seat of the fire can be discovered. Colonel Fox, Chief of the Salvage Corps, spoke very strongly against the use of concrete ceilings in warehouses, owing to their great liability to collapse and fall upon his men.

New Water Supply: Lincoln. THE latest reports from Lincoln indicate that the yield from the deep well at Boultham ought to be ample for the total water supply of the city. This well has been sunk to the depth of 1,502 ft., and is the largest and deepest work of the kind in the world. From its bottom an artesian well of 30 in. diameter will be bored for an additional depth of some 2,200 ft., making the total about 3,702 ft. Although the depth of the bore itself has been exceeded, the two portions of this well taken together certainly surpass the limits hitherto reached in connexion with any waterworks undertaking. As originally intended the diameter of the bore was to have been 13 in., but after the loss of the boring tool in November, 1903, it was decided to increase the size to 30 in., with the object of securing increased supplies. The wisdom of this decision is fully justified by the copious flow from the 3-in. pilot boring recently completed, the delivery having far exceeded the expectations of the engineers. We understand that operations on the larger boring will be recommenced without loss of time. There seems good reason for believing that the final result will be such as to give Lincoln one of the best and purest supplies of water in the kingdom, and to remove all future anxiety in respect of this important question.

St. John the Baptist Church, Coventry. MESSRS. BUCKNALL & COMPEN in their report upon the fabric state that a thorough reparation of the exterior should be carried out forthwith, at a computed cost of 4,500*l.*, and a building fund has been opened. The church of St. John the Baptist, or Bablake, is cruciform on plan, with small transepts and an embattled tower, and was erected in 1345-75 for the Guild of St. John, to which Edward II.'s Queen, Isabella, gave a parcel of land called Babbelak, close to the Spougate and south-west of the Bablake Hospital, for a chapel, which was afterwards enlarged by two of the citizens and made collegiate. On the suppression of the college under an Act of 1 Edward VI., the fabric was alienated to the Corporation; a statute of June 23, 1734, converted it into a parish church. The piers and arches of the crossing are remarkably beautiful, and the interior is characterised by a simple yet dignified style. The choir bends somewhat to the north, as does that of St. Michael's. The west wall does not make right angles with those that adjoin it, nor are all the piers vertical. The floor, which had been raised in 1735 and then lowered, was relaid to its proper level thirty years ago. The long range of clearstory windows on the north side, with some of those on the south side, form an early instance of the adoption of square-headed windows. The font in use is a copy of the Early Perpendicular font in St. Edward's, Cambridge, and has a cover of tabernacle work finely carved.

Sir G. G. Scott restored the church in 1875-8 at a cost of some 7,000*l.*; the outer stonework has become much weathered since, and as a precautionary measure some of the pinnacles have been taken down.

Church of St. Edmund the King, Lombard-street. At a sitting of the Court of Arches on March 26 Sir Lewis Dibdin, K.C., Dean of the Arches, heard an appeal by the London County Council from a judgment of Dr. Tristram, K.C., Chancellor of the diocese, delivered in the Consistory Court on July 18, whereby he agreed that a faculty should issue for the building by the Commercial Banking Company of Sydney of a wide bay window upon steel girders over the churchyard. The rector and churchwardens contended that the land is part of the site of the earlier church. The London County Council objected that it is a portion of the old graveyard and therefore comes within the purview of the Disused Burial Grounds Act, 1884. The learned Chancellor held that the Council had not sustained their objection. Of the situation and history of the ground in question we gave an account in our number of August 12, 1905. At the hearing of the appeal Mr. C. E. Allan, counsel for the rector and wardens, stated that they had decided not to proceed with the faculty, and, having come to terms with the appellants, would, moreover, pay them 50*l.* towards their out-of-pocket expenses. The Dean of Arches adjudged that by consent and without prejudice to any question that might arise between the parties the order in respect of the faculty would be discharged; he gave no decision as to the important point of law involved, namely, whether the land is part of the site of the former church or part of the graveyard on the west side of the present church.

Church of SS. Anselm & Cecilia, "The Sardinian Chapel," Lincoln's Inn-fields. THE old church in Sardinia (until 1878 Duke street) will, it is stated, be soon pulled down. Some writers aver that it is co-eval with the archway on that side, formerly Arch-row, of Lincoln's Inn-fields; over the middle arch on each face is a tablet inscribed "Dyke Streets, 1648"; but our columns of October 22, 1898, contain a summary of some inquiries we made in the matter, showing that in November, 1687, the Franciscan Fathers of the Second English Province of Friars Minor resolved to acquire "the spot near the arches in Lincoln's Inn-fields, lately in the possession of the Countess of Bath."* A novice, by name of Our Holy Father St. Francis, was opened in the new chapel in October, 1688. The two houses, Nos. 53-4, Lincoln's Inn-fields, were at one time a single house occupied by the Portuguese, and afterwards by the Sardinian Ambassadors; the house was entered through a door, since blocked up, in Sardinia-street. No. 54, latterly the Presbytery, extends over one-half of the archway and communicates through the old hall and a door with the chapel in the rear. Having been during more than one hundred and

fifty years the chief centre of Roman Catholic worship and charity in London, the church has recently played a prominent part through the revival of an ancient ceremony—that of "La Messe Rouge," attended by members of the Bench and Bar at the close of the Long Vacation. In our article cited above we gave two illustrations of the silver medal executed by George Bower and presented to William and Mary in commemoration of the attacks made by the mob in the night of Tuesday, December 11, the day of King James's flight from Whitehall, upon the ambassadors' houses, and upon the other embassies in London. The reverse of the medal bears in beautifully-wrought relief a view of the chapel and house in ruins, and of the old elevations in Arch-row. The chapel was rebuilt and enlarged upon the site of the Embassy stables westwards, after the assault and pillage by the "No Popery" rioters in the night of Friday, June 4, 1780. The eastern portion of the fabric has an octagonal dome and a lantern, carried by four arches, with a gallery and a rounded apse; the western and later portion is much plainer and has an upper gallery. Fanny Burney was married in the church on August 1, 1793, and there on August 11, 1787, Nollekens, the sculptor, was baptised.

Mr. Byam Shaw's New Pictures. MR. BYAM SHAW is a painter of exceptional talent who is trying experiments; but his experiments are always interesting. The latest, illustrated in the three works entitled "Purity," "The Neglected Invitation," and "Hope," at Messrs. Dowdeswell's Gallery, may be described as a kind of revival of the art of Crivelli and his school, in the production of decorative paintings embellished with gold and other ornamental adjuncts in actual relief. The most important of the three, "The Neglected Invitation," enshrined in a sumptuous columned frame, represents the Saviour seated in the centre of the sacred table, facing the spectator; along the table are chalices spaced at equal distances, ready for the guests who do not appear. The whole of this is treated in a strictly conventional and decorative manner. Through semi-circular lunettes, one on each side of the Christ figure, are seen realistic pictures of the world outside—medieval crowds occupied in fighting and parade and business—hence "The Neglected Invitation." This cannot be called exactly a picture; it is an artificially made-up mingling of painting with decoration; but it is very impressive. "Purity" is a beautiful nude figure enshrined in like manner in decorative material, standing on a floor in which the perspective effect of the light and dark squares is realised by an actual inlay of mother-of-pearl and gilt plaques cut to the shape as seen in perspective. "Hope," a draped figure, is treated on the same principle. Though, as observed, this recalls Crivelli, there is a new feeling about it, and it represents practically a new form of art. There are some fine and original pictures of the usual type of painting; "Pegasus in the Plough," a fine poetic fancy; "The Pilgrim Year," much developed and improved since it was seen at the Academy; and an allegorical figure of "Autumn" which is

* *Conjer*, "The Franciscans in England A.D. 1600-1850, etc." By the Rev. Father Thaddeus, O.S.F., 1897; and "Collectanea Anglo-Minoritica: Or a Collection of the Antiquities of the English Franciscans, etc., by [Anthony] [Parkinson]": 1726.

exceedingly fine in colour. It is an exhibition entirely outside of the common-places of painting.

The Leicester Gallery.

AT the Leicester Gallery is a collection of some of the French pictures which formed part of the Staats Forbes collection. A good many of these are by Corot, but include none of his great works; and in "The Carp Pond, Fontainebleau" (3), the holdings are very bad; "The Water Meadow" (4), just below it, is a beautiful little composition. But the best things in the room are two beautiful woodland scenes by Diaz (37 and 50) in his finest style in this class of subject; and another by him called "The Salad Gatherer" (27), remarkable as a very fine little landscape quite out of this artist's usual style. It is interesting, too, to find a fine work by Rousseau (16) which is not a forest scene; and, on the other hand, a forest scene by Troyon in which he seems to have been imitating Diaz. Among other good pictures is a coast scene by Daubigny (15), "The New Moon," by the same artist (17), and "The Storm" (22), by Dupré.

The Fine Art Society.

THE announcement of an exhibition of eighty water-colour pictures illustrating the life of Christ carries the memory back to Tissot's remarkable exhibition years ago at the Doré Gallery; but the result is hardly satisfying. The subject is too great a one to hear anything but a high order of treatment, which we hardly find in Mr. Hole's drawings. We should gather that the artist's main object has been to realise the scenery of the life of Christ; in this respect he may have succeeded; but the realisation of the personages leaves much to be desired, and hardly seems to have been seriously attempted.

Mr. Maclean's Gallery.

THE exhibition at Mr. Maclean's Gallery is noteworthy for including three beautiful landscapes by M. Harpignies, and also a fine one by M. Weiss, "Autumn" (38), which however we think we have seen in another gallery in London before, or one exceedingly like it. Millais' "Jessica" is to be seen here; a fine painting, though we have never thought it answered to the character of Shylock's daughter; the figure is too dignified and lady-like in style for Jessica. Mr. Godward's cold classicities and Mr. Hurt's imitations of Mr. Peter Graham do not interest us much.

The Modern Gallery.

AT the Modern Gallery, under the title "Three Generations" is a collection of the water-colours of the late L. J. Wood, R.I., and his son and grandson, Mr. Pinhorn and Mr. Lawson Wood. The grandfather makes the best figure in the show. He was a painter of architectural subjects, somewhat in the school and manner of David Roberts; and, old-fashioned as their style of execution appears now, his drawings are excellent work of their kind, and illustrate some very picturesque architectural groupings. A curious example is that of the old bridge at Dietz on the Lahn, where

the heavy up-stream huttresses have evidently had their lower portion undermined and carried away by the water when the river was in flood, leaving the upper portions as masses of masonry hanging on to the piers of the bridge, which is probably not standing now. Mr. Pinhorn Wood's works are landscapes, and those of Mr. Lawson Wood caricature sketches in colour, very clever and humorous in many cases, though hardly meriting the name of art.

The Institute Prize subjects.

THE list of subjects for Prizes and Studentships to be awarded by the Institute of Architects in 1907 has been issued. That for the Essay Medal is an admirable subject—"The Influence of the use of Iron and Steel on Modern Architectural Design"; which should perhaps rather have been worded "The Influence which the use of Iron and Steel should have on Modern Architectural Design"; for as yet it has had little or no influence, in this country at least, except in the had sense of inducing concealed construction and displays of impossible pretences in masonry. But there is much to be said on the subject, and we hope there may be a better competition for this prize than has usually been the case. The subject for the Soane Medallion is "A Large City Hotel facing a Public Square"; a good subject, giving opportunity both for practical planning and for suggesting a better architectural treatment than we generally see in hotels. We hope the competitors will bear in mind that a hotel need not necessarily be florid and exuberant in architectural style, but is quite capable of treatment in a refined and sober manner. The subject for the Tite Prize is "A Loggia for Sculpture to screen the blank end, 150 ft. long, of a Building," but the height of the building should surely also have been given, or the height to which the loggia was to be carried. We observe that it is again stipulated that the design should be "according to the principles of Palladio, Vignola, Wren, or Chambers," which, as we have before indicated, is a misuse of the word "principles"; it should be according to the "practice" or the "examples" of those architects: "principles" is a word too large for its position as here employed.

LETTER FROM PARIS.

AT each Presidential election the Ministry of Fine Arts has a portrait engraved of the new President, prints of which are sent to all the Prefectures, sub-Prefectures, and Mairies of France. The portrait of M. Loubet was engraved by Patricot. On this occasion the etcher, M. William Barbotin, has been selected to execute the portrait of M. Fallières.

A grand Franco-American function will take place on the 20th at the Trocadéro, under the patronage of the United States Ambassador, on the occasion of the presentation to the city of Paris of the statue of Benjamin Franklin. The statue is to be erected on the Place du Trocadéro, at the entrance to Rue Franklin. It is the work of Mr. John Beyle, and is an exact reproduction of that which was erected in front of the Post Office buildings at Philadelphia. The pedestal is adorned with bas-reliefs by M. F. Bron; and on the plinth are engraved the words of Mirabeau—"Le Génie qui affranchit l'Amérique et versa sur l'Europe des Torrents de lumière, le Sage que Deux Mondes réclament."

Owing to the construction of line No. 4 of the Paris Metropolitan Railway to cross the

city from north to south, it will be necessary to make a tunnel beneath both branches of the Seine between the Place du Châtelet and the Place St. Michel. It was at first proposed to run the lines in separate tunnels, but as the result of a competition the Prefecture decided to accept the scheme proposed by M. Chagnaud, a well-known Parisian contractor, for a single tunnel of dimensions similar to those on other sections of the Metropolitan system. Except in the portions beneath the bed of the river, the subway will be excavated by means of a shield, and beneath the river it will be formed by the aid of caissons sunk from the surface of the water. The walls of the tunnel are to be built of cast-iron segments, bolted together in the usual way, to form an oval cross section, and cement grout will be injected outside the tube to fill any space between its exterior surface and the surrounding earth. The interior lining of the tube will consist of concrete-steel finished with a coat of Portland cement. Beneath the river the tube will be built in lengths, inside caissons formed of a steel framework of rolled sections and plates. One of these caissons has already been sunk. The lining tube was built inside the caisson as soon as the latter had been floated into position, and the space between the tube and the outer walls of the caisson was then filled with concrete, thus sinking the caisson upon a specially prepared bed at the bottom of the river. Sinking to the final level will be performed by means of compressed air, and when the adjoining lengths have been sunk the steel plates closing the ends will be removed to form a continuous tunnel. Beneath the Orleans railway the excavation will be conducted by the freezing process, a wise precaution intended to avoid the risk of settlement during construction.

The Municipality of Paris are at present considering the question of the future of the electric supply of the city. The concessions granted to the six private companies who supply the city with the electric light will all expire shortly, and it has been agreed to convert all the present systems, so that by 1912 they should be all practically uniform. In a report presented to the Council by the Prefect of the Seine, M. de Selves, the offer made by a syndicate of manufacturers for taking over the companies' undertakings directly their concessions expire and converting them to a uniform system is recommended for acceptance. The company would be given practically a monopoly of the electric supply for nearly thirty years. In return it would have to pay to the Municipality 3 per cent. of the gross receipts for the sale of the current, and, in addition, 45 per cent. of the net profits. The sum of these payments, however, must never be less than four million francs (60,000*l.*) per annum. The concessions granted would expire in 1938, when the whole system would belong to the Municipality. It is not surprising, therefore, that under these heavy burdens the price of electric light in Paris is dearer than in almost any other city in Europe. Under the new scheme consumers have the option of paying on the basis of a two-tariff rate or on the maximum demand system, which is extensively used in this country. When the double tariff is accepted, the consumer's meter automatically registers much faster at certain times of the day than at others. For instance, in January every unit consumed between the hours of 4.15 p.m. and midnight will be charged at the rate of 7*d.*, whilst at other times of the day the charge will only be 2*d.* In June and July only the lower tariff rate will be charged. It has been decided to have one or two large generating stations outside the city. The electric power will be transmitted by three-phase currents at 10,000 volts to substations for distribution on the three-wire system at 110 volts. Incidentally the question of the best frequency to adopt for the supply has led to the reading of several papers before the electrical societies and an animated discussion in the technical press. Many engineers are in favour of the low frequency of 25, but others say that the flickering of the light of low candle-power lamps and of arc lamps at this low frequency is very objectionable. Parliament has just voted a law in regard to the protection of sites and natural monuments of artistic beauty. By the terms of this law, a "Commission de Protection des

Paysages" is to be formed in each department in France and Algeria. This committee will draw up a list of landed properties the preservation of which would be, in regard to their artistic or picturesque interest, of public importance; and the proprietors are to enter into an undertaking not to destroy or to alter the aspect of the site without a definite permission from the Department of Fine Art, which will keep a classification of them in the same way as in the case of Monuments Historiques. In case of refusal to obey this injunction the Government will take proceedings against the proprietor "pour cause d'utilité publique" for the payment of an indemnity fixed by a jury of expropriation, and he will be also subject to a fine, under a penal clause, ranging from 100 to 3,000 francs. The measure is regarded in France as somewhat too sweeping, and an interference with the rights of individuals in private property.

Parliament has also been occupied with a Bill relative to the erection of a Chemical Institute which would occupy a site of about 9,000 square metres between Rue Ulm, Rue St. Jacques, and Rue Gay-Lussac, in the Vth arrondissement. The scheme will require an expenditure of close on five million francs.

The Société Nationale des Beaux-Arts (New Salon) has obtained the use of the two pavilions at Bagatelle for its exhibition, from April 15 to June 30, of works by its deceased members, among whom are the great names of Meissonier, Dalon, Pavis de Chavannes, Cazin, etc. The exhibition is being arranged by M. Dubufe, and is likely to be a great success. The receipts from it are to go to swell the art budget of the Municipality. It is hoped that, with these extra gains from the Bagatelle exhibitions, the Municipal Council will see its way to make purchases from the various Salons of the works of foreign artists, which hitherto it has reluctantly been compelled to pass over in its annual acquisitions. In that case certain rooms at the Petit Palais will be reserved for the works of foreign artists, as is at present done in the State gallery of the Luxembourg.

The gallery at the Petit Palais containing the collection of Henner's works, which his nephew has presented to the Municipality, has just been opened. It is a fine collection, showing Henner's best qualities, and the fine colour and calm and restrained style of these is in striking contrast with the very different character of the works of Ziem in the adjoining room. It is proposed to organise in another room a collection of the works of Carrière, some of whose best works, especially those which he painted for the mairie of the XIIIth arrondissement, are in the possession of the Municipality. There is also to be shortly opened to the public, at the Petit Palais, an interesting collection of sketches by Daniel Vierge, Diaz, and M. Harpignies.

The work of enlarging the Musée Carnavalet has been actively carried on under the direction of the architect to the museum.

Following the example of South Kensington, the Union Centrale des Arts Decoratifs has decided to open its doors to temporary exhibitions of loan collections. By way of a beginning, M. Bernard Franck has lent his fine collection of caskets, bottles, and toilet objects of the XVIIIth century.

For the first time, this year, the manufactories of Sevres and Gobelins have been invited to contribute to the exhibition of the Old Salon. They will send some of the most remarkable works executed during the last few years, and also a collection of Sevres designs of the XVIIIth century, executed from moulds still existing at the factory.

The death is announced, at the age of seventy-five, of the painter Jean Baptiste Millet, brother of the more celebrated author of the "Angelus." He was the pupil of his brother, and exhibited landscapes in the neighbourhood of Fontainebleau and of Paris. He had, however, devoted himself more especially to sculpture, and, along with Geoffroy Dechaume, he executed, under the direction of Viollet-le-Duc, important work at Notre-Dame, Paris, and at the church of Vezelay. He has left also some remarkable water-colours.

THE "WOODMAN" TAVERN, HOLLOWAY.—This tavern has recently been rebuilt from plans drawn by Mr. M. T. Saunders, architect.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

WOOD-CARVING.

AN ordinary general meeting of the Royal Institute of British Architects was held on Monday evening at No. 9, Conduit-street, Regent-street, W., Mr. Leonard Stokes, Vice-President, presiding in the absence of Mr. John Belcher, A.R.A., the President, when papers on "Wood-Carving" were read by Mr. W. Aumonier and Mr. A. W. Martyn.

Mr. Aumonier, dealing principally with the treatment proper to wood-carving, referred to the various ways of applying carving in architectural decorations. If the wood-carver, he said, can succeed in making these points of real interest in the scheme, and by a right understanding of the power of light and shade help the architect to bring his whole design into harmony; and if he impart into the work some subtle touches that will help to bring mystery and life into it, in however small a degree, he has done something to relieve the appalling monotony of machine-worked moulding and correctly-planned boards—he has done something to justify the hope that he may be regarded as a brother artist working in sympathy with the architect towards a common end. Going into details of the carver's art in relation to architecture, and treating of panel-work, the lecturer said that very fine effects can be obtained by the actual treatment of the work as light and shade, by putting some parts very low on to the ground and keeping others high. Even a bad design may be made to look tolerable by the way the work is in the language of the craft, "thrown about," and a really fine design may have no interest if carved with no sense of relief or proper variety of surface. A design should never be too elaborate or intricate in character. The lecturer expressed his strong personal sympathy in favour of solid panels carved with a considerable amount of relief, some parts being high and others very low and dying delicately into the ground and combining with it. He felt, however, that in these days of distinct, and to some architects disquieting, revival of the Grinling Gibbons sort of work, one could not ignore altogether the sumptuous effects arrived at by swags, etc., boldly applied on to the surface of plain panels. By this process rich and strongly-decorative effects may be obtained which, perhaps, could not be conveniently accomplished by any other means. Styles or rails forming part of the frames of carved panels should be treated very delicately, and carved into the solid wood itself, so as not to lose the feeling of strength properly belonging to framing of any sort. Columns, if carved, should be treated in the same flat, solid manner as recommended for styles. Perforated work should be kept very flat on the surface. As regards mouldings, architectural decoration might be often improved by giving more thought to the suitable treatment of carved mouldings—for instance, keeping some of them very delicate in effect, and some much stronger as a whole; while some may be delicate in parts and much stronger in others, always dividing the strength and delicacy to run in line with the edge of the moulding. The lecturer showed by means of diagrams various ways of treating enriched mouldings. Caps to columns or pilasters should never be overcrowded, but should show the bell plainly, thus revealing the strength of the column going right up to the abacus. They should be very lightly carved, and the volutes may be freely cut through in all directions, plainly disclosing the bell underneath them. As to carving generally, the lecturer deprecated all mechanical means of getting effect. He pleaded for its own treatment, that of real carved or cut wood, cut with sharp tools, and alive with living, nervous cuts all over, both subject and ground, making one harmonious whole. No part of the ground should ever be absolutely smooth like a planed board—no part of the surface of the carving itself ever robbed of all expression by the brutal use of glass-paper or fish-skin—all parts of the work should team with the joy of life and effort which the carver felt in doing it.

Mr. A. W. Martyn briefly sketched the history of wood-carving from early times

down to the present day, deducing the fact that the best work in all periods has been inspired by religious enthusiasm. How are we, he asked, to inspire enthusiasm, and will the expression of such enthusiasm elevate the public taste so that we shall not have such a character for the next fifty years as we have had in the past? To inspire enthusiasm one must have contagious enthusiasm oneself; had we a wood-carver—or, say, an architect, with the enthusiasm for his work that a man like General Booth has, we should find a marked improvement in all branches of architectural art. The lecturer emphasised the point that it is the architect who makes the carver. The architect must know what he wants, and must be able to inspire his carver with his requirements; he must work with him as a fellow-artist, leading him on to produce that which is in his (the architect's) mind. The lecturer cited Grinling Gibbons as an example of an artist in wood who, when left to himself, simply became a clever expert with his tools; his work lacked architectural harmony, it was wood-carving pure and simple, without direction—witness the altar-piece at St. James's Church, Piccadilly. On the other hand, much of the same artist's work in St. Paul's Cathedral, though not nearly so well carved or so dexterous, has control; it has architectural harmony, and is part of the architecture, and, what is more, part of the architect. As regards the architect's knowledge of carving, intimacy with good work is essential; and a carver to give the best results must have a fair knowledge of architecture, i.e., the carver should know as much of architecture as the architect should of carving. Contagious enthusiasm cannot be within the power of all; but intimacy with one's subject and sympathy between the artists can be secured by every architect, and will to some extent remedy the deficiency in the lack of enthusiasm. Necessarily enthusiasm must be properly directed; must be placed at the back of knowledge to encourage and direct. But how is this knowledge to be secured in the fullest degree? Though real, useful, living knowledge is being given to students at some of the schools of art, we have no central leading authority to found or carry on any given school of carving. The school of Gibbons was created by his personal force in his work, which was lifted right away from its immediate surroundings to a height carving had not reached for 200 years. Since his time carving has steadily depreciated. We must now look for some artist to lead us along the line of progress; if it cannot be done alone, it may be by united efforts. Unless we can hand down to the younger generation some of the knowledge we have gained through the years of experience, so that the threads of our knowledge may be carried on indefinitely, we cannot make such progress as history has painted for us in the past. The old schools of painting were more or less continuous, the pupil often rising above the standard of his master, and so by continued growth the fullest development took place. The lecturer expressed a wish that it were possible to found such a school for carving. A London master, he said, had given twenty years' hard service, and had probably done more good in this direction than almost all the others combined. This work ought to be carried forward, and should receive the assistance and sympathy of architects. The lecturer suggested that, as religious fervour was lacking, another spur should be found to help us along. Perhaps the best was ambition; at present ambition in a carver was almost dead. A gold medal might be founded, on the lines of the Royal Gold Medal for Architecture, and presented annually, or even triennially, as an award of merit to the individual who had done something to raise the standard of his art, be it in mural decoration, stained-glass, plaster-work, wood-carving, or any other branch of architectural work; the recognition should be public, so that the award should carry with it the good opinion of the art-loving public. But the opportunity must be created for continued study; there should be a central school directed by men of knowledge. By looking at the past one was able to judge of the future, so that in all probability the architectural profession must be looked to to raise the standard of work. The architect is the master, the carver the servant; but a direct

and living sympathy must at all times exist between them if the best results are to be obtained. The lecturer referred to a little difficulty carvers continually meet with in connexion with architects' sketches of carving. An architect will mark on his drawing the word "carving," and his assistant, often a junior, will roughly sketch what he thinks is required; and the carver is invariably affected by whatever is shown, no matter how rough. This is an important point; whatever is shown on the drawing should be strictly indicative of what the architect desires. A carver often produces a clever piece of carving by the inspiration of a clever sketch supplied by the architect.

Mr. Hubbard, in proposing a vote of thanks to the readers of the papers, said the subject they had dealt with was essentially one of the high arts, and it became exceedingly difficult to criticise this art, as the leading architects of the day had just been telling them they could not examine or criticise art. He did not know exactly what that meant, but they would appreciate the difficulty in which he was placed on that occasion. He began at last slightly to realise what was meant by that when he saw one of the photographs which had been exhibited. This photograph showed a good deal of the carving executed by Grinling Gibbons which was originally in the chapel of Winchester College. Some forty-five years ago one of the leading architects of that time—Mr. Butterfield—had instructions to carry out certain works at this chapel, and when he saw this carving—and it was some of the finest carving in the country—he did not consider it quite appropriate. At all events, he must have considered his own Gothic architecture more important, for he turned this carving out of Winchester College and superseded it with his own. That carving, whether it was appropriate or not, had apparently been placed in the rooms of the Institute, and it was difficult to say whether Mr. Butterfield was right or not, inasmuch as he was a leading architect of his times; but, if he (the speaker) as a humble architect representing no influence at all might say so, he was inclined to think that, handsome as the carving was in that room, it might still have been more handsome in the position in which Grinling Gibbons wished it erected. They saw another example of Grinling Gibbons's work on the opposite side of the room, and one of the characteristics of his work was this—that he invariably neither enlarged or diminished the size of the foliage, or flowers, or fruit he was depicting in his work, and he so arranged his carving that any flower or fruit could easily be picked out from the wall on which it was hanging. The realistic effect thus gained was perhaps the chief characteristic of his work. The lecturers had pointed out how the best effects might be obtained, but there was a great deal more in wood-carving than just the effect which was attempted to be obtained from the artistic point of view. At the back of all artistic work they would find there was a certain sentiment, and it was the duty of the architect or the carver to represent that sentiment in his work. Even in the architecture more than the carving they could embody the sentiment. Architecture and carving was but the representation of a sentiment quite apart from the artistic effect. He noticed amongst the examples given a long panel, and one was confused in one's mind to know in what position it could be properly placed. It was a handsome piece of work from the carving point of view, but whether it was intended for a church or a ballroom it was impossible to say. The cherub with wings growing out from the shoulder-blades seemed to imply that it was meant to give an ecclesiastical effect, whereas other features of the carving seemed to suggest a ballroom effect. Mr. Martyn had pointed out that it was for the architect to instruct the carver in the work he was to carry out; that it was really for the architect to explain to the carver the sentiment he wished carried out, and the architect ought to be in a position, however roughly, to indicate that sentiment. He was sure that if they as architects really did try to represent the sentiment intended to be carried out the better would be the result, and it was, thanks to lecturers like those who had been there that night, and who had explained their difficulties, that architects would be able to appreciate how best to assist them.

Miss Eleanor Rowe, in seconding the motion, said that as a sister carver she appreciated many of the difficulties which had been referred to. If carvers only bore in mind what Mr. Aumonier had said about the treatment of the ground, they would find it very helpful. What was said about mouldings also was very helpful. She would like to see more pierce carving. Such carving applied to the hollow moulding had been done with wonderful effect in some of the churches in Devonshire. One instance was the church at Coleridge, where some panels were brought forward which gave an exquisite effect. With regard to Gibbons, she would be very sorry if there was any attempt to revive his carving, although the carver could learn an immense amount from his work. The way Gibbons treated his foliage and flowers was admirable; he knew exactly what to take and what to omit, but she did not like the effect of the cutting and applied ornament, for there was a lack of harmony in the whole arrangement. They would see this in St. Lawrence, Jewry, although the carving was very fine. She felt that the giving of a gold medal would be a very great encouragement, and hoped the Institute would see its way to offer one.

Mr. Alkin Perry said he felt there was scarcely a word in Mr. Martyn's paper which would not appeal to the sympathies of all present. Mr. Martyn, amongst other things, spoke of the indefinable thing called "spirit" in the work, and he contrasted the commercial spirit with the true artistic spirit. They knew that the commercial spirit was the bane of all they as architects were trying to achieve, and it was unfortunately very prevalent in these days. Mr. Martyn seemed to imply, and, in fact, said, that architects made the carver. That might be so, but he thought the architect was very much in the hands of the carver, and very much dependant on the carver. The carver might either make or mar the work of the architect. Mr. Martyn also spoke of the enthusiasm that was necessary. They knew that enthusiasm was a potent force if it met with due encouragement, but that it was in art a delicate and sensitive plant, and was chilled and withered by the want of encouragement. How often they as architects had to deplore that want of encouragement from those who employed them? They were not absolutely masters of the situation, but they were in the hands of those who had to pay for the work which was executed, for often when they would like to employ the very best talent they were prevented by the want of encouragement and want of enthusiasm on the part of their clients. Therefore he did not think that architects must be held entirely responsible for making the carver. He wished it were so. Mr. Martyn referred to the practice of the architect in writing the word "carving" on the drawing and some other hand attempting to interpret the word and very often spoiling the whole thing. He thought it would be much better if the architect left the word "carving" to be interpreted by the carver, because, given a carver of the right sort, he was quite certain they would get carving of the right sort.

Mr. H. Inigo Triggs remarked that, so far as English work was concerned, he had chiefly studied those of Inigo Jones, and had always felt that he did an enormous amount towards the development of English wood-carving. In All Souls' College, Oxford, he had gone through a lot of Inigo Jones's original sketches which he made for wood-carvers, and was very much struck at that time to see how very minutely he sketched out all the work which was executed for him. He certainly did not write the word "carving" on his drawings. He understood that up to that time carving was very much left in the hands of the carver himself. There was a wonderful collection of Inigo Jones's drawings at Worcester College, Oxford, which he was afraid that architects did not value as they should, and it was wonderful to see what an amount was shown in them. It was some time said that Wren rather started English craftsmanship, but it seemed to him that Inigo Jones was a little bit before him in that respect. He had seen a good deal of Mr. Aumonier's work at Oxford, and it had always given him the very greatest pleasure.

Mr. J. D. Crace said that, taking a great interest as he did in wood-carving, he had followed the speakers with close attention, and there were some points which were

perhaps worth laying a little stress upon. He entirely agreed with Mr. Martyn's view that Grinling Gibbons became valuable as a carver, apart from the *tour de force* of his power, from the time that he came under the direction of Wren. Gibbons's work when subjected to architectural direction became at once valuable to the building, and so long as the carving, however beautiful, does not contribute to the beauty of that which it is supposed to adorn it had no value from the architect's point of view. In examining the work of Grinling Gibbons, or the work, at any rate, done under him or in connexion with him, too much stress could not be laid upon the extremely able treatment of the mouldings. Whenever the mouldings were not near the eye or when they were running in long lengths and in great continuity, their contours were never disturbed. They found in Wren's work almost throughout St. Paul's and in other places that the wood sections of the mouldings could always be read right through. There was an undisturbed surface, and that was one of the great charms of the work done under Wren's direction by Grinling Gibbons. This was observable in the strap mouldings and in the most beautiful ogee carving. One of the most beautiful examples of Grinling Gibbons's architectural carving had not been mentioned. He alluded to the chapel of Trinity College, Oxford. Of course, the library of Trinity College, Cambridge, was better known, but for the most beautiful woodwork of Wren's time he thought that of the chapel of Trinity College, Oxford, was quite amongst the very best. There had been allusion to French work, and the work of the XVIIth and XVIIIth centuries was mentioned, but there had been no allusion to the stalls at Amiens and Auch, which were both superb and far beyond anything executed in England in the same period. Another point which it appeared to him that wood-carvers of the present day were apt to overlook was the great importance in architectural work, and especially in panel work, of maintaining the line of interest in ornament. Of course, in the panels illustrative of Grinling Gibbons's *tour de force* style practically the direction of the ornament was lost unless one was actually opposite them. The Italian carvers worked with an extraordinary knowledge of effect. In such work as the doors of the Vatican and the panels in the stalls at St. Pietra, Perugia, or, again, in the beautiful work at Bergamo, there was always direction of the main line of scroll, however elaborate the ornament. It might be a piece of foliage or a mere string of light or shade, and the first feature in the carving was that they always maintained the motif. That was a thing very often lost sight of now. In reference to French and Italian work, in both of course, there was a life and delicacy quite unknown in the English work of the same periods. Speaking of the later carving, Bergamo afforded a most beautiful example, which no wood carver should fail to see in the stalls of the cathedral. At least, he believed it was the cathedral, but there were two churches near together, and it was many years since he was there. In those stalls there were a number of children carved in wood surmounting the arms and canopies. He believed there were over 200 of them, and they were the most natural and beautiful representations of children ever produced. It should certainly be well studied by wood-carvers as an admirable example of the form in which the more independent kind of wood-carving could be carried out.

The Chairman said they would all agree that they had had two most valuable papers. Mr. Aumonier dealt, if he might say so, more with the practical side, and Mr. Martyn seemed to be filled with enthusiasm and vigour of the theoretical side, although to him were largely due the examples of practical work which they had before them, and which showed clearly that, however much he was imbued with theoretical ardour, yet he was also endowed with practical knowledge. They would all admit that, while there were carvers and carvers, there were also architects and architects. While it may be very wise for some architects who write "carving" on the drawing and leave it to the carver, it might be well for other architects to do a little more. Some architects might have some knowledge of carving, and might suggest to the carver pretty straightly the sort of thing they wished to see carved on their buildings. But, as he had said, some of them were architects and

some were carvers, and some were carvers of one kind and some architects of another kind, and so they could not lay down a hard-and-fast rule. He felt that it was most desirable that carvers should know something about architecture. Mr. Martyn quite admitted that, and he (the speaker) thought many of their buildings suffered, if he might say so, from the want of knowledge of the carvers. They got unnatural foliage trickling about their buildings, which they had hoped when they saw the sketches and models were not going to be so unmarred and trickling. Of course, Grinling Gibbons was a master, and, although they might not hold exactly all his views, they could not help admitting that his work was full of genius. Mr. Hubbard seemed to be disturbed with regard to a piece of carving as to whether it was meant for a church or ballroom, and had pointed out that the figure of the cherub was suitable for a church. He, however, sometimes thought that a cherub was more suitable for a ballroom, but they would not quarrel over that. He himself did think that Grinling Gibbons was a great master. Of course, there was the good old Gothic principle that they should carve everything out of a chunk of wood. He himself was brought up in those principles, and he supposed he would die in them. At the same time, he could not help thinking that this applied work had a charm of its own. They would probably each go their own way, and some would carve out of the chunk and some would apply their carving in the way that Grinling Gibbons did.

The vote of thanks was then carried. Mr. Ammonier said that, with regard to Mr. Crace's point that no mention was made of the Amiens work, he might say that, personally, he did not care to speak about the historical part of the subject, but when he read a paper before he did mention it. He came there to talk about what he himself knew, and to show how men of the greatest culture appreciated good work. He would tell a little tale of the very work of Grinling Gibbons to which Mr. Crace referred at Trinity College, Oxford. He knew that work years ago, when it was beautifully dirty and toned. Some time ago he went to Oxford again, and, as usual, visited Trinity College, and directly he entered the door he found the carving looked quite white and new. He thought it had been cleaned, but when he went to examine it he found that every inch of that work had been painted with white oil-paint. That was the way that some of the cultured people of England took care of priceless examples of old work. He expected something better from Oxford, but he did not get it.

Mr. Martyn said the only thing he would point out was that in all Gothic carving the value of the carving was taken from the front of the work. Whatever piece of Gothic carving they took, the outline—the front line—was its value. On the other hand, the classical carving, they would find that the value was created through the background.

The Chairman announced that the next meeting would be held on April 23, when papers on "Plaster Work" would be read by Messrs. G. P. Bankart and L. A. Turner.

Registration.

A special general meeting was held on Tuesday, Mr. Edwin T. Hall, Vice-President, in the chair, to receive formally the draft Registration Bill and the report and recommendations (see our last issue) of the Registration Committee adopted at a meeting on March 20, 1906, when it was resolved to recommend the Royal Institute to adopt the scheme outlined in the report instead of the Draft Registration Bill already published.

The following resolutions were proposed from the chair:—

"1. That the report and recommendations of the Registration Committee dated March 20, 1906, be adopted.

"2. That the Council be requested to take the necessary steps forthwith to apply to His Majesty the King for a revised or supplemental charter embodying the said report and recommendations, and also as soon as possible to prepare and present a Bill to Parliament to give effect to the same."

After discussion, the resolutions were varied, and unanimously adopted as follows:—

"Resolved, that the general principles of the report and recommendations of the Regis-

tration Committee dated March 20, 1906, be adopted, and the details referred to the Council for further consideration and report to the general body.

Resolved, that the Council be requested to take the necessary steps, when the scheme is perfected and approved by the general body, to apply to His Majesty the King for a revised or supplemental charter and to prepare and present a Bill to Parliament."

THE LEGAL OWNERSHIP OF ARCHITECTURAL DRAWINGS.

A JOINT meeting of the Architectural Association Discussion Section and the Law Students' Debating Society was held on Wednesday evening last week in the Law Society's Hall, Chancery-lane, W.C., when an interesting discussion took place on the subject of "The Legal Ownership of Architectural Drawings." Mr. E. B. Ames, of the Law Students' Society, presiding.

The discussion was opened by Mr. William Woodward, on behalf of the Discussion Section of the Association, who said that he might subdivide the subject as follows, viz., (1) The Sentimental, (2) The Practical, (3) The Legal, (4) The Remedy. As to the sentimental view, we must differentiate between the architect of fifty years ago and the architect of to-day.

Fifty years ago the architect was permitted by his employer to occupy a far longer time in the preparation of his designs than he is now, and this resulted in a careful inking-in and finish of the drawings which would astonish some of the younger architects of to-day—not only inking-in and colouring, but perspective views and elaborate shading of full-sized carved work and ornament—so that really and truly, apart from design, these drawings might be appropriately termed works of art. Therefore, to deprive the architect of these particular sheets of paper was an injury to his sense of right, and his sentimental views were considerably upset. He took the pride of an artist in the result of so many weeks and months of study, of the work of pencil and of brush. As an evidence of this just pride he even went so far as to put into frames what were really pictures possessing considerable artistic merit, apart altogether from design. As to the average architect of to-day, days were allotted to him in place of weeks and months to his *confirms* of half a century back; he had frequently to be content with hastily-produced one-eighth-of-an-inch scale pencil drawings, which he thrust into the quantity surveyor's hands as soon as he possibly could; he scarcely ever inked-in these small-scale drawings; tracings were made from them to supply to the builder; the half-inch scale and full-size details followed on as soon as possible, all in pencil, and the photographer's art was called in to reproduce as many copies of these tracings, within an hour or so, as might be desired. So that, regarded as works of art, these drawings were as different as possible from those of fifty years ago, and probably the last wish of the up-to-date architect would be to produce them in court, and, except for other reasons, the sooner these drawings were put out of sight the better the architect would like it. They would, therefore, probably agree that, apart from other questions which naturally arose, the sentimental idea of retaining the drawings depended a good deal upon the amount of work and of finish which had been bestowed by the architect upon the particular sheets of drawing-paper under consideration at the time. The late Professor Kerr had dealt with this question of ownership of drawings in a broad, business-like way, and, no doubt, what it must all come to was that if we could not establish custom we must get what we want by contract. He assumed that when architects' drawings were referred to as regards "ownership," the contract drawings were meant, and he thought the late Alfred Waterhouse, appreciating this, made the tracings the contract drawings, and thus defeated the client as regards the retention of the original drawings in the event of dispute as to ownership.

As to the practical point of view, and the injury which might arise to architects unless the present state of the law was altered, he would quote a case which had recently come to his knowledge illustrating the desirability

of some change in the law. About fifteen years ago a Roman Catholic church was built in Warwickshire, under the superintendence of an architect, who handed over the drawings to his employers at the finish of the work, but whether compulsorily or voluntarily he (the speaker) did not know. Quite recently another church had been erected in another part of England from the very drawings left with the original employer, who handed them over to the new employer, who placed them in the hands of a builder to proceed with the work without the aid of an architect, only making such modifications as became desirable in the second church.

He (the speaker) built a house at Hampstead, and, most curious to relate, a gentleman, who wished to build a house and stables on the adjoining piece of land, took a fancy to his design; but, instead of coming to him, he found out the builder, went to him, and, saying that he supposed he had the drawings from which he built the house, asked him whether he would build him a similar house, thus, no doubt, thinking he would save the architect's charges. The builder had the drawings, but was honest enough to decline to have anything to do with the matter unless the gentleman employed an architect. He (the speaker) then received a visit from the employer, and ultimately built him a house and stables at a cost of over 12,000.

Another reason—it might be a selfish one for the non-parting with the drawings was that it occasionally happened that additions and alterations had to be made to premises, and there were many employers who thought, very wrongly no doubt, that they could save money if they got rid of the architect and went direct to a builder with the drawings, who would thus see the nature of the construction, and be enabled to make the proposed alterations or additions without the aid of the architect. Another important point was that frequently questions arose years after the completion of the building, when it was absolutely essential, for his own defence, that the architect should be in possession of the original drawings, and, finally, it was perfectly clear to him that architects' drawings could be of very little value to an employer, unless he intended to use them in some way or other to the ultimate injury of the architect. All this might arise in the case of executed works, but the door was opened for greater mischief in the case of abandoned works. In these cases his employer could get the drawings, and, having paid only half of the charges which he would have paid if the contemplated building had been completed, he could hand the drawings over to a builder, and so save 25 per cent., or, at all events, he thought he would. But whether he did or not, the architect lost a job.

As to the law on the subject, the first case fought was the well-known one of *Ebdy v. McCowan*, and in this it was decided that, upon payment of the balance of his charges, an architect must deliver up the plans unless it had been stipulated that they were not to become the property of the employer, and, in his book on Building Contracts, Mr. Hudson gave a note on a case at Quebec, in which it was held that plans formed an essential part of the contract, and, in the absence of proof that they were the property of the architect, were deemed to be the property of the employer, and they could not be reclaimed by the architect. The court denied the existence of any general binding usage to the effect that the plans belonged to the architect and not to the employer. This case was apparently decided upon that of *Ebdy v. McCowan*, and apparently no case had been subsequently tried in this country except the important recent one of *Gibson v. Pease*, which resulted in the defeat of the architect's contention, and, upon appeal, the same unfortunate decision was arrived at. A case somewhat bearing upon the subject was fought some years ago by a firm of quantity surveyors. It was the School Board for London v. Northcroft, in which the Board had demanded from the surveyors the delivering up of their dimensions, abstracts, and bills of quantities for some work they had done for the Board. The surveyors declined to give these documents up, and they were supported in their contention by Mr. Justice A. L. Smith, who held that the dimensions, etc., asked for

were the private property of the defendants. The ink, paper, and brains, he said, used in making the documents were all the defendants', and "they are right in law in refusing to give them up." He should have thought that a similar train of argument to that used by Mr. Justice A. L. Smith would have been appropriate in the case of an architect's drawings as against the surveyor's dimensions. Perhaps lawyers had somewhat confused the issue by an interpretation placed upon the document issued by the Royal Institute of British Architects, and entitled "The Professional Practice as to the Charges of Architects." In clause 1, detailing the services covered by the commission of 5 per cent., it stated, *inter alia*, "the necessary general and detailed drawings and specifications" had to be provided by the architect, but that, of course, only meant that in the 5 per cent. was this provision for the drawings, etc.; it certainly was never intended to mean that the drawings became the property of the employer.

As to the remedy it seemed to him that the whole case lay in the fact that the employer did not really pay for the drawings at all when he had secured his building. He employed the architect, not to make drawings, but to erect a structure, and when that had been done the material which had produced the architect's work, composed of brain, paper, pencil, brush, etc., was no concern of his, and he should have no power to demand their delivery over to him. Many of the details of a building were made verbally and by rough sketches on the job itself, and these also it would be difficult to hand over to the employer. In France and in Germany it was the acknowledged custom that the architect retained the drawings, and, if the employer wished for copies, he might have them by paying for them as a distinct extra fee. He knew one architect who inserted a clause in the specification that all drawings and documents, together with all copies of same by whomsoever received, were to be returned to the architect within fourteen days of the issue of the final certificate. If the law was not to be altered they must make the matter the subject of a special contract with the employers. They must make it clear that the original drawings are the property of the architect, and that copies would be supplied on the client paying the cost thereof on condition that these copies were not used for any purpose other than that in connexion with information which might be legitimately required after the work was finished, and that such drawings were not to be used for reproducing any structure from them or in any other way to the detriment of the architect who supplied the drawings. Architects might also provide for drawings and specifications and all other documents supplied by them for the purposes of the building being delivered up to them at the end of the job, and this would include the builder, the clerk of works, sub-contractors, etc. If the law could not at present be altered they might ask the Council of the Institute to consider a revision of the scale of charges, and to insert in that scale, as the acknowledged custom of the profession, a paragraph to the effect which he had set forth. He was glad to see that one of the subjects for discussion at the forthcoming Congress of Architects in London was "The Architectural Copyright and the Ownership of Drawings," and no doubt the result of that discussion would be some improvement on the present condition of matters.

Mr. C. M. Knowles, of the Law Students' Debating Society, quoted from the Master of the Rolls in *Gibbon v. Pease*, that he found some difficulty in distinguishing the case from a contract to paint a picture or design a coat of arms, and he (the speaker) felt it was unreasonable to suppose that the ownership of the drawings should be in the hands of the architect and not the client. Mr. Woodward said that the drawings were of no value to the employer unless he intended to make use of them in some way injurious to the architect. That he emphatically traversed. It frequently happened that some sort of repair to a building was necessary—the drains, or the flues, for instance—and how was the owner to discover where the defects were without the drawings? That was sufficient

to rebut the suggestion that the building owner had no use for the drawings. The client, on the other hand, might think that, if the drawings remained in the hands of the architect, someone might take a great fancy to the bonus and might ask the architect to build him one just like it, and the building owner might very well object to that—the drawings, remaining in the hands of the architect, might, in such a case, be used injuriously against the building owner. There was considerable point in what was said as to an architect's drawings being used again by the building owner or someone else after they passed out of the hands of the architect. It was a complicated question; but there was a distinct grievance from the architect's point of view, and it would be interesting for the architectural societies to bring up some test case, as it was possible that, by a process of injunction, an architect might find some remedy. There was no reason why a *prima facie* case might not be made against a building owner for using the drawings in the illegitimate manner suggested. As to the custom in the architectural profession, no judge could recognise it. To make a custom legal it was necessary, not only that it should be general, but also that it should be reasonable. In the matter under discussion were two decisions alleging that the custom was not reasonable, and therefore there was not much prospect of success for the contention of architects. The judges had considered the cases on their merits, and had decided that the custom was not reasonable from the clients' point of view. And there was a simple remedy for all this, *i.e.*, by contract. He did not know why architects were not satisfied with the opportunity of embodying in their contract a distinct clause stating that the ownership of drawings was in the hands of the architect.

Mr. E. W. M. Wonnacott, Chairman of the Discussion Section of the Association, expressed, on behalf of the Section, the appreciation of the members to the Society for the invitation to join in that debate. He hoped that it was the initiation of a new policy, which, in the future, would be extended to the benefit of both societies. The question of the ownership of drawings was intimately connected with the question of copyright, but the number of legal cases bearing on the former was small. In addition to the cases of *Ebdy v. McGowan* (1870) and *Gibbon v. Pease* (1904), there was the Westminster County Court case of *De Castro*, which, however, did not establish a precedent, and, in that case, the architect was called upon, six years after their preparation, to produce the drawings. The trouble which had arisen over the claim to the ownership of drawings was due to the fact that there was a misunderstanding of the architect's function. Architects contended that they were employed to erect a building, and when that was done the client had all bargained for: the use of the plans was only incidental to work, and were the architect's instructions to workmen and explanations of his ideas. The fixed idea in the legal mind, however, was that the architect was a man who sold plans, and would not part with them when paid for them. The architect was employed to impress upon his work his own individuality—those little touches, which might be called his handwriting, by which he appealed to the emotions, and which, primarily, indicated that the architect was an artist, though that was the view that architects could not get lawyers to see. How his ideas were expressed to the workmen was no concern of the client, and really plans were not essential to the erection of a building, nor was there any obligation to prepare them. Why should the architect deliver up his drawings? The sculptor did not deliver up his sketches, models, or even his full-size studies. In the case of *London School Board v. Northcroft*—in which the defendant won—the ultimate object of the quantity surveyor, Mr. Northcroft, was to make a bill of quantities, and he was held to be right in refusing to give up the means by which he prepared his quantities. The ultimate object of the architect was to deliver to the building owner a completed building, and the materials with which he was enabled to do that should by analogy be his. The case of *Gibbon v. Pease* was not put fairly and clearly before the court, but the defendant gained his case on the question of

quantities and other documents, and was actually awarded costs on this part of the case. It had been suggested that the remedy was by simple contract, but why should the architect be called upon to enter into a contract in regard to a matter which, by custom, he claimed as a right? If the drawings were given up, the architect's position was a hopeless one, for his designs might be carried out by someone else. He became a planning machine, deprived of those credentials of his professional ability. Drawings were often wanted for the purpose of sending to would-be clients so that evidence might be afforded of ability, and especially in important competitions. If evidence of custom had been called in the case of *Gibbon v. Pease* they would have been more satisfied even if the case had gone against them, but the learned judge simply ruled that there was no custom. As to the remedies, why should architects give up the whole principle they were contending for by making a contract in regard to the drawings—a contract which was unnecessary abroad? If the contract were entered into it would pave the way to discord, and by making the ownership of the drawings a special right the onus would be put on the architect to prove the right which was his by reason. As to special legislation, on the Continent architects had the law almost in a nutshell, and a decision like *Gibbon v. Pease* was regarded as absurd. In France, Belgium, Italy, Roumania, Austria, Spain, Switzerland, Hungary, Russia, Denmark, and Norway architects were protected. In France, the architect kept and had an absolute right to his drawings, but, by an act of courtesy and the payment of extra fees, the client could have copies. He had not the slightest right to them except by special agreement. In Germany the client had the right to a copy of the drawings, but could not use them for future building operations. The only countries in which there was no legislation governing the subject were Great Britain and the United States, but there was a movement in the States in favour of legislation on Continental lines. As to the view that if the client was not allowed to have the drawings he could not know about the drains of his own house, there was a statutory deposit of plans as to drainage, as the judges in *Gibbon v. Pease* might have been told, and drawings for nearly all other purposes were useless to the building owner. In conclusion, Mr. Wonnacott gave, as an instance of the law in France, a decision as to the reproduction of the Palais de l'Industrie of the 1855 Exhibition. It was held that the exclusive right to reproduce this monument and to publish the plans lay with the architect.

Mr. A. E. Riddett, a member of the Society, in supporting the views of architects, asked what was the contract which the building owner made with an architect. Did he contract for the plans or for the building which was to be erected, and of which the plans were but means? If there was nothing specially stated in the contract about the drawings, which he understood was generally the case, then he thought that the contract was for the building and not for the drawings. There were many analogous cases to that under consideration. In the erection of a derrick the scaffolding was not given up, nor did the tailor hand over his patterns. As to the case of *Ebdy*, where tenders had not been invited at all he thought it was reasonable to hand over the plans to the building owner, as otherwise he got nothing at all for his money, but in the case of the completed building he thought that the plans ought not to be handed over, as the building was all the client contracted for. Even for purposes of reference it was more convenient for the plans to be kept by the architect.

Mr. Frank Daphne, who acted for Mr. Pease in the case of *Gibbon v. Pease*, said the point was not whether it was more convenient for the architect or the building owner to have the plans, but it was a question of contract. He did not think the case of *Ebdy* had any bearing on the case of *Pease*; it was a question of contract between the parties. He used to think that the architect was a man who prepared plans, but he knew now that he was more than that—*i.e.*, that he was an artist; but in the case of *Ebdy*, the client bought and paid for

plans, just as he might have paid for boots; the contract was to prepare plans, and the ordinary 5 per cent. rule of the Institute of Architects seemed to imply the preparation of plans, and but for that he should say that the ordinary contract between architect and client was to build a building and not to prepare plans. There was no doubt that the Institute rule mentioned the preparation of plans. If the contract contemplated the preparation of plans, those plans would be the property of the building owner; if it did not, the drawings should remain the property of the architect just as much as scaffold-poles remained the property of the builder of a house. He could not see how the means by which the ultimate end of the quantity surveyor was achieved differed substantially from the means employed by the architect, and he ventured respectfully to differ from the decision of the Court of Appeal.

Mr. Hart, for the Society, said that the sentimental arguments of Mr. Woodward might more emphatically be described as selfish arguments. Architects seemed to fear that the unfortunate client had some sinister motive in asking for the plans, but surely it was hardly politic to impute such motives. There was no important principle involved; it was all a matter of contract. Why did not architects stipulate in their contracts that the plans should be their property? Had they the courage? Did they fear that to do so would mean some reduction of the 5 per cent.? That 5 per cent. had been fixed for something, and surely for something more than artistic touches. He suggested that there was something else, and that it was the plans. The short principle was what was meant by the contract which was entered into between the building owner and the architect. Mr. Riddett had suggested that it was analogous to a number of examples he gave. As to the tailor's pattern, no one went to a tailor for anything but the clothes, and the pattern was of no use except for the purpose of making clothes for a particular person. As to a photograph, the person whose photograph was taken had an unanswerable right to the negative. The negative belonged to the person who ordered the photograph, and that was obviously fair, because it would prevent the duplication of the picture. When one ordered and paid for a picture one had a perfect right to it. The architect's plans fell within the Copyright Acts, but not, he thought, within the Artistic Copyright Acts. They came within the Literary Copyright Act, just as maps, etc., did, and there was a right to prevent the multiplication of them. If anyone, it was the building owner who had the right to object to his building being duplicated, and surely the architect need not complain if the earth was studded with his master pieces. The whole difficulty seemed to be as to who should bear the expense of making the tracing of the plans. In his opinion there was no valid ground for altering the law.

Mr. C. H. Brodie, for the Association, said that two of the ablest lawyer-speakers had taken the architect's point of view, and the last speaker would do the same when he had studied the question. Mr. Hart said that when he employed a man to paint a picture he had a right to the picture. Who said he had not? But he had no right to the 100 sketches which were made in the production of the picture. There were great artist's sketches of priceless value throughout the galleries of Europe and America, and they were not the property of the owner of the picture which had been the outcome of those sketches. That case was analogous to the case of architects. There was only an implied contract, and what they arranged to do was to give a man a building. As to the photo negative, the fact that the photographer had been compelled to hand over the negative did not affect the case, as there was no art in a negative. It was purely a mechanical piece of work. That was not the case with architects' designs. As to Mr. Riddett's contention that in the case of a building which was not carried out by the building owner was entitled to the drawings, as otherwise he would get nothing for his 2½ per cent., what about the time and skill and experience of the architect? That was what he paid for. If a man went for a physician in Harley-street he paid for advice,

not medicine; the architect was paid in the same way, and paid badly. Unfortunately, there were dishonest men, and therefore dishonest builders, and it might be law, but it could not be sense, that a man could engage an architect for the erection of a house and then use the plans for erecting fifty more houses without further payment. The case was mentioned of the lawyer's draft being handed over, but the draft could not be of use in another case. ("Oh, yes, it is!") Then he was sorry they had to hand over the draft. ("We keep copies.")

Mr. Pleadwell, for the Society, said that there was no doubt that under statute the man who commissioned the architect was entitled to the production of the drawings. The fact that there might be duplication was certainly a grievance, but there was the suggested remedy of entering into a contract. As the law at present stood, he thought that the legal ownership of the architect's drawings belonged to the building owner.

Mr. Hamp, for the Association, said it would be quite unfair if they had to hand over to clients all the drawings they produced. A great deal of work was done in the preparation of drawings, and if the architect felt that the client could demand them, and later on get someone else to carry out the work, the architect would not devote the time, etc., to their preparation that he did now.

Mr. Rendell, for the Society, and Mr. Waldram, for the Association, having spoken in favour of the drawings being handed over to the building owner.

Mr. Woodward, in replying to the discussion, said he thought that the point as to the tailor's pattern was a good one. If a high-class tailor had to give up his patterns, what was to prevent a man getting his clothes made from them in the Bethnal Green-road at very much less cost? As to the charge of selfishness, he was selfish; if a man tried to take advantage of him he did what he could to protect himself. He had never been asked by the client for a copy of his drawings. Architects were not in favour of the repetition of similar designs; they desired to get originality in all the work they did. The rough sketches an architect did not much care about, but he felt that the finished drawings, if handed over to the building owner, might be misused.

The Chairman said it had given the members of the Society great pleasure to have the members of the Association with them, and he hoped it was not the last debate they would have together. He then asked them to vote on the following motion—i.e., "That the legal ownership of architects' drawings should be in the architects." There voted in favour of the proposition 27, and 19 against.

The proceedings then terminated.

SCOTTISH BUILDING TRADE NOTES. (FROM A CORRESPONDENT.)

THERE are many signs that a revival of the building trade will follow the great improvement which has taken place in the shipbuilding, jute, and iron industries in Scotland. Last year there was a drop of over 800,000L. in the value of buildings erected in Glasgow as compared with the value of those erected in each of the three previous years. In Edinburgh and Paisley the fall last year amounted to 25 per cent., while in Aberdeen the number of plans passed by the Dean of Guild was the smallest on record for fifteen years.

The depression is, however, not the only thing requiring improvement in the Scottish building trade. Recent law cases show that there is much need of reform in some of its antiquated customs. In one most notable law action it was clearly shown that, though it is the custom to make contracts which are as verbally binding as need be, some contractors do not consider it necessary that they should act up to them if the work they have taken shows but a narrow profit. The effect of this outrageous custom is all against both the public who build and the straightforward contractor who has given a fair estimate and desires to do conscientious work. It has also, needless to say, the bad effect of reducing prices to a point at which good work is impossible, and only the contractor who has fallen into the habit of estimating for first-

rate work at the price at which only third-rate work is possible benefits, because he gets the job, and, relying upon the custom brought to light in this law case, actually puts in only third-rate work.

These abuses have been sufficiently made known, and there is some hope that the exposure may result in something like reform. They are, however, not the only points at which reform is needed, the system of including in general schedules the work of specialists is the cause of serious loss, not only to the sub-contracting specialist, but also to those who pay for the erection of buildings and to the general public in the case of buildings erected with public money. To give an example from actual fact; in a general schedule there was not long since included a sum of 2,000L. for work done by specialists whose trade was in no way connected with that of the contractor who quoted for the chief work contained in the schedule in question. What happens in cases of this kind? The contractor goes round to the specialist with the object of squeezing as high a commission as possible from him. He approaches large firms and little, and is naturally able to squeeze the little firms most; but he must be able to say if questioned that he has approached the large firms and that they are too dear. The price allowed by the architect was in the instance before us one at which the very best work could be done. In England 10 per cent. is regarded as a fair builder's profit, but some Scottish contractors, in dealing with a sub-contractor, think this humble 10 per cent. very poor business indeed, and the small contractor in this case actually took the work at a price which was more than 40 per cent. below the price allowed by the architect.

What was the result of this? What must inevitably be the result of the abstraction of 40 per cent. from a job without value given? The work must be starved, and so it was in this instance. Instead of the best work which the architect had a right to expect for the price he had allowed, a perfectly plain and second or third-rate job was given, and the most important material entering into the composition of the work was of the cheapest description. The fault cannot be placed at the door of the sub-contractor; it was impossible that better value could have been given at the price.

Attention has been called to the application of the North British Railway Company for power to enable them to stop the public right-of-way along the so-called "Cromwell's Dyke" at Burntisland. It is hoped that efforts will be made locally to oppose the application. At the south end of the dyke is what is known as "The Island," which also has historical associations. Cromwell captured the interesting and picturesque little town after several unsuccessful assaults in 1651, and from his quarters there on July 29 he wrote: "It has pleased God to give us Burnt Island, which is, indeed, very conducive to the carrying on of our affairs. The town is well seated pretty strong. . . . We took three or four small men-of-war in it, and I believe thirty or forty guns. . . . The enemies' affairs are in some discomposure, as we hear, surely the Lord will blow upon them." The beauty of Burntisland was destroyed by the railway company, which, after cutting through the woods and cliffs of lovely Aberdour and paving with cement the primrose-strewn walk by famous Starley burn, out the seafont of Burntisland in two by running its line along the whole of its length. This, however, will be no excuse for allowing the company to wipe out a landmark of its historic past.

The movement of a large Glasgow firm in passing plans for the building of a garden city near Greenock will increase the number of houses to let in Glasgow, and cause a general improvement in the accommodation offered to the householder. Greenock has also a similar scheme, Dundee is following, and the plans of its garden city prepared by Messrs. C. Ower & Co., of Dundee, have just received the sanction of the Dean of Guild.

SOCIAL INSTITUTE, WAKEFIELD.—The foundation-stone of the Wakefield Social Institute was laid a short time ago in Brook-street. The plans for the work have been prepared by Mr. Abraham Hart, architect.

ARSENIC IN FABRICS AND PAPERS.

Many years ago a great outcry was, very properly, raised against the use of arsenical colours in wall-papers. More recently an extensive examination of the beers sold throughout the country revealed the fact that arsenic was quite a common constituent of this beverage. Professor Thorpe, Chief of the Government Laboratory in London, has just communicated to the Chemical Society a paper in which he shows that arsenic is present in commercial wool, flannel, blotting paper, writing paper, white wall-paper, and undyed silk. Apparently Japanese paper, filter paper, and white linen are the only forms of commercial cellulose which were found to be free from arsenic. The presence of arsenic in natural undyed lambs' wool is shown to be due to the practice of dipping the mother in arsenical dip some time before the birth of the lamb.

The results obtained in the Government Laboratory are shown in the following table. Instead of raising alarm, they will probably convince most persons that arsenic may be present in the articles enumerated in such small quantities as were found and yet be quite harmless:—

Material.	Mgm. of arsenious oxide in one gram of material.
1. Flannel No. 2 (natural wool)	005
2. Flannel No. 3 (natural wool)	009
3. Flannel No. 3 (after two washings) ..	010
4. Flannel No. 3 (after four washings) ..	009
5. Flannel No. 3 (after six washings) ..	009
6. Old worn flannel (undyed)	004
7. White Berlin wool	007
8. Green flannel	004
9. Welsh flannel	015
10. Vest wool	011
11. Blotting paper (white)	001
12. Writing paper (azure-blue)	024
13. Foolscap (white, blue-lined)	028
14. Wrapping paper (white)	024
15. Paper (for sugar)	003
16. Paper (for butter, grease proof)	001
17. Japanese paper	Free
18. Wall-paper (white, for lining)	018
19. Linen (white)	Free
20. Silk (undyed)	001

INTERNATIONAL CONGRESS ON SCHOOL HYGIENE.

On Friday evening in last week, at the University of London, a meeting, convened by the Royal Sanitary Institute, was held under the presidency of the Duke of Northumberland to make preliminary arrangements for the second International Congress on School Hygiene which it is proposed to hold in London during August, 1907.

Sir Lauder Brunton (President of Congress) said that the first Congress was held in Nuremberg about three years ago, and at it were representatives of all civilised countries. It was then resolved that the next Congress should be held in 1907. The French were anxious that the next Congress should be held in Paris, but as the invitation to hold it in London had been previously sent by the Royal Sanitary Institute the French gave way. He was glad to say that the French Minister of Education had become a Vice-President, and had appointed committees in every town, Austria, Finland, Germany, Japan, Denmark, and Sweden had all formed national committees, and many had got local committees. Two years ago he went to the United States and Canada and obtained promises to co-operate from every large town in those two countries. Last year he went to South Africa and obtained promises in the same way. Therefore they could very fairly hope that at the Congress to be held next year not only would Great Britain and the Colonies be thoroughly represented, but also every civilised country in the world. At that Congress they hoped to get the digested opinion of all countries on questions affecting the health of school children, and also plans for carrying the views into effect. The Congress promised to be not only one of the largest, but one of the most important congresses ever held in London, and therefore he trusted they would have a unanimous body of support throughout the country.

Lord Reay moved—"That, in view of the importance of school hygiene in developing a strong and vigorous race, the necessity for scientific methods being followed in the training of the young, and for hygienic surroundings being supplied in order to promote the health of the children during school life, this meeting, consisting of representatives of educational authorities, medical men, teachers,

and others, is unanimously of opinion that it is desirable to hold the second International Congress in London in August, 1907, to which representatives from India and the Colonies should be invited, in addition to representatives from other countries."

The resolution was seconded by Dr. Lyttleton, and carried.

On the motion of the Chairman, it was resolved to present a petition to His Majesty the King praying that he would be pleased to extend his Royal patronage to the Congress.

Mr. A. J. Shephard (Chairman of the Education Committee of the London County Council) moved—"That this meeting heartily approves of the steps already undertaken by the Organising Committee to initiate the arrangements for the Congress, and earnestly invites the co-operation of the educational and municipal authorities, societies, and other representative bodies interested in education and the health and development of children during school life, in promoting the Congress and carrying out the necessary organisation." He remarked that they all knew that their schools should be well built and well ventilated, and he was glad to think that they would have the opportunity of enforcing these facts upon the people of England.

Sir John Cockburn seconded the motion, and it was carried.

Further resolutions were carried authorising the issue of an appeal for subscriptions, and appointing an Organising Committee, of which Sir Edward Brabrook will be chairman, Sir Richard Martin, Bart., treasurer, and Dr. Kerr and Mr. E. White Wallis secretaries.

THE LONDON COUNTY COUNCIL.

The ordinary weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Alderman Evan Spicer, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Hackney Borough Council 4,000*l.* for electric lighting purposes; Finsbury Borough Council 540*l.* for street improvement; Hammersmith Guardians 8,000*l.* for poor law purposes; Kensington Royal Borough Council 5,620*l.* for street improvement; Poplar Borough Council 3,02*l.* for works at Bow depot and for paving; St. Pancras Borough Council 13,500*l.* for site for public library; and Shoreditch Guardians 27,000*l.* for poor law purposes.

Storm Floodings.—The Main Drainage Committee recommended, and it was agreed:—

"That the estimate of expenditure on capital account of 9,500*l.*, submitted by the Finance Committee in respect of the construction of section No. 2 of the Falconbrook pumping-station, be approved.

"That expenditure not exceeding 9,500*l.* be sanctioned in connexion with the construction of section No. 2 of the Falconbrook pumping-station, cost of supervision, general incidentals, etc.; that the work be done without the intervention of a contractor; and that the drawings, specification, and estimate of 9,500*l.* be referred to the Works Committee for that purpose."

School.—The Education Committee recommended, and it was agreed:—

"That the Board of Education be informed that the Council will raise no objection to the proposal of the managers of the St. Charles-square R.C. Training College (Kensington, N.), to provide a new public elementary school for about 200 girls and infants to be used as a practising school in connexion with the college."

Appointment of Electrical and Mechanical Engineers.—On the recommendation of the Fire Brigade Committee, it was agreed that Mr. Leicester Richards Lee be appointed in the fire brigade as electrical and mechanical engineer at a salary of 400*l.* a year, and that Mr. Victor Ambrose Cornelius be appointed in the fire brigade as assistant electrical engineer at a salary of 200*l.* a year.

Totterdown-fields Estate, Tooting—Completion of Cottages.—The Housing of the Working Classes Committee reported as follows:—

"One hundred and twenty-six cottages on section B of the Totterdown-fields Estate have recently been completed, and twenty more are almost finished. The cottages contain accommodation for 1,278 persons. . . . Upon the completion of the twenty cottages accommodation for 3,462 persons in 464 tenements will have been provided on the estate."

The Council adjourned soon after seven o'clock.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Conversion of Buildings.

St. George, Hanover-square.—The conversion of Nos. 6 and 7, George-street, Hanover-square into a domestic building (Mr. C. H. Worley for Mr. T. Stevens).—Refused.

Lines of Frontage and Projections.

Levisham.—That the application of Mr. E. C. Christmas for an extension of the period within which the erection of three houses with one-story shops in front, on the site of No. 63, Dartmouth-road, Forest-hill, and the erection of additional stories over the existing shops at Nos. 55 and 55A, Dartmouth-road were required to be completed, be granted.—Consent.

Hammersmith.—A greenhouse at the rear of No. 24, Shepherd's Bush-green, Hammersmith, to abut upon Camden-gardens (Mr. G. Stone).—Consent.

Clapham.—That the application of Messrs Homer & Lucas for an extension of the periods within which the erection of buildings between Nos. 65 and 69, South-side, Clapham-common, Clapham, was required to be commenced and completed, be granted.—Consent.

Finsbury, East.—An oriel window in front of No. 88, Goswell-road, Finsbury (Mr. P. B. Tubbs for Mr. F. Gough).—Consent.

Greenwich.—The retention of a greenhouse at the rear of Siebert House, Gleniuch-road, Greenwich, abutting upon Westcombe-hill (Mr. E. Mills).—Consent.

Hammersmith.—Buildings with projecting one-story shops, on the eastern side of The Grove, Hammersmith, on the site of Nos. 2 and 2A (Mr. L. V. Hunt for Mr. F. Britton).—Consent.

Strand.—A projecting sign in front of No. 11, Long-acre (Messrs. Windover, Turrill & Sons).—Consent.

Marglebone, East.—An addition to No. 1, Cochran-street, St. John's-wood, to abut upon Wellington-place (Messrs. Woodrow & Helston for Messrs. J. K. Tinson & Son).—Consent.

Wandsworth.—A house with large boxes on the eastern side of Mount Ephraim-lane, Streatham, to abut upon Norfolk House-road (Messrs. Chapple & Utting).—Consent.

Levisham.—That the Council do extend the periods within which the erection of buildings on the east side of Bromley-road and south side of Sandley-lane, Catford, was required to be commenced and completed.—Consent.

Width of Way.

Hampstead.—A deviation from the plan approved for the erection of buildings upon the site of No. 106, Heath-street, Hampstead, so far as relates to an alteration in the height and length of the bank wall abutting upon New-end (Mr. J. D. Hunter for Miss G. Elston).—Consent.

City of London.—A wooden screen at the rear of Nos. 6 to 10, Barden-place, Aldgate, City, at less than the prescribed distance from the centre of the roadway of Aldgate-avenue (Messrs. J. Hood & Sons for Mr. G. Horwitz).—Refused.

Lines of Frontage and Construction.

Bow and Bromley.—The retention of an iron and concrete timber drying stage at Tredgar Works, on the south-west side of Ordell-road, Bow (Messrs. Perry & Co.).—Consent.

Hammersmith.—The retention of two wood and iron buildings on a site on the western side of Latimer-road, Hammersmith (Mr. A. Dawkins for Mr. W. J. Moore).—Consent.

Levisham.—The retention of two wooden sheds on a site abutting upon the northern side of Elmer-road and upon the western side of St. Fillens-road, Catford (Mr. E. Wright for M. H. Amey).—Refused.

Width of Way, Lines of Frontage, Space at Rear and Projections.

Westminster.—Buildings to abut upon Regency-street, Chapter-street, Frederick-street and Hide-place, Westminster (Messrs. Clutton for the Ecclesiastical Commissioners).—Consent.

Space at Rear.

Levisham.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to Nos. 3 and 5, Rusby-green, Catford, with irregular spaces at the rear (Mr. A. L. Guy).—Consent.

Whitechapel.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a block of dwellings on the western side of Rupert-street, Whitechapel (Mr. R. W. Hobden for Messrs. Hickman, Limited).—Refused.

Deviation from Certified Plans.

Strand.—Deviations from the plans certified by the district surveyor under section 43 of the Act, so far as relates to the proposed erection of buildings upon the site of Nos. 28 and 29, Lisle-street and Nos. 28 and 29, Little Newport-street, Strand (Mr. P. E. Pilditch).—Consent.

Formation of Streets.

St. Pancras, East.—That an order be issued to Mr. S. G. Castleman, sanctioning the erection of two-story workshop buildings upon land at the rear of houses in St. Paul's-road, and Elm-road, Camden-town, St. Pancras, and in connexion therewith the formation or laying out of a street (for Mr. H. G. Rognart).—Consent.

Wandsworth.—A deviation from the plans approved for the formation or laying out of new streets for carriage traffic on the Furzedown-park estate, Back (or Rectory) lane, Streatham, so far as relates to an alteration in the gradients of two of the proposed streets (Messrs. Milner, Son, & White).—Consent.

The recommendation marked † is contrary to the views of the local authorities.

Architectural Societies.

CARDIFF, ETC., ARCHITECTS' SOCIETY.—A lecture was delivered at the meeting of the Cardiff, South Wales, and Monmouthshire Architects' Society in the architects' room at 5, High-street, Cardiff, on Thursday evening last week by Mr. Ernest Runtz, of London. Mr. J. H. Phillips, of Cardiff, presided. Mr. Runtz had chosen as his subject "The Planning of Modern Hotels and Restaurants." and the lecture was illustrated with lantern slides of plans and buildings. He traced the development of hotels from the times of the old coaching days and inns, made famous during the last century by Charles Dickens, and said that the improved means of locomotion, with the introduction of steam in the early part of the XIXth century, and the laying of railway tracks, had given a great impetus to hotel construction, resulting in the bulk of the railway companies erecting large hotels at their termini. Facilities for ocean traffic being also greater, the interchange of ideas between England and foreign countries had caused many palatial hotels to be built in the heart of the entertainment centres, and in these the great feature was the restaurant and lounge, the latter practically taking the position of the old-time coachyard, roofed in. From six to eight millions sterling had been spent on the principal hotels in London during the last ten years, and it was estimated that over 1,000 miles of electric wiring had been installed in them. The Gaiety Hotel alone had thirty miles of electric wire. A vote of thanks, proposed and seconded by Mr. Brunton and Mr. Seward respectively, terminated the meeting.

MANCHESTER SOCIETY OF ARCHITECTS.—At the meeting of the Manchester Society of Architects, on the 27th ult., the chair was taken by Mr. Alfred Darbyshire, and a paper was read by Mr. John Swarbrick upon "The Works of Sir Christopher Wren." At the outset, Mr. Swarbrick called attention to the fact that, so numerous were the works of Wren, that it would not be possible for him to do more than review the principal phases. He then outlined the architect's early career; and pointed out that the discouragement that the arts suffered during the Commonwealth was probably the cause of Wren's early adoption of scientific, rather than artistic, study. During this period, Inigo Jones died a disappointed man. One who could have risen to the heights of architectural achievement passed away with his strivings defeated. How long this condition of things would last, no one knew. When Wren's opportunities came later, the fabric of architectural development had been seriously injured, and it became his task to begin at the foundation once again. Passing reference was made to the lamentable manner in which John Webb, Inigo Jones' assistant, was overlooked. All the speaker said, high and low alike, delighted to extol the merits of the man, who, by his gifts and perseverance, raised himself from the abyss of obscurity. But, Wren was not long unknown and overlooked like many of the most distinguished artists. Evelyn, the diarist, did not discover Wren as he discovered Grinling Gibbons, in an obscure street of Deptford. He did not begin his career in poverty and unaided like that great painter, J. W. M. Turner. Though Wren did not gain force of character by combating almost overwhelming odds, he seemed to have possessed that initial ardour that alone led to success. He ought, therefore, not to be disparaged because he would not shroud himself with that glamour

of achievement by which the less fortunate rightly commanded admiration. Mention was made of the architect's brilliant career at Oxford, terminating in his election to a Fellowship at All Souls', and his appointment to the Professorship of Astronomy at Gresham College, London, and to the Savilian chair of Astronomy at Oxford. Wren's active interest in the formation of the Royal Society was also referred to. At the meetings of the Society and elsewhere, he frequently met his Sovereign, King Charles II., and possibly this was, to some extent, the reason why the King offered him the commission to survey the fortifications at Tangiers, which was not accepted. The reason for Wren's selection may, however, have been due, in a larger degree, to the great influence of Evelyn, and his uncle, Matthew Wren, the Bishop of Ely. To this source, at all events, must be attributed his appointment as assistant to Sir John Denham, the Surveyor-General. Wren was very promising, but he was protected and assisted by fortune, while those around him, who were at first better qualified, were overlooked and ultimately forgotten. Soon carried aloft by fortune and great ability, he rose to an eminence above and beyond them all. His work at the Chapel of Pembroke College, Cambridge; and at the Sheldonian Theatre at Oxford, was then described, and also the details of his six months' architectural study in Paris, his letter to Dr. Bate-man being read, and the opportunities afforded by Paris during the "Siècle de Louis XIV." outlined. Soon after his return from this, his only period of architectural studentship, the Great Fire broke out. The Great Fire brought about his magnificent opportunity. Those qualities and knowledge that he at first lacked were cultivated and acquired by observation, as the almost innumerable commissions he received were executed. In 1662, two years after the fire, Sir John Denham, the Surveyor-General, died, and Wren was appointed to the position. Yet the King had already officially granted this office to John Webb, in reversion upon the death of Denham. Thus, Wren secured a signal opportunity, supreme pre-eminence, and was, without any influential rival. The plan for rebuilding London and the designs of the City churches were next discussed, the letter that Wren wrote long afterwards, as one of the Commissioners of Queen Anne's Act for building fifty new churches, being read to explain some of the guiding principles that had governed his work. Mr. Swarbrick especially mentioned the campanile of St. Bride, Fleet-street, and St. Mary-le-Bow, Cheapside; while many others were incidentally referred to. Among the churches with the most interesting interiors were St. Stephen, Walbrook; St. James, Piccadilly; and St. Mildred, Bread-street. Subsequently, many very important works were considered, foremost among these being St. Paul's Cathedral, Hampton Court Palace, and Greenwich Hospital. In conclusion, the speaker said, in speaking of Greenwich Hospital, their chief regret must be that Sir Christopher Wren, although he lived beyond the usual span of life, did not live long enough to complete his work entirely himself. Wren's life, in spite of all its early artistic failings, was considered, as a whole, one of the most glorious records in the history of English architecture. Few others had such opportunities, but they must be thankful that, in that instance, fortune had favoured one so worthy and so able. The Chairman, Mr. Alfred Darbyshire, subsequently referred to Wren's use at St. Paul's of concealed flying buttresses, and also to the intermediate brick cone in the dome. Mr. Charles H. Potter, in proposing a vote of thanks to the speaker, remarked upon the beauty of the design of the interior of St. James', Piccadilly, and St. Stephen's, Walbrook. Mr. R. W. Orme, in seconding, made special reference to the treatment of the campaniles of the City churches. An opportunity was ultimately afforded for a more careful examination of the numerous drawings and other illustrations provided.

EXETER DIOCESAN ARCHITECTURAL SOCIETY.—This Society held its annual meeting a few days since at the College Hall, Exeter. The Rev. O. Reichal, in the chair. The Report stated that an excursion to St. Germans was fixed for May 29, and it was probable that a visit to Ford Abbey would be arranged in

the autumn. The Committee regretted that the old church of Allhallows, Goldsmith-street, Exeter, was to be demolished. That would be the fourth church destroyed within about fifty years, the others being St. George, St. Kerrian, and St. Mary Major. The old history of the city in its architecture was fast being obliterated. The removal of Mount Radford House, the old manor-house of the Barings at Exeter, disclosed, in the pulling down, many traces of XVIIth century work, and also work of an older structure, which had been at a late period clothed in a pretentious exterior of stucco-work. Some rich examples of old work remained in the partially-dismantled Lark-bear House, in the valley below Mount Radford House. At Henock Vicarage two XVIIth century wood windows of three lights had been revealed, and were being reopened. One had a most unusual feature, viz., oak stanchion bars. The attention of one of the secretaries had been again called to the fact that one of the original "misereres" in the choir of the Cathedral, removed during the restoration of 1870-7, was now in the Cathedral library. The Committee suggested that the odd one of perpendicular work, now among the XIIIth century ones, should be removed, and the original one of Bishop Bruere's work (1224-44) put in its place, so as to complete the fit of that bishop's time. The Committee were glad to see the decided improvement of the street architecture of the city, and hoped that when anything more was done the houses might be designed in keeping with the remaining houses of the XVIth or XVIIth century, so as to retain the picturesqueness of the old streets. The Report was adopted, and the Committee and the officers re-elected.—The Rev. Cecil Square read a paper on "Parish Registers," in which he reviewed their whole history. For the first use of registers they must look to Spain. It was a matter of a little uncertainty as to when registers, as they now thought of them, were really instituted in England. They found at least two registers dating as far back as 1536, and six others had been found of earlier date than 1538, when the duty of keeping them was imposed upon the parochial clergy by Royal injunction by Thomas Cromwell, Vicar-General. In 1653 a new system of registration was enforced, and the clergy were ordered to give up their registers to laymen, who were appointed under the names of parish registrars. In many parish registers they saw the appointment of these men set forth.—Mr. James Jerman contributed some notes on "Ancient Ecclesiastical Needlework," claiming that the study of art, as expressed in needlework, might fairly receive a share of attention, along with the cognate subjects of metal-work and carving, especially having regard to the great antiquity of the decorative treatment of the woven and needlework fabrics and embroidery associated generally with the ritual of religious service and the adornment of palaces.

Correspondence.**THE OFFICE OF WORKS, AND DESIGNS FOR PUBLIC BUILDINGS.**

SIR,—I believe most architects will be in sympathy with the Note in your last issue about the alteration or omission of any feature of importance, such as towers or pavilions in the late architect's design, and see at once that, so far as two main frontages are concerned, no great interference with the light of adjacent offices would occur by towers. I hope that a further appeal will be made for reconsideration, so that the features may be retained with due importance, as it is said not to be for economy they are to be omitted.

I believe the same curtailing, or, rather, cutting off entirely the corner towers in Sir G. G. Scott's design for the Foreign, etc., Office block occurred, so that there we have another incomplete building. Perhaps you may know if any reason was given.

While glad that these works are put out to competition, it does not seem fair that the architect who wins should never be sure that the accepted design will be adhered to.

E. W. H.

ARCHITECTS AND TIMBER SPECIFICATIONS.

SIR,—I, a clerk of works, was glad to read the comments you made on this subject, page 341. There is nothing which causes more friction than timber and its quality in the carrying out of building contracts, owing to the loosely-worded and often quite inaccurate clauses in the specification.

Now, in front of me, I read that the timber in the building I am superintending is to be "good Baltic." The general clauses say that all materials are to be "best." Is "good Baltic" timber best Baltic? Can I demand Russian, or must I accept Swedish, and if so, must I put up with middling quality Swedish, or can I insist upon best Swedish?

Nothing in the building trade varies so much in price as timber; it can be bought at prices ranging from 10*l.* to 20*l.* per standard, and, naturally enough, a contractor is more inclined to think 10*l.* is a better price than 20*l.*, and is anxious to pass in timber at the lowest figure specified, and the loosely-worded description almost justifies him in doing so. In some specifications I have had it stated that the timber is to be best Christiania or St. Petersburg, but not the slightest attention has been paid to it, either by the builder or the architect, the words used being looked on as an euphemism, a figure of speech, something handed down to us by our grandfathers. If the stuff is not altogether sappy, not very much crowded with knots, is moderately free from shakes, and is evidently the produce of a tree or its branches rather larger than an ordinary scaffold-pole, it is accepted as "best" nine times out of ten. At the tenth time the builder learns to his cost that it is intended to have what is known as "best" in the general clauses, and does not stultify itself by saying "good" in other clauses, then the bother begins.

All this might be avoided if more attention was paid to trying to make clear what kind of timber was required. Nothing would help the writer of a specification more than the study of the book referred to (page 352), "Shipping Marks on Timber": W. Rider & Son. A few high-class brands might be specified from which the timber was to be selected, and the architect would then know whether he was getting his wood goods from Sweden, Norway, Russia, or Denmark (all Baltic ports). He would also know by reference whether the exporter considered his goods were firsts, seconds, or thirds, and that would be of great assistance.

To a painstaking clerk of works wood and its quality is the bane of his life, indeed doubly so by the wording of its specification, and the apparently general indifference, or ignorance, of those in authority over him.

CLERK OF WORKS.

REPORT OF THE REGISTRATION COMMITTEE.

SIR,—The last paragraph in your "Note" of this week will, I feel sure, meet with the hearty approval of a large number of the Royal Institute of British Architects. You say:—
"We strongly object to the proposal to change the title of 'Institute' to 'College,' for which we can see no possible reason, and which is simply throwing away attention. A matter of detail, no doubt, but still it is better not to clash with the letters used by any other body, which would be the case if these were adopted. It would appear that the Registration Committee did not know of the Royal Cambrian Academy of Art (the Welsh Academy), founded over twenty years ago, with such names as Sir E. J. Poynter, P.R.A., Sir L. Alma Tadema, R.A., Professor Henker, R.A., and W. Goscombe John, A.R.A., on their roll of honorary members; their academicians using R.C.A., and their associates A.R.C.A."

There appears to me to be one very definite reason why the title should not be altered as recommended in the Report, as will be seen by the following letter addressed to the Secretary of the Royal Institute of British Architects immediately after the issue of the Report:—
"Mostyn Estate Office, Llandudno.
March 26, 1906.

W. J. Locke, Esq.,
Secretary, I.L.B.A.,
9, Conduit-street, London.

Dear Sir,
Report of the Registration Committee.
The Report of the Registration Committee is one of momentous interest to architects (for and against), and will be subjected to much careful analysis by both sides. The principles involved are too important for it to be otherwise.

A first perusal of the report suggests some difficulty in respect to the proposed new titles. Regrettably I note the omission of the word 'British,' but it is the initials A.R.C.A. and R.C.A. to which I wish to draw attention. A matter of detail, no doubt, but still it is better not to clash with the letters used by any other body, which would be the case if these were adopted. It would appear that the Registration Committee did not know of the Royal Cambrian Academy of Art (the Welsh Academy), founded over twenty years ago, with such names as Sir E. J. Poynter, P.R.A., Sir L. Alma Tadema, R.A., Professor Henker, R.A., and W. Goscombe John, A.R.A., on their roll of honorary members; their academicians using R.C.A., and their associates A.R.C.A.
I had the honor of being elected an associate some years ago, and at one of the annual meetings I remember some trouble arising owing to the letters A.R.C.A. being used not only by the Cambrian Academy, but by the Royal College of Art, South Kensington, and each of these bodies wanted the other to adopt some other letters. Yours faithfully,
G. A. HEMPHEYS."

Perhaps those who suggested the change will give us their reasons for the proposal.
G. A. HEMPHEYS.

SIR,—In the appendix to the Report of the Registration Committee I notice that there is a proposal to alter the name of the Institute to that of the Royal College of Architects, making the initials for Fellows and Associates F.R.C.A. and A.R.C.A. respectively. There is already an associateship of the Royal College of Art granted by the Board of Education to their art masters. It would be a pity to confuse the two.

L. SYLVESTER SULLIVAN.

SEA SAND FOR MORTAR.

SIR,—In answer to your correspondent, "Enquirer," the objection to the use of sea sand in mortar has been over-rated. It is well known that sea sand is impregnated with alkaline deliquescent salts, which possess the property of attracting moisture from the atmosphere and consequently causing a certain amount of dampness when used. These salts, however, after a short time become effete, after which no further dampness can occur.

The cohesive value of the sand is unaffected by the presence of salt, and what dampness does occur is usually slight, and cannot be seriously objected to.
CHARLES D. HAWLEY.

Ipsowich.
** In our opinion the use of sea sand in construction can only be dictated by the desire to save money, because it is well known that, owing to its fineness and the shape of the grains, sea sand makes weaker mortar for a given proportion of cement than coarser sands. The salt can be removed by washing, but clean sharp sand is preferable, as the cement adheres better, the grains offer greater resistance to movement under compression, and that the mortar is stronger. The most suitable sand is one with grains of variable size, so that the smaller particles fill the voids between the larger grains.—Ed.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XIII.

LABOUR-SAVING CONSTANTS (continued).

AS constants are given in Table VI. for hollow octagonal bodies it may be convenient to indicate the manner in which these have been derived, as in the case of the other forms discussed in Article XII.

Octagon.—(1) Determining the area of material in the cross section of a hollow octagon by taking the difference between the areas of two octagons calculated from the outside and inside dimensions, respectively, we apply the general rule for the area of any hollow polygon:—

$$A = \left(S \times \frac{r}{2} \right) - \left(s \times \frac{r}{2} \right)$$

where *s*, the length of the inner side, = *S* - (*2t* × *tan* θ), as explained in connexion with hollow hexagons.

But as the internal angle of an octagon = 135°, it follows that *tan* θ = *tan* 22.5°.

For an octagon the value of *n* = 8, by Table V. the value of *r* = 1.2071, and by any table of trigonometrical ratios we find the value of *tan* 22.5° = 0.4142.

Substituting these values, the above equation becomes

$$A = \left[S \times 8 \times \frac{1.2071}{2} S \right] - \left[\left\{ S - (2t \times 0.4142) \right\} s \times \frac{1.2071}{2} (S - 2t \times 0.4142) \right]$$

which reduces to

$$A = \{ S^2 - (S - t \cdot 0.8284) \} 4.8284$$

Then, as the weight of a hollow octagonal body = *A* × *lv*, the weight per foot length is *w* = [*S*² - (*S* - *t* 0.8284)] *c*, where the values of the constant are

$$c = (4.8284 \times 12 \times w) \text{ for dimensions in in.}$$

$$c = (4.8284 \times 1 \times w) \text{ " " " ft.}$$

Applying the equation to the case of a hollow octagonal cast-iron column 12 ft. long, with length of side = 6 in., and thickness of metal = 1 in., taking the dimensions in inches, and the weight of cast-iron per cubic inch at 0.26 lb., the value of *c* = (4.8284 × 12 × 0.26) = 15.0646, we have for the weight per foot length

$$w = \{ 36 - (6 - 0.8284) \} \times 15.0646$$

$$= (36 - 26.7454) 15.0646$$

$$= 139.42 \text{ lb.,}$$

then the weight of the column is 139.42 × 12 = 1673 lb.

(2) Determining the area of a hollow octagon by employing as factors the mean length of

side, the thickness of side, and the number of sides, we have

$$A = s_m \times t \times n$$

The mean length of side *s_m* = *S* - (*2* × $\frac{1}{2}$ × *tan* 22.5°).

Substituting the values of *tan* 22.5° = 0.4142 and *n* = 8, the equation becomes

$$A = S - (t \cdot 0.4142) t \times 8$$

The insertion of factors representing unit length and weight gives

$$w = S - (t \cdot 0.4142) t \times (8 \text{ } lv)$$

$$= S - (t \cdot 0.4142) t \times c$$

where the values of the constant are

$$c = (8 \times 12 \times w) \text{ for dimensions in in.}$$

$$= (8 \times 1 \times w) \text{ " " " ft.}$$

Applying the rule to the case of the column taken in method (1), and taking the dimensions in inches, with *c* = (8 × 12 × 0.26) = 24.96, we have for the weight per foot length

$$w = \{ 6 - (1 \times 0.4142) \times 1 \} \times (24.96)$$

$$= 5.5858 \times 24.96$$

$$= 139.42 \text{ lb.}$$

Then the weight of the column is 139.42 × 12 = 1673 lb., as before.

To facilitate calculations relative to the weight of hollow columns, beams, flues, and other conduits, or tubular bodies of various shapes, we give in Table VI. constants for different materials, by the aid of which the weight can be readily computed per foot length from the axes, or lengths of side, as the case may be, and the thickness of material, these measurements being taken in inches or in feet, as may be most convenient. This table has been calculated for use with the equations:—

- (1) Hollow Ellipse $w = (D_m + D_n) t c$
- (2) Hollow Square $w = (s_m \times t) c$
- (3) Hollow Hexagon $w = (S - t \cdot 0.5774) t c$
- (4) Hollow Octagon $w = (S - t \cdot 0.4142) t c$

One illustration has already been given showing the practical application of each rule, but the following examples will show more clearly the labour-saving character of the constants in Table VI.

Example (1): Find the weight of material in an elliptical drain 150 ft. long, with the major axis = 4 ft. and the minor axis = 3 ft., and a thickness of 6 in. of cement mortar.

By formula (1) the weight per foot length is $w = \{ (4 - 0.5) + (3 - 0.5) \} \times 0.5 \times 294 = 6 \times 162 = 612 \text{ lb.}$

Then the total weight of the drain is $W = 612 \times 150 = 91,800 \text{ lb.}$

Example (2): Find the weight of a brick chimney 20 ft. 9 in. square, with parallel sides 60 ft. high by 9 in. thick.

By formula (2) the weight per foot length is $w = (2.75 - 0.75) \times 0.75 \times 448 = 1.5 \times 448 = 672 \text{ lb.}$

Then the total weight of the chimney is $W = 672 \times 60 = 40,320 \text{ lb.}$

Example (3): Find the weight of lead, 8 lb. per foot superficial, required to sheath the outer walls of a hexagonal turret 8 ft. high, the length of each side being 3 ft. The weight of lead per cubic foot by Table IV. being 712 lb., the thickness per foot superficial will be $8 \div 712 = 0.0112 \text{ ft.}$

Therefore the length of side measured outside the lead will be $S + (t \times \tan \theta)$.

Hence by formula (3) with the + sign substituted for the - sign the weight per foot height of the turret is $w = (3 + 0.0112 \times 0.5774) \times 0.0112 \times 4272 = 3.0065 \times 47.85 = 143.8 \text{ lb.}$

Example (4): Find the weight of an octagonal tower of concrete, the height of the tower being 45 ft., the length of each side 7 ft., and the thickness of the walls 18 in.

By formula (4) the weight per foot of height is $w = (7 - 1.5 \times 0.4142) 1.5 \times 1040 = 9.568 \times 1040 = 9950 \text{ lb.}$

Then the total weight of the tower will be $W = 9950 \times 45 = 447,750 \text{ lb.}$

Other series of constants can be prepared in a manner generally similar to that indicated in this and the preceding article.

In Table VII. we give some data that will be found useful in calculating the weight of various solid bodies.

The constants in columns (1) and (1a) are suitable for calculating the weight of square

TABLE VI.—CONSTANTS FOR CALCULATING THE WEIGHT OF HOLLOW COLUMNS, BEAMS, FLUES, CONDUITS, AND OTHER TUBULAR BODIES OF DIFFERENT SHAPES AND OF VARIOUS MATERIALS.

Material. (Weight per cubic foot as in Table IV.)	Values of Constant per Foot Length.							
	Ellipse.		Square.		Hexagon.		Octagon.	
	Diameter and Thickness.		Diameter and Thickness.		Diameter and Thickness.		Diameter and Thickness.	
	In in.	In ft.	In in.	In ft.	In in.	In ft.	In in.	In ft.
	$c = 1.5708 \text{ in}$	$c = 1.5708 \text{ ft}$	$c = 4 \text{ in}$	$c = 4 \text{ ft}$	$c = 6 \text{ in}$	$c = 6 \text{ ft}$	$c = 8 \text{ in}$	$c = 8 \text{ ft}$
Brickwork	1.2	176	3.1	448	4.7	672	6.2	896
Cement	0.9	136	2.4	344	3.6	516	4.8	688
Cement Mortar	1.4	204	3.6	520	5.4	780	7.2	1,040
Concrete	1.1	204	3.6	520	5.4	780	7.2	1,040
Earthenware	1.2	180	3.2	460	4.8	680	6.4	880
Cast-iron	4.9	706	12.5	1,800	18.7	2,700	25.0	3,600
Wrought-iron	4.9	754	13.3	1,920	20.0	2,940	27.2	3,800
Mild Steel	5.3	769	13.6	1,960	20.4	3,000	27.6	3,840
Brass	5.5	793	14.0	2,020	21.1	3,030	28.1	4,040
Copper	6.0	862	15.3	2,196	22.9	3,234	30.5	4,292
Lead	7.7	1,118	19.8	2,848	29.7	4,272	39.6	5,686
Zinc	4.9	706	12.5	1,800	18.7	2,700	25.0	3,600

The constants in this table are calculated upon weights per cubic inch where diameter and thickness are intended to be taken in inches, and upon weights per cubic foot where diameter and thickness are intended to be taken in feet.

and rectangular piers, columns, beams, and bars, and the weight of water contained in rectangular tanks.

Example (1): Find the weight in hundredweights of a square concrete pier 20 ft. high by 36 in. square.

Taking the constant 0.00806, say 0.008, from column (1a), the weight per foot high is

$$w = 36^2 \times 0.008$$

and the total weight

$$W = 207.36 \text{ cwt.}$$

Example (2): Find the weight in pounds and hundredweights of 150 ft. run of 2-in. square steel bars.

Taking the constants 3.4 and 0.0303 from columns (1) and (1a) the weight is

$$W = 2^2 \times 3.4 \times 150 = 2040 \text{ lb.}$$

$$W = 2^2 \times 0.0303 \times 150 = 18.2 \text{ cwt.}$$

Example (3): Find the weight in pounds per foot run of cast-iron plates 4 in. wide by $\frac{1}{2}$ in. thick.

Taking the constant 3.12 from column (1) the weight per foot run is

$$w = 4 \times 0.875 \times 3.12 = 10.92 \text{ lb.}$$

Example (4): Find the approximate capacity in hundredweights of a rectangular tank with the inside dimensions of 36 in. wide by 20 in. deep by 6 ft. long.

Taking the constant 0.00385, say 0.004, from column (1a) the weight of water is

$$W = 36 \times 20 \times 0.004 \times 6 = 17.28 \text{ cwt.}$$

Example (5): Find the approximate weight in hundredweights of cement that can be stored in a rectangular bin with the inside dimensions of 30 in. wide by 38 in. deep by 7 ft. long.

