds, thousands, and so on. To the number so obtained add one-half and one-fourth of that number, and the sum will be the required product.

Example: Multiply 1872 by 17·5.

Adding one cipher and adding one-half and one-quarter of 18720 we get:—
18720
9360
4680
32760

To multiply any whole number by 25.

Rule.—Add two ciphers to the multiplicand; then one-fourth of the number so obtained will be the required product.

Example: Multiply 1872 by 25.

4)187200
46800

To multiply two mixed numbers each ending with the fraction 1/2 (= 0·5).

Rule.—To the product of the two integral parts add half their sum and the fractional part (= 0·25).

Example: Multiply 15 1/2 by 10 1/2 (= 15·5 x 10·5).

Then
(15 x 10) = 150 = 150
1/2(15+10) = 12 1/2 = 12·5
1/4 = 0·25
162 1/2 = 162·75

To multiply any whole number by 33·3, 333·3, 3333·3, and so on.

Rule.—Add to the multiplicand as many ciphers as there are figures in the integral part of the multiplier. Then one-third of the number so obtained will be the required product.

Example: Multiply 1872 by 33·3.

Adding two ciphers and dividing by 3, we get:—
3)187200
62400

To multiply any whole number by 35, 350, 3500, and so on.

Rule.—Add to the multiplicand as many ciphers as there are figures in the multiplier; divide the number so obtained first by 4, and then by 10. The sum of the two quotients will be the required product.

Example: Multiply 1872 by 35.

Adding two ciphers and proceeding as stated above we get:—
4)187200
46800
18720 = (187200 ÷ 10)
65520

To multiply any whole number by 75, 750, 7500, and so on.

Rule.—Add to the multiplicand as many ciphers as there are figures in the multiplier; divide the number so obtained by 2, and divide the quotient by 2. Then the sum of the two quotients will be the required product.

Example: Multiply 1872 by 75.

2)187200
93600
46800
140400

Multiplication by various other numbers can be performed in a manner similar to that embodied in the foregoing rules.

OBITUARY.

MR. BROWN.—Mr. Oswald Brown, M.Inst.C.E., who died on February 10, in his fifty-ninth year, at his residence, Silvertown, Wimbledon, was a son of the late Mr. Joseph Brown, K.C., of Avenue-road, St. John's Wood. He was elected member of the Institution of Civil Engineers in 1879. On leaving King's College, London, he entered the service of Messrs. James Simpson & Son. He then took charge of the erection of the pumping plant, Berlin waterworks, and of the waterworks at Gelatz. As hydraulic engineer to the government, South Australia, he carried out the deep drainage scheme for Adelaide. Mr. Brown enjoyed an extensive practice in London as a consulting engineer, chiefly for water supplies; and he designed the waterworks for Pernambuco. **MR. EDWARD TAYLER.**—We regret to announce the death, at the age of seventy-seven, of Mr. Edward Tayler, the well-known miniature painter.

He was born at Berne, and studied art for a short period at Nottingham, afterwards coming to London, where he paid special attention to miniature painting with great success, eventually adopting this as his profession. For over half a century his beautiful miniatures and water-colour drawings have been known to the public, and for thirty consecutive years he was an exhibitor in the Royal Academy. He was also the Honorary Treasurer and one of the Founders of the Royal Society of Miniature Painters, and in the present exhibition of the Society three of his works occupy a place of honour.

MR. PEEL.—The death, on January 28, at Reading, is announced of Mr. James Peel, aged ninety-four years, one of the oldest members of the Royal Society of British Artists. Mr. Peel was a native of Newcastle, and began his studies under the elder Dalziel. When twenty-nine years old he removed to London as a portrait-painter. He soon, however, devoted himself to landscape painting, and frequently contributed to the Royal Academy and Suffolk-street Exhibitions.

MR. CHANEY.—Mr. H. J. Chaney died on February 13. He was during many years Superintendent of the Standard (Weights and Measures) Department of the Board of Trade, Old Palace-yard, Westminster, and was lately decorated with the Imperial Service Order.

GENERAL BUILDING NEWS.

CHURCH, BURTON-ON-TRENT.—The contracts for the new church of St. Chad, Burton-on-Trent, have been let. The principal contractors are Messrs. Wilcock & Co., of Wolverhampton. The architect is Mr. C. F. Bodley, R.A., and the church will be of Hologram stone, both inside and out, and will be in the late Decorated style. The nave is to be 85 ft. long and 25 ft. wide, and the chancel will be 46 ft. by 12 ft. There will be a chapel with a length of 52 ft. and a width of 15 ft. 9 in. The church will be provided with a square tower rising to a height of 70 ft. The building will seat 750 persons.

CHURCH EXTENSION, ADEBSHOT.—A Commission appointed by the Bishop of Winchester reports that there is pressing need of increased church accommodation in the town, where the civilian population amounts to nearly 20,000 persons. The Commission recommends that the parish church should be enlarged, and that a new church should be built, at an estimated outlay of 8,000l. The scheme has been referred to Mr. T. G. Jackson, R.A., and a building fund has been opened, to which 1,400l. is already subscribed.

CHRIST CHURCH, SHAW, WILTS.—This church has been formally re-opened by the Bishop of Salisbury. Under the direction of Mr. C. E. Ponting, the architect, the west wall of the church has been removed to allow of an extension of the nave. A new apsidal sanctuary has been built in place of the shallow recess in which the altar, originally stood; pillars and arched traces and cloisters of oak have been erected to form nave and aisles, and a new oak roof has been fitted. The new church has been enclosed on three sides by oak screens, and a new oak reredos has been added, consisting of a large central panel, designed to hold the figure of the Crucified Lord, with six smaller panels on each side holding figures of the twelve Apostles. A scheme for filling the windows with stained-glass has been drawn up, and in accordance with this, one of the windows on the north side, representing St. Aldhelm, has been carried out by Mr. Horace Wilkinson, as a memorial presented by the family of the vicar.

BRIDLINGTON NEW CONGREGATIONAL CHURCH.—On the 1st inst., at Bridlington, the foundation-stone of a new Congregational church was laid on a site on the Elms estate, facing St. John-street. The new building will accommodate 240 worshippers, and a schoolroom will be attached, which on occasion may be used as an extension of the church by means of a sliding partition. The architect of the new buildings is Mr. Joseph Shepherdson, Bridlington.

ART SCHOOL, BURSELEM.—The foundation-stone has just been laid of a new school of art, Burslem, as an addition to the Wedgwood Institute. The Town Council has obtained powers to raise a loan of 8,000l. for building purposes, etc., and the building contract has been let to Messrs. W. Grant & Sons for 6,500l. The designs for the new building have been prepared by Mr. A. R. Wood, and they show that the new school will be arranged on the central hall plan.

St. HELEN'S GIRLS' SCHOOL, ABERDEEN.—The new buildings, in Shippon-road, for the school, conducted by the Wantage Sisters, have just been completed, at a cost of about 30,000l., after Mr. F. L. Pearson's plans and designs. They will accommodate forty boarders and 200 day scholars, and comprise a chapel, school-hall with gallery, laboratory, dormitories wherein each child has its own window, community and recreation rooms, and an isolated infirmary having its own kitchen. The general plan is on the central hall system.

COUNCIL SCHOOLS, BLAENAVON.—The new Hillside Council Schools at Blaenavon have just

been opened. The new buildings, which have been erected at a cost of about 7,000l., comprise a mixed school with accommodation for 250 children and an infants' school to accommodate 150 children. The buildings are heated on the low-pressure hot water system, and the schools have been built of St. Julian red bricks, with Forest of Dean stone dressing, by Mr. Charles Cooke, Hereford, from designs by Mr. J. B. Francis, architect, Abergevenny.

BYFLEET NATIONAL SCHOOL.—Since the end of November, the Byfleet National School has been closed for alteration and enlargement, and it was re-opened recently. As enlarged, the school will be recognised by the Board of Education as providing accommodation for 367 children, consisting of 239 mixed boys and girls and 128 infants. This number exceeds the original accommodation by about 140 places. Two new classrooms have been built, and the infants' schoolroom has been enlarged. A central hall, 40 ft. by 22 ft., has been provided, and new cloakrooms and lavatories for the boys and infants, while one of the old classrooms has been converted into a girls' cloakroom and lavatory. The building will be heated by open fireplaces. The alterations involved pulling down the master's house, which abutted on the old school. The sanitary arrangements have been entirely remodelled. The contract price for the work was 2,251l., and the whole of the work is being carried out by Messrs. Martin, Wells, & Co., of Aldershot, from the designs of Messrs. Jarvis & Richards, architects, London.

COUNCIL SCHOOLS, BARNSTAPLE.—The Mayor of Barnstaple recently laid the foundation-stone of the new Council schools in Ashleigh-road. The buildings are being erected by Messrs. Henry Stirling & Son, builders, from designs by Mr. Arnold Thorne, architect.

THE CAUSEWAYSIDE LADS' INSTITUTE, EDINBURGH.—New premises are to be erected for this institute on a site in Causewayside. The building has been planned and designed by Mr. de Spigarnovitch and Mr. J. McLeod, Mr. Robert R. Hogg acting as surveyor. It will contain on the ground floor a refreshment-room and kitchen, waiting-room, lavatory, etc. The first floor will consist of a gymnasium and hall, and on the second floor, which will be partly lit from the roof, there is provision made for a workroom and a games-room. The two entrances on the stair landings will form a bathroom, lavatory, etc. It is intended to heat the building with hot-water pipes. The cost of the premises complete will be about 1,500l.

CENTRAL WESLEYAN HALL, GREENWICH.—The adaptation of the Wesleyan church in London-street, Greenwich, to the purposes of a central hall for the district has now been completed. The work was carried out at a cost of 5,000l. from designs by Mr. George H. Oatley, architect.