Taking the constant for cement 0.00533, say 0.005, from column (1a) the weight is

$$W = (30 \times 38) \times 0.005 \times 7 = 39.9 \text{ cwt., say 2 tons.}$$

The constants in columns (2) and (2a) are specially applicable to calculations relating to the weight of solid cylindrical piers, columns,

and bars, and the water capacity of cylinders and pipes.

Example (1): Find the weight in hundredweights of a concrete column 10 ft. high by 4 ft. diameter.

Taking the constant = 0.00633 from column (2a) the weight is

$$W = 48^2 \times 0.00633 \times 10$$

$$= 145.8 \text{ cwt., say 146 cwt.}$$

Example (2): Find the weight in pounds per foot run of $1\frac{1}{4}$ in. diameter copper rods.

Taking the constant = 2.99, say 3.00, from column (2) the weight is

$$w = 1.25^2 \times 3.0$$

$$= 4.68 \text{ lb.}$$

Example (3): Find the capacity in hundredweights, pounds, and gallons, of a hot-water cylinder with the inside diameter of 2 ft. 11 in. and the inside length of 6 ft.

By columns (2) and (2a) the constants for water are 0.00303, and 0.34.

Then the weights are

$$W = 35^2 \times 0.00303 \times 6 = 22.3 \text{ cwt.}$$

$$W = 35^2 \times 0.34 \times 6 = 2,499 \text{ lb.}$$

And as 1 gallon of water = 10 lb.,

$G = 2499 \div 10 = 249.9$ gall., say 250 gallons.

Example (4): Find the weight in pounds and the number of gallons of water contained in a 4-in. internal diameter pipe 30 ft. long.

Here we have

$$W = 4^2 \times 0.34 \times 30 = 163.2 \text{ lb.}$$

and

$$G = 163.2 \div 10 = 16.32 \text{ gall.}$$

The constants in column (3) and (3a) will be found useful for calculating the weight of paving, floor and roof slabs, and metal sheets and plates.

Example (1): Find the weight in hundredweights of a concrete floor slab measuring 25 ft. long by 20 ft. wide, by $\frac{1}{2}$ in. thick, covered with tiles $\frac{1}{2}$ in. thick.

TABLE VII.—CONSTANTS FOR CALCULATING THE WEIGHT OF SOLID PIERS, COLUMNS, BARS, AND RODS OF VARIOUS MATERIALS.*

Material.	Weight of 12 cub. in. (= 1 ft. long or high by 1 in. sq.)		Weight of 12 cylindric in. (= 1 ft. long or high by 1 in. dia.)		Weight of 144 cub. in. (= 1 ft. sq. by 1 in. thick or deep.)	
	lb.	cwt.	lb.	cwt.	lb.	cwt.
Brickwork	0.9648	0.777	0.00634	0.611	0.00545	0.633
Cement	0.9487	0.567	0.00533	0.469	0.00418	0.638
Cement Mortar	0.9752	0.962	0.00806	0.709	0.00683	0.987
Concrete	0.9665	0.798	0.00713	0.627	0.00559	0.957
Earthenware	0.9665	0.798	0.00713	0.627	0.00559	0.957
Cast-iron	0.260	3.12	0.0279	2.45	0.02.9	37.50
Wrought-iron	0.277	3.33	0.0287	2.61	0.0233	40.00
Mild Steel	0.284	3.40	0.0303	2.67	0.0238	40.63
Brass	1.292	3.50	0.0313	2.75	0.0245	42.08
Copper	0.317	3.81	0.0304	2.99	0.0246	43.75
Lead	0.412	4.44	0.0314	3.88	0.0249	59.33
Zinc	0.269	3.12	0.0279	2.45	0.0249	37.50
Water	0.0369	0.432	0.00366	0.310	0.00303	5.19

* In using columns (1) to (2a) transverse dimensions must be taken in inches and length or height in feet. In using columns (3) and (3a) thickness or depth must be taken in inches and superficial dimensions in feet.

By column (3a) the constants for concrete and tiles are 0.0067 and 0.0356 respectively, and the weights are

$$\text{Concrete } W = 4.75 \times 0.0067 \times 25 \times 20$$

$$= 229.66 \text{ cwt., say 230 cwt.}$$

$$\text{Tiles } W = 0.625 \times 0.0356 \times 25 \times 20$$

$$= 26.75 \text{ cwt., say 27 cwt.}$$

∴ Weight of floor slab = 230 + 27 = 257 cwt.

Example (2): Find the approximate weight in pounds and hundredweights of two steel plates $\frac{1}{2}$ in. thick and of size sufficient to cover a pair of doors each 7 ft. high by 3 ft. 6 in. wide.

Taking the constants 40.83, say 40.8, and 0.364, from columns (3) and (3a), the weight of the two plates will be

$$W = 0.25 \times 40.8 \times 7^2 = 500 \text{ lb.}$$

$$W = 0.25 \times 0.364 \times 7^2 = 4.46 \text{ cwt.}$$

Example (3): Find the weight in pounds per square foot of 20 S.W.G. sheet zinc (thickness = 0.036 in.).

Taking the constant = 37.5 from column (3) the weight is

$$w = 0.036 \times 37.5 = 1.35 \text{ lb.}$$

We do not think it necessary to give tables of equivalents and conversion factors, as such data are to be found in the various pocket-books published for architects and engineers. Our main object in this and the preceding article has been to suggest the manner in which data can be employed in the preparation of labour-saving constants.

Illustrations.

ST. BARTHOLOMEW CHURCH, STAMFORD HILL.

 HIS church was erected with funds derived from the sale of the church and site of St. Bartholomew, Little Moorfields.

The materials consist of red brick and Douling stone, with tiled roofs. The fall in the ground eastward gave an opportunity of placing the morning chapel, which is vaulted in brick, and the vestries under the chancel. The pulpit, given by the Bishop of Islington, and the font (both of which are excellent specimens of Sir Christopher Wren's work) came from the Church of St. Bartholomew, Little Moorfields.

The contractors were Messrs. Dove Bros., and the architect was Mr. W. D. Caroe.

WAYSIDE NOTES IN EAST ANGLIA: THE GABLES OF BROADLAND.

THE architectural student who has wandered in the vicinity of the Norfolk Broads and in other parts of East Anglia where reeds were at one time the accepted roof-covering of all buildings, whether for domestic or commercial purposes, must have been struck with the variety and quaintness of the gables. These gable-ends are generally of brick carried up above the thatch, and the outlines consisted of graceful curves, and pediments finished and coped with ordinary bricks. On the external face the ends of the principal timbers of the roof are tied in with iron straps having ornamental wrought-iron elaborated with scrollwork, dates, initials letters forming perhaps the name of the owner, or with plain, hammered spear-ended bars sometimes single and sometimes crossed at right angles.

The bricks were smaller than the usual brick of to-day, rising 12½ in. to five courses, and were 8½ in. long and 4½ in. wide. Flint and rubble were often introduced where the former was plentiful locally, in conjunction with the brick, and it may even be that this rubble once formed part of still more ancient buildings. Now and then rubbed arches were introduced, as at Potter Heigham, but, as a rule all bricks were handmade, and the mouldings were simple and moulded also, not cut.

The dates of these gables are XVIIIth and XVIIth century, the earlier forms, such as the crow steps, being almost XVIIth century. Here and there we find Georgian fronts put on to these early buildings, as an example I have given from Beccles shows.

Again, we have evidences of buildings converted from domestic purposes to commercial requirements, as at Martham and Beccles. Then, again, we see this brick treatment introduced into ecclesiastical buildings, as

videnced by the interesting church at Hoveon, which has many points worthy of study. All these examples indicate a strong Flemish influence, and point to the fact that the revival of the manufacture of bricks became active in Norfolk and Suffolk towards the close of the XVIIth century, and that then the timber-constructed buildings were disappearing, and were being superseded by those constructed of the more permanent and weather-proof material.

JOHN SHEWELL CORDER.

EXAMPLES OF WROUGHT-IRON WORK.

THE sheet of wrought-iron work represents few examples of the style and class of work turned out by smiths of the XVIIIth and XVIIIth centuries. Many modern craftsmen might with advantage take a lesson from these old Continental specimens. The smith of the present century has lost much of the cunning of his forefathers, and, as a general rule, cannot afford, in these times of hurry and competition, to work for art's sake as in the days of old. Much of the beautiful detail is, therefore, lost by the metal-worker of the present day, and that must have been at one time a work of leisure to the craftsman is now but an ordinary toil. L. D.

THE OLD COTTAGES, POTTER HEIGHAM AND ST. OLAVES.

THE Cottage at Potter Heigham stands opposite the post office close to the railway station. It is of somewhat unpretentious proportions and low elevation, and is constructed of brick resting on a rubble plinth foundation—the roof being of the usual red hatch. Though it has never probably been a residence of much importance, yet it displays much care and thought and skill in dealing with simple materials so as to produce a pleasing and harmonious effect and sound construction. The bricks are best kiln bricks, 2½ in. thick, with plain oiled plinth and corbels; dark headers were freely introduced, producing simple patterns, and the arches are cut and rubbed. No window is placed at the end on first floor, the upper panel being probably a date panel with the owner's initials—see other examples, as at Martbam. The tumbling in of the coping with continuous kneelers gives a great sense of quaintness to the whole, and the gable end is tied into the roof members with wrought straps. The gable end at St. Olaves is of similar construction, it slightly varied in design; this roof was so originally thatched.

Engineering Societies.

SOCIETY OF ENGINEERS.—At a meeting held at the Royal United Service Institution on Monday, the 2nd inst., Mr. Maurice Wilson, President, in the chair, a paper was read on "Harbour Exigency Works," by Mr. Frank Latham, Borough Engineer of Penzance, of which the following is an abstract:—After describing the construction of the heavy swing-bridge at the Penzance Harbour, the author proceeded to deal with the works which were rendered necessary owing to the unsafe condition of the retaining walls and defective foundation under the main structure. The weight of the bridge, when open, had caused the foundation to slide, and the retaining walls to be thrust towards, and there was a tendency for the structure to be let down sideways into the harbour. The opening and closing gear had become crumpled, and required immediate attention. The author then described the methods adopted by him in rectifying the slipping structure, commencing from the king down and rebuilding of walls and the rapping up of others, to the remedial measures adopted under and around the pier-path and lifting-gear. The manner in which the work was effected caused no interruption of the traffic over the bridge, and cranes were provided by which it could be opened and closed for passing vessels almost at any stage during the progress of the work. He next described the design and construction of the wrought-iron dock gates at the ft. entrance to the floating dock. The gates consist of inside and outside skin

plates, built up on a framework of steel angle iron, and strengthened by division stay plates which divide each gate up into several watertight compartments. Each gate is calculated to weigh 50 tons. There is provision for partially overconing the concussion of the waves, and for neutralising the buoyancy of the gates during high water. Certain suggestions made by the late Mr. James Abernethy, which were adopted, are referred to. An unforeseen weakness revealed itself during a storm in 1900, and the gates suffered considerable damage, one gate becoming a total wreck. The author described the methods he adopted in beaching the water-logged gates, the various details of reconstruction, and the features introduced by which the defect was rectified. The work of reconstruction was one of great urgency, and was continued without cessation from start to finish. The work was subjected to hydraulic test previous to fixing. The author then described the method adopted by him in exigency cramping. The masonry over the dock gates had commenced to lift through being severely shaken by shocks from the gates during storms. The masonry was expeditiously made secure by further mishap. Mr. Latham then described simple but effective cramping, thus averting an effective method adopted by him in reconstructing a length of harbour wall, which had suffered considerable damage. The work was completed without interfering with the overhead traffic or disturbing the filling behind the wall, and the cost was comparatively small. He further described the method adopted in removing and reconstructing a pier head in deep water, in which advantage was taken of the old wall to protect the new one, thereby saving the cost of a temporary dam.

METROPOLITAN ASYLUMS BOARD.

THE usual fortnightly meeting of the managers of the Metropolitan Asylums District was held on Saturday last week at the offices, Victoria-embankment, E.C.

The Proposed Consumptive Sanatoria.—Among the correspondence received was a letter from the Local Government Board, stating that they had considered the subject of the proposed establishment by the managers of sanatoria for the treatment of consumption, but that the information at present before them did not appear to afford sufficient justification for the very heavy outlay which would be involved in the proposal.

East Cliff House.—Plans of the proposed accommodation for the laundry staff at this institution were approved and ordered to be submitted to the Local Government Board. The cost of the proposed building is 600l.

Tooting Bec Asylum.—The Asylums Committee submitted a lengthy report from the Tooting Bec sub-Committee relative to the accommodation for patients in that asylum, and recommended:—

"That the proposal to increase the number of beds for patients at Tooting Bec Asylum be approved, and that application be made to the Local Government Board to sanction the normal accommodation for adult patients at that institution being at once increased from 750 to 855, and from the latter figure to 1,062 when the two additional blocks have been erected."

This was agreed to.

The Congress of School Hygiene.—The action of the Children's Committee in appointing Mr. Corbett and Dr. Elliott S. Browne to represent the Board on the Organising Committee of this congress was approved.

Joyce Green Hospital.—Roads.—It was agreed that certain of the roads at this hospital should be repaired in accordance with the report of Mr. W. Harston, the cost being estimated at 1,757l. The matter was referred to the Works Committee.

North-Eastern Hospital.—The provision of thirty-six pedal-spray lavatories in certain wards at this hospital was authorised, and this also was referred to the Works Committee to be dealt with.

COURT OF COMMON COUNCIL.

A MEETING of the Court of Common Council was held at the Guildhall on Thursday last week, the Lord Mayor presiding.

Street Works.—The following recommendations of the Streets Committee were agreed to:—

That the carriage-way of Doggate Dock be retold with 3 in. by 7 in. Aberdeen granite cubes in cement grout upon a concrete foundation at an estimated cost of 550l.

That the carriage-way of Goddard-street (St. Paul's-churchyard to Knight-riding-street) be paved with cross-slated wood blocks at an estimated cost of 240l.

That the carriage-way of West Smithfield be paved with cross-slated deal blocks laid on 8 in. of concrete at an estimated cost of 4,800l.

That the contracts with the Improved Wood Pavement Company for maintaining the carriage-way pavements of the undermentioned streets be extended as under:—Cannon-street (Abchurch-lane to St. Paul's-churchyard), for fifteen years (subject to the right of the Corporation to terminate the arrangement at the end of five or ten years) at 1s. per yard super, per annum, being a decrease of 3d. per yard super, per annum on the existing contract. Shoe-lane (Fleet-street to St. Bride-street), for fifteen years (subject to the right of the Corporation to terminate the arrangement at the end of five or ten years) at 10d. per yard super, per annum, being the same price as the existing contract.

That the carriage-way of Finsbury-circus, between West-street and Circus-place (now paved with macadam), be repaved with cross-slated deal blocks at an estimated cost of 800l.

Loan Exhibitions.—On the motion of Mr. William Rome, it was referred to the Library Committee to consider and report as to the desirability of holding a loan exhibition of pictures in the Art Gallery in the summer of 1907, and the probable cost.

Milan Exhibition.—It was agreed, on the motion of Sir Thomas Brooke-Hitching, to grant a sum not exceeding 100l. towards the cost of the expenses in connexion with the loan of exhibits from the Corporation to the forthcoming Milan International Exhibition, 1906.

Obituary.

MR. WOODS.—The death on March 26 at his residence in Bournemouth is announced of Mr. Thomas Hoade Woods, of "Durrants," Croxley Green, aged seventy-six years. Mr. Woods was, until recently, the senior partner of Messrs. Christie, Manson, & Woods, of King-street, St. James's, whose service he entered in 1846, and of whom he became a partner twelve years afterwards. On the retirement of Mr. James H. Christie from the firm seventeen years ago Mr. Woods and Mr. H. F. Taylor became the senior partners, and then Mr. Woods, through ill-health, retired in October, 1903. During his long connexion with the house he played a leading share in the dispersal at auction of a large number of famous art-collections, amongst them being the Bernal, Bicknell, Gillett, Hamilton Palace, Dudley, and Adrian Hope collections. Mr. Woods enjoyed a high reputation as a judge of the merits and value of pictures, and had gathered for himself some choice examples.

General Building News.

ST. SAVIOUR'S CHURCH, GUILDFORD.—The opening ceremony took place on the 26th ult., by the Bishop of Winchester. The church has been erected at a cost of 9,500l. from designs by Mr. Herbert A. Legge, of London. It is of Bargate stone, with Bath stone dressings, and provides seating accommodation for 750. The contractors were Messrs. Goddard & Sons, of Farnham. Warming by Messrs. Kite & Co., London, and electric installation by Messrs. Fentum Phillips, of Guildford.

ST. STEPHEN'S CHURCH, BRIMMINGHAM.—Mr. W. H. Bidlake is appointed architect for the rebuilding of the church which was built in Newtown-row, in the parish of St. George, in 1843-4, for 800 sittings, after designs, in the early decorated style, of R. C. Carpenter. It formed the fourth of the ten churches erected in Birmingham under Sir Robert Peel's Act of 1843-8 and 7 Viet. c. 37. It is cruciform in plan. The red sandstone employed for the structure has fallen into decay. Various minor repairs having been made from time to time it was found necessary to pull down the entire west front, which was rebuilt of red brick, with terra-cotta, facings in 1886, by Mr. Bidlake, who at the same time decorated the interior.

ST. MARGARET'S CHURCH, HOLLYWOOD.—A tower has recently been added to this church. Mr. Frank Freeman, of Bolton, was the architect, and Mr. Joseph Clough, of Failsforth, the builder for the work.

SETTON - IN - ASHFIELD CONGREGATIONAL CHURCH.—The opening ceremony of this church took place on Wednesday. The building occupies a prominent corner site, and is designed in late Gothic—freely treated. The facings are of pressed red bricks, and the dressings of Matlock stone. A lofty tower forms a feature at the corner of the block. The contract has been carried out by Mr. J. Greenwood,

of Mansfield, the amount being 3,982l. The architects are Messrs. George Baines & Son, Clement's-lane, Strand, London, W.C.

WESLEYAN CHURCH, PENARTH.—The memorial stones of a new chapel have just been laid at Penarth at the west corner of Albert-terrace. The entire scheme for the new church and schools, which will cost about 12,000l., includes a chapel to seat (with the galleries) about 750, a school to accommodate about 500 scholars, an assembly-hall to accommodate 250, and church parlour for about 100. A chancel is provided in the chapel, where the choir will be located, the organ-chamber being adjacent. The school buildings consist of central hall and galleries, fourteen classrooms, and a large infants'-room. The material to be used in the walls is local stone, with Newbridge stone facings and Bathstone dressings. Electric light will be used throughout. The contract price is 9,982l., the builder being Mr. D. T. Price, Penarth, and the architect Mr. Henry Budgen, Cardiff.

PRIMITIVE METHODIST CHURCH, CHESTER-LE-STRÉE.—On the 24th ult. the new Primitive Methodist church, which has been erected in Durham-road, Chester-le-Strée, was opened. The whole scheme provides for a church, school, and a number of vestries. Only the church is being built at present, the school and some of the vestries being left for a future occasion. The church is 56 ft. long and 41 ft. wide. It provides seating accommodation for 400 people, 300 on the ground floor and 100 in the gallery. On the ground floor a vestry is provided for the minister, together with a room, which will be temporarily used as a kitchen vestry. The design is Gothic, the exterior being finished with Lumley facing bricks and stone dressings. All the interior fittings are of pitch pine. The windows are filled with stained glass supplied by Messrs. Davidson & Walker, Newcastle-on-Tyne. The building is heated by the improved small bore hot water system, installed by the R. J. Ward Company, Newcastle-on-Tyne, who also supplied the roof ventilators. The cost of the building has been about 2,500l. The whole of the work has been carried out under the supervision of the architects, Messrs. Boyd & Groves, Blackcliff-street, Newcastle. The contractor for the building was Mr. C. Groves, Chester-le-Strée.

PRIMITIVE METHODIST CHURCH, LONG EATON.—A new Primitive Methodist church was opened at Long Eaton on the 22nd ult. The church, which is a portion of the scheme of complete church and school, has been designed in a late period of Gothic architecture. A square tower is erected on one corner of the front, terminated by a spirelet. The windows are traceted, and all filled with coloured lead lights. The seating is of Orhan, stained green, and on a circular plan. Two vestries, etc., are provided. The church will seat about 500 persons, the contract being 2,544l. The whole work has been carried out by Mr. John Bull, builder, Long Eaton, from the designs, and under the superintendence, of Messrs. George Baines and R. Palmer Baines, architects, London.

CHURCH RESTORATION, MILSTON, WILTS.—The parish church of St. Mary, Milston, has just been re-opened after having been restored. The walls, which were formerly very crumbled, have been put into the straight and underpinned, the stonework has been renovated where necessary, and a new tile roof has been put on. Inside, the most noticeable feature of the restoration is the opening-up of the oak timbers of the chancel roof, which were previously covered with lath and plaster. The walls have been re-plastered, though care has been taken to preserve as far as possible some old inscriptions and decorations. The interior of the nave roof has been renewed, a new heating apparatus has been installed, and other minor improvements effected. The diocesan architect, Mr. C. E. Ponting, F.S.A., of Marlborough, drew the plans, and the contractors were Messrs. Kite, of Salisbury.

CHURCH RESTORATION, CASTLEFORD.—The condition of some portions of the Castleford Parish Church has for some time occasioned grave concern. Recently the three great piers supporting the tower have shown increasing signs of surface fracture, and of steady subsidence. Messrs. Berry, engineers, of Huddersfield, were instructed to resort to underpinning, in order that the structure and foundations of the faulty piers might be thoroughly examined. When this was done it was discovered that the piers had had practically no foundations whatever, and that they had only been shells of stone filled with rubble. Since August last the lower portions of the piers have been entirely rebuilt of solid stone resting on thick beds of concrete. The clearstories and arches have also been rebuilt, and by the end of the present month the entire work will be completed. The total cost of the undertaking, including the relaying of the transept floors, washing the interior walls, etc., will, it is expected, amount to 1,250l.

THE RESTORATION OF HEXHAM ABBEY.—A meeting of the Hexham Abbey restoration committee was held on the 30th ult. at Hexham, when it was decided to hold a public vestry meeting on April 11 for the purpose of applying

for a faculty with a view to proceeding with the rebuilding of the nave according to the plans submitted by Mr. Temple Moore and the late Mr. T. Spencer's trustees. The late Mr. T. Spencer gave 16,000l. for the building of the nave. The repairs that are being carried out at the north end of the north transept are rapidly nearing a completion.

MAGDALEN CHAPEL, NORWICH.—Mr. Eustace Gurney has bought from Mr. Walter Ryse the old Magdalen Chapel in Mowdun-lane. The building has been sold to Mr. Gurney on the understanding that all the architectural features shall be preserved. The building is to be carefully restored under the advice of Mr. J. Owen Bond, architect, Norwich.

JEWISH SYNAGOGUE, STOCKTON.—The foundation-stone has just been laid for Hartington-road, Stockton, of a new synagogue. The building, which has been designed by Mr. T. W. Richardson, architect, will occupy a site of 26 ft. by 76 ft. It will be in the Renaissance style, the front being faced with Accrington red pressed bricks and artificial stone dressings. The main entrance will open into a tiled vestibule with ladies' and gentlemen's cloak rooms on either side. From the ladies' cloak-room a staircase will give access to the ladies' gallery, with accommodation for fifty persons. From the vestibule the Synagogue, which will be 29 ft. long by 23 ft. wide, will be entered by means of folding doors, and there will be a recessed entrance. There will be a recess in the east wall, and in front of this will be the usual platform. In the rear of the Synagogue there will be a classroom 24 ft. by 13 ft., with a separate entrance for the children from the street.

SCHOOLS, BYELEET.—A new school has been erected for the managers and building committee of the Byfleet National Schools, by Messrs. Martin Wells & Co., from the designs of Messrs. Jarvis & Richards, architects to the Surrey Education Committee.

SCHOOL EXTENSIONS, FISHSILL, SHEFFIELD.—Sir Charles Eliot, Vice-Chancellor of Sheffield University, recently opened a new department for infants, which has been added to the Fishsill Council School, Pitsmoor. The new building, which will accommodate 350 children, comprises a central hall and six classrooms. The cost of erecting it and making alterations to the original buildings has been 5,600l. This does not include the cost of fittings. Mr. J. R. Wigfull was the architect for the work.

SCHOOL, KINGSTON-ON-THAMES.—The new elementary schools in Bonner Hill-road, Kingston, have just been opened. The site of the new school abuts upon Bonner Hill-road and Oil Mill-lane, and is about two acres in extent. Competitive designs for the building were invited, and the first premium was awarded to Mr. F. W. Roper, of Adam-street, Adelphi, W.C., under whose supervision the work has been carried out by the contractors, Messrs. Burges & Sons, of Wimbledon. Mr. R. Squelch, on behalf of the Education Committee, has acted as clerk of the works. The buildings are in two blocks, the infants being accommodated in the smaller block, while the boys are accommodated on the ground floor, and the girls on the first floor of the larger building. Each department is provided with a central hall, in which the whole school can assemble, and there are eight classrooms in each of the three departments, which are likewise provided with teachers' rooms, cloak-rooms, and lavatories. Accommodation is provided for 1,144 children, viz., 400 infants, 372 girls, and 372 boys, and the total cost, including site, fittings and furniture will be about 21,000l. The school buildings are lighted throughout with electricity.

POLICE STATION, GLASGOW.—The new Central Police Office in St. Andrew's-square, Glasgow, which has just been opened, was designed by Mr. A. B. McDonald, the City Engineer, and will cost 40,000l. The main frontage to St. Andrew's-square, facing eastwards, is about 157 ft., and that to St. Andrew's-street is 91 ft., both frontages being built of red terra-cotta bricks, with red stone dressings and cornices. The principal entrance is from St. Andrew's-square, through a passage-way to the quadrangle, on the right of which are the entrances to the lieutenants' and detectives' bar and detectives' rooms, also to the chief superintendent's rooms. On the left are the mortuary, lavatory, dog-house, van sheds, and harness room, with the stableman's house above it. On the west side of the quadrangle are stables for six horses, stores, a large muster hall, a lamp room, and rooms for inspectors and sergeants. On the left of the main entrance are the chief constable's office and the rooms of the police-surgeon, also a room which will be used as a museum for the display of a curious and interesting collection of relics connected with criminals. The registrar's rooms enter from St. Andrew's-street, and there is a separate entrance for witnesses and the public from St. Andrew's-square, also a private entrance for the chief-constable and the presiding magistrate. The basement is occupied by the boiler-house, clothing stores, and book rooms. On the first floor is a court hall, with two witness

rooms adjoining. The cells are immediately behind the court hall, occupy two floors, and number sixty-seven. They are finished with concrete floors and ceilings and enamelled brick walls. Immediately adjoining the court hall are the magistrate's room, with separate lavatory, the library, a waiting-room, the chief-constable's rooms, public and private rooms, and the chief clerk's rooms. On the second floor are the rooms of the procurator fiscal and the assessor, also stores for productions. On the third floor are stores for clothing and the tailors' workshops, etc. The buildings are heated throughout by hot-water pipes and radiators.

CENTRAL LIBRARY FOR EAST HAM.—At the meeting of the East Ham Town Council on Tuesday the Libraries' Committee reported having gone into the question of proceeding with the erection of the proposed Central Library on the Town Hall site. They will submit full details and particulars of the scheme at the next meeting of the Council.

BATHS, NEWCASTLE-ON-TYNE.—The foundation-stone has just been laid of the new Corporation baths and wash-houses at the corner of Gibson-street, Newcastle. The new buildings are being erected from the designs of Mr. F. H. Holford, the City Surveyor. The bathing hall will be 88 ft. by 58 ft. 6 in., and will be built on the amphitheatre plan, with three tiers of steps on each side. There will be two club-rooms, one 26 ft. 6 in. by 14 ft. 9 in., and one 16 ft. 6 in. by 15 ft. 9 in., which can also be used as artists' rooms during the winter months. The dressing-boxes will be made to fold against the wall, and this will allow for about 600 spectators. The pond will be boarded over during the winter months, and the hall fitted as a gymnasium, or the apparatus can be removed and the hall used for entertainments, with accommodation for about 900 people. Separate entrances will be provided for men and women, the women's entrance leading to five slipper baths and the wash-houses. There will be a small waiting-room at the entrance, which is to be used as a crèche. The wash-house will be approached by a corridor 6 ft. wide, and will contain forty-two washing-stalls, with a similar number of driers, and two hydro-extractors. There will be one mangling and ironing room, with a callender, mangles, ironing-tables, etc. On the first floor, which will be approached from the men's entrance only, there will be four first-class slipper baths, fitted with lavatory basin and a spray bath; seven second-class spray baths and eight second-class slipper baths. Each of these fifteen baths will have two dressing-boxes. On the second floor will be provided a five-roomed house for the resident superintendent and a large store-room for establishment purposes. The wall on the inside of the building will be lined with glazed bricks, and the outside faced with stone. The building work is being carried out by Messrs. J. & G. Douglass, and the engineering work by Messrs. W. Dix & Co. The buildings are to cost 16,334l.; the boilers, laundry machinery, tanks, etc., 3,850l.

WORKERS' DWELLINGS, NEWCASTLE-ON-TYNE.—New dwellings in Walker-road have been erected by the Newcastle Corporation for the accommodation of poor families in the city. There are 63 houses to be erected, or 126 dwellings—112 two-roomed, and 14 one-roomed; each dwelling being provided with a scullery with set and wash-up sink, a larder or food-cupboard, a yard, and a separate water-closet to each dwelling. The following is a description of the single-room dwellings:—Each dwelling is self-contained, and comprises a living room, 16 ft. 9 in. by 12 ft. 9 in., with a bed recess 6 ft. 6 in. by 5 ft.; a scullery 7 ft. 6 in. by 7 ft., containing a sink and set pot, a food cupboard, and a water-closet. The block is two stories in height, the rooms being approached by a stone staircase in the centre, with a balcony along the front for entrance to the upper dwellings. Each dwelling has its own entrance-door. There is through ventilation provided by windows in both the front and back walls of the general room. An iron rod with rings near the ceiling is provided in front of each bed recess for the purpose of hanging a curtain and screening the bed from the room. The walls are plastered with adamant plaster. The two-room dwellings are in two-story flats, each flat being self-contained, and, with the exception that the front room of the upper floor is considerably larger than that of the ground-floor, the dwellings are practically the same. The ground-floor dwelling comprises a living room or kitchen 12 ft. 6 in. by 10 ft. 10 in.; a bedroom 12 ft. 6 in. by 10 ft. 3 in.; a scullery 8 ft. 9 in. by 6 ft., with sink and set-pot, a food cupboard, a coal-house, water-closet, and a yard. The upper dwellings have similar accommodation, excepting that the bedroom is 17 ft. 4 in. long, with an average width of 9 ft. 9 in. Each dwelling has a separate entrance and yard. The two-roomed dwellings are to be let at 4s. 3d. per week downstairs, and 4s. 3d. per week upstairs, and the one-roomed at 2s. 3d. per week. An open space is to be provided in Hawick-crescent, to be used as a playground for children, containing an area of about 800 sq. yds. The buildings are faced with red pressed bricks to the

streets, with common bricks at the back. The work is being carried out by Messrs. W. Franklin & Sons, Ltd., under the direction of the City Architect, Mr. H. Holburn.

SANATORIUM, BLACKROCK.—The first portion of the extensions to Blackpool Sanatorium has just been opened. The extensions provide for considerable additions to the administrative block, a portion having been built in front of the old block. The new administrative block contains a suite of rooms on the ground floor. In addition, on the ground floor, is a nurses' dining-room, a servants' hall, and a sitting-room for the nurses, also a dispensary and matron's office combined. The kitchen has a granolithic floor. There is a large store-room for groceries and dry goods close to the kitchen, and also two other store-rooms. On the two upper floors are seventeen bedrooms for servants and nurses, and two bath-rooms and other necessary accommodation, besides linen cupboards. Electric light is laid on to all rooms, and the house is warmed by radiators supplied from a calorifier in a cellar. Another calorifier supplies hot water to the various parts of the house. The main additional accommodation for patients is a large new pavilion, running, as do the old blocks, east and west. It has accommodation for twenty-two beds, ten in each of the large wards, and one in each of two small wards opening out of the large wards.

The nurses' duty room is in the centre of the block, and opening on to the main hall separating the male from the female wards. At the end of each ward are two sanitary annexes, entered from the ward by cross-ventilated passages, and containing baths, etc., for adults and children. Hot water is supplied by a storage calorifier. The wards are heated and lit under each window. The floors are of narrow teak planks, planed smooth, and finished with Ronuk. The walls are finished in Keene's cement and Ripolin paint. Shorland's Manchester grates, with chimney breasts of green glazed bricks, and with green tile hearths, are placed at each end of each large ward, and one in each small ward. The wards are lighted by incandescent electric lamps. A glass-roofed verandah runs along the south side of the building, and at the centre is another annex, forming the principal entrance, and containing a scullery, doctor's room, food lift, and staircase leading to the children's play-room, which occupies the centre of the building over the nurses' duty room and the main hall. There are also store-rooms on this floor. The other block for patients consists of a double isolation block, one portion entered from the north side and one from the south. On each side is a three-bed ward, two single-bed wards, a kitchen and a lavatory. The old disinfecting and laundry block has been pulled down and a new disinfecting-house and laundry combined has been erected. The laundry consists of sorting-room, wash-house, drying-room, ironing-room, and delivery room. Near this block, and parallel with it, is the new boiler-house. A new chimney 60 ft. high has been erected. The cost of the extensions, including furnishings, is expected to be about 16,500. The architect was Mr. F. T. Waddington, and the contractor Mr. J. Eaves.

MUSIC-HALL, SUNDERLAND.—A new music hall is to be erected on the site of the old Bishop's wearmouth rectory. The contractor and architects for the work are respectively Mr. J. W. White and Messrs. W. & T. R. Milburn, of Sunderland. The contract price is said to be between 20,000 and 30,000.

LEEDS CONGRUOUS BLOCKS.—The first completed building of the Beckton-street Workhouse Infirmary extensions has just been opened. Block "A" marks the first step towards the accomplishment of a scheme which will involve an outlay of 100,000. Three years ago, after consulting Mr. Saxon Snell as to the best manner of utilizing the ground at their disposal at Burmantofts, and obtaining the approval of the Local Government Board, the Guardians commissioned Messrs. Thomas Wynn & Sons, architects, of Leeds, to prepare detailed plans. The new scheme, when complete, will provide for the erection of new kitchens and general stores, receiving and delivery rooms. For males containing 186 beds; sick and venereal wards for females (183 beds), male venereal wards (20 beds), maternity wards (26 beds), infectious diseases wards for ten males and a similar number of females, and children's wards containing 66 beds. Altogether, the new accommodation will be for about 500 beds, bringing the total for the infirmary to between 900 and 1000 beds. In addition the old nurses' home will be considerably enlarged, and an operating theatre and a mortuary erected. A set of observation wards will be arranged for. The buildings will be lighted by electricity, the new accommodation will be ready for installation of the electric light at the workhouse, a sub-station has been built in the grounds, power being received from the Corporation.

PROPOSED THEATRE, SUNDERLAND.—A company has been formed, under the name of the King's Theatre, Sunderland, Ltd. for the purpose of acquiring a theatre and shops to be erected in accordance with plans prepared by Mr. Wm. Hope, architect, Newcastle. The proposed theatre will accommodate about 2,540

persons. The auditorium will be arranged on the two-pier principle, comprising stalls, circles, pit, and gallery; the tiers will be entirely supported by cast-iron columns on a platform. The stage will be 42 ft. deep from the curtain to the back wall and 80 ft. wide; the auditorium will be 72 ft. wide.

NEW THEATRE, CARDIFF.—A new theatre is in course of erection in Park-place, Cardiff. Messrs. James Allan & Sons, Cardiff, are the contractors, and Messrs. Old-road, Ashton, & Ford, London, the architects for the work.

GRAND STAND FOR THE WARWICK PAGEANT.—Messrs. Saunders & Sons, Ltd., of Cirencester, have secured the contract, amounting to 1,500l., for the erection of the grand stand in the Castle ground. The stand is to seat about 5,000 persons, and is divided into seven blocks by six gangways. The whole structure is in timber and carries a light shalter roof. Messrs. F. P. Trespass & E. M. Richards, C.E., are responsible for the design, which has been approved by Messrs. Baker & Shelford, of London.

PUBLIC LIBRARY, ASHTON.—A new public library has been erected on a site at the junction of Wigan-road and Market-street, Ashton. The work was carried out at a cost of 5,843l. from plans prepared by Messrs. J. B. & W. Thornley, architects.

CLAREMONT HALL EXTENSION, PENTONVILLE.—The work of extension has just been begun at Claremont Hall, the London Congregational Union's Central Mission in Pentonville. A site is to be created, comprising men's institute and other premises, to relieve the crowded state of the present institute. The plans were drawn by the architect, Mr. Alfred Conder, of Westminster.

POST OFFICE, HULL.—The contract for the superstructure of the new Post Office now in course of construction at the corner of Leger-street and Alfred Gelder-street, Hull, has been obtained by Messrs. Arnold & Son. The total estimated cost of the building and fittings is 53,000l.

Sanitary and Engineering News.

SANITARY CONDITIONS AT SUTTON BONNINGTON (NOTTS).—The following is taken from Dr. Spencer Low's Report to the Local Government Board on the occasion of an outbreak of enteric fever at Sutton Bonnington, in the Leake Rural District:—"A most offensive nuisance, to which the attention of the Inspector of Nuisances and Medical Officer of Health had from time to time been directed, is occasioned by the overflow from a tank receiving the sewage of a large residence on the higher ground above Sutton Bonnington. Liquid from this tank passes in an open drain within a few feet of a large house beyond which point the drain is piped some 200 yds. to one of the sewage dykes. On account of smell from this drain the windows of this house have, on one side, to be kept closed at times. At the date of my first visit the stench from this open drain was almost nauseating. This nuisance is but a few yards from a farm where a District Councillor resides. I am told that the gentleman owning and occupying the house causing this offensive condition claims that he has a right to continue disposing of his effluent (crude sewage on the date of my visit) in this way. The officers of the Council do not seem to contemplate action in the matter. Some wells that I saw had, on chemical analysis, been shown to be polluted, and certain measures had been taken to improve them. However, since the wells in these villages (with one exception as far as I learnt) are sunk in the superficial gravel, are near garden land, are often not far distant from privy middens, and are steyned with brick with open joints, wells generally must be regarded as affording water of questionable quality at all times, and on occasion water distinctly dangerous owing to the pollutions to which they are liable. Whether or not these wells were the cause of the limited outbreak of enteric fever to which this Report refers, there can be no question that, given specific pollution of the subsoil water in the district, many wells might become agents in spreading this disease. The first and most pressing need of the villages of Normanton and Sutton Bonnington is a safe water supply."

WATERWORKS, SELBY.—The foundation-stone of the new Selby Waterworks, to be erected on land purchased from the Earl of Londesborough, at Brayton Barff, about two miles south-west of Selby, was laid on the 29th ult. The estimated cost of the new undertaking is 30,000l. The new works comprise an engine-house, boiler-house, coal depot, and workshop, the former being 30 ft. by 30 ft. in dimensions. The buildings are to be of red brick, with stone facings, and have two towers, under which are the pumps and bore holes, the latter being 400 ft. in depth. The pumps, engine, and boilers are to be duplicated, and the engines will be capable of pumping three-quarters of a million gallons of water per day. The reservoir covers a site of about an acre,

with a holding capacity of 800,000 gallons of water, and is 150 ft. above the level at Selby, and 170 ft. above that of the ordnance survey. The water will be conveyed to Selby by gravitation. The engineers of the new scheme are Mr. Percy Griffith, M.Inst.C.E., of London, and Mr. Bruce Gray, A.M.Inst.C.E., Surveyor to the Selby Urban District Council.

WATER SUPPLY, MALVERN.—On the 29th ult. a supplementary water supply, which will more than double the present one, was opened at Malvern. The work has been carried out under the superintendence of Mr. W. O. Thorp, the Town Surveyor, and the cost, inclusive of the Act of Parliament (4,600l.) will be about 25,000l.

RECONSTRUCTION OF GOUROK GASWORKS.—The opening of the reconstructed gasworks at Gourock took place a short time ago. The extension, involving the erection of new buildings and additional apparatus, entailed an outlay of about 6,000l. A new retort-house has been built, and on the ground adjoining have been placed the condensers and purifiers. The lime stove is immediately above the purifiers and by means of pulley blocks and lime brackets the purifiers are charged with lime through a canvas chute. Mr. James M'Giechrist, of Dumbarton, has been the engineer of the reconstructed works. The leading contractors for the new works were Messrs. W. & J. Steel, masons, Greenock; Alexander Black, joiner, Gourock; Mr. Hision Paisley, retorts and large chimney, Messrs. Blakeney, purifiers, and Messrs. Houston, Greenock, roofers.

DRAINAGE SCHEME, BURNBAM.—The ceremony of cutting and turning the first sod of the new Burnbam drainage scheme took place recently. The scheme was prepared by Mr. Arthur Gladwell, Surveyor to the Eton Rural District Council, whilst the tender of Messrs. Jackman & Sons, contractors, of Slough, has been accepted for carrying out the work.

Foreign.

AMERICA.—The Managing Committee of the John Stewardson Memorial Scholarship in Architecture, announces, by authority of the Trustees of the University of Pennsylvania, who act as trustees of the Memorial Fund, a competition for a scholarship of the value of \$1,000, the holder of which is to spend one year in travel and in the study of architecture in Europe under the direction of the Committee. Candidates must be under thirty years of age, and must have studied or practised architecture in the State of Pennsylvania for the period of at least one year immediately preceding June 1, 1906. Candidates are required to pass preliminary examinations in freehand drawing, the history of architecture, construction, and language. The preliminary examinations will take place at the School of Architecture of the University of Pennsylvania early this month.

Miscellaneous.

GOOD FRIDAY WEEK.—In consequence of the Easter holidays, next week we go to press a day earlier than usual. All communications for the Editor must reach him by first post on Wednesday morning, except lists of tenders, which will be received up to 10 a.m. of the same day.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. D. Santoni & Co., electrical, mechanical and general engineers, have removed from 20, Ely-place to Alba Works, 15 to 17, Beauchamp-street, Brook-street, Holborn.—Messrs. Mountain & Son (Leeds), plasterers and makers of fibrous plaster, have divided their business into two branches. Mr. Arthur Mountain will carry on the business, as heretofore, of cement merchant and wholesale dealer in laths, plaster of Paris, etc., at 47, St. Paul's-street, Leeds, under the style and firm of "J. P. Mountain & Son." Mr. Fred Mountain will trade in his own name and carry on the business of plastering under the style of "Fred Mountain," 31, Manor-road, Holbeck.

MOVING THE WITTENBERG LIGHTHOUSE.—With the object of obviating the constant dredging hitherto necessary and to provide for a wider navigation channel the Hamburg Department for Commerce and Navigation recently decided to remove the Wittenberg lighthouse tower to a new site about 30 ft. to the south of its original position. The tower stands 115 ft. high and weighs 60 tons, and on account of its great height and the small area occupied, more difficulties had to be overcome in the work of removal than would have been the case had a considerably larger building been displaced. New foundations were prepared on the selected site, and a sliding way between the old and new foundations was built of girders on which steel rollers were fitted to facilitate the movement of the tower. The necessary motion was communicated to the structure by means of a strong hand-driven winch

with the aid of a wire rope, and in order to avoid any displacement of the lighthouse in the case of rough weather a second winch was installed in the opposite direction. To avoid the risk of longitudinal oscillation, two other winches were installed, one in front of the tower and the other behind, wire ropes from these being attached to the top of the lighthouse; and to guard against lateral oscillation, two wire ropes attached to crabs were placed on either side, these crabs running on girders laid parallel to the sliding way. The actual work of removal occupied only thirty-two minutes, and was successfully performed without interfering in any way with the operation of the lighthouse.

THE ROCHESTER CARD RECORDER.—Various types of ingenious time-recording appliances are now generally used in large industrial works. As compared with the old-fashioned system of booking, the automatic registration of time certainly saves cost and obviates the possibility of disputes. It is capable of development in such a way that all the time devoted to work in the week shall be mechanically registered upon a card for each workman, this card constituting his pay voucher. To provide for job work special cards can be provided—in addition to the weekly time card—constituting the order to proceed with the work, and furnishing an exact record of the time spent upon it. The Rochester card system as applied to these classes of work is one that works well and is perfectly fair to employer and employed. Each man on entering the works, or his particular shop, takes his week's card from the "out" rack and, dropping it into the recorder, pulls a lever which causes the day, hour and minute to be printed in the proper space and column. The workman then places the card in the "in" rack and begins work. Similar registration takes place at meal times and at the end of the day. As every man prints his own time sheet in indelible ink, there is no risk of dissimulation on either side, and clerical labour in the office is materially reduced. For dealing with job work the foreman is supplied with "job-cards," which are allocated to various men by being placed one at a time in a rack having a compartment for each man. Each man takes a card from his compartment on entering the shop and immediately registers his time upon the card. When the job has been finished he again registers the time and drops the card into the "finished-job" receptacle. The workman is then in the position of not earning anything until another card has been drawn from his compartment and stamped in the recorder. Thus he has no temptation to loiter away a few minutes, for the luxury will be at his own cost instead of that of his employer. Hence he loses no time in starting another job. Of course no mechanical contrivance can prevent a man from dawdling over his work, the only safeguard against this being efficient supervision by the foreman, and comparison of time records for similar jobs by the official staff. The system briefly described above has the further advantage that it keeps the foreman up to his work, because he is virtually compelled to see that a job is always ready in advance for each man.

CEMENT FOR BRITISH SOUTH AFRICA.—During the six months ended December 31, 1905, cement was imported into British South Africa from the United Kingdom to the value of 59,000*l.*, and from Germany and Belgium to the value of 103,000*l.*

BUILDING AND PAVING WORKS IN BULGARIA.—A consular report states that the Municipal Council of Sofia have approved the terms of a new loan of 1,400,000*l.*, bearing 5 per cent. interest and repayable in fifty years, of which 272,000*l.* is to be appropriated for the purpose of carrying out the following works:—Baths and adjoining hotel, 72,000*l.*; street paving, 120,000*l.*; sheds and slaughter-houses, 40,000*l.*; water pipes, 20,000*l.*; drain pipes, 12,000*l.*; repairs to canals and bridges, 8,000*l.*

MARSEILLES CEMENT MARKET.—The annual report of Mr. Gurney, British Consul-General at Marseilles, gives the following list of prices for cement prevalent in Marseilles at the time of writing:—Artificial Portland, in barrels of 200 kilos, from 44 to 45 francs; ditto, in barrels of 180 kilos, 46 francs to 47 francs; ditto, in barrels of 100, 48 francs to 50 francs; Natural Portland, in barrels of 200 kilos, 36 francs to 45 francs; ditto, in barrels of 180, 38 francs to 37 francs; ditto, in barrels of 100, 40 francs to 42 francs; Valentine Superior, in barrels of 300 kilos, 30 francs; ditto, in barrels of 250, 31 francs; ditto, in barrels of 100, 36 francs to 37 francs; Valentine Ordinary, in barrels of 300 kilos, 25 francs to 26 francs; ditto, in barrels of 250, 26 francs to 27 francs; ditto, in barrels of 100, 31 francs to 32 francs; Roquefort, in barrels of 300 kilos, 25 francs to 26 francs; ditto, in barrels of 100, 30 francs to 27 francs; ditto, in barrels of 100, 30 francs to 31 francs.

VANADIUM STEEL.—Owing to the present high price of vanadium it is not practicable to make use of this metal in the production of steel for ordinary structural work. The chief source of vanadium hitherto has been a vanadium lead ore mined in Spain, but other sources of supply are now being opened, and it is probable that with a

considerable reduction of price the use of vanadium steel will be widely extended. In the course of a paper on "Vanadium as a Steel-Making Element" read before the Liverpool section of the Society of Chemical Industry, Mr. J. Kent-Smith remarked that the nickel-vanadium steels, although showing great strength, were far below the chrome-vanadium steels in resistance to alternations of shock and torsional strain, and that for this reason far more was to be expected from the latter alloy. In ordinary mild steel, such as is employed for structural purposes, it is possible to increase the breaking stress to a considerable extent by heat treatment, but this affects the resistance to impact in a much greater ratio. On the other hand, a chrome-vanadium steel, after being annealed has a resistance to dynamic shock about double that of high carbon steel, and at the same time exhibits a very high resistance to torsion. Mr. Kent-Smith stated that one variety of chrome-vanadium steel, after special heat treatment, was found by experiment to withstand a tensile strain of 103 tons per square inch, at the same time showing high resistance to dynamic shock and torsional strain. Such a combination of properties has not been attained with any other steel, and may justly be described as phenomenal.

ANDERSON'S PATENT SLIDE-RULE.—Various ideas have been brought forward from time to time for realising the principle embodied in the slide-rule in such a way as to secure the practical accuracy of that valuable instrument. The length of an ordinary rule cannot well be increased beyond about 20 in., and even in that size the expansion and contraction of the material with temperature variations is apt to cause a certain amount of inaccuracy. Rotary types of rule have been made, with a sliding scale giving exact readings to four figures, but the use of such instruments is far more limited than that of the ordinary slide-rule. The slide-rule invented by Lieut.-Colonel Anderson, and made by Messrs. Casella, is based upon a novel application of the logarithmic principle, and consists essentially of upper and lower fixed scales with a sliding scale and cursor. But the scales, instead of forming a series in one horizontal line are split up into a series of parallel lines, the graduations of each line being separated from those of the next line by a common geometrical ratio. The various lines are identified by numbers shown in the margin at each end of the scales, these numbers enabling the operator to obtain exact readings to one decimal place beyond that given by an ordinary slide-rule of the same length, and one great advantage is that by the calibration adopted results are directly obtainable for a range between 0.1 and 10,000*l.* At first sight the instrument seems to be a little complicated, but anyone of average intelligence will soon learn to use it with facility and confidence. In our opinion this invention embodies a most useful extension of the slide-rule principle, which thoroughly deserves the examination of architects, surveyors, and others who have to perform laborious calculations in daily practice.

MERSEY DOCKS AND HARBOUR BOARD.—The Select Committee of the House of Lords, of which Lord Dartrey is Chairman, have ordered to be reported to the House for third reading a Bill promoted by the Board for the construction of two new docks and a half-tide basin at the north end of Liverpool, the embankment and enclosure of a part of the adjoining foreshore, and the building of another dock at Birkenhead. The outlay upon the works is computed at about 4,500,000*l.*

BRIDGEWATER CANAL BILL.—The Select Committee of the House of Lords, of which the Duke of Bedford is Chairman, have passed the preamble of a Bill introduced by the Manchester Ship Canal Company for enabling the working of minerals underneath the Bridgewater Canal, about six miles between Monton Bridge and Leigh the canal passes through a rich portion of the Lancashire coalfields. The Bill is promoted at the initiative and charges of the Earl of Ellesmere, who has undertaken to indemnify the company against any loss that may result from subsidence of the soil caused by the mining of the coal.

LIVERPOOL UNIVERSITY.—The Council of the University have elected Mr. Robert Carr Bosanquet to the newly-established chair of classical archaeology. Mr. Bosanquet, Craven student, Cambridge, 1894-6, has, during six years past, been director of the British Museum at Athens. As a condition of his appointment he will take leave of absence for at least one term in the year, that he may thereby be enabled to conduct practical research work and so to keep in touch with current exploration.

THE LABOUR MARKET IN THE COLONIES.—The April circular of the Emigrants' Reform Office (31, Broadway, Westminster, S.W.) states that the emigration season to Canada has commenced, and there is a good demand for general labourers and navvies for railway construction, and a fair demand for mechanics, especially those in the building trades. Emigrants to Canada should beware of strangers, and always apply to the Dominion Land or Immigration Agents. Two Acts affecting emigrants have

recently been passed by the Commonwealth of Australia. The first Act prohibits the landing in Australia of any person who fails to pass the dictation test; that is to say, when an officer dictates to him not less than fifty words in any third language, fails to write them out in that language in the presence of the officer. The second Act repeals the former law as to contract labour, and should be carefully attended to by immigrants. It enacts as follows:—

"A contract immigrant—i.e., an immigrant to Australia under a contract or agreement to perform manual labour in New Zealand or elsewhere otherwise prohibited by law, land in the Commonwealth if the contract is in writing, and is made by or on behalf of some person named in the contract, and resident in Australia, and its terms are approved by the Minister for External Affairs." Cheap assisted or nominated passages are now granted to suitable emigrants from New South Wales, Queensland, and Western Australia. The principal demand is for experienced farm labourers and female servants. There is no special demand for mechanics or miners, but competent men who land with a little money to keep them for a time can generally find work. Reduced passages to New Zealand at 10*l.* a head are granted to persons with a small capital, and navvies without capital who are able to work at railway construction, and to their wives and children, and to experienced farm labourers and domestic servants who will possess 5*l.* on landing. All these persons are required to be employed by all these persons. There is a good demand now for as early as possible to the High Commissioner for New Zealand, 13, Victoria-street, London, S.W. No one may enter Cape Colony unless he possesses 20*l.* on arrival, or has secured employment beforehand according to a prescribed form of agreement. There is no improvement in the building trade at Cape Colony, and building trade employees are specially warned not to go to the Cape at the present time in search of work. In Natal labour is plentiful in all trades, and mechanics in the building trade are warned against going there to seek employment. No one may enter the Transvaal without a permit. No permit is granted to any one unless he possesses 20*l.* on arrival, or has secured *bond fide* employment beforehand. Though the output of gold, coal, and diamonds has increased, and more white men are being employed, yet there are a great many persons out of employment in Johannesburg, Pretoria, and other towns, and no one should go there now on the chance of getting work. Business in the building trades has been very slow, and no building trade employees should go out now in search of work. The cost of living remains very high.

HARMS FIRE PREVENTION COMMITTEE.—The Czar has conferred the noble medal "For Zeal" with the ribbon of St. Stanislaus, upon Mr. James Sheppard, member of the Executive of the British Fire Prevention Committee, and Chairman of its International Fire Library. The King has granted permission to Mr. Sheppard to wear the medal. Mr. Sheppard was the Hon. Meeting Secretary at the International Fire Prevention Congress of 1903.

LONDON FIRE BRIGADE AND FIRES.—According to the annual report just issued of the Fire Brigade of the London County Council, the following fires in connexion with the building trade occurred in the Metropolitan area in 1905:—Buildings, 2 serious fires (September 13 and September 17), and 24 slight fires. Causes: Boiling over fat, 1; boiling over tar, 1; children playing with matches, 1; defective electric circuit, 1; fumigating, 1; light thrown down, 6; spirit lamps exploding, 1; spark from fire, 1; stove improperly set, 1; unknown, 10. Buildings (under repair and building): 1 serious fire (August 29), and 24 slight fires. Causes: Boiling over fat, 2; burning rubbish, 1; escape of gas, 2; candle, 1; hot ashes, 4; light thrown down, 8; lime slaked by rain, 3; lime slaking, 1; spark from watchman's fire, 1; watchman's fire, 1; mineral oil torch, 1; unknown, 7; foul fire adjoining, 1; spark from furnace, 1; vapour of spirit coming in contact with lamp, 1; house decorations, 3 fires. Causes: Children playing with fire, 1; escape of gas, 1; unknown, 1. Building material manufacturer, 1 serious fire (July 20), cause unknown. Timber merchants, 1 serious fire (October 25); 5 slight fires. Causes: Light thrown down, 1; spark from locomotive, 2; swinging gas bracket, 2; unknown, 2.

CRYSTAL PALACE ENGINEERING SCHOOL.—On Wednesday the 11th inst., at twelve noon, Sir Alexander Binnie, President of the Institute of Civil Engineers, will take the chair on the occasion of the one-hundredth distribution of certificates to the students of the Crystal Palace Company's School of Practical Engineering.

WEST RIDING EDUCATION COMMITTEE'S BUILDING CONTRACTS.—At a meeting of the Education Committee of the West Riding County Council, held on the 27th ult., at Wakefield, considerable discussion arose on the acceptance of tenders for the erection of some new elementary schools. According to a statement made by Mr. H. Smith, certain contractors had been allowed to amend their tenders after they had been sent in. Here,

he felt, there was opportunity for abuse, and he moved that the tenders should be sent back to the Committee. Mr. J. H. Watson said the Committee were satisfied that the tenders were already made, and that in future contractors who did so must pay the penalty of having their names struck out altogether. Mr. J. P. Hinchcliffe, chairman of the Committee, agreed that the mistakes made were bona fide but felt that in future the authority ought to have a more stringent form of tender. The Chairman renewed that some of the work was already in hand. After further discussion the amendment was lost. The Elementary Sub-Committee recommended that the Accommodation and Attendance Sub-Committee should be empowered to accept "all tenders for repairs or the erection of any public elementary school, provided that they fall within the estimates." This gave rise to another debate. In the end the resolution was passed, with the proviso that the sub-Committee's powers should be subject to confirmation by the larger Committee.

DISTRICT SURVEYORS' RIGHT TO PRACTICE.—A District Surveyor draws our attention to a sentence in paragraph 10 of the 10 which implies that a District Surveyor has said that a district surveyor shall not carry on private practice within the area of his own district; which of course is not the case. The sentence was inadvertently worded; it should have run "shall not carry on practice in his own district except subject to supervision."

BUILDING MATERIAL.—Mr. John Roche asks the Chief Secretary of Ireland whether he will give instructions to those responsible for making out the specification for building the College of Science in Dublin that the superior quality of the Ballinacree limestone shall be taken into account. Mr. Keenan replies in the Parliamentary Papers that the architects of the Royal College of Science have lately been making a special study of Irish building materials, and have come to the conclusion that, subject to prices being satisfactory, large quantities of them can be used in the building. It would not, however, be possible at this stage to state what particular stone will be employed.

WELSH SLATE TRADE.—In Wednesday's Parliamentary papers Mr. David MacIver asked the President of the Board of Trade whether, having regard to the magnitude of the trade in slates, especially in Carnarvonshire, and to the depression in that trade at present existing owing to the importation of slates from abroad free from any contribution to the Imperial Revenue or local rates and taxes, he would be prepared favourably to consider a proposal that all foreign slates should pay an import duty, at all events equivalent to the Imperial and local rates which are incident to those produced in this country. Mr. Lloyd-George, in reply, states that the slackness in the slate trade appears to be rather attributable to the general depression in the building trade of the United Kingdom than to the import of slates into this country, which he found was less than in any of the past five years. The figures for the last five years were—1901, 273,000; 1902, 286,000; 1903, 467,000; 1904, 340,000; and 1905, 262,000. He was not prepared to recommend the imposition of an import duty on slates.

THE GRAND THEATRE, IPSWICH.—This property, which has been let on the market, comprises the theatre, leased for forty-two years from March, 1894, at a rent of 2,185, per annum, the scene-dock and store-room in Torrens-street, the "White Swan" public-house, and No. 44, High-street—yielding an aggregate income of 2,363, a year. The Grand Theatre, at one time the chief suburban play-house in London, has had a chequered existence. It was originally built on the site of the Philharmonic Music Hall (burned in September, 1882) by Mr. E. Toms, contractor, at a cost of about 15,000, after Mr. Frank Matcham's designs, in the early Renaissance manner; the fire-proof stairs, landings, and corridors were by Messrs. Charles Drake & Co., the interior decorations by Mr. J. M. Beekinder. After the fire on December 29, 1887, it was rebuilt by Messrs. G. H. & A. Bywaters, Mr. Matcham being the architect, and re-opened on December 1, 1888, with seating room for 2,500 persons. The house was again almost quite destroyed by fire on February 26, 1900, and rebuilt, with many improvements, by Mr. Matcham, who designed the hand-painted panels of the walls and ceiling. In October, 1902, the theatre (as a going concern), with all fixtures and adjoining houses, was let for an unexpired term of thirty-four years, at a yearly rent of 2,300, and five leasehold redemption policies for 27,960, were sold at the Mart for 10,000.

CHURCH OF ST. PETER, ST. PANCRAS.—An appeal is made for help in raising a fund of 4,000, which is needed for the repair of St. Peter's, in the square, the parish is of the Church was built in 1822-6 amongst the brick-fields, and before the laying out of the square, from designs after the Ionic order of H. & H. W. Inwood, and in many respects closely resembles the (new) parish church, by the same architects.

The principal front has a hexastyle portico, having double perpendicular shafts instead of fluted in the columns, and a pediment raised upon a stepped platform. The east front has a projecting centre between two wings which contain the vestries. The tower consists of two round stories, each in the form of a peripteral temple, with stylobate and entablature. The galleries are supported by nine reeded shafts or columns both within and six on the west. The details of the interior are highly enriched, and the columns both within and without present three examples of the order. The church cost nearly 17,000, and has room for 1,830 persons.

CEMENT TRADE OF THE UNITED STATES.—Official returns show that the imports of cement into the United States in 1901 was 377,956,944 barrels; in 1902, 798,195,089 barrels; in 1903, 927,180,235 barrels; in 1904, 418,561,431 barrels; and in 1905, 338,630,739. The number of barrels exported was 373,934, in 1901; 340,821, in 1902; 285,463, in 1903; 774,940, in 1904; and 1,026,502 in 1905. In regard to the growth of the Portland cement industry in the States, it appears that the number of works, which in 1890 was only 16, had increased to 50 in 1900, to 65 in 1902, to 78 in 1903, and to 83 in 1904, whilst the quantity produced rose from 335,500 barrels in 1890 to 8,482,020 in 1900, to 17,230,644 in 1902, to 22,342,973 in 1903, and to 26,505,881 barrels in 1904. Needless to say, whereas the British Commerce in New York, that the cement mills are mostly constructed on the most modern principles, Rotary kilns are the rule, and in many cases electrical power is used throughout the plants. In this, as in nearly all the industries of the United States, everything is done to reduce the cost of manufacture, especially in the way of employing machinery, in order to dispense with manual labour as much as possible.

BUILDING AND BUILDING MATERIALS IN POLAND.—Mr. Murray, British Consul-General at Warsaw, in his annual report on the trade of Poland and Lithuania, mentions that very little building was done in 1905, and the demand for materials was accordingly small, added to which very little credit was given for building purposes, and in many cases where it had been granted was withdrawn. An additional reason for the small amount of building carried out was the increase in the wages of masons to 25c. remaining over from 1904, bricks were cheap, the price being 11. 5s. to 11. 7s. per 1,000. There are about fifty brickworks in the environs of Warsaw, with a production of about 4,000,000 bricks, and their owners had a bad year in 1905, not only on account of the small demand, but also owing to the compulsory raising of the wages of the workers, which increased the cost of making bricks by 5s. per 1,000. Fire-bricks continue to be imported from the United Kingdom for use in factories and bakeries. For the past three years cement works in Poland have been doing badly on account of over-production. The attempt made in 1904 to form a new syndicate of manufacturers to replace that which was formed at the end of 1903 was renewed in 1905, but was unsuccessful, it being again found impossible to come to an agreement. Prices during the past year were practically the same as those ruling in 1904, that is to say, 1s. 80c. to 2s. 10c. (3s. 9d. to 4s. 41d.) per barrel of 360 lbs. at the works, and 2s. 60c. to 2s. 80c. (5s. 5d. to 10s. 10d.) at the town of Warsaw. Of the nine cement works now existing in Poland one only were unable to work during the past year owing to want of capital. The remainder contrived to carry on for nine months out of the twelve, and were less adversely affected by strikes than were factories in general, as the hands went on strike at a time when the demand for cement was small. Although the Government, on account of the disturbed state of the country, and also, it is said, from motives of economy, diminished its orders to a considerable extent, the consumption of cement by private firms increased, and, owing to the low price, they were enabled for certain purposes to use cement in place of granite. As was the case in 1904, no cement works in Poland paid any dividend at all, and there were no transactions in their shares, which have no market value.

Legal.

ACTION AGAINST THE LONDON COUNTY COUNCIL.

In the King's Bench Division on the 4th inst. the hearing was concluded of the case of Platten v. the London County Council, an action by the plaintiff claiming damages from the defendants including 925l. the cost of rebuilding premises, and 700l. for loss of trade and goodwill. Mr. Footc, K.C., and Mr. Lewis Thomas appeared for the plaintiff, and Mr. Dickens, K.C., and Mr. F. P. Daldy for the defendants.

It appeared that the plaintiff was the lessee and occupier of No. 175, Mare-street, Hackney, where he carried on the business of a provision dealer. Defendants are the owners of land and

premises adjacent to the plaintiff's premises. Plaintiff's case was that in November, 1904, defendants wrongfully removed the adjoining buildings and wrongfully and carelessly left the walls, and made excavations in a negligent manner and without proper support. In consequence of this the plaintiff's premises were deprived of support and were badly shaken and rendered unsafe and dangerous, and a portion of the parapet was torn down. As a result of the defendants' work the defendants served him with a dangerous structure notice, requiring him to do certain things for the safety of the building. For these acts the plaintiff claimed damages.

Defendants, by their defence said they acquired the premises in question for the purpose of street improvements, and whilst they were taking down the premises they suddenly collapsed. Defendants denied that they wrongfully or carelessly removed the walls or made the excavations alleged. Defendants said that, with the exception of the parapet, no portion of the plaintiff's house was supported by the defendants' buildings. Defendants further said that plaintiff's building was in no way affected by the collapse of their buildings. They denied all the plaintiff's allegations, and in the alternative paid into court the sum of 51l. as being sufficient to satisfy plaintiff's claim.

The case resulted in a verdict for the plaintiff for 1,390l. and judgment was entered accordingly.

NORWICH ANCIENT LIGHT CASE.

MR. JUSTICE FARWELL, in the Chancery Division on the 3rd inst., concluded the hearing of the case of Hyde and others v. the London and Provincial Bank.

This was an action by the plaintiffs against the defendants for an injunction to restrain the defendants, their servants, agents, and workmen, from erecting or keeping erected upon the site in London-street, Norwich, any building so as to darken or obstruct any of the ancient lights of the plaintiffs' premises in London-street, on the opposite side of the way, in such a manner as to cause a nuisance or illegal obstruction to the ancient lights of the plaintiffs' premises, as the same were enjoyed prior to the demolition of the buildings occupying the site in question.

Mr. Jenkins, K.C., and Mr. Nisbett appeared for the plaintiffs, and Mr. W. H. Upjohn, K.C., and Mr. Wood for the defendants.

Mr. Jenkins, in opening the case, said this was an action with regard to the obstruction of ancient lights to the property of the plaintiffs, who occupied premises on one side of London-street, against the defendants, who acquired some old premises on the opposite side of the road. Those old premises they had demolished, and had proceeded to erect a new building on the site of the old building, and were carrying it to such a height as would darken or obstruct the light coming to the plaintiffs' premises. The first thing he would have to do was to prove that these were ancient lights, and next he would have to establish that the defendants' building would interfere with those lights.

Mr. Robert Bray, a builder and resident in Norwich since 1862, said he knew the plaintiffs' premises, and remembered them being occupied by a Mr. Dixon. It was an old house, and witness was engaged to put an addition to it. In 1886 Mr. Dixon employed witness to do some work on the ground floor of the house. Witness gave evidence in support of the plaintiffs' contention that the lights were ancient.

In the result it was stated that the case had been settled, the defendants agreeing to limit the height of their building in accordance with an agreement arrived at with the plaintiffs.

ACTION AGAINST AN URBAN DISTRICT COUNCIL.

The hearing was concluded on the 3rd inst. in the Court of Appeal, before Lords Justices Vaughan Williams, Stirling, and Morlon, of the case of Foster v. the Warlington Urban District Council, on the defendants' appeal from a judgment of Mr. Justice Walton in the King's Bench Division.

In this case the plaintiff, Mr. J. D. Foster, the owner of an oyster business at Emsworth, near Chichester, sought an injunction to restrain the defendants from placing or maintaining their sewer outfalls in the neighbourhood of his oyster storage beds on the foreshore of Emsworth Creek, and from delivering sewage on to the same, and to contaminate the same, and to render the oysters therein liable to become infected and unsafe for human food, and to cause a nuisance to the plaintiff. The plaintiff also claimed damages for loss and injury to his business caused by the alleged nuisance. The defence was that the plaintiff was himself a member of the defendant Council and drained crude sewage into the tidal waters at Emsworth Creek, and that as a member of the Council the plaintiff was a party to the resolutions of the said Council in connexion with all matters relating to the sewage of the defendants' district. Defendants further denied the title of the plaintiff to the said storage beds.

Mr. Justice Walton came to the conclusion that the plaintiff had a good title to the soil of the beds, and that his right had been in fact disturbed by the deposit of sewage matter by the defendants. His lordship refused to grant an injunction, but gave judgment for the plaintiff for damages, the amount of which was by consent reserved for further consideration. Hence the present appeal.

Lord Justice Vaughan Williams, in the course of a long and elaborate judgment, said there could be no doubt that the plaintiff's oyster beds had been polluted by the sewage, and that was admitted. Some of the oysters were in 1902 supplied for a banquet at Winchester, with the most lamentable result. In his judgment there had been such an occupation of the beds for such a length of time as to entitle the plaintiff as against the defendants, who had no interest in the foreshore, to sustain his action for the injury done by the sewage to the oysters kept in the beds. He thought there was ample evidence that the injury done was caused by acts done by the defendants. In these circumstances he was of opinion the judgment of Mr. Justice Walton was right.

Lords Justice Stirling and Moulton concurred, and the appeal was accordingly dismissed with costs.

Patents of the Week.

APPLICATIONS PUBLISHED.*

5,681 of 1905.—L. BROUSSAS: *Trussed Bricks, Tiles, Slabs, or the like, and Constructions formed Thereof.*

This invention relates to a system of trussed brick constructions. In a form of construction for erecting ceilings and floors lower bricks are used of dove-tail shape, and provided with a groove for the insertion of the base rod or iron. The tie iron is hooked to said rods, and their other ends are either simply bent or are connected to another rod in the upper brick. Between the beams or joists so formed are arranged a certain number of other bricks, slabs, or tiles, forming the ceiling and floor respectively.

7,120 of 1905.—W. BRUGOS: *Flushing Cisterns for Water-Closets, and the like.*

This relates to an apparatus for starting the syphonic flush of cisterns used in connexion with water-closets, and the like. According to the invention there is employed within the cistern a quadrant-shaped vessel or chamber, which is open to the cistern along its base and is connected to the inlet end of the syphon. Within this vessel or chamber is fitted a pivoted flap, which is adapted to be operated by a suitable lever or levers arranged in connexion with an ordinary chain pull. The vessel or chamber is provided with a small internal projection or stop to limit the downward movement of the pivoted flap.

7,681 of 1905.—H. G. WAREL: *Surface Apparatus for Use in Heating or Cooling.*

This relates to a surface apparatus for use in heating or cooling, and consists in the combination of elements each composed of two stamped recessed metal plates, each perforated with two holes and joined everywhere at the edges with a specially-constructed frame between them acting as a stay, together with two tubes screwed only at the ends, distance tubes between the elements, and nuts and jointing washers, all metal being wrought.

8,324 of 1905.—S. SKINNER: *Mortising Machine.*

This relates to mortising machine, and consists in reciprocating the tool-holder by means of a rack fixed thereon, and a toothed quadrant gearing with the rack, and adapted to be turned out of the path of the rack teeth during the adjustment of the tool holder. The invention further consists of a pinion and crank for adjusting the rack, normally held away from the rack, but released by the quadrant before it leaves the rack, and an adjustable stop for limiting the movement of the rack and tool holder in one direction.

8,339 of 1905.—C. BARTER: *Apparatus for the Heating of Water and other Fluids.*

This relates to appliances for heating water and other fluids, the combination comprising a hollow body part formed with apertures at its upper extremity, through which the liquid can flow into the interior, a steam nozzle secured at the lower extremity of the said body part, and a perforated tube arranged in alignment with the said nozzle and adapted to deliver the heated liquid in a jet or spray.

10,290 of 1905.—V. PERRETT and L. PERRETT: *Presses used for Pressing Sand-Faced Bricks.*

This relates to a press for pressing sand-faced bricks, and consists in the method of adjusting the effective weight of the wheel upon the vertical screw shaft so that it commences to revolve

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

by its own weight at the top of the stroke, thus turning the screw shaft and increasing its speed until at the bottom of its stroke by its momentum, which presses the disc down upon the half-finished brick below, by means of levers to which adjustable weights can be applied and connected with the holder which carries the movable die so as to balance its weight more or less as desired.

12,831 of 1905.—H. J. DURNFORD: *Fasteners for Window Sashes, Doors, and the like.*

This relates to fasteners for window sashes, doors, and the like, having a pivoted arm which engages with a catch on a separate catch plate. The inner end of the arm has a small sleeve with a projecting pin or pins which engage with holes in a plate connected to the back plate of the fastener. A small pressure spring placed above the sleeve presses down the sleeve and locks the pins automatically when the arm is brought to the fastened or shut position. To unfasten the arm it is necessary to lift the sleeve and thus disengage the pins, when the arm can be turned back. The sleeve may carry a small knob, hook, or button for this purpose.

15,832 of 1905.—R. V. HUMPHREYS: *Device for Ventilating Greenhouses, Conservatories, Sheds, Outhouses, and the like.*

This relates to a device for ventilating greenhouses, conservatories, sheds, outhouses, and the like, comprising upright longitudinal members provided with projecting pieces, and distance or strengthening pieces, a hood formed with a central part and side inclined portions, arms pivoted to the said hood and the members, an additional covering piece formed with a projecting part designed to engage a groove or recess in the said hood, with means for raising and lowering the said hood.

20,296 of 1905.—P. BAUR: *Machinery for Preparing or Treating Loom, Clay, and the like.*

This relates to a machine for treating or preparing loam, or clay, or like material, and consists of a rotary perforated cylinder or cylinders, one or both ends of which is or are open, and means whereby the material is pressed into the interior thereof, and is discharged from said interior through the said open end or ends.

21,191 of 1905.—F. SCHUI: *A Combined Water-Closet Basin and Flushing Apparatus.*

This relates to a self-acting water-closet, the feature of which is that the closet seat is so connected with the valve for admitting the pressure water that when the said seat is pressed down it opens the said valve, whereby the flushing chamber is filled with flushing water and the air locked in the chamber is compressed, and when the seat is released it closes the valve so as to shut off the pressure water and opens the passage for flushing water, so that the latter is forced by the compressed air in the chamber out of the latter into the closet basin.

26,663 of 1905.—G. E. HAMMOND and J. W. P. TURNER: *Door Chains.*

This relates to door chains, and consists of a staple, ring, or bar, attached to a plate obliquely or the plate slotted obliquely to carry the door chain, so that the chain must fall by its own weight obliquely to the further side of the staple, ring bar, or slot, hanging quite clear of and away from the door. The object of this oblique staple, ring or bar, is to prevent the usual damage now caused to doors and door frames by the chains at present in use hanging too close to the door posts.

16,840 of 1905.—H. EARLE: *Colour Washes for Brickwork and Other Surfaces.*

This relates to the manufacture and use of colour washes for brickwork and other surfaces produced by compounding together, by mixing and grinding to a very fine condition, equal or substantially equal, quantities by weight of plaster, ground flints, and a sufficiency of concentrated size, with the addition of a quantity also by weight of such mineral colouring matter or matters as are adapted to give to the wash which results from the admixture of the dry powder produced with water the desired colour or shade of colour.

18,241 of 1905.—T. W. ADSHEAD: *Fenders or Curbs for Fireplaces.*

This relates to a curb or fender for fireplaces, provided with end dogs and corner cover caps, and consists in casting in one piece or making integral with the corner cover cap the side or cheek of the dog, or both the side or cheek and its support or leg.

2,704 of 1906.—C. F. HALL: *Manufacture of Faced or Enamelled Bricks, Slabs, Tiles, and the like.*

This relates to the manufacture of a brick, slab, tile, or the like, having an enamelled metal plate or plates attached to its surface, and consists in introducing the said plate, which is roughened or scored on the back or provided with keys or flanges, face downwards into the mould before the introduction of the material

of which the brick is composed, so that during the compressing operation the said plate becomes firmly attached to the material.

3,337 of 1906.—P. J. ROBERTS and H. G. ATKINSON: *Building Blocks for Constructing Fire-proof Partitions, Walls, and the like.*

The object of this invention is to construct building blocks with connecting edges, which break up the usually straight lines of connexion into lines of undulating character, thus effecting preventing the formation of long straight breaks or cracks in the finished wall, whilst at the same time the slabs interlock with each other to a certain extent, and thus are caused to support each other and relieve the central portion of the floor from bearing the entire weight of the central portion of the structure. To accomplish this the connecting edges of the slabs are formed with regular undulations composed of repetitions of a complete curve, each slab having each of its edges formed in one or more complete curve or curves. A slab might thus be square, having each of its edges shaped to the pre-determined complete curve; and the sides and the ends would contain either single curves or multiples of the same, but would not contain any incomplete portion.

4,743 of 1905.—S. PRIEST: *Wall-Tie or Means for Holding Together the Two Divisions of Cavity Brick Walls.*

This relates to ties for hollow walls, and consists in the combination with the longitudinal wires, of wires twisted respectively around said longitudinal wires for a certain distance, which are carried across the intervening space between said longitudinal wires, so that they cross one another at an angle about midway between said longitudinal wires, when each is twisted around the opposite longitudinal wire, the operation being repeated as often as necessary to make a tie of a pre-determined length.

7,118 of 1905.—P. F. DESWARTE: *Means for Facing Bricks, Batters, Dykes, and the like.*

This relates to a construction composed of bricks, or slabs of cement, or other appropriate material for facing banks, batters, dykes, and the like, and is characterised by the fact that the adjacent edges of the bricks constituting a semi-circular joint are shaped in such a manner as to leave between these edges when the banks have been assembled a certain angular space permitting the banks to turn around their joint.

8,821 of 1905.—T. A. WILLIAMS: *Construction of Floors in Buildings.*

This relates to the construction of floors in buildings, and consists of levers formed with horizontally-grooved or slotted ends, and projecting soles, and having their end portions shaped to enable them to be threaded diagonally with either right-handed or left-handed inclination between the pair of suitable girders and then turned transversely thereto, so as to abut against the girders and contiguous rows of bricks.

25,072 of 1905.—P. LASSABLIÈRE: *Process and Apparatus for the Disinfection of Premises, Articles, and such like.*

This relates to a process for producing and utilising formic aldehyde for disinfection, and consists in causing formic aldehyde to become disengaged in a pressure chamber where the pressure is maintained between limits determined by means of a valve adapted to permit the gas outlet to be closed until the pressure rises to a pre-determined maximum, and a retaining valve adapted to automatically close the gas outlet when the pressure falls below a pre-determined minimum, with the object of avoiding the polymerisation of the formic aldehyde, which becomes produced when the pressure falls below a determined amount.

26,809 of 1905.—A. C. DAVES: *Appliance for Use in Cleaning Floors, and the like.*

This relates to an appliance for use in cleaning floors and the like, which comprises a scrubbing brush and a flannel or floor cloth mounting the brush in a suitable holder, so that by rotating it on its pivots from its operative to its imoperative position it moves the flannel or floor cloth into its operative position and maintains it in its position distended over the back of the scrubbing brush.

26,298 of 1904.—J. R. TEMPERLEY, J. TEMPERLEY, and W. ALEXANDER: *Transporting Appliances, and the like.*

This relates to a transporter having a single rope or chain hoisting gear, in which a hoisting drum is driven indirectly from a motor through epicyclic gearing and a traversing drum arranged to positively traverse the carriage in both directions is independently driven, but is connected to said epicyclic gearing, the arrangement being such that while the operation for imparting vertical movement is in progress, the operation of traversing may be commenced and simultaneously carried on quite independently, i.e., for effecting the operation for imparting vertical movement, and vice versa.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xviii.; Auction Sales, xxx. Certain conditions, beyond those given in the following information, are imposed in some cases, such as; the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

Competition.

* **NO DATE.—BELFAST.—EXHIBITION OF HOUSES, NOVEMBER.**—The Belfast Garden Estates Company offer 700l. in prizes for the best designed and most economically built houses. The awards will be made by the assessor, Mr. Maurice B. Adams, F.R.I.B.A. Full particulars at office on the estate, Cliftonville-circus; or from the agents, Messrs. R. J. McConnell & Co., 37, Royal-avenue, Belfast.

Contracts.

BUILDING.

APRIL 9.—HAYFIELD WOODHOUSE.—SCHOOL.—Alterations and interior fitting and painting, at the Woodhouse Provisional School, for the West Riding C.C. (Education Department). Specifications for the several works may be obtained on application. Tenders to Mr. Hy. Lindley, divisional clerk, Education office, Leeds, by April 9.

APRIL 9.—HECKMONDWICK.—LIBRARY.—Public library, for Heckmondwike U.D.C. Specifications, etc., Henry Stead, architect, Heckmondwike. Sealed tenders to Mr. Arthur Macaulay, Clerk to the Council, Heckmondwike, before 12 o'clock noon, April 9.

APRIL 9.—LEADS.—URINALS.—A three of urinals in Parliament-street and additional entrance to urinal at Victoria Cattle Market, for the Sanitary Committee. Particulars at the City Engineer's office, Municipal-buildings, Leeds. Tenders at the Town Clerk's office not later than 10 a.m. on April 9.

APRIL 9.—LOCHORE.—HOUSES.—A block of twelve workmen's houses, at Lochore, for the Fife Coal Company, Ltd. Plans, etc., from Mr. John Houston, architect, Dunfermline. Offers to be lodged with the Fife Coal Company, Ltd., Leven, on or before April 9, by 10 a.m.

APRIL 9.—LYNN.—GALLERY AND PUBS.—New gallery and public printing and painting, at the London-road Wesleyan chapel. Plans, etc., at office of Messrs. Jarvis & Son, architects, Paradise-parade, Lynn. Tenders by the 9th inst.

APRIL 9.—UPPER TILNICHILL, ABERDEEN.—HOUSE.—A new dwelling-house at Upper Tillichill Farm, Plans, etc., with the tenant, Mr. George McAlhau, or with Messrs. Walker & Duncan, architects, 3, Golden-square, Aberdeen, whom they receive tenders up to April 9.

APRIL 10.—ARMLEY.—SHEDS.—Sheds, boiler-house, and 100-ft. chimney to works in Charnwood-road, Armley, Plans, etc., from Messrs. Beckwith & Webster, 2, Basinchill-square, Leeds. Tenders by April 10.

APRIL 10.—BRAMPTON.—HOUSES.—A pair of houses at Brampton. Plans and specifications at Messrs. Dickinson's, Constable-st., Brampton. Estimates to be forwarded to the Rev. J. Rutherford, Rose Cottage, Brampton, on or before April 10.

APRIL 10.—PENTONVILLE MILITARY HALL.—A mission hall at Haxhollow, Pentonville, for Calvary Baptist Church. Tenders to Mr. Arthur Lloyd Thomas, A.M.I.E.C.E., architect and engineer, Church-street-chambers, Pontypool, by April 10.

APRIL 10.—WALKER.—COOKERY CENTRE.—The Corporation invite tenders for erection of a building in connexion with the cookery centre of the Education Department of the Borough of Walsend, at the Richardson Dress School. Plans, etc., on application to the Borough Surveyor, Mr. George Hollings, Corporation Offices, High-street, Walsend. Tenders, marked "Tenders for Cookery Centre," on or before April 10, to Mr. W. V. Mulester, Town Clerk of Walsend, 26, Sandhill, Newcastle-upon-Tyne.

APRIL 12.—ABERTHAW.—SCHOOL.—Glamorgan C.C. invite tenders for temporary iron school building at Abertidwr, near Capelrhilly, in the county of Glamorgan. Plans, etc., from Mr. T. Mansel Franklin, Clerk of the Glamorgan C.C., Glamorgan County Offices, Westgate-square, Cardiff. Tenders, sealed outside "Tender for Abertidwr Iron Building," will be opened by the Education Committee on the 12th inst., and should reach the Clerk on the previous day. The tenders are in a separate specification, and will be comprised in a separate contract.

APRIL 12.—KENDAL.—ALTERATIONS.—Alterations and additions to Kendal Infirmary, for Mr. J. Curwen, architect and sanitary engineer, 26, High-zate, Kendal, up to April 12, upon which date tenders must be sent to architect before noon.

APRIL 12.—LICHFIELD.—HOUSES.—Pulling down of old cottages and erecting two dwelling-houses and domestic offices in Stone-street for the Trustees of Milley's Hospital, Lichfield. Plans, etc., at Mr. William Perry, 39-41, Bore-street, Lichfield. Tenders, endorsed "Stone-street," received by Mr. Hubert H. Brown, steward, Bird-street, Lichfield, not later than noon, on April 12.

APRIL 12.—NEWQUAY.—SCHOOL.—Alterations and improvements to Newquay Council School, for Cornwall Education Committee. Forms from the architect, Mr. B. C. Andrew, Education Office, St. Austell, endorsed "School," to be sent to Mr. F. R. Pascoe, Secretary, Education Office, Truro, on or before Thursday, April 12.

APRIL 12.—STREYTON.—COTTAGES.—A pair of cottages at Streyton, for Mr. George Lambert, M.P. Plans and specifications at office of Mr. Herbert Reed, architect, 12, Castle-street, Ketter. Tenders to be delivered on or before April 12.

APRIL 13.—KIRKBY-FURNESS.—BANK.—New bank premises at Kirkby, for the Lancaster Banking Company. Plan, etc., on application to Mr. Jas. Waver, care of Messrs. Settle & Brundill, Ulverston. Sealed tenders, endorsed "Bank," to be sent to Mr. Waver by 12 noon on April 13.

APRIL 14.—COPPEMANN.—COTTAGES.—Two cottages at Coppehmann, Pontypool, for the Wesleyan Trillion Mission. Plans, etc., at office of Messrs. A. O. Evans, Williams & Evans, architects, Pontypool, to whom tenders are to be sent on or before the 14th inst.

APRIL 14.—HALIFAX.—ALTERING SHOP.—Altering and remodelling shop in Northgate (late occupied by Horner's). Plans, etc., from Messrs. Jackson & Fox, architects, 7, Lawson-street, Halifax. Tenders by 12 noon, April 14.

APRIL 14.—NEWHAVEN.—SHEDS.—Leith Harbour and Docks Commissioners invite tenders for the erection of small sheds for stores at Newhaven Harbour. Drawings, etc., may be obtained on application at the office of the Superintendent, Mr. Peter Whyte, M.Inst.C.E., Tower-pier, Leith. Tenders to be lodged with Mr. A. Nord Paton, W.S., Clerk to the Commission, 31, Melville-street, Edinburgh, on or before April 14.

APRIL 14.—NORMANTON WOODHOUSE.—SCHOOL.—Parties desirous of tendering for all or any of the following trades should send in their names to the undersigned on or before the 14th inst.: New school at Normanton Woodhouse, and alterations to existing Norman Woodhouse Provisional School (builder, joiner, slater, plasterer, ironfounder and plumber, painter). A deposit of 1l. is required. Mr. J. Vickers-Edwards, County Architect, County Hall, Wakefield.

APRIL 15.—QUEENSTOWN.—HOUSES.—Six houses at Queenstown, for the Queenstown Naval Dwellings Company. Tenders to be sent to Messrs. W. H. Hill & Son, architects, 28, South-wall, Cork, by April 15. Detailed quantities may be obtained from the architects on payment of 1l.

APRIL 16.—AVIMORE.—MANSE.—For the mason, joiner, slater, plasterer, plumber, and painter work of the Refectory and Avimore United Free Manses. The plans may be seen at Mr. Fraser's, Inverurie, Avimore. Sealed offers to be sent to Mr. J. D. Macleod, architect, 108, George-street, Edinburgh, not later than April 16.

APRIL 17.—HERNE BAY.—POLICE STATION.—For the enlargement of the county police station at Herne Bay, ordered by the Board of Joint Committees. Plans, etc., on deposit of 2l., at the office of the County Architect, 8, Weck-street, Maidstone. Sealed tenders, endorsed "Herne Bay Police Station," are to be delivered to Mr. Charles Turner, Clerk, Sessions House, Maidstone, at the Sessions House, Maidstone, not later than 5 p.m. on April 17.

APRIL 17.—ULVERSTON.—HOUSES.—The Swarthmoor and Ulverston Co-operative Society invite tenders (whole or separate trades) for the erection of five houses in Clarence-street, Ulverston. Drawings, etc., at the office of the architects, Messrs. Settle & Brundill, 30, King-street, Ulverston. To be enclosed in a sealed envelope, endorsed "Tender for Five Houses, Clarence-street, Ulverston," and to be delivered to the architects' office by noon on April 17.

APRIL 18.—ABERAVAY.—HALL, INSTITUTE, AND LIBRARY.—Public hall, institute, and free library at Aberavay, Abercrombie, for the Committee. Plans, etc., at office of Mr. E. Roderick, architect, Clifton-street, Abercrombie. Sealed and endorsed tenders to be sent to Mr. W. V. Price, Bryn offa, Hill-street, Aberavay, not later than April 18.

APRIL 18.—NEWHAVEN.—CIVIC OFFICES, etc.—The U.D.C. of Newhaven invite tenders for the works required in the erection of new Council offices and fire station in Fort-road, Newhaven. Specification, etc., may be seen at the office of Mr. F. J. Rayner, architect, 34, Meeching-road, Newhaven, from whom copies of the bill of quantities and forms of tender may be obtained on deposit of a postal order value one guinea.  Clayton Bros. 12,680
 R. Hayes 12,585
 W. Thorpe 12,437
 A. Hodgkinson 12,420
 Burgess & Galt 12,144
 R. Carlyle, Manchester* 11,915

PONTYPRIDD.—For erecting a house and shop, Tramroad-side, for Mr. F. O. Reed, Pontypridd. Mr. J. Perry Williams, architect and surveyor, Taff-chambers, Pontypridd. Quantities by architect:—
 J. L. Williams £653 4 8
 D. Davley 630 0 0
 Evans Bros. 427 0 0
 E. Jones £569 7 0
 W. Roger & Son, Cardiff* 535 0 0

SHILDON.—For the erection of a cartmaker's house, for Shildon Working Men's Club, Mr. J. W. Hodgson, architect, 65, Main-street, Shildon, E.S.O.:—
 Douglas & Angus £283 10 0
 S. Gladwin 272 10 0
 W. Coates 270 0 0
 A. White 265 0 0
 A. Metcalfe £259 8 0
 J. F. Adamson, Shildon 259 8 0
 B. Muggidge 234 8 10

SKEGNESS.—For laying sewers in Franklin-avenue, Ocean-avenue, Derwent-cave, and Tanton-road, for the Urban District Council. Mr. R. Hinson, Surveyor, Skegness. Quantities by Surveyor:—
 C. Seymour £470 18 9
 D. Roberts 413 5 0
 W. H. Hill 402 10 11
 J. Wright 331 14 9
 G. E. A. H. Holmes, Skegness* £270 9 3

SOLLHULL.—For erecting a new laundry block at the workhouse, for the Guardians. Mr. W. H. Ward, architect, Paradise-street, Birmingham:—
 W. Hopkins, Thorpe-street, Birmingham £1,659

WALTHAMSTOW.—For reinstatement of factory after fire, for the British Nylomite Co., Ltd. Messrs. Scarie & Hayes, architects:—
 Brown & Son £1,370
 W. Johnson & Co. 1,128
 G. Dobson & Son 1,197
 W. Shurrur & Sons, Ltd. £1,443
 G. Wagaft & Son 1,092
 A. G. Barton 1,064

WALTHAMSTOW.—For the erection of six dwelling-houses, Chingford-road, for Mr. T. Welham. Mr. J. W. Dunford, architect, 100c, Queen Victoria-street, E.C.:—
 Fuller & Son £2,148
 Wilson 1,960
 Wells & Son 1,862
 Sands & Burley 1,860
 F. J. Smith & Son £1,575
 W. H. Barker, Walthamstow* 1,530

The Church of Shere.

N the midst of the beautiful and well-wooded Surrey village of Shere, about halfway between Guildford and Dorking, stands the old parish church of

St. James, so dear to artists. The building, apart from its general attractiveness and picturesque surroundings, possesses distinctly interesting and somewhat unusual architectural features, and has emerged comparatively seatless from a recent restoration.

There was a church here at the time of the Domesday Survey, when Shere was in the hands of the King, and the advowson subsequently passed to the successive lords of the manor. In 1243, Roger de Clare, lord of Shere, sold to the abbot and convent of the Cistercian house of Netley, Hants, for 300 marks, the tilled land and pasture which lay between their manor of Gomshall and the highway from Guildford to Dorking, together with the advowson of the church of Shere. Pope Innocent IV., in the following year, sanctioned, under certain restrictions, the appropriation of the church of Shere to the abbey; and at the time of the taxation of 1291 this church was a vicarage, the appropriated rectory being worth the large annual sum of 23*l.* 6*s.* 8*d.* Gomshall Grange, in this parish, was at that time worth 10*l.* a year, a sum considerably in excess of the other granges

of the monks of Netley. They also held 100 acres in Shere manor, and many liberties and privileges, both at Shere and Gomshall (*Vic. County Hist. of Hants, ii.*, 146-7). By the time, however, when the extant episcopal registers of Winchester diocese begin, at the opening of the XIVth century, Shere was a rectory in lay patronage; but how the change was brought about has not been ascertained. Towards the close of the XIVth century the abbey of Netley recovered the patronage, but not the appropriated tithes, and Shere rectory remained in the gift of the abbot and convent until the dissolution of the monasteries.

The church consists of chancel, nave, south aisle (with chapel extension to the east), central tower and spire, short north transept, and south and west porches. The following are the inner measurements:—Length of nave, 42 ft.; of crossing under the tower, 15 ft.; and of chancel, 33 ft.; yielding a total length (including the width of the two tower arches) of 98 ft. The width of the nave is 19 ft., and of the chancel, 20 ft. The length of the south aisle up to the archway into the old south transept is 46 ft., and from that point to the east end of the south chapel of the chancel, 42 ft.

The growth and development of this church can be traced without much difficulty. In all probability the church on this site in pre-Conquest days, in the midst of a well-wooded valley, was of timber: if of stone, it is possible that some of the core of it may be left in the north wall of the nave. This Saxon

church, whatever was its material, sufficed for the use of the inhabitants under the invading Normans until well on in the XIIth century, when a church of some size and importance was erected here in the later Norman style that prevailed in the days of Stephen. The church of this date consisted of nave, central tower, short transepts, and a short chancel, which probably terminated in an apse. Of this Norman church there are certain parts remaining which are quite obvious. In the first place there is the enriched and removed doorway under the south porch. But it is the tower which shows the importance of this church fabric in the later Norman days. Externally there is a double semi-circular window, with substantial and renewed mullion of masonry between the two lights, in the centre of the second stage of the north wall. On the south side of the tower the Norman string can be seen, which formed the weathering for the roof of the transept, and the upper part of a buttress of the same date is visible on that side at the eastern angle, which is absorbed in the XIVth century buttress that shows in the aisle below. The semi-circular Norman arch, worked in chalk, which opened from the tower basement into the south transept, now shows plainly on both sides in the interior of the church. The four archways of the crossing were substantially rebuilt in the XIVth century. The preservation of the outline of the Norman arch on this one side seems due to the fact that when this replacing of the old arches was in progress there were signs of a collapse on

the south side, and hence the Norman arch stones were not taken away, but the archway was partially filled up, and a smaller new arch, only 6 ft. in width, inserted. The west and east rebuilt archways under the tower measure 12 ft. in width, and that on the north side 9 ft. The new stair turret, in the south-west angle of the tower, has two small lights on the south face, which must have originally been external. The small pointed doorway in chalk stone to this stair turret is in the inner side of the south wall of the tower just clear of the jamb stones of the Norman archway. Some of the stones run through from the arch to the doorway, but the upper part of the doorway is clearly later than Norman times.

In the outer rubble walling of the east end of the chancel are various small squared stones, which are, beyond doubt, of Norman workmanship, and represent part of the reused material of the old Norman chancel. One of them, of larger dimensions, seems to show a part of the apse curve. In the south wall of the south chancel chapel, 13 ft. from the eastern buttress, is a shallow buttress with no set-offs, having a width of 2 ft., and only projecting $7\frac{1}{2}$ in. from the wall surface. Most of the actual masonry of this buttress, as well as its form of construction, point to a Norman date, and it can only be concluded that it was taken down and reused in much the same form when a chapel was added at the south side of the old chancel.

In the first half of the XIIIth century the church underwent considerable extension. Doubtless the prosperity of the immediate district grew when lands and privileges came to the monks of Netley. With prosperity would come an increase of population, and, as the monks at that time held the advowson as well as the appropriation of the church, it may with confidence be assumed that the Abbey of Netley was chiefly responsible for the enlargement of the fabric, and for its beautifying in the newer and eminently English style of architecture that then prevailed. The work was probably done about 1745. Of this Early English work the traces are abundant. The beautiful western doorway is an admirable example of the deep-cut mouldings of this date, and it has single detached jamb shafts. A section of the mouldings of this doorway is given in Parker's *Glossary of Gothic Architecture* (1846 edition, vol. II., p. 83), where he assigns to it the date *circa* 1230. The nave was relighted; a lancet window remains on the north side of the western porch, and another in the recess of the north wall of the nave. An aisle of some size was thrown out on the south side of the nave, from which it is separated by an arcade of three arches. This aisle was opened out at the east end into the enlarged south transept, which was extended eastward as far as the rebuilt Norman buttress already described, thus forming a new Lady Chapel, for here, as we know from wills, stood the altar of the Blessed Virgin. The archway out of this aisle into the chapel is of much beauty and of costly design. The jambs on each side are ornamented with four tall detached shafts of Purbeck marble, fitting into base moulds and capitals of the same material. Several of these

shafts, which are 6 ft. 2 in. high, are monoliths.

This aisle retains a lancet window at the west end, on the south side of a larger window of later insertion, and there is another of like dimensions in the south wall immediately to the east of the porch. The south wall of the extended chapel has a pair of larger lancets, but these have been altered and somewhat debased at a much later date.

During the extensive XIIIth century alterations, an upper stage was added to the low centre Norman tower. This stage, which contains the bells, is lighted on each side by three lancet lights, save that the centre one on the west side has been filled up to admit of a clock face. The tower is surmounted by an octagon wood and shingle broach spire, which was doubtless originally designed at the time of the general reconstruction of the church in the XIIIth century. Most of the main timbers are, we believe, of that date, and are natural limbs of oak.

There is no proof in any of the chancel windows of that part of the church being extended *circa* 1250, but the outer walling of the east end puts this matter beyond doubt. Careful examination shows that the eastern angular buttresses of the chancel are certainly later than the east wall, and are of advanced XIVth century date. This wall, as has already been mentioned, contains a fair amount of reused Norman material. It, therefore, clearly follows that the small Norman chancel was taken down and extended up to its present extent in the XIIIth century.

But much the most remarkable and exceptional of the Henry III. alterations remains to be noticed. The south doorway of the south aisle is a fine and enriched example of Norman moulding. Notwithstanding all the destructive tendencies of English mediæval church builders, as style succeeded to style, the Early English designers not infrequently removed with care a Norman nave doorway to the new outer wall when they were adding an aisle. A score of such cases will readily suggest themselves to the mind of anyone who has a large acquaintance with England's old parish churches. But in the case of Shere the builders when re-erecting the old south entrance to the Norman church in the new wall added a slender shaft to each jamb, and inserted amid the old Norman mouldings a section of Purbeck marble, later moulding in a line with the shaft capitals. The shaft bases are also identical with those of the arch across the south aisle. The effect is at once curious and rich. We know of no like instance.

There is one more important detail of this date, namely, the good example of an Early English font of Purbeck marble, which now stands at the west end of the nave. The top of the bowl is 2 ft. square; it is supported by a central shaft, with four small shafts at the angles. This font was considered sufficiently noteworthy to obtain special mention in Parker's *Glossary* (i., 170); it is illustrated in Manning and Bray's *Surrey* (1801), i., p. 525; and again in Hussey's *Churches of Kent, Sussex, and Surrey* (1852), p. 341.

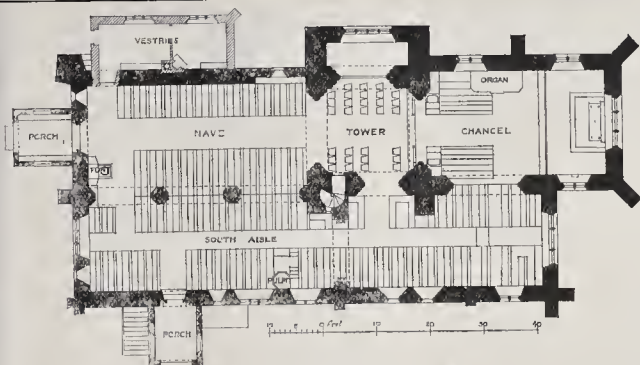

The next step in the fabric story of Shere church occurred in the XIVth

century, when the Norman arches that had been left under the tower probably began to give way owing to the additional weight of the raised tower and of the spire. At all events three of the archways were entirely rebuilt, whilst the fourth on the south side had to be strengthened by being partly built up and partly sustained by a smaller pointed arch. At the same time great buttresses were erected on the north side of the tower, the Norman transepts being removed, and a shallow transept formed on that side between the projecting buttresses, which have undergone frequent repair at later dates. The four-light XIVth century window of this transept is of a bold and unusual but not very attractive design.

The XIVth century alterations included the prolonging eastward of the south aisle, the insertion of an archway between this south chapel and the chancel, the buttressing of the chancel, and the insertion of windows in the chancel and chapel of that date. There are two two-light pointed windows on the north side of the chancel and one on the south. The three-light east windows of both chancel and chapel are of very nearly similar design and size. The centre of the upper tracery consists of a circle containing a group of four quatrefoils. On the whole the XIVth century work of this church may probably be assigned to the period when there was some revival after the paralysing shock of the Black Death of 1349, namely about 1360. The masonry of the chancel gable shows clearly the alteration of the pitch that was made in the walling of Henry III.'s time, when the big window of Edward III.'s date was inserted.

In the latter part of the XVth century certain alterations were made in the church, consisting mainly, as was usually the case, in new and enlarged windows. The walls of the nave seem to have been somewhat raised at this period, when a two-light square-headed window was inserted in the west gable over the porch. A three-light window, of a quasi-clear-story character, was also inserted over the lancet in the north wall of the nave at its eastern end. We know from early pictures what was the former nature of the window; some years ago it was foolishly restored after a quasi-Early-English fashion. Here there is an arched recess, into the back of which this lancet appears to have been rebuilt. This archway must have originally opened into a small chapel or tomb recess. About the same date alterations were made in the south aisle; a three-light window being inserted in the west end and another in the south wall beyond the porch. To the east of this last-named window is another two-light debased window, without tracery, and having a straight mullion running up the centre. This was probably a lancet light, clumsily enlarged in the churchwarden era to give more light to the "three-decker," which until recently stood in this place.

In the parish chest is preserved a valuable old churchwarden's account-book which goes back to the reign of Henry VII. Various interesting particulars were printed from it in Manning and Bray's *Surrey* as to "Church Ales" for providing funds, for church rates were unknown in pre-Reformation days. From

Plan of Shere Church. (The Vestries are Modern.)

this hook we find that the church itself was re-roofed with shingles about the year 1500.

There are some interesting entries in this account-book of the year 1547 relative to the rebuilding of the church porch, which was probably the one over the south entrance:—

"I'm payed for the carryng of tymbre to the Pytt and for ij. sawyers that dyd helpe lade yt for the new porche, iij*s*.

I'm payed to the sawyer for the sawyng of tymbre for the porche, iij*s*, viij*d*.

I'm payed for the sawyng of the porche at another tyne, iij*s*, iij*d*.

I'm payed for maylles for the selles of the kastors of the porche, iij*d*.

I'm payed for the maylles for to tacte on the bordes, iij*d*.

I'm for iij. lode of tymbre for the porche, xij*s*.

I'm for the carryng of the same tymbre to the church, x*d*.

I'm for expences in meatt and drynke when the old porche was taken downe and the setting of the new porche up, xij*d*.

I'm payed to John Frances for the working and framyng of the porche, xxx*s*.

I'm for iij. tytell bordes whyche was framyd in the porche, and for the tymbre of the box, iij*d*.

The last of these entries refers to the "poore mens boxe," which was made the same year at a cost of vs. x*d*.

The west door of the church is a fine piece of panelled joinery, well studded with nails. In the upper part is a shield of arms—two bendlets and a canton, impaling a bend, and the date 1626. It is interesting to note that the older villagers still speak of this as "the new door," though nearing three centuries in age. It has a good key-plate.

In Cracklow's *Lithographic Views of Surrey Churches*, published in 1823, a north-west view of Shere shows that the spire was at that time only partially shingled; much of the lower part was leaded, the lead being applied after the usual diagonal fashion. But if the south-east view of the church in Manning and Bray's history (1804) is to be trusted, the upper part of the spire was then leaded, and the lower part boarded. The shingles were entirely renewed at the recent restoration.

There were five bells in the tower *temp.* Edward VI.; they had been cast in 1509. The number was afterwards increased to six, and the whole ring was recast in 1712. The old bell-cage was described by the Society for the Protection of Ancient Buildings (Eighteenth Report, 1895) as "an handsome piece of old English carpentry"; it was, however, at that time altered to admit of the addition of

two new bells, so that the tower now contains a tunable ring of eight.

Considerable repairs were done to the church in brickwork during the Georgian era, apparently towards the close of the XVIIIth century. The pillars of the arcade between the nave and south aisle were renewed in brick and cased over thickly with plaster, so as to assume the stout octagon shape which they now present. At the same time the shafts and mouldings of the beautiful archway at the east end of the aisle were similarly cased, but all that has been happily removed. A west gallery, with a handsome oak front, was then erected across the western bay of both nave and aisle. Entrance to the gallery is gained through an outer doorway, which is reached by a flight of eleven wide stone steps against the west side of the south porch. A curious wide-based five-sided buttress of brick, at the north-west angle of the nave, is apparently of the same date.

A most careful and admirable restoration of this church was effected in 1895, under the direction of Mr. W. Samuel Weatherley. None of the special features of this interesting village church were destroyed. Even the west gallery, which is good of its kind, was retained, together with the outer means of access, so characteristic of a particular period of church alteration, and now so very rarely seen. Both choir and clergy vestries were urgently required, and they were placed in an unusual but happily-conceived situation against the north wall of the nave at its western end, where there was previously a long stretch of blank wall. There is no attempt to imitate any part of the old church in these low-roofed vestries, but they are comely and do not clash with the ancient fabric; they tell the tale of their own later date after a quiet fashion, but, to avoid any possible mistake, bear the date of 1895 over the west entrance in plain figures. This is just as it ought to be.

In the refitting of the church one great improvement was effected. In 1814 the ringing floor of the tower became unsafe, and was taken down. From that date up to 1895 the bells had been rung from the ground floor right in the centre of the church, and open to all the worshippers. This unsightly proceeding came to an end in 1895, when the old upper ringing floor was replaced.

There is a XIVth century piscina

niche in the south wall of the chancel. In the north wall of the chancel near the west end is a quatrefoil opening about 3 ft. from the ground, and close to it is a squint, which would command a view of the high altar. The height of both openings are between 5 ft. and 4 ft. from the ground, at a convenient elevation for anyone kneeling on the further side of the wall. The quatrefoil opening was doubtless for the communicating of the recluse or anchorite who occupied the small outer cell built on to the chancel in that position. There are plain traces outside of the lean-to roof of this cell. The remains of such cells on the north side of the chancel, with like communications, are occasionally met with elsewhere, as at Michaelstow, Cornwall, and Romburgh, Suffolk.

The beautiful combined Norman and Early English doorway within the south porch has other interests besides its decorative mouldings and work of two periods. No fewer than seven of the small incised early sundials may be noticed on its jambs, such as were cut from time to time to enable the priests to keep their canonical hours. Their presence proves that there was originally no porch to the south entrance, and shows positively that this was the old south doorway and not the west doorway, as has been supposed by some. Another sundial may be noticed in the masonry of the rebuilt Norman buttress of the south chapel. There may also be noticed on these jambs a number of diminutive incised crosses. The supposition that these are marks made by Canterbury pilgrims is a possible though not very probable one, as they are met with occasionally in non-pilgrim localities. The supposition is perhaps rendered more probable by the fact that one of these marks is the cross of Jerusalem, showing perchance the visit of one who had made the Holy Land pilgrimage.

In this porch is an usually large parish chest, over 7 ft. long; it seems to be probably of early XVth century date.

There is an Elizabethan chalice and pateu-cover pertaining to this parish church, of the year 1569; it was, however, during recent years transferred to the district church of Peaslake (Surrey Arch. Coll. xi., 52).

There is distinct interest pertaining to the monumental remains in Shere church. The oldest is a small brass effigy of Robert Scarelyf, rector, in Eucharistic vestments, with a brief inscription recording his death in 1412, and asking for prayers for his soul. His will, at Lambeth, is of great length. He left special vestments to this church and a picture for the Lady altar. There was to be no display at his funeral, but his black hier cloth was to contain 24 yds. of material, which was afterwards to be divided among poor parishioners. He left various small bequests, and the residue of his effects were to be shared among poor couples of Shere, and in marriage portions for poor maidens of his parish.

There used to be an altar or raised tomb on the south side of the chancel to John Touchet, Lord Audley, who died on September 20, 1491, bearing his effigy in brass. This was taken down in 1747, and the effigy laid on the chancel floor.

Only the upper half of it, and part of the inscription now remains; it is in plate armour, and measures 19½ in. in length.

There is a small brass effigy of the wife of John Redford at the east end of the south chapel, and of Oliver Sandes in the window-sill of the north transept. Rubbings of these brasses when perfect are in the British Museum (Add. MSS. 32,490, D. 9; K. 33; QQ. 22, 21).

Lord Audley, in 1486, granted the manor of Shere to Sir Reginald Bray, who held prominent court appointments in the reigns of the last two Henrys and Queen Mary. He was a benefactor to the royal chapel of St. George's, Windsor, where he erected the Bray Chapel in the south aisle. The Bray crest or badge of a flax-breaker appears frequently in the ornamental work of that chapel, and also occurs in the remains of the old glass in Shere church. The registers, which begin in 1547, have many entries of the Bray family, who still hold the manor; the earliest of which tell of the baptism of Reginald, son of Sir Edward Bray, Kt., on May 1, 1556, and of the burial of Lady Magdalen Bray on March 8, 1563. Against the south wall of the chancel is a tablet to the memory of William Bray, the Surrey historian, who died in 1832, aged ninety-seven.

The old churchwarden's accounts show that this church, in addition to altars to our Lady and to St. Nicholas, had images of St. Anthony, St. Roche, St. John the Baptist, and Our Lady of Pity.

We desire to record our indebtedness to the rector, the Rev. F. C. Hill, under whose auspices the happy conservative restoration of 1895 was carried out, particularly for the loan of the ground plan of the church.

THE TRIBUNAL OF APPEAL.

WE fear that the memories of many of our London County Councilors are shorter than that which evidently belongs to our correspondent, "Haud Immemor," whose letter we print in another column. *Litera scripta manet, verbum ut inane perit*, and history has a way of sometimes reversing itself, as will be seen by comparing the report of the meeting of the London County Council in our issue of the 24th ult., with a "Note" which appeared in the *Builder* of November 4, 1893, commenting on the case of *Regina v. The Members of the Appellate Tribunal*. In that case an application was made to the Queen's Bench Division on October 26, 1893, for a *certiorari* to set aside the decision of the Tribunal as to the general line of building on the ground that one of the members of the Tribunal was actually the Chairman of the Building Act Committee, which had ordered the prosecution, and was therefore biased. In those days the County Council appointed one member of the Tribunal. The following is taken from the *Times* Report, October 27, 1893:—

"Mr. Justice Charles, in giving judgment, said the question did not affect only Mr. Ellis, the applicant, but the general principles of the administration of justice. Dr. Longstaff, Chairman of the Building Act Committee of the London County Council, was also a member of the Appellate Tribunal as to

the 'general building line.' There was a resolution in November, 1891, of the Building Act Committee to proceed against Mr. Ellis as the building owner of the houses. Dr. Longstaff being the Chairman, and proceedings were accordingly taken against Mr. Ellis. The magistrate had to ascertain what 'the general line of building' was, and he adjourned the proceedings to ascertain it, and when he had ascertained it he made an order for demolition of the houses. There were appeals against that order, and also against the decision of the architect as to the 'general building line,' and on the latter appeal Dr. Longstaff sat. Was it right that he should so sit? Surely not; for he was Chairman of the body which directed the proceedings. That there was general misconduct no one would suppose, but there was a general rule of law against anyone taking part in a judicial proceeding in which he had probably a bias. And though Dr. Longstaff had taken no part in the resolution, still he was Chairman of the Committee; and though no doubt he had not been guilty of any conscious misconduct, there was a probability of bias, and therefore the decision was invalid, and the application must be acceded to.

"Mr. Justice Wright concurred. Rule absolute."

To-day some members of the London County Council openly proclaim that they want "to get another Tribunal." Twelve years ago the constitution of the then Tribunal was changed, and it was changed by taking away from the Council the power to appoint one single member to the Tribunal; moreover Parliament enacted that "No member or officer of the Council shall be a member of the Tribunal of Appeal." We recommend the Building Act Committee, therefore, to ponder a while over the difficulty of combining judicial and administrative functions, and to think twice before making an ill-founded allegation of bias against a Tribunal which, ever since it was purged of its "member of the Council" in 1894, has been free from the taint of partiality.

NOTES.

THE PANAMA CANAL. WHATEVER type of canal may be ultimately adopted by the American Congress,

the control of the Chagres River will be an important factor. The problem presented by the regulation of this waterway is probably one of the most difficult for solution in connexion with the Panama Canal, and is responsible for a good deal of the controversy that has arisen among engineers with regard to the general subject. In view of the possibility that a lock-canal may be finally thought to be more advisable than a sea-level canal, the paper by Mr. A. G. Menocal now before the American Society of Civil Engineers possesses some interest. Its object is to submit for discussion a modification of the route recommended by the Isthmian Canal Commission of 1899-1901, by which the author believes the River Chagres may be kept under absolute control, its channel left free to carry off flood waters, and an abundant supply of water kept close at hand for

the operations of the canal, without increasing the estimated cost of the works, while at the same time reducing the time required for execution. The author's proposal is illustrated by a plan, which gives in a convenient manner the present and the proposed routes. Under this new scheme the Chagres River would be crossed by means of a combined dam and viaduct with control works, the dam to impound the river at an elevation of about 109 ft. above mean sea-level, and the viaduct to carry the canal over the river. The structure would be of reinforced-concrete, and being founded on hard rock should possess ample strength and all the conditions of stability and durability essential in a work of this character. The author is entitled to speak with some authority on the subject, having been the engineer-in-charge of the United States Government surveying expedition of 1875. Although the combined dam and viaduct would cost a large sum of money, it is believed that the expenditure would be more than off-set by savings elsewhere, and the project is one that will deserve serious consideration if the final verdict should be in favour of a lock canal.

THE ENLARGEMENT OF THE HOUSE OF COMMONS. IN the current issue of the *Nineteenth Century* the Editor very appropriately republishes, with its illustrations, the article furnished by Mr. Charles Barry, and now out of print, on his proposed scheme for the enlargement of the House of Commons. Mr. Barry's scheme for enlarging the House laterally, by carrying up the slope of the seats further and providing new Division Lobbies partly under the upper ranges of seats, with no exterior alteration except a slight projection into the present area of the Commons' Court and the Star Chamber Court, is so simple and practical, and could be so easily carried out, that it is really surprising that this manner of getting rid of the anomaly of having a House of Parliament which can only provide seats for three-fifths of its members should not have been long since carried out. It is less expensive than any other scheme which has ever been proposed, with the advantage that it involves no architectural alteration of any importance in the building. We hope the republication of the article may lead to the scheme being seriously taken up by those in office, before some more drastic and less desirable interference with the building is proposed.

Vauxhall Bridge.

As mentioned in our report under the head of "London County Council" on another page, a model of Vauxhall Bridge has been prepared showing the structural portion as carried out, and two alternative designs for pylons at the ends, to be crowned with sculptured figures by Mr. Drury and Mr. Bertram Pegram. The faces of the piers are steel above the plinth line, containing panels with large figures in relief, which will be executed, as we understand, by Mr. Pomeroy and Mr. Drury in collaboration. Except for the pontoon-like steel casing under the projection of the footway, which we have always disliked, the design now looks admirable, and is

a different work indeed from the dreadful thing at first proposed. In regard to the pylons, we are inclined to think that No. 1 is the best in its general lines, but the insertion of a gilded bronze railing on the cornice, and near its outer edge (in order to provide a "practicable" gallery round the top) would interfere with monumental effect; and we doubt if it is wise to make these erections accessible standpoints with staircases, and if it would not be better to make them rather smaller, and treat them simply as pedestals for sculpture. We recommend a study, in this connexion, of the Paris bridge pylons, which are purely decorative.

Waterloo Bridge Lamp Standards. IN a letter in another column Mr. F. W. Troup draws attention to the fact that, in re-instating the original design of the lamp standards on Waterloo Bridge, a characteristic bit of the original design, the side wings of laurel leaves at each side of the pedestal, had been omitted. We of course noticed the omission at the time, but after having had the satisfaction, after much paper warfare, to see the original design in its main features re-instated, we were unwilling to prolong a controversy on the subject. Mr. Troup is quite right, however, in saying that these details form a characteristic feature in the design, and also that they could be easily replaced, and we hope it will be done.

Football Stand Construction. THE failure of another football stand, reported last week, although not involving any very serious consequences, comes as an additional reminder that the perils encountered by spectators of football matches seem to be fully as great as those popularly ascribed to referees. Some failures that have occurred in the past are attributable largely to faulty design, and in no small measure to impaired strength owing to long-continued exposure in all weathers. The last-mentioned consideration clearly suggests the desirability of concrete-steel as a material of construction. The great elastic strength, homogeneity, and durability of the combination render it most suitable for work of the kind indicated, and the example about to be set at Liverpool, where the new grand football stand will be built entirely in reinforced concrete, is one distinctly worthy of imitation. The structure, 378 ft. in length by about 41 ft. in width, will be supported on fifty-seven columns arranged in three longitudinal rows, and varying in height from 14 ft. to 22 ft. above ground level. The tops of the columns will be connected transversely by sloping beams, 12 in. wide by 16 in. deep, and the two longer columns in each set by a horizontal girder 9 in. wide by 12 in. deep. The transverse beams are to be connected longitudinally by joists 7 in. wide by 10 in. deep, and the framework so formed will be covered by a continuous slab 4 in. thick, upon which the seats and the usual stepped flooring will be placed. The stand has been designed by Mr. Archibald Leitch, M.I.Mech.E., on the Hennebique system, for a live load of 168 lb. per sq. in., in addition to the dead load of the structure itself.

New Data Concerning Eye-bars. IN connexion with the construction of the Quebec cantilever bridge, with the great river span of 1,800 ft., careful inquiry was thought desirable by the engineers into various matters, which are of relatively small importance in smaller structures. Among such subjects for study was the behaviour of eye-bars, and during the period of one year numbers of full-size bars were tested under tension up to about 24,000 lb. per square inch, with the effect of indicating how defective is general knowledge of such members. As a rule, it is not recognised that the elongation of an eye-bar actually takes place from out to out of the bolt-holes, and not from centre to centre of the bolts. Too frequently the elongation and elastic limit are determined over a given length of the bar, and the data so obtained are applied to the bar as a whole. And, again, it is often supposed that a set of bars working in parallel will take up equal shares of the strain, so long as this is below the elastic limit of the metal. All these assumptions are very clearly shown to be incorrect by the tests to which we refer, and which are fully described by Mr. Theodore Cooper in a paper recently read before the American Society of Civil Engineers. These tests indicate that in eye-bars with a minimum length of 50 ft., when subjected to tension on pins neld parallel, and for an average working strain of 21,000 lb. per square inch, the softest bar will only take about 17,600 lb. per square inch, or 84 per cent. of the average strain, and the hardest bar about 22,540 lb. per square inch, or 107 per cent. of the average. But in bars of short length, under high-working strains, the difference becomes so great that the employment of such bars is very undesirable. Therefore, in structures of great magnitude, where high-working strains are involved, long bars only should be used unless the stretch of the eyes can be overcome by special methods of manufacture and treatment of the metal.

Dust on Country Roads. THE present spell of dry weather has conclusively proved one thing—that dustless material for the roads has not been discovered. On some sections of the roads in Kent three different methods have been adopted, but far from proving dustless—the only difficulty is to determine which is the most dusty with motor traffic. Dwellers in towns, where the roads are watered, can have no idea of the condition of things in the country. Since the introduction of motor-cars a permanent cloud of dust hangs over the roads and the neighbouring land, and at the time a motor rushes past at 25 to 30 miles an hour the road is so obscured that carriages have to stop, for it is impossible to see any following vehicle coming, and the road remains invisible. When trees border the road this impenetrable cloud hangs over the road for a considerable time. In the interest of everyone, including the motorists, something will have to be done. It is curious if the law of nuisance cannot be applied to the raising of dust. A man must not annoy his neighbours by noise, smell, or vibration, but a stranger rushing along the roads can destroy the comfort, clothes,

and crops of those on or within half a mile of the roads with apparent immunity. Civility compels many motorists in dusty districts to slow down, but when native politeness is absent surely some civil action will lie? At present the motorist appears to enjoy the same freedom from civil responsibility for his actions that the trade unions so much covet.

House Refuse. THE case of Mayor, etc., of Westminster v. Gordon's Hotels, heard by the Divisional Court, has decided a point of interest under the Public Health (London) Act, 1891. The Hotel Metropole summoned the sanitary authority for neglecting to remove their house refuse. The answer of the authorities was that the refuse they were required to remove was not "house refuse," but "trade refuse," for which, under sect. 33 of the Act, they were entitled to make an extra charge. By sect. 141 of the Act "house refuse" is defined to mean "ashes, cinders, breeze rubbish, night soil, and filth"; "trade refuse" means "the refuse of any trade, manufacture, or business, or of any building materials." The refuse in question consisted of ashes from the grates, sawdust from the kitchen floors, empty sauce bottles and preserve tins, straw bottle cases, tea leaves, waste paper, egg-shells, and small quantities of broken crockery and glass. The Court held that this refuse, being of the same kind as would be produced in an ordinary dwelling-house, was "house refuse," and did not become "trade refuse" by reason of the house being used as a hotel. The Lord Chief Justice, however, intimated some doubt as to what the decision would have been if this refuse had come from a restaurant where there was no living accommodation. In the case of the Vestry of St. Martin's v. Gordon (1891), decided in connexion with a somewhat similar statute, Lord Esher defined "refuse of manufacture" as refuse from the material which is being manufactured into something else; "refuse of trade," refuse directly connected with the trade, not, for instance, ashes from fireplaces used to warm the operatives; and the word "business" he defined as extending the word "trade" to transactions which did not involve the buying or selling of any article. It must be remembered that if the refuse of hotels is large, so is also the amount paid by their owners in rates, and the municipalities' first duty is their public duty—they are not principally commercial undertakings.

Private Electric Lighting. IN some cases it is more economical to generate electricity by means of a private installation of prime movers and dynamos than to take it from the mains of the supply company. The problem, however, of deciding which procedure is the more economical is, in general, difficult, as the proper charge for maintenance and depreciation varies with local conditions, and depends on so many circumstances that at the best only a rough comparison can be made. In this connexion the paper recently read to the Leeds section of the Institution of Electrical Engineers on "The Cost of Electricity per Unit from Private Electrical Plants," by Mr.

W. Hartnell, will be found most useful. A careful enumeration is made of the items of cost in the case of twelve private plants. He divides the costs under the three headings of—(1) Capital outlay; (2) capital charges; and (3) operating charges. He has taken the customary 10 per cent. of the initial outlay for interest and depreciation, but we agree with him in thinking that 15 per cent. would in many cases be fairer. The greatest economy is obtained in factories where steam engines have to be employed, and the electrical machines are only adjuncts. Mr. Hartnell calls this a "half," or an "incomplete," electrical plant. In flour mills where high-class compound condensing engines are employed, and run with few stoppages for nearly the whole week, the cost of generating electricity is very small. In several of the cases he gives it is little more than a farthing per unit. On the other hand, for lighting three private houses the costs average about 6d. per unit. The general conclusion, therefore, is that in factories where an incomplete plant can be installed, and no reserve plant beyond a spare armature is necessary, it is much more economical to generate electricity privately; but for private house lighting it is, as a rule, cheaper to take electricity from the public supply mains.

Building in the Black Forest. SOME of our readers may have noticed in the *Times* a few days ago the brief account of a most serious disaster, in the fall of the Hotel Zum Hirsch in the Black Forest during a festivity to celebrate the opening of the house, by which it appears that forty-two people were killed and more than seventy seriously injured. It is to be hoped that we shall have some information as to the construction of the building which collapsed in this manner. It is too grave a matter to jest over, otherwise one might be amused at the naive manner in which the *Times* correspondent accounts for the disaster:—

"The accident is attributed to want of proper precautions. The roof of the building was only put on this morning, and the occasion, according to German custom, was celebrated by a banquet. It is said that the guests danced, and in view of the numbers present it was probably this that led to the collapse of the house."

Are we to understand that under the building regulations in the Black Forest a hotel can be built in so flimsy a manner that it is dangerous to dance in it?

Hoefnagel's Map of London, and its Date. ONE of the coloured maps in George Brann and Franz Hoefnagel's "Civitates Orbis Terrarum"—of which several editions were published at Cologne in 1572-1618—is a bird's-eye presentment of London by Hoefnagel, which hitherto has been considered to have been drawn in or about 1572. In a communication to the *Athenæum* Mr. Alfred Marks, who is an eminent authority on these matters, makes a notable contribution to the story of the view. Whilst we have not room for a full rehearsal of his arguments we may mention that Mr. Marks, beginning with the interval 1547-1561 upon the internal evidence of the map itself, reduces that period, step by step, to 1554-1558. He

points out that in 1554 were erected at Charing Cross the gallows for punishing those who took part in Wyatt's rebellion, and that after August, 1557, the style of "Suffolk-place" ceased to designate the riverside palace (Buckingham and Villiers streets) which Heath, Archbishop of York, acquired at that time and renamed "York House." Hoefnagel delineates the gallows at Charing Cross and marks "Suffolke-place." Despite the smallness of its scale his map is remarkable for the minuteness of details which, albeit disproportionate in themselves, give so striking an air of verisimilitude and precision to the view. One or two, indeed, provoke a smile, and yet there may be humour even in map-making. The clipping and the misspelling, or rather distortion, of many place-names, combined with the minute details, seem to indicate that a foreign hand had copied and re-engraved the map from one to a much larger scale. Nor can we readily believe that for a work of so wide a compass Braun and Hogenburgh (or Hohenberg) caused a new survey to be taken in every instance for their atlas. In some respects Hoefnagel's view is more faithful than that which for lack of more certain knowledge is generally ascribed to Ralph Aggas, of which we printed a brief historical description on December 23 last. Mr. Mark's surmise that the maps by Aggas and Hoefnagel have perhaps a common origin will not be gainsaid by those who are familiar with and compare the two works.

Messrs. Tooth's New Gallery. MESSRS. ARTHUR TOOTH & SONS have opened their new gallery in Bond-street with a very good exhibition. The exhibition rooms are on the first and second floors, not quite so convenient therefore as the old gallery in the Haymarket (though a very good lift is provided), and the first floor room is a little deficient in light for pictures; the upper room has an excellent light. The most important work in the lower room is M. Dagnan-Bouveret's "Dans la Forêt" (18), which we remember at a Salon exhibition some time since. Among the other works in this room are three diminutive Meissoniers (38, 39, 40) of the best order; a landscape by Cazin (28); two small but fine landscapes by M. Harpignies (17, 20); several small Corots; a beautiful little landscape by Mr. Davis, "Pastures by the Sea" (50), a replica of a larger painting; two fine but gloomy landscapes by J. Maris (21, 34); a fine example of that unequal painter Isabey, "L'Approche de l'Orage" (1); and a very charming and finely executed work by Lady Tadema, "A Sonnet" (54). But the best part of the exhibition consists in the collection (in the upper room) of landscapes, mostly pastels, by M. Lhermitte, every one of which is worth looking at, and some of which are among the finest things ever produced by this powerful and original artist; we may draw attention particularly to "Washing in the Mill Stream," "Le Passenur," "Troupeau de Vaches à la Rivière," "Reapers," and "Field Workers." This collection of M. Lhermitte's work is enough in itself to render the exhibition one of the most interesting of those open at present.

IMPORTATION OF FRENCH BUILDING STONES.

By W. R. PURCHASE.

In several of the daily papers it is stated that one of the "Paris-in-London" schemes on the new Aldwych site, now before the London County Council, is likely to be carried into effect, and that preference will be given to the original syndicate that brought forward the project which the London County Council rejected a year ago, having in the meantime modified the scheme so as to comply with our insular requirements.

A French architect, in conjunction with two eminent architects on this side of the channel, is, it is understood, preparing plans for these new buildings, which are to cost 1,600,000*l.*, and it is said that a "white stone" (this is the point I wish to emphasise) is to be used in the façades. Doubtless, the London County Council, who presumably have the control of these buildings, will give particular attention to this specific stone; for I notice that several French stones have lately been introduced into the London market having the names of "Palotte," "Euville," etc., and commonly termed "French Portland" (which name, however, is a misnomer), and used in various buildings in the metropolis, especially on public banks, etc., in the West-end. If it is suggested that either of these stones is to be used in the new buildings at Aldwych, evidence of its enduring qualities should be forthcoming.

Looking at these French stones from a practical point of view, I should like to offer a few remarks as to the result of my observations. These stones are apparently a portion of the great oolitic formation in Normandy; the "Palotte" being very similar to the Caen stone re-introduced into London in the forties and fifties of the last century, and used in the façades of Buckingham Palace and the palatial clubs of Pall Mall and St. James's-street, with such disastrous effects, for all of these buildings are in a bad state of decomposition, although several of them have been re-worked, painted, etc. Experience has, therefore, proved that Caen stone will not resist the dissolving power of water charged with carbonic acid gas, and as the rain-water of our large towns contains a large quantity of that gas, it is not safe to employ this stone in any position where water is likely to lodge, or even to be taken up by capillary action. It has been generally accepted as a dictum that most building stones last longest or show greater signs of durability in the locality in which they are quarried. This, however, does not seem to be the case with the Norman oolites, Caen stone in particular, for although the towns in the immediate neighbourhood of the quarries in which this stone is used have the advantage of clear dry air, unpolluted with coal smoke, yet the restoration of their churches and cathedrals proceeds apace owing to the stone disintegrating and falling to pieces.

This being so in its natural climate, it is obvious that the use of a similar stone in London in which the air is charged with various deleterious and destructive acids, is, without doubt, a great mistake, and will ultimately result in complete failure.

The "Palotte" is an extremely soft stone of a light cream colour; it is cut with a toothed saw, and wrought with carpenters'-shaped chisels and gouges, and finished off with the drag; if necessary, it may be sandpapered, and the stone can also be carved with a pocket-knife, so soft is its nature. An industrious mason may do almost as much work as he pleased in it, consequently a building may be executed in this stone in a shorter space of time than in any other. It may be urged that there is a generally-accepted opinion that a soft stone will become hard and durable by exposure to the atmosphere; this is true to a certain extent, although it is not of sufficient importance to warrant its appreciation in new buildings of an architectural character. All free-working limestones and oolites when newly quarried are in a "green" state, and are softer and more easily worked than after they have been exposed to the weather for several months; and this quality arises from a chemical change which takes place on the evaporation of the water, termed "quarry

sap," contained in the stones when lying in the quarry; but beyond this the stone will only get a little harder, and this only on the surface.

I repeat that the use of this French stone, if it is anything like the "Caen" stone, would be attended with danger, as it would yield easily to the action of frost and other destructive agencies.

A large building possessing features of architectural merit has recently been completed in the High-street, Kensington; it is in the style of the old buildings in the neighbourhood, the facework is of red brick, and the dressings—cornice, pediment strings, etc.—are of the "Pallotte" stone. A large amount of enrichment is in the tympanum of the pediment and main front, and to the onlooker it is an exceedingly fine building; the creamy white of the stone standing out in marked contrast to the red brickwork. It is, however, a serious matter to contemplate what will be the condition of this building after it has been exposed to the weather for a few years.

One of the other stones, the "Eville," is doubtless a better weather stone than the last described. It is of a whitish brown colour, coarse in texture, and somewhat crystalline in its composition; its texture, however, is far from uniform, coarse beds seem to predominate; these are open, and consequently porous, which renders the stone liable to be attacked by the deleterious agencies of the surrounding atmosphere. This stone apparently cannot be obtained in deep beds, as in one or two instances in a new building I noticed columns about 5 ft. in height, to all appearance face-bedded, the strata showing in a most pronounced form, and in a vertical direction when fixed. Defects also seem to be numerous in the stone; these have been concealed by the masons with the aid of "stopping," giving to the stone a somewhat spotted appearance in the building.

With regard to porous stones, it has been stated that those stones which readily absorb moisture should not be used for the external and exposed portions of buildings, as when frosts occur the freezing of the water on the wet surface continually peels off the latter, and eventually destroys the ornamental work upon it. This, however, is not a universal rule, as, although a stone may be very porous and absorbent, it may also be extremely durable, its durability depending upon the cementing substance which holds the grains together being strong enough to resist the physical forces acting upon the stone, such as the rain, frost, and wind. Examples of this are found in the durability of our own shelly oolites, such as Ancaster, Donling, Ham Hill, Box Ground, Ketton, Portland, etc., which form such a good series of building stones.

The policy of importing building stones from France, whether from economic reasons or otherwise, is at the present time questionable. If the stone imported was a special stone, the lasting properties of which had been well tested by time, and if it was better and cheaper than our own market could supply, it might be excusable; this, however, does not appear to be so, but on the contrary. In the grounds of a large public school at West Kensington a memorial is being erected in the form of a drinking fountain to the "old boys" who died for their country in South Africa. The design is classical, partaking of the Doric order; it is circular on plan, and consists of a platform of steps, on which rest half a dozen columns about 5 ft. in height, which support the entablature, and cornice, all being of "Eville" stone; it is surmounted by a wooden dome, covered with sheet-lead or copper. The fountains supplying the water are in the centre of the erection, and are also of stone. The gist of this matter is that all the stonework is supplied ready worked direct from the French quarries. This is humiliating. Here is a national memorial for English boys erected as an incentive to the younger generation, simple almost to severity in its design, with nothing complex about it, every portion of which could be done expeditiously and skilfully by English labour and with English material; and yet we have had to enlist the foreigner to give us—what? Certainly not a better stone, nor yet better workmanship, for even this

structure, although simple, has not been without its mistakes in execution.

The motives which prompted the "Entente Cordiale" are doubtless to be admired, but at the same time, we should not forget that "charity begins at home," and that the use of our own material would provide work for our craftsmen. In this country we have a number of good building stones, the durability and weathering qualities of which have been tried and are well known, consisting of sandstones, limestones, oolites, etc.; these stones have a range of colour in easy gradations from white to grey, cream, brown, red, and blue. The supply, too, is unlimited and easy of access; any quantity can be obtained at short notice, and the price can, or should at least, compare favourably with any French stone. Merchants at the present time have a large stock in hand, and it certainly would be only patriotic to use our own material in preference to others.

BRITISH SCHOOL, AT ROME.

THE fourth open meeting of the British School at Rome for the present season was held on Monday, April 4, in the library of the School. Mr. H. Stuart Jones, ex-Director of the School, read the first paper, dealing with certain points in the historical interpretation of the series of reliefs which decorate the column of Trajan, and which illustrate his two campaigns in Dacia in 101-102 and 105-106 A.D. He pointed out that the artist who designed them employed three methods of narration—the continuous style, marked by an unbroken background; the successive style, in which a series of individual scenes is shown, each scene being marked off from the next by some expedient—a brick in the background, a tree, or a change in the direction in which the figures are placed; and the panoramic style, in which a band of relief represents several scenes which are to be conceived of as going on simultaneously, and are to be interpreted as a whole. Using this criterion, he showed that the supposition adopted by Choribus and by Petersen that a junction of two armies is indicated early in the first campaign (as though Trajan had invaded Dacia by two different passes), on the ground that two bridges of boats over the Danube are seen, was not warranted; as a fact, Trajan's march was represented by some detached scenes, which led up to a continuous passage, ending in a battle, after which the Roman forces are checked by a fortified position—no doubt the Iron Gate pass. Early in the second campaign, on the other hand, the convergence of two armies was clearly shown; they were represented as on the march in the same direction, one below the other, on the same band of relief, being divided by a longitudinal strip of rock.

At the beginning of the second campaign another continuous passage represents the voyage of Trajan from Ancona, first to another Italian port, which could not certainly be identified, and eventually to the goal of his march—a country inhabited by friendly Dacians, no doubt a portion of the Roman province of Upper Moesia, to which they had been transferred after the first campaign. For it appears that after the first war was over the Romans evacuated Dacia, and Mr. Stuart Jones further concluded from the representations of the reliefs that the Dacian King actually carried offensive operations into the province of Upper Moesia. The exact point indicated was the centre (as yet unidentified) of the imperial worship in that province; the six altars shown, at one of which the Emperor is sacrificing, corresponding to the number of his predecessors to whom Divine honours had been decreed. Next, a panoramic view, which begins and ends with a group of *classarii*, or men of the Danube fleet, engaged in road-making through a difficult country, showed the relief of Roman positions which the Dacians were attacking. After this came detached scenes, showing the stone bridge over the Danube, with the Emperor sacrificing on the south side, while on the north he receives envoys. Then followed the representations of the final offensive campaign, the Roman success in which led to the incorporation of Dacia as a province of the Empire.

The second paper was read by Dr. T. Ashby, jun., Assistant Director of the School, on an unpublished panorama of Rome by Anton van der Wyngaerde.

about the middle of the XVIIIth century. The panorama was one of a series of four preserved in the Sutherland collection in the Bodleian Library, three of which had already been published, the first by Professor Lanciani in the *Bullettino della Commissione Archeologica Comunale*, 1895 (p. 51, Pl. VI.-XIII.); the second by Dr. Ashby in the same periodical (1900, p. 28, Pl. IV.-IX.); and the third in the *Mélanges de l'Ecole Française*, 1901 (p. 471, Pl. II.). The present view, at any rate, or its original must have been drawn at some time before September 27, 1557, the date of the flood which destroyed the Pons Aemilius, now known as Ponte Rotto, for the third time (see Lanciani, "Ruins and Excavations," p. 20), inasmuch as the bridge was here shown as intact. The point from which it was taken was about 150 yds. to the east of the church of S. Sabina, on the Aventine; on the extreme left is the island of the Tiber and the bridge already referred to, to the right of which are seen some of the buildings of the Forum Boarium and the Campus Martius, then the Capitol and part of the Forum, with S. Gioiio in Velabro. The central portion of the panorama was occupied by an interesting representation of the ruins of the Palatine, with the valley of the Circus Maximus in the foreground, and the view closed with the Caelian hill and the Aurelian wall near the Porta Latina, and (probably) the church of S. Prisca in the foreground. The changes which Rome had undergone during the past 350 years rendered such drawings as these of great value, and the positions of the various buildings were, as a rule, given with remarkable accuracy.

Dr. Ashby also read the third paper, an account drawn up by Mr. Thomas Ashby, sen., of certain Italian silver charms, such as horns, hands, *cimaruta*, sirens, sea-horses, etc. These charms were until a generation ago in common use, in Southern Italy and Sicily especially; and the first two classes were still frequently seen, though the rest were no longer worn. The *cimaruta*, or sprig of rue, is a compound charm, formed, as a rule, by the addition of various subsidiary charms to the main one, which, however, is not lost sight of, though in some instances conventionalised. The siren and sea-horse, on the other hand, which are figures in the round, while the *cimaruta* is in flat relief, are far more frequently found in isolation than combined, though to the latter buds of rue or lizard may occasionally be added, and both have, as a rule, bells. All these charms could be traced back to a classical origin; of the horn and the hand this was well known, but the virtue of the rue plant was strongly asserted by ancient writers, and both sea-horses and sirens were found in classical art, while the latter could be traced through the mediæval period down to the patterns of Italian embroideries and lace of a century or two ago.

All the papers were illustrated by lantern slides. The meeting was well attended by British residents in and visitors to Rome and by foreign scholars, including Commentatore Boni, Director of the excavations in the Forum; Professors Körte and Hülsen, of the German Archaeological Institute, etc.

GIRLS' SCHOOL, CLEWER S. STEPHENS, WINDSOR.—To meet the requirements of the Education Board, the managers of the Clewer S. Stephen's National Schools are erecting a new girls' school on a site in Vansittart-road. The new building will comprise six classrooms, all on the ground floor, and the central hall will hold 500 persons and be capable of extension by throwing into it two classrooms divided by removable partitions, which will accommodate an increased audience of 800 persons. Over the classrooms, etc., will be rooms and apartments for the head mistress and teachers. The block will be of red brick, and has been designed by Mr. J. Wightman Douglas, of Newcastle-on-Tyne, the contract having been entrusted to Messrs. W. Green & Son, of Clewer, for the sum of 2,382l.

SCHOOL EXTENSIONS, BARRY.—Plans were submitted by Mr. G. A. Birkenhead, architect, at a recent meeting of the governors of Barry County School, for alterations and extensions to the school for the accommodation of 350 scholars, at an estimated expenditure of 7,000l. Provision will also be made for a dining-room for 150 children and the installation of shower-bath apparatus for boys and girls. It was decided to submit the plans to the County Council for confirmation.

SOCIETY OF PAINTERS IN WATER-COLOURS.

The most important work at the Society's exhibition is undoubtedly that by Mr. E. R. Hughes which is hung in the central position at the top of the room—"The Valkyrie's Vigil" (68). Mr. Hughes is almost the only member who produces figure subjects which are of the highest class in importance and finish, and which have also the additional interest of poetic significance. In this picture the beautiful draped figure of the Valkyrie, holding a sword and helmet, is seated in the moonlight on the top of a battlemented tower; halfway below is the platform of a lower tower, and beneath that the moonlit city. Both the perspective effect and the light effect, which offer a very difficult problem, are very carefully worked out, and the whole will rank as one of Mr. Hughes's best works.

Next to this, we were interested in the new achievements of Miss Mildred Butler, who in this exhibition has gone quite beyond what former work of hers we can remember. "The Green Mantle of Summer" (2), in its combination of a meadow and heavy belt of trees behind with a study of peacocks in the foreground, strikes a new note, and is an admirable small drawing; but in "Dignified Leisure" (109) we have the combination of peacocks and landscape on a larger scale, in what is really a grand drawing, both in composition and its broad style of execution, and gives its author a new position among water-colour artists. A new name, if we mistake not among the contributors, is that of Mr. H. S. Hopwood, who paints interiors with figures in a broad style in which precision of detail is rather avoided. His first work, "The Mirror" (1), we do not care much for; but "Painting the Riding Light" (63), a cabin interior, is a fine work, and "Morning" (72), the interior of a room in which a girl draws the window curtain to admit the dawn, is still better. A foreign exhibitor, Herr Vosper, contributes another subject of this class, which may be labelled "interior with figure"—"The Blind Peasant" (32), a picture pathetic in the expression of the figure and striking in the colour combination of the costume. The exhibition is rather notable for subjects of this class; Mr. Paterson, known here hitherto as a painter of landscapes in a peculiar technique of his own, has gone into figures, one of them a roughly sketched portrait figure (47) in which the dress is very boldly treated; the other, a far superior work, is entitled "Betsy" (52), an interior with a housemaid on her knees in the kitchen; the character in the face is admirable, and it is worth notice how realistic is the effect of the circular stove or boiler, in regard to texture and appearance of the metal, while preserving entirely the artist's characteristic broad style of handling. This it is to know exactly what effect and what meaning resides in each touch.

Among other works in which figures are predominant are two by Mr. Anning Bell, "The Banners" (7) and "The Garden of Sweet Sound" (38). It is needless to say that the colour is fine in both these; the first-named work rather wants subject—it is simply a composition of figures for the sake of a composition: some of the figures are very interesting studies, and as a composition the whole is admirably designed; but one wants some kind of story in a picture of this kind. In "The Garden of Sweet Sounds," the figures, which are a complete colour-blend, so to speak, with the landscape setting, mean something; there is a rapt expression on all their faces which reminds one of—

"Heard melodies are sweet, but those unheard
Are sweeter."

There is a poetic suggestiveness in the picture. So there is, and fine colour also, in Mrs. Forbes's "The Muse of Herrick" (19). But Herrick is the very last kind of poetry it would remind us of; her "Good-bye" (50), a parting between two dimly-seen country lovers under a plantation with the moonlight struggling through, is a remarkable piece of effect. Mr. Walter West, illustrating "The Ladies of St. James's" (13) as characterised in a verse by Mr. Austin Dobson, takes us to another world of art, that of brilliant realism, charming too in its way, but not poetical except as Mr. Dobson's verses are poetical—the poetry of "Vers de Société," which has its value nevertheless when first-rate

in its kind; whereas Mr. Anning Bell's "Finding of the Head of Orpheus" (132) is only poetry reduced to commonplace in painting—commonplace of conception, that is; the colour is not commonplace. Mr. Dollman's "The Incantation" (69), where a witch prepares her charms under the gaze of sympathetic following of apes, is a clever piece of *diablerie*; he exhibits also a replica on a small scale (125) of his powerful design entitled "Famine," which was seen as an oil-painting at the Royal Academy. The sort of figure picture which we cannot put up with is such a thing as "Too Many Cooks" (161), which represents sheer vulgarity in art. Mr. Arthur Rackham's goblins we have had rather enough of, but at all events they are not commonplace, and in "Goblin Thieves" (240) he has some charming little figures among the mortals of the scene; and we know that no one can do more lovely children than he can, when he can put his goblins on one side.

In pure landscape there are a number of fine things; some of them exceptional. Among these we may reckon Mr. Colin Phillip's "A Break in a Thunderstorm" (102), with its green foreground, and the distant crag bright in the passing rays; one of the finest things he has ever done. We may note some of the others in the order of hanging, Mr. Thorne Waite's small "Findon Downs" (4) and his larger work, "A Gap in the Downs" (22), are fine examples of delicate distances expressed in pure water-colour style; in "The Rainbow" (26) he has made an experiment in the very difficult task of expressing a rainbow in water-colour, with the result that the rainbow really does look evanescent and aerial, but—it is deficient in colour. That is the difficulty; to express colour which is only a radiance in the air, and not a reflection from a solid object; but it is always interesting to see the experiment tried. In architectural subjects Mr. Albert Goodwin is splendid in his most unusual treatment of "Durham (in Grey of Dawn)" (10); and his "Venice" (142) is worthy of Turner in point of effect, with a more precise treatment of the architecture than Turner (in this class of picture) troubled himself about. We do not know what Miss Montalba is about in her Venice scenes this year; she represents sea which is nothing but a surface of wash. Mr. Herbert Marshall's "Frosty Sunset, Westminster" (35) is effective, but where does his spire on the left of the view come from? We have not been to look, but we cannot recall any such object. Mr. Reginald Barratt as usual treats architecture admirably, especially in his delicate little drawing of "A Garden Gateway" (42). Mr. R. W. Allan's "Stormy Weather" (44) is a masterly example of the effect to be got in sea pictures in water-colour by broad and bold indication of movement and line with no attempt at detailed modelling of the sea; what is lost in detail is gained in force and freshness. Mr. Robert Little's "Massa Carrara" (66) is a fantasia in colour which makes one think of Turner's answer to the man who said he did not see all those colours in nature—"Don't you wish you could, though?" Mr. Napier Henry has two very powerful torpedo-boat pictures; Mr. R. W. Allan again shows a fine run of sea in his coast scene "Whitehills" (129). Among other landscapes are to be mentioned Mr. Phillip's "Clearing after a Storm, Ballachulish" (146), almost as fine as the one already mentioned; Mr. Cuthbert Rigby's "Autumn" (157) and "Kentuere" (226); Mr. Eyre Walker's "The Valley of Desolation" (185) and after "Winter in Yorkshire Woodlands" (196), the latter a large and remarkable work; and (to return once more to architecture) Mr. T. M. Rooke shows a careful and effective study of the north side of "Notre Dame de Semur" (148). Altogether a very fine exhibition.

MASONIC HALL, BARRY.—The new Masonic Hall at Barry, which has been erected in Broad-street, has been opened. The building was carried out by Mr. W. T. Morgan, contractor, Cardiff, from the designs of the architect, Mr. J. A. Owen, Cadenton, Barry. It has a frontage to Broad-street of 35 ft., extending back for a distance of 100 ft. The ground floor comprises two look-up shops, a central entrance and vestibule, and a concert-hall. The concert-hall will be utilised for public-meetings, dances, etc. The first floor comprises another large hall and ante-room.

THE ARCHITECTURAL ASSOCIATION.

An ordinary general meeting of this Association was held on Friday evening last week at No. 18, Tufton-street, Westminster, S.W., Mr. E. Guy Dawber, President, in the chair.

The minutes and nominations were read and the following gentlemen were elected members, *i.e.*, Messrs. P. J. D. Webster, A. V. Sutherland Graeme, and W. W. Diggle. Mr. R. P. Bruce was reinstated as a member.

The Building Fund.

The Chairman announced the following further donations to the Building Fund:—

	£	s.	d.
Janne Boyd & Sons	25	0	0
Hippolyte J. Blanc	3	3	0
A. Ebb	1	0	0
W. Potch	1	10	0
E. E. Frank (double sub)	10	6	0
P. Hunter	10	6	0
C. W. Piper	10	6	0
H. D. Scaries Wood	10	6	0
G. Scheriff (double sub)	10	6	0
A. Whitlow	10	6	0

He also proposed a vote of thanks to the executors of the late Mr. R. P. Brevelon for donation of copies of photographs.

This was agreed to.

The Chairman then read the house list for session 1906/07, as printed in our issue for March 31. He also stated that Mr. E. W. M. Wonnacott had been nominated by Mr. E. R. Taylor and Mr. Alan Potter as a member of the Committee. Messrs. T. L. Dale, G. F. Blackburne Daniell, T. J. Weatherall, and R. A. V. Harrison were elected as scrutineers in connexion with the election.

The Intermediate Examination of the R.I.B.A.

The Chairman said that all the members would be glad to know that the following letter had been received:—

Royal Institute of British Architects,
9, Conduit-street, W.

DEAR SIR,—Your letter of February 14 has been laid before the Board of Examiners, who have reported thereon, and the Council will grant exemption from the Intermediate Examination of the Royal Institute to those students of the Architectural Association who have passed through the four years' course of the Architectural Association Schools in a manner that shall be found satisfactory by the Board,

Yours faithfully,
(Signed) W. J. LOCKE,
Secretary.

Henry Tainter, Jun., Esq.,
Hon. Secretary.

Architectural Association,
18, Tufton-street, Westminster, S.W.

The Chairman said they were all indebted to the Institute for having agreed to the suggestion made by the Association. It meant that those students who had already passed two years in the Day School and two years in the Evening School would, if their work was satisfactory to the Visitors, be exempted from passing the Intermediate Examination. It was hoped to arrange some class or course by which the students attending the Evening School would also be exempted. It was a step in the right direction, and showed that the Institute were recognising the Association schools as the best in the kingdom.

Valuations, Compensations, and Light and Air.

Mr. E. Greenop then read the following paper:—

"In acceding to the request of our Council to read you a paper on these subjects I wish to explain that I lay no claim to any special knowledge upon them. They were suggested to me, and I willingly offer you my consideration this evening a few observations which my limited experience suggests."

I confess that the title of the paper would not have been a tempting one to me in those rose-coloured studentship days which many of you are still happily enjoying. We all start with ideals, which I believe and hope aim higher than the prosaic matters of valuations, compensations, and light and air. Further, this Association exists for the purpose of training architects rather than surveyors, upon whom these matters usually devolve. Not that I hope any of us mind being termed 'surveyors,' a title honoured by age, and borne by greater men than any of us can reasonably hope to become. But we must take our world as we find it, and if we are to grapple successfully with it, we must observe the conditions which its manner of life and requirements impose. In other

words, there must be a considerable commercial element in our up-bringing to accompany the artistic training. Without this it is not, I think, possible for an architect to protect the public from whom we derive our means of subsistence. The client has a right to think that the most important factor when employing us is our ability to protect his pocket, and to enable us to attain this qualification something more than the artistic spirit must be added; we must, by diligent observation and study, make ourselves competent surveyors. The term 'surveyor' embraces many departments, but my observation, I think, may fairly cover them all.

With the hope that this short preface will be some justification for this paper at the Architectural Association, I will proceed to unburden myself of a few thoughts, which I trust may be useful to some of you. Were I by some wizard's aid suddenly transformed from an architect to a client, I should, if looking for an architect for my proposed building, choose one who, besides satisfying my artistic instincts, if I had any, was something also of a valuer, something of a land agent, and something also of a quantity surveyor. The more this text is considered the more convincing is the sermon that grows out of it, and, example being better than precept, I can recall—and I do not doubt many of my hearers can also—dire results to clients arising from deficiency under one or more of these heads—picturesque results maybe, but built upon an ill-digested financial foundation, leaving a legacy of a precarious 24 per cent. investment or less. The reason is not necessarily reckless misrepresentation, or roseate exaggeration born of the enthusiasm of a young architect to see his long-studied fancies moulded into reality, but ignorance of the broad principles of business and commercial life, which govern building operations equally with dealings in stocks and shares, or, indeed, any other commodity. Everything has its market price, and if we manufacture under such conditions as produce a total cost greater than the saleable value we have failed in applying a first principle of worldly wisdom, and our client may righteously be dissatisfied.

You will note that I am tuning these remarks down to a student's keynote, and this for two reasons—firstly, because any attempt on my part to pretend to put forward original ideas on the subjects of valuations, compensations, and light and air would be as out of place here as they would be presumptuous elsewhere; and, secondly, because I interpret the invitation of the Council to mean that I should say something to enable some of you who may be a little younger than myself to bring your ideas to a useful working focus. In doing this I shall doubtless say much that is everyday knowledge to men of my own age, for which I ask their indulgence. If I should appear to make too lavish a use of the personal pronoun or to speak dictatorially I must ask you to attribute it to the desire I have to avoid giving you what is readily available in the many excellent text-books on these subjects, and to speak only from my own experiences.

Valuations.

To speak first of valuations. What I understand by value is the price which would be given by the average investor ordinarily on the look-out for the commodity in question. It is conceived, and that is something less than the actual theoretical value, as every man expects to get something, however small, off the theoretical value; but, on the other hand, it may be more than would be obtained upon a forced sale in open market, where it is known to possible buyers that there is from some cause a necessity, more or less acute, to realise at once. The figure is not to be arrived at by running your finger down a printed table, followed by an elementary problem in arithmetic, but by the exercise of a judgment trained by observation and experience, with knowledge of the world and some study of human nature. A good pinch of common sense may be thrown in with the other ingredients.

A common object on a solicitor's bookshelf is a copy of Inwood's 'Valuation Tables.' I can recall instances in which, as events have transpired, a moderate charge of gun-cotton would have involved a preferable risk. As popular works on legal advice in the hands of a layman are to the lawyer, so is the book of valuation tables in the hands of the lawyer

to the surveyor. As this sounds like a rule-of-three sum, you may be looking to me for an answer; I should give it as—ultimate increased business to the professional man and corresponding loss to the unfortunate client. Said a solicitor once to me: 'We generally do these probate valuations ourselves. To my inquiry as to why he made the particular matter an exception, he replied: 'Well, we found we could calculate everything except the proper amount to be deducted for annual repairs and the number of years' purchase.' A reply like that would dispel a London fog. I think it must have been the same sunny temperament which induced the gentleman to instruct me that in valuing a fixed rent-charge I should have particular regard to the then standing price of Consols. However, here we were on common ground, and all I asked was that he would allow me to throw in for momentary consideration a theoretical pound of butter.

The young valuer cannot too clearly keep before him the principle that there is no value in land except for what you can make out of it. This may appear so obvious as to almost insult your intelligence, but it is singular how frequently it is insufficiently grasped. I was once asked by a member of this Association what price per foot super he could offer for a site off Fleet-street. When the full blast of this staggering query had passed over I suggested that, if he contemplated turnips, the price at the moment, having regard to the probable quality, would not probably justify his offering more than 30s. an acre. Doubtless by this time he has learnt, like the philosopher with the doubtful breakfast egg, to work from the other end. First find what crop is wanted, then calculate what that crop will cost you from seed time to harvest, and then what the crop is worth in the market when finally gathered. In other words, what building is appropriate for the position is the question to determine—the rest follows. Observation and inquiry alone can assist you here.

When valuing existing buildings one must, of course, have the necessary knowledge to enable one to estimate with accuracy the probable cost of repairs, the deductions for rates, and a deduction for possible loss of rent and similar contingencies. It is not unusual to see 10 per cent. upon the gross rental value deducted for repairs, but the experienced valuer prefers to take each case on its merits. A stuccoed house, for instance, requiring painting externally every three or four years, would obviously necessitate a much larger annual average outlay than a stone or brick-faced house of the same size; again, the age of the property, the class of tenant, and other such considerations may vary the conditions materially. The parochial rates in the pound are easily ascertained; they vary in London, as you doubtless know, from about 3s. 6d. to 12s. 6d. They are calculated on the net rateable value. I have not time to go into the question of the manner in which under the Rating Act of 1869 this net rateable value is arrived at, but it represents the theoretical net amount going into the landlord's pocket after he has paid out of the gross rent received such outgoings as are necessary to insure the property against fire risk and to keep it in a condition to command the rent. It is a popular error to deduct property tax from the gross rent when making calculations for the purpose of arriving at capital value. There is no such thing as property-tax; it is merely income-tax, mis-called because it happens to be derived from land or house property instead of from profits of business or the many other sources from which the tax is derived.

In the case of property of small annual value overseers are legally authorised, if they think fit, to allow a rebate to the landlord upon his paying the rates instead of the tenant, the advantage to them being that he pays whether the property is let or not, and they are not at the expense, trouble, and risk of collecting small sums from small tenants. Owing, however, to the increased difficulty of late years of raising sufficient money to meet their many demands, the overseers have in some cases ceased to allow the abatement, with the result that the landlords have refused to collect. It has proved to be an interesting corroboration of the belief that the working classes have been under the delusion that they do not pay rates, for, notwithstanding that the

amount of the rates has been deducted from the rentals, serious losses have been incurred to owners of such property owing to their inability to keep tenants, who consider additional burdens are being imposed upon them.

When you have finally got at your net income, you have then to decide upon what is the most important matter—namely, the number of years' purchase to be applied as a multiplier. In other words, what percentage would an investor require during the term in question, in addition, of course, to getting back his capital. Here the tables help you, as far as the mathematics go, but as regards the proper percentage to adopt you must decide this yourselves. In the case of a house, say, in Belgrave-square an investor would be content—indeed, would have to be so—if he could see, say, 4 per cent. for his money, whereas in the case of an inferior East-end wicker property the expectation of 8 or even 10 per cent. could be justified, the one being well assured, the other more or less precarious.

Valuations of property perhaps more often arise out of mortgage proposals than for other objects. Here I need hardly say the greatest care has to be exercised. Careful inquiry should be made in the neighbourhood in order to compare the rentals of the property in question with those surrounding it of similar character. This is not only a check upon possibly artificially-created rentals, but in the case of old-standing tenants it will occasionally be found that the property is under-rented. In making such investigation it is generally possible with a little humouring to get information of value from tenants, and it is well to follow up any clue, however unimportant at first sight, as one comes by chance sometimes on information not to be obtained by direct inquiry. Quite recently, by merely following up a casual remark made by a street loafer, I was enabled to get at some facts which I had been for weeks unsuccessfully attempting to obtain through ordinary channels. In weekly property a respectful and sympathetic attention to the recital of the varied complaints to which the flesh is heir, and of which the female members of this class would appear to enjoy an abundance, will be found profitable, and the continuation of the narrative into the third and even fourth generation backwards may, if borne with fortitude by the surveyor, prove to have a less remote bearing than would appear at first sight upon the subject he is specially concerned with. Old residents will compare the past and present character of the occupants of the houses, and drop many useful hints, which you will not find in your written instructions, the borrower not having thought it necessary to mention them. At times a visit to the local board or vestry hall to inspect the rate-books will be useful, as the rateable values nowadays are usually kept up to date, and, used with caution, are a very good guide as to value. I have always met with courtesy, and at times offers of assistance, at the hands of vestry clerks and their subordinates. Unless you are a ratepayer, a charge of 1s. is occasionally made, but your professional card handed in is frequently accepted as a substitute, the object of the charge being to prevent unnecessary inquiries by busybodies, who, having little to occupy themselves with, are over-concerned about their neighbors' affairs. On going to an unknown district examine the particulars displayed in the windows of the local house agents, usually in the neighbourhood of the railway-station. The results of sales at the Mart are reported in the daily papers and appear weekly in a handy form in the *Builder*.

Where the money to be lent is derived from trust funds it behoves one to be especially careful. The Trustee Act of 1893 throws the responsibility entirely upon the surveyor, as it should do; a trusteeship is a thankless office at best. Trustees are precluded by Act of Parliament from lending upon leasehold property having less than sixty years unexpired. This very much limits the opportunity of investment, and at the present time, when there is so much money always available, it would strike the lay mind as going a little too far on the safe side. It is possible to guarantee the loan made on a property by paying a premium to one of the existing guarantee societies, but, as the income is reduced by the amount of the premium, and they are fastidious in their choice, I am

unable personally to see that they are of much practical use in ordinary everyday transactions one has to deal with. Freehold ground rents are, as you know, a rich man's security. As a fact, they are generally a little cheaper than Consols, although, not being liable to loss on realisation by daily fluctuation or by having the return arbitrarily cut down by Chancellors of the Exchequer, they should be worth a little more. The average ground rent is considered sufficiently secured if it does not exceed one-fifth of the rack rental, but in important sites in the centre of great cities the ground rent will form the greater part of the rack rental.

I fear I have occupied more than its fair share of the time allotted to me to valuations, and must now pass on to the next heading.

Compensation.

Compensation in the sense in which we here use the term is payment for property compulsorily taken in the public interest. The circumstances which may arise are endless. The most frequent are perhaps those arising out of the formation of and additions to railways, the widening of roadways, the acquisition of land for schools, drainage, etc.

The proceedings are governed mainly by the Lands Clauses Acts, which are generally incorporated with the special Acts obtained by the various bodies acting as promoters. This is not the place in which to go into the procedure in compensation cases, which, as a fact, is looked after by the solicitors engaged. The surveyor's work is confined to making the claim, and supporting it in the witness-box falling a settlement privately. The claimant can elect to go to arbitration or before a jury of laymen, and generally chooses the latter. You are all familiar with the conflicting evidence given by eminent surveyors as to value in these cases. Of course, every allowance must be made for bias, over which the professional mind has a limited control, varying with the individual, but in some cases the evidence given would lead one to consider certain people are more than ordinarily affected. However, I think there is little harm done, for if the figures of the promoters and claimant are added and divided by two it is astonishing how closely the verdicts of juries approximate to the result. The young surveyor should be cautioned against the client who has inflated ideas as to his claim, or who imagines that, regardless of the actual value, the more you ask the more he will get. It is you, not he, who will have to go into the witness-box and be cross-examined as to how you arrive at your figures, and he will sit unruined in court whilst you are having a very uncomfortable time. With such clients it is safer to decline to act, or to limit your evidence to such as you can conscientiously agree to, making him understand that it is open to him to go into the witness-box, since he is so satisfied about it himself, to prove it. This generally brings about the result desired.

The ordinary principles of valuation, of course, apply to compensation cases. It is usual to add 10 per cent. to the actual value as the recognised solatium for having to part with your property against your will. In one of the recent draft Bills promoted by the London County Council it was provided that compensation should be paid in certain cases based on the amount which would be required by a 'willing seller.' As this was no doubt intended as a joke, we cannot do better than end compensations with it.

Light and Air.

It is mere trifling to introduce this subject and dispose of it in a few minutes, as I nevertheless am compelled to do in order to carry out my undertaking. You all know how such questions have arisen out of the crowding of buildings belonging to different owners in large cities and towns.

Of all the varied matters with which surveyors have to deal, I think light and air questions are the most unsatisfactory to everyone concerned, not excluding the professional men themselves, who, as far as my experience goes, are never in any way adequately compensated for their services. Those services have generally to be performed under great pressure as regards time, the work is fraught with much worry and anxiety, and if you happen to be on the dominant owner's side you are liable to have to listen to such terms as 'blackmail,' 'blood-sucking,' etc., from brother architects, who

do not want to be interfered with, however much in the wrong they may be. If litigation ensues the proceedings are usually long drawn out, and it is difficult to get the case properly appreciated without models and visits to the premises, which are costly matters. In the end the parties are probably far worse off than if they had settled their differences out of court.

As you are no doubt aware, there have been many methods put forward from time to time for ascertaining the amount of privation of light, but they are theoretical rather than practically conclusive, and the tendency now is rather to rely on the actual opinions of witnesses upon the question of the quality of the lighting before and after the alleged interference.

In endeavouring to make terms privately with your adversary the opportunity of getting an equivalent for the light obstructed by enlarging windows and skylights should be looked for. Glazed bricks are, I think, of doubtful value. They get dirty, peel off, and the amount of light gained from them is, I think, more imaginary than real. Were both sides to employ a reasonable surveyor and be reasonable themselves, I believe there are few cases which need be fought.

I endeavour myself to get these cases referred to a surveyor as sole arbitrator. It is a comparatively inexpensive method of dealing with the dispute, and it is generally speedily settled, the latter point of no little importance where buildings are going up.

I must almost apologise for mentioning the famous case of *Colls v. The Home and Colonial Stores*, so much having been heard of it, and so much more having been made of it, during the last few months. Put into a few words as possible, the House of Lords decided that, provided a sufficient light remained to the building affected, having regard to the use to which it was ordinarily put, no claim for damage could be sustained against the person building. The plaintiffs in the case made a claim for more than a sufficient light, in which they were supported by earlier decisions. The case was, however, of special interest as reviving and re-stating the existing, but dormant, law. The earlier decisions laid down that in order to obtain redress for interference with light you must show the interference to be of sufficient importance to amount to a nuisance, and in the older works on 'Nuisances,' such as 'Gibbons' Law of Fixtures and Nuisances,' you will find the question of light and air dealt with under the heading of 'Nuisances.' As was pointed out in the judgment in the *Colls* case, that which originally was in the nature of a negative right that your light should not be interfered with became gradually looked upon, owing to the tendency of the decisions, as a positive right in the nature of an easement. By its decision in this case the House of Lords brought us back to the point from which we had strayed. The result should, to my thinking, be satisfactory to every fair-minded man. It is the assertion of reason and honourable dealing over selfishness and cupidity.

At the same time, it might be imagined, from the statements one hears occasionally, that this case presented anyone who cares to avail himself of it with a definite charter to do precisely what he pleases in his building operations, as though his neighbour were entitled to no light at all, except such as the chartered gentleman, in the goodness of his heart, allowed him to retain by special favour. I have had people who knew so little of the case that they have scarcely been able to quote the name of it in an intelligible form, quote it against me as though it were a parting shot which settled the whole of my clients' rights, body and soul, for ever.

This, however, is not the case. A man can no more interfere with your rightly-acquired reasonable amount of light now than he could before the case of *Colls v. The Home and Colonial Stores* was tried. In leaving this subject I might mention that one of the lords justices in his judgment spoke approvingly of the value of the angle of 45 deg. as a test, and thereby gave, I hope, a new lease of life to it. It may not be very accurate or scientific, but it is very convenient and time-honoured. It is also readily understood by lawyers.

I may mention in conclusion that a Bill was promoted several years ago, with the combined aid of the Royal Institute of British

Architects, the Surveyors' Institution, and certain eminent lawyers, for the purpose of dealing with light and air matters on the lines of Part VIII. of the London Building Act, which, as you know, deals with party structures. The Bill is, I think, a most excellent one, but a private Bill of this nature is not hurried on, as you know, in Parliament, and I fear it will be a long time before we see it pass into law.

I have now only to thank you for so patiently listening to these, I am afraid, rather disjointed observations."

Mr. W. Woodward said he had much pleasure in proposing a hearty vote of thanks to Mr. Greenop for his interesting and valuable paper, which contained the important quality of humour so valuable in a paper of the kind. Mr. Greenop had given an excellent idea of the three subjects in a condensed form, and he had imparted some valuable information to the members. As to artistic training and the combination of the architect's business with that of the valuer, the quantity surveyor, and perhaps the land surveyor, if they dismissed land surveying as one of the valuable adjuncts to an architect's profession, they certainly ought not to omit quantity surveying. He had had reason to thank his old master for having in the first years of his experience in his office taught him the practice of quantity surveying; not only did it teach a student method, but in after life it enabled an architect to protect the pockets of his client to a considerable extent by the knowledge of measurements, and particularly by a knowledge of prices. A client did not employ an architect to make pretty drawings merely, and an architect could be as artistic with a knowledge of quantity surveying and valuations as he could be with an entire absence of those adjuncts to his profession. The term "surveyor" had been used almost with opprobrium in certain places, but there were surveyors who were not only members of the Association and the Institute, but were men of great artistic attainment. As to light and air matters, in giving evidence in the courts it was just as well carefully to avoid using the word "air," as the lawyers made a point that if a man no law affecting air. We knew that if a man interfered with light he interfered with air, but the law did not recognise that; it recognised it only in conjunction with light. As to Inwood's tables, certain solicitors, to his knowledge, knew how to use those tables as well as any surveyor. As to valuations, the whole thing turned on the surveyor's experience of what number of years' purchase he was to put down after arriving at all other figures, and the number of years' purchase was determined by an inquiry in the locality as to the character of the property. No one could be too careful in reference to the number of years' purchase, for there were many contingencies, such as unlettings, repairs, loss of rental, which resulted in the owner getting no adequate return for his investments. As to valuations, the surveyor was liable, particularly if dealing with trustees, for any error in his calculations or any mishap which might occur in consequence of his recommendations. A friend of his, a Fellow of the Royal Institute of British Architects, was induced by his own father's firm of solicitors to value a riverside property on the Thames. He valued it at 2,000*l.*, but the property was unlet, and proceedings were taken against the surveyor for negligence in preparing his report, and he was put to an expense of 1,100*l.*, although his fee had been only 2*l.* 2*s.* Words should be put in the report such as: 'If the house, or property, is let as such and such a rental to a substantial tenant on a repairing lease, then it will be worth so much.' If some such words were not put in the report the surveyor was likely to get into trouble. As to freehold ground rents, it was important to remember that if the present Government brought in a Taxation of Ground Values or Rating of Ground Values Bill, surveyors would have to be very careful in estimating the value of freehold ground rents and freehold property altogether. Mr. Greenop truly said that the young surveyor should be cautioned against the client who had an exaggerated idea as to the value of his claim. On the principle of adding the two valuations and taking half, it was obvious that the more one put on for the client the better would be the result. This method of

adding the two valuations was often adopted, and it was curious how often the result was an approximation of the real value. As to professional men who gave evidence in light and air cases, he agreed with the author that they were seldom adequately recompensed. If the witness were not a busy man the case might be remunerative, but the busy man who kept himself in readiness to give evidence in a case which did not come on for a long time and then lasted for days was rarely adequately compensated. Models were sometimes desirable in light and air cases, and sometimes, and generally, very undesirable. And as to angles and the determination of the loss of light by angles, he thought that that method was most misleading. Mr. Justice Kekewich held, and held properly, that angles were not the only determining factor in estimating the quantity of light; there was diffusion of light, which was of great importance; and as to evidence as to the number of degrees of light which may be lost or gained, that was very deceptive. The best method was to make a simple drawing. He partly agreed with what had been said as to glazed bricks, but if the use of white glazed bricks was a condition in a light and air case, it should be stated that they must be cleaned down periodically. As to Michelangelo's Taylor's Act, he had had occasion to read through it, and it seemed to provide for everything. When a surveyor was reporting to a solicitor it was very advantageous to state what deductions had been made, what the estimated rental was, and what number of years' purchase or rate of interest they had put down. The solicitor could not afterwards plead ignorance as to the basis of the valuation, and that was an important matter.

Mr. Max Clarke, in seconding the vote of thanks, said that one of the objects of those meetings was to teach the members to speak publicly, and he should like to see the younger members avail themselves more of the opportunity. It was the primary object of the Association that those who were trying to learn their profession should extract as much information as possible out of the lecturer, and especially on such a subject as they were now considering. The lecturer said it was essential in such matters as valuations, compensations, and light and air cases that they should have knowledge, but he did not say how they were to set about getting that knowledge. Did Mr. Greenop's clients suffer when he commenced this sort of work? That he should like to know. Something besides knowledge was required, and that was a feeling of responsibility to the client, and that was somewhat wanting among some architects at the present time. They forgot that they were employed by the client to do a particular thing to the best of their ability for the client. That was one of the first essentials in carrying out the profession of an architect, and still more so in valuation cases, particularly if it was trust money which was being expended on a valuation, for then the surveyor became absolutely liable. Of course, with architecture there was only a moral obligation, but he should like to impress that on them, too. They were useless without this knowledge, and they should devote a little more time to acquiring it. It was one of those occupations which it was impossible to learn in a train with half a sheet of note-paper; on the contrary, they must go about the neighbourhood where the valuation was to be made, and that was where they had a chance of using their brains.

Mr. Louis Jacob said it was a common thing in the case of shops for a little piece of ground to be left in front. That land was of no use for building purposes, and it was left as public property more or less, except that the shopkeepers put their goods upon it. It would be interesting to know how they were to estimate the value of such land. He should also like to know what was the usual basis in arriving at the difference between the value of property (a) in the case of a willing purchaser and a willing vendor, (b) in the case of a forced sale? It was most important to make the most stringent inquiries about property in neighbourhoods which they did not know very well, as some very shady tricks were resorted to in order to deceive the surveyor.

Mr. Green said he appreciated what had been said as to the difficulty of the young man who was called upon to make a valuation.

Mr. Matt. Garbutt said that whenever he

had had to look into a valuation and it had been a question of a client contemplating a purchase, he had found that they started with a high ideal—to use the language of the lecturer—and that was a high ideal of the value of the property for sale. Vendors generally entertained such notions, and one of the things the young valuer had to consider was how he might detect what often amounted to dishonest misrepresentations. Fictitious rental values were common. The tenant in occupation had documents which looked all right on the face of it, but they were dummies, and the rental the "tenant" was supposed to be paying was far higher than the ordinary market price. Should the client buy the place, the tenant disappeared, and when the client went into the open market with his property he suffered. In buying for personal occupation a man might be content with a return which looked absolutely insignificant when viewed in the ordinary way. If a man for his own pleasure put in a lot of decorative work, for instance, it frequently happened that if the property were sold it would not go for a figure proportionate to the actual cost. The question of the class of property had to be remembered particularly; if they were dealing with big residential property they must be careful to think of the possibility of the neighbourhood going down and the consequent fall in value. Property, on the other hand, which was exceedingly small and poor in character might be relied on to keep full of tenants, but then there were the stringent sanitary and other regulations, which involved landlords in large and frequently-recurring expenses, cutting down, sometimes almost to a vanishing point, the value of property which otherwise looked rather tempting.

Mr. John Murray, who had taken the chair in consequence of the President being compelled to leave the meeting, in putting the vote of thanks, said that to carry on an architectural practice successfully in these days it was advisable for an architect to have considerable knowledge of these subjects. In architectural design appearances were of importance, but in valuations they were apt to be very deceptive, and correct valuations could be arrived at only by considering many facts which were hardly discernible at once, and then it was that judgment, aided by knowledge of the world and some study of human nature, was so useful. It was also necessary to be up to date in these matters, and to keep a sharp look-out on what was going on around. The value of property was usually based upon the use to which it could be put and the return that such use would produce. As to compensations, he would advise younger members to be careful to have a proper basis for all assertions made in connexion with compensation values. The difficulties as to light and air were no doubt known to most of them, and it was desirable to keep in mind the words of the law, i.e., "it is not sufficient to say that it will alter the plaintiff's lights." "The law says it must be so near as to be a nuisance"—and a nuisance was a matter of opinion. When the Bill proposed by the Institute and others became law it should materially assist in the solution of these difficult questions.

A member said that if some of the young members had the same opportunity that the elder members had of seeing a proof of the paper before the day of the meeting more of them would take part in the discussions. The Chairman said that the supply of proofs was limited, and if each member received a proof before the meeting he was afraid that the lecturer would sometimes not have much of an audience, as members would not trouble to attend if they had the chance of reading the paper beforehand. But if a member wished to speak on any subject he would be supplied with a proof at any time. The vote of thanks was then heartily agreed to.

Mr. Greenop, in reply, said it was quite correct to say that they could not make a claim for air as distinct from light. But it was usual to tack it on to light, for there was a possibility that where light was interfered with the free passage of air was also. As to Mr. Woodward's friend who was mulcted in damages of £1,000, the first mistake he made was in taking on a job like that for a 2½% fee. A large part of the fees was for risks of having to

do some day what Mr. Woodward's friend had to do. The first thing that ought to have been done in that case was to estimate the rental value having regard to the fact that the property was empty. The neighbourhood might have gone down and property of the kind no longer be wanted. A careful man would have made inquiries in the neighbourhood. As to ground values and taxation, people who talked about taxing ground rents or values were either ignorant people or the demagogues who fattened on them, for ground rents were very much taxed now. A rack rental included ground rent, which paid local rates and imperial taxes, and what some people seemed to want was that the ground should be taxed twice over. On the question of taxing unused sites, the whole point of the 1869 Act was that property should only bear its burden of taxation when it was producing profit, and that was why charitable institutions and churches and chapels were not taxed, though if those buildings were used for profit-making purposes they were. As to the angles in light and air cases, the fallacy of the angle of 45 deg. was that a room might not be used at the time of day when it got the angle of 45 deg. Still, there was a value in adopting the angle of 45 deg., for lawyers understood it. He always advised clients if they could get an angle of 45 deg., not to proceed further with their objections, for it was no good going into court. As to whether his clients suffered when he commenced valuation work, he hoped they did not. When as an assistant he was sent to look at property in order to report to his master, he used to think how he should act and what he should do if these were his own jobs. His employer soon noticed that he studied the various matters for himself, and asked him for his opinions. When he started for himself, therefore, he felt as though he had been at the work all his life. Another practice he made was, if he had any doubt about matters of this sort, to think what he should do if he were about to lend his own money. If they always answered that question conscientiously they were not likely to make the client suffer. As to the question about the space in front of a shop, in estimating the value it should only be taken as a place for putting goods upon. As to how they should describe property if advising trustees, he advised them to keep closely to the wording of the instructions. They should not take the least responsibility beyond what the instructions pinned them to. They should answer the requirements closely, but should not talk about property being suitable unless asked to do so. One should not speak definitely as to matters which were not within one's personal knowledge. In buying for personal occupation one might give a fancy price, and not infrequently one again obtained a fancy price.

The Chairman said that the next meeting would be held on the 27th inst., when Mr. Walter Cave will read a paper on "Fenestration."

The meeting then terminated.

A MELBOURNE ARCHITECT ON COMPETITIONS.

A CORRESPONDENCE which is inserted in the last issue of the *Journal* of the Royal Victorian Institute of Architects is of sufficient interest to be worth quoting. A Melbourne bank which intended to build new offices addressed the following letter to a certain number of architects:—

"— Bank, Melbourne.
December 19, 1905.

DEAR SIRS.—My directors are considering the advisability of altering the building now occupied by the bank, and have decided to ask several architects to submit plans of the alterations which they think should be made.

I am directed to ask if you are willing to submit such a plan, in terms of inclosed memorandum, on the conditions that the architect whose design is adopted by the board will be employed to carry out the work, and that none of the other architects are to receive any remuneration for their designs, but will be entitled to have their plans returned.

The directors do not bind themselves to accept any of the plans submitted.

Yours faithfully,

Manager."

Then followed a general statement of the requirements for the building. From one of

the firms thus addressed the manager received the following reply:—

"DEAR SIR,—We are in receipt of your letter of the 29th inst., inviting us to submit designs for alterations to the building now occupied by the bank, in competition with several other architects. Our experience in this class of work is that the best results can only be obtained by the architect and proprietor being perfectly in touch with one another in working out the best way of meeting all requirements.

In the case of a competition, this condition cannot obtain, because the several competitors (in the interests of fair play) must necessarily be kept to a certain extent "at arm's length" from the proprietor.

If you should see fit to select an architect to act for you in the way above indicated, and should we have the honour of being selected, we should be prepared to exhaust the possibilities of the case by as many alternative sketch designs as might be necessary to obtain finality—only charging you our commission on the cost of carrying out the plan ultimately adopted.

Should you, however, still desire competitive designs, our views are so definite as to the correctness of the principle above laid down, that, while we thank you for the honour done us, we must respectfully decline to compete.

Yours faithfully,
— & —"

The matter came before the Council of the Victorian Institute, who, after commending the architects for the stand they had taken, passed a resolution that the correspondence should be inserted in the *Journal*.

THE SANITARY INSPECTORS' ASSOCIATION:

HYGIENE IN SMALL TENEMENTS.

AT Carpenters' Hall, on Saturday last week, before a meeting of the South-Eastern Centre of the Sanitary Inspectors' Association, Mr. John H. Clarke (Chief Sanitary Inspector, Chiswick) read a paper on "Hygiene in Small Tenements." He said that the present state of the law in regard to landlord and tenant was often a great hardship upon the small property owner. Wealthy owners might do much more to alleviate the unhappy conditions of housing in certain directions, but, on the whole, the majority did discharge their duties satisfactorily. Referring to the powers of sanitary inspectors, the lecturer said that notwithstanding the adverse decisions of the courts as to power of entry, he was in the happy position to state that during a period extending over fifteen years as a sanitary inspector he had never yet been refused admission to a small tenement, which was most gratifying, having regard to the circumstances which frequently necessitate such an inspection. He did not presume to suggest that the system adopted in his own department was by any means original, knowing as he did that a vast amount of earnest and good work was carried on by sanitary inspectors in every district so far as they were able in discharging the variety of duties which they were called upon to perform, and the inadequate methods which existed in many health departments, and which did not tend to cultivate that zealous interest which every assiduous officer should possess and take credit for.

For the purpose of systematic inspection he had allocated certain areas for inspection each month throughout the year, and under this system 2,250 artisan dwellings were inspected last year, out of which 907 were double tenements, the mode of inspection including particulars as to sanitary defects, population, and other general details which enabled them to check overcrowding, and to register all tenements not kept in a satisfactory condition, and which were consequently inspected from time to time until an improvement was attained. These duties, performed with tact, had resulted in a marked improvement throughout the district, and tenements which were once the object of indescribable filth were now in a much better sanitary condition, and the tenants were induced to take some interest in cleanliness. The inspections referred to were arranged to cover practically the whole of the artisan areas in his district, with a population of 15,175, of which 4,740 were children under twelve years of age. The infantile death-rate of this population during the last year was 118·2 per 1,000 births registered in the area of the working classes, and how many of these deaths arose from preventable diseases he was not prepared to state, but

it was certain that a large number of deaths had occurred from conditions which could be remedied if parents realised more fully the necessity for cleanliness and judicious feeding. On the contrary, the infectious diseases notified from these areas had decreased to 155 last year as compared with 267 in 1896. Whether that was due to systematic inspections or not the fact remained that nuisances of every description were promptly dealt with, and the districts in question must consequently be healthier and the material for the propagation of infectious diseases ceases to exist.

THE ARCHITECTURAL ASSOCIATION SPRING VISITS:

VI.—NEW SCOTLAND YARD EXTENSION.

THE sixth spring visit of the session, held on Saturday, 7th inst., was an interesting occasion to those members of the Architectural Association who attended, as facilities were given for viewing an important public work—an extension to New Scotland Yard.

As in the older building, Mr. Norman Shaw, R.A., has designed the new block. Most of the working drawings, however, were prepared in the office of Mr. J. Dixon Butler, the police architect, whose presence at the visit under notice added materially to the success of the gathering. The design generally is a reproduction of the older work adapted to fit the limited area at disposal. The façades of the Embankment and the private road are shorter than the corresponding fronts of the existing building, and only the north-east angle of the latter, including gable and turret, is now reproduced. Other features, based on the present work, are introduced in prominent positions, but the whole extension interrupts the peculiar isolation which has for so long constituted one of the great values of the original offices.

The nature of the site involved structural difficulties of considerable magnitude. Chief among them is the carrying of parts of the south and east fronts on iron stanchions and girders above the District Railway and Westminster Bridge Station. In many instances, however, it is a welcome sight to observe massive blue-brick piers performing mighty acts of support in places where slender iron columns are nowadays so generally found. The accommodation consists principally of offices and stores, numbering approximately one hundred rooms, disposed throughout ten stories. Varying floor levels have been well arranged with the respective staircases and entrances.

Dartmoor granite is used for facing the three lower floors, varied with Cornish granite in the large doorways. The upper stages are finished with red brickwork, five courses to the foot, relieved with Portland stone bands and moulded window dressings, while the roofs are covered with green Westmorland slates. Internal construction is, of course, fireproof, the floors being finished with solid wood blocks and red-tile borders, 18 in. wide—a very attractive method for the particular purposes of the building. The barrel-vaulted ceilings in the main corridors are turned in brickwork.

The principal feature of the extension is, perhaps, the bridge connecting the old and new buildings. This is 60 ft. long, and consists of a covered way, carried on a massive granite arch of 35 ft. span. The general design follows that found on the present building at the same level. As an echo of this feature, the upper end of the private road will have a granite wall with large rusticated piers and wrought-iron gates. Arched openings will span the footways, and the piers will have massive lead urns.

The party of members afterwards assembled at the new police courts and station in Old-street, Shoreditch, recently completed from Mr. J. Dixon Butler's design. Again the architect explained the scheme, giving full information upon the planning and materials used. The accommodation comprises police offices with cells for prisoners, two courts and a duplicate set of magistrates' rooms, clerks' offices, prisoners' waiting-rooms and cells, etc. Portland stone, red brick, and Cornish granite are again the materials employed upon the exteriors, while a good modern feeling for breadth characterises the design of the interiors. The planning is most successful for a work of

this nature where some rooms are used in common with the two departments, and have yet to be arranged for separation upon occasion. It is not possible at the present time to fully describe the work, but it will be seen that this is, perhaps, one of the most important and successful police buildings in London of recent years.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Alderman Evan Spicer, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Bermondsey Borough Council 4,345*l.* for electric lighting purposes; Camberwell Borough Council 3,000*l.* for an open space, 685*l.* and 1,507*l.* for housing purposes, 1,750*l.* for laying out an open space, and 1,236*l.* for street improvement; and St. Marylebone Borough Council 48,545*l.* for electric lighting. Sanction was also given to the following:—**Borrowing** by Chelsea Borough Council 22,500*l.* for the erection of additional municipal offices; and borrowing by Westminster City Council 3,421*l.* for sewer reconstruction work, and 4,600*l.* for housing purposes.

Jobbing Works—Schedules of Prices.—The General Purposes Committee reported as follows:—

"Paragraph 13 of the order of reference of the Works Committee provides that the estimates, measurements, and certificates of the several certifying officers in respect of jobbing works shall be based upon schedules of prices agreed upon between the manager of works and the several supervising officers and approved by us. We have to report that we have approved such a schedule for use in connection with the certification of accounts for drainage and sanitary works executed by the Works Committee at schools. This schedule is based upon the schedule of 1902 for repairs to buildings executed under the supervision of the architect (Education), and upon the addendum thereto of 1905, and provides for an addition of 12½ per cent. to the prices in such schedule and addendum.

Mr. E. Collins moved, and Mr. Hunt seconded, that the paragraph should be referred back. It was unfair that there should be an addition of 12½ per cent. to the prices in the schedule. The schedule was already very high.

Sir Thomas Brooke Hitching said that the cost of building was much lower to-day than it was four years ago, and yet it was proposed to add 12½ per cent. to the schedule. In the open market the work would be done at the schedule price.

Canon Jephson said that the Works Department was simply doing what contractors had done over and over again.

Mr. Buxton said that they were told, when the Department was started, that they would be able to do away with the alleged huge profits of the contractors, and yet they were now told that what the Committee proposed was what contractors were doing.

Mr. McKimmon Wood said that the Department did the work at cost price.

Mr. E. White said that when work was put out to tender it generally cost less than the estimated cost of the responsible officer. He should like to know who prepared this schedule, and how old it was. He thought that 12½ per cent. was too high, but everything would depend on the schedule, and as to that the Council were in the dark. It was a sort of confidence trick, the Council being asked to trust the Works Department.

Mr. Gilbert said that the schedule was the School Board schedule of 1902.

Mr. Cautrey said that contractors who did work for the late School Board generally tendered at about 12½ per cent. above the schedule.

The motion was defeated, and the paragraph approved.

Proposed Schools.—The Education Committee reported as follows:—

"The Board of Education on May 27, 1902, sanctioned the erection of a school for the accommodation of 800 children, on the site in sub-division K of the West Lambeth (School Board) division, and compulsory powers were subsequently obtained over a site in Lawn-lane (Kennington). The total cost of erecting the school is estimated at 20,352*l.*

The Board of Education on August 6, 1901, sanctioned the erection of a school for the accommodation of 800 children in sub-division 4G of the West Lambeth (School Board) division, and compulsory powers were subsequently obtained over a site in Fountain-lane, Gerrard-lane, which is known as the Fountain-road site (Wandsworth). The total cost of erecting the school is estimated at 21,414*l.*

The Board of Education on July 27, 1901, sanctioned the erection of a school for the accommodation of 800 children in subdivision AR of the West Lambeth (School Board) division, and compulsory powers to obtain a site in over a site in Franciscan-road (Wandsworth) for the purpose.

The total cost of erecting the school is estimated at £19,600. The cost of the proposed special school is estimated at 3,762.

The Board of Education on January 23, 1900, sanctioned the erection on the Janet-street site (Poplar), of a school for the accommodation of sixty twenty-five children. The cost of the proposed special school is estimated at 3,762.

As regards the Law-lane and the Franciscan road schools, the Board of Education have approved the preliminary plans, but state that they consider the provisions of rooms for drawing and science unnecessary at these elementary schools. We are carefully considering this matter, and will submit a report thereon at a later date. If these rooms be omitted from the plans, the estimate, in each case, will be reduced. In the remaining two instances the consent of the Board of Education has been received to the preliminary plans of the proposed schools.

We do not propose at this stage to commit the Council to any expenditure beyond that involved in preparing detailed plans, etc. When tenders have been invited, we will submit the necessary estimates of the whole cost of the proposed works. We recommend—

That the estimate of expenditure on capital account of 1,562, submitted by the Finance Committee in respect of the preparation of working drawings, etc., in connexion with the schools proposed to be erected on the reconstruction sites, be approved:—(a) Kennington—Law-lane (new school); (b) Wandsworth—Fountain-road (new school); (c) Poplar—Franciscan-road (new school); (d) Poplar—Janet-street (special school).

The recommendations were agreed to.

Cost of Erecting Schools.—The Education Committee reported as follows:—

We submitted a report on December 5, 1905, with reference to the plans of new public elementary schools proposed to be erected on sites in (i) Law-lane (Kennington), (ii) Fountain-road (Wandsworth), and (iii) Franciscan-road (Poplar). We also submitted a special instruction on the Janet-street site (Poplar).

The Council, however, postponed the consideration of our recommendation in order that an inquiry be made into the cost of erecting public elementary schools, with a view to ascertaining whether it would be possible to effect any economies in the erection of school buildings.

On February 2, 1906, a report was presented with reference to this question, but our original recommendation respecting the preparation of plans was again postponed until we had submitted a further report on the subject.

The particulars of the accommodation of the proposed new elementary schools are as follows:—
(i) Kennington—Law-lane: New school—Boys, 256; girls, 256; infants, 228. (Three-story building planned for enlargement.) Halls—Boys, girls, and infants, 40 ft. by 28 ft. (Three-story building.) Classrooms—50, 48, 48, 40, 40, 40, boys, girls, and infants. Drawing classroom and science room, each 580 sq. ft. Area of playground on top of school building for girls. Heating by open fires and low-pressure hot-water apparatus. Ventilation by tobin inlet tubes and extract shafts. Area of site, 32,380 sq. ft. Area of playgrounds—Boys, 30 sq. ft. per child; girls and infants, 27 sq. ft. per child, including girls' playground on top of building. It is also proposed to erect a schoolkeeper's house.

(ii) Wandsworth—Fountain-road: New school—Boys, 275; girls, 275; infants, 290. Total, 840. (School planned for enlargement.) Halls—Boys', 57 ft. by 27 ft. 6 in.; girls', 41 ft. by 26 ft. (Two-story building.) Classrooms—Boys', 50, 45, 45, 45, 45; girls', 50, 45, 45, 45, 45. Drawing classroom and science room, 620 ft. area each, over halls. Infant's playhouse (building), hall, 54 ft. by 26 ft. 6 in.; classrooms, 50, 48, 48, 48, 48. Heating by low-pressure hot-water apparatus and open fires. Ventilation by windows, tobin inlet tubes, and extract shafts. Area of site, 86,900 sq. ft. Area of playgrounds—Boys', 75 sq. ft. per child; girls and infants, 70 sq. ft. per child. It is also proposed to erect a schoolkeeper's house.

We have again related this matter very careful consideration and have had the advantage of a conference with representatives of the Works Committee in regard to the specifications for the three new schools. It is the opinion of the Council that the meeting held on March 30, 1906, and which was also attended by some members of the Council interested in the construction of schools, the representatives of the Works Committee, and various other directions in which, in their opinion, the Council might, without materially reducing the efficiency of the schools, effect a reduction in their cost. These suggestions submitted by the Committee for their reference to works of any particular manufacturer; constructing the offices and covered playgrounds in a less costly manner; providing boarded flooring on the West Lambeth site; and for the heating installation to be tendered for by selected firms, who will submit their own scheme under a guarantee; using blue lias mortar instead of cement; and grouting the concrete for sills and copings, etc.

Four months have elapsed since we first brought our proposals before the Council, and on each

occasion on which our report has been considered, we have pointed out that there is very urgent need for the provision of elementary school accommodation, especially in the Wandsworth electors area. At the present moment temporary accommodation is provided in the district for 1,115 children, but, nevertheless, there is still a considerable number of children out of school. The provision of accommodation, and building operations are progressing very rapidly in the district. We desire particularly to emphasise this fact, and to remind the Council of the seriousness of further delay. The provision of such accommodation which the Council is under statutory obligation to secure. In order that steps with this end in view may be taken at the earliest possible date, specifications should be prepared embodying the modifications outlined above. We propose, in carrying out the works, that the specification as thus modified should be adopted. At the same time we suggest that tenders should be obtained, based upon both the original specification and the specification as now revised. The Council will thus be made aware of the actual saving that can be effected by the modifications proposed.

The subjoined table shows in detail the modifications, together with the estimated saving in respect of each item, so far as the Law-lane school is concerned.

(1) Fittings to teachers' and children's water-closets of a less costly nature	£290
(2) Board flooring rebated and secret nailed to the concrete to be substituted for wood-block flooring	160
(3) Blue lias mortar to be used for brickwork and concrete, except in the case of isolated piers, chimney stacks, and work below ground, and also in cases where the nature of the sites require foundations to be built in cement	272
(4) Stocks to be specified as "good best" stocks, and not as "picked"	10
(5) Stone curbs to be reduced and gravel fill to be used for sills and copings (general architectural features) instead of stone	390
(6) Drains underneath school buildings (if any) to be in iron, or other pipes outside building to be in stone	175
(7) Yellow deal for framing, and white deal for panels of cupboards, instead of pine, and also less expensive wood throughout the school, with the exception of the roof timbers	25
(8) Railings of a cheaper design	5
(9) Cheapening cost of playsheds, and substitution of iron columns for brick piers where possible	200
(10) Plaster to be specified as "render" and "set" instead of render, float, and set. Plaster carried to be omitted, and wood frieze moulding without cornice to be specified instead	108
(11) Providing salt-glazed down-pipes instead of perforated iron water-closets	151
(12) Omit N.A.P. fittings to windows and substitute running gear for window gearing	100
(13) Eight-inch galvanised iron cisterns in lieu of Alexander's pattern	11
(14) Screws only to glazing beads in lieu of cups and screws	10
Total estimated reduction	1,875.

Similar modifications with it is understood, effect a reduction of £1,990 in cost of each of the two schools in Wandsworth. The total cost of erecting the first portion of these schools, including furniture, fittings, and certain provisions for the completed school, and based upon the specification hitherto adopted, was estimated by the architect (education) at £20,332, £21,414, and £19,692 respectively. It will be seen, therefore, that the modifications now proposed will effect a substantial reduction in the cost of these schools.

In submitting these views to the Council, we think it right to point out that although a considerable monetary saving will be effected, this will be done at the cost of some sacrifice. Inasmuch as materials and work of a somewhat less high character will be provided for. We do not think, however, that the substantial efficiency of the schools will be impaired, although possibly in some details their appearance may suffer. We have some doubts whether their appearance will be not yet effected all the savings in expenditure which we think may be made in the erection of schools generally, as if modifications in the elevations and in cost throughout the whole building. We are applying ourselves to this large question, and will report again on the subject at an early date. We suggest, however, that in the three cases in question the Council should authorise us to proceed without further delay, as the modification of existing plans will necessitate very great delay and also involve considerable expense. We recommend:—

That modifications be made in the specifications for the new schools proposed to be erected on the sites in Law-lane (Kennington), Fountain-road (Wandsworth), and Franciscan-road (Wandsworth), as indicated in the foregoing report, and that tenders be invited, by public advertisement, for the erection of the schools based upon the alternative specifications.

Mr. Phillimore moved, and Mr. Hardy seconded, to refer back Nos. 2, 7, and 10 of the modifications on the ground that he did not agree with the proposals.

Mr. Stephen Collins, M.P., said he hoped the Committee would seriously consider before they did away with wood blocks, which were far preferable to simple board flooring laid on concrete; and several other members of the Council expressed the same opinion. Canon Jepson said that the report was in the nature of a compromise, and he sincerely hoped that it would be dealt with one way or the other that day. The work was pressing.

The Chairman of the Committee, Mr. Shepherd, read a letter from the Architect

(Education) against the proposal as to floors (No. 2).

Mr. Howell J. Williams said that straight board flooring laid on concrete was rapidly taking the place of wood block flooring, and he strongly recommended the economy.

Items 2, 7, and 10 were then put separately as amendments, and No. 2 was referred back and 7 and 10 were retained. The recommendation, as amended, was then agreed to.

Site for Training College.—The Education Committee recommended as follows, and it was agreed:—

"(a) That the estimate of expenditure on capital account of £5,502, submitted by the Finance Committee, in respect of the purchase of a site for the establishment of a training college for teachers, be approved.

"(b) That a training college for teachers be established in the north-east district of London, capable of accommodating 200 students."