BUSINESS PREMISES, WIGAN.—New offices have been opened by the Prudential Assurance Company in Library-street, Wigan. Mr. W. C. Ralph was the architect for the work, the contractor being Mr. W. Johnson.

BIDEFORD IMPROVEMENTS: NEW MUNICIPAL BUILDINGS, ETC.—Visitors during the present year to Charles Kingsley's beloved "little white town on the hill" will not fail to notice decided evidences of advancement in Bideford's architectural attractions. The beautiful statue of Charles Kingsley on the river bank at the Park entrance, which was unveiled by Lord Clinton on February 7, is the first monument of its kind erected in Bideford. On the same day was formally opened the new Municipal Buildings and Free Library, situated at the west end of the Long Bridge and adjoining the Fowl Hall. The new buildings are one story in height and in Elizabethan-Gothic style, and are from designs by Mr. A. J. Dunn, of Birmingham, the work being carried out by Mr. H. Glover, of Bideford, whose tender was 5,492l. In adding the new premises, some of the alterations which have been made to the old Town hall, and the seating accommodation in the Petty Sessional room has been increased, whilst the system of hot water heating installed in the new portion has been extended to the Town Hall. The new buildings occupy a frontage of 31 ft. on Bridge-street, and 108 ft. on the New-road. The stonework at the base is in grey Foresters' Dean stone, and the upper portions of the buildings are of bricks with Monk's Park freestone dressings. A loaded turret is one of the most striking portions of the exterior. The new Council Chamber is 29 ft. by 26 ft., and 24 ft. in height. Below this are rooms designed as offices. The entrance to the library and reading-room is the New-road, facing the river. The reading-room is 34 ft. long, by 23 ft. wide, and 19 ft. in the clear of the wagon-head roof.—*Western Morning News.*

EPISCOPAL RESIDENCE, SOUTHWELL.—The Bishop of Southwell laid the foundation-stone of a new episcopal residence at Southwell. The new house is the design for which is Mr. W. D. Carie, has been planned so as to incorporate the ancient hall which was restored by Bishop Trollope in 1884, as well as

the old palace now in ruins. The form of the old building will not be altered, and the new part is designed on simple lines.

PROPOSED EXTENSION OF THE DEWSBURY WORKHOUSE INFIRMARY.—Mr. G. A. Fox, architect, attended the meeting of the Dewsbury Board of Guardians on the 2nd inst. to explain the plans of the proposed extension of the Workhouse infirmary. He stated that, basing his estimate on what had been done previously, the cost would amount to 100l. per bed. There were ninety-four beds. In reply to questions, Mr. Fox said they could reasonably hope to complete the work for 10,000l. The plans were approved, and it was decided to forward them to the Local Government Board.

GRAND SURREY CANAL, CAMBERWELL.—A new foot-bridge across the canal, affording means of access between St. George's-road and Neate-street, was opened on January 29. It consists of a steel lattice girder bridge, having three spans, and with the approaches is 410 ft. long. Messrs. Henry Woodhull & Sons, of Catford, were the contractors for the entire work, upon a contract for 3,969l., and the designs were prepared by Mr. William Oxtoby, Engineer to the Camberwell Borough Council.

ROWTON HOUSE, NEWCASTLE-ON-TYNE.—A new Rowton House has just been opened at the top of Dog Bank, Lower Pilgrim-street, Newcastle, for the Northern Rowton Houses, Ltd. The building, which exteriorly is of red brick, is of three stories, containing 254 cubicles, or separate chambers. The whole of the doors and staircases are of ceramic tile, the former being covered with wood sheathing. On each landing there are three water hydrants—there being fifteen altogether in the building—with the necessary hose, so that a copious supply of water can be instantaneously at command, and there are two emergency staircases, one at either end. The entrance to the building is in the former being in Dog Bank, and leads immediately to the office, where tickets are taken. From this office the whole of the telephones and electric lighting throughout the building are controlled. Turning to the right after passing the turnstile the visitor reaches the kitchen, sculleries, cooking ranges. At this end of the building also are the crockery, blanket, linen, and other stores, a disinfecting chamber, hot-water boiler-rooms for heating purposes, the staff women's bedrooms, wash-houses, etc., and there are also lifts for sending up to all the floors the blankets, linen, etc. There are four large bath-rooms, and several ranges of hand and foot washing basins in different parts of the house, all of which are lined with white enamelled tiles. On the left of the main entrance is a recreation-room, a library, and a small writing-room. At the front of the building facing the river is a balcony, on which seats are provided. The building has been designed by Mr. J. C. Maxwell, architect, the contractor being Mr. S. F. Davidson, Newcastle.

MASONIC CLUB, NORWICH.—A new club for the Freemasons of Norwich and Norfolk has been erected at 47, St. Giles's-street, Norwich, from competition plans prepared by Mr. A. C. Havers, architect. The facade is classic in character, and is carried out in Monk's Park stone, with parts in Portland stone. The rooms for the club members are all on the ground floor, and those for the different lodges and chapters on the first floor, being approached by a staircase from the entrance hall. The kitchen, scullery, and domestic offices are on the second floor, the approach being by secondary or service staircases from the back hall adjoining the staircase hall. The service bedrooms and linen store are on the top floor in close proximity to the kitchen and domestic offices, but on a higher level. The following firms have been concerned in the work: Messrs. John Young & Co., builders; Chas. Payne & Co., electric light; Ellis Geary & Co. London, flooring; Kite & Co., London, heating and ventilation; Watson & Kirby, Norwich, paper hanging, electric bells, lavatories, and lifts; Chas. Havers & Sons, stoves, etc.; Mr. Arthur H. Norwich, Grouse plaster ornamentation; and Mr. Geo. Boston, furniture ornamentation.

MITCHELL LIBRARY, GLASGOW.—The new building for the Mitchell Library in Glasgow will occupy a site in North-street, to the east of the St. Andrew's Halls, and extending from Berkeley-street to Kent-road. The length of the building from north to south is about 189 ft., and the depth from east to west about 105 ft.; and there will remain a considerable space between the library and the halls available for extension of the library in the future. The accommodation provided includes a main reading hall, 11 ft. by 51 ft., arranged for 300 readers; students'-room for 50 readers; ladies'-room for 50 readers; magazine-room for 200 readers; and suitable apartments for the Jeffrey Reference

Library, for the Glasgow Collection, and for the Burns' Library and Scottish Poets' Corner. Provision is made for the storing of about 400,000 volumes, and for the necessary administrative offices. The estimated cost of the building as approved by the Corporation is 52,850l. The architect is Mr. William B. White, of Glasgow.

ASSOCIATED, LIVERPOOL.—In terms of the will of the late Mr. William Buckwell, of Deptford, a portion, amounting to about 15,000l., of his residuary estate will be expended upon the building and endowment of memorial almshouses at Lingfield, Surrey, for the poor of Lingfield and Deptford.

PROPOSED PAVILION, LANCASTER.—It is stated that Lord Ashton intends to present to Lancaster a structure which will be erected in the park, and, in fact, work has already begun. The structure is from designs by Mr. John Belcher, of London, who has prepared a model for the Academy. The structure will be reached by flights of steps, and is surrounded by a terrace about 70 ft. above the lower level of the park. The lower hall is 5 ft. 6 in. above the terrace level, is 42 ft. in diameter, and the same in height, with an octagonal dome. From this hall there are two staircases leading to the upper stage and also into the main domed chamber. Another staircase leads from this hall to the higher galleries, and it also provides communication with the four angle terraces. There is a third gallery above the upper colonnade, which surrounds the drum of the dome. At this level there will be four groups of stately, illustrating "Commerce," "Industry," "Science," and "Art." The sculpture work has been entrusted to Mr. Herbert Hampton. An iron staircase leads through the dome to the belvedere, 118 ft. above the level of the terrace. The total height to the vane is 220 ft. from the ground below the main stairway. At the base of the main steps, and enclosed by the two semi-circular flights, is an ornamental water, 51 ft. long by 20 ft. wide, with a niche under the landing, at present shown with a figure of Atlas. The main building is to be constructed externally of Portland stone.

STAINED GLASS AND DECORATION.

LIVERPOOL CATHEDRAL.—It is announced that Mr. S. J. Waring (of Waring & Gillow, Ltd.) and his sons will present an entire set of choir stalls—to be executed after designs by Mr. G. F. Bodley, R.A.—to commemorate the firm's long connexion with the city of Liverpool, where their business was first established. It is anticipated that the carving of the stalls will be executed in Messrs. Waring & Gillow's workshops at a cost of nearly 8,000l.

MARLBOROUGH CHURCH, NORFOLK.—A memorial window has been placed in the parish church of Marlborough, Wiltshire, in memory of Sub-Lieutenant E. Travers Flotcher, R.N., who was lost in his ship, *Submarine A3*, last summer. The window, erected by his brother officers of his rank, is emblematical of "Hope," and was executed by Messrs. James Powell & Sons, of Whitefriars, E.C.

BURTONUPON AVON, CHESHIRE.—A stained-glass window, by Mr. Edward Frampton, of Pimlico, has been set up in the chancel of St. Boniface parish church, Bunbury, near Tarporley, in memory of Dr. J. Everett Dutton, who died from fever at Kosongu, Central Africa. The design represents "Christ healing the sick."

FORDCOMBE GREEN, BRISTOL, WELLS.—Under the supervision of Mr. C. H. Fellows Prynne, architect, Messrs. Percy Bacon & Brothers have just executed and erected in this church at Fordcombe Green a large three-light stained-glass east window. The central light contains Our Lord in Majesty surmounted by an angel; at the foot are S. Gabriel and S. Michael—the side lights contain figures of the Virgin and S. John in the top portions, with S. Augustine of Canterbury and S. Mildred (founder of Minster Abbey) in the lower parts.