Aldwych to Islington Electric Tramways.—The Highways Committee recommended, and it was agreed, after discussion:—

"(a) That the estimate of expenditure on capital account of 46,500, submitted by the Finance Committee, for the underground conduit system of electric traction, of the proposed extension of the Aldwych to Islington tramways from the Angel, Islington, and High-bury-street, to High-bury (N.L.R.) Station, namely:—

Trackwork, including rails, special work, etc.	£45,000
Cables, cable-ducts, and switchboard panels, etc.	3,500
Total	£46,500

"(b) That expenditure, on capital account, not exceeding £2,204, be sanctioned for the supply of the special trackwork required for the reconstruction of the tramways from the Angel, Islington, to High-bury (N.L.R.) Station.

"(c) That, subject to the approval of the Board of Trade being obtained to the system of electric conduit traction proposed to be adopted on the tramways, the offer of the Halford Steel Foundry Company, Limited, to supply, for a sum of £2,204, the special trackwork for the reconstruction of the tramways from the Angel, Islington, to High-bury (N.L.R.) Station, for electric conduit traction, be accepted; that the solicitor do prepare and obtain the execution of, a contract to give effect to the arrangement; and that the seal of the Council be affixed to the contract."

Tramways between High-street, Lewisham, and Lee Green.—They also recommended, and it was agreed:—

"(a) That the estimate of expenditure on capital account of 39,500, submitted by the Finance Committee, be approved in respect of the construction, for the underground conduit system of electric traction of the tramways authorised by the London County Council (Tramways and Improvements) Act, 1904, from High-street, Lewisham, via High-road, Lee, and Lee Green, to Lee Green, namely:—

Trackwork, including rails, special work, etc.	£36,000
Cables and cable-ducts	3,500
Total	£39,500

"(b) That the estimate of expenditure on capital account of 27,000, submitted by the Finance Committee, be approved, in respect of alterations to fittings necessary in connexion with the construction of a electric conduit tramway from High-street, Lewisham, to Lee Green."

Flood Relief Works.—The Main Drainage Committee recommended, and it was agreed:—

"That expenditure on capital account not exceeding 100,493. 5s. 4d. be sanctioned in respect of the construction of the Bermondsey and Southwark storm relief sewer, exclusive of that portion now in course of construction by the Works Committee; that the tender, amounting to 100,493. 5s. 4d., of the Tibour Contracting and Dredging Company, Ltd., in respect of the work, be accepted, subject to the names of satisfactory firms being submitted for the supply of ironwork, etc."

Vauxhall Bridge.—The Improvements Committee reported as follows:—

"The Council, on May 19, 1903, upon the recommendation of the late Bridges Committee, approved the design, then submitted, of the new Vauxhall Bridge and the proposed architectural and artistic treatment of the same, but reserved for future consideration the question of erecting propylæa on the abutment piers. Models have been prepared and designs submitted to us for propylæa which are suitable for erection on the bases as now constructed. We have therefore to the question whether any artistic treatment at all of the abutments should be attempted, we think that, unless something be done in this direction, the bridge will appear in every way incomplete and unsatisfactory. The alterations are, therefore, presented either of erecting propylæa on the abutments or of covering them with large groups of statues. There will be little difference in cost of the two schemes, and as, in our opinion, the erection of propylæa will produce a much better effect than groups of statues, we recommend that the Council should sanction the erection of propylæa. We have caused the models of the same, to be placed in the lobby of the Council chamber. One of the models (No. 1) is square and of plain design, of the other (No. 2) has rounded ends and some decorative treatment of the sides. The

total estimated cost of erecting, in granite, propylæa for both approaches to the bridge, in accordance with design No. 1, would be 12,600*l.*, while, if design No. 2 be adopted, the cost would be 15,120*l.* We think that design No. 1 would be in greater harmony with the general features of the bridge than No. 2, and we propose that it should be adopted, but we would ask the Council to authorise us, if necessary, to introduce some slight modification on the Lambeth abutment. We have also considered the arrangements to be made for the erection of suitable figures on the summits of the propylæa.

Mr. Alfred Drury, A.R.A., has been engaged in collaboration with Mr. F. W. Pomeroy, A.R.A. (Mr. Drury being the contracting artist), to model and cast the piers for the piers of the bridge, and we consider that he should also be entrusted to design and provide the figures for the propylæa. He is prepared to provide four subjects, different in design but in harmony with each other, in a composite material, for a total sum of 2,800*l.* The material, which we are advised is an excellent one, has been used, amongst other works, for the fountains at Versailles and for works at Hampton Court. We think that Mr. Drury's offer should be accepted, but that Mr. Bertram Pomeroy, who was originally suggested by the Bridges Committee to collaborate in the work, should be associated with him in the provision of two of the groups. The unexpended balance of the several votes passed by the Council for the construction of the bridge is amply sufficient to cover the cost of the works proposed, and we recommend:—

(a) That expenditure on capital account not exceeding 15,400*l.*, be sanctioned for the erection of propylæa, with suitable groups of statuary thereon at both approaches to Vauxhall Bridge.

(b) That granite propylæa be erected at both approaches to Vauxhall Bridge, in accordance with design No. 1 submitted to the Improvement Committee on March 28, 1905; and that the Committee be authorised to arrange for minor modifications of the design of the structure on the Lambeth abutment and for the execution of the complete work.

(c) That the solicitor do prepare and obtain the execution of an agreement with Mr. Alfred Drury, A.R.A., for the modelling and casting of a total cost of 2,800*l.*, of four groups of statuary, to be placed on the propylæa; that Mr. Bertram Pomeroy be associated with Mr. Drury in the case of two of the groups; and that the seal of the Council be affixed to the agreement (in duplicate).

As to the decorative treatment of the bridge, the Committee reported as follows:—

"This model to a scale of $\frac{1}{4}$ in. to a foot has been prepared to show in effect the decorative treatment of the finished structure, and the principles which guided the composition as a whole. It will be observed that the constructive steelwork has been accepted in its mercantile form and treated in the most legitimate manner, such artistic value as obtains being dependent solely on the fine sweep of the balustrade from end to end, and the bold curved projection to the footways. The decoration, which is in the hands of sculptors of distinction, and is thus of the best quality obtainable, is employed sparingly, and only to such parts as are of considerable importance in the design. The approaches, for example, are marked with granite propylæa rising to a height of 56 ft. from the pavement, crowned by symbolic decorative figures, while the points of support, over the cutwaters, are treated with bronze figures representing science, fine arts, local government, engineering, architecture, agriculture, education, and pottery. The foregoing treatment of the monument of the work is, it is submitted, justified on both economical and artistic grounds, for it will be seen that when the whole of the decoration is paid for, including the sum required for the proposed propylæa at both approaches, a balance of about 25,000*l.* on the sum voted for the original structure will remain. The result, it is thought, is such as will assure a dignified and satisfactory effect, worthy of the important work it is intended to complete."

The consideration of the matter was postponed.

Mansell-street.—The Swan Public-house.—The Improvements Committee reported as follows:—

"The widening of Mansell-street is being executed by agreement with the owners of the property required, the Stepney Metropolitan Borough Council having undertaken to assist by exercising, if necessary, any statutory powers which it may possess for the compulsory acquisition of property in these cases where the Council's negotiations are unsuccessful. Terms were agreed for the purchase of the portion of the site of the Swan public-house needed for widening the road to 50 ft. It was arranged that this width should be measured from the front of the buildings on the buildings on the opposite side of the road, but the premises were rebuilt with the frontage 50 ft. from the frontage of the buildings on the opposite side of the road, and not, as arranged, 50 ft. from the front of the forecourts. In cases where the Council acquires only a portion of a property for widening the road it is the practice to give the owners notice when it is proposed to rebuild the property, so that the Council's officials may be present when the new line of frontage is set out. In the absence, through illness, of the architect acting for the owners of the Swan public-house, the line of frontage was set out by one of his assistants without informing the Council of his action. The Council's officials thus did not know that the premises were being re-erected until the work had been practically completed. We are advised that, as the Council allowed the building to be erected without protest, it is for the specific performance of their contract, by setting back the frontage to the proper line, would be successful. The encroachment on the land purchased for the improvement is about 2 ft. 3 in. in depth, and comprises an area of about 33 sq. ft. As the result of prolonged negotiations, we have agreed with the owners of the property for the deduction, owing to this encroachment, of

500*l.* from the purchase money payable to them, and that when the premises are rebuilt the frontage shall be set back to the proper line without further compensation. This sum represents almost twice the *pro rata* cost of the land which has been unlawfully built upon, calculated on the basis of the total amount payable to the owners in respect of their interest in land and the disturbance to their trade, but excluding the cost of rebuilding. We recommend that the arrangement under which, in consequence of an encroachment upon land acquired for the widening of Mansell-street, 500*l.* has been deducted from the compensation payable to the owners of the Swan public-house, No. 54, Mansell-street, be confirmed."

An amendment was moved to refer the matter back, and this was carried.

Avery-hill—Refreshment House.—The Parks and Open Spaces Committee recommended that expenditure not exceeding 2,500*l.* be sanctioned in respect of the provision of a refreshment house, including all incidental charges, at Avery-hill.

Lord Welby, on behalf of the Finance Committee, moved as an amendment that the expenditure should not exceed 1,000*l.* He saw no reason why they should build a palace with marble halls in which children could eat penny buns.

Sir Algernon West, in seconding the amendment, said the Council had bought a white elephant in the shape of Avery-hill, on which they had already spent an enormous sum of money, and were committed to spend more in converting the vulgar palace erected by a former owner into a training college. The place was too far away to be of any use to Londoners.

A show of hands resulted in a tie, and on a division the amendment was carried by 40 votes to 34. After a further discussion the whole matter was referred back for reconsideration.

Ruskin Park—Laying-out Works.—The Parks and Open Spaces Committee recommended, and it was agreed, that the estimate of expenditure on capital account of 4,910*l.*, submitted by the Finance Committee, be accepted in respect of the laying out of Ruskin Park.

Proposed New Tramways—Widening of Blackfriars Bridge.—The Parliamentary Committee recommended, and it was agreed, that the solicitor do complete the agreement with the City Corporation with regard to the widening of Blackfriars Bridge and the construction of tramways thereon, and that the seal of the Council be affixed to the agreement.

Having transacted other business, the Council adjourned until May 1.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

THE London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Kensington, South.—An addition to the porch in front of No. 9, Cambridge-place, Victoria-road, Kensington (Messrs. Totten & Willett for Messrs. Slingson, Rushforth, & Co.).—Consent.

Kensington, South.—Retention of a projecting sign in front of No. 184, Brompton-road, Kensington (Messrs. Boyton, Sons, & Trevor for Messrs. Cox & Yeman, Ltd.).—Consent.

Marylebone, East.—An iron-and-glass shelter in front of St. George's Hall, Langham-place, Marylebone (Mr. J. G. Buckle for Mr. J. N. Maskelyne).—Consent.

Woolwich.—A porch in front of Nos. 33 and 35, Plumstead-common-road, Plumstead (Mr. F. J. Gurney for the Plumstead-common-road United Conservative and Unionist Club).—Consent.

Battersea.—Porches to five houses on the eastern side of Latchmere-road, Lavender-hill (Mr. W. L. Ingram for Mr. J. Jenkins).—Consent.

Fulham.—The retention of an iron-and-glass hood over the entrance to an iron-and-glass house on the entrance to No. 22, West Kensington-mansions, North-end-road, Fulham (Messrs. Clarke & Co.).—Consent.

Kensington, South.—Retention of an iron-and-glass porch in front of No. 4, Addison-road, Kensington (Mr. E. K. Purchase for Mr. A. du Cros).—Consent.

St. George, Hanover-square.—The bringing forward of the frontage of No. 142, Brindley, and the erection of a porch and balcony in front of such building (Messrs. Thurogood & Martin for Miss A. de Rothschild).—Consent.

Strand.—A deviation from the plans approved for the erection of two glass-and-iron shelters at the Aldwych Theatre, to abut upon Aldwych and Drury-lane, Strand, so far as relates to an

alteration in the construction of the shelter at the main entrance to the theatre (Mr. W. G. R. Sprague).—Consent.

Dulwich.—That the application of Mr. W. L. Ingram for an extension of the period within which the erection of six houses and shops on the site of No. 174, Lavender-hill, and houses on the east side of Latchmere-road, Battersea, was required to be completed, be granted.—Consent.

Nevington, West.—Two iron-and-glass shelters at the Kennington Theatre, Kennington-park-road, Nevington (Messrs. McVey & Co. for Mr. R. Arthur).—Refused.

Strand.—An iron-and-glass shelter in front of Nos. 161A and 166, Strand (Mr. R. J. Worley for The Colonade, Ltd.).—Refused.

Chelsea.—A porch in front of No. 213, King's-road, Chelsea (Mr. D. Blow).—Refused.

Dulwich.—Buildings on the north side of Half Moon-lane, Dulwich, to abut also upon Holmdene-avenue (Mr. W. Graham for the trustees of the late Henry Fisher).—Refused.

Width of Way.

Camberwell, North.—Dwelling-house and a one-story office building on the western side of Harvey-road, Camberwell, southward of No. 6, with external walls at less than the prescribed distance from the centre of the roadway of the street (Mr. W. Smith).—Consent.

Greenwich.—A building on the southern side of Lambeth-street, Greenwich, with external walls at less than the prescribed distance from the centre of the roadway of the street (Mr. F. J. Gorham).—Consent.

Width of Way and Frontage.

St. George, Hanover-square.—Buildings on the site of Nos. 321 and 323, Oxford-street, to abut also upon Dering-street (Messrs. Gordon & Gunton for Messrs. Hitchings, Ltd.).—Consent.

Width of Way, Projections, and Constructions.

Holborn.—An external wood-and-iron staircase at the rear of No. 13, Great James-street, Holborn, to abut upon Cockpit-yard (Mr. C. I. Jones for Mr. G. Angold).—Consent.

Width of Way, Line of Frontage, and Space at Rear.
Stepney.—Buildings on the site of No. 11, Philpot-terrace, Stepney, to abut upon Nelson-street (Mr. E. H. Abbott for Mr. C. Martin).—Refused.

Formation of Streets.

Wandsworth.—That an order be issued to Mr. W. C. Poole sanctioning the formation or laying-out of new streets for carriage traffic on the Fairfield House estate, Tooting, to lead from Mitcham-road to Tatterdown-street, and in connexion therewith the widening of a portion of Court-lane (for the Governors of Alleyn's College).—Agreed.

Dulwich.—That an order be issued to Mr. C. E. Barry sanctioning the formation or laying-out of a new street for carriage traffic to lead from Woodward-road to Court-lane, Dulwich, and in connexion therewith the widening of a portion of Court-lane (for the Governors of Alleyn's College).—Consent.

Wandsworth.—That the Council do consent to the application of Mr. C. W. Braine, on behalf of the Wandsworth and Putney Gas Light and Coke Company, for an extension of the time within which the roadways of proposed new streets for carriage traffic out of the east side of Merton-road, Wandsworth, were required to have been clearly defined throughout by posts and rails or so otherwise as the Council should permit and thrown open to the public as highways.—Agreed.

Buildings for the Supply of Electricity.

Hammersmith.—Additions at the generating station, Fulham Palace-road, Hammersmith (Mr. H. Hair for Hammersmith Borough Council).—Consent.

The recommendations marked † are contrary to the views of the local authorities.

Correspondence.

WATERLOO BRIDGE LAMP STANDARDS.

SIR,—I am among those who were horrified at the removal of the original lamp standards from Waterloo Bridge, and therefore rejoice and congratulate you on the part you have taken in getting them replaced. The new standards were, I understand, carefully cast from one of the old ones, but apparently the side wings of laurel leaves which should abut on each side of the iron base have been overlooked. They were about 9 in. long and some 6 in. high, and by those who can remember the old lamps are missed at once on the recent restorations. These little adjuncts are clearly shown in the steel engraving published in Shaw's "Examples of Ornamental Metal Work" (1836), and, moreover, the rough part on the end of each lamp base where they

abuted can be seen on the new lamps, even though these are only castings taken from one of the originals. I have little doubt that if search be made in the same lumber heap from which the pattern standard was unearthed one of the wing-pieces might also be recovered, and with very little additional expense enable the lamps to be completed.

Having in your columns taken the initiative in this restoration, I would now suggest that you should urge the completion of the good work which is so nearly finished.

F. W. TROUP.

' PALE REPORTS AND PURPLE SPEECHES.'

SIR,—There has just been issued the "Annual Report of the Proceedings of the London County Council for the Year Ended March 31, 1905," in which is contained the Report of the Building Act Committee, signed by Fitzroy Hemphill (Chairman). From this Report I have taken the following extract:—

"Tribunal of Appeal.
The Tribunal of Appeal constituted under section 175 of the London Building Act, 1894, consists of the following members:—Mr. J. W. Penfold, F.R.I.B.A., L.S.L., appointed by the Council of the surveyors' Institution (Chairman); Mr. E. A. Gruning, F.R.I.B.A., appointed by the Royal Institute of British Architects, and Mr. A. A. Hindon, barrister-at-law, appointed by the Secretary of State for the Home Department.

There are some twenty-two matters which under the Act may be the subject of appeal to the Tribunal. During the year three appeals against the Council's decisions were lodged with the Tribunal, of which one was dismissed. In the remaining two cases amended applications were submitted to and approved by the Council."

In your issue of the 24th inst. Captain Hemphill, at a meeting of the London County Council, is reported to have said that—"As to the Tribunal, he did not intend to say that they (the Tribunal) were habitually unjust to the Council, but their decisions had been in the great majority of cases against the interests of the public and in the interests of the people who appeared before the Tribunal against the reasonable and fair decisions of the Council."

The following is an extract from the Report for the year ended March 31, 1904, of the same Building Act Committee, signed by the same "Fitzroy Hemphill (Chairman)."

"There are some twenty-two matters which under the Act may be the subject of appeal to the Tribunal. During the year thirteen appeals against the Council's decisions were lodged with the Tribunal, of which two were dismissed, three allowed, and eight not proceeded with. There were two appeals against the decisions of district surveyors which were allowed by the Tribunal subject to certain conditions. The effect of the Tribunal's decisions was practically to uphold the district surveyors' decisions."

Pending the appearance of the Council's Annual Report "for the year ended March 31, 1906," which presumably may be expected in the spring of 1907, when Captain Hemphill's words will most probably have been forgotten, it would be useful to have an explanation of this very serious discrepancy between the "printed reports" and the reported speeches of the members of the Building Act Committee, whose "reasonable and fair" proceedings are watched with considerable interest by many besides HAUD IMMEMOR.

R.I.B.A. PRIZE SUBJECTS.

SIR,—On page 371 of the *Builder* for April 7 you express a hope that there will be a better competition for the Essay Prize than has usually been the case; and I venture to suggest that the chief reason why the competition has been poor in the short period of time allowed for the preparation of the essay. The subjects for the year are not announced until the end of March, leaving less than nine months in which to collect the material and write the monograph; a competitor with the whole of this period at his disposal should find a difficulty in writing anything worth reading, and one with the evening only available for study must find it an impossibility. No doubt there is the same difficulty with the other set subjects, with the difference that designing is part of an architect's daily work. I feel sure there would be no lack of competitors if the subjects were announced in the March of the year before the competition, and can see no reason why they should not be.

A WOULD-BE ESSAYIST.

formerly belonged to the Cecil family (spelt "Cecwith"), but is now in the possession of the Bassetts, who have owned it for centuries.

Gwilt, in his encyclopædia, describing the use of the orders in Renaissance architecture during the reigns of James I. to Anne, mentions Beaupré Castle as having a porch of the Doric order, together with the Ionic and Corinthian, the capitals and columns of which are accurately designed.

The porch was built by Richard Bassett, as inscribed on the panels above the entrance doorway to same, the inscription being as follows:—

"Say, cowidst thou ever fynd or ever heare or see worldly wrefche or coward prove a faythfull frynde to bece. Rycharde Bassett having to wyfe Katherine daughter to Sir Thomas Johns Knight buyit this porch with the Tonnes* in Anno 1590 his yeres 65, his wife 60."

The entrance gateway, which was illustrated in our issue of August 19, 1905, is of

* Tonnes (wedding dowry).

earlier date, being built in 1586, but the detail is not so good as that of the porch.

In a panel over the entrance is the following inscription:—

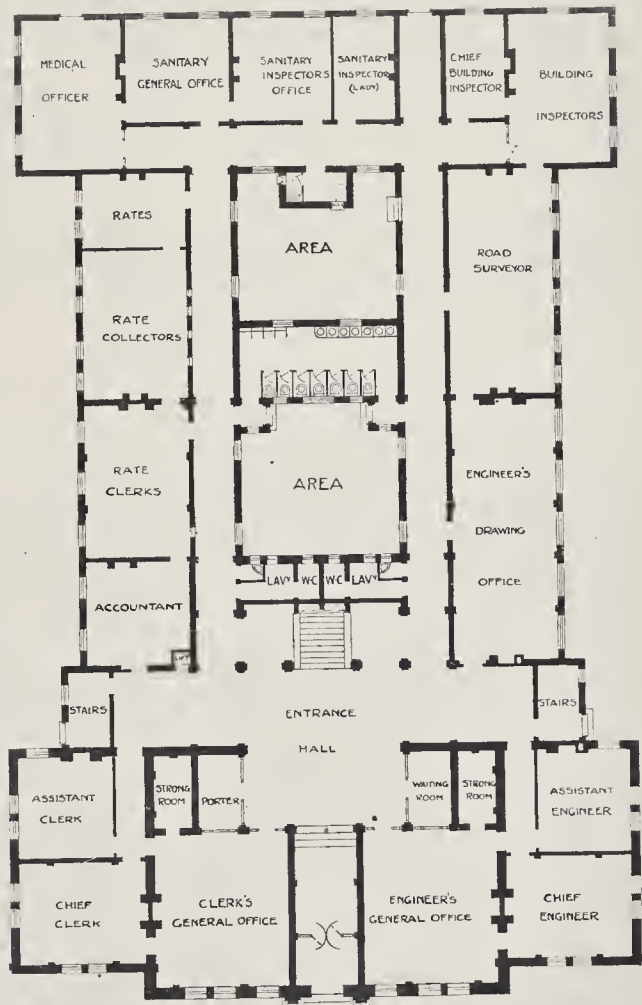

"Gwilt. Ang sy sa chw-lydd."

The greater portion of the buildings are in ruins, the roofs having in many cases fallen in, and very little now remains but the ivy-clad walls, the beautiful Renaissance porch, and the entrance gateway, the stonework of the latter being in a fairly good state of preservation, owing to the care bestowed upon it by the owner.

W. EATON.

TOTTENHAM MUNICIPAL BUILDINGS.

In this issue we illustrate the principal elevations, staircase, and ground plan, etc., of this group of buildings, which were the subject of a public competition in 1902, when Mr. J. Macvicar Anderson acted as professional assessor, and awarded the first premium to Mr. Arnold S. Taylor and

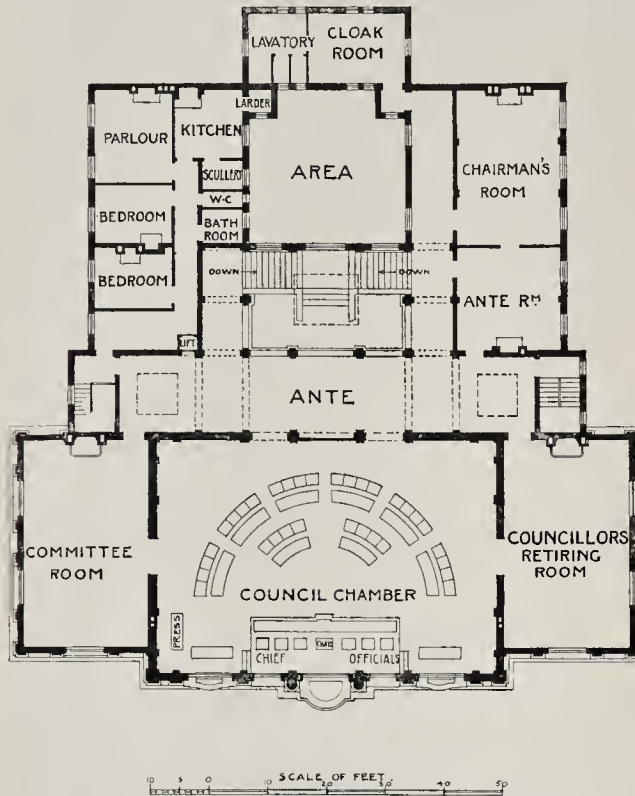

Illustrations.

THE ENTRANCE-PORCH, OLD BEAUPRE, GLAMORGANSHIRE.

LD Beaupré Manor House, or Castle, as it is sometimes called, occupies a commanding position, overlooking a beautiful valley on the outskirts of the village of Cowbridge, Glamorganshire, South Wales. It

New Town Hall, Tottenham. Ground Plan.

New Town Hall, Tottenham. First Floor Plan.

Mr. A. R. Jemmett, of Old Queen-street, Westminster, who have jointly acted as architects. The buildings were publicly declared opened in November last.

The site is a spacious one, and is fortunate in facing on to what is locally known as "The Green," and thus there is ample space in front to view the principal façade. The facings are of local red bricks and Portland stone from the quarries of Mr. F. J. Barnes.

The buildings have been designed to allow an entrance and exit to the depot yard at the back of the site by means of two roadways, each 10 ft. wide. The road next the baths gives access to the coroner's court and public entrance to the gallery of the council chamber in the municipal offices, as well as to the coal-store and boiler-house, artists' entrance, and the gallery and hall exits from the baths, whilst that next the fire-station gives access to the superintendent's entrance, the station yard, and the men's quarters.

The various buildings have been entirely isolated by these roadways for the better provision of light and air, and to enable the distinct character of each building to be better expressed on the elevation to "The Green."

Municipal Offices.

This block has been designed to keep the whole of the offices to which the public has daily access upon the ground floor. The council chamber and the committee-rooms are placed on the first floor to the front, where they form a fine suite of rooms for special occasions, and influence and give character to the elevation, producing a central feature for the whole group of buildings. The departments are arranged so that the principal offices are in the front, and the rooms to which the public have most need of access are near the entrance. The engineer's suite of offices, on the north side, has a north light to the drawing office, and

his department, extending through to the back of the building, obtains access to and control over the depot yard at the rear. On the south side the clerk's suite of offices has been provided, and is a counterpart of that provided for the engineer's department. The medical officer of health's department has been arranged on the west side of the buildings.

Public Baths.

These have been arranged to obtain an efficient and economical control and administration. For this reason the building is served by a single pay-box, which divides the entrances for men and women. These entrances are well controlled by the superintendent and matron respectively.

The first-class swimming-bath is 100 ft. by 35 ft., and the second-class bath 75 ft. by 25 ft. Arrangements have been made so that winter meetings and entertainments can be held in the first-class bath by a floor being placed over the pool. Ample entrances and exits, cloak-rooms for men and women, and artists' retiring-rooms with special entrances have all been provided.

There are thirty slipper baths, situated on the ground and first floors, so as to secure adequate light and cross ventilation. They are arranged so that the baths and waiting-rooms in both classes in each department can be controlled by one attendant.

The walls and ponds of the swimming-baths, douche-rooms, lavatories, and laundry are lined with ivory-white glazed bricks or tiles. The first-class swimming-bath is decorated with bands of coloured glazed bricks. The gangway round the bath is composed of terrazzo, with a curb of sand-faced Victoria stone. The roof of the bath is constructed with steel trusses and trussed purlins, and the centre portion is formed of plaster, as being better for the acoustics of the hall. The gallery is of fire-resisting construction carried on cantilevers, with wooden floor and iron railing.

Fire-Station.

The fire-station having a limited frontage, the engine-room, watch-room, and superintendent's office only are placed to the front; the rest of the rooms are conveniently grouped round the yard at the back of the engine room. Quarters for the six married men are provided at the rear of the station. Each man's quarters are self-contained, and communicate with the yard at the back. Quarters for single men are placed over the harness and engine-rooms, etc.

The superintendent's house, over the front part of the engine-room, is approached by the south roadway, and is in direct communication with his office and the engine-room.

The coroner's court, etc., has been made an independent building, situated behind the boiler-house of the baths.

The contract for the whole buildings has been carried out by Messrs. W. Lawrence & Son, of Tottenham and Waltham Cross, Mr. E. A. George acting as general foreman of the works, and Mr. G. Venables and Mr. W. T. Dewbury were clerks of works. The following sub-contractors were employed:—Messrs. Ashwell & Nesbit, of Leicester and London, for the complete heating installation in connexion with the baths and offices; Messrs. J. Westwood & Co., of Millwall, for constructional steelwork in roofs, etc.; Messrs. Leo Sunderland & Co., for the electric light wiring and telephones; Messrs. H. H. Martyn & Co., for the fibrous plasterwork in the council chamber ceiling; the Mosaic Manufacturing Company, of King's Cross, laid the floors in the entrance hall and corridors of offices and baths; Messrs. Jenkens & Son, of Torquay, executed the polished Hopton Wood stone balusters to the grand staircase, and supplied the dark Devonshire marble for the handrail and skirting.

The total outlay on these buildings, exclusive of furnishing, has been approximately 60,000l.

SHERE CHURCH, SURREY.

The illustrations of this church, from photographs by Mr. Yeo, of Dorking, are given in connexion with the first article in this issue, to which the reader is referred.

Architectural Societies.

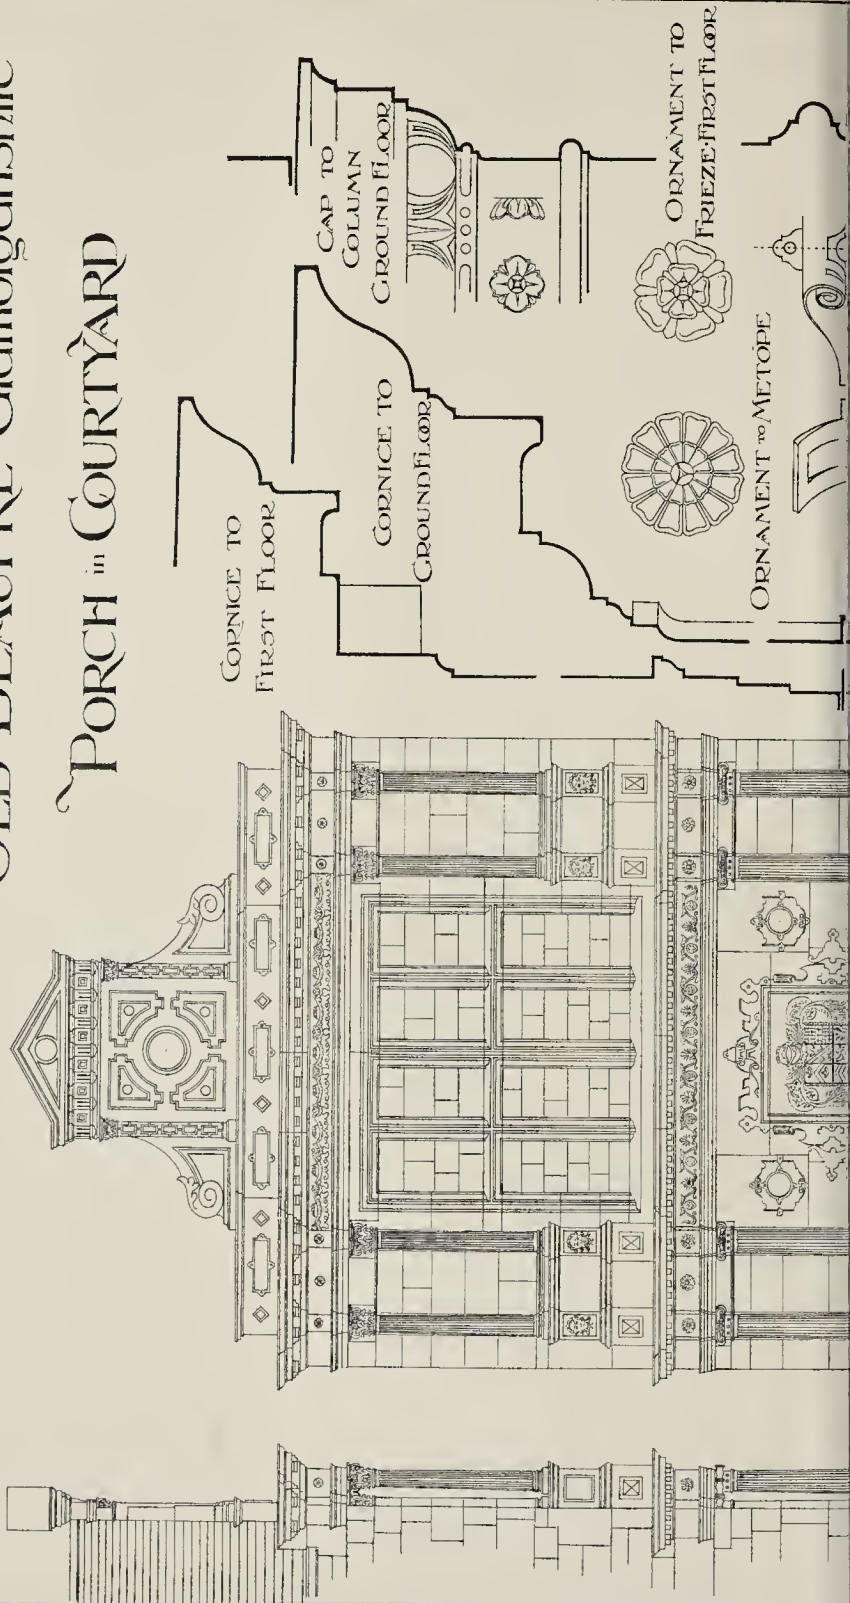

ABERDEEN ARCHITECTURAL ASSOCIATION.—The first annual general meeting of this society was held on the 31st ult., in Kenneway's Rooms, Union-street, Mr. Geo. G. Irvine, President, in the chair. The treasurer, Mr. A. B. Cheyne, submitted the financial report for the past year, which showed a balance in favour of the Association. The following office-bearers were then elected for the ensuing year:—Hon. President, Mr. W. Kelly; President, Mr. Geo. G. Irvine; Vice-President, Mr. J. B. Davidson; Hon. Secretary, Mr. B. Gibbon; committee, Messrs. J. Blake, J. Fordyce, A. B. Cheyne, R. S. Garrow, L. H. Ross, J. P. Thomson. At the close of the business meeting an "At home" was held, which was largely attended by members and their guests, the principal feature of which was an exhibition of working drawings lent for the occasion. The President, in the course of an introductory speech, said that this was their first year as an association, and their objects were to encourage good fellowship and the study of architecture amongst their members, and those working in any art or craft related to architecture. He referred to the rapid progress as a body which the Association had made pointing to its supplying a long-felt want, and, considering its first meeting was held last November, he thought it very satisfactory that they had, since that date, had a very successful session, at which lectures had been delivered on architectural subjects, and at which the attendance and the interest displayed had been most gratifying. He expressed the hope that, by the time the next "At home" took place, their ranks would be joined by every available man in Aberdeen. He drew their attention to the number of interesting drawings which, through the kindness of some of the most eminent architects of the day, they had been enabled to bring together—a collection of the very highest value and interest to their

Competitions.

HOLBORN COUNCIL'S NEW OFFICES. — The Establishment Committee of Holborn Borough Council reported on Monday that

on the 14th ult. six architects were appointed to submit preliminary plans for the Council's new offices. Instructions had been framed for their guidance and to obtain uniformity in the plans submitted for selection. The Town Clerk informed the Committee that he had received letters from several of the architects appointed objecting to one of the provisions laid down in the Instructions, which was to the following effect:—"That the Council do not undertake to select any one of the architects submitting drawings as a future architect for the work." After careful consideration of the case the Committee were of opinion that as, apart from the small honorarium, the sole inducements for the architects to compete is the certainty of being called upon to undertake the work, should their plans be accepted by the Council, their request should be acceded to. This undertaking in no way binds the Council to accept any of the six plans sent in should such plans not meet with their views in matters of economy or suitability, but it merely meant an assurance to the architect that the Committee would not accept his plans or modifications thereof while employing another architect to superintend the work. They had accordingly decided (subject to the usual sanction) that such an assurance as indicated above be given to the architects.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XIV. LOGARITHMS.

N Article IV. a logarithm was briefly defined as "An artificial number representing the power to which a number (constant for each system and called the base of the system) must be raised in order to produce the natural number."

To illustrate this definition and the relation between a series of arithmetical and a series of logarithmical numbers let us consider the two series:—

- (a) 1 2 4 8 16 32 64 128 256, and so on.
- (b) 0 1 2 3 4 5 6 7 8, and so on.

Here the series (a) is in geometrical progression and its ratio is 2. Series (b) is in arithmetical progression and, as arranged, any one of its terms indicates the number of times the ratio 2 has been compounded to produce the corresponding term of series (a). Thus the ratio 8 : 1 is compounded three times of the ratio 2 : 1, and the ratio 64 : 1 six times of the ratio 2 : 1.

Consequently in the series (a) and (b) we have the rudiments of a logarithmic system to the base 2, wherein series (a) contains natural numbers and series (b) their corresponding logarithms.

The utility and extreme convenience of a complete system of logarithms is suggested by inspection of the incomplete table given above, and from this table we can deduce the four important rules stated below.

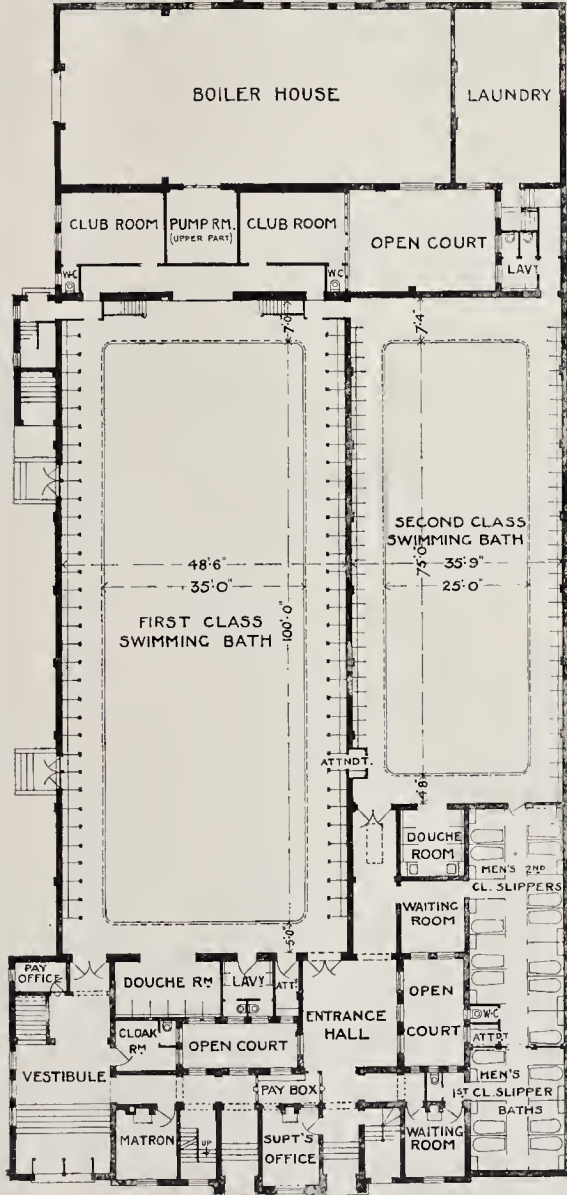

- (1) *Multiplication*.—The sum of the logarithms of two numbers is the logarithm of the product of those numbers.
- (2) *Division*.—The difference between the logarithms of two numbers is the logarithm of the quotient obtained by dividing one number into the other number.
- (3) *Involution*.—The product of the logarithm of a number by the index of any power of the number is the logarithm of the same power of that number.
- (4) *Evolution*.—The quotient obtained by dividing the logarithm of a number by the index of any root of the number is the logarithm of the same root of that number.

The following examples will serve to demonstrate the manner in which the four rules can be applied by the aid of our simple table of logarithms to the base 2.

The usual abbreviation *log* is used hereafter to denote "logarithm."

Example (1): Multiply 32 by 8.
By the table *log* 32 = 5, and *log* 8 = 3.
Therefore, by rule (1) the *log* of the product = (5 + 3) = 8.
Above 8 in the table we find 256, which is the required product.

Example (2): Divide 256 by 64.
By the table *log* 256 = 8, and *log* 64 = 6.
Therefore, by rule (2) the *log* of the quotient = (8 - 6) = 2.

10 5 0 10 20 30 40 50 SCALE OF FEET.
New Baths, Tottenham. Plan. (See page 410.)

Above 2 in the table we find 4, which is the required quotient.

Example (3): Find the 7th power of 2. By the table log 2 = 1. Therefore by rule (3) the log of the power = (1 x 7) = 7.

Above 7 in the table we find 128, which is the required power. Example (4): Find the cube root of 64. By the table log 64 = 6. Therefore by rule (4) the log of the root = (6 ÷ 3) = 2.

Above 2 in the table we find 4, which is the required root. Of course, to make the logarithmic table complete it would be necessary to include in series (a) the intermediate numbers: 3, 5, 6, 7, and so on, together with the corresponding numbers or logarithms in series (b).

However, we need not devote more attention to this experimental system, which is merely intended to make clear the general idea of logarithms and the immense saving of time that can be effected by a complete system established upon a suitable base.

The employment of artificial numbers in the manner indicated appears to have suggested itself to Archimedes and Euclid, but no practical scheme was evolved until after the end of the XVIIth century when trigonometrical calculations had become so complex that mathematicians began to seek for some ready means of reducing the labour thereby involved.

For the invention of logarithms the world is indebted to John Napier, of Merchiston, who published in 1614 a treatise containing a table giving logarithms to seven or eight figures of sines, cosines, and other functions of angles. Napier's logarithms are not quite the same as those now described as Napierian or hyperbolic logarithms, and they possess the disadvantages of being sometimes positive and sometimes negative, and of decreasing as the corresponding natural numbers increase. These defects were remedied in 1619 by John Speidell, who published amended tables in which the logarithms were all positive, and increased with the corresponding natural numbers. Further, they had for their base or radix the number, now denoted by the symbol e, which is the sum of the series

1 + 1/2 + 1/4 + 1/8 + 1/16 + ...

This sum is usually taken at 2.71828, its more precise value being e = 2.7182818284590452353602874 + ...

Speidell's numbers are often termed Napierian logarithms, but are more correctly described as hyperbolic or natural logarithms. They are extensively employed in the higher branches of mathematics, and in some practical calculations.

A still greater improvement upon Napier's logarithms was effected by Henry Briggs, professor of geometry at Gresham College, who published in 1617 a table of logarithms to the base 10 for numbers from 1 to 1,000 to 14 places of decimals.

These numbers are termed alternatively Bryggian, common, and decimal logarithms, but being almost universally employed for ordinary work they are more usually termed simply logarithms or, shortly, logs.

Seven years later Briggs published a book containing logarithms of numbers from 1 to 20,000 and from 90,000 to 100,000 to 14 places of decimals. Four years afterwards Adrian Vlacq, of Gouda, produced a table giving the logarithms of numbers from 1 to 100,000 to 10 places of decimals, 30,000 of the logarithms having been taken from Briggs's tables. The table prepared by Vlacq is the model from which all but one of the subsequent tables of logarithms of numbers have been derived, the solitary exception being the seven-figure table by Mr. Sang, published in 1871. Other computers have devoted themselves to the task of correcting the original and revised tables already calculated.

The inconvenience of the base e = 2.71828 in hyperbolic logarithms is that each movement of the decimal point in a line of figures involves an alteration in both the integral and the decimal portions of the logarithm, while on the other hand the decimal portion of an ordinary logarithm of any number serves equally for any decimal part or multiple of that number.

Table with 3 columns: Number, Hyp. Log., Dec. Log. Values include 0.38, 3.8, 38, 380, 3800.

In the first decimal logarithm above only the integer 1 is negative, the fraction 0.5797836 being positive. Inspection of the figures will show that for each change in the position of the decimal point the value of the hyperbolic logarithm is increased by 2.30258509+.

It will also be found that if any of the hyperbolic logarithms be multiplied by 2.30258509+ the product will be the decimal logarithm for the corresponding natural number.

Conversely, if any of the decimal logarithms be divided by 2.30258509+ the quotient will be the hyperbolic logarithm of the corresponding natural number.

The reciprocal of 2.30258509+ = 1/log 10 is 0.434294+, a quantity which is termed the modulus of the decimal system of logarithms. This modulus has been calculated by Professor J. C. Adams to 282 places of decimals, but for ordinary use the approximation 0.4343 is sufficiently close, and, similarly, its reciprocal may be taken at 1/2.3026.

At the beginning of this article we gave a simple illustration showing the general idea embodied in logarithms. Let us now turn to the consideration of the decimal system of such numbers.

Nothing could be more simple, for the entire theory is founded on the principle that every multiple or sub-multiple of the base 10 is represented by the index of the power to which that base must be raised to equal the given number.

Hence, decimal logarithms are simply the indices designating certain powers of the base 10.

The following is a skeleton of the decimal logarithmic scale from 0.00001 to 100,000.

Table with 3 columns: Number, Power of Base, Log. Values range from 0.00001 to 100000.

Here the index of each power makes clear the value of the log corresponding to the natural number, and it will be seen that any of the numbers can be multiplied or divided into each other simply by addition or subtraction of their logarithms.

To multiply 0.01 by 1,000 we add the logarithms in accordance with rule (1).

Thus log 0.01 = -2, log 1000 = 3, and -2 + 3 = 1.

Opposite log 1 we find 10, which is the required product.

Again, to divide 100,000 by 1,000 we subtract the logarithm of one number from the logarithm of the other.

Thus log 100,000 = 5, log 1,000 = 3, and 5 - 3 = 2.

Opposite log 2 we find 100, which is the required quotient.

In order to complete the table for practical use, fractional logarithms have to be inserted between the positive and negative integral logarithms.

The integral portion of a logarithm is termed the characteristic, and the fractional portion the mantissa, terms which can be abbreviated to char and mant. The characteristic is sometimes called alternatively the index, but this may lead to confusion, for while the characteristic may be regarded as the index of the logarithm, the logarithm itself is the index of the natural number.

The calculation of fractional logarithms has involved a prodigious amount of labour; but having once been calculated their use is just as simple as the use of the integral logarithms given above.

Briggs explains in the preface to his treatise Arithmetica Logarithmica the methods employed for the construction of his tables.

In performing this task Briggs extracted the square root of 10 fifty-four times to about thirty places of decimals, finding thus that log 1.00000 00000 00000 12781 61843 20032 35 = 0.00000 00000 00000 65551 11512 31257 82702, and that, for numbers commencing with 1 followed by fifteen ciphers, and then by seventeen, or a less number of significant figures, the logarithms were proportional to these significant figures.

Then by proportion he found the logarithm of 1.00000 00000 00000 1 to be 0.00000 00000 00000 0434294481+, and that the logarithm of 1.00000 00000 00000 x would be obtained by multiplying x into 0.00000 00000 00000 0434294481+.

The logarithm of 2 was found by raising this number to the tenth power (2^10 = 1024) and extracting the square root of 1.024 forty-seven times, thus obtaining the result 1.00000 00000 00000 16851+. Then multiplying the significant figures by 43429 and by 2^13, Briggs obtained 0.01029+ as the logarithm of 1.024. Adding the characteristic 3, and (as 2 = 10^2/10) dividing by 10, he obtained log 2 = 3.01029+ ÷ 10 = 0.301029+.

In a similar way log 6 was found to be 0.7781513 and log 3 was deduced

Thus As 6 ÷ 2 = 3, so log 6 - log 2 = 3. Therefore log 3 = 0.7781513 - 0.3010300 = 0.4771213.

Briggs also employed a method of obtaining the mean proportionals by continually computing geometric and arithmetic means between two numbers, one greater and the other less than the number required, until the geometric mean and its corresponding arithmetic mean, or logarithm, were found to a sufficient degree of accuracy.

To obtain log 5 in this way take the geometric mean between 1 and 10 = 3.162+; then, the arithmetic mean between log 10 and log 1 being (1 + 0) ÷ 2 = 0.5, the geometric mean between 3.162+ and 10 = 5.623+ corresponds to the arithmetic mean (0.5 + 1) ÷ 2 = 0.75; the geometric mean between 5.623+ and 10 = 7.746+, corresponds to the arithmetic mean (0.75 + 1) ÷ 2 = 0.875.

After twenty-two operations of the kind the arithmetic mean 5.000000 and the corresponding logarithmic mean 0.6989700 are obtained, the latter being log 5.

By laborious methods of this nature Briggs and Vlacq produced the first of those tables which have saved an incredible amount of time, and which, in conjunction with logarithmic tables of trigonometrical functions, have rendered possible researches that otherwise would have involved calculations of such magnitude as to be entirely beyond human capacity.

As originally conceived, a logarithm was regarded as an expression indicating a number of compounded ratios, hence the name was derived from logon arithmos—literally "the number of the ratios." If, according to this theory, the ratio 10:1 be considered as compounded of 1,000,000 small ratios, then the ratio 2:1 is approximately equal to a ratio made up of 301,030 of these small ratios. Similarly, the ratio 3:1 is equal to a ratio compounded of 477,121, the ratio 4:1 to a ratio compounded of 602,060, and the ratio 5:1 to a ratio compounded of 698,970 of the same small ratios, and so on.

The actual nature of a logarithm is more clearly indicated by the statement that it is an index or power of the base.

Then 10^0 = 1, 10^0.301030 = 2, 10^0.477121 = 3, 10^0.602060 = 4, and so on.

By looking at the matter in this way we are able to realise clearly the true meaning of the figures contained in a table of logarithms, as in the subjoined statement.

Table with 3 columns: Number, Power of Base, Log. Values range from 1 to 50.

With the object of saving space only the mantissae or decimal portions of logarithms are

There is also a low-level pumping-station at Angel-road which receives the sewage from the factories and what few cottages have been built on the east side of the railway; the sewage is pumped by means of two Crossley's gas engines and centrifugal pumps through a stoneware rising main on to the land. The effluent enters Salmon's brook near Angel-road, and reaches the River Lea below Tottenham Lock. With regard to the irrigation of the land with sewage, until recently about 15 acres were used for watercess beds, but although the water was clarified before it was sent to the beds, on the advice of the medical officer and in deference to public opinion, the Council declined to let any land for watercess beds. The Council has also grown osiers and rye grass, but the former were difficult to keep clean and the latter not in such demand as to warrant any large quantity grown; the Council are, therefore, driven to growing green crops of different kinds and roots, such as mangolds, swedes, and turnips, which are all fairly saleable. The level of the water over the whole area of the sewage farm was, some thirty years ago, within a foot or two of the surface of the land, but by straightening the watercesses and widening and deepening them considerably with fat falls of only about 2 ft. in a mile, the level of the water has been lowered considerably and at the present time it is further lowered artificially to a very great extent by a portable engine and pump used for the purpose of getting gravel of which there is a considerable depth. The question of clarifying the sewage effluent and purifying to a greater extent than can be done by broad irrigation, is now under consideration, and it is probable that this will be effected by means of septic tanks and contact beds. The land has been levelled with fairly uniform slopes from north to south and generally also from west to east with falls of about 1 in 600.

Appointments.

UNIVERSITY OF LONDON.—The following appointments have been made: Professor F. Brown to the Slade Chair of Fine Art; and to lectureships for the session, 1906-7, Mr. A. T. Walmisley in waterways, docks, and maritime engineering, Mr. W. M. Blair in roads, street-paving, and tramways, Mr. H. Deans in railway engineering, and Mr. N. T. Ormsley in surveying.

STANDARDS DEPARTMENT, BOARD OF TRADE.—Major P. A. McMahon has been appointed to succeed the late Mr. Chaney as superintendent of the Standards Department, of which he had been practically in charge during some months past in Mr. Chaney's absence through illness.

EDINBURGH.—The Streets and Buildings Committee of Edinburgh Town Council agreed, on the 6th inst., to recommend that Mr. James Sim, Deputy City Road Surveyor, be appointed Surveyor, in room of Mr. D. C. Proudfoot, whose retirement is to date from May 15 next.

Obituary.

SIR WYKE BAYLISS.—We regret to announce the death, on April 5, at 7, North-road, Clapham-park, S.W., of Sir Wyke Bayliss, K.B., F.S.A., aged seventy years. During the past eighteen years Sir Wyke Bayliss was President of the Royal Society of British Artists. Of his architectural paintings we may mention those of the interiors of cathedrals and churches in the United Kingdom, France, Belgium, Germany, and Italy. His literary works comprise "Rex Regum: A Painter's Study of the Likeness of Christ from the Time of the Apostles to the Present Day," 1905, and "Seven Angels of the Renaissance: the Story of Art from Cimabue to Claude," 1905, the "Angels" or "Messengers" being Cimabue, Leonardo, Michelangelo, Titian, Raphael, Correggio, and Claude. Sir Wyke Bayliss was the author of several theses and papers, the more recent of which were lectures to the Society for the Encouragement of the Fine Arts on "The Bogy in the Studio," March 26, 1903, and "The House of Her Friends," upon art in relation to the social condition of our great cities, April 21, 1904. He was a native of Madeley, co. Salop, became a member of the Royal Society of British Artists forty years ago, and was knighted in 1897.

MR. FRANKLIN.—The death, on March 26, is announced of Mr. J. E. Franklin, of Regent-street, Rugby, architect and surveyor. Mr. Franklin was senior member of the firm of Messrs. Franklin & Newman, having taken into partnership Mr. C. J. Newman, his former pupil. During the past fifteen years or so Mr. Franklin was architect of store buildings at New Bilton, at Rugby, and in the neighbourhood for the Rugby Co-operative Society; the enlargement, with improvements, of the Congregational church at Rugby, adding two new transepts and vestries, lengthening the choir, and making four new entrances: the St. Matthew's infants' school, Pennington-street, Rugby; and a block of shops, with assembly-hall, educational rooms, etc., in

Chapel-street, as an extension of their premises, for the Co-operative Society. He recently laid out some property on the Naseby's estate for the Rugby Benefit Building Society, and acted in a similar capacity in respect of the erection of many houses and business premises in the district, and was lately a member of the Urban District Council. Mr. Newman, we understand, will carry on the practice of the firm.

General Building News.

HOLY TRINITY CHURCH, BROMPTON.—At a sitting of the Consistory Court of London on March 28, Dr. Tristram, K.C., Chancellor of the diocese, agreed that a faculty should issue for the erection of a vestry, 20 ft. square in plan, on the south-east side of Holy Trinity Church, Brompton-road, with a lobby and porch to communicate with the avenue leading from the church to the main road, and for additional exits from the church through the new vestry, and also at the east end, and from the south gallery to the lobby. At present the chief exits are one on Francis's design, at the west end, and one on the south side, whilst there are only two small exits from the galleries, which hold 500 persons. For these and some minor improvements, estimated to cost 1,300l., the plans and designs have been prepared by Mr. Arthur Blomfield. Holy Trinity Church was built in 1825-9, by Professor Donaldson, after the Early English style, for 1,500 sittings. Sir A. W. Blomfield restored the fabric in 1880.

CHURCH OF ST. MARY, ACTON.—The Consistory Court of London will issue a faculty for the enlargement and improvement of the church after designs prepared by Messrs. Edward Monson & Sons, of Acton. It is intended to extend the present vestry on to a portion of the churchyard, which has been practically disused during some while past, and to make a third exit by opening out a doorway on the south side of the east end. The church accommodates a congregation of 950, but has only two doors, both at the west end, facing the west and north respectively. It was originally built from Francis's design, and enlarged in 1866; the tower was rebuilt thirty years ago.

NEW CHURCH, EDMONTON.—The Bishop of London recently consecrated the new church of St. John the Evangelist, Upper Edmonton. The church, which has been built to the plans of Mr. G. B. Wrenell, of Westminster, has sittings for 800 people.

WORK ON WINCHESTER CATHEDRAL.—The work of underpinning the east end of Winchester Cathedral is proceeding satisfactorily, and two divers are occupied in four-hour shifts in taking out the peat under the building and putting bags of cement in its place.

CHURCH RESTORATION, NORTH MUSKHAM.—The restoration of the church of St. Wilfrid, North Muskharn, three and a half miles north of Newark station, has just been begun, the contractors being Messrs. A. Wood & Sons, of Alford. An outlay of 1,700l. is necessary. The architect is Mr. C. Hodson Fowler, of Durham.

BAPTIST CHAPEL, BARGOE.—The laying of the foundation-stones for the extension of the English Baptist Chapel at Bargoe took place recently. The building has been erected on the walls of the chapel built in 1896. When completed, it will provide seating accommodation for about 1,500. The cost of the extension work will be about 3,500l. Mr. R. T. Burns, Bargoe, has the contract, which is being carried out from plans prepared by Messrs. James & Morgan, architects, Cardiff. The seating accommodation and fittings will be of pitch-pine. The exterior will be of Forest stone and red bricks.

WESLEYAN REFORM CHAPEL, HUCKNALL TORKARD.—The foundation-stones of the new chapel of the Hucknall Torkard Wesleyan Reformers were laid recently. The church is designed in the Gothic style, the Annisley-road front being executed in red Istock bricks and Pilongh stone. The building will cover an area of 112 ft. by 43 ft. The architect for the work is Mr. Harry Spencer, Hucknall, and the contract has been let to Mr. J. A. Munks for 2,660l.

SCHOOL CHAPEL, TAUNTON.—The foundation-stones of the new chapel at Taunton School, to be laid shortly. The design, which was prepared by Mr. Frank Wills, architect, will cost about 10,000l. to carry into effect, and its execution has been entrusted to Messrs. W. Cowlin & Sons, of Bristol. The chapel is cruciform in plan, and in the Early English style. The nave will be 64 ft. in length by 25 ft. in width, and the pews will run parallel to the central aisle. The chancel adds another 36 ft. to the length. The design provides for rubble walling with Guiting stone dressings. Broseley tiles are to be used as the roof covering, and the windows will have leaded lights. Among the features of the interior treatment will be the broad barrel roof, a west-end gallery, and a gallery over the vestry.

PARK INSTITUTE AND ADULT SCHOOL, HARROGATE.—Ald. Jas. Chippindale recently opened the New Park Institute and Adult School, The

new building occupies a site facing on the main road, and comprises a lecture-hall, billiard-room, with two tables, reading-room, bath-rooms, etc. The total cost, including land, is about 1,300l. The accommodation of the new institute includes, on the ground floor, an entrance porch and lobby, with stone staircase to first floor, billiard-room, two bath-rooms, etc. On the first floor is a meeting-room, 36 ft. 6 in. by 24 ft. A caretaker's house is attached to the institute. The architects are Messrs. Bland & Bown, and Mr. J. Allen was the contractor.

IMPROVEMENT OF THE COUNTY COURT, SHEFFIELD.—The county court buildings in Bank-street, Sheffield, are at present undergoing alterations. The scheme provides for a new public office on the ground floor, quarters for the High Bailiff and his staff in the basement, and a Registrar's court on the first floor. In order to carry out these improvements, extensions have been made on the low side of the present building. The new premises will face Scarfhill Croft, and New-street. The plans were drawn by Mr. H. N. Hawks, of H.M. Office of Works, and the alterations have been entrusted to Messrs. Ash, Son, & Biggin, contractors, Sheffield.

COTTAGE HOMES, MORPETH.—Cottage homes have been opened by the Morpeth Board of Guardians for the purpose of providing a home for workhouse children. The building, which was originally a villa, comprises two homes, each of which is an exact duplicate of the other, forming one block. The contractors for the alterations were Messrs. R. Carse & Son, Morpeth and Ambie; Messrs. Swinney, Morpeth, for the wrought-iron gate designed by the architect; and the entrance-road was made under the direction of Mr. J. M. Macgregor, Surveyor to the Rural District Council. The whole has been carried out to the designs and under the supervision of the Board's architect, Mr. L. A. Loades, Morpeth.

NEW DEPARTMENT, ROYAL ORTHOPEDIC HOSPITAL, BIRMINGHAM.—The foundation-stone of the new out-patient department of the Birmingham Royal Orthopedic and Spinal Hospital was laid on the 2nd inst. by the Lord Mayor (Councillor A. J. Reynolds). The new department is being built in Great Charles-street on the west side of the garden of the old hospital. A larger scheme is on foot for the rebuilding of the old hospital, and a space to be left between the two structures will be laid out as a garden. The site is part of the Colmore estate. The new building has a frontage of 22 ft. to Great Charles-street, and extends backwards 85 ft., with various rooms looking into the open garden. The front is in the Elizabethan style, with mullioned windows, and is being faced with slightly glazed gray bricks and terra-cotta. The plans were prepared by Mr. F. B. Osborn, and the contractor is Mr. Harvey Gibbs, King's Heath. There will be a vestibule entrance in Great Charles-street, leading to the hall, with staircase and lift, and on the ground floor will be the dispensary, the out-patients' waiting-hall for eighty-five, surgeon's room, dressing-rooms, etc. On the first floor will be two exercising-rooms, two massage-rooms for men, women, and children, and spare rooms. On the second floor will be provided two isolation wards, two nurses'-rooms, and bath-room, and in the basement accommodation will be made for perambulators.

WESLEYAN MISSION, BOLTON.—The memorial-stone has just been laid of the King's Hall, the new mission building which is being erected in Bradshawgate. The new building has been designed by Messrs. Bradshaw & Cass, architects, and the contract has been let to Messrs. J. C. & F. Woods. At the corner of Bradshawgate and Brightmet-street the entrance is dominated by a tower 75 ft. high, over which will be a glazed verandah. On the front and side shops are arranged, and the verandah is taken along the whole frontage. The vestibule leads to the reception and crush hall. Directly from the hall is the entrance to the mission hall. In addition to the corner entrance near the hall level, a new entrance will be formed at the south side, giving access to both the lower and upper floors. The main staircases and the entrance-halls are all of fireproof construction. On the first and second floors are assembly-rooms, lecture-rooms, club and class rooms.

ASYLUM, YORK.—The new asylum for the City of York, which has been erected at a cost, with the site, of about 130,000l., was formally opened on the 4th inst. The buildings are situated in the parishes of Water Fulford and Naburn. The main aspect is southerly, and the buildings cover between 2 and 3 acres. They are built from the designs of Mr. Alf. Creech, A.M.I.C.E. Accommodation will be provided for 151 males and 211 females. There are extensive grounds and a farm attached, while a chapel, medical officer's residence, a lodge, and cottages are situated in the vicinity of the front entrance, which occupies the centre of the administrative block. The contractors are Messrs. G. Longden & Sons, Ltd., Sheffield.

TOWN HALL, LANCASTER.—The new Town Hall at Lancaster will be situated in Dalton-square,

where some old private houses will be demolished to make room for it. The choice of this site involves the closing up of a public road, and the making of a new one further back, as well as the removal of the tramway car shed. All this work has already been done. The architect is Mr. E. W. Mountford, of London, and the contractors are Messrs. Waring & Gillow, of Lancaster, and London. The new building will accommodate the staffs of the Town Clerk, the Borough Accountant, the Borough Surveyor, the police and tramways departments, and sanitary and other officials. In addition there will be a Court House and a public hall for meetings, with a large organ at the rear of the stage. The main entrance is to be through a pillared portico fronting Dalton-square, and surmounted by a clock-tower of a total height of 146 ft. The Town Hall will stand by itself, with frontages to four streets. It will be built of local stone.

PLEASLEY HILL FREE LIBRARY.—The plan submitted by Mr. J. E. Goodacre, architect, of Mansfield, for the Carnegie Library at Pleasley Hill has been accepted. The leading library will have a reading room, and accommodation for 3,000 volumes, and the reading-room will be 32 ft. by 22 ft., to accommodate forty-eight readers. The main front will be designed in brick with stone dressing, and it will have a central stone arch, with pediment and inscription over. The site is in Bagshaw-street.

NEW BEDFORD MARKET EXTENSION.—The Kew Bridge Wholesale Market for the sale of fruit and vegetables has just been extended and opened. The market is approached by a main entrance from the Chiswick High-road, which entrance is 25 ft. in width, and covered with glass; on each side are four shops, and offices over and cellars under. The market is fitted with covered over and below aprons, and is lighted from the top on the north side only, and it is divided into three ways or avenues. Along the main walls on the north and south sides are constructed thirty-three shops, with 15 ft. frontages and a depth of 13 ft., with an office over, and selling spaces 15 ft. by 10 ft. in front, and cellars constructed under the entire length, 23 ft. by 15 ft. The old potato warehouses are added to by constructing an office over and an entrance into the new market. A refreshment-room is provided for the use of the market. A new buyers' standing has been made. Seventy-five new horse stalls are provided. Mr. Novell Parr was the architect, and Messrs. Dorcy & Co., the builders.

LIBRARY, MOTHERWELL.—On the 5th inst., the new public library at Motherwell was opened. The library, which has been erected at a cost of 12,000l., is situated in Clyde-street, opposite the Town Hall. The architects are Messrs. Greig, Fairbairn, & Niven, Edinburgh.

HALL, CARDIFF.—The memorial-stones of the new hall of the Cardiff Forward Movement, in Whitechurch-road, were laid on the 4th inst. It will, with its vestries, accommodate 1,200 people, and is costing 3,600l. It has a frontage to Whitechurch-road of 56 ft., and is ornamented by two towers, which rise one on either side of the entrance-hall. It is built of rubble stone with Bath stone dressing. Its depth is 94 ft. The architect are Messrs. Veall & Sant, and the builders Messrs. Knox & Wells.

HIPPODROME, PUTNEY.—A Hippodrome is in course of erection at Putney. It is to be built of white stone and red brick, with a frontage of about 110 ft. The height of the parapet will be nearly 40 ft. above the pavement, while at the corner, next to the High-street, a tower will rise to a height of over 70 ft., surmounted by an open work metal globe. The house will accommodate an audience of about 1,500. The Hippodrome has been designed by Mr. Frederick W. Kingston, and the building is being carried out by Messrs. Kinglerlee & Sons, of Oxford.

POST OFFICE, WARRINGTON.—A new Post Office is to be erected at the corner of Springfield-street and Egypt-street, Warrington. The tender of Messrs. J. Parkinson & Sons, Ltd., of Blackpool, has been accepted for the building, and the total cost of the work, including the fittings, will be about 16,000l.

CONVALESCENT HOME, BODNOR.—On the 4th inst. Princess Alexandra, of Teck opened a Children's Convalescent Home for Surrey at Bodnor. The new institution, which is situated in Clarence-road, will provide accommodation for fifteen children and eight women with their infants. The work was carried out under the supervision of Mr. H. G. Sawyer, Petersham.

The new Tollard Royal Hotel in Southampton-row, for which Messrs. Bradshaw & Gass specified the valve closed called "The Only," by the Sanitary Appliances Syndicate, but the builders were informed that this could not be used, "as the New River District had no official knowledge thereof." That it was in an early stage they have "no official knowledge" of a fitting before they condemned it does not seem to have occurred to the authorities. However, the Syndicate took the matter up, with the result that the Board's Inspector visited their show rooms and reported that the closest in question complied with the regulations and that there was no objection to its use. One would have thought that the Board might have taken the trouble to ascertain this in the first instance before condemning it wholesale.

HULL JOINT DOCK.—It is announced that Messrs. S. Pearson & Son have undertaken the contract for the Joint Dock of the North-Eastern and Hull and Barnsley Railway Companies. The estimated cost is 850,000l. The dock, 3,000,000 cubic yards will be excavated; the works are to be finished in the summer of 1910.

NEW WORKS FOR MESSRS. YARROW & CO.—This well-known firm of engineers and ship-builders have decided to migrate from Poplar to a site of 12 acres, with a frontage of nearly 800 ft. to the river Clyde, at Scotford, near Glasgow. We gather that the new works will be built by Sir William Arrol & Co., and that the construction of the fitting-out basin, which will be roofed in and equipped with overhead cranes, together with the building of the engine and boiler shops, berths, etc., is to be sub-let to Messrs. Morrison & Mason, of Glasgow.

SEWERAGE SCHEME, MORECAMBE.—Colonel W. R. Slacke, R.E., at Morecambe on the 4th inst., conducted an inquiry into the application of the Corporation to borrow a further sum of 7,200l., with the sanction of the Local Government Board, for works of sewerage and sewage disposal. The Town Clerk (Mr. Wm. Eilly) stated that the total cost of the works to date was 83,480l., and of the 7,200l. it was now proposed to raise, 3,390l. represented money overpent and 3,800l. for additional works. Mr. H. B. Nichols, C.E., the engineer to the scheme, explained in detail the nature of the application.

THE LONDON COUNTY COUNCIL DRAINAGE BY-LAWS.—The London County Council are taking steps to obtain the opinion of the Metropolitan borough councils upon the advisability of repealing the drainage by-laws requiring an intercepting-trap to be fixed in every main or other drain.

COMBINED DRAINAGE.—The Town Clerk of Fulham has been instructed to convene a conference of Metropolitan borough Councils with a view to approaching the Local Government Board for the purpose of asking for an amendment of the existing law dealing with combined drainage.

WATER SCHEME, NEWTONWARDS.—Mr. P. C. Cowan, M.Inst.C.E., Chief Engineer in Charge to the Local Government Board, held an inquiry on the 4th inst., in the Board Room of the Urban Council, Newtownwards, with regard to the application of the council for sanction to a loan of 18,500 for the purpose of providing a water supply to the town. Mr. J. H. Swiney, engineer for the scheme, gave details in regard to the supply, and the probable capacity of the storage reservoir which is to be constructed, also to the specification. The object of the scheme is to provide a supply was estimated at two million gallons, and the supply was estimated at 20 gallons per head per day on the present population. If the town increased in population, additional storage accommodation could be made. The cost of the entire work was 215,470 12s. 5d., to which he added 20 per cent. for land, law, engineering, and supervision expenses, which would amount to 23,094 7s. 7d., making together 218,565. Mr. John Ernest Crossadale, engineer, gave evidence as to the way in which the reservoir was to be constructed.

Foreign.

FRANCE.—M. Allouard, the sculptor, has just completed a monument to Carnelle, which a subscription committee proposes to erect at Paris. The monument is to be erected on the Place de Pantheon, alongside of the St. Genevieve Library, so as to form a pendant to the monument to Rousseau at the other side of the Place. The Municipal Council of Paris have decided not to allow the erection of any further statues in the Parc Monceau, the Cours la Reine, or the Champs Elysees. The jury of the Ecole des Beaux-Arts commissioned to the first competition of architectural students of M. C. Simardesco, pupil of M. Paulin; the subject being "Une Maison Hospitaliere Ouvriere." The following architects have been selected to take part in a limited competition for the proposed tower hall at Lyons: MM. Blanchard and new Town Hall at Lyons: MM. Blanchard and Tabourier (Versailles), Horneker (Nancy), Huguet (Lyons), Patoullard (Paris), and Perrin (Lyons).

—Since 1873 the Académie des Sciences et Belles Lettres of Lyons awards every year the prize founded by M. Dupasquier, which goes alternatively to architects, painters, engravers, and sculptors, natives of Lyons. This year the prize has been awarded to an architect. The Municipality of Avignon have voted a sum of 3,000,000 francs for various works to be undertaken for the better sanitation of the town. A new public Casino is to be built by the Corporation of Mentone. The Municipality of Nantes have voted 770,000 francs for expenditure in street improvements. The Municipality of Boulogne-sur-Mer propose to transfer the public library to another position, and to build a circus on the site. A new Bourse is to be erected at Lille. M. Injalbert, the eminent sculptor, has just completed a large monument to be placed in the Pantheon at Paris, which forms a kind of apotheosis of Mirabeau. He is represented standing on the Tribune, above him a winged genius accompanied by a lion as an emblem of Force. The group will stand on a pedestal having at the four corners figures symbolising respectively Royalty, Revolution, History, and Sorrow; the latter as lamenting the loss of the great orator. As in former years, the Chantilly Museum will remain open from April 15 to October 15, at an entrance charge of one franc. The Château de Breussieu, in the Department of Isère, one of the finest mediæval ruins in France, has been scheduled among the "Monuments Historiques." M. Boutterin, architect, has been commissioned to carry out a new school of clock making to be erected at Besançon, at a cost of 25,000 francs. The Municipal Council of Toulouse have decided on the construction of a hospital intended to replace the old Hôtel Dieu. The cost is estimated at a million and a half of francs. The Under-Secretary for Fine Arts has under consideration a scheme for restoring or replacing the frescoes by Girardet which decorate the ceiling of the Hôtel de Ville at Nancy, which are in a very dilapidated condition.

Miscellaneous.

GOVERNMENT BUILDINGS.—Sir Wm. Bull has asked the First Commissioner of Works if there are any Government buildings in Whitehall for which towers were originally designed but which have been abandoned by his predecessors. Mr. Harcourt replies that towers formed part of the design for the buildings now occupied by the Home Office and the Local Government Board, but they have never been completed.

ROADS IN HYDE PARK.—Answering Mr. Verney, Mr. Harcourt, in the Parliamentary Papers, states that approximately 22,000l. has been expended in the last five years on the roads in Hyde Park, and the average expenditure per mile per annum is 1,000l. The roads are first scarified, then retailed with Guernsey granite, machine broken to a 2-in. gauge, rolled with 15-ton rollers, and finally dressed with gravel.

THE FURTHER STRAND IMPROVEMENT.—The Clerk of the London County Council has informed the Further Strand Improvement Committee that the Improvements Committee will receive a deputational report in support of the memorial on Wednesday, May 2. The memorial may be signed at the Royal Academy of Arts, Burlington House; the Surveyors' Institution, 12, Great George-street; or at the office of the honorary secretary, 7, Pall-mall.

ST. MICHAEL'S CHURCH, BURELICH-STREET.—The site and materials of the church, of which we recently printed a description, were sold at the Mart, by order of the Ecclesiastical Commissioners on March 28. The site covers 4,450 ft. superficial; the bidings advanced from 10,000l. to 20,500l., at which sum the property, which is frechold, was sold.

GLADSTONE'S MEMORIAL, HAWARDEN.—It is stated that the centaph which Sir W. B. Richmond, R.A., has sculptured for Mr. Henry Neville Gladstone will be inaugurated in the side chapel of Hawarden parish church in the course of next month. The memorial, which presents a remarkable and original example of monumental design, embraces recumbent effigies of the late Mr. and Mrs. Gladstone; the former wearing the gown of an L.L.D., with an owl at his feet, a winged Angel of Watchfulness supports the pillow, and bends over the figures, each of which lays a hand upon a large cross which lies between them. The yellow marble pilasters of the base alternate with silver plaques in bas-relief to symbolise love and the plaques in bas-relief to symbolise love and the plaques in bas-relief to symbolise love and the plaques in bas-relief to symbolise love and the plaques in bas-relief to symbolise love.

THE BRITISH ASSOCIATION.—The seventy-sixth meeting will be opened at York on August 1. Professor Ray Lankester is being the President-elect. The Council have appointed the sectional presidents and vice-presidents; those for Engineering (section G) are Mr. J. A. Ewing, president, and Sir Colin Scott Moncreff and Mr. W. Cudworth, vice-presidents. The Association held its

Sanitary and Engineering News.

THE METROPOLITAN WATER BOARD AND FITTINGS.—Both the old water companies and the new Metropolitan Water Board have been too much disposed to condemn sanitary fittings, taps, etc., on the mere fact that such fittings were new to or unknown to them. A case of this kind seems to have occurred in connexion with

inaugural meeting at York in 1891, and met there again in 1844, and in 1881 under the presidency of Sir John Lubbock, now Lord Avebury. A sum of nearly 1,600*l.*, including subscriptions of over 700*l.*, is available for purposes of the medal fund to commemorate the recent visit to South Africa, and finished sketches of obverse and reverse designs, to be executed in bronze, have been made by Mr. F. Boucher. The medal is intended to signalise achievement and promise in scientific research in South Africa, and the balance of the income of the fund will be awarded, by the South African Association for the Advancement of Science, in respect of the same objects.

CASTLE OF SANT' ANGELO, ROME.—The mausoleum of Hadrian and of at least three of his successors, which has been used as a fortress, prison, and barrack in turn, has recently been converted into a historical museum to illustrate the engineering side of the Italian military service. Amongst the exhibits are some interesting plans of celebrated fortresses in Italy as in the XVth and following centuries, and it is anticipated that these will be supplemented by some models of the older fortifications.

GROSVENOR-SQUARE.—For clearing the site the materials of the two handsomely-fitted houses Nos. 22-3 have been sold. The houses stand on the west side, near the end of North Audley-street. Before the renumbering of the houses in the square in 1888—an episode of its history which is commonly overlooked—the two houses we mention were numbered 19a and 20, respectively.

THE "POTTERIES" DISTRICT, NOTTING HILL.—We lately republished from our number of November 10, 1895, a notice of the late G. Godwin's lecture upon "The Homes of the People," with a summary of the chairman's remarks, in which particular mention was made of the disgraceful condition of the Potteries. That reproach has endured to our own time. We may, therefore, mention that the Council of the Royal Borough of Kensington have taken steps for the erection of six blocks of working-men's flats upon the site of Nos. 33-49, Kenley-street, Notting Dale; each block will contain six suites of two rooms apiece.

SANITARY OFFICERS.—The Local Government Board has sanctioned increases in the salaries of Mr. G. O. Pavitt and Mr. E. T. Crook, sanitary inspectors in the Metropolitan Borough of Stepney, as from 31st January.

HOUSING SCHEME, LINTON.—On the 5th inst. at the Linton Workhouse Mr. E. A. Sandford Fawcett, M. Inst. C.E., Local Government Board Inspector, and Mr. B. T. Ritchie, F.R.I.B.A., Architect to the Local Government Board, held an inquiry into the application of the Linton Rural District Council to borrow 1,600*l.* for the purposes of a scheme under Part III. of the Housing of the Working Classes Act, 1890, for the provision of cottages for persons of the working classes in the parish of Linton. Mr. F. W. Chappell, the Sanitary Inspector, said it was proposed to charge 2s. 6d. per week rent, which would be remunerative. The buildings were to be constructed in groups of five, and were to have 9-in. party walls.

EXCAVATIONS AT HOLME CULTRAM, CUMBERLAND.—Aided by a grant from the Cumberland and Westmorland Archaeological Society, excavations have just been completed in the Holme Cultram churchyard, a few miles from Wigton, amongst the ruins of the ancient Cistercian Abbey, which was founded between 1100 and 1150. The excavations have been made to the east of the present structure, where once stood the chancel and transepts of the Abbey. The floor of the old chancel, laid with tessellated tiles, was reached, and also that of the northern transept, from the floor of which some four dozen square clay tiles with glazed upper surface of a floral design have been unearthed. The excavations were superintended by the Rev. W. Baxter.

Legal.

ACTION BY BUILDERS' MERCHANTS.

The case of Hooper & Ashby v. Willis came before the Court of Appeal, consisting of the Master of the Rolls and Lords Justices Romer and Cozens-Hardy, on the 10th inst., on the appeal of the plaintiff from a judgment of Mr. Justice Kekewich in the Chancery Division. (The case was reported in the *Builder* of July 29, 1905.)

This was an action by the plaintiffs, a firm of builders' merchants, carrying on business at Southampton, with branch offices at Bournemouth, Poole, Portsmouth, and other places, for an injunction to restrain the defendant from carrying on such business at Broadstone in alleged breach of an agreement of service. The facts were these:—The defendant entered the service of the plaintiffs in September, 1898, when he was aged nineteen. The plaintiffs, by an agreement of service dated September 29, 1898, agreed to take the defendant into their employment, and in that agreement it was provided that defendant

should not for the space of fourteen years after the termination of his employment with the plaintiffs, whether the employment should be terminated by the plaintiffs or the defendant, at any place within a radius of thirty miles from the Town Hall at Bournemouth or the Bargate at Southampton, carry on directly or indirectly as principal clerk, agent, manager, or traveller, in any other capacity, the business of a builders' merchant or manufacturer of or a dealer in cement, lime, bricks, plaster, lathe, whitening, and any other building materials which at any time during his employment should be manufactured by or dealt in or sold on commission by the plaintiffs. The agreement was executed by the defendant, but not by any member of the plaintiff firm. The defendant was employed first as a clerk and afterwards as a traveller at the plaintiffs' Bournemouth office, but discharged himself from their employment in August, 1903. The plaintiffs subsequently discovered that the defendant was carrying on business at Broadstone, which was within seven miles of Bournemouth, and accordingly brought the present action, claiming the before-mentioned relief.

Mr. Justice Kekewich held that the area covered by the agreement was larger than was reasonably required for the protection of the plaintiffs' trade, and dismissed the action with costs. Hence the present appeal of the plaintiffs. Mr. Stewart Smith, K.C., and Mr. Mark Romer appeared for the appellants; and Mr. P. Ogden Lawrence, K.C., and Mr. Hohler for the respondent.

During the course of Mr. Stewart Smith's argument Lord Justice Romer pointed out that he could not see how it was made out that the agreement was beneficial to the defendant, who was an infant when he entered into it. There was no contract by the plaintiffs to employ him for any time or to give him fixed wages. Mr. Smith said it gave the defendant employment.

Lord Justice Romer: I do not know that it does except for the moment.

Mr. Smith said that the defendant had been going on in the plaintiffs' employment for several years, getting successive rises of wages, and he recognised the existence of the contract when he had the opportunity of leaving the trade, and not become a formidable competitor of those who had taught him.

Lord Justice Cozens-Hardy thought the practice of exacting these restraining covenants a pernicious one.

Mr. Smith said it was one of the conditions of entering the employment that the covenant should be entered into, and it was insisted on in the case of every employee. It was necessary to protect the interest of the employer. If the employee was to go away with the information he had acquired, and use it for his own benefit, he was taking part of his master's property.

Lord Justice Romer pointed out that, while the defendant had entered plaintiffs' employment as a clerk, he had afterwards been employed as a traveller, and suggested that the agreement thereupon came to an end.

Mr. Smith thought not because the covenant did not depend upon the nature of the employment.

Mr. Mark Romer having followed on the same side, the Master of the Rolls, without calling upon counsel for the respondent, in giving judgment, said Mr. Justice Kekewich had decided against the plaintiffs on the ground that the area was too wide for the reasonable protection of the employers and that the agreement could not be enforced. On that ground the learned judge was, he thought, right, and the appeal ought to be dismissed. There were, however, other difficulties in the plaintiffs' way. He was not satisfied, for instance, that the agreement, being made with an infant, and containing the clauses it did, was in itself a valid agreement, and if invalid there was no evidence of a fresh contract in writing on the defendant attaining the age of twenty-one. It was not necessary to decide these points, but he was not satisfied that the plaintiffs' position could be maintained on these grounds.

The Lords Justices concurred, and the appeal was accordingly dismissed with costs.

POINT UNDER THE PUBLIC HEALTH (LONDON) ACT, 1891.

In a Divisional Court of King's Bench, composed of the Lord Chief Justice and Justices Darling and Bray, on the 6th inst., judgment was given in the case of the Mayor, etc., of Westminster v. the Gordon Hotels, on the appeal of the Westminster Corporation from a decision of the Bow-street stipendiary, the case raising an important point under sect. 30 of the Public Health (London) Act, 1891.

It appeared from the special case stated that the appellants, as the sanitary authority, were summoned by the Hotel Company on April 8, 1905, for an offence falling without reasonable cause to comply with sect. 30 of the Public Health (London) Act, 1891, in not having re-

moved from the Hotel Metropole at the ordinary period the house refuse in accordance with a notice served by the respondents. The magistrates, on June 23, 1905, convicted the appellants and imposed a fine of 10*l.* with 15*l.* costs. The facts were as follows:—On February 27, 1905, the appellants had been in the habit of removing daily all refuse from the hotel. On February 27, 1905, acting on legal advice, appellants gave notice in writing to the respondents that on and after April 1, 1905, they would not remove "trade refuse" from the hotel except in pursuance of sect. 33 of the Public Health (London) Act, 1891—that was to say, upon being required to do so by the respondents—and that they would make a charge of 10*l.* a load, or portions of a load, of trade refuse removed by them. The refuse which the appellants refused to remove consisted of ashes, sawdust, empty bottles, and tins, straw, sea leaves, waste paper, etc. The magistrate found as a fact that the appellants had failed to remove from the hotel within forty-eight hours after service upon them by the respondents of a written notice requiring its removal the refuse in question, and that such refuse was refuse of the same character and description as that which was removed by the sanitary authority from every large dwelling-house, and that it was ordinary domestic refuse resulting from, and incidental to, the supply of warmth, food, and other refreshment to the guests who had come to the hotel. He further found as a fact that the refuse was in the main not such as should be allowed to remain at the hotel, and that the refuse which the appellants had failed to remove was "house refuse" within the meaning of sect. 30 of the Public Health (London) Act, 1891, and that the appellants had not shown reasonable cause for their failure to comply with the respondents' notice requiring the removal of the refuse. The question for the Court to determine was whether, on the facts of the case, the conviction was right in law.

Mr. Macmorran, K.C., and Mr. Courthorpe-Munroe appeared for the appellants; and Mr. Danckwerts, K.C., and Mr. Cunningham Glen for the respondents.

Their lordships decided that the refuse was house refuse, and affirmed the decision of the magistrate.

ACTION AGAINST THE CHORLEY CORPORATION.

The hearing of the case of the Chorley Bleaching Company, Ltd., v. the Mayor and Corporation of Chorley and Townley Parker concluded before Mr. Justice Joyce in the Chancery Division on the 9th inst.

It appeared that under a 999 years' lease granted by the Corporation in 1803, the Company erected bleaching works, costing over 3,000*l.*, on a portion of the Common Bank farm, and the question for decision was whether the Company had the right to use the road leading to their works from the Southport-road. When a mere foot and bridle path the road in question was conveyed in 1887 by Mr. Townley Parker to the Corporation, who required access to their sewage farm at Common Bank, and vended it as to make a cart road. They gave the plaintiff Company the right to use it "so far as they could lawfully do so," but Mr. Townley Parker now claimed that on the true construction of the conveyance the Corporation and their assigns were only entitled to use the road for agricultural purposes, and could not do so for bleaching works. He therefore called on the Corporation to stop the plaintiffs using the road, and they had done so. It was stated that there were other roads giving the plaintiffs access to their works.

In the result, his lordship held that the plaintiffs were entitled to use the road in the manner they contended for, and made a declaration to that effect. He gave costs against both defendants with liberty to apply if they differed as to how they should be divided between them.

Order accordingly.

Capital and Labour.

BUILDING TRADE ARBITRATION, COVENTRY.—Under appointment from the Board of Trade, Mr. A. Hudson sat at St. Mary's Hall, Coventry, on the 4th inst., to arbitrate a dispute between the Coventry Master Builders' Association and the carpenters and joiners. The former had given notice to the latter of a proposed alteration of rules regarding overtime. The practice hitherto has been for time and a quarter pay to be made for hour done after the ordinary working hours, but this payment has been according to the employers, only after given in other branches of the trade after eight o'clock, the masters sought to bring the carpenters and joiners into line with other departments. On their part, the carpenters and joiners put in notices demanding an advance of wages from 8*h.* to 9*h.* per hour. Mr. Hudson promised to give his decision at an early date.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this list, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. viii. x.; Public Appointments, —; Auction Sales, xviii.

Certain conditions, beyond those given in the following information, are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

Competition.

April 24.—Aldershot.—Kraning, etc.—Aldershot I.D.C. invite tenders for the supply, free on rail at

either the London and South-Western Railway or South-Eastern and Chatham Railway Stations, Aldershot, of 1,300 ft. run of 12-in. dressed, flat, granite kerling, and 1,500 of 12-in. by 6-in. Kerling or blue penant channelling, all in lengths of not less than 33 in. by 6 in. Tenders, endorsed "Kerling and Channelling" stating the price per foot of each material to be sent to Mr. Fred. C. Green, District Surveyor, on or before 24th inst.

April 27.—Rawdon.—Road Metal.—Rawdon I.D.C. invite tenders for the supply of the following road metal, broken and unbroken, during the year ending March 31, 1907, to be delivered at Yeardon Railway Station, as and when required by the Council:—(1) Whinstone macadam; (2) granite macadam; (3) dark blue limestone macadam; (4) dark blue unbroken. Sealed tenders, marked outside "Road Metal," must be delivered on or before April 27 to Mr. John H. Pratt, Royal Bank, Rawdon.

April 27.—Thursk.—Winstone, etc.—Thursk R.D.C. invite tenders for the supply of about 4,000 tons of whinstone and 6,000 tons of slag, to be delivered, carting free on rail, at the following stations:—Baldersby, Boroughbridge, Brafferton, Coxwold, Humberton Sidings, Newby Wiske, Otter-

ton, Pilmoor, Sessay, Sinderby, Thursk, Thirsk Town Station, and Topcliffe. Forms of tender can be obtained from Mr. William Swarbrick, Clerk to the Council, Thursk, or the Council's surveyor, on receipt of stamped addressed envelope. Duplicate samples of stone are to be sent in to the Surveyor of Highways, Thursk, R.D.C., 28th inst. or before Friday, April 27. Tenders are to reach the Clerk by twelve o'clock at noon on April 28.

April 28.—Teddington.—Mazrulis.—Teddington I.D.C. invite tenders for the crushing year for the supply and delivery of the following:—1,000 yds. of broken granite and 2,000 yds. of blints, to be delivered as required, either by barge alongside the Teddington public landing wharf on the River Thames, or by rail at the London and South Western Railway Station, Teddington. Also for the execution of all sashery, smith's work, and team labour, the supply of tools and implements, oil, waste, and engine-house goods, household sundries, pipes, gullies, etc. Forms, etc., may be obtained on application to Mr. Marshall Hainsworth, Surveyor, Council offices, Teddington. Sealed tenders to be delivered to Mr. G. H. Salmon, Clerk, Council offices, Teddington, at the Council's offices, not later than April 28.

Patents of the Week.

APPLICATIONS PUBLISHED.*

5,167 of 1905.—H. C. CLEAVER: Domestic Fireplaces.

This relates to a domestic fireplace, wherein fuel is continuously fed from a hopper to the top of a forwardly inclined grate at the lower extremity of which a curb is provided, and consists in the provision of a door giving access to the space beneath the grate for the removal of the ashes.

5,569 of 1905.—A. E. HARRIS: Apparatus for Heating Water.

This relates to a water heating apparatus wherein two vessels are connected by a zigzag or tortuous passage upon the surface of which heat is applied, and the sectional area of which is relatively small, so that heat from it will be rapidly imparted to the water flowing through the said passage.

6,604 of 1905.—J. YARDLEY: Fireplaces, Steam Boiler Furnaces, and the like, to Facilitate the Consumption of Smoke.

This relates to fireplaces, steam boiler furnaces, and the like, having a main and secondary fire grate, the latter of which acts as a combustion chamber to the products of the former, and is characterised by dividing the main fire grate from the secondary one by means of fire bars and a swing door, whereby the smoke from the main fire is caused to pass over or through the secondary fire, and the smoke from the secondary fire is drawn down through its own fire for the purpose of being thoroughly consumed.

9,421 of 1905.—E. RUDD: Jackets or Casings for Water Heaters.

This invention relates to jackets or casings for water heaters of the kind in which the water to be heated passes through pipes of a heating coil in the interior of the heater, and is heated by hot gases in the space surrounding such pipes or coil within the jacket or casing, and consists of a door or doors in the casing, and means for automatically closing such door or doors, which at the same time permit them to open under the increase of pressure within. These doors are also convenient for giving access to the interior of the casing for inspection or cleaning purposes.

10,323 of 1905.—E. HURLEY: Chimney Cowl and Ventilating Cowl.

This relates to a chimney cowl or ventilating cowl, and consists in the combination of an upright air or smoke shaft, a vertical spindle fixed thereto, and projecting through the back or inward side of the hood, which revolves on said spindle and is made with a top wall and an inclined sided depression in its rounded side, terminating in a slot in the hood above the smoke shaft or air shaft, and provided with a bracket made with a depression on its underside to receive the top end of the vertical spindle, and also having a lower eye hinge through which passes the spindle, and means to prevent the hood from rising.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

10,921 of 1905.—F. M. PROCKTER and H. C. HOWORTH: Apparatus for Supplying Humidified Air to Rooms or Enclosed Spaces.

This relates to an apparatus for supplying humidified air, and consists of a rotary drum having radiated openings through its periphery mounted in position to come into contact with water contained by a vessel beneath, while shields and grilling parts are situated upon it relatively with said drum, so that a fan mounted in the position described may induce air to flow to be humidified by the several parts employed.

13,732 of 1905.—J. H. CARLAND: Door Springs and Checks.

This relates to door springs and checks, and consists in the combination with a cylinder connected to a box or frame, and having a piston and spring enclosed therein, of a connecting rod having studs and spindle suitably carried in said box or frame, and claw-like arms, said spindle having further provision for connecting it to the moving door.

21,666 of 1905.—R. HUDSON: Gates and Doors.

This relates to a gate or door wherein shanks formed integral with or secured to the two hinges extend across the frame of the gate or door to the free end thereof, each end of the gate or door frame being secured to the shanks by nuts or cotters in suchwise that the frame can be adjusted upon said shanks towards or from the hinge post.

25,919 of 1905.—F. G. MANSFIELD and E. H. CUTFORTH: Water-closets.

This relates to a water-closet having a combined "wash-out" and "wash-down" shelf extending from the front of the pan towards the back to the same extent as the seat-opening; the trap and back part of the closet being closed.

26,117 of 1905.—G. C. DOUGLAS (W.) ROBERTSON: Ventilating Cowls.

This relates to a ventilating cowl without fixed wind vanes, and consists in the combination of an internal and an external fan mounted on a spindle carried by a rotatory cowl for the purpose of assisting in the extraction of smoke or foul air, the extending fan also acting as a wind vane.

TO CORRESPONDENTS.
NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.
We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or models or samples sent to or left at this office, unless he has specially asked for them.
Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT Duplicated.
All communications must be authenticated by the name and address of the sender whether for publication or not. No notice can be taken of anonymous communications.
We are compelled to decline pointing out books and giving addresses.
Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, those received by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. The Editor reserves the right to read and consider articles offered for acceptance unless they are type-written.
All communications regarding literary and artistic matters should be addressed to THE EDITOR, those relating to advertisements and other business matters should be addressed to THE PUBLISHER, and not to the Editor.

In the Abruzzi.

NTIL within the last ten years the mountains of the Abruzzi were amongst the most inaccessible regions of Italy. But now the entire district is opened up by a new railway, the construction of which was commenced about 1895. This railway forms a curiously exact cross on the map, of which the four extremities are Cittaducale on the north, Isernia on the south, and on the east and west Chieti and Avezzano. Solmona happens to be in the exact centre of this cross as a railway junction. The Abruzzi (formerly divided into Abruzzi Ultra and Citra) forms the northern frontier district of the mediæval kingdom of Naples, where the Apequines seem to circle round the flat country of the Roman Campagna on its eastern side. These Abruzzi Apennines form two main ridges, with a string of deep valleys in between, running from north to south. The high alpine range of the "Gran Sasso" rises to over 10,000 ft. above sea level, and now that a direct railway runs from Rome to Solmona these mountains have become a special summer resort for dwellers in the Eternal City, who can here enjoy an almost Swiss climate at the end of a small railway journey.

The northern visitor to the Abruzzi naturally enters the province by way of

a branch from the main line between Florence and Rome either by Perugia or by Orte; in any case he finds himself at the fine old walled city of Rieti, a city which has many characteristics to remind him of mediæval Rome, its huge palace walls inlaid, with the doors and windows of varying styles, lining narrow lanes paved with cobblestones—the Rome which is so rapidly passing away at the present day. Here and there a fine Gothic church tower, square and covered with flat tile roof, and also a few venerable Gothic churches remain. The town walls of Rieti are also of the Roman kind, low curtains with square towers and square-towered gates, and in places these seem to have been "restored" of recent years.

From Rieti junction and its wealth of surrounding vineyards and woodland the Abruzzi railway enters a narrow defile to the first Abruzzi town—Cittaducale. Here, in the days before Garibaldi, the unhappy traveller was subjected to all the inconveniences of the old passport regulations, which in the Neapolitan kingdom seem to have been exceedingly annoying. Cittaducale was built in 1308, and there are a few mediæval traces, notably a fountain in the principal piazza, but the town wears a dilapidated appearance, and looks as if it had been repeatedly rebuilt after suffering the fortunes of frontier war and earthquakes. Its ancient walls have, to a great extent, been demolished.

The narrow pass through which the road to Aquila—one of the capitals of the Abruzzi—proceeds is remarkable for the

number of ruined castles of different ages visible on either hand. Evidently this must have been a hotly-contested part of the world in former ages. Some of these mountain forts date back perhaps to Rome for their origin, but it is singular that so very few Roman monuments of any first-class importance now exist in the Abruzzi. On the contrary, the long chain of valleys between Cittaducale and Castel di Sangro may be said to breathe forth an atmosphere purely of the Middle Ages. All that preceded or followed the XIIIth—XIVth centuries is of little importance, and attracts no attention.

Aquila is about 2,350 ft. above sea-level. As a consequence, the architecture, although Neapolitan in character, is much modified by the requirements of almost a northern climate. Here the flat terrace roofs of Naples have to be replaced by the usual heavy tiles and projecting eaves of the north, and the wider spacing and smaller size of the windows marks the rigorous nature of winter weather. Even in July the glaciers visible from Aquila on the neighbouring "Gran Sasso" suggest the necessity for thick walls and capacious fireplaces during the greater part of the year. The older buildings of Aquila arrest the attention of the architectural student at once. He feels that he has crossed the frontier of a new artistic province. The Tuscan-Umbrian Gothic of Assisi and Perugia, with its rather meagre decoration and severity of un moulded arch or simple column construction, gives place to a style suggestive of the French

Fig. 1.

flamboyant," and even more of the Spanish and Portuguese work of the same kind. This peculiar style, specimens of which may be found on almost every northern shore of the Mediterranean from Gibraltar to Cyprus, appears like a very early development of what we call the "last Gothic style." The ogee arch and square-headed window with dripstone, the dying off of arch mouldings into splays, and many peculiarities which we associate with the later XVth century in Europe, appear as immediate developments from a primitive style of Gothic which is little more than a pointed Romanesque. In other words, there are few traces in Mediterranean lands of that intermediate "geometrical" or "decorated" type which we are familiar with in England, France, and Germany.

The ecclesiastical buildings of Aquila are not so interesting as those of a domestic kind. This is due, perhaps, to their having suffered more from earthquake—that force which, even more than man's destructiveness, has ruined so many monuments within Neapolitan territory. The Duomo, or Cathedral, has been entirely rebuilt in a heavy classical style, and not a vestige of the mediæval building remains. The great church of S. Bernard of Siena—in most Italian towns of the Middle Ages there is a "great church" independent of the cathedral—is an ugly and uninteresting XVth century building enclosing a poor specimen of the XVth century style of shrine, one of those over-elaborated masses of white marble, like the outside of the "Santa Casa" of Loretto. There are traces of an older and mediæval structure about the building. The smaller churches of Aquila have all been more or less modernised, and one or two are being "restored" at the present time. Outside the city walls the enormous Celestine monastery of S. Maria di Collemaggio attracts attention. The monastic buildings are now an impenetrable penal settlement, but the church, which internally reminds one of S. Giov. Laterano in Rome, is open to the public. Of its mediæval character nothing remains but the singular west front in coloured marble and stone, with three deeply-recessed doorways, the centre one of which is round arched. This church was ruined by an earthquake in 1703, and thus a monument of the greatest interest, to judge by the

surviving front, was lost to art. On the south side of the singular west front is what appears to be a machicolated tower suggestive of fortification.

Several of the small mediæval houses mentioned in Murray for 1855 no longer exist. To judge by others which still survive in different parts of the town, which are presumably of less importance than those mentioned fifty years ago, the aspect of Aquila must have been at one time very remarkable. In the quiet narrow back streets of the town many of these little houses, or traces of them, may be noticed; their number tends, of course, to diminish year by year, as modern life and business penetrate the Abruzzi in the wake of the railway and the mania for creating new streets through old cities spreads amongst the people. Amongst the most interesting objects of art destroyed during the past fifty years is probably the great fountain of Aquila described by Ricci in *Storia dell' Architettura in Italia*, 1858.

One of the most singular features about the small house architecture of S. Italy in a large number of cases is that the accommodation of two, or at most three, rooms on an upper floor—*primo piano*—seems to have remained sufficient for the use of a family throughout three or four centuries, and that these small houses with such limited accommodation were originally built by persons sufficiently well-to-do to be able to cultivate a taste in architecture. As

Fig. 2. At Aquila.

will be seen in Figs. 2 [and 3] these houses were designed for the shopkeepers who probably occupied the shops below them, but the entrances are always quite distinct from the shops. In Fig. 3 it will be noticed that the entrance to the *primo piano*, which pierces the quaint line of arched shops, probably leads to a larger house more like a palace—the residence of some more important merchant, perhaps. In the case of this larger house there is a singular mode of suggesting a plinth to the building by a heavy *boutell* moulding which follows in a stepped-up line the rise of the street. It is a peculiar and effective treatment of a wall in a very narrow street; it must also have been intended to keep the wall clean in days before the advent of carriages.

In all the little towns of the Abruzzi mediæval street architecture may still be studied chiefly in the form of small houses, with occasional palaces, as at Popoli, where the Palazzo Cantelmi is one of the finest examples. As the traveller proceeds along the new railway towards Sulmona he notices from the carriage window many churches and ancient houses in ruins; these features

Fig. 3. At Aquila.

of the landscape naturally suggest the frequency of earthquake, and, indeed, as has recently been exemplified in Calabria, this terrible force has been the chief destroyer of historical landmarks in the Neapolitan kingdom, as well as in the older Magna Græcia. Such colossal fortresses as that of Aquila, or another on the way to Sulmona called Fossa, have, however, remained proof against the devastation.

Solmona is a large town which has been on the increase during the last few decades. It is situated at some distance from the railway-station, to which a road leads through a kind of public garden. There are many most interesting mediæval buildings in this capital of the Abruzzi. The most important, and one which is first seen by the visitor on entering the town, is the very interesting façade of the Annunziata (Fig. 4), an institution for the maintenance of the Abruzzi foundlings, or at least the administrative office for the purpose. The richly decorated façade of this building suggests to northern eyes the idea of a town-hall, but in the "kingdom," as the Neapolitan territory was called in the Middle Ages, to distinguish it from the Papal State and the northern Republics, town-halls

Fig. 4. The Annunziata, Solmona.

the homes of countless generations, whose descendants still survive. Of such houses Figs. 5 and 6 are characteristic. The houses of Solmona are somewhat larger in scale compared with those of Aquila; they approximate more to the palace type. Fig. 5 shows the entrance to the little palace of the Tabazzi family, and is, perhaps, one of the most elaborate examples of such a design in the town. The delicately-carved double window is the only piece of ornamentation on the street front; the other windows of the same story are mere square holes, and must always have been so. The same idea of an entrance with the double window above occurs in Fig. 6. This treatment was evidently a very common local one during the XVth century, and may often be noticed elsewhere in Neapolitan towns. In Naples itself the doorway is usually the only portion specially elaborated, the windows

Fig. 5. At Solmona.

of a façade in the narrow mediæval streets evidently being considered too much out of sight to be worth decorating.

At the side of the doorway of the Palazzo Tabazzi is a curious little tablet, on which is engraved "Mastro Petri da Como fece questa Porta, A.D. 1448." Here we have, therefore, an interesting dated example of Neapolitan architecture, and at the same time a curious evidence of how little the peculiar characteristics of local style were carried into foreign parts during the later Middle Ages. If this inscription means that Master Peter really came from Como in the middle of the XVth century as a wandering mason, it is evident that he did not bring with him any of the Comacine peculiarities of masoncraft. There is nothing in this work, with its flat surface ornament and, horizontal lines, to suggest affinity with the half-German style of the north of Lombardy. The high stilted

arch is also somewhat peculiar to the south of Europe.

Not far from Solmona is the immense monastery and the adjacent hermitage of S. Pietro da Morrone, or, as he is more commonly known, Celestin V., a Pope whose memory is associated with politics as much as religion of the XIIIth century. Owing to this historical association the enormous buildings which have been erected both at Aquila (S. Maria di Collemaggio, where he was crowned Pope, and which seems to have been intended to take the place of S. Peter's, Rome, at that period) and here at Solmona would have an interest as most important monuments of the Middle Ages, but, unfortunately, there is very little mediæval left about them. S. Pietro da Morrone is even more completely transformed than the church at Aquila, and the only record of the mediæval building is a canopied tomb in a side chapel, with the recumbent figure of a youthful knight in the style of so many such monuments in Naples.

The Cathedral of Solmona is an interesting building of Romanesque style, with raised choir and *confessio* beneath. It seems to occupy a site which must have always been at some distance outside the town limits. Like the neighbouring S. Pietro da Morrone and the curious church of Pellino, it appears to have been built out of the ruins of an ancient Roman town of Corfinium. Many of the parish churches of Solmona retain Gothic doorways and details; the once splendid and interesting church of S. Maria della Tomba (described in "Murray" of 1855 as having an almost English interior) has been rebuilt, excepting the ancient west front, in a mean classic style: Everywhere the terrible earthquakes of the "Kingdom" have perhaps been a sufficient reason for the disappearance of so much that was still visible even in the middle of the last century.

The old consular road of the Abruzzi continues past Solmona in a direction due

Fig. 6. At Solmona.

do not seem to have been much *en évidence*. A founding hospital was evidently thought more of importance by a paternal government. The Annunziata exhibits that very peculiar characteristic of the early Italian Renaissance, the building by fragments of different styles, possibly by the same master mason, or at least at about the same period. It seems as if, owing to the change in task as to architectural detail in the XVth century, such a committee as must have existed for the building of this chief civic monument was unable to carry on the work in any particular style. In this curious example we see a gradual change in architectural forms from the ordinary Gothic detail of the clustered columns intended to support an arcaded street front of the XIVth century, through the last development of the pointed style, into distinctly Renaissance pilasters and decorative cornices, which take the place of the earlier mouldings and string courses. All these curiously jumbled details have an appearance of being coeval in workmanship, and in all probability they date from a special foundation of this charity by Alfonso I., King of Naples, in 1442. The Gothic details represent probably the lingering masoncraft of the district; the early Renaissance in art had become popular before the building was completed. At the present day it would perhaps be difficult to carry out a large public building in such a manner, although some of our more eclectic designers have made attempts in the same direction. In the later Middle Ages such a combination was natural, owing to the lingering traditions of an older style.

Solmona is the second capital of the Abruzzi, or at least of that portion which lies between the two great mountain ranges. Although now becoming the principal capital of the district in consequence of its position at the junction of the railways, it betrays no particular sign of changing its character from a small centre of agricultural industry. For long to come the visitor will be able to appreciate its air of mediæval quiet; its grass-grown streets and absolute absence of all modernism. Much more than Aquila it shows traces of past earthquakes, where mediæval houses still stand shattered and roofless. No new streets have yet been cut through the century-old lanes, with their old houses,

Fig. 7. Casa del Leone, Castel di Sangro.

south over a plain or upper valley about 4,300 ft. above the sea. Here in former days the road was always stopped in winter time by snow, but the railway has done away with such an interruption to traffic. At Introdacqua the train passes in a loop round one of the most picturesque villages in existence, standing on a steep rocky ridge round which the railway and the river wind through deep gorges. The country becomes then bleak and uninhabited, and is used by the shepherds of Apulia as a summer camping-ground for the flocks which make this annual migration. At Roccasecca is the highest inhabited village in S. Italy—4,370 ft. above the sea—from hence begins the descent towards Capua and Naples, and following the river Sangro the road leads to Castel di Sangro, a rather dirty village clustering round the base of a hill on which the castle of the Marsi, from which the village takes its name, is built.

Castel di Sangro possesses several old houses of the interesting XIIIth and XIVth century style. The one represented in Fig. 7 is perhaps the most important in the little town. It is still in a delightfully untouched condition, with merely the accretions of six centuries added to its venerable walls. This house is known as the "Casa del Leone," on account of the shield with that emblem on it carved between the trefoils of a window. As has already been remarked, it is somewhat surprising to note how very limited the accommodation seems to have been in the mediæval Italian house, and yet a family of apparently knightly pretensions would have need for more rooms than appear in such a house as the present. Are we, perhaps, to suppose that this little "Casa del Leone" was merely a small town house or factor's office for some noble family, whose feudal home

may have been in the vicinity of Castel di Sangro?

In the town, or, more properly speaking, village of Castel di Sangro are several traces of mediæval shops with living rooms or houses above them, precisely similar to those of Aquila already noticed. The same characteristic wide opening, which may form either a blacksmith's forge, a butcher's, or any other kind of shop or workshop on the level of the street, affords to the passer-by a glimpse of some craft or industry still carried on in the little Italian *bottegas* in a primitive manner which seems almost forgotten in our modern cities of more northern climes. Here no plate-glass windows intercept the view, and instead of the "manufactures" being made by machinery in mills far away from the place where they are sold, they are clearly enough made by hand on the premises.

The little town of Castel di Sangro is at the most southerly point of the Abruzzi; from it one descends into the lower plains of the Neapolitan kingdom, where the architecture, losing all the restraint to some extent imposed by the presence of snow—the "white pilgrim," as Italians call it in picturesque language—becomes thoroughly Levantine or Spanish "flamboyant" in character, and the Gothic gable develops into a mere decorative moulding, straight or curved, as the case may be, against a flat-topped wall.

It must be admitted that the mediæval art of Italy affords but little to the student in search of models for imitation in northern lands. In countries with climatic conditions similar to those of the 40° parallel—countries which of late years the British race manifests an inclination to colonise—the southern mediæval style has certain qualities

which seem certainly more appropriate to warmth and sunshine than the national styles of England, France, or Germany. The wide arched doorway, the open arcade of court and terrace, and, above all, the windows fitted with wide opening wooden shutters, not to mention the perhaps doubtful advantage of a flat roof, all indicate the necessary adaptation of the pointed style to a southern climate, and it is certainly quite as foolish to introduce the English "perpendicular" or other northern styles into a country south of the Alps (as is actually being done in Florence at the present moment) as for the Albert Memorial to have been built in the "Giottesque" taste.

However, whether the mediæval architecture of Italy be of any interest to the practical designer of modern buildings or not, there is no doubt about its extraordinary value to the artist and archaeological student of Italian history. A trip in the far south of the Peninsula (rendered easy by modern means of communication) is always delightful, and the only regret one can feel is that the terrible forces of Nature have destroyed so many beautiful buildings—apparently without much of the usual human assistance—during the past five hundred years.

WINCHESTER CATHEDRAL.

TO the casual visitor there are not many evidences of the peril which in a measure still threatens Winchester Cathedral, partly because the effects of the settlement of the foundations are practically confined to the presbytery and other portions of the building to the east of the transept, and partly because the height of the vaulting above the floor level tones down irregularities and makes it difficult to detect new and old cracks. Moreover, the reredos hides much of the eastern portion of the cathedral, and partitions erected across the aisles shut out the general public from the parts most affected.

On ascending the scaffolding which has been erected for the purpose of centring the vaults of the north and south aisles many serious defects are revealed, some obviously of old standing, and showing signs of repairs executed during past years, and some of recent date. Not only is much of the vaulting in a dangerous state, and in parts only held up by being bolted to timbering in the roof space above, but many of the ribs are seriously distorted, so that in some cases tensile stress developed on the under side has splintered the stone. This state of things, serious as it is, does not involve quite so much danger as might be assumed from a first perusal of the foregoing lines. The fact is that settlement of the foundations has been going on for a long period of time, during which the vaulting has been continually accommodating itself to the slowly altering conditions, and as far as possible attempting to maintain a state of equilibrium—up to within quite a recent date with a considerable share of success. But we are perfectly satisfied, as the result of careful examination made this week, that the Dean and Chapter have been well advised in taking measures

with the object of arresting the movement which has caused the vaulting to crack, and which, if not arrested in time would certainly have led to serious disaster. At the present time the threatened parts of the vaulting are being securely centred, an operation which is nearly completed.

The cause of the trouble is twofold. In the first place, the north and south walls to the east of the transept have slowly rotated about their foundations in an outward direction until the distance between the two walls at the top is some 15 in. greater than the distance between them at foundation level. In the second place, the eastern end of the building has moved perceptibly towards the east. Both of these movements are due to sinking of the earth, and the outward tilting of the walls has naturally been effected by the outward thrust of the vaulting. However good the walls may have been, they were bound to suffer under the stresses developed, and they undoubtedly did suffer, but, fortunately, only to so comparatively small an extent as to make their satisfactory repair no insuperable task. Any efforts made to repair the vaulting and the walls would evidently have produced no lasting good so long as the foundations remained insecure, and to place these upon a sound footing has been the first care of the authorities, acting under the advice of Mr. Jackson. As a precautionary measure, instructions were given in August last for shoring the greater part of the south wall, and for bonding across the cracks in the same wall, and we were able to see on the occasion of our visit that this work had been satisfactorily accomplished from ground level up to window level—a height of about 15 ft. As Mr. Jackson states in his recent report to the Dean, repairs below ground level await the execution of the underpinning, and above window level the application of tie-bars, which will be carried transversely across the cathedral to prevent further spread of the walls.

The insecurity of the stones in the vaulting was brought forcibly to attention in February last by the falling of one stone almost above the Waynflete Chantry, this fall being very reasonably attributed by Mr. Jackson to the jarring caused by the cutting of holes for the passage of the ties. Consequently, the piercing operations were stopped, the adjoining stones were securely wedged, and instructions were given for the erection of centring under the vaults, and of shoring outside the north wall similar to that on the south side. There is now nothing to prevent the fixing of the tie-bars, and when these are grouted in and screwed up it will be possible to proceed with greater confidence with the underpinning works, and at the same time to push on with the repair of the walls and the vaulting. The ties will pass horizontally between the springings of all the arches in the width of the cathedral, and though it is a pity that such a remedy should be necessary, the only alternative would be the equally undesirable one of erecting perfectly new buttresses on the exterior. When all cracks in the north and south walls have been bonded in the admirable manner already evidenced by the work so far accomplished, we have no doubt what-

ever that these portions of the structure will be perfectly safe for centuries to come, providing their foundations are made secure. And, given secure foundations and sound walls, we are equally satisfied that Mr. Jackson's proposal to reset some parts, and to grout and pin up the whole of the defective vaulting, will be attended with satisfactory results.

Turning now to the most important matter of all, the underpinning of the main walls, we ought to say at the outset that this vital question has been the subject of most careful consideration and inquiry from the very first. Actual operations have not been advanced very rapidly, for a certain amount of experimental work has necessarily to be done, and because elements of insecurity in the superstructure demanded prior attention. While endeavouring to avoid delays, which might prove very dangerous, Mr. Jackson appears to have acted with much caution and good judgment in dealing with a fabric of which some portions were in a rather nicely-balanced condition, and whose equilibrium might have been upset very easily by hasty action or injudicious treatment. That the critical stage may now be looked upon as a thing of the past is certainly a reason for congratulation.

From the architect's report it appears that the whole eastern end of the building was originally supported by a grillage formed of two layers of tree-trunks laid crosswise to each other on the soft soil. Many of the trunks remain sound, but others, as we have seen for ourselves, are so decayed that portions may be crumbled to powder between the fingers. Even if the timber had remained sound there would still have been settlement, for the trunks have been pressed down into the soft earth by the weight of the masonry above. The last-mentioned difficulty seems to have been recognised by the builders who extended the Lady Chapel in the XVth century, for the timber grillage then employed was made of proportionately greater area, so as to distribute the weight more effectually. Bearing in mind the fact that the nature of the earth becomes worse the further it goes eastward, Mr. Jackson decided to commence underpinning at the east end of the building. Accordingly, a trench has been dug along the east wall of the Langdon Chapel, and the greater portion of the foundations below this wall now rests upon concrete, cement, and brickwork, carried about 9 ft. inwards, and built up from the solid gravel formation, encountered 21 ft. below ground level and 14 ft. below the present level of the water. The programme laid down for the underpinning operations is a good one, the intention being to arrest any further movement of the foundations by a solid substructure at the east, and then to work in a westward direction along the south wall of the presbytery, and probably along the north wall also. Some difficulty was occasioned by the flow of water from the gravel into the excavation. As the water proved to be perfectly clear, and experimental pumping showed that no sand or other material was removed thereby, a steam-driven centrifugal pump was installed, which cleared the way for the laying of concrete and brickwork. On the second section of underpinning

undertaken a fresh difficulty arose from the fact that a thin layer of chalky material was found above the gravel, and as pumping would have brought away some of this it became necessary to employ divers to deposit a layer of concrete sufficient to seal the spring, and thus to permit the water remaining to be removed by pumping. Good progress is now being made with the underpinning works, and there is reason for hoping that before very long the threatened portion of the cathedral will rest upon a permanently secure foundation, which with the works of reparation previously described should finally remove all cause for future anxiety.

NOTES.

Two Reports issued by the British Fire Prevention Committee give the results of tests conducted upon two floors consisting of broad flanged steel beams and light steel joists with a filling of concrete, the aggregate being gravel in one case and furnace clinker and coke breeze in the other. Examination of the Reports shows that the results were very different, as the clinker and breeze concrete afforded far better protection than the gravel concrete, and, so far as concerns resistance to fire, it appears to be clear that the former aggregates are distinctly superior. It should not be inferred, however, that cinder concrete is generally more suitable than gravel or stone concrete, for the question of strength and the protection of metal from corrosion have also to be taken into account. Clinker and coke are light but relatively weak, and, owing to their capacity for the absorption of moisture, often cause voids, which account for the quantities of steel that have been rusted when encased in concrete mixed with these materials as aggregate. Sometimes, also, they contain oxide of iron, which facilitates corrosion. The remedies for these disadvantages are to be found in the use of sufficient water and cement to guard against voids and to cover the aggregate. With proper attention to these points clinker and coke concrete may be used with entirely satisfactory results in floors of construction akin to those forming the subject of the present Reports. It would be very unwise, however, to draw the hasty conclusion that, for different forms of design and for other purposes, cinder concrete should be substituted for concrete made with gravel and other stone.

ANALYSIS of the figures contained in the recent return made by the London Fire

Brigade shows that of the 3,511 fires which occurred in the metropolis last year nearly two-thirds were due to general carelessness and the lack of proper precautions in handling materials and apparatus for the provision of heat and light. Nearly a thousand fires were caused by children playing with matches and fire, and by grown-up children throwing lights carelessly aside or dropping lighted tobacco. Nearly a thousand fires also were caused by carelessness and accidents in connexion with

gas-fittings, lamps, candles, and electric light installations. In this category gas-fittings easily head the list, probably because the use of gas has extended so largely within recent years. The use of swinging gas-brackets in places where such fittings are convenient for igniting curtains and other combustible hangings ought certainly to be discouraged, and so also should the natural but fatuous habit of looking for escapes of gas by the aid of naked lights. If people would be more sensible in these two respects the number of fires might be considerably reduced. Fires resulting from the employment of electricity represent only a small proportion of the total number, but might be almost entirely obviated if architects, electrical engineers, and property owners would set their faces against the use of wood casings and other conduits which are not able to prevent moisture and water from gaining access to cables and wires. The remaining fires reported last year were due to various causes, among which we only notice two of special interest to our readers—improperly fitted stoves and the slaking of lime by rain, these being responsible for sixty-seven and five fires respectively.

In a Note, December 2, 1905, The Factory Act. we had occasion to draw attention to the difficulties introduced by the wording of the Factory and Workshop Act in determining what is a factory and what is a workshop. By sect. 149 of the Factory Act a workshop is defined as a place not being a factory in which "any manual labour is exercised by way of trade or for purpose of gain in or incidental to the altering, repairing, ornamenting, or finishing any article." A fisherman had a boat store over which was a chamber to which fishermen and their wives resorted for the purpose of mending the nets; the owner was summoned for not complying with the Factory and Workshop Act by exhibiting an abstract of the Act as in a workshop. The Divisional Court held that this was not a workshop, and following the case of *Nash v. Hollingshead* (1901) laid it down that the article must be manufactured, or the work expended for the purpose of direct gain. In argument the illustration was given of a railway company making its own railway rolling stock, and it was argued such workshops would be excluded by the reasoning in this case. The Court intimated that such workshops would be within the Act, but was not prepared to say how the distinction would arise. This method of slipshod definition in Acts of Parliament gives rise to much litigation, and its difficulties and absurdities are well illustrated by these cases. In *Nash v. Hollingshead* the real reason of the decision was that the Court could not bring itself to hold a farm to constitute "a non-textile factory."

ALTHOUGH we cannot approve the attempt made last week by a daily paper to create a scare with regard to the character of the metropolitan water supplies, it certainly is the case that considerable difficulty is experienced in dealing with public authorities who persist in contaminating the rivers

Thames and Lea with sewage effluents. At the last meeting of the Thames Conservancy Board the pollution caused by the War Office was again the subject of discussion, and while the belief was expressed by the chairman of the Rivers Purification Committee that the Department were endeavouring to comply with the requirements of the Conservators, it is the fact that no effective measures have yet been adopted. The condition of the Lea, again, is so unsatisfactory that the Metropolitan Water Board have decided to establish an intake higher up the river for the purpose of safeguarding the interests of the public. Moreover, in the south-eastern district, the Darenth pumping-station is within about 1,000 yds. of the Metropolitan Imbecile Asylum, whence a large proportion of the untreated sewage is distributed upon a layer of porous gravel and sand, overlying a stratum of fissured chalk. The Medical Officer of Health for the district reported in 1904 that twenty-six cases of enteric fever and five deaths from this cause were directly traceable to polluted soil carried into the hospital on the feet of workmen engaged in repairing some defective drains, and as the Metropolitan Water Board's pumping-station is situated at a lower level than the asylum there is urgent need for prompt action with the object of compelling the Metropolitan Asylums Board to place their drainage system upon a footing more worthy of the XXth century, and less likely to endanger the health of the public.

TWO QUESTIONS CONCERNING CONCRETE-STEEL. IN the course of the discussion that followed the paper on "Ferro-concrete," read by Mr. S. Bylander at the last joint meeting of the Architectural Association and the Junior Institution of Engineers, Mr. Max Clarke raised two questions which may have occurred to other architects who are interested in concrete-steel, and feel inclined to adopt it in practice. Admitting the valuable properties of the new material if applied in accordance with correct designs and under efficient supervision, Mr. Clarke first asked how architects could best secure the attainment of that standard of workmanship which is necessary to give an adequate guarantee of strength and durability, and next, whether under existing conditions it would be possible to erect ordinary buildings in concrete steel comparing favourably as to cost with similar buildings in brick. These two questions are certainly most pertinent, and unless they can be answered satisfactorily in any given case, the practical advantage of adopting reinforced concrete cannot be particularly striking. Until building contractors generally have acquired the necessary knowledge and experience, it appears to us that architects must rely chiefly upon the aid of firms who are accustomed to deal with concrete and steel in the exceptionally careful manner demanded by the new method of construction. As for the second question, we believe that, in places where building regulations are of reasonable character, ordinary buildings can be erected in concrete-steel at prices which compare favourably with brick construction. This, however, cau-

not be taken as an invariable rule, and data bearing upon the question would certainly be welcomed by the profession.

IN the latest issue of the *Journal of the Franklin Institute* will be found a copy of the paper read by Mr. H. W. Spangler on the heating installation of the dormitories of Pennsylvania University. The dormitories comprise at the present time a group of twenty-one buildings disposed partly around an interior quadrangle, and having a total frontage of about 1,325 ft. The buildings are heated by steam supplied from a central station situated at a distance of 1,200 ft., and conveyed through underground mains. The group of dormitories first erected, accommodating 361 students, is heated by means of indirect radiators fixed in the basement, but as each battery of radiators supplies several rooms the method of heat control has not proved entirely satisfactory. Therefore, in equipping the second group of dormitories it was decided to employ direct radiation. The data presented in Mr. Spangler's paper relate to one of the new buildings, known as the Edgar F. Smith house, of which plans and sections are given showing the disposition of the heating apparatus, and particulars of the various rooms and the radiator surface provided for each. After the heating apparatus had been planned a proposal was made that some of the radiators should be fitted with thermograde automatic control, and as the building was one in which such an installation could be tested conveniently, this system was applied to eighteen rooms, while in other rooms the ordinary hand control was adopted. Separate meters were applied so that the quantity of condense water from each group of radiators could be accurately measured, and after comparison of the results obtained during the winter of 1904-5, it was found that a saving of from 38 per cent. to 47 per cent. could be effected by means of the automatic control. The paper contains a full record of this practical test, and will repay perusal by all who are concerned in the heating of buildings.

A PRACTICAL difficulty which has hampered the progress of electric lighting is the want of a rapid, simple, and economical method of testing the efficiency of glow lamps. The old method of taking a few sample lamps and making a thousand hours' life test is expensive and unsatisfactory. What is wanted is a simple piece of apparatus which will enable the consumer to find rapidly the light efficiency of his lamps. In many cases this knowledge will enable him to effect considerable economies even although the illumination is increased. In the *Electrician* for last week Dr. Torda describes a portable selenium photometer for glow lamps which seems to solve the problem of measuring the efficiencies in a very satisfactory manner. It has been known for many years that the resistance which selenium offers to a flow of electric current through it is much greater in the dark than in the light. Unfortunately, however, after being exposed to

the light it takes some time to recover its normal condition. Dr. Torda gets over this difficulty by arranging by means of clockwork that the selenium cell is only exposed to the light of the lamp under test for two seconds, and the shutter of the box is then automatically locked for forty seconds. It is found that this time is amply sufficient to allow the cell to recover. On pressing a push-button on the photometer box a current produced by a few dry cells, similar to those used in electric bell systems, passes through the selenium, and an ammeter in the circuit gives a reading. By pressing a lever a shutter is opened for two seconds, and the increase of the ammeter reading due to the light rays diminishing the resistance of the selenium measures the intensity of these rays. It will be seen that anyone can use an instrument of this nature, and inferior lamps which consume too much current for the light they produce can easily be detected. Dr. Torda's photometer is sufficiently accurate to show the great fluctuations in the light given out by glow lamps due to fluctuations in the pressure of the supply mains. In conjunction with a standardised lamp, therefore, it can be used as a voltmeter to measure the pressure.

Egyptian Gallery, British Museum. The statues, sarkhets, sarcophagi, and other massive sculptured objects in the gallery (ground floor) of the west wing are being re-arranged, and two or three fresh statues are set up at the remote end of the gallery. A large portion of the more familiar objects were deposited in the Museum about one hundred years ago, having been taken from Napoléon's army, as spoils of war, after the capture of Alexandria. An illustrated catalogue of the exhibits, as re-classified and newly-grouped, will shortly be prepared, to supplement the catalogues now issued of the smaller Egyptian antiquities.

Exhibition of German Art. We learn that it is proposed to hold an Exhibition of German art, or at all events of Munich art, at the Grafton Gallery, to open on May 2. It is promised that all the artists belonging to the different Munich schools will contribute. It is to be hoped that the exhibition will be such as to raise our estimate of modern German art, but we surmise that there will be some curious things to be seen there.

Craig's-court, Charing Cross. THE demolition now in progress in Craig's, or rather Cragg's, court (1702) includes two or three of the original houses, one of them, at the corner by the entrance from Charing Cross, being that wherein by name of the Elvaston Fruit Stores the Earl of Harrington during many years kept a fruit and flower shop for the sale of his own garden produce. The freeholds of Nos. 8, 9, 9A, and 10, in the court, together with No. 21, Charing Cross, the fruit-shop, covering an aggregate of more than 2,500 ft. superficial, were placed in the market last June. At the same time was offered for sale No. 4, occupying the entire east side of Craig's-court, a fine old Early XVIIIth-

century mansion belonging to Elizabeth Still, Dowager Countess of Harrington. The house, however, had remained many years uninhabited; with the garden, which once overlooked the river, it extends over an area of nearly 7,000 square ft., and it is being placed in repair for occupation. The premises in the corner of the court, now a department of the War Office, were formerly the Royal Alms-houses, removed thither sixteen years ago from Spring-gardens after the demolition of the old Queen's Treasury. Whitehall. The house was adapted in 1840 for the collection, made at Sir H. de la Beche's instance, of specimens gathered during the geological survey of the United Kingdom, which became the nucleus of the Royal Geological Museum; it then served as the Census Office, 1850-63. In November, 1888, Messrs. Cox & Co., successors to Cox & Greenwood, army agents and bankers, migrated from Nos. 1-2, Craig's-court to Nos. 16-7, Charing Cross, built for them by Ewan Christian. The court was built, or rebuilt, in, it appears, 1702, so the tradition that claims No. 2 as a home of Nell Gwynne (*obit* 1687) lacks confirmation. At No. 9 were the offices of S. S. Teulon, architect. The Sun Fire Office was established in 1726 in the court, so named, some say, after the father of Secretary Cragg. The fruit shop was, it is said, the offices of Woodfall, the printer; on first coming to London, in 1762, Romney lodged in Craig's-court.

Croyland Abbey. THE Rector of Croyland writes a letter to the *Times* of Saturday which we are sure would be read with sympathy by all who are interested in the preservation of our national architectural monuments. Mr. Le Beuf has for many years given proof of the interest he takes in the ancient church which is under his care, and in order to assist in bringing his appeal under the notice of our readers we have gone somewhat out of our usual course in reprinting his letter in its entirety (see page 436). We hope those of our readers who are able to give any assistance towards this good work will do so.

THE CRYSTAL PALACE SCHOOL OF PRACTICAL ENGINEERING.

EVEN in this non-decimal country we have the habit of reckoning some things by tens and hundreds, and our readers will probably agree with us in considering as a noteworthy event the hundredth distribution of certificates at the close of the hundredth term of the Crystal Palace School of Practical Engineering. Founded thirty-four years ago, this institution is comparatively little known among the general public, but, owing to the eminently useful nature of the instruction imparted, and the successful career of many old students, the school has secured a reputation in engineering circles which suffices to bring more pupils than can be dealt with comfortably within the premises at present available.

The difficulty of securing just the right sort of engineering training has been recognised for many years past. The pupil who enters the office of a purely professional engineer has little or no opportunity of becoming acquainted in a practical way with the operations involved in the designs which he assists to prepare, or the work he helps to carry out. Similarly, the pupil in an engineering workshop does not come across much that tends to throw light upon the theoretical principles underlying the types of constructive work upon which his attention is engaged.

Before the Crystal Palace School of Practical Engineering was founded, Mr. J. W. Wilson, the father of Mr. J. W. Wilson, the present principal of the school, established, in connexion with his drawing office in Westminster, pattern and fitting shops for the training of his pupils, and, realising the benefits conferred by this method of instruction, he suggested the foundation of the present engineering school to the directors of the Crystal Palace, an idea which was adopted in 1872. Since that year the original purpose of the founder has been kept steadily in view, the main object of the school being to provide students of civil or mechanical engineering with thoroughly practical tuition in the rudiments of their future profession, and so to prepare students by a system of combined practical and theoretical instruction that, on entering an engineer's office or works, they might at once become useful and be the better enabled to increase their knowledge by experience and observation.

The course of instruction extends over about two years, during which period the student passes through seven departments. In the first year one term is occupied with the study of mechanical drawing, one term to pattern-making and foundry work, and the third term to fitting and smith's work. In the second year the student has the choice of taking up the civil engineering or the electrical engineering course. The first of these comprises three terms—one devoted to practical surveying and the preparation of plans for some imaginary public work to be executed on a site surveyed in the Palace grounds; another devoted to the preparation of working drawings, estimates, and specifications relative to a public work such as that outlined during the preceding term; and the last term is devoted to original design, the preparation of stress diagrams, the preparation of reports, and to the general application of scientific principles to practical work. The electrical engineering course covers two terms, during which the student receives theoretical instruction, and gains practical experience by working under competent direction on the electrical installation in the Crystal Palace and its grounds.

The foregoing brief outline will serve to give a general notion of the educational methods practised at this engineering school, and, as a proof of the advantages offered thereby, we may mention the fact that, out of some 1,750 old students, no fewer than 900 are known to be occupying, or to have occupied, responsible positions in their profession.

On the occasion of the hundredth award of certificates by Sir Alexander Binnie on Wednesday, April 11, we had an opportunity of inspecting the various departments of the school, and some of the work finished during last term. While finding ample evidence of the useful work that is being conducted, we could not help being struck with the need that evidently exists for more suitable and larger premises, and, in some departments at least, for more modern tools and appliances. Although about 120 students are now on the books, there really is not comfortable room for more than 100, and we think the directors of the Crystal Palace would do well to consider the advisability of erecting and equipping new buildings upon an adequate scale, so as to support more fully this valuable institution and to render possible an extension of its sphere of usefulness.

MAGAZINES AND REVIEWS.

THE *Art Journal* this month is very largely occupied with the subject of designs for posters, of which a number of examples by English artists are given, and a few French and German examples, with an article on the subject by Mr. Lewis F. Day. The humorous element is prominent in most of these, sometimes accompanied by a good deal of force of drawing and effect, but not such as to add to the beauty of the hoardings much. There is, however, as Mr. Day remarks, a wholesome tone of fun about these, very different from the style we constantly meet in French poster designs, such as the one by Grün given as one of the illustrations, which are vulgarly suggestive of the *Armi-monde*. There are some fine designs among the more serious examples, two of the best of them German—"Der Kunstschatz" by Herr Koloman Moser, and

the "Concours des Canots Automobiles" at Monaco by Herr Hohenstein. This is designed for the same purpose as the French one by Grün just referred to, and it is worth while to compare the spirit of them—the pleasant figure of the young girl at a steering wheel in the German example and the highly objectionable female figured in the French example. Herr Stuck's poster for the "Internationale Kunst Ausstellung," with the head of Minerva in a hexagonal panel, is a fine one; and among the English examples we may mention Mr. Buechel's fine poster for the play of Ulysses (he bears a German name, too, but the design is obviously not "made in Germany"); the same artist's drawing of "The Last of the Dandies"; Miss Brodie's procession of oxen for the Lambeth School of Art (the pertinence of which to the subject is not, however, very obvious); Mr. Morrow's "The Exile"; Miss Houghton's "Arts and Crafts"; and Mr. E. Bertram's familiar one for Bovril ("I hear they want more," an exceedingly clever piece of brute expression. It is interesting, too, to find the names of such artists as Mr. Wylie and Mr. Brangwyn attached to two posters of steamboat companies, which are really fine pieces of marine painting. We entirely agree with the protest which Mr. Day makes in favour of advertisers who require posters going direct to artists, and not to firms who supply them commercially, and from whom they will not get the best art.

In the *Darlington Magazine* an editorial article on "The Purpose and Policy of National Museums" suggests that there are three classes of museums, which must be considered on separate grounds—(1) great national museums such as the Louvre and British Museum; (2) provincial museums; (3) museums having a special scientific or educational purpose. The article is partly in reference to what seems to be a new department in the Boston Museum, of exhibiting a certain proportion only of the most remarkable works for the general public, and reserving the remainder for special study by students. We entirely agree with the writer that, even if this system may for any special reasons be best suited to the Americans, it would be an entirely mistaken one for adoption in such museums as the Louvre or the British. These are for the housing and display of great representative collections, for enjoyment and for comparative study; and the argument that the majority of visitors do not care for or attempt comparative study is no justification for removing the opportunity for it out of their reach. We cannot tell how far the sense of comparative criticism may be aroused in the popular mind, or a portion of it, by continued opportunity; and it is far more delectable for the studious few to see their material all before them instead of having to apply for special permission to see things. In a national museum the rule should be—show everything publicly that you can. We do not know that it is quite a fair criticism against the management of the South Kensington Museum, to say that while this museum is really a collection which in splendour and importance is in its way comparable to the Louvre or the National Gallery, it is managed "as if it were merely the *annexe* to an art school." But that is what it originally was; it had its first beginnings in the idea of reviving applied art in England, and furnishing models for study. Probably its originators did not foresee what a future was before it, but it was certainly established for educational purposes, and it is difficult to see how and when this tradition could have been broken with. When the collection comes to be definitely arranged in the new building, that may afford an opportunity for organising a different policy. The point that there is not only a moral and intellectual but a material profit from keeping up great national museums, is well put and is worth enforcing, since it will appeal to some persons to whom the higher considerations may not appeal. There is no doubt that there would be fewer visitors to this country and less foreign money spent in it if our great art museums were suffered to decline; and there is the consideration of national prestige, too, which is also worth something both in a material and a moral sense. In connexion with a short article on "The Most Magnificent Book in the World," by Mr. Yates Thompson (the fortunate possessor of the book), we are given full-page

reproductions from two pages from the Latin Aristotle produced in 1483 by Andrea dei Torresani. The text is quite a subordinate element of the page, which is crowded with fantastic figures and ornament in Renaissance taste not of the purest kind, but fascinating from its very richness and multitudinous character; at the top of the first page, in the foreground of a landscape, a mediæval-looking Aristotle is instructing Averroes, whose comment forms part of the text. "Silver Plate at Belvoir," by Mr. Starkie Gardner, is illustrated by some splendid examples. A short article on Menzel, one of the idols of contemporary art-critics, by Mr. C. Ricketts, is refreshing from its same and moderately expressed criticism; Mr. Ricketts can see (what most contemporary critics cannot) that Menzel was little more than a supremely clever realist, and that he had little sense of beauty; he "never attempted that ordering of his perception and emotion which makes for style, nor had he that sense of crisis which also makes for beauty." And yet one is told over and over again in print now that Menzel was one of the greatest of artists. It is just a fashion.

The *Architectural Record* (New York) contains an article on and illustrations of "Two New Armories" in New York which exhibit a very clever and interesting attempt to give a specially warlike or fortress-like character to these buildings, partly by suggestions from mediæval castle architecture, partly by specially designed modern features. One could wish that something of the same kind had been attempted for our War Office, instead of a building on stately classical lines which might be any other class of Government building. Surely a War Office should look threatening in its architecture, "Examples of Georgian Work in Charleston" are very interesting and in some cases remarkably English; in looking at the view of "The Market, Charleston," we might almost fancy ourselves in an English country town, but for the tramlines and the web of telegraph wires. The interiors of rooms in two houses designed by Mr. Robert Spencer are worth attention for their refined and yet unostentatious treatment. In "Notes and Comments" there are some amusing details as to the work at rebuilding the Venice Campanile, and the manner of work of the Italian labourer, by "K. G. H." *Blackwood* contains an article by Mr. H. W. Lucy on "A New House for the Commons," which, after rather exaggerating the supposed inconveniences of the building, we are glad to see supports the late Mr. Charles Barry's scheme for enlarging the House, the republication of which in the *Nineteenth Century* we have already referred to. Mr. Lucy seems to think, as we do, that it is surprising that this perfectly feasible and effectual, and comparatively economic scheme, has not been already taken in hand. To the same magazine Mr. Edward Hutton contributes an exceedingly picturesque article on the architectural glories of old Salamanca.

In the *Westminster Review* Mrs. Bidulph's article on "The History, Use, and Abuse of Trade Unions" is one of the most impartial and sensible articles on the subject that we have seen, and we would recommend its perusal to those who think that Trade Unions are an unmixing good and a kind of divine institution, if we could hope that anything would induce them to consider any point of view but their own.

In *Scribner* Mr. Charles Pepper, the United States and Pan-American railway commissioner, gives an account of what is termed "The Pan-American Railway," the five thousand miles track of which, when completed, will bring New York into direct connexion with Buenos Aires and Alaska, and Hudson's Bay with Patagonia. It is evidently an immense scheme, which has required the co-operation of fifteen republics. Great portions of this vast scheme are completed, though much remains to be done; and the illustrations which accompany the article give a vivid idea of the various difficulties to be encountered and of the sensational scenery of the line, now zig-zagging along the sides of a vast mountain, now carried by a bridge across a narrow gorge between immense precipices. We gather that the gauge even of the trunk line is a comparatively narrow one, one metre (3 ft. 3½ in.), probably in order to facilitate the passage

over some of the more difficult portions of the route; and some of the branch lines are even narrower; that from Antofagasta to Oruro, crossing the volcanic ranges known as the Occidental Cordilleras, will be 575 miles in length when completed, and is of 2 ft. 6 in. gauge; probably, as the author says, the narrowest railway for its length in the world. The number includes an article (rather over enthusiastic) on Sir F. Seymour Haden and his etchings, which we cannot agree in accepting as the *ut plus ultra* of etching, though he has produced some very fine things. Among the anecdotes is a good one of Sir Seymour seeing in a print shop window in New York a palpable forgery after his "Breaking up of the Agamemnon"; he entered the shop, asked to look at the print, and coolly tore it in four pieces, handing them back to the shopkeeper with his card and the name of his hotel. Nothing more was heard of the matter. Under "The Field of Art" Mr. W. Walton has some remarks on "Some Un-ecclesiastical Religious Art"—the realistic scenes from the life of Christ by von Ude, for instance, and the sensational pictures by M. Jean Déraud in which the figure of the Saviour is contrasted with personages of modern Parisian life. We agree with him in the opinion that there is no earnestness of feeling or conviction behind these pictures, which are only an artistic pose, arresting the attention on first acquaintance from the novelty of the idea, but soon losing their hold. Von Ude is a painter of much more serious intention, but his attempt to bring realism into the scenes of the Life of Christ, though well meant, results, as in his picture of "Suffer Little Children to Come Unto Me," in a sense of anachronism; the children are those of a modern Sunday School, and the result is entirely unconvincing. Still von Ude's pictures are marked by a spirit of reverence, of which there is nothing in those of Déraud.

Under the title "A Sculptor of the Labourer" the *Century* publishes a rather over-wrought article on the work of Constantin Meunier, the Millet of sculpture, as he may be called, but who was not really a great sculptor, though a very gifted and earnest one in the restricted path he followed. The closing sentence, "His art seems to palpitate with the benediction of a divine pity," is a specimen of the whole and of the kind of sentimental exaggeration which so often passes for art-criticism nowadays. "Public Squares in City and Village," by Mr. Sylvester Baxter, is an excellent article on making the most of opportunities afforded by open spaces, either regular squares or spaces formed at the meeting of roads. An illustration of a small park in New York formed by filling in an old dock on the East River front is a good example of an opportunity made the most of. The illustrations are excellently drawn by Mr. Guérin. No. IV. of "Historic Palaces of Paris" illustrates and describes the Hôtel de la Rochefoucauld-Dondeauville.

In *Harper* an article under the title "A Glimpse of the English Washington Country," viz.: the part of the country in which George Washington's progenitors lived, by Mr. W. D. Howells, gives a pleasant description of Northampton and its neighbourhood, and the scenery of the Nene valley, as seen with the eyes of an American visitor, and is illustrated by some beautiful sketches by Mr. Vernon Bailey. An article on "The American Nile," by Mr. Gordon Copp, takes us back to the new world; the American Nile being the Colorado River, which appears to have its season of high rise, its delta, and the same capacity for bringing rich fertilising soil which distinguishes the historic African river.

The *Antiquary* contains a long and full article, by Mr. Alfred C. Fryer, under the title "A Pilgrimage to St. David's Cathedral," going in detail into the history and characteristics of the building, with some illustrations. It is to be continued in future issues, and will be useful as calling fresh attention to a cathedral which is less visited than it would be if it were not so inconvenient of access. The history of all that has been done at the Egyptian Hall, Piccadilly, is continued by Mr. Aleck Abrahams from a previous number; it forms a remarkably interesting record of the varying tastes of the London public in amusements during the time that the Hall existed.

In *School* Mr. Sydney F. Walker continues his series of articles on "The Engineering of School Buildings," the present one being devoted to short descriptions of the methods and advantages of various systems of heating rooms, on which we have no remark to make except that the subject is much larger than can be adequately treated in a short paper like this, which can only be regarded as a general suggestion, but as such may be useful to headmasters and others. But we put in a caveat against the suggestion that "an ascending flue in the middle of the room may be used to cause an ascending draught of air in addition to that created by the fire." Theoretically, and in our belief practically, this would only result in the stronger exit current cancelling the other, and making it temporarily an inlet. In other words, in ventilation you may have any number of inlets, but you can only have one extract.

In these days of class journalism almost every profession and industry has its special organ, and many branches of general professions and industries are similarly represented. The *Engineer-in-Charge* is the latest publication of the kind, being addressed to an indispensable and most useful class, the members of which occupy the position once held by the engine-driver or mechanic placed in charge of machinery and plant in public institutions and industrial works. Owing to the greatly increased adoption of mechanical, electrical, and other engineering plant in such establishments, the responsibilities of the engineer-in-charge have gradually become more onerous, and the standard of technical knowledge necessary for the satisfactory performance of his duties has been raised in corresponding measure. Hence at the present time the engineer-in-charge may fairly claim to be regarded as a member of the great engineering profession. The main objects of the new journal are to discuss practical points connected with the selection, installation, and management of engineering plant, and to afford a medium for the interchange of ideas upon matters of professional interest and difficulty. So far as can be judged by the first number, these objects are likely to be fulfilled in a satisfactory manner. The principal articles are "Some Notes on the Design and Management of Waterworks Pumping Machinery," by Mr. Percy Griffith, M.Inst.C.E.; "The Truth about Producer-Gas Plants," by M. W. A. Tooke; "Systematic Stores Keeping," by Mr. W. R. Pettit, A.M.I.Mech.E.; and "Modern Methods of Heating and Ventilating," by Mr. Kenneth Gray; and besides these there are short articles and notes devoted to the management and repairs of machinery.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION: FERRO-CONCRETE.

Mr. W. Wonnacott presided on Wednesday evening in last week over the last meeting of the session of the Discussion Section of the Architectural Association. The meeting was a combined one with the Junior Institution of Engineers, and during the evening Mr. Sven Bylander (member of the Junior Institution of Engineers) read a paper on "Ferro-Concrete."

The Chairman reported that Messrs. Belcher and Trant Brown had retired from the Committee, and Messrs. S. H. Hamp and S. Towse had been nominated to fill the vacancies, while they had been fortunate in getting Mr. A. H. Belcher to act as Hon. Secretary.

There being no further nominations, the Chairman declared the following officers elected:—Chairman—Mr. F. Lishman; Vice-Chairman—Mr. K. Gammell; Hon. Secretaries—Messrs. M. G. Pechell and A. H. Belcher; Committee—Messrs. H. Passmore, R. J. Turner, S. H. Hamp, and S. Towse.

Mr. A. H. Belcher proposed a vote of thanks to the retiring Chairman, and said that Mr. Wonnacott had had a record session. At one meeting they had had eighty-four members present, which was a thing to be proud of. Mr. Wonnacott's encouragement to young members to speak had been a great help to them all.

Mr. S. Hamp seconded the motion, and it was carried.

The Chairman briefly expressed his appreciation of the compliment paid him. He

trusted that his successor would have a pleasant year.

Ferro-Concrete.

The Chairman, in calling on Mr. Bylander to read his paper, said that the use of ferro-concrete was of the greatest importance both to engineers and architects. Without going into the matter dealt with in the paper, he felt there was one point on which engineers could not help architects. He meant that unless architects stood shoulder to shoulder, and pushed their material as an up-to-date material, they would never get the by-laws and Building Acts amended so that they could be up to date in the material they employed.

Mr. Bylander said that ferro-concrete was a building material composed of concrete and steel. As concrete had a low co-efficiency to tensile stresses steel was placed in it to resist tension. The method of construction and the disposition of the steel was the secret of the work. Many engineers had tried to discover the most effective and economical methods of combining the two materials, and different systems, each having its own advantages, had been patented. Such systems were the Monier, Hennebique, Coignet, De Valier, Ransome, Kahn, etc. He proposed in his paper, however, to take a broad view of the term, "ferro-concrete," but, for the purposes of illustrating his remarks, he would take the Hennebique system, as it was well known in this country. Explaining diagrams thrown upon the screen, the lecturer said that the arrangement of the stirrups was a special feature of the Hennebique system. In a beam constructed with four rods in its lower part, two of the rods were bent upwards from the lower part of the beam to its upper part, near the supports, the object being two-fold—to make the longitudinal reinforcement at the centre of the beam greater than at the ends, and partly to take up the shear, and to form a reinforcement at the upper part of the beam at the support in order to take the tensile stresses which occurred there. The stirrups were placed closer together near the support, and if the support was a pillar, a bracket or seat, properly reinforced, was formed on the pillar underneath the beam to take up and transmit the shear. The main reinforcement consisted of round rolled bars, used as they came from the mills. Vertical reinforcing members, or stirrups, should be placed far apart at the centre of the beam, and close together, or made of greater cross-section, nearer to the supports. It was of the greatest importance in the construction of a ferro-concrete beam that the shearing forces should be properly taken care of. Most of the full-size tests which had been made showed that beams were more liable to fail owing to insufficient resistance to shear than to bending. The determination of the strength of a ferro-concrete member was a problem which puzzled many engineers and scientists, and even the specialists in ferro-concrete construction. The reason was that no satisfactory theory for the stresses which occurred in ferro-concrete members had yet been found. However, on the basis of many and important experiments, sufficient facts had been ascertained to enable the ferro-concrete designer to set up simple empirical formulas, giving results which practically satisfied the actual conditions. Mr. Bylander then showed a diagram illustrating the determination of the internal stresses in a beam subjected to an outer bending moment. He said that the resistance of the concrete on the tensile side of the neutral axis was considered equal to nil, all the tensile stresses being taken up by the steel rods. The concrete of the other sides of the neutral axis would, without reinforcing, take up all compressive stresses. Bars with diameters of $\frac{3}{8}$ in. to 1½ in. were largely used. The cohesion between the steel and the concrete was relied upon for transmitting the stresses between the concrete and the steel, no mechanical bond between the bars, or stirrups, being provided. Beams, the lecturer continued, were generally subjected to a load uniformly distributed over the entire length, and in ferro-concrete construction they were generally made continuous, and it was claimed that thereby the structure was made more rigid, and the stresses were less than if the beams were freely supported at the ends. Ferro-concrete beams so constructed were considered semi-fixed at both ends. These claims were, of course, true if

all the parts of the structure were loaded exactly as assumed in the calculations, and if no settlement of foundations took place, but, as those assumptions were generally not true in practice, he believed that the stresses in a monolithic construction were sometimes greater than if the construction was not monolithic. However, the additional stresses due to unequal loading were generally taken care of by using a large factor of safety, and it was more practical and simpler to make all the members in one continuous mass or monolithic. The lecturer then showed a number of diagrams illustrating the foregoing points, and said that the steel reinforcement was generally known as being of two kinds—horizontal and vertical; and the section and strengths of the reinforcing members should be made in proportion to the intensity of stresses in the different parts of the beam—greatest at the centre of the beam from the neutral axis was D_c and D_s , the moment of the internal stresses of the moment of the stresses was as follows:— $M_b = R_c \times D_c + R_s \times D_s$,—which moment was equal to the external bending moment. R_c and R_s must be equal and act in opposite directions. The diameter of the steel reinforcing rods was generally small compared with the distance D_s , and the fibre stress could, therefore, with sufficient accuracy, be said to be

R_s .
The location of the area of the rods = J_s . The location of the neutral axis was not the same as for steel, viz., passing through the centre of gravity of the cross-section, or located at a distance of half the depth of the beam from the bottom. It was generally placed somewhat higher, but opinion as to its exact position differed greatly. Generally, however, it was calculated from the proportion between the modulus of elasticity for the two materials in a somewhat similar way as the position of the neutral axis was ascertained for a cross-section of cast-iron. That which complicated the accurate calculation still more was the irregular deformation of the concrete, and because the intensity of stresses did not increase directly in proportion to the distance of the fibres from the neutral axis, particularly when the stresses were high. Compression members, such as pillars, might be calculated as follows:—Assume that the proportion between the modulus of elasticity of steel to that of concrete was 15, and that A_c = area of concrete and A_s = area of steel in square inches, and the load P in pounds, the stress on the concrete per square in.

would be:— $J_c = \frac{Ac + As}{P}$, and for the steel, $J_s = 15 J_c$. Mr. Bylander, having shown diagrams illustrative of these calculations, continued, that when concrete and steel in one and the same member were placed together to resist compression only the deformation must, of course, be the same for the two materials. If the diameter, or width, of the pillar was sufficiently large compared with the length, the lateral flexure might be neglected in the calculations, and the pillar might be calculated for compression only. In case of eccentric loading the stresses due to bending must, however, be always ascertained. The author's opinion was that simplicity was of the greatest importance in actual practice, and the engineer was less liable to make mistakes when he was using simple formulas and short calculations, and the results obtained were generally more satisfactory than if apparently more accurate formulas were used, providing that he used proper judgment in applying the formulae. For greater and more important structures, such as bridges and heavy girders, more accurate methods and formulas must be used in the calculations. Simple formulae, such as he had explained, should be used for simple members, such as ordinary beams, floors, and pillars. He considered that no one should attempt to design or calculate ferro-concrete construction but such men as had complete knowledge and a practical experience of that material. Many assumptions had been made in setting up formulas, so that the greatest care must be exercised by the designer when applying them, or otherwise dangerous mistakes could easily be made. The location of the reinforcement was of great importance, and must be distinctly shown on the drawings. It must not be left to the foreman to determine. For buildings which had to be erected very

rapidly, and where the drawings had to be made in a relatively short time, it was advisable to have all working drawings made to standards or to adopt a certain system which could be easily understood by anyone either in the office or on the site. The different methods of employing the two materials, concrete and steel, in building construction might be placed under three headings:—(1) Ferro-concrete construction where the entire structure was made of a monolithic mass of reinforced concrete; (2) construction where steel was used for the skeleton or frame; and (3) combination of these two methods. This last system was represented in buildings where steel columns and steel girders carried the principal loads. The floor slabs, and sometimes also the secondary beams, were constructed in reinforced concrete, this being more generally used in America than in Europe. The author said that he did not claim that ferro-concrete was the right material for all constructions, for each kind of material should be used to its greatest advantage, cost, safety, and duration being considered. The compressive strength of concrete was more than ten times as great as the tensile resistance, while in the case of steel the compressive and tensile resistance was practically the same. Speaking of the Hennebique system, the lecturer said that the vertical steel rods for the pillars were first placed in position and tied together with wire at intervals. The shuttering around the pillars was then erected on three sides only, the fourth side being left open in order to permit access. The concrete was filled in sufficient small layers, and was properly tamped in order that no voids should occur. The fourth side of the shuttering was carried up as the concrete was filled in. The vertical rods in the pillar were extended above the concrete, and the shuttering for the next floor put up. Reinforced rods for the girders were first put in place, the concrete filled in; then reinforcing rods for the floor-plate were laid, and the centring for the entire floor slab and the finishing of the girders proceeded with. Thus the floor-plate, girders, and pillars were moulded at practically the same time, and the whole construction was monolithic. The influence of the hooping of a pillar was very remarkable, it having been proved by Mr. Considere in his experiments that a hooped pillar could resist a load three or four times as great as a pillar without hooping or lateral reinforcing. Another method of combining steel and concrete was in foundation works; in fact, the author thought that foundations could with greater advantage than perhaps any other part of a building be so constructed. Such foundations, being thinner, could be made at less cost than foundations of solid concrete. But consideration should always be given to local conditions. Ferro-concrete had been used with great success for bridges, culverts, conduits, water-tanks, reservoirs, and retaining walls and dams. In the case of conduits and similar works care should be taken that the steel was well protected. Another interesting use for the material was for the construction of piles, which were usually fitted with a wrought or cast iron shoe. In conclusion, Mr. Bylander said that the materials for the concrete or ferro-concrete must be of much better quality than for ordinary concrete. The aggregate must be of smaller size, crushed to pass through a 3/4-in. mesh. Coke breeze or cinder was not satisfactory, and there must be no voids in the finished concrete. The concrete should be put in a wet state and in thin layers, and should be properly tamped to cover and embed the steel. One important point which occurred in testing members was that cracks in concrete were not visible, the introduction of steel producing this phenomenon. Reinforced concrete deserved to be recommended if properly designed and constructed, but it was dangerous if the work was not carried out well.

Mr. P. J. Waldram, in proposing a vote of thanks to the reader of the paper, said that one particular point not mentioned was as to the legal difference, so to speak, between these various systems of reinforced concrete. Were they patented, or were they interchangeable? This was important, because the architect had to be very careful in adopting any system which had any patent rights attached unless he went to the patentees and paid their price, which

was a thing architects should avoid, if possible, in the interests of their clients. It was one thing to adopt a patent bearing a very small proportion to the total cost of the building, but it was a very serious thing where the greater part of the construction of the building would be placed in the hands of any particular firm. He did not say that with the slightest disparagement to the Hennebique or any other system, but it was a serious thing for architects to go in for any particular system without any competition at all. With reference to that, he noticed that very few of the systems published any indication of how they were to calculate the system, and, as an engineer was not afraid to put his formulae in such a way that people could understand them, so personally he would be more inclined to trust the manufacturer who was not afraid to put his system before the professional public in such a way that they could calculate it for themselves, than the manufacturer who absolutely kept all his formulae and data to himself. The architect, and especially the engineer-architect, should be in a position to say not only that the manufacturer said this was sound, but to say, "This is sound because I know it and have calculated it myself." There was also a considerable misapprehension about the question of shear, and it was often as difficult to explain to an architect or engineer what shear was as it was for a sanitary inspector to explain what a drain was. He was inclined to suggest that any system which did away with the complicated question of shear was a better system than one in which shear was to be taken out as a separate factor. The question of the position of the neutral axis was certainly a difficult one, and in that connexion they were greatly indebted to Mr. Bylander, who, instead of quoting oceans of data calculated by different engineers, told them that it was about two-thirds. That endorsed a rather curious point which should not be forgotten, viz., that the elasticity of concrete was greater than that of steel. Most people said that steel was the more elastic material, but that was not so. The importance of superintendence had been touched upon, but he thought hardly sufficiently. It was absolutely necessary to have drawings showing precisely where the reinforcement should be, but it was a very different thing to get the reinforcement put in as shown in the drawings. It must be remembered that the concrete was filled in with the shovel often without skilled superintendence, and if the bars got displaced it was a very important thing indeed. The ordinary navy knocked a bar and put it out of place, and no one probably knew anything about it, but the reinforcement of the beam was in an entirely different place to that in which the engineer thought it was. There was nothing to be gained by overlooking things of this description. In ferro-concrete they had a new material, and it had the disadvantage, like all other new materials, of being put to all sorts of improper uses, and nothing was to be gained by overlooking the disadvantages. When once the disadvantages were realised then it could be used in its proper place. They must take care that the reinforcement was kept in place, and that there were no voids. It was an easy thing when concrete was being filled in to find when the case was knocked away at the bottom a great big gap, and when it came to a thin floor gaps became a serious matter. Then, again, it was very necessary to have proper superintendence at the mixing of the concrete; there must be no superabundance of large material and no insufficiency of sand, and especially must they be careful where the reinforced concrete was to be exposed to damp. The concrete must be solid, and the materials known to the designer, and the materials must be mixed in the proper proportion. Another disadvantage was the difficulty of cutting the material after it had been fixed—it was almost impossible when the reinforcement was very large. The advantage of the material was that it enabled bold things to be done which could not otherwise be done, but that was no part of ordinary everyday architectural practice. They did not often want to construct a building to project over a road, but they did often have to build ordinary walls and retaining walls, and those were the lines on which architects should mainly look

for assistance for the use of reinforced concrete. Much material put into foundations at the present day was absolutely wasted, and if by the use of reinforced concrete they could make savings in the foundations and retaining walls and floor construction and beams, then such savings might be used on other parts of the building. Freak buildings were no part and parcel of the everyday business of the architect. So far as he could see, the designer was not tied down to any particular system of armoured concrete, and he saw no reason why a man who could design an ordinary steel work should not be able to thoroughly grasp the principles of the design of concrete steel, and by careful attention to the work be able to produce a wholly satisfactory drawing. A difficulty one found in designing brickwork was the unreliability of large brick piers, and the known tests of brick piers did not carry them very far. It was often necessary to put very heavy weights on ordinary brick piers, and he had been endeavouring to collect information with regard to the employment of Hennebique reinforcement in brickwork. The difficulty was that they could not reinforce it without destroying the bond, but he had not been able to make a practical test yet. He felt, however, that it was not impossible to reinforce brick piers without giving trouble.

Mr. A. T. Walmisley, seconding the motion, said that reinforcement, to his mind, consisted of concrete and steel in which the steel was part and parcel of the whole construction—the rods which the author described became part and parcel of the whole construction. Of course, every inventor tried to bring out something which somebody else had not brought out, whether it was good or not—and the architect or engineer had to consider what was the best kind to adopt. Reinforced concrete for floors and columns and foundations concerned the architect as much as the engineer, and the architect often adopted a system, and then said to the contractor, "You must take the whole responsibility of the construction, and you must submit drawings to an engineer whom I will name, for him to approve of them." He will not think that was the right thing. The architect should have the engineer under his control, and the engineer ought not to be the servant of the contractor. The author had shown them the rod system, but a system he had not shown was that in which expanded metal was employed. With rods it was very evident, and especially in piles, that they must have lateral bracing, or otherwise they would have the rods bulging out and destroying the concrete. He had seen at Messrs Armstrong's works at Newcastle a floor of a workshop which carried very heavy machinery connected with the manufacture of guns, and that floor was constructed with expanded metal. The expanded metal system, to his mind, prevented the anxiety of having to watch the exact position of the rods. An enormous amount of superintendence was needed with the rod system, and there was the tying together of the rods, whereas with expanded metal it was all prepared for them, and they had only to lay it down in a proper position.

Mr. E. O. Sachs said the question of patent rights of concrete systems was very important. In his opinion reinforced concrete, taken as a whole, was not subject to patent rights, but many patents had cropped up which were true patents on special points, and both architect and engineer should be very careful not to infringe these patents on special points. So far as he could make out, there were thirty-six German and Austrian systems, twenty in the United States, fifteen in France, and two or three absolutely English systems. As an architect, he was astounded at the ugliness of the reinforced buildings presented on the screen. The only beautiful thing shown was the Luxembourg Bridge, and that was not entirely reinforced concrete. He felt that the material was one merely for use for business premises. He did not think it a material which lent itself at present to domestic and town architecture, for where it was used it required a great deal of clothing and artificiality. He was glad to hear the warning about accepting the guarantees of firms and what had been said as to the secrecy of the formulae, and he was glad to say that the United States firms were now showing formulae on which

the work was calculated. Supervision was absolutely essential, both in respect of the materials and the putting together of the work. He recently came across a piece of reinforced concrete in the North in which natural Belgium cement had been used. The contractor said it was cheaper, and why should they not use it? One point which had not been mentioned was as to the fire-resistance of reinforced concrete. He would like to know what happened to the rod with half an inch protection of concrete.

Mr. A. G. Green remarked that, in regard to the formulae of different systems being open to inspection, they had also to consider whether they were capable of judging the value of the formulae. If they studied the subject and mastered it, then they had only to invite competition to carry out the work, and it would not be a competition of different systems, but a competition of contractors to carry out a given system. Mr. Green proceeded to give details of various works he had been connected with. They had to underpin a hospital at the Albert Docks and construct a new foundation as, owing to the action of a grub, the timber piles had been eaten away. They used reinforced concrete piles and beams, which had given great satisfaction. In the case of a warehouse building for a tinsmith printer at Bermondsey where the soil was soft, reinforced concrete was used for the foundation, and the floor was now bearing a weight of tinsmiths of 3 tons per superficial foot. They made some tests in connexion with that building. Four beams were tested. One was concrete only, the second was reinforced in the bottom only, the third was reinforced with four bars, and the fourth was reinforced on the Hennebique system. Boxes of tinsmiths were piled on the beams. The concrete beam broke off short with 3 tons upon it, but the others were loaded up to 29 tons and did not break. The beams were crippled beyond use, but they did not break. They had also used reinforced concrete for a water-tower, the tank being 70 ft. in diameter, and the walls 5 in. thick at the top and 6 in. at the bottom. That was standing well.

The Chairman said he would draw the attention of the members to the representative committee which had been appointed by the Royal Institute of British Architects in consultation with other bodies to consider the subject of ferro-concrete under all aspects, and also the fact that the Congress of Architects were calling for papers on the subject from two aspects.

Mr. Max Clarke (the Special Visitor) said that he had asked Mr. C. Marsh, whom they knew as one who knew something about ferro-concrete, to come there that evening. Unfortunately, he was unable to do so, but Mr. Marsh had sent him some written remarks, which he proposed to read to them. Mr. Marsh said:—"The paper is a valuable contribution in that it brings reinforced concrete to the notice of the members. There are, however, one or two statements to which exception may be taken, and some that it is essential to notice."

Mr. Bylander says that in the lower part of a beam it is advisable to use as few bars as possible in order to simplify the construction. This is true, so long as the bars are not too large. It should be borne in mind that a small number of large diameter rods have not so large a perimeter as a greater number of smaller rods, and the aggregate perimeter of the rods in a beam should be as large as possible in order that the shearing stresses may be resisted in the concrete surrounding the rods. For example, it is not good practice to use one large rod in a beam where two or four smaller ones could be employed, but it may be better, taking all the points into consideration, to use, say, four larger rods in place of six smaller. In slabs it is always advisable to use small diameter bars spaced fairly close together in preference to large diameter bars far apart. One of the objects to be aimed at in all reinforced concrete design is to divide up the reinforcement so that the stresses on the concrete in contact with the bars may be distributed as much as possible throughout the whole layer in which the reinforcements are placed. A further point to which it is necessary to refer is the nature of the formulae recommended in the paper. Although simplicity is of importance in practice, still the simple formulae used should be based on

true principles. The author of the paper in his beam formula assumes that the internal moments of the tensile and compressive resistance about the neutral axis are equal to one another. It is curious how this error is so frequently made. The resisting forces in tension and compression are equal to one another since the resisting moment is the couple composed of the tensile and compressive resistances, the arm of the couple being the distance between their centres of action. It follows in a reinforced concrete beam, where the neutral axis is always considerably nearer the centre of action of the compressive forces than the axis of the reinforcements, that the moments of the respective resistances about the neutral axis cannot equal one another. The author remarks that the draughtsman is less liable to make mistakes when he is using simple empirical formulae and short calculations, and the results obtained are more satisfactory than if more accurate formulae were used. A far better view to take is that the designer should first be thoroughly conversant with the true principles, and no design should be undertaken unless these principles are thoroughly understood. The designer can then make intelligent use of simple formulae or diagrams based on the true principles, of which there are a great number by various authorities. There is danger in the employment of reinforced concrete when the design is left in the hands of anyone who does not understand the true principles involved, even if he has had practical experience, and more especially so if he uses formulae which are based upon fallacies. I would say to any young engineer who is interested in reinforced concrete, first study the theoretical aspect, and thoroughly master the true principles involved. You will then be in a position to select formulae and constants suited to the work you may have to design. Empirical formulae may give results of sufficient exactitude when used by those who understand their limitations, but are certain to be dangerous when employed by those who have not taken the trouble to study the subject in a proper manner." Proceeding, Mr. Max Clarke said that with regard to brickwork he was told that brick pillars reinforced had been used at the Imperial Institute. One thing he would like to know was how the cost of building an ordinary warehouse with ferro-concrete compared with brickwork and steelwork in the ordinary way, for no man departed from that which he knew to something of which he knew nothing, and he took it that in this case they would not depart unless they got something cheaper. He noticed from the report of a paper in the *Builder* of March 24 that the cost per cube foot of ferro-concrete was stated to be 1.625d. per foot, and that the rate of insurance was reduced to 1s. 5d. per 100l., and if they could only be sure of building at 1 1/2d. per foot cube they would all use it at once. On the other hand, he saw the regulations of the National Board of Underwriters as to by-laws for the construction of buildings in America, and if a man had to carry out such regulations in this country he certainly would not build for 1 1/2d. a cube foot. He would like to know what effect rust would have on the rods, for they could not always get them as they came from the mills. It was also said that when the building was guaranteed the contractor used a high factor of safety. Of course that was so, and the client had to pay for it. Then he had a strong impression that if the bars were placed very near the surface, whether they were round or twisted, the building would not be even fire-resisting. Then it was said that beams were more liable to fail from insufficient resistance to shear than to bend. He had seen some experiments at Messrs. Cubitt's where concrete beams were tested, and they were practically split in the centre at the bottom, and there were no cracks at the end. He took it that the rods must have been sufficiently numerous or thick to prevent any shearing. Then he was told that one of the essentials in making a ferro-concrete beam was to put the concrete in dry, and that was in direct opposition to what Mr. Bylander said. It was said that men of complete knowledge and experience only should be employed, but the difficulty was to find the men. The vote of thanks having been passed,

Mr. Bylander made a very brief reply, and said that the reason he did not refer to expanded metal was that he had to cut out the portion of his paper which dealt with a number of other systems. He did not mean that special rolled bars were not as good, but that the advantage of them was not very great. He certainly agreed that rust had not a good effect on the bars. As to the failure of the beams from shear, he had noticed that where a beam was loaded with a uniformly-distributed load it had more tendency to fail from shear than from tension.

SCULPTURE PANEL: "MUSIC."

This is an illustration of a panel by Miss E. M. Rope which was exhibited in coloured plaster at the Arts and Crafts, and had also been exhibited in bronzed plaster at the Royal Academy, as one of a pair illustrating the

Sculpture Panel: "Music."

words "Sing we merrily unto God our strength, make a cheerful noise unto the God of Jacob"; but as the companion panel did not lend itself well to colour and this one did, the marginal text was cut off and it was entitled simply "Music."

FIRE STATION, HAMPTON HILL.—The new fire station which has been erected near the railway bridge in Windmill-road for the accommodation of No. 2 section of the Hampton Brigade, was opened on the 11th inst. The building is of red Leicestershire bricks with Portland stone dressings. Beside accommodation for the manual engine, escape ladder, hose reel, and other appliances, there is a men's room and other offices at the rear. The premises are paved with Victoria stone, and are electrically lighted, and heated by gas radiators. The building was designed by Mr. S. H. Chambers, Surveyor to the Council, and the builder was Mr. Budd.

CROYLAND ABBEY.

The following letter from the Rector of Croyland Abbey appeared in the *Times* of Saturday, the 14th inst. We reprint it here for the reason given in our "Note" on page 431.—

"Sir.—For more than twenty years I have endeavoured to raise sufficient money to simply preserve the historic remains of this once glorious Benedictine nunnery, but, being situated in the Lincolnshire Fens, remote from the general thoroughfares of the nation, we seem to attract little attention and little response to my fifteen appeals. I am now too ill to issue another appeal on behalf of the serious rents in the inside wall of the north aisle, on that portion still used as the parish church. Since January 1, 1906, four surveys have been made of the abbey fabric. Large rents from the roof to the foundations, buckling of the north wall and window jambs, caused by vaults weakening the foundations, which were laid on a peat bed 2 ft. in thickness, compelled me to give the order to immediately underpin that portion inside the church, and rebuild the west portion of the north window. The funds required for that work and the roof section X are £3,000. I have written 17,910 letters since 1882, when I became rector of Croyland, otherwise Crowland. Unfortunately, the labour and anxiety have told seriously upon my health. Four times I have collapsed during Divine Service, and am now (in advanced age) compelled to employ extra clerical help, and that on an income less than I had as curate of Croyland in 1880. This is the reason, Mr. Editor, why I trespass once more on your valuable space, so that by the *Times'* world-wide circulation, some of your generous readers may be led to help us. The work is most urgent.

Croyland Abbey is a nation's memorial, and as such I feel I have a claim upon the nation in endeavouring to preserve this land-mark of the bold religion had in the ages long gone by.

The history of Croyland Abbey goes back to a period long anterior to the establishment of the English kingdom. The abbey was founded nearly 100 years before the supremacy of Wessex under Ebert was formerly recognised, and it shared the varied fortunes of the great religious houses in the ten centuries, during the three centuries which preceded the Norman Conquest. Cambridge University was founded by monks from Croyland Abbey.

I trust, Mr. Editor, through your kindness, this letter may meet with sympathetic response from all those who are interested in architectural memorials.

Surely those whom God has blessed with this world's wealth will not turn a deaf ear to its appeal, as the work is most urgent, but come forward and help to preserve to our children's children this noble land-mark of the faith and hold religion had in a great age.

Reader, pray help us by sending a donation according to God has prospered you.

I remain, Sir, yours faithfully,
T. H. LE ROY, Rector of Croyland Abbey,
otherwise Crowland, near Peterborough, and
Surrey, in the Diocese of Lincoln.
Croyland Rectory, near Peterborough, April 9."

Architectural Societies.

DEVON AND EXETER ARCHITECTURAL SOCIETY.—The annual meeting of the members of the Devon and Exeter Architectural Society was held at Tiverton on the 7th inst. The Hon. Secretary presented the nineteenth annual Report, from which it appears that there is an increase of membership by eight, the total numbers being now ninety-four. The Hon. Treasurer presented the balance-sheet, which, with the Report, was adopted. The retiring President (Mr. B. Priestly Shires) then delivered his address. He said that the history of the XIXth century would be a history of associations, the extent of whose influence it would be impossible to over-estimate; social life had been intensified and improved by associations; scientific research had been accelerated by it; it had given an unparalleled impetus to civilisation; and had made the last sixty or seventy years the most important period in the history of the world. Architecture, however, did not possess the same power of imparting an impetus to the progress of civilisation as science; it acted more as a record, and formed a monument of the various stages of advancement amongst mankind. Architecture, like other fine arts, is more passive in character than the sciences; but of all fine arts architecture is the most allied to science. It made the sciences minister to its requirements; it clothed them with beauty; it is the art of making the useful pleasing, and the connecting link of science with art, and numberless buildings have been erected testifying to the increased knowledge and taste of modern architects. But in addition to having architects possessed of taste and knowledge, it was almost as necessary that there should be clients possessed of the same qualifications. When we look upon a successful piece of architecture

a considerable amount of praise was due to the client who had had sufficient taste to appreciate the architect's efforts as well as to the architect. Good architecture was contagious, for, however plain a client wishes a house building, nowadays, he would look aghast if his architect built him one as bald as those of fifty years ago. Everyone who built was bound to make some small concession to the public and do his part in improving the character of the vicinity in which he built; he was not compelled to build extravagantly but tastefully, as though he was not wrapt up entirely in himself, but had given some consideration to others. He believed that one of the principal objects of the founding of the Devon and Exeter Society was to afford facilities for the study of architecture. Apart from any pecuniary gain architecture was a study, entertaining to both professional and non-professional men, and no man would ever succeed as an architect unless he lifted himself above the level of mere sordid interest in the level of enthusiasm for his art, and in this sense he would welcome to their lectures those who cared to come. So long as the public were uneducated in architectural taste architects would not have the opportunity of producing buildings commensurate with their skill. Since Ruskin first drew attention to the unarchitecturalness, if he might use the term, of our buildings, architectural practice had been revolutionised. It was important that architects should be thoroughly equipped for the responsible work they had to undertake, and he welcomed and appreciated the work that was being done in London and in some of the provincial centres for the architectural student, and hoped it would be still possible to carry out a curriculum of study for those who desired to enter the profession of an architect in the province of Devon and Cornwall. A general impression seemed to be abroad that if a youth was fond of drawing his parents at once concluded he ought to be an architect, but the mere liking of drawing was not always capacity for the architectural profession. Drawing was but the means whereby the architect expressed himself; it was the creative genius which was necessary to make an architect. No one would deny that the architects of mediæval times were true architects, yet they were not draughtsmen; joiners made better drawings now. He did not underrate draughtsmanship, far from it; it was one of the principal accomplishments of an architect, but it was well to remember, as there was such a danger to think it so in these days, that draughtsmanship was not all in all. Drawing each line had, or should have, a meaning; each line represented an idea and an expression of the architect's mind, and by these multitudinous lines he imparted his instruction to others.—After the conclusion of his address, Mr. Shires proposed Mr. Harbottle Reed (Exeter) as President for the ensuing year, and this was seconded by Mr. A. S. Parker, and supported by Mr. C. J. Tait, and carried. Mr. Reed, in returning thanks, said he would endeavour to advance the interests of the Society as his predecessor and those members present who had been President had done before him. Mr. M. A. Bazeley (Plymouth) was elected Vice-President; Mr. Allan J. Pinn, Hon. Secretary; Mr. O. Baling, Hon. Treasurer; and Messrs. P. Morris, W. A. May, and C. J. Tait were chosen to fill the vacancies on the Council.—The meeting was followed by a luncheon at the Palmerston Hotel, after which the new President, Mr. Harbottle Reed, remarked that, in suggesting Tiverton as the place of meeting, he was afraid it might possibly deter some of the three towns' members from coming, but he was assured that many were prepared to go as far as Bideford. They had come to what on the face seemed a more prosaic town, but some future Kingsley might expand the interest aroused by Blackmore in the old borough, for there was no lack of material. We had the Saxon town belonging to the Lady Cyther, as did Exeter, afterwards over-awed in the time of Henry I. by the castle built by Richard de Redvers, the Earl of Devon (1106). The castle was the residence of the Redvers and the Courtenays after them, until 1540, when the Marquis of Exeter lost his estates, and his head. Here the Princess Katherine, daughter of Edward IV., was wife of Courtenay, and her presence

conjures up stately scenes of pomp and pageantry, of which her funeral was not the least impressive. Edmund, second son of Henry III., married the last heiress of the Redvers. From Tiverton Castle went three brothers of the Courtenays to fall by the axe or in battle during the Wars of the Roses; one early at Tewkesbury. The old castle had its part in the Civil War; was taken in assault by Parliamentarians, under Massey, in 1645, and afterwards dismantled. Hard by is the Church of St. Peter, most picturesquely situated, especially when viewed from the river; it possesses many features of interest, although the restorers, (?) in 1830, did their best to restore them to oblivion. Except the tower and Greenway aisle it has been almost entirely rebuilt. Some traces of Norman work exist, and the red tower is very pleasing; but the south porch and aisle, with its chapel of St. Christopher, St. Blaize, and St. Anne would claim most attention. The chapel was founded after 1517 by John Greenway, a Tiverton wool merchant, who died in 1529. On the exterior are elaborate sculptures of Scripture scenes, arms, ships, cyphers, trade emblems, and inscriptions, as "Whilist we think well, and think to amend, time passeth away and death's end." A panelled and pendentive ceiling remains, but the frescoes, screens, and tabernacle work have vanished. It was for its woollen trade, begun as far back as the XIVth century, that Tiverton was famed, and Dr. Leisching had consented to the party viewing his house, which was at one time the wool market, built in 1611; it had much interesting work. But, of course, the most famous name was Peter Blundell's, who died in 1601, leaving his fortune to found the school, begun in 1604. His nephew, Robert Chilcot, who succeeded to his business (dying in 1609), was founder of Chilcot's School, erected in 1611. Following the lead of his bachelor uncle, he ruled that no married man should be a master of the school, and no maids or girls should be taught therein, but men children only. Not only to educational purposes, however, did the wealthy old clothiers leave their money, but they remembered their less fortunate brethren and employees, for John Greenway, who built the south aisle of the church, erected a set of almshouses in 1517, which, despite its being largely rebuilt in 1732 after the fire, still presents much of interest in its little chapel, with lowly porch and pious inscriptions, "Have grace, ye men, and ever pray for the soul of John and Jane Greenway," niches with figures of the apostles, and armorial bearings. Another successful wool merchant, John Waldron, who died in 1597, built another block, with a somewhat similar chapel and porch. The four doorways of the houses is carved, "Deposit thy goods whyl thou hast time, after thy death they are not thine. God save Queen Elizabeth." While the cornice bears the advice—

If that upon the Poor doth spende,
The goods that he hath here,
To God agen that same doth send,
And paye the same with great increase.

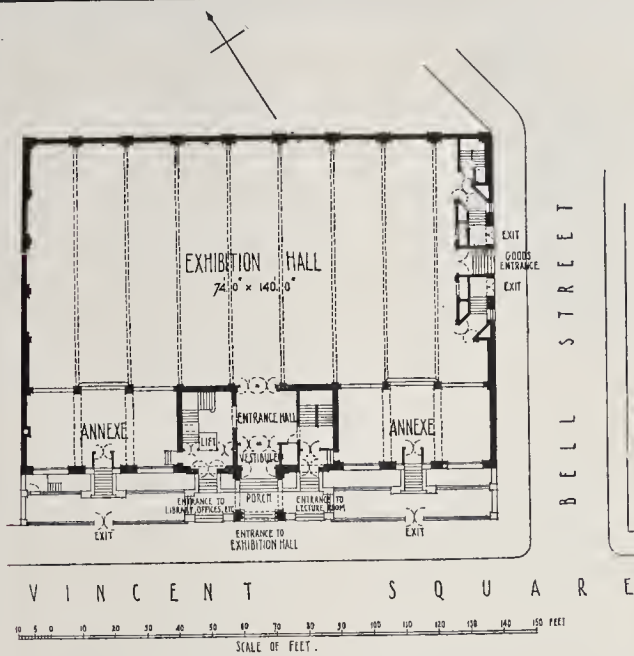

On the porch are the royal and founder's arms. At the conclusion of the visit thanks were expressed to the Rector, Prebendary Scott, and Mr. Churchwarden Deeks, Mr. Featherstonhaugh, and Mr. Brown for their courtesy.

Fifty Years Ago.

From *The Builder* of APRIL 19, 1856.

THE REIGN OF UGLINESS.

We will take one example, and that shall be the huge building of iron and glass which is being erected at this moment for the *Royal Commissioners of 1851* on the Kensington Gore estate, and is intended for the exhibition of the Marlborough House collections—the Trade Collection, presented to the Royal Commission by various exhibitors, at the close of the Great Exhibition of 1851; the Patent Museum; the Educational Museum; and the Museum of Animal Produce, formed at the Society of Arts, in conjunction with the Royal Commission. It is 266 ft. long, 126 ft. wide, and is in three equal spans, covered by three elliptical roofs, all at the same height from the ground, like three huge boilers placed side by side. The shell, is formed of flat iron uprights, filled in with

Royal Horticultural Society's Hall. Plan.

boarding. Messrs. Young & Co., who are the contractors for the works, claim in the newspapers the exclusive credit of the design; Sir William Cubitt overlooks them, and there is a resident engineer acting on behalf of the Commissioners. Of the construction we say nothing, we shall give our readers some sections and a plan in another number; nor of the effect of the interior just now, and the probable want of light in great part of it; our immediate object is to direct the attention of the Commissioners, before it be too late, to the exterior, which, if carried out in accordance with the drawing, will discredit all who are concerned in it, and be an eyesore and injury, so long as it remains. Its ugliness is unmitigated; never was a beautiful sward, where the daisies blossom and trees and shrubs put forth their leaves and branches in forms of beauty

unapproachable by man, so vilely disfigured. We know nothing with which to compare it. Railway sheds and locomotive depôts have often some little bit of art or taste about them, but here there is nothing; up one side and down the other, all is blank and offensive. No squatter in the Back-woods, no New Zealand savage, would erect a structure so utterly and indefensibly ugly. If the Marlborough House authorities retain their Chamber of Horrors—their examples of "what to avoid," when they get into their new quarters—Mr. Cole's first act must be to have a model made of this Museum itself. Seriously and earnestly, we do hope that the Royal Commissioners will call in some artist to their aid, and endeavour to improve the appearance of this ugly result of the '51 Exhibition, whether it is to be called temporary or not.

Illustrations.

FOUNTAIN, VITERBO.

FHIS fountain in the courtyard of Viterbo Municipal Buildings is one of the finest to be seen in this town, famous for its public fountains (there are nearly one hundred) and the Villa Lante, about two miles distant.

The fountain, constructed of dark rich brown sandstone, is attributed to Vignola, although the screen is of later date. The court also contains the "six fine Etruscan sarcophagus lids shown on the plan.

The municipal buildings date from 1264, with a beautiful portico of XVth century date. The doorway shown on Section AA. is very typical of the charmingly simple Early Renaissance work to be found at Viterbo.

LIONEL U. GRACE.

THE ROYAL HORTICULTURAL HALL, WESTMINSTER.

Built by the Royal Horticultural Society to celebrate the centenary of the Society, this building was opened by the King in July, 1904.

The whole of the ground floor, except the portion occupied by the entrances and staircases to the upper floors, is appropriated to the exhibition hall and its two annexes, thus affording the maximum area for the Society's fruit and flower shows.

The exhibition hall, decorated with ornamental plaster and Austrian oakwork, is covered with a single-span roof of steel and glass.

The basement is utilised for storage and cloak-rooms; on the first floor are a lecture-room and committee-rooms; on the second floor the council chamber, library, secretary's room and offices; on the third floor the hall-keeper's quarters.

The building is faced with sand-faced red bricks, with dressings of Portland stone above a basement of Withnell pressed red bricks.

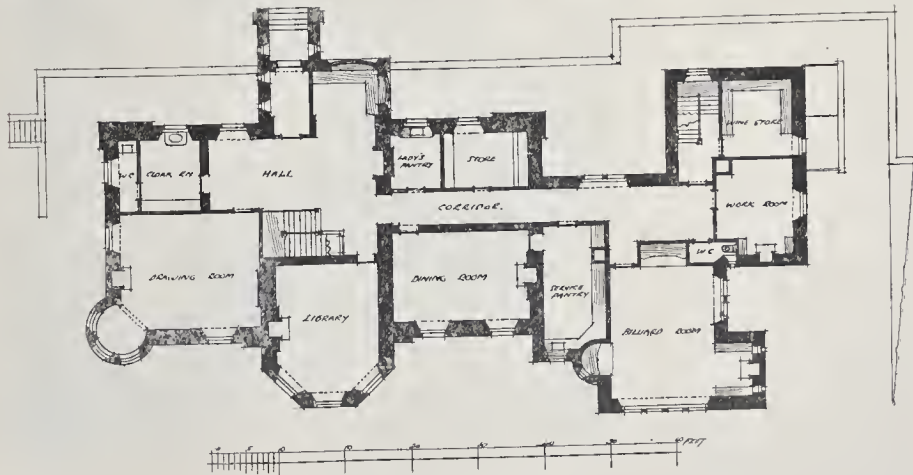

The contractors for the buildings were Messrs. G. E. Wallis & Sons, of Maidstone, and for the concrete foundations, Messrs. John Mowlem & Co.

The architect was Mr. Edwin J. Stubbs.

BALLUMBIE HOUSE, N.B.

THIS house is situated about four miles from Dundee; the original house was of a severe classic design, but this style was departed from in favour of a more picturesque treatment, and the house, as now completed in cement rough-cast, with Caithness stone slates and crow steps in roughly-hewn stone, leaves little trace of the original design. The inside finishings have been executed largely in fumed oak and pitch-pine.

The architect is Mr. James Findlay, of

Ballumbie House, Forfarshire. Plan.

Ballumbie House, Forfarshire. Sketch of House before Alterations.

Dundee. The general contractor was Mr. John Howie (Alyth); joiners—Messrs. Paton & Fairweather (Broughty Ferry); plumbers—Messrs. Jas. Fyffe & Son (Dundee); plasterer—Mr. Alex. McRitchie (Dundee); slaters—Messrs. Robt. Brand & Son (Arbroath); painter—Mr. Jas. C. Bruce (Broughty Ferry); heating—Messrs. H. Walker & Son (Newcastle-on-Tyne); and electric lighting—Messrs. Lowdon Bros. & Co. (Dundee).

"REDHEUGH," SUTTON VALENCE, KENT.

"REDHEUGH" Sutton Valence, stands on the southern slope of a hill, with brick-walled terraces below, one bearing the date 1645 in cut brick. In its older portions, on the north side, "Redheugh" was constructed entirely of timber, chiefly of oak, though this had been concealed latterly by lath and plaster work. On the southern front were various minor outbuildings of recent date.

The scheme of reconstruction involved the demolition of these latter to make way for the erection of a new wing, and the entire remodelling of the interior. The half-timber work of the north front has been exposed to view where possible, and new oak casement windows inserted.

The builders were Messrs. James Wood & Sons, of Boughton Monchelsea; and the architect the Hon. A. McGarel Hogg, of London.

Engineering Societies.

THE INSTITUTION OF CIVIL ENGINEERS.—At the ordinary meeting on Tuesday, the 10th inst., Sir Alexander R. Binnie, President, in the chair, the paper read was "On the Resistance of Iron and Steel to Reversals of Direct Stress," by Mr. T. E. Stanton, D.Sc., M.Inst.C.E., and Mr. L. Bairstow, A.R.C.S. The following is an abstract of the paper:—

While recognising the valuable work which has been done by previous observers in the study of the fatigue of metals, the authors call attention to the fact that further experimental work on the subject is much needed for the following reasons:—

1. Practically all the previous work, with the exception of Reynolds' and Smith's experiments, has been done by subjecting the materials to transverse stresses, the intensity of which has, therefore, to be calculated by the ordinary theory of bending.
2. The resistance of the materials in common use by engineers at the present day when subject to reversals of stress is imperfectly known, and there exists considerable difference of opinion as to the materials best suited for stresses of this kind.
3. Although it appears from Reynolds' and Smith's experiments that the resistance of iron and steel is seriously diminished when the alternations are very rapid (i.e., 1,500 to 2,000 per minute), it is not known if this reduction in resistance is considerable at those speeds which are common in

high speed reciprocating motors (i.e., in the neighbourhood of 800 reversals per minute), since the majority of experiments have been made at approximately sixty reversals per minute.

4. Although it is generally recognised that the effect of moderately rapid or sudden changes in section of materials subject to reversals of stress is to diminish their resistance, the amount of this reduction in strength for the various materials commonly used is not known.

5. The common assumption that, in cases in which the stress varies from tension to compression, but between unequal limits, the resistance depends solely on the range of stress and not on the actual values of these limits, has not been experimentally verified.

From these considerations it was decided to undertake a research, the object of which should be the experimental determination of the resistance of certain kinds of iron and steel, under the special conditions mentioned in the above paragraphs, when subject to reversals of direct stress. The experiments were made on the alternating stress-testing machine which has been designed and constructed at the National Physical Laboratory, and which has been fully described in *Engineering* (February 17, 1905). Jointly with this work, a microscopical investigation has been made of the changes which take place in the crystalline structure of materials under reversals of stress as the test proceeds, to determine, if possible, the manner in which ultimate failure occurs. The materials upon which the tests have been made may be conveniently divided into three groups:—

1. Three samples of Swedish Bessemer steel and one sample of Swedish charcoal iron presented by Mr. R. A. Hadfield for the purpose. The carbon content of the steels was approximately 0.17, 0.44, and 0.64 per cent.
2. Four samples of steel presented by Messrs. Belliss & Morcom for the purpose. Of these, two were mild-steel bars, one was a bar of harder steel used for piston-rods, and the fourth consisted of specimens which had been cut from a large steel forging.

3. Two samples of wrought-iron of British manufacture, bought for the purpose of the tests.

Although more uniformity in the results of the tests would no doubt have been obtained by subjecting all the specimens cut from any given material to an annealing process, it was felt that this would detract from the value of the tests owing to the well known effect of heat treatment on the resistance of steel. For this reason the tests were made on the bars as received; and in cases in which there were several bars of the same material, the specimens in any group of tests were not always cut from the same bar. This does not apply to the case of the specimens whose structure was examined microscopically, in which the actual resistance was of secondary importance. The results of the experiments may be stated briefly as follows:—

1. The superiority, in resistance to reversals of stress, of moderately high-carbon steels over low-carbon steels and wrought irons, which was discovered by Wöhler to exist when the rate of reversals was six per minute, still holds when this rate is increased to 800 per minute, although, according to Reynolds' and Smith's experiments, this superiority no longer exists when the rate of reversals is in the neighbourhood of 2,000 per minute.
2. As far as comparisons can be made between the results of the present experiments and those of Wöhler and Sir Benjamin Baker, there is no marked reduction in resistance due to raising the rate of reversals to 800 per minute.
3. Experiments in which the ratio of tension to compression varied from 1.4 to 0.72 indicated that between these limits the value of the maximum range of stress was practically independent of the actual values of the limiting stresses in tension and compression.
4. The resistance of the materials in three typical cases of rapid reduction of area of the specimens has been determined.
5. The failure of iron specimens due to the development of the slip-lines of Ewing and Rosenhain into cracks has been determined for the case of direct stress; and the failure of moderately high-carbon steel, due to the development of cracks in the ferritic areas of the structure has also been established.

STATUE TO GENERAL JOHN NICHOLSON, DELHI.—Lord Minto recently unveiled a statue of General John Nicholson at Delhi. The statue is the work of Mr. Brock. It represents General Nicholson with his head inclined towards the Kashmir Gate and his sword unsheathed.

Competition.

LIBRARY, BANGOR.—The award in the competition for the proposed Free Library at Bangor has been secured by Mr. Albert E. Dixon, of Messrs. Dixon & Potter, King-street, Manchester. The competitive plans numbered 119.

Books.

The Roman Forum: Its History and its Monuments. By CHARLES HUELSEN. Translated from the second German edition by J. B. CARTER. Rome: Loescher & Co. 1906.

AS WITH the widow's curse, so with the Roman forum; every visit produces a fresh supply of treasure. Its yield is no sooner thought to be exhausted than the thrust of a pick and the turn of a spade reveal some vestige which as likely as not overthrows theories held for centuries. That the Press can hardly keep pace with these discoveries is shown by the short history of this, the newest of handbooks on the subject. In June, 1904, Professor Huelsen, of the German School at Rome, brought it out for the use of those who, though not wishing on the spot to go deeply into the subject, are still anxious for more information than is conveyed by the curt statements of guide-books. Such was the reception given this little book that in less than a year a second edition was called for. This was supplied by Professor Huelsen, who enriched it with further illustrative material and brought it up to date in the way of the newest discoveries and investigations. The value of such a book to English visitors was the excuse for the present excellent translation, which, although based in general upon the second German edition, has been revised, altered, and brought still further up to date by Professor Huelsen himself, so that it may be considered the third edition of the work in eighteen months.

The methodical, practical treatment of the subject is what one would expect of its author. The history of the forum is minutely traced as the burial-place, the market-place, the centre of social life, the arena of political events, the site of memorial monuments, and, finally, the scene of destruction and ruin. The different periods of exploration are then dealt with, and the section plentifully illustrated with representations of the state of the forum from 1490 onwards. The greater part of the book is devoted to the monuments. They are taken topographically, not chronologically, and their life's history traced with

a confidence and precision which can only come of intimate knowledge.

The London Building Acts, 1894 to 1905. With Introductions and Notes, and the By-laws, Regulations, and Standing Orders of the Council, etc. By E. ARAKIE COHEN, M.A., of Lincoln's-inn, Barrister-at-Law. London: Stevens & Sons, 1906.

THIS work, which is an exhaustive commentary on the building law of London, is addressed not only to experts, but, being provided with introductions to the more important parts, will also enable those who are not conversant with the subject to get a succinct view of the London Building Acts. To have stated with clearness and precision in language which is intelligible to laymen the law in regard to so complex a subject is no inconsiderable achievement; and, so far as we can judge, Mr. Cohen has successfully accomplished that task. It is not to be expected that a first edition constructed on so ambitious a scale should nowhere present some inequalities; for example, to define one of four kinds of buildings which sect. 6, subsect. 5, of the Act of 1905 makes to be new buildings as "a building which has been altered in height so that the under (sic) surface of the floor of any story of which (sic) is more than 50 ft. above the level of the footway" (p. 238) is to make a statement which is at once ungrammatical and inaccurate; though it is only fair to say that in the course of a careful examination we have lighted on no other serious slip of this sort. We would also suggest that the expression "twenty-person" building, uncouth though it be, is to be preferred before "sleeping accommodation or employment" building, which Mr. Cohen uses "in the absence of one to serve the purpose better" although it is true he is "sensible of the clumsiness" of the latter expression.

These which we have called inequalities ought not to be allowed to obtrude so as to spoil the clear impression which we have formed of the finished work as a whole. The illustrative cases are really as illuminating, the notes are fully and accurately set out, the effect of judicial interpretations and the principles of decided cases are clearly expressed, and what will be of especial service to the practitioner, the by-laws and regulations of the Council under the Acts are fully cited, and the rules of procedure drawn up by the Tribunal of Appeal are given, together with the Council's requirements as to the provision of means of escape in case of fire in factories under the Factory and Workshop Act, 1901. We will close this review with a quotation, which may be taken as a typical example of the lucidity of Mr. Cohen's style, where, in commenting on the law relating to (a) "high" buildings and (b) "twenty-person" buildings, he says:—
"The law relating to existing buildings of both class (a) and class (b) differs from the law relating to new buildings, not only in that it comes into operation a year later than the latter, but also in that the burden of saving what the means of escape should be is transferred from the owner to the Council. The Council are required to serve notice on the owner (not vice versa as in the case of new buildings) of the building which they think is not provided with sufficient means of escape, and to specify in detail in such notice what they require the owner to do to provide such means of escape."

Baku: An Eventful History. By J. D. HENRY. London: Archibald Constable & Co., Ltd.; price 12s. 6d. net.

AS AN interesting and well-written account of the Russian oil fields this book is certainly worth reading. Some years ago Mr. Charles Marvin dealt with the same subject in a technical manner, and Mr. Henry, having recently returned from Baku impressed with the magnitude and importance of the work there conducted, now describes in popular style the origin, progress, and present position of the Russian oil industry. The neighbourhood of Baku, where the "eternal fires" were once regarded as the manifestation of a deity, has become the scene of most remarkable activity, and since hand-dug wells were superseded by deep borings the yield of the oil fields has increased immensely. After the first attempt made by Mr. Novossiltzev to drill with the aid of machinery about 1865 had resulted in the opening of the first "spouter," the hand-dug well soon became a thing of the past. Mr. Henry, like other visitors to Baku, was much struck with the spouters, and he devotes two

chapters of his work to some highly interesting and sensational details concerning famous wells of the kind. Perhaps the most striking and regrettable feature recorded in connexion with these is the enormous quantities of oil that have run to waste owing to the past lack of means for controlling the flow and of collecting the oil yielded during the first violence of the outburst. In the case of one well alone the waste was estimated at between 220,000 tons and 500,000 tons, Mr. Henry saying that "Thousands of tons were burned outside the district to get rid of it; thousands more were diverted into the Caspian; huge lakes of oil were formed near the well."

Nobel Brothers undertook the improvement of well drilling in the early seventies; in 1877 they laid the first pipe line for the transport of oil, and in 1879 built the first tank steamer for transport across the Caspian Sea. During the past quarter of a century this firm has drilled some 500 wells, from which about twenty million tons of oil have been raised. In 1904 they paid more than 1,000,000*l.* in railway and steamship freights, and 1,100,000*l.* in excise duties. These figures serve to give some idea of the oil industry, whose growth is fully discussed in Part I. of Mr. Henry's book. Part II. is entirely historical, and deals in a most graphic manner with the terrible features of the recent rising in the Caucasus. Part III. is chiefly concerned with the shipping trade of Batoum, the greatest oil port in the world. In spite of all precautions, fire is still the dreaded foe of the oil well sinker. As a general rule the oil bursts forth without warning, and a single spark is sufficient to start a fire, which extends to the oil-soaked ground, to reservoirs, tanks, derricks, and buildings. As the author says, "the belching forth of these fountains of liquid fire—the terrible roar of escaping gas, the short, sharp reports, the fierce flashes of blinding light, and the thick clouds of smoke, which roll upwards, fold upon fold, and shut out the sky—is a thrilling and appalling sight." Some of the most noteworthy fires which have occurred in the Russian oil fields—and probably the most appalling the world has ever known—are described in this book, which possesses much literary merit and commercial interest, although in no way to be described as a technical work.