MEMORIAL WINDOW, BARKINGSIDE.—The Bishop of Barking recently unveiled the window which has been erected in Barking-side Church in memory of the late Mr. George Henry Ingram. The window is placed in the north wall of the church, the chief figure being Christ healing the sick. It was designed and executed by Mr. Hemmings, London.

SANITARY AND ENGINEERING NEWS.

ARMSTRONG COLLEGE, NEWCASTLE.—The Council have resolved to establish a Chair of Civil Engineering, and have voted a sum of 2,600l. towards new electrical engineering laboratories in the college. Two scholarships of 125l. per annum apiece will be offered, in competition, to the graduates, in aid of the prosecution of definite research.

COMBINED DRAINS.—The General Purposes Committee of Wandsworth Borough Council has decided to draw the attention of the Local Government Board to the unsatisfactory state of the law with regard to combined drains. It is asked that the matter may be considered with the view of

Bill being introduced next session to amend the law.

MANCHESTER SHIP CANAL.—The half-yearly report of the engineer states that twelve new cottages for the accommodation of the Company's workmen at Eastham have been completed and are in use. The lay-bye above Eastham Locks is practically complete, and the sheers alongside for removing and relaying steamers' funnels have been satisfactorily worked. The works for the extension of the wharf and lay-bye at Warrington have been completed and are in use. All the leading jetties at the locks have been completed. At Partington cooling basin the two additional hoists on the northerly and southerly sides of the canal, with the approaches thereto, have been completed and are in use. The new hydraulic power station has also been completed and is in use. Additional railway sidings at Barton and Trafford Wharf have been completed and are in use. The work required for the increase in the depth of the canal to 28 ft. from Latchford Locks to Manchester, is progressing steadily. Several of the works required in order to permit of the level of the water in the estuary section of the canal being raised so as to give a minimum depth of 28 ft., have been completed, and the others are in hand.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The practice of the late Mr. W. J. H. Glynn, architect and surveyor of 37 and 39, Essex-street, Strand (and formerly of 39, Essex-street), has been taken over by Messrs. Hukins & Mayell, architects and surveyors, of 76a, Westbourne-grove, W., who will continue the practice at the same offices as before.

ROYAL SANITARY INSTITUTE.—At an examination in sanitary science as applied to buildings a public works held at Glasgow on February 9 and 10, one candidate, Mr. David Miller (Glasgow), presented himself, and was granted a certificate.

GOLDSMITHS' COLLEGE, NEW CROSS.—The Goldsmiths' Company have agreed to contribute a further sum of 1,558l. in addition to their previous endowment of the College, in order to defray the cost of equipping the buildings in complete working order.

MEMORIAL TO THE LATE DR. W. REA, JESMOND.—There has just been erected in the old Jesmond cemetery a memorial of the late Dr. William Rea, the musician. It takes the form of a headstone, 7 ft. high, with bronze inscriptions surrounded by a wreath. The stone was designed by Mr. Rob North, architect, of Clifford's Inn, and the bronze relief by Mr. Frank Derwent Wood, sculptor.

CONFERENCE OF METROPOLITAN BOROUGH COUNCILS.—The Lambeth Borough Council have invited the various metropolitan borough councils to send delegates to a Conference which it is proposed to hold at the Lambeth Town Hall with the purpose of framing and establishing a uniform scale of trade-union rates of wages and conditions of service for the workmen employed in each department of the several borough councils.

DIARY AND HANDBOOK OF THE LONDON MASTER BUILDERS' ASSOCIATION.—The London Master Builders' Association have just issued their Diary and Handbook for 1906, and we are glad to call attention again to a well-arranged and useful little work. It contains the names of the officers and members, and a short history of the Association; a summary of working rules and agreements; a list of Conciliation Board decisions; a comparative statement showing the hours worked per week and the rates of wages per hour in various towns; a number of useful tables; some electrical notes and a glossary of electrical terms, and much official and other information which a builder or contractor is likely to want from time to time. The price of this excellent little book is 2s. 6d., and it can be obtained at Nos. 31 and 32, Bedford-street, Strand.

THE SECREPHONE.—This is a simple appliance, made by the Secrephone Company of Coleman-street, London, for securing that conversations at the telephone will not be overheard. It can be easily fitted to the transmitter or mouth-piece of any kind of telephone. By its use it is possible to carry on a conversation at a desk telephone, when other people are in the room, without being overheard. The only drawback to its use apparently is the condensation of moisture on the mouth-piece. The company therefore supply an antiseptic absorbent paper lining which can be readily fitted in and removed from the mouth-piece.

ROYAL ARTILLERY WAR MEMORIAL.—The Royal Artillery South African memorial which is to be erected at the corner of the Mall and the road leading to Storey's Gate will consist of two groups, one of a gun in action and the other of a limber with a pair of horses and one driver. The sculptor is Mr. Colton.

RUSKIN'S HOME IN VENICE.—A memorial tablet has been affixed on the front of the inn occupied by Ruskin in the interval 1877-82. The inscription states that the tablet is erected by the grateful city of Venice to his memory.

LONDON BRIDGE: OLD AND NEW.—A set of pencil drawings by E. W. Cooke, R.A., which Sir David Salomon presented to the Corporation some thirty years ago, have been hung in the corridors of the committee-rooms in the Guildhall. The drawings delineate, with much detail, the demolition of old London Bridge, and the building of its successor. They include views of the St. Thomas's crypt and Chapel pier with the derrick used for drawing the piles of the starlings; the longitudinal arch over Nonesuch lock; the ribbed middle arch, 18 ft. wide, of Long Entry lock; with the cavity of the chapel and additions made from time to time; the alternate polygonal and squared pier-heads; the Shore, Mill, Chapel, King's, Draw, St. Mary's, and others of the originally twenty locks (or arches); and old Fishmongers' Hall. They are valuable, moreover, as a record of riverside scenes, and of shipping and river traffic, under conditions which have ceased to exist. The Grace Collection contains some prints, 1827-32, after E. W. Cooke and W. Knight, of the old bridge, together with Major Yates's water-colour drawings showing the former approaches, etc.

FIRST GARDEN CITY, LTD.—At the recent second annual general meeting, presided over by Mr. Ralph Neville, K.C., the directors' report for the twelve months ended on September 30 was adopted. The report sets forth that a large number of workmen's cottages will be created during the current year, mostly by the Garden City Tenants, Ltd., and that many of the workmen employed by the Garden City Press, Ltd., Messrs. Vickers & Field, asphalt makers, and others, are arranging for the building of their own homes. The total resident population now exceeds 1,500, and houses are required at once for 100 more families. The Heatley-Gresham Engineering Co. settled on the estate in October and, when their works are removed from Bassingbourne, will employ 150 men there. A public elementary school is provided; gas-works have been erected; twelve miles of water-mains are laid; about 280 houses have been erected, representing a capital value of some 90,000l.; and covenants have been ratified for the erection of an additional 150 houses, shops, etc. The total number of workmen employed on the estate in factories, building operations, workshops, and so on is about 500.

EAST END DWELLINGS COMPANY.—From the report to be submitted to the twenty-third ordinary general meeting of the Company on the 19th inst., we learn that "Evesham Houses," the new buildings in Old Ford-road, Bethnal Green, were finished early in the summer, and, with the exception of some of the larger tenements, were rapidly taken up. There has been a marked improvement in the letting of the Company's buildings in and near Victoria Park-square and Globe-road, Bethnal Green. As cottages appear to be more popular in Bethnal Green than tenements in block buildings the directors, with the concurrence of the freeholders, decided to build cottages on some of their leasehold land in that district, and at the close of the year eleven were approaching completion. There are a number of applicants for these cottages, and it is expected that they will let at remunerative rents as soon as they are ready.

SHEFFIELD MASTER BUILDERS' ASSOCIATION.—The annual general meeting of the members of this Association was held recently at the Builders' Exchange, Cross Burgess-street. At the commencement of the proceedings, Mr. Arthur Mastin, the retiring President, occupied the chair. Mr. T. Roper was unanimously elected President for the ensuing year, and was invested with the badge of office by Mr. Mastin. Mr. G. E. Powell was elected senior Vice-President, and Mr. T. Eshelby junior Vice-President. Mr. Arthur Mastin was re-elected treasurer, and Messrs. William May and H. H. Hodkin, auditors. The following formed the committee:—Messrs. J. Longden, J. Biggin, A. J. Forsdike, J. D. Cook, A. Mastin, F. Fidler, H. H. Hodkin, F. Turner, W. Kirkham, J. Vasey, J. S. Teasby, J. Dawson, jun., Charles Roberts, Walter Shaw, J. C. Waring, W. May, G. H. Bown, and W. W. Mears. The deputy treasurer (Mr. J. D. Cook) presented the accounts for the past year, and they were approved. The annual dinner was fixed for March 8. Votes of thanks were unanimously passed to the retiring President, the auditors (Messrs. W. May and H. H. Hodkin), and the deputy treasurer.