Technical Dictionary in Six Languages.
Vol. I.: The Machine Elements and Tools for Working in Metal and Wood (825 illustrations). Edited by P. STREPNAGEL.
London: Archibald Constable & Co. 1906.

This dictionary is the first volume of a series intended to give, in English, French, German, Italian, Spanish, and Russian, the technical terms employed in connexion with all departments of engineering and architectural practice. Each volume will be devoted to one particular branch of work, the terms being classified according as they are of general, theoretical, or practical application, and to enable the user to find any term, an alphabetical index of words is given at the end of the book, together with a separate index in Russian. Vol. I. is of convenient size for use as a pocket dictionary, and, in addition to terms frequently used in metal and wood, working, it gives a large number of terms relating to the drawing office and employed generally in constructive work. With one or two exceptions the English terms are admirably stated—a feature not always to be found in dictionaries of the kind—and the utility of the work is much increased by the numerous diagrams and symbols printed in the middle of each page.

BOOK RECEIVED.

FIRE TESTS WITH FLOORS; Nos. 107 and 108 of British Fire Prevention Committee's publications.

INSTITUTE PREMISES, HARROGATE.—The New Park Institute and Adult School at Harrogate were opened a short time ago. The new building comprises a lecture hall, billiard room with two tables, reading room, bath rooms, etc. The total cost, including land, is about 1,300*l.* Mr. J. Allen was the contractor for the work, Mr. Brown, of Messrs. Bland & Bown, being the architect.

Trade Catalogues.

From the Carron Company, Carron, N.B., we have received a well-produced catalogue of cast-iron baths, lavatory-stands, and sinks, fully illustrated by half-tone blocks, some of which are also coloured. It is somewhat strange that, although fifty illustrations of baths are given, there is not one which shows fully the waste and overflow fittings in position. Two pages contain separate illustrations of taps, traps, standing wastes, etc., but sections of the baths showing the wastes and overflow fittings would have added very much to the value of the catalogue. Some of the lavatory stands are of a better type of design than usual, but even greater simplicity might have been studied with advantage, and it is surely high time that the "ornamental" supports for baths should be discarded in favour of something simpler and more appropriate.

The London Warming and Ventilating Company have published a catalogue containing illustrations of various adaptations of the "Senior" fire (Florence patent). One of the most important features of the firegrate is the firelump back, in which a flue is formed, commencing a little above the bottom grate and communicating at the top with the main flue; by means of a damper the back flue can be opened and the front flue closed, or *vice versa*. When the back flue only is open a quick draught is obtained, and the smoke from the surface of the coal is drawn through the body of the fire, and is partly consumed. After the fire has "burnt up," the main flue can be opened, and the grate is converted into a slow-combustion grate with a normal draught. The grates are made either with or without front bars, and with metal or glazed-brick surrounds. Nearly all the designs are simple, but not without character, and architects will certainly find the catalogue useful.

A supplementary catalogue has also been received from Messrs. E. H. Shorland & Brother, Manchester, and contains the latest designs of Shorland's patent "Manchester" grates and stoves and exhaust roof-ventilators. The grates and stoves are of the ventilating type, and are adapted for use in houses, schools, hospitals, and other buildings. The new designs are of simple character, tiles and glazed-bricks being freely used. The single and double open-fire stoves, with ascending or descending flues, deserve a special word of praise for their freedom from dust-collecting ornament; the sides and top are of tiles in an angle-iron framework, the top moulding being a small ogee around the top.

Messrs. Twyford's, Hanley, sent us some time ago a copy of their supplementary catalogue, Section A, which contains illustrations of sanitary appliances for schools, reformatories, and other institutions. There are some very good ranges of enamelled fireclay ("Adamant") lavatory ranges, with simple supports of cast-iron. The waste arrangements have been carefully considered. Among the other fittings are laboratory sinks, slop-sinks, wash-tubs, urinals, water-closets, and latrines, and foot, shower, and plunge baths.

The Nautilus Fire and Heating Company have sent us their 1906 catalogue, which contains a number of new designs of their well-known "Nautilus" grate and also of other heating and sanitary appliances now manufactured by the company. Attention may be drawn to the varied selection of fire-grates with and without front bars, of which the "Hearth" fire may be specially mentioned, and to the wood and iron mantels, some of which are of excellent design. Various kinds of stove are also shown, together with a number of kitcheners, fitted with the "Mermaid" boiler, which is an improvement on the ordinary types of domestic boiler. Some sanitary fittings are included, and an illustration is given of the "Simplex" water-softening apparatus. The catalogue contains a full index, and is much more comprehensive than the previous catalogues issued by the firm.

From the Phoenix Engineering Company, Chard, we have received a catalogue of the contractors' plant and municipal appliances manufactured by the firm. These include boilers, tanks, buckets, etc., for tar and asphalt, asphalted tools, mechanical mixers for tar macadam and concrete, road-sweeping

and scraping machines, gully-emptiers, watering and orderly carts, and other appliances for the making and maintenance of roads; pumps of various kinds, crabs, derricks, etc. The catalogue is fully priced and illustrated, and contains a complete index.

Messrs. Mellows & Co., Sheffield, have sent us their new catalogue containing complete illustrations of the patent "Eclipse" roof-glazing. This is adapted for either wood or steel bars, the upper surface of the wood and the whole of the steel being protected by a covering of "tin-lead." The catalogue contains illustrations of many large railway-stations and other buildings where this method of roof-glazing has been adopted, and a folding-plate is inserted giving details of the purlins, plates, etc., required in wood and steel roofs glazed on this system.

The Cydesdale Iron Foundry Company have sent us a copy of their new catalogue, consisting of about fifty separate plates, bound together by means of two screws and nuts. The advantages claimed for this method of binding are that sheets can easily be taken out to show to clients, and that new sheets issued by the firm can be inserted, thus keeping the catalogue up to date. On the other hand, the sheets are not paged, and an index is, therefore, impossible. The illustrations include inexpensive firegrates of various kinds, cast-iron and wood mantels, etc. Most of the designs are of a class more desired by the speculating builder than by the architect, but there are two or three exceptions, such as the hob-grate No. 394, even in this, however, the trail of the "New Art" is too conspicuous.

Messrs. John Bolding & Sons, in their "Supplementary Catalogue of Sanitary Appliances," show a number of "Commode" arm-chairs, valve and wash-down closets, stall urinals, lavatories, baths, etc. Special mention may be made of the fireclay plunge bath, sunk in the floor and fitted with a marble curb, and of the various spray and shower baths. The ingeniously-hinged "arm-chair" seat for a pedestal water-closet is also worthy of notice.

The Safety Tread Syndicate have sent us their new catalogue of Mason's patent non-slipping treads, which consist of ribbed plates of iron, steel, or bronze, having the alternate corrugations of dovetail section and filled with lead. The new pattern has deeper corrugations than the original design, and, therefore, wears longer. Mason's treads can be fixed on steps of wood, stone, or concrete, but "constructional treads" are now made, which are self-supporting, and can be built up to form straight or circular staircases. The same "non-slipping" surface is also adopted for area-gratings, man-hole-covers, coal-plates, etc.

Messrs. Millars' Karri and Jarrah Company have sent us a small illustrated catalogue of their karri and jarrah fencing and gates. The designs include post-and-rail fencing of various kinds, open and close park-pale fencing with sawn palings, military or pallisade fencing, and gates to match. The "ornamental" gates are not very pleasing, but, of course, other designs will be made to order. Karri and jarrah have obtained a good reputation for durability, and there does not appear to be any reason why they should not be extensively used for gates and fencing in this country.

The Richardson Electrical Company send us a book of numerous illustrations of their electric-light fittings, not all of equal merit; but some of them show good simple lines of metal design; the simple dies are the best. The "flounced" designs, as one may call them, with silk draperies, we do not like, but we suppose ladies will have them.

GOLF CLUB PREMISES, BOURNEMOUTH.—The new club-house and pavilion erected at Queen's Park, Bournemouth, by the Meyrick and Queen's Park Golf Club, Ltd., was opened recently. The architects were Messrs. Creek, Gifford, & Oakley, the builder being Mr. G. W. Meadus.

CHURCH RESTORATION, SANDBY, NOTTINGHAMSHIRE.—The western tower of the church of St. Botolph, at Sandby, is seriously dilapidated, Mr. C. Hodgson Fowler, F.S.A., of Durham, who has been consulted, proposes to shore up the tower and build two buttresses at the north-east angle. It will then be possible to take out the east wall and reconstruct the nave arch. Such other repairs as are required will then be done piece by piece. The total cost will be 1,200*l.*

Correspondence.

MUCH ADO ABOUT NOTHING.

Sir,—The members of the Institute's Registration Committee deserve credit and the thanks of the Profession generally for devoting so much valuable time and trouble to the work intrusted to them, but the result of it all is rather disappointing. The labour has been painful and prolonged, and the handling is such a very little one, that it is even with some difficulty that we are able to see it! For, after all, what do the recommendations of the Committee amount to but that the Institute should continue to act to what has done for many years, and as it does at present, as a learned society willing to give its diploma or certificate of efficiency to all who apply for it and prove their fitness by passing certain examinations? Then, it is proposed that the Institute should undertake the duty of declining architects to be competent to give no evidence of this by passing an examination. These would not become thereby members of the Institute, and if that body chooses to take the responsibility of giving such certificates there seems to be nothing in the Charter to hinder it doing so. In short, there is nothing to prevent these two methods of registration being thrown away.

Why should this prestige be thrown away? Why, above all things, should such a misnomer as "College" be proposed? The Institute never was a college, and never can be. The Royal College of Physicians probably was a college to begin with, although latterly only retaining one of its functions: that of examining. The idea of a rivalry between the two professions has been greatly exaggerated. There is practically none. I shall not waste time by saying more on this point, but will only ask, in passing, whether the greatest architectural works throughout the country have been designed by men who have passed the Institute's examinations, or by men who never did so—the majority of whom could not have done so had they tried.

But even if the majority day should ever come when the art of architecture shall be interfered with by statutory qualifications it may be safely asserted that the Institute will not be the only body empowered to conduct the necessary examinations, whether it changes its name or not, any more than the Royal College of Physicians is the only body retaining a degree of B.S. Degrees elsewhere, indeed, are much more highly esteemed in the profession, and in the event of registration being made compulsory, other centres for examination must be created in the provinces and in Scotland. Why not in Birmingham, Liverpool, Edinburgh and Glasgow, for instance? And even now, there is a flourishing architectural school, originated by Sir Rowand Anderson, and in Glasgow there is a school of architecture under the direction of Professor Bourdon of Paris, the diploma of which requires qualifications higher than those of the intermediate examination of the Institute. But a still lower standard of examination must suffice

for universal registration, or consequences will ensue which any thoughtful architect can foresee. What, then, has been gained by the Institute's intervention in this matter? Absolutely nothing. We are exactly in the old satisfactory position of having a door wide open for the admission of all who wish to obtain a certificate of fitness which is recognised by the public both at home and abroad. Recent discussion may serve to create interest and induce young men to seek admission, but no great accession to the number of Associates can be expected, I think, till two obstacles which at present stand in the way are removed. There can be no doubt that the payment of two guineas annually is a difficulty in the way of young men in the provinces at least.

Architecture is not a lucrative profession generally, and beginners—it may be for years—are frequently so situated that a contribution is apt to be burdensome, especially when they think that they get no equivalent for it compared with their fellows in London. It therefore seems advisable that the annual payment of Associates should, say, forty miles outside of London, be reduced by one-half, or better still, that annual payments should be compounded for by a single payment at first. Many young men would prefer this, as parents or guardians would probably pay this entrance-fee, especially if relieved of the heavy premiums for nothing, the continued exaction of which means an altered educational condition so scandalous. Although the time has fully come when this relic of the old system should be abolished, the Institute appears to lack courage to grapple with it—as it appears also to lack zeal to deal with the whole question of systematic education in a business-like way.

It is deplorable that the good work of the Educational Board should be shelved to give time for the discussion of such a comparatively frivolous subject as Compulsory Registration.

AN OLD FELLOW.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XV.

HYPERBOLIC LOGARITHMS: TABLES AND THEIR APPLICATION.

HAVING now before us a general review of the history and derivations of logarithms, it will be convenient to inquire into the manner in which logarithmic tables are presented for use and to compare some of the most generally published tables with the view of ascertaining their relative suitability for practical work.

The extracts given below have been selected so as to facilitate comparison, and to make intelligible the explanation of the manner in which the hyperbolic logarithm of any given number and the number corresponding to any given hyperbolic logarithm can be found.

Table VIII. is extracted from an eight-figure table of hyperbolic logarithms of numbers from 1 to 9,999, the extracts comprising the first eleven and the last ten lines.

The hyperbolic logarithm of 10,000, not given in this table, is $\log_e 10,000 = 9.21034038$. The value is easily calculated by the rule given last week that for each change in the position of the decimal point the value of the hyperbolic logarithm is increased by 2.30258509.

Hence we can compute the value of $\log_e 10,000$ from that of 1, 10, 100, and 1,000. Thus $\log_e 10,000 = 9.21034038$

$\log_e 10,000 = 9.21034038$
 $\log_e 100 = 4.60517019$
 $\log_e 10 = 2.30258509$
 $\log_e 1 = 0$

The slight inaccuracy of the first two results is due, of course, to the omission of decimal places in the hyperbolic logarithms of the lower numbers.

To Find the Hyperbolic Logarithm of any Number.

Rule (1).—The hyperbolic logarithm of any integral under 10,000 can be found by inspection of a table such as that illustrated in Table VIII.

Rule (2).—If the number be decimal or partly decimal, but including not more than four figures, the hyperbolic logarithm may be found thus:—

Find the logarithm of the figures as if they were integrals, subtract from it the logarithm of that power of 10 which contains one more figure than there are figures in the decimal part of the given number, and the remainder will be the required logarithm. If the logarithm of the power of 10 in question be greater in value than the logarithm of the four figures the positions of the numbers must be reversed in subtraction, and the remainder will be the required logarithm, but its value will be negative.

Example (1): Find the hyperbolic logarithm of 8.2.

Here $8.2 = \frac{82}{10}$

Therefore we have
 $\log_e 82 = 4.40671925$
 $\log_e 10 = 2.30258509$
and the required $\log_e 8.2 = 2.10413416$

Example (2): Find the hyperbolic logarithm of 0.82.

Here $0.82 = \frac{82}{100}$

Therefore we have
 $\log_e 100 = 4.60517019$
 $\log_e 82 = 4.40671925$
and the required $\log_e 0.82 = -0.19845094$

Rule (3).—If the number contains more than four figures the hyperbolic logarithm may be found thus:—

Multiply or divide it by such a power of 10 as will separate it into four integers and a decimal fraction. Then multiply the difference between the logarithm of the integral part and the logarithm of the next higher number by the logarithm of the next higher number: to the product add the logarithm of the integral part of the given number and the logarithm of the decimal part of the reduced number; finally, add to or subtract from the sum so obtained the logarithm of that power of 10 first employed, and the sum or remainder will be the required logarithm.

Example (3): Find the hyperbolic logarithm of 995682.

Here $995682 \div 100 = 9956.82$

TABLE VIII.—HYPERBOLIC LOGARITHMS FOR ALL NUMBERS FROM 1 TO 9,999. (Extract.)

Table with 10 columns (0-9) and multiple rows of hyperbolic logarithm values for numbers 1-9999.

Therefore we have
hyp. log. 9957 = 9-20603110 -
hyp. log. 9956 = 9-20593066
 0-00010044 ×
 0-82
hyp. log. 9956 = 0-0000823608 +
 9-20593066
hyp. log. 100 = 9-20601302 +
 4-60517019
 and the required *hyp. log.* = 13-81118321
 Example (4): Find the hyperbolic logarithm
 of 99-5682.
 Here
 99-5682 × 100 = 9956-82
 and we obtain, as in example (3), the value
 9-20601302, which in this case is the logarithm
 of the increased number.
 Therefore instead of adding we subtract
hyp. log. 100, obtaining
 9-20601302 -
hyp. log. 100 = 4-60517019
 and the required *hyp. log.* = 4-60084283

Although the logarithms found by the above
 method are not always correct in the last
 decimal place they are sufficiently accurate for
 all ordinary purposes.

To Find the Number Corresponding to any
 given Hyperbolic Logarithm.

Rule (4).—If the given logarithm be beyond
 the limits of the table add to or subtract from
 it the logarithm of such a power of 10 as will
 bring the given logarithm within those limits.
 Take from the table the number next below
 that indicated by the reduced logarithm; find
 the difference between the logarithm of that
 number and the reduced logarithm, also
 between the logarithm of the same number and
 the next higher logarithm, and divide the
 former difference by the latter difference.
 Append the quotient so obtained to the number
 first found, thus obtaining the number cor-
 responding to the reduced logarithm; divide or
 multiply it is number by that power of 10 first
 employed, and the result will be the required
 number.

The following examples show that this rule is
 really the converse of Rule (3).

Example (5): Find the number corresponding
 to the hyperbolic logarithm 13-81118321.
 Here we have

13-81118321 -
hyp. log. 100 = 4-60517019
 9-20601302 (a)
hyp. log. 9956 = 9-20593066 (b)
hyp. log. 9957 = 9-20603110 (c)
 Difference (a-b) = 0-00008236
 " (c-b) = 0-00010044
 Then as 8236 = 0-82 nearly
 10000

9956-82 × 100 = 995682 the required number.
 Example (6): Find the number corresponding
 to the hyperbolic logarithm 4-60084283.

(a) As this *hyp. log.* is within the limits of
 the table we take the number next below that
 indicated by the given logarithm and start
 by finding the differences as explained in
 Rule (4).

Thus
 4-60084283 (a)
hyp. log. 99 = 4-59511985 (b)
hyp. log. 100 = 4-60517019 (c)
 Difference (a-b) = 0-00572298
 " (c-b) = 0-01005034
 Then as 572298 = 0-5694
 100-034

∴ 99-5694 = the required number,
 but, as comparison with example (4) will show,
 the result is correct only to two places of
 decimals.

The result can be obtained more correctly
 by adding the logarithm of a multiple of 10 so
 as to conduct the working towards the end of
 the table where similar numbers are involved
 but containing more decimal places, and con-
 sequently where the differences between the
 logarithms are considerably smaller.

Thus by adding *hyp. log.* 100 we get
 4-60084283 +
hyp. log. 100 = 4-60517019
 9-20-01302 (a)
 Then *hyp. log.* 9956 = 9-20593066 (b)
hyp. log. 9957 = 9-20-03110 (c)
 Difference a-b = 0-00008236
 " c-b = 0-00010044 = 0-82 nearly
 ∴ 9956-82 + 100 = 99-5682 the required
 number.

Hyperbolic logarithms are employed in the

manner stated in the four fundamental rules
 given last week, as shown in the following
 simple example within the range of the extracts
 in Table VIII.

Example (7): Multiply 25 by 3-6.

Here
hyp. log. 25 = 3-21887582
hyp. log. 3-6 = 1-2803385
 4-49901437

By Table VIII, we find *hyp. log.* 4-49901437
 = 90, which is the required product.

It is unnecessary to give further examples
 as division, involution, and evolution can be
 performed with equal facility by following the
 other fundamental rules given last week.

Tables IX. and X. contain hyperbolic
 logarithms in the form usually given in
 engineering pocket-books.

An illustration of one useful purpose to which
 hyperbolic logarithms are applied in practice is
 given by the following formula for calculating
 the theoretical mean pressure of steam in an
 engine cylinder, where hyperbolic expansion of
 the steam is generally assumed

$$p_m = p_1 \left(\frac{1 + \text{hyp. log. } r}{r} \right)$$

where p_1 = initial absolute pressure of steam
 per sq. in., r = ratio of expansion.

Substituting values as below for a hypotheti-
 cal case we have

$$p_m = 80 \frac{1 + \text{hyp. log. } 4.3}{4.3}$$

$$= 80 \frac{1 + 1.4586}{4.3}$$

$$= 45.74 \text{ lb. per sq. in.}$$

UNBREAKABLE TIE-BARS AND AXLES.—The
 Farman Automobile Company, who are the
 patent proprietors of Col. Fox's unbreakable axle,
 mentioned on page 356 ante, point out that the
 wording in our paragraph "a steel bar surrounded
 by a series of other bars," conveys a wrong im-
 pression, the structure being a centre bar sur-
 rounded by tubes one within another which are
 welded by heat until they become one solid bar.
 The point of the invention, as we implied, is
 that faults are not likely to be found in the same
 position in any two of the tubes before welding.

Obituary.

MR. W. FRAME.—We regret to record the death
 of Mr. W. Frame, of Cardiff, architect to the
 Marquis of Bute. He was a native of Trowbridge,
 and received his professional education in the
 office of Mr. Pritchard, diocesan architect of
 Llandaff. In 1873 he obtained the Soanemedallion
 of the Institute of Architects, and subsequently
 the gold medal in architecture of the Royal
 Academy. When Burges undertook the restora-
 tion and partial rebuilding of Cardiff Castle
 for the Marquis of Bute he engaged Mr. Frame
 as his assistant, and on Burges's death he was
 engaged as architect to continue the work.
 Among his other works were the restoration of
 Falkland House, also for the Marquis of Bute;
 the restoration of Castell Coch in the Taff Valley;
 and the Cardiff Railway Company's offices at
 the Bute Docks.

MR. R. A. BRYDEN.—We have to record also
 the death, at the age of 64, of Mr. R. A. Bryden,
 of Glasgow, of which he was a native. He had
 carried on a considerable practice in Glasgow,
 latterly in partnership with his son, Mr. Andrew
 Bryden. Among the buildings which he carried
 out in Glasgow were the building containing
 the Christian Institute, the Bible Training
 Institute and the Young Men's Christian
 Association Club, and the new Maternity Hospital;
 he also made the plans for a hospital in course
 of erection in the Isle of Man. He was a member
 of the Wrights Incorporation of the Trades'
 Hall, and some twenty years ago served the
 office of Deacon. Mr. Bryden was elected a
 Fellow of the Institution of Architects in 1878.

MR. W. H. HOPKINSON.—The death took place
 on the 9th inst. of Mr. William Henry Hopkinson,
 Engineer, Surveyor of Highways, and Inspector
 of Buildings to the Keighley Corporation. The
 deceased, after completing his education at West
 Gower Academy, entered the office of the Borough
 Engineer and Surveyor of Halifax, where he
 remained for thirteen years, occupying the posi-
 tion of district or assistant surveyor. In 1883
 he was appointed Surveyor of Keighley, and in
 1892 the Corporation, having numerous important
 engineering works to carry out, appointed him
 to the position of Borough Engineer. His
 principal works under the Keighley Corporation
 were the construction of the Marley sewage
 disposal works, at a cost of about 30,000l., the
 construction of the filter-beds in connexion with
 the waterworks at Oldfield, at a cost of about
 10,000l.; and latterly the laying of the permanent
 way for the electric tramways. Mr. Hopkinson
 was an Associate Member of the Institution of Civil
 Engineers and a member of the Association of
 Municipal and County Engineers.

MR. GOLDSMITH.—The death, on April 14, at
 the Manor House, Pinner, Middlesex, is announced
 of Mr. William Goldsmith, aged 49 years,
 No. 40, Old Broad-street, E.C. Mr. Goldsmith
 was a Fellow of the Surveyors' Institution, and
 was elected an Associate of the Royal Institute
 of British Architects in 1882.

General Building News.

METHODIST SCHOOLS, BALLYNAFEIGH.—The
 new national schools in connexion with Ballynafeigh
 Methodist Church were opened recently. The
 buildings are of red brick, with artificial
 stone dressings. They provide accommodation
 for 300 pupils. The central hall with adjoining
 classrooms is the leading feature of the school.
 This hall is 30 ft. by 27 ft. wide, by 21 ft. high,
 and it can be enlarged to 45 ft. by 36 ft. by
 opening sliding partitions. Separate entrances
 are provided for boys and girls, with cloak-room
 accommodation adjoining each. The builder was
 Mr. Wm. Oliver, who has carried out the plans
 and specifications of the architect, Mr. James St. J.
 Phillips. The hardware, including the sprout-
 ing, patent fanlight operns, etc., was supplied
 by Messrs. A. & D. Wright; while the special
 glazed sewer pipes and sanitary appliances were
 supplied by Messrs. Jones Bros. The plumbing
 was done by Mr. Thomas Campbell, and the heat-
 ing by Messrs. Hayes & Rudkin. The cost has
 been about 21,000l.

BOARD SCHOOL, ABERDEEN.—A new school
 is to be erected by the Aberdeen School Board
 at Ruthrieston. The site has a frontage to
 Holburn-street and Riverside-road of about 240 ft.,
 and its total area is about 1½ acres. The building,
 which will be a three-story one, will have a total
 length of 150 ft. and a breadth of about 80 ft.,
 measuring 45 ft. by about 30 ft. There are the
 usual rooms for the staff near to the entrance.
 Also on the ground floor at the opposite end
 of the building is the boys' entrance, with

headmaster's-room and assistant masters'-room. On the south front is the girls' entrance with lobby leading to the staircase. There are two staircases, one for boys and the other for girls, leading to the upper floors. There are six classrooms on the first floor, providing accommodation for 364 pupils. A cloak room and teachers'-room are also provided, and also a combined hall and gymnasium for junior and senior pupils, of the same size as that in the infants' department. On the floor above are eight classrooms, with accommodation for 468 pupils. At one end of this floor is provided a cookery and laundry-room, with scullery accommodation, while at the opposite end is a manual instruction room with wood store. The staircases will be fireproof. The building is to be ventilated mechanically, and it will be heated by steam, generated by a Lancashire boiler in the basement. A house for the janitor, entering from Holburn-street, is to be provided. Playsheds will be erected in the playgrounds, and latrines provided for boys and girls and infants respectively. The architect's estimate of the total cost of the building, including the laying out of the site, the playsheds, furniture, etc., is 15,788. The contract for the excavations was secured by Mr. James Gauld, and the mason work by Mr. Edgar Gault. The school has been designed by Mr. J. A. Ogg Allan, the School Board Architect.

TWEKESBURY GRAMMAR SCHOOL.—The foundation stones of new buildings at the Grammar School, Twickenham, were laid recently. The new buildings, which are in Tudor style, were designed by Mr. W. Ridler, and are being erected by Messrs. Collins & Godfrey, at a cost of about 2,700. The ground floor will contain an entrance hall, chemical and physical laboratory, balance-room, classroom with laboratories and cloak-room. On the first floor will be a master's room, an art classroom, and a general classroom.

SECONDARY SCHOOL, URBIDGE.—A new secondary school is to be erected at Urbidge. The building will be situated at the end of the Greenway, near the Hilington-road. It will consist of class-room accommodation for 150 children, with science rooms, a large central hall—so arranged that for the present it can be used as an art room, and also as a dining hall—cloak-rooms and changing-rooms for the principal and secretary, and common room for the teachers. In order to reduce the expenditure, only one laboratory, with balance-room, has been provided, leaving as a future extension a second laboratory, a dining hall, and art room. In addition to the main school building, centres for instruction in cookery and woodwork are to be built as a separate block. The buildings will be constructed with red brick and stone. The roof will be covered with tiles. The plans for the work have been prepared by Mr. H. G. Crodhall.

Y.M.C.A. PREMISES, LEEDS.—New premises are being erected by the Leeds Young Men's Christian Association at the corner of Albion-street and Albion-place. The two principal fronts will be of dressed stone. In the basement there will be a gymnasium and various store-rooms and offices. On the ground floor, besides an entrance-hall, lounge, and staircases, five shops and several offices will be constructed. On the first floor a lecture hall, gallery, able to accommodate about 450 persons, will be the principal feature, and other apartments will be refreshment-room and buffet, reading-room, secretary's and clerk's offices, etc. On the second and third floors a meeting-room, library, writing-room, committee-room, classrooms, photographic and work rooms will be provided. The total cost is expected to reach 49,000. Mr. W. H. Thorp, architect, prepared the plans for the work.

ISOLATION HOSPITAL, BURSLEM.—A new infectious diseases hospital has been erected at Stanfield by the Corporation of Burslem. The main entrance is on the south side of the site, and is approached by way of the Havill-street and in immediate conjunction with this entrance. The blocks for the treatment of patients are grouped in the rear of the lodge. The general contractors for the erection of the hospital are Messrs. J. H. Broadbent & Sons, Burslem. Messrs. Douglas & Co. have executed the hot-air stoves, and Messrs. G. G. & Sons, Staffordshire Potteries Waterworks Co. have laid the water mains, and Mr. S. Barlow, of Burslem, has provided all water tanks and water supplies throughout the institution. The wall-fires and bedroom grates have been supplied by Messrs. Shaw & Adams, and the sanitary fittings by Messrs. Burslem, Messrs. G. Geet & Sons, of Stoke-on-Trent, have been entrusted with the furnishing of the hospital, which has been carried out to the satisfaction of the architect. Mr. W. Williams, of Ettrick, has carried out the levelling and road-making on the site. Messrs. Austin & Co., of Burslem, the boundary fences and gates, and the general laying-out of the grounds has been executed under the supervision of Mr. McPhail, the park superintendent. It is expected that

the total cost of the hospital, inclusive of the cost of the land, will be between 10,000, and 11,000. The whole has been erected from the designs and under the supervision of the architect, Mr. Reginald T. Longden, of Burslem. The clerk of works was Mr. Mark Simpson, building inspector to the Corporation.

GLASGOW POST OFFICE EXTENSION.—Additions from time to time have been made to the General Post Office in George-square, but these remedies for the congestion of traffic proved only temporary, and it was decided to remove the parcel-post work from the George-square building to a new building on a site in Waterloo-street, about half a mile westward. The new parcel-post office is situated on the north side of Waterloo-street, between Wellington and West Campbell streets, having architecturally-treated façades to all the three streets. The site, which is an island one, covers an area of 2,926 yds., and is entirely built over. Although the building is nominally only a three-story one, it rises to a general level of 90 ft. above the street pavement, this unusual height being the natural outcome of the large areas of the sorting halls, which necessitate ceilings 25 ft. high. The whole of the street floor, excepting a small portion at the Wellington-street end, where the Waterloo-street branch post office is to be housed, is occupied by one of these large sorting halls, together with a loading platform and covered wayway 180 ft. long, entering from Waterloo-street by several archedways. On the first floor, and immediately over this sorting hall, loading platform, etc., is another large sorting hall, with a floor area of 18,715 super. ft. The second floor is at present unoccupied. The walls are of local iron, floor to ceiling with ivory-white glazed bricks. The floors are of wood blocks. The street floor of the Wellington-street building will be used as an ordinary branch post office for general work, and the public entrance and the posting boxes are situate in Wellington-street. The walls of the main entrance porch will be lined with marble, and the floor will be of mosaic. Passing from thence through a pair of swing doors the public office will be entered—a chamber treated architecturally in fumed oak, a counter 54 ft. long, telegram writing tables, high wall-linings, screens, etc., with a panelled plaster ceiling and mosaic floor. Entering immediately off this room is a public telephone call office. A staff entrance and staircase at the north end of the Wellington-street front gives access to the five upper floors of this block, which are mainly occupied by the postal engineers' and other departmental offices, together with cloakroom and lavatory accommodation for the whole of the block, and staff, which are used for special occasions and combined with the dining-room is provided, with the necessary kitchen and servery adjuncts. A basement extends under the whole building, and is divided up for the various departmental stores, and the electric lifts run down to same.

The heating is to be on the low-pressure system, and the illumination on electric light. The three street fronts and the returns at the back lane are faced with a cream-coloured freestone from Northumberland on a high granite base, and the stonework is being treated with preservative solution to withstand the effect of the Glasgow atmosphere. The main front is divided into five large arches, each 32 ft. wide, and 22 ft. high, and supported at one end by a solid pedimented pavilion. The other fronts are on a similar scale. The building has been erected from plans prepared in H.M. Office of Works, Edinburgh, under the direction of Mr. W. W. Robertson, H.M. late Principal Architect for Scotland, and Mr. W. T. Oldrieve, H.M. present Principal Architect for Scotland, and it is under the supervision of the latter gentleman that the work is being carried out. The general contractors are Messrs. P. & W. Anderson, Glasgow, and the clerk of works is Mr. James Hislop. The cost will amount to about 80,000.

COUNCIL OFFICES, PONTYFRIDDE.—The new public offices erected in Gellwastad-road, Pontyfridd, by the Urban District Council, were opened on the 11th inst. by Sir Alfred Thomas, M.P. The new buildings, which are from plans by Mr. Henry T. Hare, accepted in competition, provide accommodation for the various departments, besides a council room, and ante-rooms, committee room, and chairman's parlour. The main entrance facing Gellwastad-road. The frontages are faced with local stone, with Forest of Dean dressings, and the roofs are covered with slates. The whole of the construction is fireproof, and the windows are fitted with iron casements, glassed with leaded lights, those in the council chamber being of stained glass bearing various coats of arms. The stained glass bearing various coats of arms, the windows of the council chamber being provided by special radiators. Ventilation is provided by electric fans. Mr. C. Watkin Williams was contractor, the approximate cost being 16,000.

PUBLIC LIBRARY, TEDDINGTON.—A new public free library has been opened at Teddington. The building was erected from designs prepared by Mr. H. A. Cheers, architect.

NEW STANDS, CATERBRICK BRIDGE RACE-COURSE.—The new county and grand stands (which are to replace the old structure) have just been completed. The architects are Messrs. Mangnall & Littlewoods, of Manchester, the contractors being Messrs. R. Blackett & Son, of Greenocroft. The size of the county stand is 88 ft. by 35 ft., and it accommodates about 1,526 people. The grand stand is 65 ft. by 54 ft., and accommodates more than 936 people. Red-tiled roofs entirely cover the whole area of both stands. The walls are of local brickwork. Under the county stand are the new quarters for the jockeys and gentlemen jockeys, weighing-room, press-room, clerk of the course, and lavatory, etc. Sir John Lawson has a separate stand on the county stand, with a staircase leading from the paddock. This also leads to a roof stand for the use of trainers and the press. Under the grand stand is situated the luncheon-room, refreshment-room and kitchen. A new paddock, much larger than the old one, has been laid with new gravelled walks. The old building, in which was situated the jockeys' quarters and stewards, is to be converted into police quarters, telegraph-office, and lavatories, etc.

BUILDING IN BOURNEMOUTH.—Since 1899 there have been 2,156 new houses put up in the borough of Bournemouth, and in addition 742 large additions made to stables, workshops, etc., a total of 2,936. In new houses alone the yearly totals are in 1899, 150, then in succeeding years 174, 200, 294, 436, 440, and 479 in 1905.

Stained Glass & Decoration.

PRESENTATION COMMUNION-TABLE.—A new communion-table has just been given to the parish church of St. Paul, Leith, by a member of the congregation. The design of the table is Renaissance in character. Upon a plinth and caps supporting a moulded table-top of marble 6 ft. long by 3 ft. 3 in. in height. In the front, between the plasters, a panel is formed which contains the sculptured representation of Leonardo Da Vinci's picture of the Last Supper, and on the treze above, in gilt letters, are the words, "This do in remembrance of Me." The material is English coloured alabaster, the sculpture being pure white, and the work was executed by Mr. W. Birnie Rhind, R.S.A., Edinburgh.

Foreign.

FRANCE.—The new Metropolitan line "No. 2 Sud" at Paris is to be opened at the end of this month. It is on a viaduct from Passy to Rue de Vaugirard, and there is a tunnel as far as Place St. Jacques. From that station it is a high level line to Rue Corvisart and the Seine. Industries is to be held from June to October in the conservatory on the Cours la Reine at Paris. The seventy-third session of the Congrès Archeologique de France will be held in May at Careassonne and Perpignan. A Departmental Committee has been formed at Chambéry to protect from injury the monuments and picturesque sites of La Savoie. The Municipal Council of Paris has voted a sum of 128,000 francs for various works in connexion with the Petit Palais, especially the construction of some large windows and skylights to give more light to the galleries of pictures. The Chamber of Deputies, before separating, voted the cession of the Caserne Napoleon to the City of Paris, in exchange for certain properties in the Rue Oudinot, where the Ministry of the Colonies is to be accommodated. The Caserne Napoleon will be made use of as an annex to the Hotel de Ville. The annual exhibition of Pastellistes has been opened in the Georges Petit Gallery at Paris. It includes works by MM. Bernard, Gaston La Touche, Vêler, Dagnan-Bouveret, and other well-known artists. The Institute of France has just decided on the distribution of the prize fund of 30,000 francs left by M. Debrousse. Among the beneficiaries are two architects, M. Bigot, who is in charge of the excavations in the Circus Maximus at Rome, and M. Prost, for his work of restoration at S. Sophia, Constantinople. A monument to Alphonse Karr was inaugurated last Sunday at Saint Raphaël. M. Maubert is the sculptor; and a monument to Jeanne d'Arc has been inaugurated at Mars-la-Tour, the work of M. Robertson as sculptor; the pedestal, in the blue stone of Belgium, has been designed by M. Nicolas. The death is announced, at the age of seventy-three, of M. Emile Gerspach, former Director of the Gobelins, and founder of a School of mosaic work. He was the author of numerous publications

on subjects connected with art, among others a work on Mosaic, and one on Coptic textiles. He had long been known as a contributor to artistic magazines. He had been created Chevalier of the Legion of Honour.

SOUTH AFRICA.—Rough sketch plans of a new market house next the Kazerne have been prepared. The estimated cost of the undertaking is 71,500*l.*—A new hotel for Messrs. Lewis & Marks, to cost 13,100*l.*, is to be erected in Pretoria.—The Harrismith municipality is about to raise a municipal loan of 30,000*l.* for the building of a town hall, a market hall, and half the cost of a bridge over the Wilge River.—In Cape Town the foundation stone has been laid of a new block of buildings for the Norwich Union Life Insurance Society, the architects of which are Messrs. MacGillivray & Grant, and the builders Messrs. Rochelle & Smith.—A conference of the Master Builders' Federation was opened in Pretoria on March 19 and was attended by delegates from all the principal towns of the British colonies in South Africa, with the exception of Bloemfontein and Kimberley.

Sanitary and Engineering News.

ENGINEERING STANDARDS COMMITTEE.—The Secretary of State for India in Council has nominated Mr. A. Beeston, C.S.I., to represent the India Office on the Sectional Committee on Locomotives (Chairman Sir Douglas Fox), in the place of Sir Frederick R. Upcott, Chairman of the Indian Railway Board. The Council of the Institution of Naval Architects have nominated Mr. Sydney W. Barnaby, of Messrs. John I. Thornycroft & Co., to represent that Institution on the Sectional Committee on Screw Threads and Bolt Gauges (Chairman Mr. H. P. Donnan, Chief Superintendent of the Ordnance Factories), in the place of Mr. McFarlane Gray, resigned.

ROYAL SANITARY INSTITUTE.—The following is the list of members and associates elected this month:—*Members:* J. E. Doré (City Sanitary Engineer, Montreal); J. E. Farmer, (Mitcham); S. S. Gettings (West Bromwich); Dr. Laberge (Bacteriologist to the City of Montreal); F. Longland (Swindon); E. Marceau (Principal, Ecole Polytechnique, Montreal); Lieut.-Col. Melville (Wokingham); E. M. Modi (Bombay); F. R. Ryman (Borough Surveyor, Stamford); W. C. Sillitoe (Ealing). *Associates:* T. Baker (Aldwyck, W.C.); J. P. C. Bowden (Bristol); T. M. Draper (Manchester); W. Heald (Blackburn); C. Killington (H.M. Naval Yard, Wei Hai Wei); C. A. N. Ludlam (W. Kensington); G. E. Marlow (Desborough); H. Montgomery (Cape Town); A. W. Potter (Bristol); C. M. Robinson (Finchley, N.); J. I. Smith (Hounslow); Alice Vickers (Sparbrook, Birmingham); S. Wallis (Kettering); W. Whatley (Kidderminster); S. Wilmot (Nottingham).

Miscellaneous.

PROFESSIONAL AND BUSINESS ANNOUNCEMENT.—Mr. Thos. Moody, F.S.I., has removed his offices from 30, Cockspur-street, to 2, Haymarket, S.W.

"ETERMIT" ASBESTOS SLATE.—The material designated by this name is made by the Austro-Hungarian Asbestos Cement Company and supplied in Great Britain by Messrs. G. R. Speaker & Co. So far as can be judged from samples we have received, the tiles and sheets are identical in composition and in other respects with the asbestos cement tiles noticed in our issue of March 31st last, and the general remarks there made are equally applicable to the "Eternit" slate. Our readers may perhaps be interested in the following data taken from a report on the latter material by the director of the Austrian Royal Technical Institute:—

Tensile strength: 5,781 lb. per sq. in.
Crushing strength: 6,281 lb. per sq. in.
Coefficient of elasticity: 9,555,923 lb. per sq. in.
Specific gravity: 2.40.
Permeability: Impermeable to water at 15 lb. per sq. in. Duration of test, one and a half hours.
Porosity: 62% per cent., same as natural slate.
Heat conductivity: Cork = 0. Eternit = 13.9. Welsh slate 16.4.

GAS V. ELECTRICITY.—The preference recently given to gas as a material of illumination by public authorities and important companies clearly demonstrates that electricity has a very formidable opponent. It is stated that the London Brighton and South Coast Railway have saved more than 1,000*l.* a year at Victoria Station by the substitution of high-pressure gas lamps for inefficient arc lights, and that it is believed the extension of the same system to the enlarged station, involving an increase from 8,000 candle-power to 40,000 candle-power, will reduce the total cost of lighting to 200*l.* a year less than the amount formerly paid for electricity in the old part of the station. Encouraged by the

success attained at Victoria, the North London Railway have adopted high-pressure gas for the illumination of Broad-street Station, with most satisfactory results. These examples are only two out of many others showing that far from being in a state of decline, the gas lighting industries have taken a new lease of life, owing to the remarkable improvements that have been developed within the last few years.

A NEW TURBINE POWER-HOUSE.—In respect of mechanical equipment, the Williamsburg generating-station built for the Brooklyn Rapid Transit Company represents a radical departure from the practice followed in the great power-houses of New York. Instead of reciprocating engines, nine turbo-generators of the Parsons-Bullock type will be installed, the largest of these having a capacity of 9,000 h.p. An indication of the saving effected in the cost of the building is given by the statement that the floor space of the Williamsburg station represents less than two-thirds of the area that would have been required for reciprocating engines. The saving in the cost of the site must be even more considerable in a district like Brooklyn, where the value of land is extremely high.

AUTOMATIC TRAP-DOOR OPENER.—Messrs. J. H. Heathman & Co. have designed an automatic trap-door opener to comply with the London Building Act (Amendment Act), 1905. It consists of a lever pivoted (near the middle of its length) on a stud fixed to the frame under the trap-door; a counterweight is attached to one arm of the lever by an adjustable arrangement, which allows the counterweight to be fixed at the required distance from the pivot or fulcrum to counterbalance the weight of the door. The other end of the lever is pivoted to a second bar, the upper end of which works on a pivot attached to the trap-door itself. When the door is shut the two bars form an acute angle, but when the fastening of the door is released, by means of a chain and pull, the counterweight depresses the end of the lever, and raises the other end, by which in turn the second bar and the trap-door are raised. The sketch and description which have been sent to us do not explain how the door is closed again.

PRESTO COMBINED LADDER AND TRAP-DOOR.—As a convenient means of complying with the requirements of sect. 12, clause B, par. (b) of the London Building Acts (Amendment Act), 1905, the invention now being applied by the Presto Combined Ladder and Trap Company quite deserves the attention of architects. The apparatus consists of a hinged trap-door, suitable for covering an opening in a flat roof, an extensible ladder designed on the principle embodied in "lady ladders" and levers connecting the door with the ladder. The upper end of the ladder is hinged to the side of the trap framing opposite to that on which the door is hung, and the levers are arranged in such manner that when the free end of the ladder has been disengaged from a spring clip it swings downward and opens the trap-door upwards. The ladder begins to open as soon as the horizontal position is left, and as its lower extremity reaches the floor below by a gradual movement which is prevented from becoming too rapid by the fact that the trap-door acts as a counterpoise. As ceilings are usually too high to be reached by a person of ordinary stature, a "long arm" is provided for disengaging the end of the ladder from the spring clip, and the same instrument is employed for securing the ladder after it has been pushed up by hand as far as can be conveniently reached, the upward movement of the ladder having the effect of closing and securing the trap-door. The ladder is built of stamped steel, with steel bolts at the joints. There is therefore no reason to doubt its strength, and being light it can be very easily manipulated. When out of use the ladder occupies the space below the trap-door, and requires a depth of only 15 in. between the underside of the door and ceiling level. For the sake of appearance the trap-door can be fitted in the ceiling and worked automatically with the apparatus, and for the purpose of assisting women and children to step from the top tread of the ladder to the roof above, a pivoted hand-post can be fitted at the upper extremity of the ladder and automatically elevated or lowered as the ladder is drawn down or pushed up. Having inspected an installation of the apparatus at the makers' works, we are satisfied that it fully complies with the demands of the new Building Act, and represents a thoroughly practical idea. It ought to be mentioned that the trap-door cannot be opened from the outside, a point of some importance to tenants who would naturally look with disfavour upon any device likely to facilitate visits of unorthodox character to their premises.

VICTORIA AND ALBERT MUSEUM: RECENT ARCHITECTURAL ACQUISITIONS.—In the North Court have just been deposited Mr. J. H. Fitzhenry's gift of specimens of French architectural art consisting of a highly enriched Renaissance canopy from the church of St. Etienne du Mont, Paris; a fragment of an arch-soffit from Guillaume Admiral de Bonnavat's chateau, temp. Francis I.; part of a dormer-window bearing that monarch's

cognisance of a salamander in flames; and a whole dormer-window from Jehanne de Belzac's chateau de Montal near Saint Crés. The latter bears the motto "plus d'espoir" and two busts with the figure of a headless warrior on the pediment, the Belzac and Montal coat-arms are carved below, and there is a sculptured frieze of armorial torsos, and scroll work around a cartouche. Another fresh exhibit is a cast of Peter Visseher's bronze monument, 1497, for Archbishop Ernst of Magdeburg, executed in the prelate's lifetime; for the Art Library have been collected a large number of early illustrated books upon architecture.

CONSISTORY COURT OF LONDON.—Dr. Tristram, K.C., Chancellor of the Diocese, has agreed that faculties should issue in respect of the churches of St. James, Upper Edmonton, and St. Saviour in Eton-road, South Hampstead. In the latter case Messrs. Caröe & Passmore, architects to the Ecclesiastical Commissioners, have prepared plans for certain alterations and improvements at an estimated cost of 4,600*l.*, of which about 4,500*l.* are already subscribed. The new works comprise an extension of the foundations, 1497, for a strengthening of the chancel 10 ft. eastwards with a strengthening of the foundations at that end which is in a very dangerous condition and stands upon shifting soil; an enlargement of the vestries; a chamber for electrical organ-blowing apparatus beneath the clergy vestry; removal of the choir vestry west window to the south side of the south chancel aisle; a heating chamber under the two new windows in the chancel, etc. The church was built in 1856 for 750 sittings after E. M. Barry's designs in the Early English style, and Messrs. Clayton & Bell decorated the chancel twenty years afterwards. Large sums have been expended from time to time in strengthening various parts of the fabric, and Messrs. Caröe & Passmore consider that it is essentially necessary to strengthen the foundations to secure the safety of the east end.—St. James' Church, Upper Edmonton, built in 1849-1850 for 625 sittings, was designed by Ellis after the Early English style; the new works will be executed under Mr. Edward B. Ellis's direction, and superintendence. The faculty relates to repairs and improvements of the church, churchyard, and vicarage, and a rebuilding of the wall and piers and providing new gables for the frontage to Fore-street. The frontage of some 160 ft. is to be set back for a widening of the street for an authorised tramway line; the Edmonton Urban District Council will pay the sum of 500*l.* and costs in compensation, and 500*l.* of the money to be applied to the purposes we mention. The organ, by Bishop, was originally built for the London Tavern in Bishopsgate-street.

PETROL ELECTRIC SETS.—A difficulty is often experienced by the owners of motor-cars, especially in country districts, of getting their ignition accumulators charged. Occasionally the engineers who undertake motor-car repairs will do it at a reasonable cost, and so will a few electric supply stations. In many parts of the country, however, the want of facilities has to be taken seriously into account when considering the advisability of keeping a motor-car or bicycle. Messrs. R. J. Nicholson & Co., of Cannon-street, Manchester, have sent us a pamphlet describing their "ideal" petrol-electric sets, which are designed to meet this difficulty. They recognise the necessity of providing a simple petrol engine and dynamo which will stand the roughest usage and run for many hours without attention. In addition to charging the ignition accumulators, these sets can be used to light up the garage and workshop, as the smallest dynamo given in their list lights 16 eight-c.p. lamps. They also provide a larger combined engine and dynamo for house-lighting, but in this case accumulators are necessary and more skilled attendance is required.

THE LEGAL ASPECT OF BUILDING CONTRACTS.—Mr. James Cameron, solicitor, secretary of the Scottish Building Trades Federation, read a paper on the III inst. in the Building Trades' Exchange, George-street, Edinburgh, to a meeting of the Edinburgh Building Trades' Exchange, and the Edinburgh, Leith, and District Building Trades Association, of which two societies he is also secretary. Mr. Patrick Knox presided. The lecturer dealt with "The Legal Aspect of Building Contracts," and in the course of his paper he emphasised the points to be kept in view when tendering. He commented on the inconvenience to which builders were sometimes put when they could not get a certificate after the work was done, and when they had often to wait for six or twelve months, and sometimes more, before they got a final settlement. With regard to the arbitration clause in a building contract, he said that an architect acting as arbitrator must honestly and impartially exercise the quasi-judicial functions entrusted to him. The almost autocratic power put into his hands under the usual terms of a building contract had often given rise to complaints on the part of builders. The speaker's suggestion that justice would be done, a better feeling promoted, and more satisfaction given to builder and architect alike if the architect were a neutral party mutually agreed upon.

otes of thanks to the lecturer and the chairman terminated the meeting.

PAVING DISPUTE, SOUTH SHIELDS.—A Local Improvement Board inquiry was conducted by Mr. Boulnois in the Town Hall, South Shields, on the 19th inst., relative to a dispute which has arisen in connexion with certain street paving in the borough. The appellants were Mr. Thomas Banks, a builder, who was represented by Mr. Hope (Sunderland), and the Town Clerk (Mr. J. George Hayton) was present in the interests of the South Shields Corporation. Mr. Hope stated that the Corporation acquired the Fairles Estate for the purposes of public improvement, and the surplus land in connexion with this estate was bought from them by Mr. Banks. In preparing his plans for the streets, he took into consideration the cost of the making of them, so as to calculate the result of his investment. At that time he had no notice that the requirements for paving would be any other than the ordinary. After he had commenced building operations, Mr. Banks received certain notices from the Corporation re paving, which he considered to be according to the recognised method of the paving of private streets, which was by chip blocks. That was according to the specification served upon his client in November, 1903. The Corporation afterwards let the contract on specifications other than Mr. Banks had received notice of. His client complained, after he had been served with new notices, but the Corporation adhered to the amended specifications. His client estimated that the increased expense which would be incurred by reason of the change from chips to sets, would be 92s. or 2s. per square yard. The Corporation estimated it to be 67s. or 1s. 3d. per square yard. The Town Clerk spoke on behalf of the Corporation, contending that it was Mr. Banks' duty to inquire as to what was the scope and jurisdiction of the Corporation under the Public Health Acts, in the matter of paving. Had he done so he would have ascertained that sets were provided for. The Borough Surveyor had been serving the Council to do so for years, and it was no sudden inspiration on the part of the Committee. He did not agree that the Corporation should have issued notices publicly announcing the new departure. The inquiry afterwards concluded, and the inspector will make his report in due course.

IMPROVEMENTS, NEWCASTLE-ON-TYNE.—On the 9th inst. an inquiry was held at Newcastle Town Hall by Mr. H. Percy Boulnois, M.Inst.C.E., as Inspector of the Local Government Board, under an application by the City Council for leave to borrow 7,665*l.* for works of street improvement, and 535*l.* for the provision of a new boiler and fittings at the Northumberland Baths. The Town Clerk explained that the sum required for street improvements was made up as follows:—Neville-bridge, wood paving, 2,215*l.*; Stowell-street, granite sets, 1,000*l.*; portion of cost of new road at North Shields, one-half of which is to be paid by the North Eastern Railway Company, 865*l.*; Barrack-road, lowering of footpaths, etc., 3,740*l.* Mr. Kirkpatrick, City Engineer, gave the details of the various improvements.

NORTH STAFFORDSHIRE BUILDERS' ASSOCIATION.—The annual dinner of the North Staffordshire Builders' Association was held recently at the North Staffordshire Hotel, Stoke. The President (Mr. John Gallimore) presided, and the company included the Chief Bailiff of Tunstall (Alderman Heath), the Chief Bailiff of Newcastle (Mr. A. Cotton). Mr. Bennion proposed "The Local Governing Bodies," to which the Chief Bailiff of Tunstall replied, in proposing "Architects and Surveyors." Mr. Broadhurst said the building trade was in a critical condition. He thought the district was well served with architects. Mr. Scrivener, in reply, cited as proof of the disinterestedness of the men on local authorities the fact that so many bodies, by getting elected to these bodies, place themselves outside the possibility of doing a great deal of work. Mr. Scrivener deplored the slackness in the building trade. He knew of one town where not a single architect had got a job in his office. Messrs. Longden and Tindall also responded to the toast. "The North Staffordshire Builders' Association" was proposed by the Mayor of Newcastle. The building trade, he observed, was a very important one. A large amount of capital was invested in it, and the outcome of its exercise was the employment of a very large amount of labour. The building trade, he should imagine, was the first to feel any depression, but it was also the last to feel any improvement. He was glad to think that the pottery trade had very perceptibly improved during the last twelve months, and was still improving. As a natural outcome of other trades, including that of builders, should also improve. He said the building trade had passed through a period of five years' depression altogether unprecedented in its annals, and, unfortunately, he saw no immediate signs of revival. During the past twelve months they had had no labour

troubles. At the present moment they had the question of trades unionism in the forefront of practical politics. It was a lamentable fact, discussed by many builders' associations throughout the country, that during the last twenty years whilst the cost of labour had increased, efficiency in labour had not increased in the same ratio. It was singular that the trade unions in the building trade had been alone in not requiring efficiency from operatives. The building trade, unlike many other trades, was universal; it paid between one and two millions a week in wages, and it was a melancholy fact that it had no representation in the House.—Mr. H. Howlett proposed "The Visitors," which was acknowledged by Mr. H. Barrett Greene.—Mr. William Grant proposed the health of "The President," who, in reply, said Labour members and trade unions had come to stay, and the unions set builders an example of the results of combination. Touching on the Trade Disputes Bill, Mr. Gallimore said he thought it wrong that trade union funds should be entirely immune, and he thought the principle would never carry because it was wrong. The health of Mr. Harris was also drunk.

EUREKA GREEN SLATES.—Messrs. Roberts, Adlard, & Co. send us some specimens of this slate, which is of a fine green tone, and also an old specimen which had been for thirty years on the roof of St. Emanuel's Church, Ridgway, Wimbledon, and was taken off in the course of making some repairs to the roof timbers. Messrs. Roberts, Adlard, & Co. send this, we understand, in disproof of an assertion that their green slates change colour. We can hardly say that the specimen sent us has not changed colour to some extent, but it has kept its colour quite as well as could be expected after thirty years' exposure. The new specimens sent show an excellent slate, not too thin, and with a good sound metallic ring.

THE VAGARIES OF LIGHTNING.—At the monthly meeting of the Royal Meteorological Society on Wednesday evening, the 18th inst., at the Institution of Civil Engineers (Mr. R. Bentley, President, in the chair), Mr. Alfred Hands read a paper on "Some So-called Vagaries of Lightning Reproduced Experimentally." He said that lightning is an electric discharge, and as such it should act in accordance with the laws that are known to govern the subject. We have doubtless much to learn yet as regards electricity, but even though fresh facts and laws may be discovered, they can scarcely be in direct opposition to those already known, and therefore if an occurrence does not appear to accord with our knowledge, we should try and fathom the mystery, and not dismiss it as a vagary. The author, in the course of an extended investigation into the effects of lightning, has come across many cases that have been called vagaries, but which on a close inspection have proved to be but ordinary only in the erroneous way in which they were described, and had they been correctly reported would have appeared perfectly consistent with preconceived ideas—in fact, could have been foretold in every case if the conditions that led to those effects had been known before the events occurred. The author reproduced experimentally several so-called vagaries of lightning, showing by means of rough models the conditions under which they occurred.

Capital and Labour.

ABERDEEN PLUMBERS.—The operative plumbers of Aberdeen have submitted to the employers a proposed alteration of the by-laws affecting the trade. At present the hours are nine per day for eight months, and eight per day for the remaining four, or winter months. The suggestion is that the hours be eight per day all the year round, and the rate of pay 9*d.* per hour.

Patents of the Week.

APPLICATIONS PUBLISHED.*

2,003 of 1905.—R. LLOYD: *Hods as used in Building and like Apparatus.*

This relates to a metal connexion or frame for securing the shaft to the box of a hod, made out of sheet steel, the steel being first cut to a suitable shape so as to form a depending stem and arms and then bent or flanged round its edges so as to impart rigidity and strength.

7,280 of 1905.—M. WHITAKER and WHITAKER BROS., LTD.: *Excavating Apparatus.*

This relates to an excavating apparatus, consisting of a steam crane navy and a transporter,

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

combined, wherein the jib of the transporter is pivotally attached to the carriage of the navy and supported on a main pillar or frame adapted to run on a base rail.

16,319 of 1905.—H. McCANN: *Means for Moulding Concrete and like Walls or Parts of Buildings, Structures, or Foundations in situ.*

This relates to means for moulding concrete and like walls, or parts of buildings, structures, or foundations *in situ*, and consists of the arrangement of sets of box plates, each set comprising a plurality of plates connected together in alignment by connecting bolts or other fastenings, and means for holding the two sets together in parallel relation.

18,240 of 1905.—W. WARNER: *Machinery for the Manufacture of Paving Blocks, Slabs, and Tiles.* This relates to machinery for the manufacture of paving blocks, slabs, tiles, and any form of paving made from asphalt and town's refuse clinker, and consists in the use of hardened steel wearing plates riveted to the sides of the mould, and the use of ratchet gear and cooling trough in combination with the conveyor for cooling the blocks.

20,229 of 1905.—W. UWINS: *Drainage Gully and Interceptor.*

This relates to a gully or interceptor, comprising a trap of substantially U-shape and having an inlet adapted to be closed by a float in case of back flow, the arrangement of an enlarged chamber and well, whereby the float is guided and prevented from impeding the normal flow or from being washed into the outgo, while also minimising the risk of accumulation of soil behind the float.

20,237 of 1905.—F. MELLAUX: *Method for Imbedding Railway Rails in Concrete Asphalt Pavement or in any other Pavement Construction of Plastic Materials.*

This relates to a method of imbedding railway rails at the joints or other parts or in their entire length in asphalt pavement upon concrete or other pavement formed of plastic material, consisting in that recesses with smooth walls are formed on each side of the rails, and when filling the spaces under the rail head with wood blocks or the like, the said recesses are filled with blocks of concrete or the like, which reach up to the end side of the asphalt or other pavement which is then laid over such blocks up to the rail head.

5,872 of 1905.—L. A. DREYFUS: *A New Paint.*

This relates to a cold water paint composed of a basic material, binding or adhesive material, a non-volatile petroleum, and a volatile solvent of the petroleum, with or without colouring matter. These ingredients are placed in a mixer and thoroughly mixed into a homogeneous mass. They are then preferably brushed through a suitable sieve to produce a uniform and fine powdered product. This product, although not absolutely dry, is nevertheless such that it permanently maintains a substantially dry condition, so that it may be indefinitely stored, handled, and used, as well-known dry powdered paint compounds now are.

6,014 of 1905.—E. R. A. MATTHEWS: *Air Heating Arrangements for use in connexion with Domestic Fireplaces.*

This relates to a domestic fireplace, and consists in the combination with a "well" or "half-well" hearth, of an air heating box, arranged underneath the said hearth within the influence of the heat conducted therethrough, and having at its opposite ends an air inlet and an air outlet adapted to admit of the connexion thereto of air passages which are disposed outside the brick-work of the fireplace, so that both the box and its passages are isolated from direct contact with the fire, smoke, and products of combustion.

8,260 of 1905.—J. ECKERSLEY: *Window Sash Fastener and Lock.*

This relates to a window sash fastener and lock, wherein a locking arm pivoted to one sash is drawn across the sashes and passes over a catch plate attached to the other sash, and consists in the provision on the catch plate of a spring controlled tongue to engage with a notch in the locking arm and retain it until released by a key acting on the spring-controlled tongue, the locking arm having a slot across its width to engage the corresponding cross sectioned catch plate.

12,799 of 1905.—C. SNOWELL: *Sliding Bolts.*

This relates to a sliding bolt, and consists in the combination with a front plate, having guides and slot with recessed ends, of a bolt having at its rear end a central opening, slots or grooves formed therein, and a lever having crank pins formed thereon operating in said grooves.

13,419 of 1905.—E. T. HELME: *Doors of Chambers Employed for Hardening Bricks and the like.*

This relates to doors of chambers for hardening bricks and the like, and consists in the combination with the mouth of the chamber of a framework built up in parts, and consisting of two vertical plates at a suitable distance apart and

PATENTS.—Continued on page 449.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, —; Contracts, iv, vi, viii, x.; Public Appointments, xvii.; Auction Sales, xxvi. Certain conditions, beyond those given in the following information, are imposed in some cases, such as; the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

Competition.

MAY 5.—SUNDERLAND.—LIBRARY.—Sunderland Corporation invite competitive designs from architects practicing in the borough for a proposed branch library in Kayll-road. Preriums of £20 and £10 are offered for first and second designs respectively. Plans, etc., from Mr. John W. Moncur, Assoc. M.Inst.C.E., Borough Engineer, Town Hall, Designs are to be delivered, free of cost, at the office of the Borough Engineer, Town Hall, before 12 o'clock on noon, May 5.

Contracts.

BUILDING.

APRIL 20.—HAXBY.—VILLAS.—Two semi-detached villas at Haxby. Names to Messrs. Felgate & Hepworth, architects and surveyors, 3 Stonegate, York, on or before April 20.

APRIL 21.—LINCOLN.—PAVILION.—Lincoln Corporation are prepared to receive names of persons willing to tender for the erection of a shelter in connection with the Infectious Diseases Hospital, Long Leys-road. Quantities will be supplied to those persons sending in their names to Mr. R. A. MacBinar, City Surveyor, Corporation Offices, Silver-street, Lincoln, on or before April 21.

APRIL 23.—ALDINGBOM.—BRIDGE WORK.—East Ashford R.D.C. invite tenders for repairing a bridge in Oxchess-road, Aldingbom, and building a parapet wall to same. Plan and specification may be seen at the office of the Surveyor to the Council, Mr. T. W. Pugh, Kemington. Sealed tenders, endorsed "Tender for Bridge," to be addressed to the chairman and delivered at the Workhouse, Willesborough, by 9 a.m. on April 23.

APRIL 23.—DARLINGTON.—SHELTER.—Darlington Corporation invite tenders for the erection of a shelter at North Lodge Park. Forms, etc., on application to Mr. George Winter, Borough Surveyor, Town Hall, Darlington, endorsed "Tender for Shelter," to be sent to Mr. H. G. Stevenson, Town Clerk, not later than April 23.

APRIL 23.—WALSLEND.—GREENHOUSE.—The Corporation of Walslend invite tenders for the erection of a greenhouse in the Richardson Bees Park, Walslend. Particulars may be had on application to the Borough Surveyor, Mr. George Hillings, Corporation Offices, High-street, Walslend. Tenders to be delivered to Mr. W. V. McCasler, Town Clerk, Walslend, 28, Sandhill, Newcastle-upon-Tyne, marked "Tender for Greenhouse," on or before April 23.

APRIL 23.—WALSLEND.—CONVENIENCES.—The Northumberland C.C. Education Committee invite tenders for erecting boys' and girls' conveniences, boundary fencing, etc., in connection with a temporary iron building proposed to be erected at Westerhope, near Newcastle-upon-Tyne. Forms may be obtained from Mr. C. Williams, Secretary to the Education Committee, Pearl Buildings, Newcastle-upon-Tyne, and plans of the work can be inspected at the office of the Committee. Tenders, properly sealed and endorsed, must be forwarded to the Secretary, not later than April 23.

APRIL 24.—EAGLESCLIFFE.—SCHOOL.—Durham County Education Authority invite sole tenders for new Council school at Eaglescliffe Junction. Plans, etc., at the office of the architect, Mr. J. Sanderson, 134, High-street, Stockton-on-Tees. Sealed tenders, endorsed "Eaglescliffe Junction Council School—Tender," to be sent on or before April 24, addressed to the Secretary, Elementary Education Department, Shire Hall, Durham.

APRIL 24.—NEWTON ABBOT.—DRIVING CLOSET.—Newton Abbot Guardians invite tenders for the erection of a driving closet, adjoining the laundry at the workhouse, in accordance with plans and specifications, which may be seen at the office of Mr. Samuel Scar, F.I.A.S., Newton Abbot. Tenders to be sent to Mr. F. Horner, Clerk, Newton Abbot, marked "Tender," not later than April 24.

APRIL 24.—NORTHWOLD.—SCHOOL.—The Primitive Methodists of Northwold invite tenders for erecting a Sunday-school at Northwold. Plans and specifications may be seen at Mr. John Dye's, machinist, Northwold, or at Mr. Charles E. Clark's, Tether, Frywell-road, Methwold, Norfolk, marked "Tender," by April 24.

APRIL 24.—PENDLETON.—LODGE.—Salford Museum, Libraries, and Parks Committee invite tenders for the erection of a lodge at the recreation ground, Irlams-o'-th'-Height, Pendleton. Form, etc., on application to Messrs. Brimfield & Smith, architects, 23, Bridge-street, Manchester, upon depositing a cheque for 11 s. Tenders, endorsed "Lodge, Irlams-o'-th'-Height," and addressed to the Chairman of the Museum, Libraries, and Parks Committee, Town Hall, Salford, must be delivered at the office of Mr. L. C. Evans, Town Clerk, Town Hall, Salford, not later than 12 noon, April 24.

APRIL 24.—STOCKPORT.—STALLS.—For the erection of three stalls in the covered market, and for weather screens to enclose same from the streets, for the Memorial Tolls Committee. Plans, etc., may be seen and forms of tender obtained, on application to Mr. John Atkinson, A.M.I.C.E., Borough Surveyor, Stockport. Tenders, addressed the Borough Surveyor, Stockport, sealed and endorsed "Tender for Stalls in Covered Market," to be left at his office by noon on above date.

APRIL 25.—ABBEYLEIX.—ADDITIONS TO CONVENT.—Additions to the Bridgine Convent, Abbeyleix. Plans and specifications can be seen at the Convent, Abbeyleix, or at office of Messrs. William H. Byrne & Son, architects, 20, Suffolk-street, Dublin.

APRIL 25.—BLON.—BUSINESS PREMISES.—Estimates wanted for mason, carpenter, plumber, slater, plaster, and painter work in the erection of business premises in High-street, Eigin. Plans and specifications to be seen with Mr. R. B. Pratt, A.R.I.B.A., architect, 20, York Hall, Eigin. Bank-buildings, who will receive estimates on April 25.

* APRIL 25.—LONDON, S.W.—ENGINE BED AND FLOOR, and floor for the Metropolitan Borough of Fulham. Specifications, drawings, and form of tender may be obtained from the Borough Electrical and Consulting Engineer, Mr. J. H. Buxton, 11, St. Paul's Church, Tenders, addressed to Town Hall, Fulham, and endorsed "Tender for Contract T," be delivered at the Town Hall not later than 12 noon on Wednesday, April 25.

APRIL 25.—MINSHULL.—SCHOOL.—Alterations and additions to the school buildings, Church Minshull, near Middlewich. Plans and specifications may be seen at the office of Mr. H. Beswick, County Architect, Newgate-street, Chester. Quantities obtained on deposit of 11. Tenders to be sent to Mr. C. E. Spinks, Town Clerk, Education Office, Crewe, on or before April 25, endorsed "Tender for Works at Church Minshull."

APRIL 25.—PLYMOUTH.—ALTERATIONS, ETC.—Alterations and additions to licensed premises, Whimbolds-street, Plymouth. Plans and specifications and quantities may be obtained from Mr. T. Rogers Kilsell, A.R.I.B.A., George Street-chambers, Plymouth, on payment of 31 s. Sealed tenders must be delivered before 12 o'clock noon on April 25.

APRIL 25.—PROSEY.—ADDITIONS.—Erection of additions to Priestley Mill, Pudsey, for Mr. Samuel Corbridge. Plans may be seen and quantities obtained at office of Mr. Wm. Rhodes Nunn, architect and engineer, Market-street, Bingley.

APRIL 25.—SAYON.—ADDITIONS, ETC.—Mason, carpenter, slater, and plaster work of additions and alterations to the parish church at Sayon. The architect will meet masons at the church on Saturday, April 22, at 11 o'clock. Plans and specifications may be seen with Mr. Pentre, architect, Haddo House; and sealed tenders to be lodged with him on or before April 25 at 10 a.m.

APRIL 25.—STONOROUGH.—CORRIDGES.—For the erection of a row of cottages at St. Leonard's. Plans, etc., at office of Mr. W. Cooke, architect, 10, North-street, Wareham. Tenders to be sent to architect, sealed and endorsed, not later than April 25.

APRIL 25.—SALISBURY.—A house on the new road, Britford-road, Salisbury. Plans etc., at the offices of Messrs. John Harding & Son, architects, 58, High-street, Salisbury. Estimates are to be sent in before 4 p.m. on April 25.

APRIL 27.—TROYNAY.—HORSES.—The erection of fifteen houses at Tynbydd-terrace, Trocyrch, Rhondda Valley, for Messrs. Davies & Morgan. Plans, etc., at office of Mr. W. D. Morgan, M.S.A., architect, Victoria-chambers, Cardiff. Sealed and endorsed tenders to be in before noon, April 27.

APRIL 28.—BINGLEY.—MILL.—Erection of a mill at Bingley. Contractors can obtain quantities and inspect the plans and specifications at the offices of Messrs. Samuel Jackson & Son, architects, valuers, and engineers, 11, Tanfield-chambers, Bradford, from April 21 to April 28.

APRIL 28.—HENGVED.—CHAPEL.—Erection of a new English Baptist chapel at Hengved. Plans and specifications can be seen at the office of Mr. Geo. Kenstole, architect and surveyor, 11, New-road, Bangor. Tenders to be sent to Mr. Arthur Morgan Brooklands, Maescywanmor, on or before April 28.

APRIL 28.—MAESTEC.—REBUILDING.—Rebuilding the following public-houses for Mr. E. Evans Bevan, Nenth:—(1) Traveller's Rest, with stables, Nantyllyn, Maestec; (2) Farmer's Arms, Commercial-street, Maestec; (3) Crown, 11, New-bridge-road, Maestec. Plans at the office of Mr. J. Cook Rees, architect, St. Thomas-chambers, Nenth, on payment of 11. Sealed tenders to be sent in not later than April 28, endorsed "Tender."

APRIL 28.—RABON.—REPAIRING TOWER.—Repairing and repainting of the tower, and for sundry repairs to the walls and roof of the church, specifications may be obtained from Mr. Stewart Dufosse, architect, Kington, Herefordshire. Tenders must be sent under cover, marked "Tender," addressed to the Rector, New Radnor.

APRIL 28.—TYOWELLOG.—SCHOOL, ETC.—For new Council school at Tyowellog, near Pwllheli. Conditions and alterations to Llidardun Council School; new master's house at Rhye Council School. Plans etc., to be seen at the office of Mr. How Lloyd Jones, County Architect, 7, New-street, Pwllheli. Sealed tenders (separately) endorsed "Tender for School" to Mr. E. R. Davies, Secretary of Education, Carmarvon, by 10 a.m. on April 28.

APRIL 30.—BERNSIDE.—CURB.—Arch.—Taking down and rebuilding a portion of existing arch of the Ladyburn at the foot of Bishopgate, Burnside, Curragh, Form, etc., from Messrs. Bruce, Prinflood. The tender to be delivered in a sealed cover to Mr. J. L. Anderson, Town Clerk, Town Clerk's Office, Curragh, and marked "Tender for Ladyburn Covering," by 11 o'clock on the morning of April 30.

APRIL 30.—LEEDS.—GREENHOUSES.—Four ranges of greenhouses and the hot-water heating to same, also bricklayers and concretors work to same at Leeds Union Workhouse, Beckett-street, Leeds. Names to the architects, Messrs. Thomas White & Sons, 34, Albion-street, Leeds, not later than 12 noon on above date. Quantities and particulars will be duly forwarded.

APRIL 30.—LIVERICK.—SCHOOLS.—For erection of the Gerald Griffin Memorial Schools at Bridge-street, Liverick, from plans and estimating the present Christian Brothers' Schools. Plans prepared by Mr. Joseph O'Malley, B.E., architect, may be seen with the Rev. Br. M. A. Nolan, Sexton-street Schools, at Mr. Francis Hooley, Town Clerk. Tenders to be lodged by 12 noon on April 30 with the Rev. Superior.

APRIL 30.—NEW SAREM.—DEPOT.—Town Council invite tenders for alterations to a highway depot in Friary-lane, Form, etc., at the office of Mr. W. J. Survery, Endless-street, Salisbury, on payment of 11. Sealed tenders, endorsed "Highway Depot," must be sent to Mr. Francis Hooley, Town Clerk, Municipal Offices, Salisbury, on or before April 30.

MAY 1.—KINGSBIE.—VILLA.—Mason, carpenter, slater, plaster, plumber, and glazier and painter works of villa to be erected at Kingsbie, near the offices of London. Plans and specifications to be seen with Messrs. D. & J. B. McMillan, architects, 105, Crown-street, Aberdeen. Plans and specifications also seen with Mr. Mackenzie, architect, Kingsbie. Offers to be lodged with Messrs. McMillan, not later than May 1.

* MAY 1.—LEEK.—EXTENSIONS.—The Leek U.D.C. invite tenders for extensions to the retort house at Leek, Leek, on payment of 11 s. Sealed tenders, to be delivered to the Chairman of Leek Extension, and addressed delivered to the above-mentioned before noon, May 1.

MAY 1.—TASPOOL.—ENNSKILLEN.—SCHOOL.—Tenders will be received by the Rev. C. Halahan, Rector, Restory, Ennskillen, on or before May 1, for the erection of the proposed Jones Memorial School, at Lisnole, according to drawings and specifications to be seen at the office of Mr. Thos. Elliott, architect, 37, Darvel-street, Banickhill.

* MAY 1.—LONDON, N.E.—SCHOOL.—Enlarging and improving Kingsland Secondary School, Colvestones and Sneinton, N.E., for the L.C.C. Draw quantities and forms of tender, on inspected, hills of Education Offices, Architects' Department, Victoria, on payment of 11 s. Tenders (with the provision) to be enclosed in envelopes marked "Tender," to be delivered at above offices (Room 149), not later than 11 a.m. on Tuesday, May 1.

MAY 2.—TOLNES.—POOR-HOUSE.—Tolnes Guardians invite tenders for the erection of a board-room and offices at Tolnes. Plans, etc., obtained on

payment of 2l. 2s. at the office of the architect, Mr. W. F. Tolth, 10, High-street, Totnes, between the hours of 10 a.m. and 4 p.m., except on Thursdays. Tenders to be sent to the architect, Clerk, 15, High-street, Totnes, on or before May 2.

MAY 3.—SUNDERLAND.—HOUSE.—Sunderland Corporation invite tenders for the erection of caretaker's house in connexion with Harrison Buildings, Station-roads, Sunderland. Plans, and form of contract, to be delivered at the Town Clerk's Office, Town Hall, before 12 o'clock noon on May 3.

MAY 3.—WETTERAL.—HOUSE.—Excavating, brick-laying, masonry, slating and plastering required in the erection of a house at Wetteral, for Mr. John Dalton. Plans, etc., at offices of Mr. J. H. Martindale, F.R.I.B.A., architect, Eaglesfield Abbey Rooms, Castle-street, Carlisle, during office hours from 12.30 to 2.30 p.m. 5. Tenders to be sent enclosed.

MAY 4.—SHELTON AND HARDWICK.—SCHOOL. ENLARGEMENT.—Enlargement of the Shelton and Hardwick School, for the Rev. G. B. Scott, architect, Castle Meadow, Norwich, where plans, etc., can be inspected and bills of quantities obtained on and after April 23. A deposit of 1l. will be required. Tenders received by 12 noon on May 4, addressed to the Secretary, Norfolk Education Committee, 57, London-street, Norwich, and endorsed "Tender for Shelton and Hardwick School."

MAY 4.—CHURCH.—REPAIRING FLOOR FOR THE GUARDIANS OF THE POOR, CHELSA. at their workhouse. Drawings, etc., to be seen between the hours of 10 and 4 (Saturdays till 4) between April 23 and 29 at the office of the Clerk, Guardians' Office, 250, King's-road, Chelsea, not later than 12 noon on Tuesday, May 8.

MAY 8.—WEST HAM.—WHARF WALL.—Construction of new wharf wall on the Channelsea river at Sewage Pumping Station, Abbey-road, West Ham. Plans and specification may be seen at the office of the Borough Engineer, Town Hall, West Ham, upon deposit of 1l. The contractor is required to enter into a bond with two sureties for due performance of contract, and must not underlet or make a sub-contract. Tenders, endorsed "Tender for New Wharf Wall, etc.," to be delivered at the office of the Engineer, West Ham, not later than 4 o'clock on Tuesday, May 8.

MAY 10.—ROXTON.—SCHOOL.—Lancashire Education Committee invite tenders for the erection of a new public elementary school at Roughton, near Oxley, near Oldham. The plans may be seen, and bills of quantities obtained, at the office of the County Architect, Mr. Henry Litter, 16, Ribblesdale-place, Preston, by payment of a deposit of 2l. Tenders must be delivered before 12 o'clock noon on May 10, sealed and endorsed, to Mr. J. W. Kiley, Town Hall, Roxton.

MAY 12.—HEADINGTON.—SCHOOL.—Oxfordshire Education Committee invite tenders for the erection of a new provided school at Headington, in accordance with drawings and specification prepared by the architect, Mr. G. B. Blalberwick, City Chambers, South Parade, Nottingham. Plans and specification may be seen at either the offices of the architect, or of Mr. Sidney Stallard, County Surveyor, 3, New-road, Oxford, and bills of quantities and form of tender obtained from the latter on payment of 1l. 1s. Tenders must be delivered before 12 o'clock noon on May 12, addressed to the Secretary, Education Committee, County Hall, Oxford, and endorsed "Tender for Headington School."

MAY 14.—LONDON, S.W.—BATHS.—Erection of baths at the Broadway. Tooting, for the Wandsworth Borough Council. Drawings, specification, and bill of quantities may be seen, form of tender and copy of bills of quantities obtained, at the Council House, East Hill, Wandsworth, between 10 and 4 o'clock on Monday, 12 and 19. Tenders, endorsed "Tooting Baths, Building," or "Tooting Baths, Engineering," as the case may be, with priced bills of quantities, in separate envelope, to be delivered at above address not later than 3 o'clock on Monday, May 14.

MAY 15.—BILBERRIE.—INFIRMARY.—Wigan Guardians invite tenders for the erecting and completion of proposed workhouse infirmary and other buildings and works, in the township of Billinge, near Wigan. Drawings may be inspected, and limited copies of bills of quantities and conditions of contract obtained, according to priority of application, from the architects, Messrs. Heaton, Ralph, & Heaton, Wigan, on payment of 1l. Tenders, endorsed "Wigan Infirmary," to be delivered to Mr. Henry Ackerley, Clerk, 9, Victoria-buildings, King-street, Wigan, not later than May 15.

Cook, Clerk, Council Offices, 9, Carlisle, Horsham, Sussex, before 12 noon on May 14.

* MAY 15.—LONDON.—Alteration of date for receiving tenders for paving works by the Corporation of London, from April 25 to May 15.

STONE, MATERIALS, AND STORES.

APRIL 23.—TONBRIDGE.—GRANITE.—Tonbridge U.D.C. invite tenders for the supply of granite curbstones. Forms of tender, etc., on application to Mr. W. Laurence Bradley, C.E., the Council's Surveyor, at the office of Tonbridge Castle, Kent. Sealed tenders, accompanied by samples (carriage paid), are to be delivered before noon on April 23.

APRIL 25.—WISHAW.—WIRE METAL.—1,500 tons of metal for the year from 15 to 15 next. Contractors wishing to tender to obtain copies of the specification and schedules by applying to Mr. William Rodger, Borough Surveyor, Wishaw. Offers may be received by Mr. J. Logan, Town Clerk, Wishaw, till April 25.

APRIL 24.—DESBOROUGH.—GRANITE.—Desborough U.D.C. invite tenders for the supply of about 300 tons of granite, delivered at Desborough Station. Plans and specifications may be seen at the office of Mr. D. J. Diver, Surveyor, to whom samples are to be sent. Tenders to be delivered in the office of the Surveyor on or before April 24, endorsed "Tenders for Granite."

April 25.—**CANNOCK.—TOOLS, ETC.**—Cannock R.D.C. invite tenders for the undermentioned articles for the year ending March 31, 1907:—(1) Roadmen's tools; (2) oil and waste; (3) Forage for horses; (4) disinfectants. Form of tender for Nos. 1, 2, and 3 may be obtained on application to Mr. H. M. Whitehead, District Surveyor, Penkridge. Form of tender for No. 4 may be obtained on application to Mr. T. F. Pickering, Sanitary Inspector, Oxley-place, Rushbury lane, Wolverhampton. Tenders must reach Mr. A. W. Carver, Clerk to the Council, Union Offices, Cannock, on or before Monday, April 25.

April 25.—**IRIAM.—MATERIALS.**—Irdium U.D.C. invite tenders for the following materials for the year ending March 31, 1907:—Broken granite macadam, limestone macadam and chippings, cinders and copper slag; also a water cart and road-sweeping machine. The Council also invite tenders for reaving, etc. (labour only), and hire of steam-roller. Form of tender and any further information may be obtained from Joseph Cooke, Clerk to the Council, Council Offices, Irdium, to whom tenders must be sent on or before noon on April 25.

April 25.—**HULL OILS.**—Kingsdown-upon-Hull Electric Lighting Committee invite tenders for the supply of machinery oils for their electricity works and sub-stations during the ensuing twelve months. Tenders may be obtained at the offices, Solicitors, Lane Works, where samples of the oils may be seen. Tenders, endorsed "Oils, Electricity Department," are to be sent in to the Chairman of the Electric Lighting Committee, Town Hall, Hull, not later than noon on April 25.

April 25.—**KINGSBRIDGE.—STONE, ETC.**—Kingsbridge R.D.C. invite tenders for the supply of:—100 cubic yds. unbroken limestones, delivered at Kingsbridge Quay; 60 cubic yds. broken limestones, and 60 cubic yds. limestone quartering, delivered at Embankment Bridge or Fegmore; 50 cubic yds. granite delivered at Kingsbridge Station; 200 cubic yds. broken trevillard or forder stones; and 100 cubic yds. trevillard or forder chippings, for use on the main roads in this rural district during the year ending March 31, 1907. Tenders for the limestones and flints must state the price delivered

as above, and for the trevillard or forder stones and chippings to state the price delivered at (a) Fegmore, (b) Embankment Bridge, (c) Salcombe, and (d) Kingsbridge. The prices quoted must in each case include the quay dues where such are payable. Further particulars may be obtained on application to Mr. William Beer, Clerk, Kingsbridge, to whom sealed tenders are to be sent on or before April 25.

April 25.—**DARWEN.—STONES.**—Darwen Gas Committee invite tenders for the supply of the following goods for one year:—Benzol, wrought-iron tubes and fittings; cast-iron mains and specials. Full particulars and forms of tender may be obtained on application to Mr. A. H. Smith, Gas Engineer, Darwen. Sealed and endorsed tenders must be delivered to Mr. William P. Halliwell, Town Clerk, Town Clerk's Office, Darwen, not later than April 25.

April 30.—**EDMONTON.—STONEWARE PIPES.**—Edmonton U.D.C. invite tenders for the supply and delivery of the undermentioned stoneware pipes during the period ending September 30, 1906:—50 lb in., 500 lb in., 500 lb in., 1,000 lb in., 1,000 lb in., 1,500 lb in., or more or less by the full truck load. Forms of tender may be obtained on application to Mr. G. E. Ebdish, Engineer to the Council, Town Hall, Edmonton. Persons tendering are requested to quote net prices without trade discounts. Sealed tenders (which must be upon the form supplied by the Council's Engineer), marked "Tender for Stoneware Pipes," to be delivered at office of Mr. Wm. Francis Payne, Clerk to the Council, Town Hall, Edmonton, not later than 12 o'clock noon on April 30.

May 1.—**BRENTFORD.—GRANITE SPALLS.**—Brentford Guardians invite tenders for the supply and delivery of 500 tons of best burnt Guesery granite spalls, 250 tons to be delivered forthwith. Forms may be obtained upon application, and tenders, upon such terms, must reach Mr. William Stephens, Clerk in the Guardians, Union Offices, Isleworth, W., not later than 4 P.M. on May 1.

May 1.—**KEPPELHURD.—ROAD MATERIALS.**—KEPPELHURD R.D.C. invite tenders at per yard for 300 yds. of clean hand-picked surface flints, unbroken, 650 yds. of 2 in. and 50 yds. of 3 in. quartzite Guesery

granite, or Mendip (at the discretion of the Council); 50 tons of Portland gravel, delivered in quantities as ordered, carriage paid to Uckfield Railway Station, by October 1, 1906. Payment will be made by instalments. Forms of tender to be obtained on application at the offices of the Council. Tenders, with samples, to be sent to Mr. Charles Dawson, Clerk to the Council, at the office of the Council on or before May 1, marked "Tenders for Road Material."

May 2.—**HOVE.—FLINTS.**—Hove Corporation invite tenders for supplying about 5,000 cubic yds. of Combe rock flints, to be delivered during the coming twelve months. They may be tendered for in parcels of not less than 200 cubic yds. each. Further particulars at the office of the Borough Surveyor, Mr. H. H. Scott. Tenders on forms supplied, addressed to Mr. H. Endicott, Town Clerk, Town Hall, Hove, and endorsed "Tender for Combe Rock Flints," will be received up to 6 o'clock on May 2.

May 3.—**LONDON.—STONES.**—Great Indian Peninsula Railway Company directors invite tenders for the supply of the following stores, namely:—Stationery, etc.; wrought-iron hinges. Specifications and forms of tender may be obtained at the office of Mr. J. I. Berry, Secretary, Company's Offices, 48, Copthall-avenue, E.C. on payment of the fee for the specification, which payment will not be returned. Tenders must be delivered in sealed envelopes, marked "Tender for Stationery, etc.," or as the case may be, not later than 11 o'clock a.m. on May 3.

May 3.—**RICHMOND.—STONES.**—Richmond Main Sewerage Board invite tenders for the supply of the following stores required at their works, Key Gardens, during the year ending May 31, 1907:—Buxton lime; grey lime; sulphate of alumina and green sulphate; filter cloth. Specifications and form of tender on application at the office of the Engineer to the Board, West Hill-road, Key Gardens, S.W., on payment of 10s. for each specification. Sealed tenders, on the forms supplied by the Board, to be delivered to Mr. J. Leslie G. Powell, Clerk to the Board, The Sessions House, Richmond, Surrey, on or before May 3.

PATENTS.—Continued from page 445.

having a hole formed in each plate of a similar size and contour as the mouth of the chamber, the space between the said plates being closed, except at the top, by a distance piece slanted to the contour of the plates, a lid hinged to one of the plates for closing the top of the space, and held in position by bridges and bolts, a grooved seating formed on the inner surface of the outer plate for receiving the turned edges of a concavo-convex dished door employed for closing the space between the outer plate, and means consisting of hinged guides and eye bolts for temporarily holding the door in the grooved seating in the said space until it can be retained therein by the pressure of the steam within the chamber which is employed for hardening purposes.

13,691 of 1905.—F. MORTON and E. J. WHITEWOOD: *Spring Floors.*
This relates to spring floors. The floors are laid in any convenient manner on joists supported by lines of girders, each line of girder being divided into suitable lengths which abut together with a small space in between to allow for play, and are supported at each junction by a spring fitting, consisting of two metal casings, each containing a steel spiral spring. These casings are attached to the girders by means of horizontal bolts, two of which pass through each girder, one above and the other, the lower holes in the girders being suitably slotted so that when pressure occurs at the point of junction of the girders, the lower bolts will have sufficient play to slide in.

16,990 of 1905.—E. T. JOHN: *Locks or Latches.*
This relates to locks or latches, and consists essentially in the employment of a pivoted lever

for retracting the bolt, this lever being adapted to be pivoted above or below the bolt and to be reversed from the one position to the other, so that the lock or catch may be employed for either a right hand or left hand door, without the necessity of removing the locking bolt or other interior fittings.

22,810 of 1905.—A. CURWOOD: *Means for Balancing and Fastening Window Sashes.*
This relates to windows of the type wherein the sashes are provided with racks adapted to engage the sides and are counter-balanced by weights on the racks adapted to engage such pins on the opposite sides. The sashes are locked in any desired position by causing keys to engage the teeth of the pinions and thereby prevent rotation thereof.

24,527 of 1905.—C. EHRHARD: *Collapsible Frame Houses, Folding Tents, or the like.*
This relates to a collapsible frame house or folding tent, the sides and roof of which are separate and comprise detachable and collapsible or folding frames upon which a covering is supported, the relation of roof frame to the side frames being such as to leave ample space for ventilation and the structure being self-contained when erect.

24,535 of 1905.—J. J. HAROLD: *Metallic Piles.*
This relates to a metallic piling, and consists of a beam section comprising a plate provided with a flange at the outer edge of one side, a locking angle rigidly mounted on the same side and located adjacent to the opposite edge, said plate extending beyond the line of the free hook edge

of said locking angle, the best round hook edge of said locking angle being set at an angle preferably less than a right angle.

25,935 of 1905.—E. E. BURTON: *A Decoration for Panels and other Surfaces.*
This relates to a decoration for panels, walls, and other surfaces, and consists in the application to the backgrounds of prepared pieces of leather of any desired configuration, having their surfaces and edges shaded by burning and subsequently coloured, said pieces of leather each having a bevelled edge for attaching it by an adhesive substance to the background and to cause said pieces of leather to assume a natural and realistic angle.

733 of 1906.—W. J. THOMAS: *Chimney and Ventilating Shaft Tops.*
This relates to a chimney pot with four holes or open spaces of an oval shape made therein in four directions, north, south, east, and west, or the variants in an upward direction just above the ring at the base thereof, and four similar holes or open spaces in an upward direction made therein under the ring near the top thereof.

1,125 of 1906.—G. H. DORKEN: *Shelf Brackets.*
This relates to a shelf bracket, consisting of a blank, said blank containing a material for a vertical shank, a horizontal brace, and a middle strengthening rib which are folded in such a manner that the vertical and horizontal shanks stand symmetrically and the middle rib are formed of double sheets and a tong projecting from the vertical shank, said tong being folded and embraced by the material of the horizontal shank in order to strengthen the corner.

5,947 of 1905: W. FULLARD: Boring Tools.

This relates to a boring tool for use with excavating machines, comprising a rod having a screw thread thereon and a movable cap portion carrying a screw thread of increasing pitch, said screw thread being provided with pins, in combination with a surrounding tube having an enlarged extension.

6,325 of 1905.—E. C. POOLE: Method of Constructing Armoured or Reinforced Concrete Work and Erecting same.

This relates to armoured or reinforced concrete work, and consists in the method of constructing slabs, or blocks of reinforced concrete by placing and bedding the iron or steel bars in a continuous diagonal alternating direction arranged to cross or cross and re-cross the body of the slab, piece, or block in any direction and leave the bed of the bar projecting from the edge or edges of the slab or piece to form loops or eyes by which the adjacent or assembled slabs or pieces may be connected together by a continuous or other iron or steel bar, so as to form a monolithic whole.

19,579 of 1905.—J. MOORE: Laying of Subsoil, Drain, or Sewer Pipes.

This relates to the laying of subsoil, drain, or sewer pipes, and consists in the use of a shallow circular trough or support of large diameter as compared with that of the pipes which rest in arched recesses in the wall of said trough or support.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

Table listing various property sales including Bedford, Greystones, Fulham, St. John's Wood, Peckham, Putney, Stoke Newington, Forest Hill, Whipsnade, Berry-st., Canonbury, Tottenham, Weybridge, Stamford Hill, Ravenside, Rookwood, and Leabourne.

San Francisco.

HERE is a strange irony of events in the fact that during the two years preceding the terrible disaster which has just devastated San Francisco, an elaborate scheme for the improvement and laying out of the city on new lines had been in process of development under the hands of an eminent American architect, and his Report and plans were completed and laid before the city authorities just six months ago. The scheme contemplated a complete re-adjustment of the main lines of thoroughfare and vista, and a gradual rebuilding of the city on a great scale, such as could only be carried out little by little, dealing with one portion of the city at a time. The relentless forces of Nature have at all events cleared the way for the improver. One is reminded of the Great Fire of London which was the opportunity for improved building, new lines of streets, and the erection of a great cathedral and a number of churches at the hands of one of the greatest architects whom this country has produced. Unhappily the opportunity for a new London, in the way of alignment of streets and the working out of a more dignified and centralised plan, was in great measure wasted through want of energy and of large ideas on the part of the authorities. It does not seem likely that this mistake, at all events, will be made in San Francisco. The plan for an improved San Francisco is ready in advance, and we are assured that there is every intention of rising above misfortune, and of making this calamity the opportunity

for rebuilding the city according to the most approved ideas of plan and construction. If it be thought that it is foolhardy to set about rebuilding a city on a spot which has been thus visited by earthquake in its most appalling form, we may cite the instance of Lisbon, which was nearly destroyed by a similar calamity just a century and a half ago, but has remained unscathed since. But there is a more rational ground of confidence to be recognised. We now learn that the steel-framed structures carried out on the modern and peculiarly American system which we have not been accustomed to view with much favour, have at all events shown that they are fairly proof against earthquake—the best and most valuable quality which we have yet heard of in connexion with them. They are reported to be almost intact, even in the case of a building which was not quite completed, the owner of which expects to be letting offices in it in a few days. The discovery that such structures will withstand an earthquake that overthrew every other kind of building (unless the Mint, mentioned by a correspondent on another page, is an exception) is one of great importance, and teaches a lesson which is not likely to be overlooked.

There seems to have been an impression that the magnitude of the disaster was in great measure owing to the presence of a considerable proportion of wooden buildings—what are called in America "frame houses"—in the city, and that San Francisco has paid dearly for overlooking the object lesson furnished by the fire which, within the memory of many of our readers, made such fearful havoc of the old wooden-built city of Chicago. This would of course be only as regards the fires that followed the earthquake;

for, apart from that danger, we should expect to find that wooden-framed houses would resist earthquake shock a great deal better than those built of ordinary brick and stone walling. But that San Francisco has been careless and indifferent in regard to the danger of extensive wooden building in a great city appears to be quite a misapprehension. On the contrary, the matter has been for some time past the subject of special building regulations carried out in a thorough spirit of reform; and from the following information, which may be relied on, it will be seen that, though it was not possible to do everything at once, the San Francisco authorities have for some years back been proceeding vigorously and systematically towards the removal of this source of danger.

Under the charter of 1898, drafted by twenty-five freeholders comprising the foremost practical business men and lawyers in the metropolis, San Francisco's building and fire ordinances underwent drastic changes. A Buildings Department, supervised by the City Architect; the Department of Electricity; and the San Francisco Fire Department, all co-operated to insure the highest degree of safety when permits for building or repairing structures were petitioned for. Having in mind the necessity for reducing the possibility of conflagrations to a minimum, the Building Ordinance of 1901 revolutionised all previous enactments having for their *raison d'être* the immunity of the city from fires.

The "fire limits" were extended, and each time a petition for repairs came before the Buildings Department the premises desired to be altered were inspected by the Buildings Inspector, under the advice and with the co-operation of the Fire Department; and so rigorous was the campaign waged against the

maintenance of unsafe wooden buildings within the fire limits, that in the majority of cases these were ordered to be dismantled, and modern fire-resisting structures took their places. The Merchants' Association submitted a Sign Ordinance in 1901, which was adopted. This did away entirely with swinging signs, except in cases wherein the signs were so arranged as to swing over the footway at night, when they were lettered in incandescent lights, and required to be lighted until past midnight. All other signs were required to be placed at least 8 ft. above the kerb line and not to project over the freehold line for a distance of more than 6 in. at that height, and not more than 12 in. when affixed to the building at a height of at least 12 ft. above the kerb line. Within a year after the passing of this Sign Ordinance one might have looked down Market-street from the City Hall to the Ferry without noting one offending projection athwart the line of vision.

The Building Ordinance provided, as to the fire limits, that all repairs to buildings originally constructed of inflammable materials, should be carried out by the use of fire-resisting materials; and where new structures were petitioned for, the buildings must be of brick or stone, the roofs to be sheathed in corrugated steel or tiles. For districts within and without the fire limits, every detail of the proposed structure was submitted to the City Architect, who examined the plans personally, and passed his recommendation

or refusal up to the Board of Public Works, which sat weekly. The petitioner, in case of refusal of the City Architect to recommend issuing of a permit, might have appealed in person to the Board, whose mandates were final and unalterable. Theatres were reconstructed so as to provide a large number of exits, and overcrowding was punished severely. Fire escapes of wrought-iron were attached to all buildings of two or more stories within the fire limits; and all doors and apertures in the buildings of mercantile and wholesale districts were shuttered in steel while the occupants were away. As in other American cities, the housekeeper is unknown in San Francisco, at least in buildings devoted to the conduct of business.

The San Francisco Fire Department was one of the city's glories; under the direction of Chief Sullivan it had reached a condition of efficiency hardly to be exceeded. Its members were required to pass physical and athletic tests which made its *personnel* second to none of the world's fire-fighters; and it is safe to say that had the late earthquake not broken the water-mains, little of the damage which has appalled the civilised world would have been done.

The era of wooden building in San Francisco, at least within the fire limits, has passed away. The steel and stone structure has nobly justified its existence, and the municipal authorities, we are assured, in taking measures for superintending the building of a

new San Francisco, will stand for stone and iron with one voice. Elasticity is a saving factor, and in steel we have a material that should enable structural engineers to provide an almost certain safeguard against future ruin of the city by earthquake. But if safety against fire is to be secured the steel framework must be protected by fire-resisting material attached so that it cannot be shaken off or even displaced. Terra-cotta tiles and similar refractory materials cannot easily be fixed to steel so as to comply with these conditions, and it is probable that, in virtue of its elasticity and cohesion, carefully-designed concrete-steel or concrete-cased steel construction would be found the most suitable for resisting earthquake and fire.

The general aspect of the streets of what must now be called Old San Francisco is indicated in the two subjoined sketches by Mr. Chidson, showing Market-street and Post-street. The former was, and under the new laying out will still be, one of the principal thoroughfares of the city, though it is a diagonal in reference to the most general direction of the street lines. According to the proposed plan it is to start from a crescent at the wharf in San Francisco Bay, culminating in a kind of circus at the foot of Twin Peaks Hill, the peaks of which are in a line almost on the axis of the street (one of the peaks is seen at end of Mr. Chidson's sketch of the then existing street). Halfway along its course a crescent-shaped *place* is to

Market-street, San Francisco, Looking South-West (Twin Peaks Hill in the distance) From a Sketch by Mr. C. R. Chidson.

open out from the street on its north-western side, which forms the starting-point for a great boulevard which is to branch out due west and conduct to the long narrow ornamental park which runs down to the western shore of the city. For San Francisco enjoys the advantage of having a sea front on three sides, north, east, and west; as at New York, the land transit access is rather restricted by this position, but the three-fold sea aspect undoubtedly makes for

hygienic conditions. According to the rule which holds good, no one knows exactly why, in almost all large cities, the western is the best residential side; the eastern margin has the quays and docks and is, we presume, the portion of the city referred to in *The Wrecker* as "the front." The city has several picturesque hills on its borders, or in one or two places almost within the city itself, and the treatment of these counts for something in the new scheme of laying out.

About two years ago the "Association for the Improvement and Adornment of San Francisco" issued a circular letter pointing out that San Francisco had suffered (like many other modern cities, we may add) from the want of a comprehensive plan which would be a guide in laying out new parks and streets, and suggesting that the construction of a boulevard round the shore, the position of public buildings so as to produce the best effect, and other minor matters

From a Sketch by Mr. C. R. Chidson.

bearing on the general appearance of a city, required consideration. Subsequently they invited a well-known American architect, Mr. Burnham, to draw out a regular scheme for the improvement of the city, and a studio was built for him on the slope of Twin Peaks, where he and his assistants occupied themselves for sixteen months on the plans, for the execution of which fate seems now in so terribly dramatic a manner to have cleared the ground, as if by previous arrangement.

A good American architect of course goes to Paris, not only when he dies, but in search of ideas while he is living. and Mr. Burnham introduces, as a key to his leading idea, a kind of skeleton plan of the system of laying out of Paris, which he reduces to the idea of three concentric elliptical main lines crossed by diagonals from the centre to the circumference. This ideal plan, however, can neither be said to represent Paris as a whole, nor is it as a whole represented in the new San Francisco plan. We have the diagonal streets and the exterior surrounding boulevard, but not the inner concentric lines; the main portions of the plan represent the scheme which seems to be such a favourite one in the artificially planned American cities, of a kind of gridiron of parallel streets and blocks, with other streets crossing at right angles, and penetrated at various points by diagonal streets, which generally begin and end in some kind of open space, larger or smaller. There is something to be said for this system of diagonals, in regard to locomotion; it has the geometrical merit that the hypotenuse is always shorter than the sum of the two other sides of a triangle. Has it any other merit? We rather doubt it. To the stranger in the city, these diagonal routes are puzzling in reference to direction; to the resident and the owner of building property they mean that a very large number of the buildings in the city are cut into triangular shapes equally inconvenient for the architect to plan or for the tenant to inhabit. Judging from some of the extraordinary and portentous-looking angle blocks ("gores" seems to be the name for them in Mr. Burnham's Report), illustrations of which come to us from across the water, it would seem that American architects find a certain diversion in the treatment of high three-cornered buildings with acute angles. Perhaps one may get used to anything; but to the European eye these are, and we hope will always remain, somewhat in the light of architectural monstrosities; and it is possible that the public of American cities, who have to see them and, if not to live, to do business in them, may get tired of them before long. We should certainly recommend, in the plan of the new San Francisco, a reconsideration of this system of diagonals, which is very well in a suburban neighbourhood among houses with plenty of ground round them, but involves a great deal of inconvenience in the manner in which it affects the sites for city buildings. After all, to get from one part to another by the shortest possible route is not everything in city life.

In other respects Mr. Burnham's scheme is a fine one. He makes the

most of the hills. He proposes to leave the tops of them as far as possible unbuild on, and to surround them with two or three zone roads with terraces, communicating by roads up the gradients of the hill, where not too steep. Where they are, it would be a good plan to have a spiral road winding up; we do not notice that this is suggested. In the flat portions of the city it is suggested that a great charm may be added to certain quarters by the elimination of some of the streets in the monotonous system of blocks, and the substitution of a chain of parklike squares, formed in a measure by the un-used or misused back areas. He observes that "the isolated square of the Old World, unless maintained by wealthy residents, is a quiet, almost desolate spot seldom feeling the throb of life. The chain is suggested to obviate this, and induce a current of life to flow agreeably from end to end, to the exclusion of unnecessary vehicles, thus leaving the main traffic to the intermediate streets." This is an idea very characteristic of the restlessness of the American temperament, which seems rather to eschew repose. In London it is this very quiet of some of the squares which are not general thoroughfares which is attractive to many residents, and is felt as rather an advantage than the reverse. Another sentiment in the Report will meet probably with general approval: "The first step in civic improvement should be towards ideal streets, faultless in equipment and immaculately clean. Until this is taken, monuments and statues are out of place; men and events can be much more effectually commemorated by street improvements." It is partly no doubt with this view of rendering the streets pleasanter in appearance that it is proposed that the diagonal arteries should be provided with an underground service of cars, the excavations for which could be made at the same time that the streets are constructed. It would seem then that these diagonal arteries are an entirely new feature; we have already commented on the drawbacks to them, but we admit that the opportunity of creating an underground traffic line would form their best excuse.

Mr. Burnham proposes to increase considerably the extent of public parks in and around San Francisco, forming as far as possible a chain of parks on the outskirts. He would select for parks ground which has a certain natural beauty but which, from its steepness, inaccessibility, or difficulties of drainage, is unsuitable for residences; and as such parks would be more or less on rising ground, the appearance which one will present as seen from another should be considered; and he makes the excellent suggestion that in whatever buildings are erected in such parks a consistent type of architecture of the greatest simplicity should be adhered to. "Buildings, the memorials of fêtes or expositions, no matter how interesting they may be, have no real sympathy with a park, and are therefore an unrestful influence." We may add that the crowds which any kind of exhibition on a large scale draws together are liable to spoil the appearance of a park to an extent which it takes a good deal of time and expendi-

ture to recover from. The Paris 1900 exhibition ruined the aspect of the Champ de Mars, and other portions of the ground covered, for a long time after; nor is its effect in this way yet obliterated. Mr. Burnham remarks that if statues are placed in the parks "it is better to make formal parterres and alleys for its reception than to scatter it haphazard"; but this should be taken *cum grano*. Statues should certainly not be placed "haphazard"; they should emphasise and give the central decoration to some special feature in the laying out of the ground; but anything like a collection of sculpture along one walk or parterre becomes a little too like an exhibition; and moreover, a really fine piece of outdoor sculpture will have more impression when seen as the sole object of the kind in the centre of a circle or as the culmination of a vista, than when aligned with a number of others.

In the main, however, Mr. Burnham's scheme is a noble one, and may render the revived San Francisco, with its exceptional advantages of position, one of the most beautiful cities of the world; and we can only add our best wishes for its realisation and for the future safety and prosperity of the city which has suffered for the time under such an appalling and heartbreaking disaster.

THE PRESENT STAGE OF INDUSTRIAL ART.

PAMPHLET has lately been issued by the Junior Art Workers' Guild* which has

attracted a good deal of attention among art workers. As far as we know, this is the first expression of the collective thought of the younger school of architects, artists, and craftsmen which has come into existence in late years, and in whom the difficulties they have to face have bred a seriousness and purpose that will surely have its effect in the years to come. It came out rather appropriately at the same time as the last of the Arts and Crafts Society's triennial exhibitions, each of which has marked a stage in the development of modern English applied art; and it seeks to determine the causes which have led to the curious situation in which we at present find ourselves—possessing, that is, a school of applied art which is admittedly the first in Europe, but which remains a thing wholly apart from the life and industry of the country, and of which the followers can obtain little or no effective patronage from the public. The pamphlet is at once a review of the history and present situation of the Arts and Crafts movement, an investigation of the forces which have militated against it, and some suggestions as to the remedy.

Two causes the authors consider to have been mainly instrumental in producing the present deadlock—one belonging to the course taken by the Arts and Crafts movement itself, and the other to the industrial conditions of the age. The first was the rash abandonment of tradition by the leaders of the

* "The Junior Art Workers' Guild: What it is and Where it Stands: An Appeal to Craftsmen." Post-free 2id., from the Secretaries, 12, Bedford-gardens, W.

movement in their revolt against what was stereotyped and academic, as to which the authors say:—

"At first this new philosophy seemed to promise excellent results. Men who were saturated with tradition, when they thus took to thinking for themselves, turned out very creditable work. But another generation came along who were without this training, and in their hands the results were very different. Little by little was created a new cult which we know now by the name of 'Now Art.' . . . It spread like a plague over Europe. It went from extravagance to extravagance, until finally it has produced what such things always do—a Nemesis of reaction.

"Unfortunately this reaction is telling against the Arts and Crafts movement with which 'Now Art' had become too closely identified—'Now Art' and 'Arts and Crafts' in the popular mind meaning the same thing—and so that which is real and vital promises to suffer from that which is bad and meretricious, and there is a danger that the good may be lost sight of and disappear."

The remedy proposed in the pamphlet is an intelligent—not slavish—return to tradition, a regrafting, as it were, of our art on to its parent stock, by making the study of the great work of the past an indispensable part of every artist's education. At all events, one of the first necessities of the case seems to be the establishment of a more universal standard of taste, even among artists themselves, which can only be reached by much greater sympathy and co-operation than at present exists among them. Individualism has been allowed too free a play and originality has been worshipped for its own sake, with the result that little progress has been made towards the formation of a national style or of a body of tradition capable of guiding the future development of the country's art.

The other force which the authors consider to have militated against the movement is the modern industrial system. Division of labour is the keynote of modern production; but division of labour, when carried beyond a certain point, makes craftsmanship impossible and turns men into machines. The present tendency of commerce is to separate designer and craftsman, the object of the Arts and Crafts movement is to bring them together. Here is, perhaps, the most serious obstacle to progress, and one for which it is difficult to see any remedy except in such a gradual improvement in public taste as will lead the public to demand such a standard of work as can only be reached by the artist craftsman.

Whether these results can be obtained at all under present social conditions is a point upon which the Guild in the present pamphlet do not commit themselves, but they end with the following appeal to their fellow-workers:—

"We fully appreciate the gravity of the situation that has thus been created and the necessity for finding a solution upon it. Indeed, in this connexion we feel ourselves in the position of commissioners in the Arts whose duty it is to investigate and collect evidence on these points.

"In these circumstances the Junior Art Workers' Guild will heartily welcome to its ranks all artists and craftsmen eligible for election who can lend a helping hand to the efforts it is making and sympathy with the efforts it is making to cope with the present situation. They feel that they should do something to organise the younger generation of artists and craftsmen, to bring together the best artistic thought of the day, and, where possible, to direct their energies into such channels as shall be most advantageous both to themselves and to the art of this country. In the accomplishment of this work they believe that it may be possible also to do something to arouse such a popular interest as will awaken the people to the ugliness of modern life, and that by taking in hand definitely the work of reform they

will find a common ground of interest with the public, and so discover the artist's and craftsman's rightful sphere of influence and usefulness in the social system."

NOTES.

The Labour Market.

THE latest labour returns show some improvement for the month of March, but the building trade shows only seasonal improvement, the continued activity in other industries still leaves this untouched. The total number of work-people affected by trade disputes which began or were in progress in March was 13,536 more than in the same month last year. The *Frankfurt Gazette*, quoted in the *Times*, April 18, gives some interesting figures in connexion with the German Labour Market, which in spite of the new tariff arrangements and a considerable influx of Austrian miners and Russian refugees, shows unusual activity, in which it is stated the building trade participates.

Roads Improvement.

FROM the annual Report of the Roads Improvement Association it is evident that the past year of this body has been one of great activity, and satisfaction must be felt that the House of Commons, some leading Government departments, and various local authorities have admitted the desirability of the recommendations made by the association in matters connected with the construction, maintenance, and administration of highways generally. The most welcome news contained in the Report is that a joint committee of the Roads Improvement Association and the Automobile Mutual Protection Association has been formed for the purpose of conducting experiments with the object of ascertaining the relative cost of constructing dustless roads, and the best materials for the purpose. Palliative measures have been found of little avail, and it has now been decided to lay experimental stretches of road with different materials, so that the effect of each can be separately studied. This work should be of much value to local authorities, as it will place at their disposal exact data as to the cost of dustless roads, and save them considerable outlay by rendering costly experiments unnecessary. In other countries investigations of the kind would be undertaken by the State, and it is really a disgrace that a private organisation should be compelled to act as an intelligence department in matters connected with the administration of the national highways.

The Petrol Nuisance.

CONSIDERING the rapid increase of motor vehicles in the streets of London it is quite time that more stringent regulations should be framed for the purpose of enabling the authorities to keep the atmosphere free from the fumes of petrol and lubricating oil. The petrol omnibus as at present made is a large and noisy contrivance, with a maximum capacity for the emission of noisome odours, but it is not the only offender. Petrol motor cars even of the most approved design are bound to leave behind them a distinct flavour, and it is certain that the promised supersession of horse-drawn

by mechanically-propelled vehicles is not a thing to be desired, unless all forms of motive power other than electricity are to be prohibited. Existing laws are sufficient, if strictly enforced, to prevent the emission of steam and smoke from road locomotives of every kind, but they afford no protection against invisible vapour and smell. Of course, constant improvements in design tend more and more to mitigate the undesirable characteristics of petrol engines, but even assuming perfection to be attained, such machines would still generate quantities of carbon dioxide—small individually but enormous in the aggregate. Hence the adoption of electrically-propelled vehicles is much to be desired, and the promised introduction of the electric omnibus on a large scale comes as a most welcome innovation, although it remains to be proved whether the difficulties which have hitherto militated against the financial success of such ventures have been satisfactorily overcome.

Electric Lifts.

THE paper by Mr. Crews on "Lifts and Hoists" which was recently read before the Manchester section of the Institution of Electrical Engineers gives an impartial account of the costs of the working of twelve hydraulic and twelve electric lifts. The examples seem to have been judiciously chosen, and therefore the comparison he makes is instructive. The simplicity of the design and the mechanical excellence of hydraulic working compare very favourably with the motors, starting resistances, and complicated switches required for electric working. Yet, according to the author, at least five of the leading English makers supply three times as many electric as hydraulic lifts. The manufacturers recommend them as being equally trustworthy in working, and the maintenance contracts in the two cases are practically identical. From the data given in this paper it appears that the prime cost of an electric lift is greater than that of a hydraulic lift; but the cost of the energy required in the latter case is six times that required in the former. In an electric lift the power required is proportional to the load, but in the single ram hydraulic lift the power consumed is the same at all loads. The annual cost of the energy, however, for an hydraulic lift is only about a third of the annual total cost when maintenance, wages, and depreciation are taken into account. It will be seen, therefore, that if the electric lifts are more liable to breakdowns, etc., the saving in the power bill may be dearly purchased. Mr. Crews says that many electric lifts have been working satisfactorily for over ten years. The number of fully automatic push button electric lifts is rapidly increasing. In the case of one in use for over a year the working results are in substantial agreement with the figures given by Mr. Crews.

Professor Curie.

By the untimely accident resulting in the instantaneous death of Professor Curie, France and the scientific world have suffered a great loss. Although recognised for many years past as an

investigator of unusual capacity, Professor Curie first became known to the general public in 1898 as the joint discoverer with Mme. Curie of radium. The remarkable properties which Becquerel showed in 1896 were possessed by uranium compounds, and the fact that certain uranium minerals were found to exhibit the quality of radio-activity in higher measure than metallic uranium, suggested to the Curies the probable existence of a new substance. Selecting pitch-blende as the material for examination, they proceeded in their search by methods of chemical analysis, and ultimately found an exceedingly small quantity of the radio-active substance now described as radium. Subsequent investigations showed, among other things, that radium possessed the extraordinary property of being able to emit heat continuously without perceptible diminution of bulk, and of transmutability into helium, thereby suggesting that the gropings of mediæval alchemists, ignorant as they may be considered, were not altogether based on folly. What further light the continued labours of Professor Curie would have been able to throw upon the hidden mysteries of nature no one can now say, but scientists in every part of the world have abundant reason for regretting the sudden termination of so exceptionally brilliant and valuable a career.

DR. WHEATON'S Report to the Local Government Board on the sanitary condition of the Abertillery Urban District.

seems to point to inadequate water supply as the most serious element in its unsatisfactory condition. The principal water supply is derived from the Tillery brook. From the intake the water passes to a small screening tank, and from this tank to filters; and thence to a clear water tank of 500,000 gallons capacity, from which it is distributed by gravitation. There are two of these tanks, but one is cracked owing to subsidence of the underlying strata, and cannot be used. The filtered water accumulates in the sound tank during the night, but is soon all drawn off in the morning, and at a time varying according to circumstances the supply becomes intermittent, the water running straight from the filters to the mains. Hence it is not surprising to read that with few exceptions water-closets are hand flushed, the water supply being insufficient to allow of the provision of flushing cisterns; it is also stated that the habits of the people are so rough that they would break any flushing apparatus provided in connexion with water-closets; and owing to imperfect flushing the boppers of the closets are frequently found to be in a filthy condition. The Report recommends that the local authority should endeavour to provide an increased supply of water from a reliable source, and should also at once proceed to the appointment of a district surveyor.

Framework Knitters' Almshouses, London. The freehold site of the old almshouses belonging to the Framework Knitters' Company has been placed in the market. The almshouses are situated in Kingsland-

road, Haggerston, having a frontage of 200 ft. to the main thoroughfare, with a return of 87 ft. 6 in. to Pearson-street. The charity was founded in 1727 by Thomas Bourne, who bequeathed 3,000*l.* to the Company for the erection and endowment of an almshouse, and directed his executors to lay out not more than 1,000*l.* in the purchase of ground distant within 5 miles from the City of London, whereon to build an almshouse for twelve poor freemen, or their widows, and to invest the residue of the bequest in lands to yield profits for maintenance. The Company bought the land for 145*l.*, in a favourite quarter for institutions of that kind; they expended 800*l.* upon the building of a block with two wings, containing twelve tenements, and invested the residue in Old South Sea Annuities. Subsequent bequests made by Mrs. Staunton, the founder's daughter-in-law, T. Cook, and T. Taylor (1759-1854), on behalf of the inmates, in money and in kind, augmented the trust funds to the additional extent of 2,500*l.* The total income of the charity is given as 131*l.* 18*s.* in an official return rendered some years ago. A water-colour drawing by T. Hosmer Shepherd, 1857, of the almshouses is in the Grace Collection.

Lectures on Greek Dress. PROFESSOR BALDWIN BROWN gave at the Royal Institution, on Tuesday last, the first of two lectures on "Greek Classical Dress in Life and Art." The main object of the first lecture was to show that the Greek dress, as represented in sculpture and in vase-painting, was not a mere artistic convention, but was, so far as realism in sculpture could be allowed to go, an actual representation of the dress of everyday life; and to explain how this dress was put on—one could hardly say how it was made, as all the normal forms of it could be made by folding and fastening a rectangular piece of stuff. This process of folding, making up (as it were) the costume as it appears in Greek sculpture, was practically illustrated by a series of photographs from life, showing the process of folding and fastening in its successive stages. The Greek dress was, he thought, one of the most characteristic artistic creations of the Greeks, for the simplicity of its elements and the variety and beauty of its actual form and arrangement. From the illustrations of the process of putting on one gathered the meaning of two or three characteristics of Greek drapery which must be familiar to everyone who has looked at Greek statues, but the practical origin of which has probably often been overlooked. The second lecture will be given at the Royal Institution at 3 p.m. on Tuesday next.

The Baillie Gallery. At the Baillie Gallery there is a mixed collection of works by Scottish painters—too many of them in what we call the "smudgy" style of landscape which is so prevalent now, and in which nothing seems to be distinctly made out; in Mr. M'Taggart's "Sunburst after Rain at Carradale" (7) there is hardly any distinction between the sea and the foreground beach or rock, as one must suppose it to be, on which figures are reclining

who look as if they were in the water. There are some good effects here and there; Mr. Cadenhead's "September Afternoon" (3) for instance; Mr. Campbell Mitchell's "Aberlady" (10); Mr. Gibson's "Landscape" (22); Mr. Evan Geddes's "Winter" (52). Mr. Wynne Apperley's Venice sketches in water colour are in the same unfinished style, but show good effects; the architecture is badly treated; no one has any right to paint a celebrated building in the way the Salute Church (78) is treated. A small collection of water-colours by Mr. Walter St. John Mildmay and Miss (?) Mabel St. John Mildmay show some good landscape effects, the lady's being the best; "The Coming Storm" (23) is a powerful sketch, and we like also "A Kentish Stream" (16), "A Venetian Canal" (29) and "The Mill Stream" (34).

The Fine Art Society. At the Fine Art Society's Gallery there is on view a large collection of old engravings of Oxford and Cambridge and of the Public Schools, not valuable mostly in an artistic sense—indeed, in the majority of them the buildings are very badly drawn, but of no little interest in a historic and topographical sense. With this collection is united an exhibition of a series of water-colour illustrations of Oxford and Cambridge as now existing, by Mr. Wallace Rimmington, and a smaller collection by Mr. W. Matthison. On the whole we prefer Mr. Matthison's in point of colour; but both sets form an interesting collection of illustrative water-colour art.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

Mr. E. T. HALL presided on Monday over the fortnightly meeting of the Royal Institute of British Architects held at No. 9, Conduit-street, W.C.

Mr. Alex. Graham, Hon. Secretary, announced with regret the decease of Mr. R. A. Bryden, of Glasgow, Fellow, elected 1876, and Mr. W. Goldsmith, Associate, elected 1882.

Plaster-Work.

Mr. Geo. P. Bankart and Mr. Laurence A. Turner then read papers on "Plaster-Work," of which the following are abstracts:—

Mr. Bankart said that plaster had so long been looked down upon for its modern commonplace vulgarity of treatment that it seemed almost incongruous to think of it as a vehicle of art. Any really healthy revival seemed only seriously possible by again reverting to the beginnings, by the gleanings of some of that simple impulse which urged the artists of the past to find expression in materials and methods most in sympathy with their own nature, and in the right and full development of those methods.

What, the author asked, are some of the abstract points of value to be gathered from a general rumination amongst all the accumulated wealth of the labour of men's hands in the application and shaping of a kind of mud in or on buildings; and what may we rightly take to heart in pursuing or in attempting to give fresh hope and vitality to modern plaster-work? The shadow of the first half of the first century A.D. revealed to us remnants of modelled wall and ceiling decoration of a beauty, subtlety, and delicacy never since surpassed or even approached. It spoke to us of the extraordinary decorative instinct of the Greek and Roman in the combination of extreme simplicity of line and surface with refinement and power of execution. For the plasterer the lessons to be learned from these fragments of decorative art can never be too plainly noted or too highly praised. The stucco of the Romans tells us of their investigations, their admiration, and of their imitation. This imitation

as not the copying of the form, but of the spirit, of the art of the ancient Romans and Greeks. We of the XXth century have our own religion, our science, our folklore, or national virtues, our industries and manufactures, to embody in our art.

Tracing the history of the plasterer's art through Renaissance times, and speaking of its results brought about by the changes in building construction, the author demonstrated that each one of these developments had its marked effect upon the decorative art of the plasterer. From each of these ages it would be found that the plasterer produced his best work when the particular kind of plaster he used, whether stucco, gesso, or plaster of Paris, was worked in its own particular plastering way, and was not forced into simulation of carving in marble, stone, or wood.

The success of his art depended best assured when his material was put to the noblest right use without abuse. To the question, Did the Classic or the Renaissance architect consider whether the methods then employed were legitimate or not? the author was inclined to suggest the negative, but that they were accepted as the most convenient and durable methods of expression then known. The primary object of the decoration of a ceiling or of a wall, as in all decoration, was the giving of pleasure to the eye. The construction of the ceiling had undoubtedly its bearing on the design, but once the impression of sufficient support and strength satisfied the artist, he relied in his emulation to obtain the praise of his patron (eager to outshine his rivals); and to do this, while framing his work with due respect to reasonable economy, he thought highly of his enrichment, treated in the language of the time. This point concerning right or mistaken method, whether past or present, had an important bearing on all workmanship. Had the artists of the Italian Renaissance known of the method of casting from moulds of flexible gelatine, the author thought that they as artists would have carried their method to a much greater pitch of perfection, and not so much in mechanical skill as in suiting their forms more particularly to the advantages of the mechanism.

He claimed for plaster at least that respect and technical liberty which is due from the artist to any other material or medium of expression, whether the surface of operation be large or small. He believed each period of the art of the plasterer should be regarded on its own merits in combination with the peculiar circumstances and efficiency or inefficiency existing, according to the peculiar materials that it was then most convenient to procure and to manipulate. If mechanical skill be the plasterer's diploma, then should the XXth century be able to dim the glories of the Italian Renaissance; but we must go back again to simplicity of line, of form, and of spirit, in the giving of pleasure, with our money's worth. If this object is unattempted and unaccomplished, or undesired, by the lack of desire or knowledge of the sense of beauty on the part of the people and of the worker, then the world will be so much the poorer by ignoring, not only the art of the plasterer, but all of the lesser arts.

Mr. Laurence A. Turner took for his subject "Decorative Plaster Ceilings," which he divided into two broad divisions—lime plaster and plaster of Paris. These two materials, he said, required widely different methods in their use. As to which gave the most satisfactory plasteresque result there could not be two opinions. Lime plaster must take the first place, and ceilings in this material must be modelled *in situ*. The quality we should try to reproduce in plaster-work is that which we find in the Elizabethan and Jacobean lime-plaster ceilings. These form the best models and standards of work for the art. Most uses of lime-plaster; but there is no reason why the same effect should not be produced with plaster of Paris. The chief quality that made the old plaster-work so charming was the exceedingly soft, delicate, and subtle play of light and shade that was produced on its modelled surfaces. In modern work it is the hardness of line and sharpness of shadow, dead flatness of the non-modelled surface, that make it so dreadfully dull. The most satisfactory results in any plaster-decoration we possess are those in which there is no undercutting except in detached ornaments. Therefore, it is necessary, in modelling a ceiling, to avoid

all undercutting, hard edges, and rigidity of line. Court everything that is the reverse of these qualities—softness, rounded contours, soft shadows, breadth of surface, and extreme modulation of line and surface. Plaster-work worthy of the name must have the quality of softness. Every atom of it should be modelled. There should be a subtle play of light and shade all over it: the plain spaces as well as the mouldings and foliage should be alive with delicate modelling, and not dead and cold like the early Victorian ceilings. With the many new methods and materials discovered since that Utopian period for plasterers between 1400 and 1600, what can be done, the author asked, to produce a fine, satisfactory, decorative result at a reasonable cost? To make a ceiling nowadays in lime-plaster, using only the methods that those old people used, it is useless to imagine that anything can be done that is not very costly. Besides, the difficulty of obtaining the properly-scaled lime renders it almost impossible to model the plaster with the fingers. Tradition says that twenty years was not an out-of-the-way time for the lime to be slaked before use. The author advised the use of Keen's cement if well-slaked lime was not procurable. In ceilings he had modelled *in situ*, in which Keen's cement had taken the place of lime, he had always mixed silver sand and size with it, the latter to prevent the cement from setting too quickly. He did not personally incline to the method of modelling in plaster *in situ*. He preferred to model the ceiling on the bench, in Keen's cement and sand, and to use his fingers only. When the model is finished a mould of plaster of gelatine is made from it, and the work cast in fibrous plaster. If there is a doubt about the amount of relief required, it is easy to offer up a cast *in situ*, and there is the advantage of being able to repeat the pattern instead of having to model the whole ceiling. Another advantage is that, by using sand with the cement, one can by using a coarser sand, and more of it, prevent the work from becoming too small in detail or too elaborate in finish, for the material will not allow of it. Another advantage of fibrous plaster over lime is that the ceiling is three or four times lighter, and will not crack or fall, as the lime plaster on lathes sometimes does. The author confessed his partiality for ribbed or panelled ceilings, the method of construction of which he described in detail. Their beauty is chiefly dependent upon the modelled effect they should possess, the ever-varying play of light and shade of a most subtle kind. Very great care must be taken in modelling the plain ground for this type of ceiling, as the richness of effect is chiefly dependent upon it. The practice of using moulded wooden ribs, dividing up a ceiling into panels and painted white to appear like plaster, he strongly deprecated. It had the result of bringing a ceiling down and making it look heavy, whereas a well modelled ceiling of plaster does the reverse, making the room look lighter and giving a sense of greater space.

The ceilings of Wren's date, although very beautiful, depend upon their design for their beauty, and not upon that quality which is peculiar to plaster-work. They might equally well have been carved in wood or plaster. The Adams' ceilings, made, the author believed, entirely from carved-wood moulds or carved wooden models, are hard and uninteresting, though very refined; they depend for effect entirely upon their design, and not upon modelling.

With regard to the question as to how far the architect should supply drawings for a ceiling, the author thought that nothing more than a small-scale drawing indicating the type of work he required should be given to the modeller, more than that only hampered him. The architect should supervise and criticise the models, but unless the modeller did the details himself the result would probably lack life and freedom.

The author, in conclusion, emphasised his view that if a plasteresque effect be wanted, the whole ceiling should be softly modelled, mouldings as well as ground; but if that was not to be, then let it be, frankly, carving produced in plaster.

Professor Baldwin Brown, in proposing a vote of thanks to the readers of the papers,

said that a great many points must have occurred to everyone present, but he himself would only touch on one or two. The historical point of view of the question had not been dwelt upon so much that night as had been the case in previous lectures, but there was no doubt that the history of plaster-work was of very great interest, because the most ancient nations were perfectly familiar with the material, and used it for building purposes; but they did not apparently realise its artistic properties. The prehistoric Greeks, however, as one knew from the remains of modelled plaster-work found at Knossos, had a knowledge of artistic work in plaster. The later Greeks used terra-cotta where we now used plaster in decorative work. There was no doubt that the idea of the work at the Villa Farnesina at Rome came from the Greeks. He thought there could be no doubt that the work was elaborated at Alexandria, like so many of the technical details of building, and came into vogue afterwards in Rome; and that which we called Imperial Roman was really Greek adapted or imitated by the Romans. The subject of the modelled panels in the work of the Villa Farnesina was like those of sculptured reliefs which were known to be Alexandrian, and, as a matter of fact, some wall-paintings found in connexion with these plaster ceilings had Egyptian or Alexandrian subjects, which proved the case. As one saw it both in the Villa Farnesina and in the Tombs of the Via Latina, the plaster work hardly came up to the ideal which the lecturers had put before them—that there should be the same quality of handling for the whole of the ceiling, both for the figure parts and also for the mouldings. He thought the Roman or Greek work was partly cast from moulds, and it seemed to him a little incongruous that in the beautiful work of the Villa Farnesina the mouldings were rigid and obviously cast-work, while the other part of the work was modelled with extreme freedom by hand. There was a gap in the history of plaster-work which might be filled up, for it seemed to have reappeared again in the XVIIIth century as a consequence of the discovery of so many Roman buildings at that period which were decorated in this fashion, and the work was reproduced by many persons. As a matter of fact, there was no break in the history of modelled plaster-work, and there were some extremely fine examples of mediæval plastering. One of the finest was at Cividale, in the extreme north-east corner of Italy. In an old chapel there there was some extremely fine and bold modelled plaster-work, consisting of figures in very high relief and of about two-thirds life-size, and one might do worse than make a pilgrimage thither for the purpose only of studying this particular piece of work. It might date about 1100, and would, without doubt, be of the same period as that very interesting stucco screen in the church at St. Michael's, Hildesheim, Germany, where, again, the figures were about two-thirds life-size, modelled in high relief with bold foliage-work. Those examples of mediæval work showed that the art was alive. One matter about which he would like to ask a question was with regard to a recipe for preventing the plaster drying too rapidly, which was the mixing of baked meal with the plaster. There was a reference to it in regard to the plaster-work at the Palace of Non-such, and the late Mr. Robinson, who was so well known in connexion with plaster-work, said that he tried that material and found it worked very well. He said that the plaster remained plastic a long time under the fingers, and when it dried it gave a very fine old ivory tint. He would like to know whether the readers of the papers had tried that material to prevent the plaster drying too rapidly. He was glad to hear lime plaster indicated as being a finer material for working than plaster of Paris, and there was one use of lime plaster about which it occurred to one to say a word. If they read the earliest accounts they had of plaster-work by Vitruvius, they saw that the finish of plaster-work was of two kinds. The material was made of pounded marble mixed with lime, and Vitruvius spoke of "ten men with macerating rods carefully macerating the plaster for a long period of time." He did not know what effect this continual maceration of the material was supposed to produce. At any rate, the material was of such excellent quality,

and gave such a fine surface, that no additional treatment was necessary. And then another way was to apply to the plaster immediately it was finished a coat of pigment mixed with water, so that the whole work dried together. This was what was familiarly known as the fresco process. Now they all spent the greater part of their lives within plastered walls, and they as a rule treated these walls either by papering, by oil-painting, or by distemper, and none of these was a really satisfactory way of finishing the plaster-work. In each case an additional material was put on and hid the plaster, and neither the paper nor oil-painting could be properly cleaned, while the distemper could not be cleaned at all. Further, two or three processes of sizing and two or three coats of paint were required. Supposing as soon as the plaster was laid a coat of simple colour mixed with water was laid evenly over it when wet, then, according to the chemical processes with which everyone was familiar, the colour would be crystallised on the plaster, and would remain as a permanent finish to it. He thought everyone would agree that there was no surface so pleasing to the eye as a coloured surface produced by fresco, and it was the quickest and most beautiful way of colouring a surface. There was no doubt that people grew frightened of fresco-painting, as a great deal of fuss was made over it in connexion with the walls of the Houses of Parliament, but the colouring of the surface and the painting of a picture were very different. He hoped that when the Institute got its new building some of these experiments would be tried. It might be tried in a corridor, and they could see if they could restore this old process, which was perfectly familiar in ancient times.

Mr. Atkin Berry seconded the motion, and thanked the lecturers for the comprehensive way in which they had dealt with the subject.

The Chairman said they had had interesting papers on a subject which had a great fascination to every architect. The historical sketch which was given them by Mr. Bankart was very interesting, and he had referred to the remarkable plaster-work in the Temple at Knossos. They must all have been struck by the views which were presented to them by the excavator of Knossos some years ago in that room and with the wonderful paintings, which were interesting as examples of plaster-work, and also as representing to them a civilisation of which they had practically no knowledge until these buildings were discovered. Professor Baldwin Brown had given them a description of various adaptations and applications of plaster, and had told them that there was no cessation of this great art, but that it passed on through the centuries until they saw its great display at the beginning of the XVth century. Indeed, wherever there was a classical art they found that it had never been absolutely lost, but they found it cropping up in most unexpected corners. Their attention, however, was only drawn to it when they saw an exceptional display, as was the case with plaster-work at the period of the Renaissance. It had been suggested that in the building which the Institute was going to put up they should make experiments. He was not quite sure whether experiments were very desirable things when they were building their own home, because if there were failures he was afraid the public would simply think they were failures through their absolute inexperience and ignorance of the profession in which they were practising, and would not give them any credit for having tried to follow Professor Baldwin Brown in his suggestion with regard to the treatment of plaster when it was wet. One of the great difficulties which faced them in dealing with wet plaster was that they were so limited in the shades of colour they could use. They could use yellows and reds, but not greens and blues, and therefore they had a very limited field. He believed that many of them in their humble way had tried to carry out the suggestion of Professor Brown. He had himself, and found his clients dissatisfied with the result, because he had endeavoured to get some shade a little less common than yellow and red. He thought they were all grateful for the series of photographs on the walls. They could recognise in many of them

their influence on the brothers Adam and other men of the period. Such a display of photographs showing the methods of the past would serve to inspire those of the present day to try and attain equally beautiful results.

The motion having been heartily carried, Mr. Bankart said he had little doubt but that the early work of which they had seen the mouldings and the more mechanical parts dividing the panels were cast from moulds of some kind, but the panels themselves seemed to suggest that they were modelled almost *in situ*, and the surface-work seemed clearly to indicate that they were entirely the work of a free hand. Professor Baldwin Brown had mentioned some of the mediæval work, and Violet le Duc mentioned some work in France during the Carolingian Period which was also modelled in stucco, practically speaking, from the receipt given by Vitruvius. He mentioned it in a rather beautiful way, and said that this work was extremely slight, and merely to cover the bareness of the walls. That such work was going on in France during the Carolingian Period there was no doubt. With regard to the question of ingredients being used with stucco, they had it on record that log's lard and blood and common beer were used to retard the setting, and Vitruvius mentioned that the pounding of the lime for a long period was done chiefly to break up any particle which was not properly slaked. As regarded the colouring of plaster-work, he believed that nearly all the old stucco plaster-work that they knew to be coloured in fresco, as they called it, was done with fine temper-colour. At any rate, in the old Italian work about which Mr. Sumner read a most interesting paper before the Society of Arts, he gave a very interesting account of how the colouring was used in the old days, and how it was mixed with the liquid plaster, and how he himself mixed the different colours (mostly yellows and reds), and how extremely difficult it was to make use of blues. Mr. Sumner mentioned one blue which it was possible to use, the name of which he (the speaker) could not remember for the moment, but it was a mineral colouring of some kind.

Mr. Turner also responded, and said that the photographs belonged to Mr. Bankart. He had some there that night to learn, and would have liked to have heard Mr. Bankart tell them something of how the early men made their ceilings. It would be extremely interesting if some expert would write an account, as far as he knew, of how these old plaster-ceilings were made. He was inclined to think that they must have had other methods than those which, so far as he had read, were ascribed to them, and it was strange that they had not a single example remaining of the tools which were supposed to have been used. As regarded the treatment of the surface of plaster, one thing he had done to plaster ceilings after they had been fixed was to give them a coat of turpentine and beeswax, which gave a nice ivory tint, and also enabled the ceiling to be afterwards washed. They could not make the mistake of putting on too much, because the plaster would only suck up a certain amount, and they could do more. He had in a small way tried to colour plaster of Paris casts, and a delightful method of colouring could be done by using simple oil-colours and turpentine. One could not, however afford to make a mistake, for the plaster would only take one wash, and directly one tried to put on a second coat one got an opaque colour. With one wash they got the quality of water-colour on a piece of white paper—the white paper showed through the colour and gave a quality which could not be reproduced in any other way. He had made no experiments with meal. His experience had been almost entirely with plaster of Paris and a substitute for lime-plaster, because they could not get the lime properly slaked. He had referred to a village in Italy where the villagers slaked their lime for a long period, and he was told that the lime was slaked wet, and was not sifted. They only used the liquid plaster which exuded from one pit and flowed into another.

The International Congress.

The Chairman announced that the annual general meeting would be held on May 7 for the presentation of the annual Report and the transaction of other business. Previous

to that meeting there would be a special general meeting, when the Chairman would bring forward a resolution proposing that the present President and Council should retain office until the conclusion of the Congress to be held in July, and that by-law 30 be temporarily suspended in order to allow that to be done. They would all recognise that it would be an inconvenient and almost impossible position that the Council which had charge of the great International Congress should be a new Council coming in at the very last moment. The present Council had had all the labour of the arrangements for the Congress, and it would be in the interest of the Institute and in the interest of architecture that those who had had the arrangements should remain in office until the conclusion of the Congress.

THE NEW GALLERY.

The exhibition at the New Gallery does not include any work of the highest order of interest, but, among a certain proportion of weak and doubtful pictures, there is a good deal that is well worth attention. Perhaps the strongest works there are two portraits, that by Mr. Lavery of the Earl of Plymouth (143), and that by Professor Herkomer of General Palmer; the first notable for the fine and subtle colour which the artist has contrived to make out of an ordinary country costume; the second remarkable not so much for colour as for simple and vigorous characterisation. Mr. Hughes-Stanton's large landscape at the top of the north room, "Sand Dunes, Dannes-Camiers" (221), may also be singled as something exceptional in English landscape-painting for its large scale and monumental style; it is the kind of landscape one expects to find in the Salon rather than in an English exhibition, and it is certainly the most important work by this artist that we remember to have seen.

The South Room, in which the numbers commence, contains no figure picture that is really important except for its size, beyond a very charming half-length portrait of a lady (68) by Mr. Lavery; Mr. P. A. Hay's ideal personage "When Vanity Sleeps" (6) is too long in the neck, though there is something in the work, and the neighbourhood of "Rannoch Bridge" (9) by the same artist is at all events an evidence of versatility. There are some very good small landscapes. Mr. James's "Approaching Storm" (4) and Mr. Fisher's "A Lane—Antilles" (5), hung close together, illustrate by contrast (perhaps intentionally on the part of the hanging committee) two altogether opposite methods of regarding landscape: the first as imitation of nature (in this case by no means as commonplace as such imitations often are), the second as translation of nature through the medium of a special technique peculiar to the artist, and which precludes all idea of illusion. Mr. W. H. Bartlett sends two of his admirable Irish coast scenes; "From an Island in the West" (10) is a fine bit of sea-painting of rather unusual style; "For Island Pasturage" (14), the finer work of the two, is an admirable landscape composition. In Mr. Thorne White's "Children of the Downs" (18) the foreground and figures somehow hardly seem to belong to the middle distance, at least in colour and execution; they come into the composition all right, but have a kind of appearance of having been put in by another hand. Mr. Hill's "Evening on the Arun" (28) is a landscape of artistic completeness of feeling and composition; Mr. Arnold Priestman's "Heather Burning" (46), though a small work, is something more than that, showing not only composition and unity of design, but an effect of landscape gloom portrayed with great power—a picture which is a landscape poem, very different from the crude lumping together of dark masses of pigment in "A Cornish Valley" (56) by Mr. Peppercorn, whose work of this kind has become a fashion among art-critics, but will not take in those who have saner judgments than the art-critics of the present moment generally display; this kind of landscape convention is a very easy one, and there are plenty of other people who could do it if they thought it worth while. This cannot be said of Mr. Ernest Parton's convention, as illustrated once more in "Autumn Leaves" (49); this is delicate and highly finished and

entirely his own; but then it is so very conventional, and has been so often repeated.

In the West Gallery Mr. Melton Fisher's "Mrs. T. C. Bowen" (85) is a half-length portrait noteworthy for its delicate delineation of character and for fine colour; Mr. Coutts Michie's half-length of "Mr. Idris" (95), in some kind of official costume, is a very dignified portrait; Sir George Reid's of "Sir John Glover" (139), Chairman of Lloyd's, is of the best class of what may be called "Board-room portraits," which must be done, and should therefore be well done, but are not the most interesting contributions to a picture gallery, to those at least who have no personal or official interest in the subject of the portrait. Mr. Clark's attempt to emulate Watts in "Spiritus adversus Carnem" (163) is as ambitious and as unsuccessful as Mr. Dicksee's similar attempt in last year's Academy.

But Watts's magic could not be copied; he: Within that circle none thrust walk but he:

at least, if they dare, they are likely to come to grief. Mr. Austen Brown's "A Haymaker" (141), which looks rather like an inspiration from Millet, loses the effect of what is in the main a good picture by the want of strength and precision in the treatment of the head; a weakness still more evident in his other single-figure picture in the north room, "Meadow Flowers" (194), where modelling of the features is so curiously evaded that the figure suggests a ghost rather than a flesh and blood personage. Mr. Wontner's "In the Garden of Dreams" (115), on the other hand, is too hard and over-finished, a kind of furniture picture which may assist in decorating a room but leaves nothing for the imagination. The most really artistic conception among the figure subjects in the west room is Mr. Henry's "The Hourglass" (97), a title which serves to give, from one of the accessories, a distinguishing name to what is simply a piece of beautiful composition in drawing and colour, to which the spectator may attach any fancy that he pleases; in spite of its unsuggestive title, this is a really poetic work, which "The Garden of Dreams" (in spite of its title again) is not—there is no suggestion in it but of painstaking workmanship in a rather hard style. Mr. Llewellyn's "Bedtime" (112), where a half-length figure moves across a window which forms the background, carrying a sleeping child in her arms, is pleasant both in sentiment and in its broad and well-balanced execution.

In this room is the largest but hardly the best of Mr. Wetherell's contributions, "Dawn at the Gate" (90), where the effect of the morning light breaking, as if the farm-yard gate were being opened to admit it, is most fresh and charming, but the calves in the foreground seem singularly stiff and wooden in their structure. Mr. Wetherell's real gift is shown in his smaller but beautiful picture in the north room, "Joemud Day" (203), one of the idylls of rural life in which he mingles so well the real with the ideal. Among the other landscapes in the west room is a spring scene by Mr. Edgar Barclay, "Amidst Winter's Wreckage" (84), which is full of sunlight, and should have been hung on the line, where various works of quite inferior value have found place. A small landscape by Mr. H. W. B. Davis, "Glomming" (102), is noticeable especially because he has contrived to give a radiance to the moon without exaggerating her size; the majority of moons in landscape-painting are too large, as painters would find out if they would take the trouble to calculate what angle the width of the moon really subtends in the arc of the sky, and how many degrees of arc they are including in their picture: to find a moon really no more than the relative size of nature is an incident to make a note of. Mr. Thorne White's "Cornfield near Arundel" (111) is in a different and more vigorous style of execution than is usual with him; perhaps the sky is a little too restless, but it is a good picture. "The Old Garden at Tivoli" (130), by Mr. Harold Speed, is a moonlight effect, in which the moon does not, however, appear; it is an interesting and very clever attempt at a difficult effect. We have before referred to some of the architectural pictures which Mr. Sydney Lee has taken up as a special class of subject; he is making something very good out of this; his picture here of "The Belfry" (131), a simple rough-east country church tower with the upper

portion in sunlight, is excellent; even the churchyard wall is made pictorially interesting. Further on we come to a small but exceedingly fine seascape by Mr. Henry, "The Bell Booy" (150), one of the most real pieces of sea-painting we have ever seen. Mr. Brangwyn's large picture entitled "A Wine Shop" (167) is merely a very powerful piece of still life painting; it may be a question whether the subject was worth the extent of canvas bestowed on it. Mr. Talbot Hughes's "Music and Moonlight" (177) shows a young couple in evening dress in the moonlight on a terrace, beside an open door through which the sound of the music may be supposed to be heard; a clever picture both in light effect and in the graceful and *spiritual* figure of the lady.

In the north gallery Professor Herkomer's rather flaring portrait of a lady in bright blue dress (216) is conspicuous—rather too conspicuous; we prefer Mr. Melton Fisher's severe and monumental portrait of a lady in black (226). Mr. Hugh Riviere has a fine seated portrait of Miss Genevieve Ward (240), the face painted with great power; and Mr. Coutts Michie exhibits a three-quarter length of a beautiful girl in a crimson dress partly covered by a cloak, under the title "Ruby" (154). But one of the most interesting and characteristic figure paintings in this room also is one by Mr. Henry, "Summer Morn" (258), a life-size painting of a young lady at an open window, through which the summer landscape is seen; this is a picture quite out of the usual run of such things; there is a bright sprightliness and life about the look and attitude of the figure which is admirably imagined. Mr. Draper's small allegorical painting, too, "Art and the Jade" (220), should not be overlooked; "the jade" is Fortune with her wheel, whose half-nude figure appears as a vision behind the wandering artist seated in the foreground; it is worth attention both for idea and execution.

There are several fine landscapes in the north room, besides that by Mr. Stanton-Hughes already referred to; Mr. Hetherington's "Life on the Marsh" (188), with a grand warmly-tinted cloud hanging over the flat Norfolk country; Mr. R. W. Allan's "The Grey North Sea" (207), almost a repetition on a larger scale, of one of his works in the Society of Water-colours Gallery—on the whole we think the water-colour is the finer of the two; Mr. J. R. Reid's small coast scene under the title "Lobster and Crayfish" (215); Mr. Alfred Withers's "Moret—Evening" (238); Mr. Coutts Michie's "On a Lonely Moor" (247), a landscape in a simple broad style of design which reminds us rather of Georges Michel; and Mr. Adrian Stokes's "The Great Plain of Hungary" (257), with its curiously characteristic ragged trees and an admirably painted foreground. We should not have omitted to mention Mr. E. Lorne's "Burning Leaves" (199), which, for those who like pictures that look as if they were an inlay of pebbles with the figures let in flat, is worth looking at; we do not like the school, but in its way it is perhaps the best thing this artist has produced.

Among the sculpture exhibits in the Central Hall is one which has considerable interest for us—Mr. Natrop's blocked-out model of the Hyde Park screen with a quadriga on the central pavilion and figures of a man with two horses on each of the lesser ones: the sculptures being supposed to be bronze gilt. The work would be a fine addition to the screen, and we should be only too glad to think that there were any chance of its being carried out. The sculpture collection as a whole is not very important, but there is a charming fancy by Miss Esther Moore under the title "Youth's Dream of Joy" (531), of which we shall be able to give an illustration, the only way to rightly explain it. Mr. Tweed's "Latona" (531) is a well-modelled nude, though why the mother of Diana should be shown in this ungainly crouching attitude is not very obvious; it looks rather like a classic title given to what was merely a Life Study. There are three pretty statuettes by Mr. Derwent Wood intended as sketches for Garden Statues (523-5), and a panel by Mr. Roscoe Mullins, the centre of a memorial (503), a figure in relief and a heraldic shield which combine in very decorative lines, and which is worth a better position than has been given to it.

ACCIDENTS FROM MECHANICALLY-DRIVEN VEHICLES.

QUESTIONS have recently been asked in the House for returns as to accidents caused by motor vehicles, and the figures are interesting. In the cases ending fatally some returns can be obtained through the Registrar-General, but the figures as to non-fatal accidents are more vague since no notification of accident is compulsory, and the accidents of which figures can be returned are only those notified by the police. Seeing the danger incurred by the multiplication of faster vehicles it is time compulsory notification of accidents was introduced. The Legislature shows a curious indifference on this subject, in strange contrast to the grand-motherly legislation in relation to factories and where workmen are concerned.

The figures given by the Home Secretary for England and Wales of fatal accidents were the following:—For the years 1903 Motor cars, 39; motor-cycles, 15; electric and steam trams, 65; traction engines, 19; motor-wagons, 1; steam rollers, 4—total 141. The figures for 1904, for vehicles in the above order, were—59, 16, 54, 23, 9, and 5; the motor-omnibus also appeared and caused two deaths, making a total of 177 deaths. The Parliamentary Return of 1904 up to April, gave the number of motor-cars in the United Kingdom as 14,887; motor-cycles, 16,534—total 31,421. The total number of accidents known to the police to persons and property for the first three months of this year from motor-cars, motor-cycles, and motor-omnibuses was 1,726; if this first quarter of the year can be taken as representative this would show the number of accidents in the year to be about 5,278, or about one accident to every six vehicles, but, allowing for the increase in the number of cars and cycles, say, one accident to every ten cars and cycles. The total number of street accidents attributable to horse-drawn vehicles in the year ending April, 1904, was only 22,538, 7,921 being accidents to persons. The strict legislation for the protection of persons in steamships, railways, factories, and workshops will become an anomaly if the dangers of the streets are to increase and be perfectly neglected.

ART UNION OF LONDON.

MR. J. MACKRELL presided on Thursday, at the rooms of the Society of Arts, Adelphi, over a general meeting of the members of the Art Union of London to receive the report of the Council, and for the distribution of prizes of works of art.

Mr. F. L. Marriott, secretary, read the seventieth annual report, which stated that the commission to Mr. W. L. Wyllie, A.R.A., to make an etching of his "Trafalgar" painting as the plate for the year had been amply justified by the appreciation with which the work had been received. The entire *Remarque* proof issue was subscribed for within a few weeks of publication. The Council had again selected a few small water-colours of special merit for inclusion in the prize list, and it was hoped to make this a permanent feature. They were considering how far it might be possible for them to include the products of the sculptors' art amongst the works issued by the Union at a scale of subscription that might bring them within reach of all. Unusual interest belonged to the plate for the coming year. The picture from which it was taken, entitled "Day Dreams," by Mr. W. R. Symonds, was exhibited in the Royal Academy in 1904, and had been purchased by the Council with a view to its adoption as the first prize in the next distribution. They were fortunate in securing the services of Miss E. M. Hester to engrave the plate. In deciding upon the issue of this plate, the Council were not altogether influenced by the wish to mark the happy revival of mezzotint engraving, which was becoming increasingly apparent. They trusted that the election of two engravers by the Royal Academy might materially help forward the realisation of the National School of Engraving which the Council had so much at heart, and which it was hoped the Academy might see their way to undertake. The Society's supporters in Canada were still debarred from any share in the prize distribution, but the Council were by no means allowing the matter to rest.

Dealing with the year's art, the Council congratulated the National Gallery on the Venus and Cupid known as the Rokeby Velasquez and also on having commenced the rearrangement of all the Turner drawings. The National Gallery of British Art had been enriched by the purchase of 116 sketches and studies by Alfred Stevens and by other works of art. The National Portrait Gallery was fortunate in having been able to purchase the splendid crayon portrait of William Cooper, drawn by Romney. Reference was also made to the additions to the Victoria and Albert Museum and the British Museum, and to the exhibitions of the Royal Academy and many other exhibitions both of a public and private character in London and the provinces.

The Chairman, in proposing the adoption of the report, remarked that no more important picture had been exhibited than that of Mr. Wyllie of last year, and proceeded to give some of his father's recollections of the state of things in the country at the time of the battle of Trafalgar when an invasion by Napoleon was daily expected. With regard to the attempt of the Society to revive mezzotint engraving amongst their works of art, he trusted it would be appreciated by the public and would tend to increase their subscriptions. The depression in trade had not helped the Society, but still they had done better than last year.

The report was adopted. The draw for the 106 prizes was then proceeded with. The first prize of 100 guineas was won by Mr. R. C. Willis, of Palmer's Green.

Architectural Societies.

GLASGOW INSTITUTE OF ARCHITECTS.—The annual general meeting of the Institute was held in the rooms, 187, Pitt-street, Glasgow, Mr. John Keppie, F.R.I.B.A., President, in the chair. The President referred to the death of Mr. R. A. Bryden, F.R.I.B.A., who was one of the original members of the Institute, having joined in 1868, and it was agreed to minute an expression of deep regret. The secretary submitted the annual report, which stated that during the past session the Council had been actively engaged with the arrangements in connexion with the scheme for amalgamating the Glasgow Architectural Association with the Institute. The attention of the Council was called to the undue proportion of unpaid apprentices employed in many architectural offices, and, as the matter was considered of special urgency, a circular calling attention to this was issued to the members of the Institute, asking them to adhere, as far as possible, to the practice of employing one apprentice only to each draughtsman. The Council desired to call attention to the facilities for study which were available in the recently-established "Glasgow School of Architecture," conducted by the Technical College and the School of Art. With reference to the reconstruction of the Royal Infirmary, the report stated that the proposal to employ terra-cotta had, it was understood, been departed from. The report was adopted. The President, in his valedictory remarks, referred to the subject of registration as perhaps the most important matter before the architectural profession at the present time. Although the scheme for amalgamating the Glasgow Architectural Association with the Institute had not yet been formally carried out, he hoped the matter would be completed at an early date. The Council for the ensuing year was elected as follows:—Messrs. A. N. Paterson, John Keppie, H. K. Bromhead, James Lindsay, T. L. Watson, James M. Monro, Alexander McGilgibon, Andrew Ealfour, Charles Gourlay, Thomas Baird, jun., R. D. Sandilands, George Bell, Alexander Skirving, Robert Miller, John B. Wilson, and H. E. Clifford. The treasurer's accounts, which were submitted and approved of, showed that a funds were in a satisfactory position. A meeting of the newly-elected Council followed at which office-bearers for the year were appointed, viz.:—President, Mr. James M. Monro; Vice-President, Mr. George Bell; Auditor, Mr. Alexander Skirving; Secretary and Treasurer, Mr. C. J. MacLean. The various committees for the year were also appointed.

MANCHESTER SOCIETY OF ARCHITECTS.—By the annual Report of the Council (the forty-second) we learn that the Society now counts 223, an increase of 4 since last year. The Report refers specially to the legacy of the late Mr. Mills to the Society, which included 8,000*l.*, to be set apart and invested so as to produce so far as practicable a certain and permanent income therefrom for the benefit of the Society; and Mr. Mills further provided that his trustees should select such of his plate, plated articles, books, pictures, prints, statuary, bronzes, linen, china, glass, furniture, and other articles of household or domestic use or ornament as will be suitable for the purpose of furnishing a building or rooms for the use of members and students of the said Society or suitable for ornamental or instructive purposes in any building or buildings belonging to or under the control of that Society or for any such purpose. The Council has received from the trustees of the late Mr. Mills the articles selected by them, which are of the value of about 1,000*l.*, and are now stored till arrangements can be made to obtain suitable premises for the use of the members; a committee has been appointed with this object, and is now engaged endeavouring to find premises.

EDINBURGH ARCHITECTURAL ASSOCIATION.—The annual meeting of the Association was held at 117, George-street, on the 18th inst., Mr. H. O. Tarbolton, the President, in the chair. The Chairman of the Committee of Management reported that 1907 would be the jubilee year of the Association, and it had been suggested that the event should be celebrated by holding an exhibition and inviting the Royal Institute of British Architects to hold their annual dinner and other meetings in Edinburgh that year. Mr. J. T. Baillie moved that Mr. Hippolyte J. Blanc, R.S.A., be appointed President for next session. Mr. W. T. Oldrieve, H.M. Office of Works, seconded, and the motion was unanimously agreed to. Mr. Baillie and Mr. Oldrieve were elected Vice-Presidents; Mr. Colin B. Cowrie, Hon. Secretary; Mr. W. G. Walker, C.A., Hon. Treasurer; and Mr. John Watson, Librarian. Mr. Tarbolton, in his address, said they looked forward to the time when the municipality would look to the Association for guidance in questions that affected the architectural development of the city. Matters dealing with the training of the architect student had been very much influenced by recent events, and possible forthcoming changes in art education in Edinburgh. The proposed new Municipal Art School would be concerned with the general principles of art education, but could not be expected to carry its students into the higher regions of the particular science of architecture. That such a school was likely to be instituted in Edinburgh was a matter for congratulation, and with it would be introduced, he hoped, a new era of activity. The foundation of this art school would be a task that would demand the most anxious attention on the part of the municipality, and he hoped no steps would be taken without consultation with acknowledged experts in architectural training. He maintained that the teaching throughout the school should be of a synthetic nature,—i.e., that there should be common groundwork for all the teaching, so that free inter-communication could take place between the various branches of study. All students should be trained up to a certain point before particularising in any one branch. Painters, sculptors, decorators, designers, and architects should have a definite and common basis of art training, for he was convinced by so doing the student would be enabled to discover his real vocation. Painters would benefit by an architectural training, and architects would gain immeasurably by a knowledge of the theory and possibly practice of painting. At present men following the various art callings worked on almost parallel lines which seldom touched, and more overlapping would produce mutual benefits. With regard to the subjects which would be necessary for the course of art and science training of the architecture student, he could only quote from the recommendation of the Board of Education of the Royal Institute of British Architects, as follows:—I.—The nature and properties of building materials. II.—Construction, including (a) applied mechanics and mathematics in so far as they

were necessary to the solution of problems of construction; (b) the practical methods of the building trades. III.—Architectural drawing, including (a) in the elementary course—geometrical, freehand, perspective, and graphic methods of working out problems, and such drawing as will train the student in the selection of form and in the study of mass and proportion; (b) in the more advanced course—drawing of a more advanced nature, and to include a course of study from the antique and life. (He should certainly like to add to this course the theory of colour, which he considered most important for all architects.) IV.—The study of architectural forms that have been evolved in the architecture of the past out of constructional necessities, and exercises in the design of construction to meet definite problems. V.—The study of the history of architecture in so far as it illustrates and explains the evolution of architecture through constructional material and social conditions. The new school for architectural training would not be complete without a workshop, where demonstrations could be given in actual materials. Modelling, too, should be taken as an item in the general art studies. Professor Baldwin Brown, in moving a vote of thanks to Mr. Tarbolton, said, with regard to the question of architectural education and the new art school that they hoped would be established before long, they would like to see architecture taught in the school according to a proper system, and that the whole decorative arts would be grouped together under architecture and looking to architecture as their head. He should like painting to remain, in their new system, entirely under the control of the Royal Scottish Academy, so as not to break the long and honourable tradition of the life school of the Academy. If that tradition were broken, they would do more harm than good to that branch of education. They would do best by building on the foundations they had.

Archaeological Societies.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—A meeting was held on the 18th inst., Mr. C. H. Compton, Vice-President, in the chair. An exhibition of Samian ware and flint arrow head discovered in Elmstead Wood, near Chislehurst, was made by Mr. Nichols. Mr. R. H. Forster, hon. treasurer, read a paper upon "The Tenth Iter of Antoninus and the Roman Stations in the North of England." He said the course of the tenth iter from Mediolanum through Manchester and Ribchester so far as Overborough has been generally agreed upon, but the positions of the remaining stations have been the subject of much speculation. Mr. Watkins ("Roman Lancashire") continues the route northwards, making Borrow Bridge, Alone; Kirby Thore, Galava; and Whitley Castle, Glanoventa, the terminus of the iter; but this is not satisfactory, as Whitley Castle is not a likely terminus, and a comparison of the distances given in Iter II. and Iter V. show that Kirby Thore was Bronconac—probably the same as the Braboniacum of the "Notitia." Old Carlisle, near Wicton, has been suggested, but it is hard to fit the intervening stations to known Roman sites. A more likely place is Ravenglass, which was an important post up to medieval times; and if Ravenglass be Glanoventa, Ambleside will be Galava, Watercrock, near Kendal, Aho, and Overborough. Galacum, the respective distances corresponding with fair accuracy if the route from Overborough be taken due west till the road from Lancaster to Watercrock is joined. Assuming that Glanoventa, Aho, and Bremetonacum of the Itinerary are the Glanibantia, Alone, and Bremetonacum of the "Notitia," we get three of the stations *per lineam colli* in a definite order, and it is possible to connect this line with the line from Segedunum to Amboglanna, if we take into account the duties of the garrison of the north of England, which at the date of the "Notitia" had been largely reduced. The wall across South Northumberland was fully garrisoned, but North Cumberland seems to have been strongly held; in fact, rather policed than garrisoned. The prime necessity in the West was the protection of the Cumberland coast from raids by the Picts and Scots, and most of the intervening stations must be sought for here. Possibly Petriana

was Stanwix, beside Carlisle, and the Ala Petriana may also have garrisoned Old Carlisle. Aballaba is identified with Papcastle, and the four remaining stations probably lie on the coast, viz., Congavata at Millray, Axeldunna at Maryport, Gabrosca at Burrow Walls, near Workington, and Tannocina at Aboresly, near Whitehaven, where a small natural harbour formerly existed. Olennacum and Virosidum remain, and these, if the line is continued, should be south of Ribchester—possibly at Wilderspool, near Warrington, and Brough, near Buxton. This arrangement suggests that a large part of the reduced garrison of Britain was employed in watching the hill tribes of the central mountain chain, and that the troops included in the second section of the Notitia list guarded the eastern and northern valleys, especially as we get a linea of Lavatre (Bowes), Vertere (Brough), and Brabonnum (Kirby Thore). Presidium may have been Brough, on the Hamber, Danum has been identified with Doncaster, and Morlum may be placed at Templeborough. Placing Arbeia at Alnborough, Dictis at Hkley, and Concaugium at Bainbridge, near Askrigg, we come to the linea mentioned. Longovicum seems to be Lancaster, in Durham, and the intervening stations of Maglova and Magva may possibly be found at Whitley Castle, near Alston, and Old Town, in Allendale. If the last station, Derwentio, were Elcheater, the linea would end only fifteen miles from Segedunum, where the "item per lineam vallii" section begins; but this would involve a change of name, and perhaps Derwentio is an outlying station on the Yorkshire Derwent. The paper was accompanied by maps and other illustrations. An interesting discussion followed the paper, in which the Chairman, Mr. Emanuel Green, Mr. Edmonds, Mr. C. J. Williams, and others took part.

Engineering Societies.

THE INSTITUTION OF CIVIL ENGINEERS.

At the annual general meeting of the Institution of Civil Engineers held on Tuesday evening, Sir Alexander Binnie, President, in the chair, the result of the ballot for the election of officers was declared as follows:—President—Sir Alexander B. W. Kennedy, LL.D., F.R.S.; Vice Presidents—Mr. W. R. Galbraith, Mr. William Matthews, C.M.G., Sir E. Leader Williams, and Mr. J. C. Inglis; other Members of Council—Lieut.-Colonel W. P. Anderson (Ottawa, Canada), Mr. B. Hall Blyth (Edinburgh), Mr. John Benton, C.I.E. (India), Mr. C. A. Brecken, Mr. R. Elliot-Cooper, Colonel Davis (Sydney, N.S.W.), C.B., Mr. Joseph Davis (Sydney, N.S.W.), Dr. G. E. Deacon, Dr. Francis Elgar, F.R.S., Mr. M. Fitzmaurice, C.M.G., Mr. R. A. Hatfield (Sheffield), Mr. G. H. Hill, Mr. Walter Hunter, Mr. J. H. Johns (Johannesburg), Mr. G. R. Jelli (Birmingham), Sir William T. Lewis, Bart. (Aberdare), Sir George Livesey, Mr. A. G. Lyster (Liverpool), Sir Andrew Noble, Bart., K.C.B. (Newcastle-on-Tyne), the hon. C. A. Parsons, C.B., F.R.S. (Wylam-on-Tyne), Mr. A. Ross, Mr. A. Siemens, Mr. J. Strain (Glasgow), Sir John I. Thorneycroft, LL.D., F.R.S., Prof. W. C. Unwin, B.Sc., F.R.S., Mr. A. F. Yarow. The Council of the Institution have made the following awards for papers read and discussed before the Institution during the past session:—A Telford gold medal to Mr. J. A. Sauer, a Watt gold medal to Mr. G. E. Stoney, and a George Stephenson gold medal to Dr. T. E. Stanton; Telford premiums to Mr. Leonard Burstow, Mr. H. S. Bidwell, Mr. J. J. Webster, Mr. Calheart W. Methven, Mr. H. A. Mavor, Sir Frederick R. Upcott, K.C.V.O., C.S.I., and a Manley premium to Mr. D. E. Lloyd-Davies. The presentation of these awards, together with those for papers which have not been subject to discussion and will be announced later, will take place at the inaugural meeting of next session.

Books.

Ecclesia Antiqua. By the Rev. JOHN FERGUSON. (London and Edinburgh: Oliver & Boyd, 1905.)

UNDER this title the author, who is the minister of Linlithgow, has written a very

full and exhaustive account of his fine parish church. From the nature of much of its contents the interest of this work will probably be, as the author suggests, largely local, but the building itself is so well known outside its immediate neighbourhood as one of the finest parochial churches of Scotland that this painstaking effort to record all that is most interesting from its foundation to the present will appeal to a wider circle of readers.

The church has undergone two restorations, and the result of each is shown by photographic illustrations. Of the first, in 1812, the less said the better. The second, commenced in 1904, has restored the church to something of its ancient beauty by the clearing away of the galleries and other disfigurements of the early part of the century and the opening of the church for its whole length. The depressed vaulted ceiling has still to be dealt with, and stalls provided in the choir.

In addition to a description of the church itself, a chapter is devoted to the ancient chapels connected with it; a list of the vicars is given from 1264, and in an appendix are given the dedications and details, as far as recorded, of the numerous altars that were formerly in the church.

Good photographs are given of the exterior and interior, and a ground plan. The latter, however, has no scale.

Hygiene. By J. LANE NOTTER, M.A., M.D., etc., and R. H. FIRTH, Lieut.-Col. R.A.M.C., etc. Sixth Edition. London: Longmans, Green, & Co. 1905.

The authors of this well-known text-book state in the preface to the new edition that "the present issue has been completely revised, in many places completely rewritten, and much new matter added." It contains eleven chapters, dealing with air, water, food, sites, and buildings, refuse disposal, personal hygiene, infection and disinfection, parasites, climate and weather, vital statistics, and sanitary law. Much of the matter is above criticism, but the architect will find in the chapter on sites and buildings the need of further revision. Fig. 34 is a case in point; the brick footings are badly bonded, the damp-courses are not continued under the wood sleepers, and water soaking from the ground into the outer lining of the hollow wall would spread over the damp-course at the bottom of the cavity and rise upwards in the inner lining. The wash-out water-closet is not one of the "best kinds," and the wash-down closet, illustrated in Fig. 45, is not "one of the best" of its class, but is defective in the shape of the basin and the position of the outlet joint. Zinc as a material for wastepipes and soil-pipes ought not to be mentioned, except for condemnation. The authors are more at home in the other chapters, which will be of great value to sanitary inspectors and others.

Sanitary Engineering: A Practical Manual of Town Drainage and Sewage and Refuse Disposal. By FRANCIS WOOD, M.Inst.C.E., F.G.S. Second Edition. London: Charles Griffin & Co. 1906.

Four years ago we reviewed the first edition of this book, and drew attention to a number of errors and misprints. We are glad to find that these have now been corrected, but it is a pity that the author has not taken the trouble to revise the whole work carefully, as we did not, in our short review, mention all the errors and loose statements which were to be found in the book. The latter part of the paragraph on pp. 175 and 176 still contains two or three serious mistakes: If the daily discharge of sewage per head is 18 gals., "an average house" which "contains five persons" will not produce "about 180 gals. per day," and if we accept the author's data as to the proportion of albuminoid ammonia, the quantity of water to be added in order to render the sewage "pure enough to be allowed to discharge into a river without treatment" will not be "67,500 gals.," nor anything like it; and what, we may ask, is to be gained by making the sewers of sufficient capacity to allow the sewage to be diluted with the surface-water produced by a daily rainfall of 8.5 in., 7-in. rainfall of more than 3,000 in. per annum! In the second paragraph of page 176 we pointed out an error in calculation, and our correction

(486 instead of 375) has been adopted in the new edition, but the author has not troubled to revise the next paragraph, where 375 still stands in company with other errors. The author's logic is more quaint than cogent; on page 177 we find (in both editions):—"The separate system [of drainage or sewerage] would be carried out in a town with good gradients; it is policy to do so, and if this is the case, which we may admit for the moment, then it is also policy to do so in all other cases." It is a pity that such blemishes as these should have been allowed to remain in a book which has many good qualities and contains much useful information. Two pages have been added to describe the method of refuse disposal adopted at Fulham, and a few small alterations have been made in the text, but, in the main, the new edition is a revised copy of the first.

Mechanics of Air Machinery. By Dr. WEISBACH and Professor HERMANN. Translation by Professor A. TROWBRIDGE. (London: Crosby Lockwood & Son, New York: D. van Nostrand Co. 1905.)

ENGINEERS in the United States are far more familiar than their English confrères with Weisbach's work on "Engineering Mechanics"—a treatise which was revised by Professor Hermann and has been translated in separate volumes for American engineers. The book now issued is the final portion of Weisbach's work published in the English language. It is not a complete treatise upon air machinery, being devoted mainly to the consideration of fans, blowers, and auxiliary apparatus, which constitute but a very small proportion of the appliances coming under the category of pneumatic machinery in the present day. The intending purchaser of the book before deciding whether or not it will fulfil his requirements. The theory of air movements and air-moving appliances is sound and admirably worked out, although some of the illustrative matter and data are now obsolete. The translator has evidently recognised the inadequacy of this chapter from Weisbach as a treatise on modern air machinery, for he has added an appendix, wherein descriptions are given of some modern air-moving machines, such as blowing-engines, blast furnace gas blowing-engines, air compressors, and high-pressure fans. As these are of American types and are only described in general terms, the appendix does not add very materially to the value of Weisbach's theoretical discussion of the subject. When an engineering treatise has arrived at the respectable age attained by Weisbach's classical work, mere translation into another language can scarcely be expected to effect the rejuvenation that is demanded by the requirements of a new generation.

Tables for the Conversion of Canal Boat Gaugings to Standard Tons. Compiled by S. L. THACKER, M.Inst.M.E. London: Iron and Coal Trades' Review, 1906.

This table serves as a further illustration of the general method of calculation recommended in Article XIII. of our present Student's Column. Recognising the disadvantages of the irregular and unsystematic methods hitherto adopted for computing the actual weights carried in canal barges, Mr. Thacker has calculated constants by which, with careful gauging, the standard weight can be ascertained by a simple multiplication within 5 cwt. The following example given by the author shows the labour-saving nature of his table of constants:—

"Boat 71 ft. × 7 ft. 1 in. New gauge 263 in. Then under 7 ft. 1 in. and oppo-to 71 ft. find 1.067. Then —26.5 × 1.067 = 28.3, say, 28 tons 15 cwt."

We may remark that, in the original, 26.5 is printed as 265, a little slip which the author and the publishers have doubtless noticed by this time. Those of our readers who make use of barges for the conveyance of materials should find the table of practical utility.

Gas and Oil Engine Management: A Practical Guide for Users and Attendants. By M. POWIS BALE, M.Inst.C.E., M.I.Mech.E. Second Edition. London: Crosby Lockwood & Son, 1905.

VERY little improvement could be made in the contents of the original edition of this

excellent companion for the user of internal combustion engines. But, as during the last year or two the adoption of gas-producers has been widely extended, the author has done well to add a chapter describing and illustrating some of the various producers in the market, and giving simple directions for their management. The subject-matter of this chapter is confined to appliances of small and medium sizes, such as are suitable for ordinary industrial establishments and public institutions, and by its addition the value of the handbook is materially increased.

Brass and Iron Founding. By JOSEPH E. DANGERFIELD. London: Dawbarn & Ward.

This pamphlet is No. 8 of "The Home Worker's" series of practical handbooks, and is virtually a complement to "Pattern Making" by the same author. The method of moulding various simple patterns is described in detail, and the patterns selected as examples serve in each case to illustrate some special artifice employed by moulders. The directions here given will no doubt be of service to the amateur and to others who merely require elementary knowledge on the subject of moulding.

The Water Supply of Villages and Small Towns. By H. C. H. SHENTON, M.S.E. London: S. Edgecombe Rogers. (No date.)

This pamphlet of fifty-six pages, eighteen of which are occupied by advertisements, index, and title, contains a reprint of articles contributed by the author to the *Local Government Journal*. According to the sub-title, the matter consists of "practical notes in a handy and portable form," and the description is accurate, but the addition of suitable illustrations would have added to the value. On page 35 there is an error in the calculations:— $1000 \div 25$ does not equal 200.

The Country Gentlemen's Estate Book, 1906. Edited and Compiled by WILLIAM BROOM-HALL. London: The Country Gentlemen's Association, 24, St. James's street, 1906.

This book shows no falling off in the variety and usefulness of its contents, most of which have appeared in previous numbers, whilst some are new, such as the paper on "The Protection of Agricultural Buildings from Lightning." Surveyors, architects, and builders who are concerned with country matters will find this book now, as heretofore, almost a necessity. Apart from its utilitarian purposes, it is often interesting reading.

THE SAN FRANCISCO FIRE.

SIR,—The Press during the past week has been full of the earthquake and subsequent fire which has laid the greater part of San Francisco in ruins. In one of the accounts published by the London Press, it is stated that the only building which effectually withstood the fire was the "Mint."

It may interest your readers to know that the Mint was built of an extremely hard sandstone, of a light grey colour, with black specks. The stone was quarried on the east coast of Vancouver Island, north of Nanaimo—no suitable stone being nearer.

In 1889 I explored portions of the coast of British Columbia for sandstone for building

* This was evidently a mistake.—Ed.

purposes, and visited this disused quarry, finding the stone as above described; the appearance somewhat resembled grey granite, but on close examination it proved to be sandstone of the carboniferous series of Nanaimo. Local masons with whom I consulted also agreed that it was a sandstone, but said they had heard rumours that it had not weathered well, so when I visited San Francisco a few months afterwards I purposely went to the "Mint" and saw the clerk of the works in charge, who informed me the stone had weathered well and had given great satisfaction.

It should be understood that the "Mint" is a very substantial building (one built to last) and not of the usual American type.

JOHN J. ROBSON, M.Inst.C.E.

* * Was this a steel-framed building, or one depending on ordinary masonry? That is an important point.—Ed.

REINFORCED BRICK PIERS.

SIR,—In your report in the *Builder* of 21st inst. of the discussion of Mr. S. Bylander's paper on "Reinforced Concrete" at the joint meeting of the Architectural Association and the Junior Institution of Engineers, I am credited with suggesting Hennebique reinforcement for brick piers. This is hardly the impression I intended to convey. My suggestion was to build in vertical reinforcement at the points where the $\frac{1}{2}$ in. vertical joints of the brickwork intersect on plan, in order to reduce the cutting of the bricks to a minimum. A cheap and simple method of tensorial reinforcement would be obviously an advantage of the greatest importance in all brick piers subject to a bending moment, as in all tall piers and all piers loaded on one side only, and it does not seem to be impracticable. For instance, a 2 ft. 3 in. brick pier in cement would be reinforced in tension up to its full strength in

compression by building in vertically small angle sections which only entail the use of two half bricks in place of whole bricks at three places in each course. This would neither materially affect the bonding nor the cost. (See sketch.)

I have since heard that experimental piers built dry and reinforced with rods at the intersections of the joints have been built and tested with a marked increase of strength; but $\frac{1}{2}$ in. rods (the largest that could be built in without cutting the bricks) would be insufficient to develop sufficient strength in tension, and would not enable a tall or eccentrically loaded pier or a retaining wall counterfort to be loaded up to its full strength in compression. PERCY J. WALDEAN.

Illustrations.

THE CITY HALL, COLORADO SPRINGS, COLORADO.

HIS building is constructed of Colorado barre granite, the texture and colour being similar to that of barre Vermont.

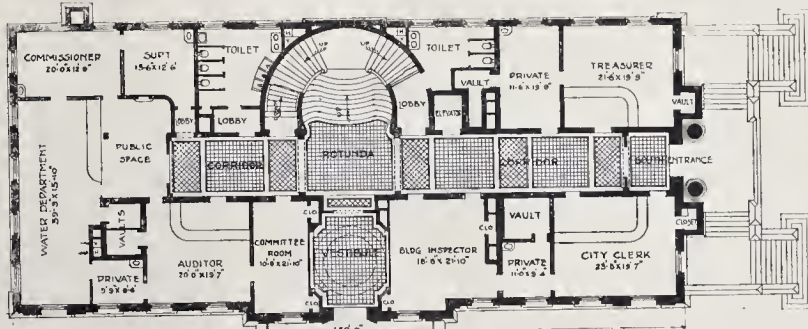

The basement and floor over are of fire-proof construction, the concrete in the floors

Basement Plan.

City Hall, Colorado Springs, Colorado. Plans.

ST. GEORGE'S RETREAT, BURGESS HILL.
SISTERS' WING & INFIRMARY.

being reinforced on the Roebbling method. Wood partitions in upper stories are covered with expanded metal lath, and cement plaster is used throughout.

The building is heated by steam on the Paul system, and with Johnson's thermostat temperature regulators attached. The steam is supplied from the city plant, thus obviating a boiler room in the building. For the ventilation of the larger rooms the Dickson system is used.

The plans herewith illustrated show the accommodations provided on the various floors. The staircase is roofed over by a simple-coffered dome and with a stained-glass light in the centre. The woodwork on the principal floors is of flat-sawn oak, and the council-chamber walls are wainscotted to a height of 15 ft. The woodwork is stained a neutral green.

The plans and specifications were prepared by Mr. T. MacLaren, architect, Colorado Springs (formerly of London), while the building was superintended by Mr. T. P. Barber, architect, and Mr. C. E. Thomas. The contractor was Mr. L. S. Atkinson.

SISTERS' WING AND INFIRMARY,
ST. GEORGE'S RETREAT,
BURGESS HILL.

A NEW wing has recently been added to St. George's Retreat, Burgess Hill, Sussex, affording accommodation for the sisters and an infirmary for the patients, which latter is provided with nine beds. It is mainly of brick and faced with local grey stocks, with red rubber arches, and is covered with green Whitland Abbey slates. The community-room is panelled with Kauri pine. All floors are of fireproof construction, and mainly laid in "Eubœolith" and wood-block paving. "Fram" partitions are used to divide the bedrooms. The infirmary being of one story only, the roofing has been so constructed as to form a promenade for the patients.

The whole building is heated with a low-pressure hot-water system, and is lighted by electricity supplied from its own station in the grounds.

The work has been carried out by Messrs. Parnell & Son, of Rugby, under the superintendence of Mr. Edward Goldie, architect, of Kensington, Mr. E. Wingfield-Bowles having acted as consulting engineer for the electric-light work.

DESIGN FOR AN OPEN-AIR
SWIMMING-BATH.

This design, by Mr. Adrian Berrington, of Prenton, Birkenhead, was submitted for the Title Prize of the Institute of Architects this year, for which it could have had no chance, as it is not in the Italian style, which is always a condition in the competition for the Title Prize, the prize having been founded with the special object of encouraging the study of the Italian style of architecture.

This, however, was only a misunderstanding, or an error of judgment, and as the design has in itself some fine qualities,

and shows very great promise as the work of a young student, we have wished to give him whatever encouragement he might derive from its publication in our pages.

The design was made when the author was a student of the age of eighteen in the Liverpool University School of Architecture.

In regard to his intentions in the design Mr. Berrington writes:—

"In my design I have striven to combine the monumental and mystic character of Egyptian architecture with the unity of conception of the Classic on broad Classic lines rather than on the distinctive Italian interpretation. I thought of it as being built in a town, hence its inaccessibility through all but the ordered entrances, and intended the large halls as a setting for splendour and the pseudo-underground apartments as a refuge from the heat; the open stadium and the spread of steps as an aid to the pageants with which I filled it in my mind's eye; the small courtyards, with their little colonnades as a foil to the plane expanses of the pylons, whose angles are carried to the ground and into the water; the whole, as a large white cup, where the rays of the sun might beat from side to side, and in which men might bask in seclusion in the town."

The name "J. Arthur Berrington" on the plates is a mistake; the father of the author wrote to us with that signature, and hence there arose a confusion between the two names, which was unfortunately not discovered till after the plates had been printed off.

Fifty Years Ago.

FROM THE *Builder* OF APRIL 26, 1856.

MONUMENT AT ST. PAUL'S TO THE DUKE OF WELLINGTON.—In reply to Viscount Chelsea, in the Commons, on the 18th inst., Sir B. Hall said that if the disposal of the 25,000*l.* balance of 80,000*l.* voted for the Duke's funeral were placed, by the Chancellor of the Exchequer, under his control, he would not rest satisfied with the two designs for a monument sent in by Mr. Baily and Mr. Foley at the time when these gentlemen and Mr. Gibson and Baron Marochetti were asked to compete, but would call in the aid of a greater number of artists of the highest eminence in this country, in order to see whether the genius of the country could produce some monument worthy of the memory of so great a man.

ALL HALLOWS CHURCH, EXETER.—The church in Goldsmith-street is being demolished for a widening of the thoroughfare. It consisted of a chancel and nave with a west turret, constructed of stone, and after the Decorated style, affording accommodation for 200 persons. It was rescued from destruction in 1658 by a parishioner, Robert Wilwayne, who bought the church for 50*l.* During the interval 1767-1822 All Hallows was used for vestry purposes only; the fabric was restored in 1883-4, and three years subsequently the west wall was rebuilt.

Competitions.

ST. PANCRA'S CENTRAL LIBRARY.—The Public Libraries Committee of St. Pancras reported on Monday having decided that the designs for the Central Library must be sent in not later than June 15. A copy of the requirements and conditions, together with a plan of the site, has been forwarded to each of the six competing architects, who have been requested to submit any questions not later than May 15.

CHURCH AND SUNDAY-SCHOOL, WOLSTANTON.—In a competition held recently for a new Congregational church and Sunday-school at Wolstanton, Stoke-on-Trent, the design sent in under *nom de plume* of "Ready" was selected by the Architect to the Congregational Union, to whom the designs were submitted for adjudication. The author of this design proved to be Mr. Reginald T. Longden, of Burslem. The scheme includes a church to seat between 500 and 600, and with vestries, organ-chamber, etc., and Sunday-schools in distinct apartments for kindergarten, primary, junior, intermediate, and senior scholars respectively, with twelve classrooms, superintendent's room, and library, church parlour, and kitchens, etc. The building will be of local brick, with cherry-coloured, sand-faced, stock facings, with wide joints and stone dressings, panels of rough-cast being introduced. The roof will be of red tiling.

BANGOR FREE LIBRARY.—The first premiated design in this competition, as announced in our last issue, was that sent in by Messrs. Dixon & Potter, 65, King-street, Manchester. The second premiated design is by Mr. Vernon Hodge, 13, Grand-parade, Teddington, Middlesex.

LIBRARY, OLD KENT ROAD.—At the meeting on Wednesday of Southwark Borough Council the Libraries Committee reported that ninety-nine sets of designs had been received for the proposed public library, old Kent-road. The Committee had instructed the Town Clerk to communicate with Mr. Rowland Plumb, F.R.I.B.A., and Mr. A. W. S. Cross, M.A., F.R.I.B.A., inquiring whether they would undertake the selection of ten of the principal designs submitted and report thereon.

BIRMINGHAM, COUNCIL-HOUSE EXTENSION.—The following are the ten successful competitors for the final competition:—Messrs. Ashley & Winton Newman (London), Crouch, Butler & Savage (Birmingham), Greenway & Newbery (Westminster), H. L. Hare (London), E. P. Howard (London), Mansell, Mansell, & Dixon (Birmingham), Matesar & Simon (Liverpool), A. N. Prentice (London), Treadwell & Martin (London), Wills & Anderson (London).

NEW CHURCH, ASH VALE.—The foundation-stone is to be laid shortly of a new church at Ash Vale. The plans for the work have been prepared by Mr. Steadman, architect.

NORWEGIAN TIMBER, GRANITE, AND BRICKS.

Mr. F. GRAY, acting British Consul at Christiania, reporting on the trade of Norway for 1905, mentions that the amount of timber shipped from Norway during the last two years has been a trifle below the average, which is roughly 1,000,000 tons. The principal timber exporting town of Norway is Fredrikstad, which exports planed timber chiefly. The Vice-Consul at that

port states as follows:—The past year was not a remunerative one for Fredrikstad flooring exporters, and probably most of them have closed their books with a loss. The reason of this is chiefly owing to the unreasonably high prices that they have for some time past had to pay for their logs and sawn wood, which again was caused by the lively demand and strong competition throughout the year from the pulp mills and cellulose factories. The total export of timber

here as compared with two previous years has been as follows:—

	Quantity.		
	1903.	1904.	1905.
	Cubic metres.	Cubic metres.	Cubic metres.
Flooring boards	355,517	308,257	290,707
Sawn wood	134,743	114,792	143,401
Heavy timber	4,736	2,971	2,144
Round timber	59,334	42,836	41,305
Staves	23,757	24,791	26,052
Firewood	55,983	50,271	48,331
Total	633,170	544,018	551,944

Design for an Open Air Bath; by Mr. A. Berrington. Perspective Sketch.

intervals. In most cases where the three first figures are not printed they must be taken from the line above, the characteristic and decimal point being added as before. The exception to this rule is explained later.

Rule (1).—To find the logarithm for a number containing four figures, take the mantissa from the column headed (0) on the same line as the number, and add the proper characteristic.

Example (1):

log. 1008 (reading 0034605) = 3.0034605
 log. 100.8 (reading 0034605) = 2.0034605
 log. 10.08 (reading 0034605) = 1.0034605

The logarithms for numbers containing five figures, from 10,000 to 10,800, can be found in the same way.

Rule (2).—To find the logarithm of a five-figure number where only four figures of the number are printed in the column headed "No.," take the first three figures of the mantissa from column (0), opposite the first four figures of the number, and the last four figures of the mantissa from the column whose heading agrees with the fifth figure of the number, and add the proper characteristic.

Example (2):

log. 10075 (reading 0032451) = 4.0032451
 log. 1007.5 (reading 0032451) = 3.0032451
 log. 100.75 (reading 0032451) = 2.0032451

The logarithms for numbers containing six figures, from 100,000 to 108,000, can be found in a similar way.

Rule (3).—To find the logarithm of a six-figure or seven-figure number where only four figures of the number are printed in the column headed "No.," the mantissa for the first five figures is obtained as explained above, and to it is added a proportional part of the difference between that mantissa and the next higher mantissa.

The difference represents the change corresponding to an increase of one unit in the fifth figure of the number, and as the sixth figure represents *x*-tenths part of the unit, and the sixth and seventh figures *x*-hundredth parts of the unit, they may be considered as decimals of it. Therefore, if the difference be multiplied by the sixth figure or the sixth and seventh figures of the number in question, the product will be the correction to be added to the mantissa of the first five figures of the number, and, when so added, will give the required mantissa. The insertion of the proper characteristic and the decimal point will then give the complete logarithm of the number.

Example (3): Find the logarithm of 101,058.

Here 101,058 = 101,050 + 8.
 Then by Table XI.
 log. 10105 = 0.045363
 log. 10106 = 0.045793
 difference = 0.000430

Then $0.000430 \times 0.8 = 0.000344$
 and $0.045363 + 0.000344 = 0.045707$
 Therefore adding the proper characteristic,
 log. 101,058 = 5.0045707

Example (4): Find the logarithm of 1,010,585.

Here 1,010,585 = 1,010,500 + 85
 Then by Table XI.
 log. 10105 = 0.045363
 log. 10106 = 0.045793
 difference = 0.000430

Then $0.000430 \times 0.85 = 0.0003655$
 and $0.045363 + 0.0003655 = 0.0457285$.
 Therefore adding the proper characteristic,
 log. 1,010,585 = 6.00457285.

For ordinary calculations the corrections can be taken from the column headed "Diff.," where differences and their proportional parts are given—every third difference at the beginning, every second difference in the middle, and every difference at the end of the table. In cases where minute accuracy is essential and the exact difference is not given, the values must be calculated by the foregoing method.

It must be understood that the differences and their proportional parts are really decimal fractions, although printed in the table as if they were whole numbers, and that in each case the significant figures are understood to be preceded by a certain

number of ciphers, the exact number being readily obtained by inspection.

Thus in Table XIA:—
 difference 433 = 0.000433
 Because
 log. 10043 = 0.018635
 log. 10042 = 0.018202
 difference = 433 = 0.000433
 Similarly proportional part 390 = 0.000390
 and proportional part 43 = 0.000043.
 Because

$$0.000433 \times \frac{9}{10} (= 0.9) = 0.000390$$

$$0.000433 \times \frac{1}{10} (= 0.1) = 0.000043$$

Note.—It should be pointed out that the arrangement in which the first three figures of the mantissa are printed at intervals, and only in column (0), leads to apparent inaccuracy in some lines of a logarithmic table so designed.

Thus, referring to Table XI, we find that log. 10,023 reads 0009977, which is correct, and that log. 10,024 reads 0000411, which is manifestly wrong. Similarly, log. 107,994 reads 05339965, which is correct, and log. 107,995 reads 05330365, which is wrong.

The fact is that, after the value of the last four figures in any mantissa has passed beyond 9999, the value of the last figure in the first group requires to be increased by 1, so that for two of the numbers cited above the figures of the mantissa 000 and 0533 become 001 and 0534 respectively. But to record these increases in the middle of a line would be inconvenient, and to avoid disturbing the symmetry of the table, the figures 000 and 0533 are allowed to remain, the change being indicated by a thin line over the figures affected.

Therefore, to find log. 10,024, we must veil the last four figures of the mantissa in column (4) opposite number 1002, and the first three figures in column (0) opposite number 1003, thus obtaining log. 10,024 = 0.010411, which, with the addition of the characteristic, becomes 4.0010411.

In the same way log. 107,995 is found to be 5.0330365.

To Find the Number Corresponding to any Given Logarithm.

It may sometimes happen that the exact logarithm for which the number is required will be found in the table, but when this is not the case, the value may be ascertained in the following manner:—
 • **Rule (4).**—Take from the table the

logarithm next lower than that given, and write down the five figures of the corresponding number, which will be correct so far as they go. Then find the difference between the logarithm taken from the table and the given logarithm, and, in the difference column, opposite the proportional part equal to this difference, read the sixth figure of the number. In case the difference column does not contain the exact difference ascertained, take the next lower proportional part, and the number opposite to it will be the sixth figure of the number, but a seventh figure may be required to give a more exact value. The seventh figure is found by subtracting the last mentioned proportional part from the ascertained difference, appending a cipher to the remainder and considering the result as a new proportional part for which the corresponding figure must be found. This figure will be the seventh figure of the number. The process can be continued if desired until an exact agreement of the differences is reached, or until any required number of decimal places has been found.

Example (5): Find, by the aid of Table XI, the number corresponding to the logarithm 4.0034295.

Then, dealing only with mantissa
 Here we have
 given log. = 0.034295—
 next lower log. = 0.034174 = 10079
 difference = 121—
 next lower pro. part = 87 = 000002
 (append cipher) = 340—
 next lower pro. part = 303 = 0000007
 (append cipher) = 370—
 next lower pro. part = 346 = 00000008
 24 10079278

As the characteristic 4 shows the result will be more than 10,000, but not so much as 100,000, the required number is 10079.278.

Example (6): Find the number corresponding to the logarithm 0.03325376.

Here we have
 given log. = 0.3325376—
 next lower log. = 0.3325081 = 107957
 difference = 295—
 next lower pro. part = 284 = 0000007
 (append cipher) = 110—
 next lower pro. part = 80 = 00000002
 30 10795772

As the characteristic 0 shows the value of the result must be between 1 and 10, it follows that 1.0795772 is the required number.

TABLE XII.—SIX-FIGURE LOGARITHMS OF NUMBERS FROM 100 TO 9,999 WITH DIFFERENCES.

No.	0	1	2	3	4	5	6	7	8	9	D.

Tables XII. and XIII. are examples of six-figure and five-figure logarithmic tables.

In Table XII. it will be observed that, in places where the values of the last four figures of the mantissa exceed 9999, the logarithms are continued on a separate line, thus obviating any correction of the kind indicated in the note made above in connexion with seven-figure logarithms.

The differences given in the column headed (D) in Tables XII. and XIII. enable the user to calculate proportional parts for numbers having more figures than those stated in the "No." columns, as illustrated in the examples following.

Example (7): Find the logarithm of 105.25 by Table XII.

$\log. 1052 = 022016$
 $D. 412 \times 5 = 206$
 $\therefore \text{Required } \log. = 2.022222$

Example (8): Find the logarithm of 105.2 by Table XII.

$\log. 105 = 02119$
 $D. 415 \times 2 = 83$
 $\therefore \text{Required } \log. = 2.02202$

Example (9): Find the number corresponding to the logarithm 0.387925 by Table XII.

given $\log. = 997925$
 next lower $\log. = 997910 = 9952$

$D. 44 \quad) \quad 15 = 000034$
 995234

$\therefore \text{Required number} = 9.95234$

Example (10): Find the number corresponding to the logarithm 0.389335 by Table XII.

given $\log. = 98935$
 next lower $\log. = 98900 = 975$

$D. 15 \quad) \quad 35 = 00077$

97577
 $\therefore \text{Required number} = 9.7577$

General Building News.

PROPOSED NEW CHURCH, BEDMINSTER.—It is proposed to erect a new church at Bedminster from the designs of Mr. W. V. Gough, of Bristol. The church has been designed to accommodate a congregation of 750, and will include a chancel, nave, two aisles, morning chapel, organ chamber, vestries, and basement. At present it is proposed to build the chancel end, and three bays of the nave with vestries below. The chancel will have an apsidal end—as will also the chancel of the morning chapel—with concrete domes, ultimately to be decorated and coloured. The walls of the building will be constructed of pennant, the interior being relieved by coloured stones and brick facings. The seating accommodation at present will be for 500, and it is proposed to use chairs. When the first part of the scheme has been completed there will then remain three bays to be added, and the organ porch.

WESLEYAN CHAPEL, BLUCHIER, NEAR NEWCASTLE.—A new Wesleyan chapel has just been opened in this village. The buildings, which are of Gothic design, have been erected with Seaton Burn bricks, supplied by the North Walbottle Coal Co., those for facing and the moulded string and label moulds for doors and windows being from Messrs. Ford & Maxwell's works at Pelaw. The church is 40 ft. by 27 ft., capable of seating 160 worshippers, with a Sunday school at right angles 42 ft. by 24 ft., to accommodate 170 children, so arranged that the two rooms can be thrown into one by the removal of a glazed swivel partition. At the rear of the church there are minister's and stewards' vestries, and advantage has been taken of the sloping nature of the site to provide a kitchen vestry, heating chamber, and storerooms in the basement. The woodwork for the pews, seats, rostrum, and dado cladding is executed in pitch pine, the remainder being in redwood stained and varnished. The front windows of the church are glazed with cathedral glass from the studio of Mr. C. J. Baguley, of Newcastle. The heating is on the low pressure system, and has been installed by Mr. Ernest Byles, of Newcastle, the painting and decoration has been carried out by Mr. E. Robertson, and the whole contract by Messrs. Brown & Bell, builders, of Newcastle. Mr. J. J. Winter has acted as clerk of works, under the supervision of Mr. J. Walton Taylor, architect, of Newcastle, who has designed the new premises.

COUNCIL SCHOOLS, ALTRINCHAM.—These new schools, in Navigation-road, Altrincham, were opened on Tuesday, the 24th inst. The schools are arranged in three separate departments and contain accommodation as follows:—Infants' department, 190; junior mixed department, 300; senior mixed department, 300. Special provision is also made for instruction in science and art,

cookery, and manual instruction, separate accommodation being provided for these purposes. The total cost of the school is approximately 13,247, and the work has been carried out from the designs and under the superintendence of Mr. Wm. Owen, Manchester, Mr. Thomas Clayton having acted as clerk of the works. The contractor for the general work is Mr. Wm. Thorpe, Old Trafford.

NEW ELECTRICAL SCHOOL, CHATHAM.—In the construction of the building for the electrical school for H.M. War Office at Chatham, considerable use is being made of reinforced concrete for floor beams of various types, designed in accordance with the Wells system, which, so far as can be judged from the drawings, appear identical with the Hennebique system except in respect of the members for resisting shearing stresses, and as these have one leg only in place of two, we do not think the new form possesses any recommendation. The building was designed by the late Colonel E. C. Moore, R.E., and is being erected by Stuaarts Granolithic Stone Co. under the supervision of Colonel A. Hill, R.E. (retired).

SUNDAY SCHOOL ENLARGEMENT, BOURNE-MOUTH.—The Sunday school of the Pakesdown Congregational Church is at present being enlarged and improved. The scheme comprises a continuation of the existing school, to a length of 45 ft., by 35 ft. in width, and the addition of four class-rooms, with cloak rooms, lavatories, etc., the construction being of red brick. Mr. R. C. O. Cooper is the architect, and Messrs. Jenkins & Son, Limited, are the builders.