BATH MASTER BUILDERS' ASSOCIATION.—The annual dinner of the Bath Master Builders' Association was held at the Assembly Rooms on the 6th inst., the company numbering about 100. Mr. William Webb, the President, had on his right the Mayor (Mr. C. B. Oliver) and the Town Clerk (Mr. F. D. Wardle), and on his left his immediate predecessor (Mr. F. J. Blackmore) and the President of the Bristol Association, Mr. Alfred W. Willis proposed (after the loyal toasts had been honoured) "The Mayor and Corporation of Bath." The Mayor (Mr. Oliver), in his reply, said that one work of the Corporation which touched the building trade had not been met with the success anticipated—he referred to

the building by-laws, and he hoped some way might be found to make operations easier for architects and builders.—The Town Clerk also replied. He said that those who had anything to do with municipal work knew most positively that whoever went on to a council sacrificed time and sacrificed money, because it was an absolute fact that nobody who was on the Council could avoid losing contracts and opportunities of doing business with the body that he served on owing to the strictness of the law.—Alderman Moore proposed "The West of England and South Wales Federation," coupled with the names of Mr. E. W. Wooster, who is President of the Federation, and of Mr. W. F. Long, also of Bath, who is both solicitor and secretary to the Federation.—Mr. Wooster, in reply, acknowledged the honour which had been paid him by the Federation in placing him in the Presidential chair. He recognised that in the south-west they were not so efficiently organised as in London and the north. There were difficulties geographically, but there were hopes now that a central secretary in London had been appointed that they would improve in this matter. Mr. Wooster dealt with the advantages made associations and federations brought to the individual, and placed high among these advantages the fact that it made them known to each other. He regretted that the advantages could not be extended to lessening competition and increasing profits.—Mr. W. F. Long, also responding, described the Federation as a sort of court of appeal, and it was one of the cheapest in the land. "The object was endeavouring to bring about universally the improved principle that the quantities should form part of the contract, or should be guaranteed by the architect or quantity surveyor. The principle of conciliation was also foremost among the objects sought by the Federation."—Mr. George Hayward proposed "Kindred Associations."—Mr. J. Howard, President of the Bristol Association, in reply, referred to the happy relations which had long existed between Bath and Bristol builders. He believed that properly conducted trade unions were for the benefit of the working men, but the great evil in the building trade had to cope with was the limitation of output, and the curtailment of men's energy.—Mr. R. F. Ridd, the incoming President at Bristol, and Mr. G. H. Perrin also replied.—The Mayor briefly proposed the "Bath Master Builders' Association." Reference had been made to the subject of quantities as being a vexed one. There was no reason why quantities should not form part of the contract, but it was the builders' business and not the architects'. If the builders said they would not enter into contracts unless quantities formed part of the contract, the thing was done, and it would only be an equitable arrangement between architect, builder, and client.—The President suitably replied.—Mr. J. Howard proposed "An Immediate Past President."—Mr. Blackmore, in reply, commented on the very admirable relations which existed between members of the Association.—Mr. Erwood then proposed the toast of "The Architects, the Engineers, and Surveyors," and congratulated them upon the selection of one of their number to fill the office of Mayor, and of another to be a member of Parliament (Mr. T. B. Siccock).—Mr. H. W. Matthews and Mr. C. J. Calvert replied.—The last toast of the evening was that of "Our Honorary Members and Visitors," proposed by Mr. C. H. Long.—Mr. Cotterell, in reply, said he had listened in vain for much allusion to the state of the trade. He thought they could say truthfully that there were unmistakable signs of a revival in the building trade. Schemes which had been pigeon-holed for a long time were being brought out and examined.—Mr. H. W. Dodge also responded.

BRITISH FIRE PREVENTION COMMITTEE.—The tests arranged for next week include on Wednesday the 21st, two tests with Kinnear Roller shutter doors, the first with a double door (starting at 9 a.m.) and the second with a single door (starting at 10.30 a.m.). There will also be a test with a floor by the New Expanded Metal Company, this being a reinforced brick concrete floor supported by protected girders. This starts at 1 p.m. On Thursday, the 22nd, there will be a test with a non-proprietary system, namely, with a clinker concrete floor supported by broad flange girders, protected by coke breeze concrete. This test starts at 1 p.m. There will be a limited number of cards available to architects, engineers, and surveyors holding public appointments, and the officials of Fire Insurance Companies. Applications for these should be made in writing to the Assistant Secretary, 1, Waterloo-place, Pall Mall, S.W., by Monday, February 19th latest.

A CHURCH STRUCK BY LIGHTNING.—The parish church of St. Edith, Anwick (a village five miles from Sleaford, Lincolnshire), the spire of which was struck by lightning during the thunderstorm on Thursday last week, is a building in the Decorated period, and is, with the exception of the north doorway and arcade, the work of the XIVth century. In consequence of the condition of the church Messrs. Brewell & Baily, architects, Nottingham, were called in in 1900, and reported upon the church. The chancel was restored

under their direction, at a cost of slightly under 1,000. During the thunderstorm the spire chiefly suffered. The top finial and 5 ft. of masonry or more were lifted right off, shattered into a great number of pieces, and scattered in all directions. Having demolished the apex, the lightning formed a fissure on the north-east of the spire, which has opened up as much as eight or nine inches in some places for at least 15 ft. down. The fluid then ran down inside the spire, and made a large hole right through the masonry about 50 ft. down, continued to the lower window, the east window of the belfry, where it moved the whole of the masonry forming the main arch and disturbed the tracery. The edge of the lead roofing of the nave on the north side is disturbed, as if the fluid then travelled along the edge, and a large stone of the chancel arch has been fung several feet away, but possibly this damage was done by the masonry falling from the spire. The lead and slates are slightly damaged, the roof of the new chancel is just touched, and several bits have been knocked off the buttresses around the church.

Legal.

DISPUTE AS TO THE APPROVAL OF PLANS.

MR. HERBERT SMITH, on the 6th inst., applied *ex parte* to a Divisional Court of King's Bench composed of the Lord Chief Justice and Mr. Justice Ridley for a rule nisi for a mandamus directed to the Middlesbrough Corporation, compelling them to show cause why they refused to approve of certain plans submitted with them in connexion with the proposal of the applicant to erect certain houses in the Lothian-road. The learned counsel said that his client, a builder, proposed to erect the houses in question, and duly deposited the plans in compliance with the local by-laws. The Corporation refused, and still continued to refuse to approve the plans. What the applicant complained of was that the Corporation declined to assign any reason for their action, although it had been pointed out to them that all the statutory requirements had been complied with. The plans had been refused approval some time ago, and on Tuesday last they were again laid before the local authority and disapproved of, although his client had had no notice. On being written to asking for the reason, the reply of the official was that he had no instructions to comply with the request.

The Lord Chief Justice: Have you any authority to show that the Corporation are bound to give their reason for their refusal?

Mr. Herbert Smith said his submission was that the applicant was perfectly entitled to the mandamus to compel the Corporation to give them or to show cause why they would not. His client was willing to take the rule at his own risk.

The Lord Chief Justice said he thought they could only act on the authority of a decided case.

Mr. Herbert Smith said his case was that the Corporation were not acting *bona fide*. His client had sent in plans which it was sworn on affidavit were in accordance with the by-laws and the builder had a statutory right to get an answer.

The Lord Chief Justice, in giving judgment, said that in his opinion the rule ought not to be granted. All the affidavit said was, that the approval of the plans had been twice refused and that they were in the applicant's belief in accordance with the by-laws. In order that a rule should be granted there should be shown that the local authority were not acting properly on matters within their discretion. If that were shown, the matter might be decided otherwise.

Mr. Justice Ridley concurred, and the motion for a rule was accordingly refused.

A RAILWAY COMPANY AND THE LONDON BUILDING ACT.

THE case of Lewis & Salome v. the Charing Cross, Easton, and Hampstead Railway Company, which came before Mr. Justice Warrington in the Chancery Division on the 8th inst., raised an important point of law under the London Building Act, 1894.

The facts were as follows:—The plaintiffs were the leaseholders of No. 21, Cranbourne-street, the house adjoining No. 21. By their special Act of 1893 the defendants were authorised to construct a tube railway running up Charing Cross-road, and crossing Cranbourne-street. At the intersection of Charing Cross-road and Cranbourne-street the company were constructed No. 21, which, being out of requisition as to the deposited plans, was property which they were not entitled to take compulsorily under their special powers, but which they were entitled to acquire by agreement for their "extraordinary purposes" in accordance with sect. 45 of the Railway Clauses Act, 1845. After the defendants had acquired the property they began to pull it down, and the plaintiffs' case was that in so doing they had affected the party wall between Nos. 21 and 22, and that they were only entitled to do

that after giving notice under the London Building Act, 1894, which had not been done. The question whether the company were justified in not giving the notice turned on the construction of certain sections in the defendants' special Act of 1893. Sect. 5 of that Act provided that the company might make and maintain in the lines and according to the levels shown in the deposited plans and sections, the railways and all necessary stations, platforms, approaches, and conveniences connected therewith. By sect. 31 the company might take by agreement for the extra-ordinary purposes mentioned in the Railway Clauses Consolidation Act, 1845, any quantity of land not exceeding in the whole 5 acres, but nothing in the Act was to exonerate the company from any action of other proceeding for nuisance in the event of any nuisance being caused by them upon any lands so taken. For the purposes of the section, "extraordinary purposes" was not, without the consent of the Council, to include the erection of buildings or works for generating electricity or the provision of wharves, and loading or unloading goods or cattle. It also provided that any buildings erected on any land acquired under the section, except such buildings or parts of buildings as might be used for the purposes of a station, should be subject to the provisions of the Acts relating to buildings in the metropolis. Sect. 45 of the Railway Clauses Act, 1845, enacted that it should be lawful for the company, in addition to the lands authorised to be compulsorily taken by them under their powers, to contract with any party willing to sell the same or the purchase of any land adjoining or near the railway not exceeding in the whole the prescribed number of acres for "extraordinary purposes" for the purpose of making and providing additional stations and places for the accommodation of passengers. The company were also empowered to do such other acts as were necessary for making, maintaining, altering, or repairing and using the railway. By sect. 5, subsect. 31 of the London Building Act the expression "building owner" meant such one of the owners of adjoining land as was desirous of building, or of the owners of buildings, storage, or rooms separated from one another by a party wall or party structure as was desirous of doing a work affecting that party wall or party structure. By sect. 20 of the Act any building or structure situate upon the railway or within the railway or station premises, and used in connexion with the traffic of the railway, was deemed exempt from the operation of Parts and 5 of the Act. By the action the plaintiffs claimed an injunction to restrain the company, its contractors, etc., from continuing the demolition of No. 21, Cranbourne-street in such a way as to interfere with the party wall between the premises in question and damages for alleged wrongful interference with the plaintiffs' possession of No. 22, Cranbourne-street. On behalf of the plaintiff it was argued that the company were subject to the provisions of the London Building Act, but the contention on behalf of the defendants was that the Act had no application to them, and that the plaintiffs' only remedy, if any, was for compensation under the Railway Clauses Act.

His lordship, in giving judgment, said he agreed with the company that the pulling down of the house No. 21 was within the company's powers under the Railway Clauses Act, 1845, but the company said that with regard to the erection of buildings to be used for the purpose of a station they were exempt from the requirements of the London Building Act, 1894. The argument of the company was that they were entitled, by virtue of their special Act, and of sect. 16 of the Railway Clauses Act, 1845, to demolish the house, and if, in the course of demolition, they interfered with a party structure, and did what in the case of an ordinary owner could not be done without notice, it did not matter in their case, for they were authorised by their special Act to do it, and the adjoining owner's remedy was compensation. The fallacy of that argument was that, though the special Act authorised demolition, it said nothing about party structures, and it did not even follow that in course of demolishing a party structure need be affected—indeed the company said that nothing they had done affected the party structure. It seemed to his lordship that the company's statutory enactments could not be read so as to authorise them to deal with No. 21 so as to affect the party structure of No. 22 without the necessity of giving notice. In these circumstances the company must be treated for the purposes of the London Building Act as an ordinary owner desirous of doing a work affecting a party wall or structure within the definition of sect. 5, subsect. 31 of the Act, and that being so they must give the required notice.

On the question of whether the party structure was affected by what the defendants had done, his lordship, after having heard evidence and personally viewing the premises, found as a fact that what the defendants had done was so trivial as not to affect the stability of the party wall. He accordingly dismissed the action, but without costs.

Mr. Rowden, K.C., Mr. Cunningham Glen, and Mr. Morle appeared for the plaintiffs; and Mr. Roskill, K.C., and Mr. Austen-Cartmell for the company.

DISPUTE AS TO THE BUILDING OF THE WALDORF THEATRE.

LAST week in the Chancery Division Mr. Rose Innes moved before Mr. Justice Kekewich, on behalf of Mr. E. G. Saunders, to restrain the Waldorf Theatre Syndicate, Ltd., from paying Messrs. Waring & Gillow, Ltd., any further sums in respect to work done or material supplied, both in regard to the erection and equipment of the Waldorf Theatre and from concluding a compromise in regard thereto without the plaintiff's consent. The learned counsel said that Mr. Saunders was a gentleman who, before the opening of Alhways, entered into a contract with the Duke of Bedford to take a considerable area of land upon which the Waldorf Theatre was built. Mr. Saunders put himself into communication with Mr. John Waring, of Waring & Gillow, Ltd., and on June 12, 1903, an agreement was made between them with regard to the finding of money for the erection of the theatre. Half the share capital in the company was to be given to Mr. Saunders and one-half to Mr. John Waring. Mr. Saunders's shares were, as later appeared, issued to himself and he then became the equitable owner of the shares to the number of 8,993, but he had the right to get them back. The motion was brought because Waring & Gillow, who were contractors for building the theatre, were largely represented upon the board of the company. They had three clerks who, as directors, had been approved on one day and what they had done as clerks of Waring & Gillow on the day before. It was Mr. Saunders's contention that the bill of 71,364, was grossly excessive, and defendants admitted that certain sums should come off. Mr. Saunders's position had been untenable, because he had been outvoted by the three other directors. He thought an arbitrator should be asked to fix the exact amount of the building bill. The amount coming in as rent for the theatre was 8,900, a year.

Mr. Maughan, for the defendants, denied that Mr. Saunders was a shareholder or had ever been one. By a resolution of March 2, 1905, passed at a meeting at which plaintiffs was in the chair, it was resolved that Messrs. Waring & Gillow should be instructed to complete the building of the theatre, shops, and offices. Shares were held by Mr. John Waring, who had a private account, and it was to his interest that the bill should be reduced as low as possible.

Mr. Rose Innes thought that Mr. Saunders had sufficient interest in the shares which had been allotted to his name to come there and say that the Syndicate were not dealing fairly with the shareholders.

His lordship, in giving judgment, said the plaintiff contended that the Syndicate should not be allowed to pay the bill of Messrs. Waring & Gillow, and the matter referred to arbitration or a proper account had been taken. He thought that as the plaintiff was not a shareholder he had no right to interfere, though it seemed strange that he was a director and not a shareholder. He was a member of the Board, and the Board was the proper authority to have the control. The majority of the Board afforded no sufficient interest in the shares to suit as a minority had to submit to a majority. Therefore in his character of an alleged shareholder or in his character as a director he seemed to have no interests which would justify him in maintaining an action against the defendants. He accordingly dismissed the motion with costs.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

2,762 of 1905.—R. MAREINICUS: *Fences or Walls*. This relates to a partition or fence consisting of armoured concrete posts or pillars formed with lateral vertical grooves in which slabs or plates also made of armoured concrete are inserted to form intermediate panels.

3,790 of 1905.—L. ZAMBONI, R. H. BOWEN, and J. WILSON: *Window Frames, Pulley Frames, Particularly Applicable for Window Sashes*.

This relates to a pulley frame, and consists in the combination with a hollow face plate, comprising primarily separate front and back members of pressed sheet metal having registered openings for a pulley, of means connecting said plate members in rigid relation, comprising inter-engaged screw sockets, flanges or press-fit metal casing having a recess and flanges on its opposite edges extending between said face plate members, a flap on one of said face plate members engaging said casing recess, a shaft in said casing, and a pulley mounted to rotate in said casing on said shaft.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

4,485 of 1905.—M. CLARKE, C. CLARKE, and J. CLARKE: *Mountings or Bearings of Tipper and Tipper Boxes for Waste, Water-Closets, and the Like*.

This relates to mounting or bearings of tipper and tipper boxes and consists of a vertical stud, an inclined stud in combination, with an inverted angular projection having a vertical portion and an angular portion and an inner bearing surface.

5,351 of 1905.—W. D. SHEPPARD: *Gas Cooking Stoves, or the Like*.

This relates to a gas cooking stove having the boiler arranged in the bottom part of the stove above the heating burner, and a water supply cistern at a suitable height in the neighbourhood of the stove, and consists in the method of connecting the water inlet supply from the cistern to the lower part of the boiler by passing it completely under and round the lower edge of the stove and thence up into the bottom of the boiler, and by connecting the outflow pipe to the boiler, and by carrying it up from the top of the boiler inside the stove and then out through the flue or chimney of the stove, so as to avoid perforating or drilling of the sides of the stove.

7,163 of 1905.—J. WOLLENDE: *Poultry Coops and Means for Ventilating the same*.

This relates to a poultry coop, which can be made of any shape or size that may be required. The two sides and back are made weather-proof, the front is formed of a head and sill and vertical bars, the vertical bars being spaced and securely fixed on the inside of the head and sill, and all fixed together from the body of the coop. The roof is made to fall from front to back and projects over the body of the coop. The back portion of the roof is secured with hinges to the back portion of the coop, and there is also fixed a steel or iron ring under and in the centre of the projecting front portion of the roof; the whole of the roof may be raised or lowered and can be kept in position at either place by a steel or iron C-shaped hook which passes into the ring at the front portion of the roof, and which has two steel or iron bars projecting downwards forming an angle of 30 degrees, one bar being made heavier than the other, which in case of a storm acts as a lock to the roof and shutter.

8,555 of 1905.—F. C. W. TIMM: *Shaft Furnaces for Smelting, Cement Burning, and other purposes*.

This relates to a process of preserving the inner walls of blast furnaces for reducing, smelting, burning, sintering, and the like, and is characterised by the feature that in charging the furnace a casing is built up against the inner wall of said furnace either by correspondingly shaped blocks or by pressing material between a metallic template and the lining in a measure to correspond to the lowering of said casing and pierced in opposite the twyers so that the air of combustion can pass through the openings into the interior of the casing.

10,740 of 1905.—A. CURRIE: *Siphon Discharge Flushing Cisterns*.

This relates to a siphon discharge flushing cistern, consisting of a box or casing, formed with dome enlargement, a saucer-shaped valve of a diameter nearly equal to the box or casing, and working in the interior thereof in order to produce the flushing, and a siphon tube having a diameter larger at its point of connexion with the dome enlargement than at its discharge or outlet end, through which the flushing water is expelled.

3,992 of 1905.—W. ROHL: *Jointless Facing*.

This relates to a process for the production of a mass for making pavements without joints, according to which pieces of mass of magnesite, gravel, sand, and the like, which is stirred to a thick consistency, with a solution of about 45 per cent. strength of magnesium chloride, is mixed with a similar quantity of a glutinous pitch-like mass, which latter consists of a pit asphalt powder soaked with benzine.

7,340 of 1905.—R. WARMINGTON: *Connections for Joining Branch Drains to Main Sewers*.

This relates to a connexion for joining branch drains to sewers and main drains, and consists of a junction piece longitudinally divided through the central plane, comprising an upper and a lower part, the end part having sockets along each side into which sockets the upper part engages and in which the two parts are cemented together, the division extending also throughout the branch throat for the branch drain.

9,350 of 1905.—J. C. BUTTERFIELD: *Road Making*.

This relates to the binding together of the material of a road by means of a mixture of fine granite, flint, slag, or the like, and chalk, limestone, or the like, with or without asphalt or pitch, or with both in combination with petroleum or other mineral oil and nitro-benzole or other nitrated hydrocarbons.

8,101 of 1905.—L. P. FRIESTEDT: *Metal Sheet Piling and Mine Sheeting*.

This relates to a metal sheet piling and consists of a beam section provided with rib edges, square or cylindrical in cross section, which are bisected by the web of the beam and furnish a locking

shoulder on each side thereof, and a joining beam section so constructed that it is provided on one side with an integral jaw and on the other side with a companion jaw which is riveted to the beam section, said jaws engaging with the above-said locking shoulders so as to lock two sections together to form a continuous wall structure.

12,282 of 1905.—H. N. WILSON: *Cellular Steel Fireproof Building Construction*.

This relates to a cellular steel fireproof building construction, and consists of an impenetrable sheet of steel, bent or folded into triangular cells, and adjacent cells having their angles supporting contact, the exposed surfaces being channelled.

12,474 of 1905.—F. E. TAYLOR: *A Sink and Bath in Combination, both forming the Pedestal to the Sink, for use in Cottages*.

This consists in the combination of a bath and sink, both constructed for and arranged with permanent fittings, for getting rid of the waste water from the sink in a direct and sanitary manner by means of a short waste pipe from the end of the sink emptying directly into the pipe head fixed to iron waste pipe at the end of the bath, this pipe being secured to lugs formed in the recess at the end of the bath.

15,148 of 1905.—G. SMITH: *Gully Traps*.

This relates to a gully trap comprising a casing the sides of which are perforated to within a short distance of its closed bottom, and a frame fitting the open top of the said casing and having perforated pockets to contain disinfecting powder.

15,210 of 1905.—C. P. BRADY: *Devices for Testing Water Pipes*.

This relates to a device for testing pipes, and consists in the combination with a main outer casing communicating with an air pump and provided with an outlet pipe, of an inner receptacle and provided with a flaring top fitting within the top portion of the outer casing, and a closing cover for the two casings.

16,917 of 1905.—W. GABRIEL: *Means for Reinforcing Concrete*.

This relates to a composite bar for reinforcing concrete, and comprises a bar and a continuous piece of wire or metal band, said wire being secured at its ends to the ends of the bar and wound around said bar at intervals apart and alternately in opposite directions, the wire between said intervals of winding being formed into stirrups which extend upwardly and outwardly from the bar and alternately on opposite sides thereof in two planes inclined towards each other in the form of a V and intersecting each other at a point directly above the bar.

17,880 of 1905.—J. O'DOWD: *Road Gutters*.

This relates to a roof gutter, and consists of lengths of plain galvanised iron having one edge flanged to fit upon the moulded edge of the guttering and of means for securing the lengths of iron to the roof.

22,699 of 1905.—G. MEISTER and R. HERZER: *An Adjustable Device for Carrying Loads on the Shoulders*.

This relates to an adjustable load-carrying device, and is characterised by a carrying strap terminating at one end in an eye, and by a rack along which the strap can be adjusted to any desired height and which terminates at its upper end in a pad provided with a felt bolster for preventing the load resting against it from being damaged, and at its lower end in a V-shaped foot which at its free ends is provided with teeth for preventing the load resting thereon from slipping off.

21,622 of 1905.—E. G. WATROUS: *Water-closet Basins and Means for Flushing the same*.

This relates to a water-closet bowl provided with a jet arranged to direct a stream of water into a discharge passage and between the walls thereof, said discharge passage having a contracted portion which prevents a flaring mouth to the jet whereby a substantially solid column or plug of water is discharged drawing or entraining in its wake the combined solid and liquid contents of the bowl.

23,532 of 1905.—DR. A. GASPARY: *Machinery for Moulding Artificial Stone, Slabs, Tiles, Bricks, and such like*.

This relates to a machine for moulding artificial materials, which is so constructed that its compressing and smoothing tool is capable of being moved up and down as well as forwards and backwards longitudinally.

24,188 of 1905.—J. LEVICK: *Ball Floats for Gully Traps and other uses*.

This relates to a ball float for gully traps, which is provided with a float which is capable of effectually resisting the corrosive or other deleterious effects arising from their contact with sewage or other liquids containing chemicals, without its buoyancy or power of flotation being detrimentally affected; and this object is attained by jacketting a metallic or other float with lead which is applied to the exterior of a suitable spherical foundation or body part by a spinning or analogous process, by electro-deposition, or otherwise.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

Table listing property sales with columns for location, details, and price. Includes entries like 'Forest Gate—Dames-road, l.g. rents 534. 8s.', 'February 7.—By BAXTER, PAYNE, & LEPPER', and 'February 8.—By DUNCAN & KIMPTON'.

MEETINGS.

Table listing various meetings and societies. Includes 'Royal Institution.—Mr. W. C. Dampier Whetham, M.A., on "The Passage of Electricity through Liquids," 9 p.m.', 'Institution of Mechanical Engineers.—Fifty-ninth Annual General Meeting', and 'Institution of British Architects.—A Special General Meeting'.

BRICKS, &c. (continued).

Table listing brick and material prices. Includes 'Best Dipped Salt Glazed Bricks', 'Quoins, Bullnose', 'Double Stretchers', 'One Side and two Ends', 'White and Dipped Salt Glazed', 'Thames and Pit Sand', 'Best Portland Cement', 'Portland Stone (20 ft. average)', 'Ancaster in blocks', 'Greenhill', 'Darley Dale in blocks', 'Best Corehill', 'Closeburn Red Freestone', 'White Basebed', 'Harn York', 'Hopton Wood (Hard Bed) in blocks', and 'SLATES'.

PRICES CURRENT OF MATERIALS.

* * * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table listing prices for various materials. Includes 'Hard Stocks', 'Grizes', 'Facing Stocks', 'Shippers', 'Pistons', 'Bed Wire Cuts', 'Best Fareham Bed', 'Best Blue Pressed Staffordshire', 'Do. Bullnose', 'Best Stourbridge', 'Fire Bricks', 'Glazed Bricks', 'Best White and Ivory Glazed Stretchers', 'Heads', 'Quoins, Bullnose, and Flats', 'Double Stretchers', 'Double Headers', 'One Side and two Ends', 'Two Sides and one End', 'Splays, Chamfered, Squinns', and 'BECKS, &c.'.

WOOD.

Table listing various wood products such as Deal, Battens, and Joists, with columns for 'At per standard' and '£ s. d.'.

JOISTS' WOOD.

Table listing Joists' Wood products like White Sea, Battens, and Second yellow deals, with columns for 'At per standard' and '£ s. d.'.

White Sea and Petersburg.

Table listing White Sea and Petersburg wood products, including First white deals and Battens, with columns for 'At per standard' and '£ s. d.'.

Fitch Pine.

Table listing Fitch Pine products like Fitch pine deals and Yellow Pine, with columns for 'At per standard' and '£ s. d.'.

Oil.

Table listing Oil products such as Raw Linseed Oil and Turpentine, with columns for 'per gallon' and '£ s. d.'.

VAENISHES, &c.

Table listing Varnishes and other products like Fine Pale Oak Varnish and Superfine Hard-drying Oak, with columns for 'Per gallon' and '£ s. d.'.

JOISTS, GIRDERS, &c.

Table listing Joists, Girders, and other products like Rolled Steel Joists and Compound Girders, with columns for 'In London, or delivered' and '£ s. d.'.

METALS.

Table listing Metals products such as Common Bars and Staffordshire Crown Bars, with columns for 'Per ton, in London' and '£ s. d.'.

METALS (continued).

Table listing Metals products like Iron, Sheet Iron, Galvanized, and Best Soft Steel Sheets, with columns for 'Per ton, in London' and '£ s. d.'.

LEAD, &c.

Table listing Lead and other products like Lead Sheet, Zinc Sheet, and Brass, with columns for 'Per ton, in London' and '£ s. d.'.

ENGLISH SHEET GLASS IN CRATES.

Table listing English Sheet Glass in Crates products like 15 oz. thirds and 2 1/2 oz. thirds, with columns for 'per ft. delivered' and '£ s. d.'.

OLLS, &c.

Table listing Oils and other products like Raw Linseed Oil and Turpentine, with columns for 'per gallon' and '£ s. d.'.

VAENISHES, &c.

Table listing Varnishes and other products like Fine Pale Oak Varnish and Superfine Hard-drying Oak, with columns for 'Per gallon' and '£ s. d.'.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom at the rate of the per annum (2 numbers) 14/6 PAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, etc., 20s. per annum.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100l., unless in some exceptional cases and for special reasons.]

BEVERLEY.—For the construction of a concrete retaining wall, on piled foundations, at wharf on River Hull, Grovehill, for the Corporation. Mr. J. Gomid Smith, Borough Surveyor, Guildhall, Beverley.

BUCKFASTLEIGH.—For building stables and bullock houses, for the Co-operative Society, Ltd. Mr. Andrew Warren, architect, Fours-street, Buckfastleigh.

COWPEN (Blyth).—For additions to stable buildings belonging to Cowpen Urban District Council. Mr. R. Grievs, Surveyor to the Council.

DEVONPORT.—For road works, lane between Whittington and Amherst streets, for the Corporation. Mr. J. F. Burns, Borough Surveyor, Municipal-buildings, Devonport.

DEVONPORT.—For road works, lane between Alma-road and Amherst-street, for the Corporation. Mr. J. F. Burns, Borough Surveyor, Municipal Offices, Devonport.

DEVONPORT.—For road works, lane between Hamilton-street and Spencer-avenue, for the Corporation. Mr. J. F. Burns, Borough Surveyor, Municipal Offices, Devonport.

DEVONPORT.—For road works, Coldrenick-street, for the Corporation. Mr. J. F. Burns, Borough Surveyor, Municipal Offices, Devonport.

DEVONPORT.—For road works, Victoria-road, for the Corporation. Mr. J. F. Burns, Borough Surveyor, Municipal Offices, Devonport.

DEVONPORT.—For making-up Alma-road, Enfield Lock, for the Urban District Council. Mr. R. Collins, Surveyor, Public Offices, Enfield.

ELTWICK (Beds.).—For the erection of a villa residence in the avenue, Eltwick, for Mr. F. Knitell, Mr. W. B. Stonebridge, architect, Woburn Sands, B.S.O.

FOREST HILL.—For kerbing, channelling, and metalling the roadway and paving footpaths at Brockley Park, for the Lewisham Borough Council.

FRAMPTON COTTRELL.—For alterations and additions to Council School, for the Gloucestershire Education Committee. Mr. R. S. Phillips, Surveyor, Shire Hall, Gloucester.

TENDERS.—Continued on page 185.

MOULE'S PATENT EARTH CLOSET COMPANY, LIMITED.
This Business, having been ESTABLISHED 40 YEARS, has all the experience that time and thought can give and ingenuity can devise in producing the **Most Perfect Earth Closet.**
Where used there is no danger of typhoid fever. The Company has obtained **A NEW PATENT, 1905,**
For further improvements, making its apparatuses **The Perfection of Earth Closets**
Without increase of prices. They have been awarded Gold Medals and other Highest Prizes ever given for Earth Closets.
BEWARE OF INFERIOR AND UNRELIABLE IMITATIONS.
They are also especially suited for buildings and places below the level of drains and outfalls, and also where there is difficulty in obtaining a water supply. Testimonials of their value in these respects can be seen at the Company's Offices. They are well made and finished, in plain and in elegant woods, and can be fitted in any position inside or outside Mansions, Cottages, Schools, Hospitals, and Workshops. They are supplied to Camps, and for use on board ship. They have been supplied to Windsor Castle and Sandringham. Over twelve thousand have been supplied to Departments of H.M. Government. When they are required temporarily the Company will contract for lending a quantity, and will fix them if necessary.
On view at the Company's Address. Descriptive illustrated pamphlets and particulars sent post free.

Tradition and Invention.

THE series of lectures on architecture delivered by Mr. T. G. Jackson to the Students of the Royal Academy, the gist of which has been pretty fully reported in

our columns, has been, we think, one of the most instructive series of lectures on architecture that has been delivered there, as it is one calculated to lead the students to think for themselves about the meaning of architecture; and it was also very well illustrated, not only by pictorial representations of buildings, but by what is much more valuable on such an occasion, diagrams showing the construction and building up of architectural features, and the relation between structure and expression. It might no doubt be thought (and we were inclined to think so on first seeing the announcement of the lectures) that the object of lectures on architecture to the whole body of Royal Academy Students, only a minority of whom are architects, should be to give them accurate knowledge as to the great book of the architecture of the past; a knowledge certainly useful to painters who may have to introduce architecture in their works, and necessary to architects, for an acquaintance with the actual forms which architecture has taken must precede the attempt to analyse and understand them. The justification for Mr. Jackson's choice of subject is that the

history of architecture had been very fully gone into by a series of previous lectures; and therefore the occasion had come for an analysis of the structural causes of these historical forms. The choice of subject has been amply justified by a series of most suggestive lectures. But future lectures to future generations of Academy Students will have to resume the historical treatment of architecture; it is a branch of knowledge that cannot be neglected, but it is possible that in future lectures the history of architecture may be taught merely as a great field of knowledge and not as affording the proper precedents for design; and if this change does come about it will probably be to some extent due to the present year's course of lectures, which will no doubt leave their mark on the subject, and in which something has been said which much needed to be said.

But it will not do to forget that there is another side to the subject of tradition in architecture. While we quite agree that the modern architect should, as Mr. Jackson says, be himself and carry out his work in accordance with the practical requirements of the present day, it would be a dangerous gospel to preach that he should try to emancipate himself from all tradition. The effect of such an effort is seen in France and Germany in the vagaries of "art nouveau," in England in a tendency, among some of the younger architects who want to escape precedent and copyism, to an exaggerated and over-acted simplicity which sometimes comes near to obliterating architectural expression altogether.

On the other hand there are those, the majority perhaps of practising architects, who would adhere to precedent, some from mere indolence, but others from a feeling that ancient forms of detail are, as it were, hallowed by long association, have become a part of architecture itself, and cannot be ruthlessly torn away. The feeling is like that expressed in regard to music in "Master Hugues of Saxe Gotha"—

"Ah! but traditions, inventions
(Say we and make up a visage),
So many men with such various intentions,
Down the past ages, must know more than
this age!"

Leave we the web its dimensions."

It was in this spirit that Mr. Richard Hunt, looking over a young architect at work on a capital for a classic building, said—"Do you think you can make a better capital than the Jupiter Stator? No? Then why try?" We do not agree with Mr. Hunt's position; the Jupiter Stator model might fairly and usefully have been taken as a ground or starting-point for a new treatment, which might be as good, though different; it would at least be a more intellectual exercise than copying. But there is something to be said for traditional forms. In the first place, we cannot get rid of them unless we are to strip our modern architecture to almost the bare walling; for we cannot invent a whole school of new detail in a generation or two. Secondly, there is something in traditional forms, such as mouldings and capitals, which has gathered round it a long and dignified association of ideas, and gives a kind of continuity to architecture which is not a thing to be lightly

thrown away. The very form of column and capital, found in the Gothic shaft as well as in the Classic order, is a tradition, and one which we can hardly imagine architecture entirely deprived of.

As to invention, we have two remarks to make, arising out of Mr. Jackson's lectures. His view of the absolute domination of structure over design—that no one ever invented an architectural feature, but that it developed naturally out of construction, appears to be absolutely true in regard to mediæval architecture; is it equally true in regard to Renaissance and (still more) in regard to Greek architecture? There is one feature in Italian Renaissance architecture which, we take it, was an absolute invention—the baluster. It does not arise out of construction; and it must have been invented by someone (we shall probably never know who) who perceived that if an open railing were wanted, something different from a miniature column was required for the situation. As to the Greeks, we are inclined to believe that they had the faculty of absolute invention, of considering a detail of construction and inventing the best treatment for it. The only account we have of the origin of the Corinthian capital actually suggests an invention; it may be, probably is, mythical, but it presupposes the faculty of invention of an architectural detail as a matter of pure æsthetic taste; and this faculty we believe the Greeks had and more or less exercised, and that they were in this respect on quite a different level, intellectually, from the mediæval architects.

Secondly, when those who, of set and serious purpose, believe in and stand by tradition in architecture, as something which they think worth holding on to—when they are accused of being mere copyists, is it not open to them to turn round and say that there are other fields of invention in architectural design besides those of columns and buttresses and detail? There is surely a field for absolute invention in plan and section. The conception of plan, and its treatment in section, is really the basis of architectural thought. A building may derive all its details from classic tradition, but if it shows invention in the idea of the plan and in the sectional treatment and (we might add) the mode of lighting, it is original building; it is invention in architecture, in spite of the details being traditional. This is a side of architectural invention which should not be overlooked; and we beg to suggest that a very useful course of architectural lectures might be given on the subject of architectural design in Plan and Section.

THE REPORT OF THE TRADE COMMISSION.

THE Report of the Royal Commission on Trade Disputes and Trade Combinations states that the main subject of their inquiry may conveniently be divided into three heads, as follows:—

A. The liability of Trade Union Funds to be taken in execution for the wrongful acts of agents of the Union.

B. The Statute Law relating to picketing and other incidents of strikes.

C. The Law of Conspiracy as affecting Trade Unions.

The Commissioners were Lord Dunsin, Sir W. Lewis, Sir Godfrey Lushington, Mr. Arthur Cohen, and Mr. Sidney Webb, but the main Report is only signed by Lord Dunsin, Mr. Cohen, and Mr. Webb; Sir Godfrey Lushington and Sir W. Lewis sending minority Reports under their own names. It is observed that the Trade Unions demand a change of law in regard to each of the above subjects, and allege that the present state of the law differs from that of the past, and is due to the effect of well-known decisions of the House of Lords, of which that in what has become known as the Taft Vale case is the most important. Considering this attitude of the Trade Unions, it is somewhat remarkable that "with some trifling exceptions," they refused to give any evidence before the Commission. The Commissioners do not feel called upon to comment on this refusal, further than to remark that their duty to continue their investigations was plainly unaffected by the attitude of any Society or individual, and that it did not involve them in any difficulty as to discovering what was the nature of the objections taken by the Trade Unions to the law as it stands, as these had been conspicuously revealed to the world both by repeated speeches delivered during the deliberations of the Trade Unions, and by Bills introduced avowedly on their behalf in Parliament. This is no doubt all that the Commission could well say on the subject; but the refusal of the Unions to give evidence before such a Commission will be felt by most people to be an indication of conscious weakness.

The Taft Vale case is the first point touched upon in the Report, and it may be convenient here to quote the summary of the portion embodied in Clause 13 of the Report:—

"13. In the case of the Taft Vale Railway Company, the Amalgamated Society of Railway Servants, being a Trade Union registered under the Trade Union Act, 1871, and its officers, were sued by the Taft Vale Railway Company in tort for having conspired to induce the workmen of their company to break their contracts, and also for having conspired to interfere with the traffic of the company by picketing and other unlawful means. Mr. Justice Farwell having granted an interim injunction against all the defendants, the defendant Trade Union appealed on the legal question whether a registered Trade Union was liable to be sued in tort. The Court of Appeal reversed the decision of the Judge, but ultimately the House of Lords restored it, holding that a registered Trade Union could be sued in tort by the name in which it was registered under the Act. The grounds for the judgment were that a registered Trade Union having been invested with the statutory powers of the Act of 1871, it must be legally inferred that it was the intention of Parliament that such Trade Union should be liable to be sued in its registered name. A strong opinion was also expressed by Lord Macnaghten and Lord Lindley that, apart from the Trade Union Act, any Trade Union whether registered or not registered could under the general rules of legal procedure be sued in tort by means of a representative suit, i.e., a suit in which a few members have been selected by the plaintiff to represent all the defendants. The case then went for trial, and verdict was found for the plaintiffs. The damages were assessed (or fixed by agreement) at 23,000*l.*, which sum has since been paid out of the Union funds."

The judgment of the House of Lords, it is admitted, took many persons by surprise, and the Trade Unions' protest against it as "making a practically new law against Trade Unions." The Report however says:—

"We are satisfied that the law laid down by the House of Lords involved no new principle, and was not inconsistent with the legislation of 1871."

The argument on which this conclusion

is based is drawn out at some length and is of considerable interest. The fact that no statute had previously laid it down that a Trade Union, as such, was liable to an action "in tort," makes no alteration in the fact that the members of a Trade Union were, by the previous existing law and before they were registered liable personally to such an action. The operation was restrained only by the practical difficulty of getting at all the defendants. In the eyes of the law before 1871 a Trade Union was nothing but an aggregate of individuals, and the Courts of Common Law adopted a rigid rule that in an action to recover damages in respect of a "tort," judgment could not be recovered against any person or persons not named as defendants in the action. The liability of the funds of a Trade Union could at any time have been effectively realised in the case of a Trade Union consisting of only a small number of persons, who could have been made individually responsible. The difficulty arose only in the case of a body so numerous that it would be practically impossible to bring them all into court as defendants. In considering the Taft Vale case the House of Lords took the view that from the provisions of the Trade Union Act of 1871 it was legally inferred that the intention of Parliament was that a registered Trade Union could be sued under its registered name, with the consequence that its funds would be liable for any damages that might be awarded. No public Commission as a body has represented that they ought to be exempt; no Government has promised that they should be exempt by forthcoming legislation; and no judge has pronounced that they are exempt. On the question of abstract justice the Report speaks plainly and strongly:—

"32. It remains now to consider the question on the ground of justice and equity, and here the objections against disturbing the law as laid down in the Taft Vale case appear insurmountable. There is no rule of law so elementary, so universal, or so indispensable as the rule that a wrongdoer or so indisputable as the rule that a wrongdoer should be made to redress his wrong. If Trade Unions were exempt from this liability they would be the only exception, and it would then be right that that exception should be removed. That vast and powerful institutions should be permanently licensed to apply the funds they possess to do wrong to others, and by that wrong inflict upon them damage, perhaps to the amount of many thousand pounds, and yet not be liable to make redress out of those funds, would be a state of things opposed to the very idea of law and order and justice."

In the face of such a decisive opinion in the Report of a Royal Commission, we do not imagine that any attempt to upset the Taft Vale decision can have a chance of success. It has been shown to be not only good in equity but good in law. In regard to this point Sir Godfrey Lushington, who dissents strongly from some other conclusions of the main Report, is entirely in agreement. But he dissents from a proposal made in the main Report, that the Provident Funds of Trade Unions should, by some form of legislation which the Report only suggests in a tentative manner, be separated under law from their other funds and made free from liability. The idea with which this suggestion is made is evidently that it bears hardly on those who paid money into such a fund, to be liable to lose their savings through wrong action on the part of the Union. To us it seems a very

natural reflection—let them see that their Unions do not act wrongly. As Sir Godfrey Lushington puts it, "Thrift is a good object, but thrift comes after payment of just debts, and certainly not least, debts incurred in consequence of wrong-doing to others. The case is only made the stronger by the attempt altogether to repudiate debts of this character. That workmen should collectively do wrong, and be able to refuse to those who have suffered such wrong any reparation out of the funds they have collectively saved for their own use and benefit, is contrary to justice;" and in fact, the knowledge on the part of those who have placed their savings in the care of a Trade Union, that in the event of the Union rendering itself liable for a wrong to others their savings will be endangered, would be a very powerful influence on those members to do all they could to keep the managing Committee in the straight path; and to exempt Provident Funds from liability would be, as Sir G. Lushington shows, a totally exceptional kind of legislation, and would remove a very strong incentive to avoid illegal acts.

On the question of picketing, which, though not a term known in or defined by law, is accepted by the Commissioners as a matter of convenience, its meaning being generally understood, the main Report is not so clear or satisfactory. The Commissioners who sign the Majority Report seem to have divided between a conviction that picketing is actually a form of persecution, and a desire to allow it with the safeguard of a new clause added to the Conspiracy and Protection of Property Act (1875). That Act defines five kinds of persecution for which the culprit is liable to fine or imprisonment. One of these runs—"watches or besets the house or other place where such person resides, or works, or carries on business or happens to be, or the approach to such house or place"; with this proviso following at the end of the clause—"Attending near the house or place," etc., "in order merely to obtain or communicate information, shall not be deemed a watching or besetting within the meaning of this section"; a sentence which is almost cynical in its disregard of realities, though on the surface it may seem harmless enough. The Report quotes on the next page the proposal made in Mr. Whittaker's Bill of 1905, which may be taken to embody the wishes of the Trade Unions:—

"Clause 1.—It shall be lawful for any person or persons acting either on their own behalf or on behalf of a Trade Union or other association of individuals, registered or unregistered, in contemplation of or during the continuance of any trade dispute, to attend for any of the following purposes at or near a house or place where a person resides or works, or carries on his business, or happens to be:—

- (1) for the purpose of peacefully obtaining or communicating information;
- (2) for the purpose of peacefully persuading any person to work or abstain from working.

It had been pointed out, in a previous clause of the Report, that the effect of the 1875 Act is that "watching or besetting" was only lawful for "communicating or obtaining information"; that for the purpose of "peacefully persuading" it was an offence; and this is the limitation that Mr. Whittaker's Bill wished to get rid of. The Report expresses the opinion

that such an enactment would legalise the attendance of any number of persons for the specified purpose, although the attendance might be such as to cause a nuisance or a trespass. But the real objection, it is observed, lies deeper:—

"The evidence on this matter laid before us is on this point really overwhelming, and is evidence which the Trade Unions have made no attempt to contradict. What it comes to is this, that *watching and besetting* for the purpose of peacefully persuading is really a contradiction in terms. The truth is that picketing—however conducted—when it consists of watching or besetting the house, etc., and it is to be observed that the statute places no limit to the number of persons attending for the purpose only of obtaining or communicating information or to the length of time during which such attendance may be maintained—is always and of necessity in the nature of an annoyance to the person picketed. As such, it must savour of compulsion, and it cannot be doubted that it is because it is found to compel that Trade Unions systematically resort to it."

That is plain speaking and common sense; but unfortunately the Majority Report does not carry its common sense far enough. It goes on to say that it is admitted that the real abuse of picketing consists in illegal intimidation, in producing in the mind of a person apprehension that violence would be done to his family and his property. But as a strike is not illegal, the right to persuade others to strike is legal and should be safeguarded; and it is suggested that this could be done, and the oppressive action of picketing struck at, if the watching and besetting clause were altogether withdrawn, and another subsection inserted—"Acts in such a manner as to cause a reasonable apprehension in the mind of any person that violence will be used to him or his wife and family, or damage be done to his property." It is really impossible to read this without amusement, as one thinks of the delicate line which will be drawn, and which courts of law will be asked to draw, between the sort of picketing which may be a source of the most intense annoyance and persecution to its victim, and yet which may adroitly be just stopped short of what can be legally made out to be causing "a reasonable apprehension that violence will be used." It is like the peaceful Quaker's "Friend, thee's not wanted here," while drowning the victim all the same.

On this subject, in fact, the Report blows hot and cold with the same breath. It is a relief to turn to the special Report of Sir G. Lushington, who on this subject speaks the plain common-sense of the matter in no uncertain tone. In his opinion, even if the sole purpose were peaceful persuading, watching and besetting of a man's premises ought not to be permissible. It is a form of persecution that a workman cannot enter or leave his house without being beset and hampered by men fastening on him, often with angry and abusive expressions; to "persuade" him—should it not rather be said to bully him—into doing as they are doing. And then, as Sir G. Lushington very pertinently asks, why are Trade Unions alone, of all the world, to have the privilege of doing this?—

"The truth is that picketing is a form of industrial conscription; and, in organising it, Trade Unions act as if they represented not only their own members but the entire body of workers, and had authority to enforce regulations to which all were bound to conform. It is a system which could not be lawfully practised by any society in which membership was purely optional, and which recognised that every individual was free

to act as he pleased. In connexion with this point it must be remembered that the Statute does not apply exclusively to workmen; at the instance of Trade Unions it was made of general application, and extends to the whole community. As a fact I believe the particular enactment is not required for anybody except workmen in time of strike. Picketing exists nowhere but in connexion with Trade Unions. Is it possible, for instance, to imagine that a tradesman should picket the premises of a competitor? or that one railway company should picket the station of another railway company? or that the authorities of a church or chapel should watch and beset the approach to a rival church or chapel? or that picketing should be introduced into political warfare, and say the Conservative organisations should station pickets at the doors of the private residences of Liberal Members of Parliament, to watch them day after day coming in and going out, to communicate or to receive information or to peacefully persuade them? The very suggestion seems ludicrous; yet this is but a very faint picture indeed of what in times of strike individual workmen have actually to undergo at the hands of Trade Union pickets."

Sir G. Lushington concludes by suggesting that picketing is an abuse for which a remedy is urgently required; that the personal freedom of workmen needs not less protection than hitherto, but more; and he therefore recommends that the existing prohibition of "watching and besetting" be retained in the Conspiracy and Protection of Property Act, and that the proviso permitting it for the sole purpose of "giving and receiving information" should be repealed; and we fully agree with him. The supposed maintenance of the distinction between "peacefully persuading" and "giving and receiving information" is absurd on the face of it; it is legislating for a man's intentions, which cannot be proved one way or another. The only fact a Court can have on evidence is that the man or men were there, "watching and besetting"; but what possible evidence can discriminate as to their purpose, or who is to draw the line between "persuading" and "giving information"? We heartily wish that Sir Godfrey Lushington's trenchant remarks had appeared in the Majority Report instead of in his own Separate Report; but as it is, it may be hoped that they will not altogether fall to the ground, and that they may do something towards putting a check on the legalising of a system of petty tyranny which is a discredit to a civilised country.

NOTES.