SCHOOLS, BOURNVILLE.—The public elementary schools which Mr. and Mrs. George Cadbury have built at Bourneville have just been completed. The schools are designed to accommodate 540 scholars—270 boys and an equal number of girls—and have cost upwards of 30,000, to build, furnish, and equip. They stand in the centre of the village and have frontages to Linden-road and Thorn-road. On the south they are bounded by the village park, and to the north the children are to have the privilege of free entry, thus extending their playing space when at school to upwards of ten acres. The buildings have been designed in the Gothic style, freely treated, by Mr. Alexander W. Harvey, consulting architect to the Bourneville Village Trust, and their construction has been carried out by Messrs. J. Bowen & Sons, of Birmingham. Their most distinctive feature is a massive square tower, embellished with sculptured stonework, which forms the southeast corner, and furnishes entrances for the girls. These are rendered imposing by bold stone staircase approaches. The boys' entrances are from Thorn-road. The general plan of the building is rectangular, with a hall 84 ft. long and 32 ft. wide in the centre, and twelve class-rooms are arranged around it. The southern aspect is built up from a basement to provide for the natural fall of the land, and in this commodious rooms have been fitted for teaching technical arts and handicrafts to the boys and laundry work and cookery to the girls. In the two upper stories of the tower are a library and a laboratory. The schools are provided with the electric light, and heated and ventilated by a combined system. A distinctive feature of the schools is a carillon of twenty-two bells set in the tower. The bells have been cast by Messrs. Taylor, of Loughborough.

MISSION HALL, SALISBURY.—The new mission hall of the Salisbury branch of the Railway Mission has just been completed. The architect was Mr. A. C. Bothams (City Surveyor), and Messrs. Day Brothers were the builders. The total cost of the building has been about 1,690.

KING'S COLLEGE HOSPITAL.—At the last annual meeting of the court of governors, presided over by the Rev. Dr. Headlam, principal of King's College, the chairman stated that they had received about one-half of the sum of 300,000, for which an appeal is now before the public, and are now in full possession of the site on the Sanders estate, Denmark Hill, presented by the Hon. W. F. D. Smith, M.P., in memory of his father, the late Mr. W. H. Smith, treasurer of the hospital. Building operations will be begun forthwith and the out-patients' department will be the first to be constructed for which the selected architect, Mr. W. A. Pitt, has been instructed to prepare working drawings.

FREE CHURCH HALL, ROTTERDAM.—The new hall of the Rotherhithe Free Church in Lower-road was opened a short time ago. In shape the structure is an elongated octagon, with a span roof. The area has been excavated to the depth of about 6 ft., so that the audience pass down several steps to reach the floor. The platform rails and stair borders are painted white, and will be picked out with gold. When sufficiently dried the walls will be coloured a light green. A system of electric lighting has been installed by Mr. Wilton. The architect was Professor Beresford Pitt and Mr. W. A. Pitt, the builders being Messrs. W. Lawrence & Sons. The scheme also includes the erection of a school-room, book-room, club-room, and temperance hotel, but only the hall has been proceeded with at present. The contract for the main buildings and vestibule was signed for 5,650, which

did not include the cost of lighting, flooring, chairs, etc., which are estimated to cost 750, additional.

PUBLIC LIBRARY, BEVERLEY.—The new public library at Beverley has been completed. The lending library, reference library, and newsroom are all on the ground floor, entered directly from a staircase hall immediately to the left of the entrance hall. In the newsroom stands are provided around the walls for twenty-two or twenty-three newspapers. Adjoining the newsroom and separated from it by oak screens is the lending library, with sufficient space to give accommodation for some ten or twelve thousand volumes. The reference library is furnished with tables and chairs for thirty-four readers. On the first floor is a lecture-room, a committee-room, and an art gallery. The latter occupies the whole length of the back part of the building over the lending library and reference room, and is lighted for the most part from the roof. The fittings and internal woodwork are of oak and the floors of the art gallery and lecture-room of blocks of the same wood. The heating throughout is by means of hot water in pipes and radiators with a fireplace in addition in the committee-room. The building is illuminated by the incandescent light. The work has been carried out under the supervision of Mr. John Cash, architect, of London. The building contractor is Mr. G. Duce, of Beverley, and the sub-contractors are Mr. Robert Page, Beverley (stonework), King & Co., Hull (heating), Darlington School Purvising Company (fittings), Robert Canby, Beverley (painting).

RAILWAY OFFICES, YORK.—The staff of the North-Eastern Railway Company will, during the next few months, enter on possession of their new head offices at York, which have been five years in course of erection. The constructional work was completed last year, and the final stages of internal fitting and decoration are approaching completion. The building occupies the site of a Congeries of old tenement property lying between Station-road and Turner-row, with a main facade to a narrow street which divides it from the old offices. The design won the silver medal at the French Exposition two years ago, and has been exhibited at the Royal Academy, as a happy result of the co-operation of two architects—not always a successful experiment—Mr. Horace Field, of London, who is mainly responsible for the elevation, and Mr. W. Bell, the chief architect of the North-Eastern Railway, having collaborated with the most harmonious results.—*Yorkshire Post.*

LIVERPOOL COUNTRY HOSPITAL FOR CHILDREN.

—The new Liverpool Country Hospital for Children is being erected at Hessel, on an elevated site of 10 acres. When completed the new hospital will provide accommodation for 200 beds, and will be erected in the form of the letter "H." It has not, however, been found possible to proceed with the full scheme all at once. The portion now being undertaken is the central block, some part of which is to be utilised as temporary accommodation for wards until the ward blocks themselves can be erected. The central block will cost 25,000, and it will eventually be used as the administration block and as playrooms and schoolrooms, and accommodation will be found for 100 beds. The final one of the whole scheme is to be about 50,000. Messrs. H. & A. P. Fry, of Hucknashley, are the architects of the new buildings, and the contractor is Mr. W. H. Ford, of Birkenhead.

GLASGOW STOCK EXCHANGE ENLARGEMENT.

—The addition to the Glasgow Stock Exchange was opened on the 17th inst. The new wing, which faces St. George's-place, has been erected in conformity with the older building, the design being French Gothic in its treatment. On the ground floor accommodation is provided for the Post Office, which has a floor area twice that occupied by the old premises. Cloak-rooms, etc., have been added for the convenience of the staff, and the remainder of the floor is let for offices. The first principal floor comprises the new mining market, telephone corridor, and smoking-room. The new mining market is a room about 50 ft. by 42 ft., and 22 ft. in height, and is lighted by three windows facing St. George's-place. It is more than double the area of the old market, which will eventually be thrown into the present general market. The telephone corridor is a spacious apartment, and it will eventually open to the main staircase in the present building, and will be over 100 ft. in length. The flooring is laid throughout with india-rubber. The smoking room adjoins the mining market and telephone corridor. Practically all the second floor is occupied by the administrative department. This includes the general office, a private room for the secretary, with waiting-room adjoining, and a strong-room and typists' apartment. Communication with the old building is direct. Directly above, on the third floor, are situated the telegraph instruments room, the committee-room, and a number of offices. New lavatories and cloak-rooms have been provided, and the entire building is heated by the Reck system, while an Otis elevator connects all the

hours. The architect is Mr. John James Burnet, St. Vincent-street, Glasgow.

HOTEL, ANGLADES.—New licensed premises and hotel are about to be erected at the corner of Market-street and Guild-street, Aberdeen. Messrs. Sutherland & Pirie are the architects for the building, which will cost about 6,000l.

VICARAGE, OXFORD.—St. Paul's Vicarage, which has been erected on a site at the Woodstock-road, Oxford, on the site of the Woodstock-observatory-street, Oxford, was dedicated recently by the Bishop of Oxford. The house is of red brick, and has been built at a cost of about 1,500l. by Mr. J. Woodbridge, from the designs of Mr. F. C. Eden, Holborn, W.C.

HOSPITAL, FAZAKERLEY, LANCASHIRE.—The new Liverpool City Hospital, which has been opened at Fazakerley, provides accommodation for 350 beds. The administrative block and the nurses' home occupy the central position in the buildings, directly facing the main entrance, while the wards and isolation pavilions are ranged on the east and west sides. The erection of the hospital has been carried out from designs by the Corporation of Liverpool, Mr. T. Shillineau, and has cost about 121,475l.

CO-OPERATIVE BAKERY, BELFAST.—The opening of the Belfast Co-operative Bakery, Ravenhill-avenue, took place on the 16th inst. Mr. W. J. Gilliland was the architect, under whose superintendence the buildings have been erected. The buildings are constructed of brick throughout, with a central part of red brick, Belfast patterned brick, with white spot stone used in the principal elevation towards Ravenhill-avenue. The walls of the interior of the bakery are lined with channelled bricks. The general contractors for the building works are Messrs. W. J. Campbell & Son, Belfast. The ovens were erected by Messrs. J. M. Bell & Sons, Glasgow, and the electric installation by Mr. Stanley Johnston, Belfast. The plumbing and other fittings have been erected by Mr. W. T. Stone, Belfast. The plumbing fittings are supplied by Messrs. Doulton & Co., of London. The baking machinery has been supplied by Messrs. Melny & Co., of Glasgow, and Messrs. Pilsdery, Glasgow, and Messrs. Musgrave & Perkins, London. Messrs. Sturges & Co., Ltd., of Belfast, supplied the stable fittings. The electric installation was designed by Mr. Turner, of the Co-operative Society, Ltd., and Mr. Scott, engineer to the United Co-operative Baking Society, Ltd., has arranged the various items of baking machinery.

BOARDED LIBRARIAN, KENSINGTON.—The Borough Board of Education has been erected at the rear of the Bancroft-road Public Library upon the site of the disused mortuary and yard space adjoining. The building, which was designed by the Borough Engineer (Mr. M. W. Jamison), on the ground floor, a lecture hall 43 ft. in length, 28 ft. 6 in. in width, and 15 ft. in height, and a private study room 28 ft. in length, 16 ft. 6 in. in width, and 12 ft. in height. As occasion may require, these two rooms may be thrown into one. The partition dividing them consists of a series of doors swinging on pivots, which allow the whole to be folded against the wall without delay or trouble. The lecture hall is provided with a platform and an ante-room fitted with seats for the use of the lecturer. On the first floor is situated the Borough Librarian's office and a chamber to be used as the central reference reading room of the Borough, 60 ft. in length, 28 ft. 6 in. in width, and 20 ft. in height. Each side wall is divided into six, and each end wall into three panels by means of rows of pilasters and a cornice above, and ceiling cove above. The room is lighted by three windows at each end, in addition to the lights in the ceiling panels. A complete electric light installation has been laid throughout the building, and sufficient switches have been inserted to allow of any light being used independently. To provide for the warming of the room a special heating apparatus has been fitted in the newly-formed basement, connected with radiators placed in various parts of the building. Ample provision has been made in the basement for storage purposes, as may be found necessary. The building has been erected by Messrs. Patman & Fothergill. Special consideration has been devoted to the question of fire and other emergency, and by permission of the Mile End Board of Guardians an extra exit has been provided through their premises adjoining, to be used in case of fire only.

HOSPITAL EXTENSION, LANSDOWN, BUCKINGHAMSHIRE.—A new wing has been added to the Lansdown Hospital, near Nursing Home. The work is being carried out by Messrs. Erwood & Morris, contractors, from the designs of Messrs. Wilde & Fry, architects.

CHAPTER HOUSE OF THE LIVERPOOL CATHEDRAL.—The foundation-stone of the chapter house of the new cathedral will be laid shortly. It will be erected from funds provided by the Freemasons of the province of West

Lancashire as a memorial to the late Earl of Lathom. The architects are Mr. G. F. Bodley, R.A., and Mr. G. Gilbert Scott.

HOTEL ADDITIONS, MARGATE.—The Queen's, Kimber's, and High Cliff Hotels have recently been converted into one hotel. The necessary alterations were carried out from plans prepared by Mr. R. Dally Reeve, architect, Margate, the contractors being Messrs. Lockwood, of Westgate.

Stained Glass & Decoration.

MEMORIAL WINDOW, EDENSOR.—The dedication of a stained-glass window placed in the chancel of St. Paul's Church, Edensor, to the memory of the late Alderman E. G. Prince, J.P., a former Mayor of Longton, took place a short time ago. The subject which it depicts is the Birth, Crucifixion, Resurrection, and Ascension of Christ, and it has been erected under the supervision of Mr. J. H. Beckett, architect, by Messrs. Heaton, Barber, & Bayne, of London.

Appointment.

MR. HARRY BLACKADDER, Bargh Surveyor, North Berwick, has been appointed to the surveyorship of Bridge of Allan.

Sanitary and Engineering News.

THE LAW AS TO COMBINED DRAINAGE.—Puplar Borough Council has sent a circular letter to all the Metropolitan Borough Councils upon the question of combined drainage. They call attention to the unsuccessful attempts made by the London County Council in five sessions of Parliament to obtain an amendment of the law in respect of combined drainage by throwing upon owners the cost of maintenance and the combined drainage systems or other drains not approved by proper authority as sewers. They also refer to a deputation from the Metropolitan Borough Councils which waited upon the President of the Local Government Board in June, 1903, to urge legislation on the subject, when a sympathetic reply was given, but nothing was done to give effect to the desires expressed, and point out that the results sought might be achieved if the London County Council were to insert a clause in its next General Powers Bill dealing with the question, a precedent for which course was established by the Corporation of West Ham in its Bill of 1898 (61 & 62 Vic. Supp. 259 Sec. 42) by which it defined the word "drain" as including sewers. In conclusion, the various Borough Councils are asked to co-operate in requesting the London County Council to renew its efforts to amend the law in the direction indicated.

NECESSITY FOR FREE PUBLIC CONVENIENCES.—Dr. Collingridge, the Medical Officer of Health for the City of London, draws attention to the urgent need of having conveniences available for the portion of the public who cannot always pay the penny demanded at most of the public lavatory places; and more especially in the case of women. Dr. Collingridge says: "If it is not necessary to enter into details as to the serious injury that may be inflicted upon women by the absence of lavatory accommodation. Suffice it to state that serious and life long trouble is at times the result of such absence. This has already been recognized and provision made wherever practicable. While the ill-results are far more serious in the case of women than of men for physiological reasons, yet with the exception of the two places mentioned (Farrington-street south and Golden-lane) no free accommodation is provided for them, and unfortunately, as long as payment is required, for many it is beyond reach. The largest class of woman for whom free accommodation is needed in the City is composed of girls who carry materials to and from the shops and places where the work is carried out. The number of outworkers employed by City firms is considerable (already more than 7,000 have been registered), and of these only a very small proportion live in the City. These outworkers largely employ girls to carry the work to and fro, and these girls have frequently long distances to travel, often carrying heavy burdens, the nature of their employment entails upon them long waiting and need for haste on their return journey. For them no accommodation is provided at the workshop, and they obviously cannot afford to pay out of their scanty earnings even the small amount required for the use of the public conveniences, and the present provision being restricted to the Northern and Western Districts only, it is not available to many of these women to whom time is money, and who have but little knowledge of the grave consequences that often result from neglect of natural functions. It is necessary that free accommodation be

provided for women at each public convenience, and I recommend that this be at once arranged for." We are glad to read further down that on consideration of this Report the Committee decided at once to provide free accommodation at each public convenience within the City.

PROPOSED ESPLANADE, NEW BRIGHTON.—The Wallasey Improvement Bill is now being promoted in Parliament. It provides for the acquisition of the whole of the property known as the Lower Parade (or Ham and Egg Terrace), the Higher Parade, the Palace, the Pavilion, etc., lying between Victoria-road, the shore, Waterloo-road, and Virginia-road. All this is to be demolished, with the exception of the Higher Parade houses, which, after alteration and renovation, are expected to yield a fair revenue towards the payment of loan charges. The site of the single-storied shops, and a strip of the land upon which the other properties stand, will be laid out as ornamental grounds at the rear of the promenade, and the difficulty of the difference between the levels of the Higher Parade houses is to be overcome by the formation of a grass slope or embankment. A café, a few ornamental kiosks, and a large shelter form part of the scheme. Waterloo-road, between Virginia-road and the shore, is to be widened, and enclosures are to be made which will be laid out with trees and shrubs. The balance of the land not required for the promenade and the gardens will be sold, subject to certain conditions, for the erection of boarding-houses, private houses, and the like. The promenade itself is to be constructed behind a sea-wall to be built on the foreshore, and, independently of the decorative strips at the rear, its width will vary from 80 ft. to 100 ft. It will cover the frontage from the Pier to the western boundary of the Marine Park, and a part of the pavement will be so treated as to admit of the laying down of a double line of tram rails at any future time. When the scheme is completed, the promenade will be of a total length of little short of three miles. The cost of the projected works, including the acquisition of the property, is estimated at 122,000l., but it is calculated that, in actual effect, this will be reduced to less than 100,000l. when the capital values of the renovated Higher Parade dwellings, the café and kiosks, and the proceeds from the resale of land are taken into account. The scheme has been designed and prepared by the District Engineer and Surveyor, Mr. Walter H. Travers.

VENTILATION OF SEWERS.—The London County Council has sent a circular letter to the Metropolitan Borough Councils asking whether they are in favour of a suggestion that by-law No. 5 of the series of by-laws (Drainage, etc.) made by the Sanitary authority under sec. 202 of the Metropolitan Management Act, 1855, should be repealed. The by-law in question requires the provision of a suitable and efficient intercepting trap in every main drain or other part of a new building. The by-law is made to apply as far as practicable to the reconstruction of drains. The question of its repeal was brought forward some sixteen months ago by the Lewisham Borough Council, that body contending that if a return was made to the old system and the owner of each house compelled to have a ventilation pipe from the highest point of the drain, each one of these pipes would act as a ventilator to the sewer and the surface gratings in the road, in most cases, and act as fresh air inlets.

Foreign.

FRANCE.—On Saturday last Rodin's statue "Le Penseur" was officially inaugurated in its position at the foot of the Panthéon steps, on the axis of Rue Soufflot. The scheme for a new Mairie in the Rue d'Anjou, for the VIIIth arrondissement of Paris, is again talked of. If carried out, it will be from the plans and designs of M. Nénot, which have been already prepared. A large School of Chemistry, in connexion with the University of France, is to be built at the corner of Rue Saint Jacques and Rue Gay Lussac; the cost of establishment, about 3,000,000 francs, is to be divided between the Government and the Municipality of Paris. The Department of Public Instruction has decided on the creation of three new ateliers at the Ecole des Beaux-Arts, devoted to etching, wood-engraving, and lithography. For this latter atelier M. Maunon, President of the Société des Artistes Lithographes Parisiens, has been already chosen as Professor. M. Dujardin-Beaumez intends to establish a school of "Paysage et Plein-Air," which is to be installed at St. Cloud. A new college for girls is to be built at Saint-Dié, under the title of "Collège Jules Ferry." The monument to Desaix, formerly in the Place Dauphine at Paris, has been restored by M. Vauzet, and is to be set up in Desaix's native town, Roim, to which it has been presented by the Paris Municipality. A monument to the memory of those who perished in the wreck of the *Hilde* is to be erected at Roscoff. A well-preserved tomb of the Roman age has been discovered at Nîmes, on the margin of the ancient Roman road called "Dont-

tiome." The tomb was that of a lady; and jewels, an alabaster vase, and other objects have been found in it, which, along with the sarcophagus itself, have been placed in the Archeological Museum at Nîmes.—The death is announced, at the age of seventy-eight, of M. Bourard, the sculptor, who was a pupil of Duret and of Hippolyte Flandrin. Among his works may be named the "Joueur de Triangle" which is at the Palace at Fontainebleau, the figures of Tragedy and Comedy in the Théâtre des Celestins at Lyons, and the statue of Pope Urban II, erected at Chailion-sur-Marne.—The death is announced at Rennes, at the age of seventy-eight, of M. Martenot, architect, a pupil of Blouet and a former Inspector at the Louvre. He was, since 1898, a member of the Société Nationale des Architectes Français. He was appointed in 1858 architect to the town of Rennes, and built there the bellry of the Hôtel de Ville, the Lycée, the Savings Bank, the Palais du Commerce, and the decoration of the Jardin des Plantes, and the church of Bonne Nouvelle. He also carried out the scheme for bringing the water of the Minette and the Loisaune to augment the town water supply. He designed also the Imprimerie Oubertier and the Hospital of St. Yves.

SOUTH AFRICA.—Messrs. Parker & Forsyth, architects, are inviting tenders for erecting a new school and boarding establishment at Villersdorp.—The tender of Messrs. Peddie & Drummond, of Harrismith, has been accepted for the construction of the new Government schools at Bethlehem, which are to cost 5,000.—In Cape Town the new building for the National Mutual Life Assurance Company of Australasia, Ltd., is nearly completed. The exterior is of granite from the Paarl. Messrs. Baker & Masey are the architects.—At a meeting in Johannesburg of the Master Builders' Union a resolution was passed declining to tolerate any interference by the trades union with other skilled workmen when employed on any work which may not strictly belong to their own particular trade. The union also affirmed the principle that as far as possible tenders be accepted from members of the Association only.

GERMANY.—BUILDING, TIMBER, AND CEMENT TRADES IN GERMANY.—In his report on the trade of Germany for 1905, Mr. Schwabach, British Consul-General at Berlin, remarks that the year under review has been a good one for German industry and commerce both at home and abroad. The satisfactory economic conditions in the first half of the year became more accentuated and general in the second half. The demand for labour increased to such an extent that in some branches it could not be entirely satisfied by Germans, and necessitated the drafting into the country of Austrian, Polish, and Galician miners, as well as Italian and other foreign builders, labourers, and navvies. Market reports from the iron and coal centres and the textile, chemical, electrical, machine, and metal industries showed increasing orders, especially in the timber trade, too, business was brisk, while even the cement industry, which for the last five years has suffered from excessive expansion and ruinous competition, recovered to some extent. Those familiar with the aspect of Germany ten years ago cannot fail to notice the general improvement and greater prosperity; people dress better, houses are built better, numerous new and spacious factories bear testimony to the growing industrialisation, and the communities of small towns and large cities in all parts of the country spend considerable sums on street and sanitary improvements and public buildings. This aspect of increasing prosperity is confirmed by the returns of the savings banks, income tax commissioners, and insurance companies, and with an uninterrupted development at home the foreign trade of Germany is likely to follow an upward course. The imports of cement in 1905 exceeded twice the quantity of 1904, while the exports, though higher than in 1904, were smaller than in 1903 and 1902. Germany imported from Belgium 65,364 tons against only 9,337 tons in the preceding year. Brazil, Chile, Mexico, and Venezuela all imported considerably larger quantities of German cement than in previous years. The exports of cement to the United Kingdom during the years 1900-1905 were as follows:—(Quantity in 1,000 tons): 1900, 12.5; 1901, 33.5; 1902, 33.5; 1903, 36.7; 1904, 29; 1905, 16.1. A comparison of the figures for the last five years shows that asphalt, etc., is losing importance as regards the total imports while increasing quantities are being exported. The satisfactory conditions of the labour market in the first half year continued and even improved in the second half of the year. Agriculture and the building trade absorbed during the third quarter large numbers of new hands, and the improvement of the coal and iron market enabled the works in August and

September to put on new men; employment in the textile industries was good, and in September the machine-building, the electro-technical industries, and the metal trades received a fresh impetus. The great labour movements which in various parts of the country involved 10,000 men, did not interfere seriously with the general aspect of trade and industry. There was no sign of diminishing activity during the last quarter. The iron and steel industries as well as the metal and engineering branches continued very active; in the coal mining industry all orders could not be executed owing to a serious shortage of trucks throughout October and November. Building operations were actively carried on until late in the year. The great activity which has prevailed in the building trade for the past three years was accompanied by numerous labour disputes, but during the year under review they were rather more frequent than heretofore, owing no doubt to the expansion of the trade. Though the tariff movement has been very successful, the aversion of large sections of employers to agreements of this kind is by no means extinct, as testified, more particularly by the long and bitter disputes which raged in the Westphalian district. The coal mining at Munich lasted two months. It was caused by the demand raised by the employers in the course of the negotiations for the renewal of the old tariff agreement that the men should sign a declaration that they did not belong to a labour organisation. As, naturally, this demand was not complied with, the employers' association ordered a lock-out, involving about 2,500 men, but through the mediation of the Trade Tribunal an arrangement was ultimately come to and a new tariff established which expires on April 1st, 1908. The wages are fixed as follows:—

Profession	Wages per hour.	
	Average.	Minimum.
Masons	52	47
Carpenters	49	47
Assistants	38	36

From April 1, 1906, masons and assistants receive an additional 1 pf. per hour, and from April 1, 1907, an additional 2 pf. per hour; carpenters receive 2 pf. more per hour from April 1, 1906, and another 2 pf. from April 1, 1907. Ten pf. above the ordinary rates are paid for overtime and 20 pf. extra for night work. A board of conciliation, composed of six labour members and six employers' members under an impartial chairman, will decide differences, the Trade Tribunal forming the court of appeal. On the whole, the compromise was more favourable to the men, though they did not carry all their points, which included a reduction of the working time by half an hour, and the five o'clock stop of Saturday. The dispute in the Rheinisch-Westphalian building trade assumed much larger proportions than the one at Munich, the number of strikers and locked out numbers, at one time, over 20,000 and the struggle lasting sixteen weeks. It began at Dortmund where the organised masons demanded an increase of wages and subsequently a strike was declared. When the lock-out proved ineffective it was extended to a number of places in the vicinity, including Essen, Gelsenkirchen, Recklinghausen, Herten, Buer, and Gladbach, where a few months earlier tariff agreements had been concluded which only expire on April 1, 1906. This measure called forth an energetic protest from the Mayor of Essen, who had taken an important part in the conclusion of these tariff agreements, and now declared that the employers were guilty of a breach of contract, and that the municipal building operations which were interrupted through their action would be completed at their expense by the municipal authorities. He also moved a subvention of 1,000, for the locked-out men. The new tariff agreement extends over more than 200 different towns and villages and remains in force until May 1, 1908. It stipulates a ten hours working day (at places where eleven hours were worked so far) and a half will be worked until April, 1906; fixes wages according to local conditions at from 44 to 55 pf. per hour, increases the rates for overtime by 10 pf. per hour, and provides for the establishment of arbitration boards consisting of eight members, four appointed by the employers and four by the men; and also of a board of appeal composed of the labour organisation and five members nominated by the employers' association. All working rules and regulations contrary to the agreement will be considered invalid.

GERMANY.—The decoration of the great hall in the Kaiser Wilhelm Memorial Church is completed; the hall is decorated in white marble, whilst on the east wall there are representations in mosaic of the Prussian Kings from Friedrich Wilhelm onwards.—An exhibition of furniture representing three fully furnished houses is now being held at Biel; the furniture is from designs by and under the direction of Herr E. J. Propper.—The new church at Walestadt is completed; the building is in Romanesque

style, and the windows are from cartoons by Herr Burkhard Mangold.—A summer theatre is to be built at Karlsruhe, from designs by MM. Curjel & Moser.—The new town hall at Leipzig is to be enlarged; the original architect of the building, Professor Lieht, is to design the new portion also.

CHILE.—The Chilean "Diario Oficial" of 20th February contains copy of a law official throughout the country local bodies entitled "Councils on Workmen's Dwellings." The aim of these bodies is to stimulate the construction of cheap and salubrious dwellings for the working classes, and to take such steps as may be necessary for the improved sanitation of existing cheap dwellings. The law also sanctions the expenditure of 600,000 pesos (about 45,000l.) on the construction of dwellings for the minor grades of State employees.—Board of Trade Journal.

Miscellaneous.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. W. S. Wetherley & Mr. Francis E. Jones, architects, have removed from 30 Cockspur-street to 2, Haymarket, corner of Suffolk-place.—Messrs. Frederic Whitfield & Co., wrought steel safe and door manufacturers, have removed their London office and show-room from St. Andrew's Hill to Godlinham House, Godlinham-street, Queen Victoria-street, E.C.

HOUSING AND IMPROVEMENT SCHEMES, ARMAUGH.—On the 9th inst. an inquiry was held in the Court House, Armaugh, before Mr. P. C. Cowan, Chief Engineering Inspector of the Local Government Board, on the petition of the urban council, who made application for the sanction of a loan of 15,000, for the erection of artisans' dwellings under the Housing of the Working Classes Act. The sum of 9,000, was asked for the carrying out of an improvement scheme, by which it was suggested to demolish about forty-six houses unfit for human habitation, and on the same site erect about sixty houses. The remainder of the 15,000, was for the erection of forty-eight artisans' houses. Mr. Francis Bergey, C.E., proved to the plans lodged for the proposed scheme, and gave evidence regarding the figures referred to by counsel as the probable cost.

PUBLIC IMPROVEMENT, BARNSTAPLE.—At the Barnstaple Guildhall, on the 10th inst., Mr. M. K. North, M.L.S., Local Government Board Inspector, held an inquiry, with reference to an application by the Barnstaple Town Council for the sanction of the Local Government Board to the alienation of two old cottages, the property of the Town Council, situate at the back of Nos. 95 and 96, High-street, Barnstaple, and lying between that of the premises belonging to the Barnstaple and North Devon Club. Mr. J. Bosson (Town Clerk) said that the owners of the club premises intended to pull down and rebuild and, for their premises, it being desired to set back the frontage of the club premises on rebuilding, a great improvement being thereby effected. It was desired to construct on the land a 16-ft. roadway as an approach from the Strand to the High-street property, this to be in substitution for the existing narrow and inconvenient approach thereto. The Town Council applied for the sanction of the alienation of these two cottages for the purpose of effecting this improvement. The Borough Surveyor (Mr. Arnold Thorne), in the course of the inquiry, said that the cottages were absolutely uninhabitable.

A CARICON BY MAFFEO.—Mr. Coe has recently deposited in the Constable studies, No. 76, Charlotte-street, Fitzroy-square, what is believed to be Maffeo da Verona's original painting, forming one of the designs, in part, of the Inferno for the decoration in mosaic of St. Mark's. In 1610-2 it was resolved to pay Maffeo 5 ducats for each whole figure in his designs to be executed in mosaic by Alvise Guetoro. The mosaic executed under the picture we mention is over the west doorway within the basilica, and no doubt is entertained of the genuineness of the picture as the work of Maffeo.

LEIGHTON HOUSE.—An appeal for contribution towards a sum of 15,000, is made by the Leighton House Committee, that they may be enabled to purchase the freehold of No. 2, Holland Park-road, and establish an endowment fund for its up-keep.

BOOK PRESSES, BRITISH MUSEUM.—To the late Dr. Richard Garnett, and his colleague in the Library, Mr. Henry Jenner, is due, it appears, the introduction of the sliding-press, as previously adopted in the Free Library at Bethnal Green, for providing additional means of storing books by means of new presses which are attached to the old ones with hinges.

MODEL OF THE ISLE OF PIRBREEK.—The Ordnance Survey authorities have just published a guide to the geological model of the Isle of Purbeck, with which they issue a geological map printed in colours, a plate of horizontal sections, and a collotype from a photograph of the model. Copies of the model, which is deposited in the Victoria and Albert Museum, have been executed

for the Geological Museum in Jernyn-street, London, and the museums in Edinburgh and Dublin.

SPARTA MUSEUM.—Mr. M. N. Tod, assistant-director, and Mr. A. J. B. Wace, student of the British School of Athens, have brought out a detailed catalogue of the contents, consisting of some 800 items, of the museum at Sparta. The text is divided into three sections upon inscriptions, sculpture, and miscellaneous antiquities, with separate introductions which classify and interpret the exhibits. The catalogue is issued by the Clarendon Press.

THE PICTURES OF THE BOLESLIAN.—A recent report drawn up by the committee dealing with the restoration of the pictures states that about 3500, is required to supplement the amount of 1,100, subscribed by the University and Colleges, and private individuals. A sum of 1,047, has been expended upon the restoration of 128 pictures, amongst those now in the hands of Messrs. F. Haines & Sons, of London, are portraits of Sir Kenneth Digby, and Robert Nelson, artist of the "Companion to the Festivals and Fairs." Those already repaired (the framing being entrusted to Messrs. Ryman & Co., of Oxford) comprise portraits of Lady Jane Grey, Elizabeth, Halley, Samuel Butler, Sir Henry Savile, and Peter Paul Rubens, and Dr. Wallis—the restoration of the last-named was undertaken at the charges of the Samuel Pepys Club; there are also Hudson's portrait of John Potter, Archbishop of Canterbury, 1737-47; and Riley's of the first Duke of Ormonde. Portraits of Archbishop Usler, Tyebo Brabji, John Sheffield, Duke of Buckingham, and the second Duke of Ormonde, and twenty other pictures will be dealt with, in so far as funds will permit.

NATIONAL GALLERIES, SCOTLAND.—The Bill introduced by Mr. Sinclair, Secretary for Scotland, is based upon recommendations made by the departmental committee, with Mr. Akers-Douglas as chairman, and an article of enquiry into the administration of the Scottish Board of Manufactures. The Government inessure proposes to transfer from the Board to a new body of trustees the management of the Royal Institution, the National Gallery, and the National Portrait Gallery in Edinburgh. The new board will consist of seven members, and will be appointed by the Secretary for Scotland. The present officers of the Board of Manufactures are to be transferred to the trustees; the buildings hitherto vested in the old Board are to be vested in the Commissioners of Works, and the charges for their repair and maintenance will be defrayed out of moneys payable under an article of the Treaty of Union under the Revenue of Scotland Act, 1718, will be transferred, under provisions of the Bill, to the Consolidated Fund.

COLLAPSE OF A WALL IN SHOREDITCH.—One man was killed and two men were injured by the collapse of a wall of a building in Rivington-street, Old-street, Shoreditch, on the 10th inst. The building, which was being converted into an electric sub-station. Two men were on a scaffold, engaged in facing a wall with glazed tiles, when suddenly the wall fell outwards, bringing down the scaffolding with it. A third man, who was working on the ground was overwhelmed in the debris. He was conveyed to St. Mary's Mission Hospital, where, after some time, he died from his injuries. The two other men, who were both cut about the head, were taken to St. Bartholomew's Hospital.

SCOTTISH BUILDING TRADES FEDERATION.—The half-yearly meeting of the Scottish Building Trades Federation was held on the 20th inst. at the Building Trades Exchange, 25, George-street, Edinburgh. Prior to the business proceedings the delegates lunched in the Royal British Hotel—Mr. Patrick Knox, President of the Federation, presiding over a company which included Mr. Gledhill, Glasgow Master Brickbuilders' Association; Mr. Charles Hezney, President, Glasgow Master Plumbers' Association; Messrs. John Morgan and James Leslie, Aberdeen Building Trades Association; Mr. Hewitson, secretary, Airdrie and Coatbridge Building Trades Federation; Messrs. William Macdonald and David Cook, Inverness Building Trades Federation; Mr. James Harper, Edinburgh Master Plasterers' Association; Messrs. William Thomson, Vice-President, and James Millar, Thomas Mackie, Robert Lamb, Simon Slater, and James Cameron, solicitor, secretary of the Edinburgh, Leith, and District Building Trades Association. Mr. Hewitson proposed "The Building Trades Federation," which, he said, was instituted in 1895, and had done good work with excellent results. He would shortly lay before the towns of the Federation. Legislation had been proposed calculated to favour workmen in relation to their employers. There was an effort to overturn the Taff Vale decision, which had such wide-reaching effects, and very possibly that would be effected in the present Parliament. They should mobilise their forces and extend the Federation's operations as far as possible. There was at present what had been a prolonged

and much regretted depression in trade. They all hoped that within the next few months there would be an improvement, but when it came the trouble would rise, and it would be then that the need of a complete organisation would be felt. That organisation must be carried out if the employers were to be in a position to protect themselves in the questions which assuredly would arise between them and the workmen. One of the aims of the Federation should be the securing of a uniform set of general conditions of contract throughout Scotland. Such a reform was urgently required. The Chairman, in replying, mentioned that the Federation included Aberdeen, Dundee, Inverness, Dingwall, Oban, Kilmarnock, Paisley, Perth, Edinburgh, Hawick, Dumfries, Banffshire, and Alloa. The Federation did not necessarily exist for the purpose of dealing with the men. They had the greatest sympathy with the men, and wanted to take the men along with them. There were many things in which employers had a common interest, such questions, for instance, as the matter of measurements, arbitration, and the conditions of contract, which last were a great burden, and more sometimes than they were able to bear. While the Federation had not done just so well as they might have, on the whole they were progressing slowly, but surely, and doing good work. He mentioned that they were negotiating with various parts of Scotland to get these to join their ranks. Mr. Leslie gave the toast of "The Edinburgh, Leith, and District Building Trades Association," saying that he had already found Edinburgh and Leith builders the men who had been taking the lead in all the affairs connected with the Federation. Mr. Simon Slater replied. The only other toast—"The Delegates"—was proposed by Mr. Robert Lamb, and responded to by Messrs. William Macdonald, Inverness, and John Morgan. At the half-yearly meeting of the Executive of the Federation Mr. Knox again presided. The proceedings were private, but at the conclusion of the business an official report was communicated. It stated that reports on the state of trade were submitted from all the centres, and that without exception these were of a more or less gloomy nature. In Perth, it was reported that building was at a standstill, and that there were no masons in employment there at present. Mr. James Leslie, of the Aberdeen Association, was appointed Vice-President of the Federation. A voluminous correspondence was read by the secretary which showed that he had been in touch with every town of note in Scotland with a view to extending the Federation, and as a consequence of this it was reported that several associations in the West and North had indicated their desire to become federated with the Scottish Federation. Arrangements were made for visiting these towns. The annual meeting of the Federation was fixed to be held at Edinburgh in September.

HOUSING SCHEME, LINTON.—Mr. E. A. Sandford, Esq., M.P., C.E., Local Government Board Inspector, and Mr. B. T. Kitchin, Architect to the Local Government, recently held an inquiry into the application of the Linton Rural District Council to borrow 1,500l. for the purposes of a scheme under Part III. of the Housing of the Working Classes Act, 1890, for the provision of cottages for persons of the working classes in the parish of Linton. Mr. W. Richardson (Clerk of the Rural District Council) gave the usual particulars as to area and population of the district, and said the Council proposed to purchase 2½ acres of freehold land for 160l. Mr. F. W. Chappell, the Sanitary Inspector, said it was proposed to obtain water by a bore well, 120 ft. deep, with 4 in. inside diameter boring. The buildings were to be constructed in groups of five, and were to have 9-in. party walls.

SIMFON'S HISTORY OF ARCHITECTURE.—The first volume of this book was issued without an index; we are asked to mention that one has now been prepared and can be had gratis from the publishers, Messrs. Longmans, Green, & Co., 59, Paternoster-row, E.C.4.

FIRE TESTS WITH ROLLING STEEL SHUTTERS.—The Report No. 111 of the British Fire Prevention Committee gives the particulars of a test with a set of double steel rolling shutter doors, and a single steel rolling shutter door, the shutters being of an American type known as the "K. K. near door," and supplied in London by Messrs. A. L. Gibson & Co. The result of the tests goes to show that a single rolling shutter is not to be depended on as fire-resisting, or at least as stopping the passage of fire, except imperfectly, and the shutter was bulged and otherwise damaged and could only be partially worked and with difficulty after the test. The test with the double shutters showed that though the inner shutter suffered considerably, as in the single-shutter test, it was an efficient protection to the outer shutter, which was reported as undamaged and in working order after a four hours fire reaching at its hottest to 1,700 degrees Fahr.

In this case the inner shutter also kept its alignment and could be worked after the test, though it had buckled a good deal. The result seems to be that double rolling steel shutters of this type constitute an effectual check to the spread of

fire. The shutters were 7 ft. wide by 8 ft. high, and overlapped the wall opening 2 in.; the exact distance between them is not stated in the Report, but it is given approximately by the fact that they were on the opposite sides of a 13 in. wall. The shutters are made of 20 (U.S.) gauge of galvanised steel, the ends of the strips being fitted with small malleable cast nibs.

Capital and Labour.

CONDITION OF THE BUILDING TRADES.—Employment in the building trades continued to show a general seasonal improvement, which was especially marked in the case of painters. Compared with a year ago, however, employment showed little change. Returns received through the Trade Correspondent from sixty-two London employers showed that in the last week of March they paid wages to 11,223 workpeople of all classes, compared with 11,152 in February, and 14,129 in March, 1905. Employment generally in London was rather better than a month ago, but a good deal worse than a year ago. Returns were received from Employers' Associations in seventy-three districts outside London. In two-thirds of these employment was reported as dull generally; at Stratford-on-Avon and Maidstone it was very good, at Birkenhead good, at Ashton and Huddersfield fairly good, and at the remaining towns moderate or fair. Compared with a month ago, no change was reported in fifty-two towns, while in fourteen, including Stockport, Portsmouth, Bournemouth, and Dublin, it was better, and in seven, including Hull, Chatham, and Swansea, it was worse. Compared with a year ago, employment was reported about the same in forty-four towns, worse in nineteen, and better in ten.—*Labour Gazette.*

Patents of the Week.

APPLICATIONS PUBLISHED.*

9,910 of 1905.—G. F. FLETCHER: *Wall or Hoarding Signs for Advertising Purposes.*

This relates to a wall or hoarding sign for advertising purposes, consisting of a raised representation of the article to be advertised, or its containing receptacle stamped or embossed in sheet metal, or other sheet material, deeply stamping or embossing the plate or sheet and suitably inclining those parts which would otherwise project at right angles to the sheet, such inclined parts being afterwards pressed in if desired.

11,048 of 1905.—A. H. GALE: *Traps for Sinks and Basins.*

This relates to a trap for a sink or basin having its limbs disposed in different planes oblique to one another, and having two openings normally closed by removable plugs and situated the one at the bottom of the trap and the other at or near the summit of the bend towards the exit of the trap.

17,875 of 1905.—C. M. GRAHAM: *Apparatus for Employment in Connexion with Register Grates.*

This consists in the combination with a fire grate of an adjustable plate hinged to the top of the grate and arranged to be suspended at an angle or vertically in relation to the grate, and a shutter hinged to the bottom of said plate and adapted to be folded upwardly against it or to be allowed to depend downward in front of the grate bars.

21,141 of 1905.—J. WICKER: *Building Blocks.*

This relates to a building block formed with a number of apertures arranged in a plurality of series, the apertures of each series having intervening necks, the necks of any series being out of alignment with the necks of either of the other series, two of the series being formed with half length apertures at the ends of the blocks.

22,668 of 1905.—F. C. WOODFORD: *Chimney Tops.*

This relates to a chimney top, consisting of a cylindrical stalk opening into the lower of two dish-like plates having an flange rim retained at a proper distance apart by flat tubes opening into the rims, the said plates and tubes being surrounded by a hand of greater diameter than the rims and held in position by cones opening into the hand and into the flat tubes.

22,679 of 1905.—W. C. FAIRWEATHER (G. NIE-MEYER): *Sash Windows.*

This relates to a sash window which can be displaced in its own plane and also moved independently at an angle thereto, while laterals cooperate with guide bars of the window to produce

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, xviii.; Auction Sales, xxx. Certain conditions, beyond those given in the following information, are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bonâ-fide tender unless stated to the contrary.

Contracts.

BUILDING.

APRIL 30.—**ABRAMAN—HOUSES.**—Building twenty-nine houses at Abramam for the Brambling Building Co. Plans, etc., at office of Mr. F. Rodrick, architect, Ashbrook House, Abberard. Endorsed tenders to be sent in to Mr. Fred. Erece, Secretary, Abramam-gardens, Abberard, not later than April 30.

APRIL 30.—**FRASERBURGH—VILLAS.**—The mason, carpenter, slater, plaster, plumber, painter, and glazier works of villas to be erected for Messrs. Wm. Bouz & Co. P. Barneil, Plans and specifications may be seen with Messrs. Reid & McRobbie, architects and C.E. Saltoun-chambers, Seaforth-terrace, Fraserburgh who will receive offers until Monday, April 30.

APRIL 30.—**NEW TREGGAR.—BUSINESS PREMISES.**—New business premises in Commercial-street, New Treggar, for Mrs. Morgan, "The Dorothy." Tenders, sealed and endorsed, to be delivered not later than April 30. Plans and specifications may be seen with Mr. D. W. Price, Cloth Hall, New Treggar.

MAY 1.—**CAMBRIDGE—SCHOOL ROOMS, ETC.**—Cambridge Town Council invite tenders for the erection of teachers' rooms and an iron outside staircase at the Brunswick Council Schools. Plans, etc., may be seen at the office of the architect, Mr. A. P. MacAlister, St. Andrew's-street, where copies of the quantities may be obtained on payment of the sum of 11. 1s. Tenders, endorsed "Tender for Mr. A. P. MacAlister, Brunswick Council School," to be sent to office of Mr. J. B. L. Whitehead, Town Clerk, Guildhall, Cambridge, on or before May 1.

MAY 1.—**CLAYFIELD CROSSING.—COTTAGE.**—The directors of the Great Western Railway invite tenders for the erection of a cottage at Clayfield Crossing, near Littleton and Bidsey Station, Wiltshire. Forms, etc., at the office of the engineer at Wolverhampton Station, between the hours of 10 a.m. and 4 p.m. Tenders, addressed to Mr. G. K. Mills, Secretary, Paddington Station, London, and marked outside "Tender for cottage at Clayfield Crossing," will be received on or before May 1.

MAY 1.—**LANDILO.—MARKET.**—Landilo and District Cattle Market and Auction Mart Company, Ltd., invite tenders for constructing a cattle market and auction mart adjoining the Landilo Bridge Station, Landilo. Plans, etc., seen at office of Mr. Arthur S. Williams, architect and surveyor, Landilo, and quantities obtained on deposit of 11. 1s. Tenders, endorsed "Cattle Market," to be sent not later than May 1.

MAY 1.—**MUSSEVWIMMER.—SHOP.**—A shop in North-avenue, Mussevimmer, for Mr. W. H. White, Cardiff. Plans and specifications may be seen at office of Mr. Wm. J. Harris, architect and surveyor, Gilfach, Bargoed. Tenders to be sent in on or before May 1.

MAY 1.—**RAWMARSH.—CEMETERY WORKS.**—Rawmarsh U.D.C. invite tenders for the laying-out, forming roads and paths, drainage, erection of two chapels with central tower and spire, lodge, and outbuildings connected with same, boundary walling, entrance-gates, and site in Leigh-road, Rawmarsh. Names and addresses, accompanied with a deposit of 31. 3s., to the Architect, Mr. J. Platts, High-street, Rotherham, not later than May 1, after which date bills of quantities and form of tender, etc., will be forwarded to parties who have applied only.

MAY 2.—**BIRTLEY.—COTTAGES.**—North-Eastern Railway Directors invite tenders for the erection of six cottages at Birtley. Plans, etc., upon application to Mr. William Bell, the Company's architect, Central Station, Newcastle-on-Tyne. Contractors will be required to take their own quantities. Sealed tenders, marked "Cottages at Birtley," to be sent to the Secretary, at York, not later than noon on May 2.

MAY 2.—**GOSS.—ALTERATIONS TO PREMISES.**—For the whole or several trades, viz.: Bricklayer and mason, carpenter and joiner, plumber and glazier, plasterer, painter and slater's work, required in the alterations to licensed premises, known as "Bromley's Vanis," at the junction of Aire-street and Adam-street, Goole, for Messrs. Harbrey's Brewery Company, Ltd., of Snaith. Applications to Messrs. Thomas Wain & Son, architects, 24, Albion-street, Leeds, not later than May 2.

MAY 2.—**LONDON.—ECONOMISER AND PAN-ROOM.**—Hackney Guardians invite tenders for building, economiser and fan-room, and altering and extending boiler flues at the Workhouse, Silney-road, Homerton, N.E. Form, etc., at office of Mr. Frank H. Coles, Clerk to the Guardians, Clerk's Office, Hackney Union, Homerton, N.E., where also the plans (as prepared by Mr. J. J. Todd, consulting engineer, 25, Brooke-road, Stoke Newington, N.) may be inspected. Sealed tenders, endorsed "Economiser and Fan room at Workhouse," must be delivered not later than 2 p.m. on Wednesday, May 2.

MAY 3.—**GLENVILLET.—BUILDINGS.**—The mason, carpenter, and slater works for the following buildings, and for the plaster work of Nos. 3, 6, 10, 12, 13, and 14.—(1) Cart sheds, etc., at Tubshallam, Auchincloyne; (2) stable and cart sheds at Bogbeand, Auchincloyne; (3) dwelling-house at Bagebrae,

Berry, Secretary, 48, Cophall-avenue, London, E.C., on payment of the fee for the specification, which payment will not be returned. Tenders must be delivered in sealed envelopes, addressed to Mr. Berry, marked "Tender for Miscellaneous Articles," or as the case may be, not later than 11 a.m. on May 3.

MAY 3.—PORTFUSH.—STORES.—The directors of the Portfush Gas Company, Ltd., invite tenders for the supply of stores for the year ending March, 1907, as follows:—Meters; galvanized tubes; steam tubes; copper pipe; fittings; galvanised; fittings; steam; oils—machine, gas engine, exhauster; paint; red oxide. Further particulars can be obtained from the Manager, Mr. W. C. Pinkney, Gasworks, Portfush. Tenders, endorsed "Stores," to be delivered on or before 12 noon on May 5, to Mr. Thos. Bamford, Secretary.

MAY 5.—LEXDEN.—MATERIALS.—Lexden and Winstree R.D.C. invite tenders for the supply of local materials and team labour, and also for steam road roller, in the several parishes of the district. Tenders to be delivered on or before 12 noon on May 5, to Mr. Thos. Bamford, Secretary. For the carting of stones from the quarries in any parish of the district; (2) for the supply of good pit stones at the various quarries in the district; (3) for the carting of stones from the quarries to the various parishes; (4) for the supply and delivery of broken Kentish flints alongside the wharves at East Mersea, West Mersea, Hard, the Steved, Saled, East Donnyland, Finninghoe, and the Hythe, Colchester; (5) for the unloading and carting from the above wharves to the roads in the various parishes; (6) for the hire of one or two steam road rollers, Forms, etc., from Mr. John Emmins, Surveyor's Office, Copford, near Colchester. Tenders to be sent to Mr. Chas. H. Tompion, Clerk, Victoria-chambers, Colchester, not later than May 5, at 4 p.m.

MAY 7.—WARRINGTON.—CEMENT.—Warrington Paving and Sewerage Committee invite tenders for 50 tons of cement, manufactured by one of the following makers:—Earle & Co., Hull; Saxon Portland Cement Company; and Rugby Portland Cement Company. Specifications and any further information may be obtained at the office of the Borough Surveyor, Town Hall, at which place tenders must be delivered before 12 o'clock, on May 7.

MAY 7.—WEST ASHFORD.—GRANITE.—West Ashford R.D.C. invite tenders for the supply of about 1,750 tons of either of the following:—Best blue Guernsey, Cleo Hill, Aberdeen, Penlee, Basak, or Cherbourg quartzite, to be delivered at the railway stations at Charing, Northfield, Ashford, Puckley, Headcorn, and Great Chart Sidings, in such quantities as the Surveyor shall from time to time order, for the year ending March 31, 1907. Forms of tender can be obtained on application to Mr. Alfred Sims, Surveyor to the Council, Surveyor's Office, Charing. Sealed tenders, accompanied by samples of the material, endorsed "Tender for Granite," addressed to the Chairman of the R.D.C., are to be delivered at the Union House, Westwell, Ashford, Kent, not later than May 7.

MAY 9.—BRADFORD.—MATERIALS.—Bradford Corporation invite tenders for the supply and delivery of the following articles, namely:—Pitch and oil required for street paving purposes; cast-iron gullies, ventilators, and storm gratings; glazed earthenware pipes, blocks, and junctions; timber for sewerage and other works. Forms, etc., may be obtained on application at the office of Mr. J. H. Cox, City Surveyor, at the Town Hall. Sealed tenders, endorsed "Tender for Materials—Street Works," to be sent to Mr. Frederick Stevens, Town Clerk, Town Hall, Bradford, on or before May 9.

MAY 10.—MELFORD.—ANNUAL CONTRACTS.—Melford R.D.C. invite tenders for the supply of the under-mentioned materials, etc., as may be required during the year ending March 31, 1907:—Broken granite; sized sanitary drain pipes, 4 in. to 42 in. diameter; blue Staffordshire bricks and kerbs; York stone kerb; Portland cement; granite concrete flags; flints; chalk; road gratings and frames; team labour; steam rolling. Forms from Mr. Wm. Carver, C.E., Surveyor, 5, Melford-road, Sudbury, Suffolk. Sealed tenders to be sent in not later than May 10, addressed to Mr. H. C. Canham, Clerk, 63, Friars-street, Sudbury, Suffolk.

MAY 24.—GLASGOW.—MATERIALS, ETC.—Glasgow Corporation invite offers for materials and jobbing work required in the various departments (hospitals excepted) as follows, viz.:—(1) Ashlar; (2) asphaltic grouting; (3) asphaltic paving; (4) bricks; (5) brick-work; (6) Chalfness and Arbroath pavements; (7) plaster work; (8) casework work; (9) jobber work; (10) lime and cement; (11) manholes and gratings; (12) painter work; (13) paving and drainage works; (14) pipes and sewer bottoms; (15) pitch and oil; (16) plank work; (17) plumber and gasfitter work; (18) repairing barrows, etc.; (19) sand; (20) smith work; (21) slater work; (22) whin and granite metal and binding. Specifications and forms of tender may be obtained on application at the office of Public Works, City-chambers, 64, Cochrane-street. Sealed offers, marked outside "Offer for State Labour Department," must be lodged with Mr. A. W. Myles, Town Clerk, City-chambers, Glasgow, on or before May 4.

NO DATE.—DENTON.—TAR.—Denton U.D.C. Gas Committee invite tenders for tar, the same to be sent in on or before May 3. Particulars may be obtained from the Gas Engineer, Mr. J. Chadwick Smith, Gasworks, Denton, near Manchester.

PATENTS.—Continued from page 473.
a wedge-like locking action, and the invention consists of the arrangement that the racks are engaged by pinions on a shaft having loose rollers for guiding the chains or the like supporting a counter weight suspended from the window frame, so that the lowering and raising of the window take place independently of the racks, which serve only to produce the movement of the window against the packing.

12,254 of 1905.—E. H. BENTLEY: *A Dust and Draught Excluder for Doors*.
This relates to a dust and draught excluder and recessed to interlock and overlap, the stretcher attached to the door overlapping the bottom stretcher, and the latter being of such a section and hinged to the former in such a manner that when the door is open it oscillates upon its hinges and lifts the bottom edge clear of the door step or floor. A stud anti-friction bolt or the like mounted upon the door-jamb acts to return the hinged stretcher into position immediately the door is closed.

13,595 of 1905.—W. J. AKERS and J. A. ROCHAIN: *Devices for Preventing the Down Draft in Smoke and other Flues*.

This relates to an apparatus for use in flues or chimneys, and consists of a frame fitted across the flue, and a fan or rotating vanes driven by the updraught and mounted on a bearing carried by a slide withdrawable from the flue, and a brake operated from outside the chimneys retarding the rotation of the vanes.

13,843 of 1905.—W. BENTLEY and W. J. D. BRONSON: *Sliding Windows and Window Frames*.

This relates to a sliding window-sash and window-frame, and is characterised by means

whereby outside of the window-frame is fitted with one window-guide for each sash, and the window-sash or sashes are provided with guiding members, each having two contact points to engage the opposite sides of the window-guides and hold the window-sash relatively thereto.
24,526 of 1905.—E. COGNET: *Reinforced Concrete Foundations*.

This relates to the establishment of foundations, comprising inverted vaults, or arches, or plane slabs, the chief of which, by the intermediary of piers constituted in the form of longitudinal girders receiving the heaviest concentrated loads, the other secondary assisting the former by causing the participation in the support of these loads of the greatest possible extent of ground and of the intermediary of secondary piers which are likewise constituted as girders either cantilever fashion upon the principal pier, or resting at each extremity upon a principal pier.

26,685 of 1905.—A. E. WATSON: *Window Sash Fastener*.

This relates to a window sash fastener, wherein a pawl is furnished with a lever extending therefrom to facilitate its release from a serrated plate, a spring being also applied to said lever to press the pawl into the serrations of said plate.

26,757 of 1905.—E. EAST and J. MEAD: *Draught and Weather Excluder for Windows and the Like*.

This relates to draught and weather exclusion apparatus for windows and the like. In carrying the invention into effect, a metallic movable flat bar is constructed, with two slots, and through these slots the movable bar is supported by means of half round-headed screws, screwed into the top bar of a glazed frame, and when the aforesaid glazed frame is being closed the movable bar in its action at one end slides or travels into its

locking position by a quadrant plate, which is screwed into a recess cut in the window-frame, and the movable bar at the other end slides or travels up a sloping path formed at the base to an opening constructed in the metallic locking plate until it arrives on a ledge or shelf, when the glazed frame is closed. When the glazed frame is opened, the flat movable bar drops or falls on the screws by means of the slots described.

16,197 of 1905.—J. MOWAT and J. MACKINNON: *Lamps for Street Lighting*.

This relates to a lamp for street lighting, having its body of corner astragals made integral with the encoline or batten frame by forming the latter with sockets to which the astragals are united by running with molten metal.

19,686 of 1905.—W. FREAKLEY and R. BILL: *Process and Apparatus for the Manufacture of Materials for the Construction of Dustless Roads and like Surfaces*.

This relates to the preparation of materials for the construction of dustless roads and like surfaces by the process of saturating crushed furnace slag with tar, creosote, or other suitable bituminous substance or solution in a heated state, by the application of heat and atmospheric pressure.

25,321 of 1905.—C. ATHERTON: *Heat Radiators*.

This relates to a heater comprising oppositely disposed heat boxes, a burner tube extending between the same, radiator tubes likewise extending between said heat boxes, the hot gases being conducted in the same direction through certain of said radiator tubes, and an exhaust chamber in one of said heat boxes in communication with one of said radiator tubes, the passage of the gases through said last-mentioned tube being in a direction opposite to said first-named direction, each of the heat boxes being provided between the rows of radiator tubes with air passages,

SOME RECENT SALES OF PROPERTY:

Table listing property sales with columns for location, date, and price. Includes entries like 'Brighton - 4, Clifton-ter, f. y. r. 611' and 'Whitechapel - 123 and 125, Whitechapel-rd.'

TO CORRESPONDENTS.

Notice regarding correspondence, including instructions on how to submit articles and drawings, and how to handle rejections.

MEETINGS.

Calendar of meetings for various professional societies, including the Architectural Association, Institution of Mechanical Engineers, and Royal Institution.

Institute of Sanitary Engineers.—Mr. G. W. Chilvers, on "Meteorology in Relation to Sanitary Work."

Civil and Mechanical Engineers' Society.—Paper by Mr. W. O. Travis, M.A., entitled "Some Observations on Bacterial Tank Operations."

Royal Institution.—Professor G. Waldstein, on "English Furniture in the XVIIIth century."

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom at the rate of the per annum £10 0 0.

PRICES CURRENT OF MATERIALS.

"Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information."

Table of material prices including Bricks, Hard Stocks, Picked Stocks, and various types of Bricks and Tiles.

NOTE.—The cement or lime is exclusive of the ordinary charge for sacks.

Table of stone prices including Bath Stone, Portland Stone, and various types of Granite and Marble.

Table of stone prices (continued) including York Stone, Hopton Wood (Hard Bed), and various types of Slates.

Table of slate prices including various types of slates and their prices per 1000 or per doz.

Table of brick prices including various types of bricks and their prices per 1000 or per doz.

Table of tile prices including various types of roof tiles and their prices per 1000 or per doz.

Table of wood prices including various types of wood and their prices per standard or per load.

Table of building wood prices including various types of wood and their prices per standard.

Table of stone prices including various types of stone and their prices per standard.

Table of stone prices (continued) including various types of stone and their prices per standard.

WOOD (continued).

Table listing various wood products such as Joists, Girders, and Metals, with columns for quantity, price, and specifications.

ENGLISH ROLLED PLATE IN CRATES OF STOCK SIZES.

Table listing rolled plate products like Hartley's, Figured and Oxford Rolled, and others, with columns for price and specifications.

UITS, &c.

Table listing oils and varnishes such as Raw Linseed Oil, Turpentine, and various Varnishes, with columns for price and specifications.

Architecture at the Royal Academy.

THE collection of architectural drawings at the Academy this year seems a good one; there is plenty of variety and a good deal of interest, and a considerable

proportion of fine drawings. The most general interest will probably attach to the three drawings representing Mr. Norman Shaw's scheme for rebuilding the front of Regent's Quadrant and for remodelling what is still called, though it has ceased to be, Piccadilly Circus. The fact that such a design has been called for at all is a satisfactory indication that the Government are waking up to the fact that the street architecture of London is of some importance; as the Treasury said that they must have a scheme before they would allow the Quadrant to be touched. In spite of the tame character of Nash's cement architecture, the Quadrant, with its long sweeping lines, was really one of the best bits of street effect in London. It is bad enough that the general design of Regent-street as a whole has been cut into and all but destroyed; it was a well-intended effort to give architectural dignity and unity to an important new street, and any alterations and rebuilding in it ought also to have been made as parts of a definite scheme to be carried out by degrees. But to have cut up the Quadrant into different heights would

have been still worse; a street which is laid out on a circular plan is worth nothing unless the lines are continuous; and it is fortunate that the official powers recognised this before it was too late. An Advisory Board was appointed consisting of Sir John Taylor, Sir Aston Webb, and Mr. Belcher, and they in turn invited Mr. Norman Shaw to make the design and plan now exhibited, and which, by the kindness of the architect, we are enabled to bring before our readers as the illustrations to our present number.

The intended effect of the Quadrant is well shown in the splendid perspective drawing which occupies the central position on the east wall of the Architectural Room. The cornice line is about 14 ft. 6 in. higher than the present cornice line; that it should have been raised at all is matter for regret, for the proportions of building and street are better as they are, but the commercial demand for raising street property higher has become so insistent that probably any proposal to keep the buildings to their present level would have met with determined opposition. As the street width from front to front is 84 ft., however, and the height to the top of the cornice 65 ft. 6 in., this is not at all events such an exorbitant disproportion to street width as we find in too many of the new buildings recently erected. The remainder of the height which was considered to be commercially necessary has been obtained in the roof, the ridge of which scales 97 ft. above street level, but which, being set well back, will not count to the eye as a portion of the architectural height.

The front is a grand piece of masonry design, for which on the whole we can express nothing but admiration, and a satisfaction that the Quadrant should be rebuilt in so monumental a manner; and as Mr. Shaw has made out all the full-size details with his own hand, there is a certainty that the design will be properly worked out in execution. The ground story with its massive rusticated arches will have a grand effect, and the design makes a most impressive whole, though of course, as the section shows, the great depth of recess on the upper stories must be obtained by building on girders set back on the cross walls; however, the girder is everywhere now, and we suppose it is an affectation to ignore the possibilities it offers. We are not quite sure whether we should not have preferred the columns without the rustication on their lower portion; it has a very powerful effect, no doubt, and is duly ranged with and linked up to the intervening portions of the design—indeed, the careful manner in which the relation of the various details of the design to each other has been considered is one of the finest qualities in the scheme; but it seems just a question whether this very bold column rustication is not a little too weighty for its position, though we should not like to come to any conclusive opinion on the point without seeing the design drawn out without them. The treatment of the chimneys as great blocks at wide and regular spacing is a fine point; and whatever difference of opinion there may be on

some details, the design as a whole is one which we think can only arouse a general feeling, not only of satisfaction, but of enthusiasm: its complete carrying out, which must be a matter of time, will be a great and important addition to London street architecture.

On the proposal for the treatment of what had now better be called Piccadilly-place rather than Piccadilly-circus we have no criticism to make except that it seems, as one may say, too good to be true; too thorough a reforming to have the best chance of being carried out. The circus form attempted to be given to this open space had long ceased to exist except in name; and in fact, a small circus with several streets cutting into it, however the ends of the building blocks may be conscientiously fitted to the curve, can never affect the eye as a circular design; the lines are too much interrupted. Mr. Shaw's plan explains itself fully, except that we may mention that it is proposed to retain the design of the front of the County Fire Office, a very good and dignified front of its type, but to set it back to the general line of front and rebuild it in stone. The effect of the open arcade in the ground story will be retained architecturally, but (as shown on the plan) it will enclose the entrance steps instead of the street pavement; so far we regret this, for the arcing of the street pavement (as done in the Ritz hotel) is always in itself a pleasant and picturesque incident in a street; but the gain in effect to the *place* by widening the street opening counterbalances this. There is a proposal, it will be seen, to mask the commonplace architecture of the London Pavilion, towards the *place*, by a loggia (intended to have a building over it); if the whole building could be removed it would be architecturally so much the better. The two wide openings westward, approximately of the same width, into Piccadilly and the Quadrant, will give a fine, spacious, and symmetrical effect; and there is no doubt that the scheme, if carried out, will rank as a London improvement of the first order.

Sir Aston Webb's "Proposed New Buildings, Merrion-street, Dublin, for the Royal College of Science and Government Offices" is shown by three drawings in one frame (1468). The main building forms four sides of a quadrangle, and is in a dignified classic style, with a central feature formed by an order of four Ionic columns which can hardly be called a portico, though as shown on the detail perspective they have a bolder projection than would be gathered from the general drawing, where the centre feature looks a little too flat. The wings are very simply treated, the centre being slightly emphasised by pilasters and a broken pediment: the cornice is carried round the whole three sides, but the frieze and entablature only maintained at the central features. The pediment over the main entrance is seated not on the main entablature, but rises from a very bold though simply treated attic over it, a departure from the more usual tradition of making the attic the background to the pediment; but the effect is quite satisfactory. There is a cupola over the entrance, with

a slight flat projection on each face of the plan, carrying a clock-face, and a seated figure of Britannia at the apex; viewed from a distance, the perspective makes the dome look a good deal distorted; it looks all right from a position near the foot of the drawing; but it illustrates the wisdom (as we have always thought) of always choosing a long point of sight for a dome drawing, whether exterior or interior; as for the latter of course it may be said that you can then show very little of the dome, but the fact is that the interior view of a dome in perspective is an impossibility except on a conventional system of viewing one-half of it from a distance with the intervening architecture removed. This, however, is a digression on drawing; before quitting the design referred to we may notice the pleasant effect of the planning of the re-entering angles of the quadrangle with a square projection crowned by a little open cupola on colonettes. On the plan the corridors are continuous but for the Chemical Laboratory, which occupies the whole width of the building; they are partly next the quadrangle and partly in the centre between two sets of rooms; in that case we conclude that they are one-story and lighted from the top; they must be rather dark otherwise. Sir Aston also exhibits "Detail elevation of the New Admiralty building at the East end of the Mall" (1470); the whole building was illustrated in our issue of April 29, 1905. This drawing shows one bay of the order in the concave portion of the front, and the treatment of what may be called the blunt ends of the plan adjoining the circular portions. This is powerfully treated with a couple of heavy rusticated pilasters with a pediment over; between them at the upper portion is some rich decorative carving of shields and other attributes, and below this a niche with a seated allegorical figure holding a sword; the inscription "Nelson" on the podium looks a little too much as if the figure above were intended as a portrait statue of Nelson. The curved face is decorated with a freely treated Ionic pilaster order and windows between; the crown moulding over the middle window just cutting out beyond the face of the pilaster and returned on it; a pretty little point in detail.

Coming to the exhibits of another member of the Academy, Mr. Belcher, the chief one takes the form of a large model, showing "New Structure in Williamson Park, Lancaster" (1613). This is apparently a stone pavilion on a large scale, erected, like a triumphal arch, purely for architectural effect; a kind of chance an architect does not often get in these utilitarian days. It shows a classic pavilion with a ground story with concave lines on plan carrying a lofty pavilion and dome above on convex (circular) lines; the spaces at the angles over the lower pavilion are filled up by smaller erections with cupolas. Without knowing more precisely what is the idea or the object at the root of the architectural conception it is difficult to judge of it; the whole effect is picturesque and striking, though one has a feeling that, with a free hand on such a work, a little more might have been made of it. The finest point in the

design is the treatment of the great flights of steps which lead up to the building; the two lower flights sweeping round in a fine curve to join the centre flight above, and leaving between them a facade of heavy rusticated classic detail with a columned recess in the centre, in which is seen a figure with a globe on his back symbolical of something, but we know not what. When we publish the design perhaps we shall be able to give more information as to its intent than is furnished in the catalogue. Mr. Belcher also exhibits, high up in an angle of the room a "Model of upper part of Angle, rebuilding of Winchester House" (1513); it is chiefly of interest as showing the grouping of sculpture, but the substructure being cut short in the model, it is difficult to judge of its relation to the architecture. In No. 1553 Mr. Belcher shows one of those fine geometrical elevation drawings with the projections profiled on, of which he has pretty nearly set the example in the architectural room, an example which we wish were more followed. This is a front marked by a very powerful rustication in the ground story; the upper part of the elevation is decorated with terminal pilasters developing into Telamon figures, and classic metal tripods are introduced above the cornice; these have no meaning, perhaps, on a modern building, but there is a pleasant antique association about them. Mr. Belcher's "New Premises, Oxford-street" (1563) suffers from the demands of the shop-front fiend (as in respect of architecture we may call him); the architect has made a heroic effort to provide a solid architectural base for his substructure; but alas! these thin tall columns are as inadequate to the eye, as they would be in fact, without other assistance than visibly appears. The treatment above is very pleasing; plain square piers first, and over them coupled columns, the windows being played with between the piers. It strikes one that the solid arcing above the columned story looks a little too heavy for its position, but in the main the upper part of this front is very pleasing work, and the balustrade grilles above the ground story are rich and effective in design.

Mr. Jackson exhibits three small drawings, one of which, "Enlargement of Billinge Church, Lancashire" (1604), is a slightly executed pen-drawing showing an interesting scheme for the addition of an octagon choir in Gothic style to an apparently very commonplace Jacobean nave; perhaps the plan of Giggleswick chapel left its tradition on the preferences of the architect. Liturgists, we believe, consider it an unorthodox plan; architecturally we think it an interesting idea, if only the exterior covering might have been made a little more gracious to the sight. Of the view of the interior of Giggleswick chapel we can only say that we do not understand the author's architectural position, nor why he chose to render the interior of his fine sober monumental-looking chapel such a curious mingling of suggestions borrowed from various styles and epochs. We should certainly have preferred to see the simplicity and unity of *motif* of the exterior more

represented in the interior. The organ-case looks as if it should be an effective piece of work.

Mr. Reginald Blomfield's "Part elevation of New Club House for the United University Club, Suffolk Street" (1435), though exceedingly simple, is a scholarly and pleasing piece of work of the classic tradition. It is shown in a large severely treated elevation drawing; the projecting wing on the left is treated solidly in rusticated masonry with pilasters, the recessed portion with an Ionic order running through the first and second floors, and an exceedingly well-designed decorative grille to the balconies. Except this latter detail, there is nothing new or original; but it is a satisfactory piece of dignified masonic street architecture with a style and treatment suggestive of a Club.

Mr. Bodley exhibits an elevation of his "First design for the monument to the late Marquess of Salisbury in Westminster Abbey" (1512), an altar tomb with a recumbent figure.

We have confined ourselves on this occasion, owing to considerations of space, to noticing the exhibits of architects who are members of the Royal Academy, to whom the first place is naturally due; other exhibits, some of them important, must be left to future articles.

BUILDERS AND THE WORKMEN'S COMPENSATION BILL.

IT may be of interest shortly to consider what will be the position of builders under the Workmen's Compensation Bill if it becomes law. The Bill has one good effect, it simplifies the law; the old questions as to the height of a building, "what is a scaffolding?" and whether a mortar-mill is a factory, will all be set at rest. But it must be remembered that the difficulties which have been experienced under the Workmen's Compensation Act have largely arisen from the desire of the Legislature at the time that Act was passed to exempt the small class builder from liabilities which it was felt he was ill able to bear. Under the new Bill this object has been sought to be attained by a general exemption of employers employing less than five workmen, but this exemption will in no case apply to builders, and the new Bill will embrace all classes of builders. This is in accordance with the recommendations of the Departmental Committee, but it will bear heavily on an industry which the labour returns show to be suffering from greater and more continuous depression than any other in the Kingdom. The clause exempting employers of less than five workmen is Clause 1 (2) (d); it is as follows:—

"This Act shall not apply in any case where the employer proves that the number of workmen employed by him at the time of the accident did not exceed five, unless the accident was attributable to the use by the employer of machinery driven by steam, water, or other mechanical power, or unless the workman at the time of the accident was employed in the care or management of horses or in mining, quarrying, or building operations, or in laying or repairing any electric line or work."

By Clause 13 "building operations" includes

"the construction, alteration, repair, decoration or demolition of a building, and the work of preparing for and laying the foundation of an intended building." This definition seems to include every possible operation upon a building, but even should this not be the case definitions so framed are never held to be exhaustive definitions, but merely declaratory, as was held in *Smith v. Coles*, a case under the Workmen's Compensation Act, 1900, relating to agriculture; and there can be little doubt that all building operations whatever are included—plumbing, for instance. This being so, it is to be observed that the builder not only does not benefit by the exemption in favour of employers of less than five workmen, but he is in a worse position than these employers, since they, if machinery is being used, can still claim the exemption if they can show that the accident was not attributable to the use of the machinery; but the builder has no such defence, and the mere fact of his employing workmen on building operations renders him liable.

In one other respect does this Bill bear more heavily on builders than it does on other employers. By Clause 9 it causes certain industrial diseases to be the subject of compensation as though they were accidents, and these diseases are those to which the workmen employed in building operations are peculiarly liable. These diseases are set out in the Third Schedule to the Bill—Anthrax, lead poisoning, mercury poisoning, phosphorus poisoning, arsenic poisoning, ankylostomiasis. Opposite to these diseases in the Schedule appears a description of certain processes which may give rise to them, and if the workman, at or immediately before his disablement, or suspension under rules made under the Factory Act, was employed in any of these processes the disease set opposite to it in the Schedule shall, unless the employer proves the contrary, be deemed to have been due to the nature of that employment. Otherwise apparently the onus of proof lies on the workman. The inclusion of these diseases within the Bill was not recommended by the Departmental Committee, and has introduced some complication in the Bill; the disease may be a gradual process, and although the last employer is made liable to pay the compensation, he can call upon other employers for contribution or indemnity. The above are the only provisions in the Bill which will especially affect builders as distinguished from other employers, but the general burden of compensation will be increased by the substitution of the period of one week for the fortnight at present in force for the period of incapacity before which compensation is not to be payable, in the case of accident as well as disease. The figures proved before the Departmental Committee showed how enormously this would increase the claims.

The extension of the Bill has naturally enabled it to be framed in simpler terms; but there is still room for improvement in this respect, and there is little doubt that some of its provisions will yet afford work for the lawyers.

THE TRADE DISPUTES BILL.

THE Second Reading of the Trade Disputes Bill last week has in no way elucidated the question as to what the Government intend should be the law as regards the liability of trade unions; this question, according to the statement of the Solicitor-General, is apparently now to be left to the opinion of the House. We venture to think that the course the Government has adopted towards this matter of principle is almost unprecedented, especially having regard to their unusually strong position. That this question is a matter of principle, and not the mere matter of detail which the Solicitor-General endeavoured to make out, can be proved from the speech of the Attorney-General, who, as representing the Government, introduced the Government measure, and with reference to the policy now introduced by the Labour Party Bill, and accepted as an immaterial amendment by the Government, used these words:—

"The alternative method is the royal road. The argument one bears is, why trouble to very carefully define liability? Why trouble to reconcile the law of agency with the administration of bodies of this kind? Why not say no action whatever shall be brought? But just let me ask the House to face that proposition. The proposition, I understand, is that, however great and ruinous the loss that may be suffered by an individual, however unjustifiable the conduct of the union which may occasion that loss, even in the case of that conduct having been carried out by means of the use of the funds which are controlled by the union, yet those funds, the property of the union, are not to be made liable to redress the claim consequent on that loss." He then pointed out that if such immunity were granted to trade unions other bodies would speedily claim similar exemption, and he cautioned the House against creating injustice to individuals in seeking to do justice to the unions, and he pointed out that it was a proposal to create class privileges, an inconsistent policy for a democratic government to adopt. He concluded, "Do not let us create a privilege for the proletariat and give a sort of benefit of clergy to trade-unions analogous to the benefit of clergy which was formerly enjoyed and which created an immunity as against certain sections of the community."

In the face of these unexceptionable expressions of opinion on the part of the Government the Solicitor-General (in the absence, through illness, of the Prime Minister and the Attorney-General) had an uphill task in reconciling the subsequent action of the Government towards that clause in Mr. Hudson's Bill which grants an immunity to the trade unions which is hardly enjoyed by even the Crown. He stated that it was the intention of the Government from the first to invite the opinion of the House on the clause of this Bill which relates to the liability of trade unions, but in face of the above statements he could hardly assert that it was their intention to act as they have done towards a Bill introduced as an alternative to their Bill, and which proposes to carry out what the Government

had urged the House it was not advisable should be done. Such is the position, however, of the Government.

We desire to notice one new argument brought forward by the Solicitor-General. He asserted that as the trade unions did not enjoy all the privileges of corporate bodies, that as they were bodies which could not sue their own members, it would be unfair to make their funds liable without giving them the privilege of enforcing their contracts against their own members; and he drew a fancy picture, if incorporation were granted, of the Unions calling in the police, and even the military, to enforce injunctions obtained against their own members. Injunctions have not, as a rule, been enforced by the military, and if the trade-unions took the course suggested by the law officer to enforce their contracts we imagine they would very soon cease to exist: for, after all, trade-unions only consist of a number of private individuals, and were their methods to be applied to their own members their existence would very soon be in jeopardy. It is also to be observed that many classes of persons in the State are under certain disability, but they, nevertheless, do not enjoy immunity from liability for these tortious acts. All the same, if incorporation and the right to sue is to be the complement to the right to be sued, we think it would be far preferable to grant the unions these rights, and as a consequence to make their funds liable. That, however, is unfortunately not the position the unions contend for, but is merely a herring trailed across the scent to divert attention from the extraordinary conduct of the Government towards one of the most serious questions of the day.

NOTES.

Rural Housing. A SECOND reading was given last week by the House of Commons to a Bill brought in by Mr. Mackarness, a private member, to facilitate the building of cottages in rural districts. The debate was remarkable for the general agreement on both sides of the House to the need for these cottages. But both Mr. Long and Mr. Burns agreed that legislation was useless unless local authorities would put the law in force and make use of their powers. It is no use to enact that a district council may borrow money and build cottages, when private owners do not provide enough, if such council will not move a hand. It is obvious, therefore, that there should be some power by which, if a public authority, which is primarily responsible, will not move, the Local Government Board should have the power to carry out the work of such body. As Mr. Burns truly said it is far better to keep men on the land than to try to send them back to it. The first essential to make rural life acceptable to manual workers is that there should be a proper supply of good and wholesome dwellings.

Recent Wages in San Francisco. THE scale of wages recently paid in the building trades in San Francisco would seem almost incredible in this country; but it

seems to have arisen from an abnormal position in local politics. Owing to an unexpected *coup d'Etat* in 1901 the United Labour Party of San Francisco were able to elect a Mayor, Mr. E. E. Schmitz, who has held the mayoralty ever since. Under his rule, combined with the recent unprecedented prosperity of the Western port, her isolation from the centres where labour offers its services cheaply, and the "trust" methods fostered by the various Guilds of Labour, a scale of wages arose which is unheard of elsewhere. Thus, the minimum to unionised unskilled labour was 8s. 6d. per day; to carpenters, 16s. 6d.; bricklayers and their assistants, 24s. 6d., and a sovereign respectively; plasterers and lathers, 26s. 6d.; plumbers, 24s. 6d.; and it is asserted, nevertheless, that these rates of pay have been justified by the employers' balance-sheets, without perceptible hardship upon them. Large fees for initiation were collected before outside labour might join the various unions. Each union was bound to the others for mutual protection, and great building enterprises were pushed forward by the capitalists with amazing assurance and courage. Having the whole municipal government dependent upon their votes for re-election, it is difficult to say where the increase in wage to artisans and unskilled labourers might have ended. What may be the influence upon it of the recent catastrophe remains to be seen.

Generating-Stations in London. IN view of the large number of Bills introduced into Parliament for the generation of electrical energy in London, the Commissioners of Works have felt it their duty to inquire into the possible injury of trees, plants, and flowers in the public parks, and of the national treasures in museums and picture-galleries, by the products of combustion emitted from the chimneys of generating-stations. They have come to the decision that the attention of Parliament should be called to the point so that it may be fully taken into account when electricity supply Bills come up for consideration. The objection to huge factory chimneys is not based entirely upon the nuisance caused by the emission of black smoke, for other products of combustion, such as sulphurous and sulphuric acids, and small particles of mineral ash, are particularly injurious to vegetation and buildings, as well as to pictures, marbles, and other works of art. Moreover, the oily steam which is frequently ejected from generating-stations is an unpleasant and deleterious mixture. While agreeing with the views of the Commissioners that effectual means should be taken to enforce the adoption of the most approved apparatus for the consumption of smoke in generating-stations, we are strongly of opinion that no more of these huge factories should be built within the metropolitan area. It is a perfectly easy thing to generate electricity at a distance from the place of consumption: The cost of establishing generating-stations could be largely reduced by building them in places where land and labour are cheap, and the transmission of current for a given distance would certainly be less costly than the transport

of fuel to London. If we are ever to get the benefits promised by the advocates of electric light and power, the necessary current must be provided without the accompaniment of smoke and other deleterious products—a condition that cannot possibly be fulfilled so long as the present irrational system of generation is permitted.

The Education of Engineers. AT a meeting of the Institution of Mechanical Engineers, held in April, 1903, it was proposed by Mr. Dugald Drummond—during the discussion of a paper by Professor Dalby on "The Education of Engineers in America, Germany, and Switzerland"—that the then incoming President of the Institution of Civil Engineers should be invited to form a committee, including representatives of kindred institutions and technical colleges, to discuss the question of the education of engineers in all its bearings. In November, 1903, the committee was appointed under the chairmanship of Sir William White, and, after deliberation extending over two years and a half, has issued a report based upon the opinions expressed by nearly some 270 experienced engineers. It says much for the practicability of the recommendations in the report that they should rest upon so secure a foundation, and we hope that efforts will now be made with the object of giving them practical effect. Speaking in general terms, the committee consider that engineering training must include several years of practical work as well as a proper academic training. To obtain the latter is not difficult in these days of technical schools and colleges, but the former can only be secured by such sympathetic assistance on the part of employers as is readily given in Germany, the United States, and other countries. Assistance of the same kind is available in Great Britain but not to the extent that could be desired, and as Sir William White observed at the annual dinner of the Institution of Mechanical Engineers last week, engineers must all pull together with a view to obtaining some definite results from the recommendations of the committee.

The City Central Markets. ALTHOUGH the Charing Cross failure was the result of a purely accidental flaw, impossible of detection by the most rigid examination, the City Corporation, like a good many other public bodies and railway companies, have been influenced by that occurrence to take steps for the purpose of satisfying themselves as to the safety of the iron and steel roofs under their care. The most important structures of the kind owned by the Corporation are those covering the Central Markets at Smithfield, a block of buildings erected at a cost of about 2,000,000*l.*, and so largely used by the public that any failure would result in an appalling catastrophe. Therefore the Corporation have acted most wisely in deciding to have the whole of the iron and steel work in the structures and sub-structures of these buildings thoroughly examined by Mr. A. T. Walmisley, M.Inst.C.E., of Westminster. It would probably be difficult to find an engineer more competent

for the performance of this onerous task than Mr. Walmisley, whose qualifications are sufficiently indicated by the iron and steel work of Olympia, the new roofing of the Borough Markets, and the roofs of the Carlisle Corporation Markets. Among the sub-structures to be examined are those in the railway tunnels beneath the Central Markets, the object being to ascertain whether the railway companies are properly discharging their obligations to the Corporation. It is to be hoped that similar investigations will be made with regard to the iron and steel structures of all the market and other public buildings both within and without the jurisdiction of the City authorities.

Steel Rolling Stock. SINCE the year 1844 railway engineers have been progressing gradually in the direction of substituting iron and steel for timber in the construction of goods waggons and passenger carriages. There has been no undue haste in this matter, as the large amount of timber used in modern vehicles abundantly shows, and it may be hoped that the paper read by Mr. H. G. Sheffield before the Tramways and Light Railways Association may help forward the present active movement in favour of all-steel trucks and cars. So far as concerns the former class it may be noted that tentative efforts were made as far back as 1850 to 1854 by the Great Western Railway and the London and North-Western Railway to introduce iron goods waggons, but the conservatism, which is as predominant in railway offices as in Government departments, seems to have prevented the general acceptance of the innovation, and no decided preference for metal was shown until steel waggons were introduced at a comparatively recent date in the guise of an American novelty. As for passenger carriages, although the Great Northern Railway built a few vehicles with steel bodies nearly a quarter of a century ago, the introduction of all-steel cars is really due to the extension of electrically-operated railways. As modern steel-built goods waggons have had the effect of converting much of the dead load into paying load, so may the increased strength and reduced weight of all-steel passenger cars, as compared with existing steel and timber vehicles, be utilised to the pecuniary benefit of railway companies. But the public have a right to demand the abolition of timber as a material of construction, for by its continued use the horrors of railway accidents are quite needlessly aggravated.

A Minor Budget Proposal. It is always pleasing to note any reform in the direction of improved postal facilities, and a passing remark may be made on the Chancellor of the Exchequer's statement on this head. His proposal to devote 135,000*l.* of his surplus to this purpose will enable the Postmaster-General to make some very useful reductions in the Parcel Post rates—commencing with 5 lb. parcels, which will be carried for 6*d.* instead of 7*d.*, while parcels weighing from 7 lb. to 11 lb. will be charged at the rate of 1*d.* per pound. It may be taken for granted that where this figure underbids the railway com-

panies, the latter will promptly follow the lead of the Post-Office. The reduction will, doubtless, prove very acceptable to the public generally, and to some industries in particular—as well as to the agricultural interest, on whose behalf the concession is primarily made. A reduction in the cost of postal orders and an enlargement of the definition of documents transmissible by post at 3*d.* will also be very generally appreciated. It has long been acknowledged that the rules regulating the 3*d.* post have been confusing and anomalous, and the benefit of that rate is to be extended to all purely formal communications.

Arc Lamps. THE paper by Mr. Andrews on "Long Flame Arc Lamps," read to the Institution of Electrical Engineers last week, is a valuable contribution to the very scanty literature of the subject. The lamp which forms the main subject of the paper is the "Carbone Arc," which is now extensively used in Berlin. By increasing the electric pressure between the carbons, by inclining them to one another at a small angle, and particularly by a most ingenious device for always keeping the arc between the ends of the carbons, M. Carbone has succeeded in appreciably increasing the efficiency of the conversion of electrical energy into light. Considerable importance was attached by the lecturer to the whiteness of the light emitted by the Carbone Arc, but we are inclined to agree with a suggestion made by Mr. Trotter in the discussion that this whiteness may be only apparent. The light coming from the lamps shown at the meeting certainly appeared to be white, but if they were placed in bright sunlight it would probably be noticed that the light they emit is really coloured. Mr. Andrews showed a striking experiment to illustrate the different colours assumed by ribbons, etc., when placed under different types of lamp. This experiment proved that indoor lighting by means of flame arcs between chemically-prepared colours would be impossible in practice, as their light is very deficient in blue and red rays. We think that the lecturer laid too much stress on the poisonous nature of the fumes emitted by these lamps and on the excessive ash. Their efficiency is exceedingly high and they can be used in low frequency circuits where ordinary lamps would flicker most unpleasantly. It was suggested that large halls can be economically lighted by arc lamps having the lower parts of their globes of clear glass and placed 30 ft. or 40 ft. above the floor. The lecture theatre was shown illuminated in this fashion, but we thought the variations of the luminous intensity too large to be admissible. The author's theory is that the lamp may send unobscured rays vertically downwards, as they do not then come within the usual visual range, and so the dazzling effect is negligible and we get the increased illumination.

The Abuses of Public Advertisement. THE National Society for Checking the Abuses of Public Advertising, whose similar Bill was read a third time in the House of Lords last session, have re-introduced a measure in Parliament for

empowering local authorities to control all hoardings above 12 ft. in height; to prevent the display of any advertising notice that might affect injuriously the amenities of any public park or pleasure promenade, or disfigure the natural beauties of a landscape; and to prevent the affixing of advertisements upon private property without the owner's consent.

Plowden Buildings, Middle Temple. WE notice that it has been found necessary to shore up the east wall of the block, Nos. 3-6, Plowden-buildings, in Middle Temple-lane, and it is expected that a reconstruction of the wall must be speedily taken in hand. Nos. 3-6 constitute the remaining portion of the original buildings; Nos. 1-2 were rebuilt by James Savage, who died in 1852. The two blocks are named after Edmund Plowden, the eminent jurist and author of the "Commentaries or Reports," and treasurer of the Society. Plowden was buried in the Temple Church (1584), where is a monument, with recumbent effigy upon an altar tomb, to his memory. Plowden was a student and reader of the Middle Temple; his bust and coat-arms are in the Hall, which was built in 1562-72, and, as Dugdale records, "Mr. Edmund Plowden being constituted treasurer for that work."

Lectures on Greek Dress. AT his second lecture on Greek Dress at the Royal Institution, on Tuesday afternoon, Professor Baldwin Brown commenced by remarking that Greek dress was specially Hellenic in a sense not previously mentioned—that it was a kind of representation of the history of the Greek spirit in art, the object of which was to give artistic form to that which was at first formless. The treatment of the dress in sculpture was gradually perfected, first in one portion and then in another. The hair, which was difficult to treat in sculpture, remained conventional in treatment the latest. It was only in the period of perfected Greek art in the time of Pheidias that the whole drapery was, so to speak, vitalised. Examples were shown of archaic figures in which the idea of the folds of the drapery was only conveyed in a formal and conventional manner. In the perfected art it fell into natural folds which assisted in giving expression to the figure, or to its action; sometimes to assist the appearance of rapid motion, as in some of the hurrying figures in the Parthenon tympana; in one of the figures of the Niobe group; in the Niké of Samothrace, descending through the air with the raiment flying behind her; or, in the more reposeful figures of the Panathenaic frieze, its lines assisted in the expression of repose and dignity. The more intricately folded parts of the linen tunic were contrasted with the broader and heavier folds of the *himation*, and both contrasted with the smooth contours of the limbs where exposed. The gradually increasing use of drapery to assist composition was illustrated in a series of the metopes, in which drapery was obviously used to fill up what would otherwise have been awkward spaces between the figures. The Ionic *chiton* was shown not to be a sewn garment; all its effects

could be got by a long and rather narrow single piece folded so as to droop in long hanging folds at one or both sides, and fastened at intervals on the arms; the process being illustrated by photographs from the living model. It was obvious, the lecturer said, from the whole consideration of the subject, that the drapery of the figure of the great period of Greek sculpture was not an ideal evolved by the sculptor, but represented the most perfect arrangement of the dress as actually worn; and it was remarkable that in the period of the most highly idealised sculpture we found the most lifelike and least conventional treatment of the dress. The lecture was illustrated by a large and most interesting collection of lantern slides from Greek sculpture and from dress arranged on living models.*

THE Munich Art Exhibition
The Grafton Gallery, at the Grafton Gallery only calls for a brief notice, for its value consists chiefly in the contributions of two artists, Herr von Kaulbach and the late Herr Lenbach. Herr von Kaulbach's portraits, which form the chief portion of his contribution, are excellent in composition, drawing, and character (notice especially "Fräulein F.," 114), and they are free from that heaviness and dinginess of colour which seem the besetting sins of the modern German school. From this defect Lenbach's are not free, and a collection of a good many of his portraits confirms us in the impression we have always had, that the praises of his work which appeared everywhere at the time of his death a year or two ago were somewhat exaggerated. He had a wonderful power of characterisation, of which his well-known portrait of Bismarck (which is included in the exhibition) is a remarkable example; and a portrait of a lady, "Frau Geheimrath Jost" (148), is remarkable in the same way; but the portrait of Gladstone (143), however powerful in expression, is spoiled by its heavy handling and disagreeable colour. There are three examples of Herr von Uhde's naturalistic treatment of the life of Christ, of which "The Sermon by the Sea" (250) is pleasing in character and expression, though not in colour. Among the others there are many things ugly and fantastic, and but few to pause before. Herr von Bartels' "Meditation" (8) is a good study of a fisher-girl seated among the dunes; Herr Cairati's "Mantua" (25) is a good architectural picture of the old castellated walls red in the evening sunlight; Herr Kaiser's "Coming Thunderstorm" (104) is a landscape of some power; Herr Samberger shows a rather fine head under the title "Poetry" (195); Herr Walter's "Study of a Head" (245) which is effective both in expression and lighting; and Herr Zimmermann's "Christ" (271), a half-length figure, is solemn and dignified. But the exhibition as a whole illustrates the poverty and (in some cases) the grotesqueness of modern German art.

* It is to be regretted that the second of these admirable lectures was very poorly attended, which, we suspect, is owing to the time first advertised having been altered from 5 p.m. to 3 p.m. This was announced as far as possible, but it is always difficult to ensure that people take note of a change of this kind, and it is unfair to an able and learned lecturer to put him at this disadvantage.

At Messrs. Walker's Gallery, Mr. Hitchens' Pastels, 118, New Bond-street, is a small collection of landscapes in pastel by Mr. Alfred Hitchens which contains some very beautiful work, and shows what fine landscape effects can be obtained in this medium of colour. The subjects are largely taken from the grand country about Ballachulish and Loch Linnhe; among these a view in the Pass of Glencoe (22) is particularly fine, and others in the same neighbourhood may be noted; also "A Mountain Path" (21), which reminds one somewhat of one of Alfred Hunt's water-colours; "Pines beside the Loch" (17); "Springtime, Windsor Park" (18), a beautiful study of forest effect; "At the Foot of the Mountains" (19); "The Rising Moon" (30); "By the Side of the Loch (Scam-madale)" (1); these are among the best, but all are good. Mr. Hitchens exhibits some good life-size portraits in pastel also; but it is in the landscapes that the real interest of the exhibition lies.

THE landscapes by Mr. J. A. M. Lomas exhibited at the Quest Gallery in Bond-street may be characterised (though they are not specially called so) as decorative landscapes, in which there is no attempt at literal translation of nature, but the representation of broad effects of light and composition in flat tints. Though we cannot call this landscape-painting in the true sense of the word, in their own category these works are very effective and suggest a good deal of the poetry of nature, Nos. 10, 11, and 12 especially, and as an effort in a special field of art they are of interest. In a gallery attached to a private house (17, Cliveden-place, Eaton-square), Mr. Hubert Medleycott is exhibiting a collection of water-colours in which architectural subjects, views of cathedrals and bits of the street architecture of ancient cities, play a considerable part. The "Old Clock Tower, Dinan" (1) is a delightful piece of architectural picturesque; among the London subjects "Old Chelsea Church and Wharf" (13) and "Battersea Bridge when Building" (17) are excellent specimens of water-colour art, the latter especially, which is perhaps the best thing in the collection. "Porte de Gand, Bruges" (33) is noteworthy for its fine colour; and "Boats at Ostend" (34) is a charming little reminiscence of the effect of the white-sailed boats on a calm misty day, looking like ghosts of boats on the still water. At the Lyceum Club a room is filled with the paintings of "The Advisory Board of Painters" connected with the Club, among which may be mentioned a fine and pathetic picture by Mme. Caiziani; some interesting studies of effects of twilight and artificial light by Miss Ida Lees; and a pastel by Mrs. Deric Hardy, "Fairy Tales," a very good figure composition with two charming children in it.

Putting Architects up to Tenders. FROM a newspaper report of a recent sitting of the Carmarthen Board of Guardians it appears that the Board, as a means of settling what architect should be employed to rebuild part of

their workhouse which had been burned, adopted the plan (alike discreditable to themselves and insulting to the architectural profession) of applying to various architects to know for what commission they would undertake the work. One firm, Messrs. G. Morgan (of Carmarthen) very rightly replied that 5 per cent. was the professional standard, and that no architect of any training or standing would depart from this scale in any important building. This lesson had no effect upon the Board, who by a majority of 18 to 11 appointed a local architect who undertook to do the work at 1 per cent. on the contract, "and would not require any clerk of works" (!)

REINFORCED CONCRETE.

JOINT REINFORCED CONCRETE COMMITTEE.*

WE reprint the following information from the last issue of the Royal Institute of British Architects' Journal:—

The following statement, which was read at the first meeting of the Concrete Committee, gives an idea of the nature and scope of the investigations the Committee has been formed to carry out:—

This Committee has been nominated by the Royal Institute of British Architects to consider and report upon the use of reinforced concrete in buildings and other structures. As we all know, reinforced concrete is largely used in other countries—in America, France, Germany, Italy, Russia, Egypt, etc.—and is now coming into use here, but very slowly.

The conservative nature of our people may be responsible for part of our reluctance to use reinforced concrete, but another reason why we lag behind is that no responsible or representative body of skilled men—no one man even whose name carries great weight—has pronounced in its favour. Also Building Acts and By-laws do not facilitate its adoption. The architect and engineer hesitate to use it until the material and what can be done with it has been generally agreed upon; until, in fact, they have some assurance that it may safely be employed.

Now, as the Royal Institute of British Architects has been the promoters of this Committee, you may naturally look to its representatives for some general idea of the line of action to be taken. Exactly what may be done must be settled by the Committee itself; and in submitting to you a general rough sketch idea of a programme, it must be understood that the sketch is necessarily only an introduction, and not in any way a finished scheme, for your guidance.

First, then, it appears that we should inquire into what has been done already, and ask the owners or architects or engineers of such works for particulars, and how the buildings have stood the test of time.

We shall have a Secretary who can apply to railway companies, owners of mills, private owners, architects, engineers, and others, who will no doubt willingly place the results of their experience at our service in connection with such works; some have actual experience in the new system; and when we have digested this knowledge we can as a body express an opinion as to its usefulness, its safety, its permanence, and other qualities, which opinion we may fairly hope will be of value to our fellow countrymen.

Something of this kind has been done already in other countries. The German Association of Architects and Engineers in conjunction with the Concrete Association have drawn up a report; the American Institute of Civil Engineers in conjunction with various other bodies have appointed a Committee which is at present engaged on similar work, and it is suggested that we should apply for copies of such information or interim reports as may be at its disposal; the French Government also is said to have appointed a Committee to prepare a set of recommendations.

A general expression of opinion as to its value would not help other architects or engineers very much; we should therefore consider and report upon the following amongst other matters, as to which there is doubt:

(1) Whether such constructions are permanent or likely to deteriorate with time. The steel skeleton is said by all those who have studied the subject not to rust, and even when steel is embedded in a material such as coke-breeze concrete containing a proportion of sulphur there is said to be no rusting. As any reduction in the section of the metal by rusting might endanger the work,

* The Committee consists of representatives of the Royal Institute of British Architects, the District Surveyors' Association, the Institute of Builders, the Incorporated Association of Municipal Engineers, the War Office, and distinguished scientists.

we should consider if it ever does rust, and under what circumstances, so as to advise upon any necessary precautions, or to reassure the doubters on this head.

(2) The resistance to fire. We shall have to consider what has been done in experimental tests, such as those of the City of Hamburg Authorities in 1891, and of the British Fire Prevention Committee just made. Also the results of tests in actual fires in buildings such as the Baltimore fire, where the conditions were exactly those we have to provide against. We may thus be able to form definite conclusions of value to all interested.

(3) The method of contracting. There are about fifty different so-called patent systems, and it is usual to entrust the design of any proposed work to one of the firms who make a speciality of this class of construction, obtaining from that firm a guarantee of strength. This arrangement is probably quite desirable; but as a certain responsibility must always lie on the engineer or architect who accepts or recommends for acceptance any such design, it is desirable for us to define as best we may the responsibility of the parties.

For instance, it may be made clear that the contracting firm undertakes all responsibility; you may consider it wise to require that the drawings should first be submitted to the architect or engineer, and should be signed by the contracting firm, or by some responsible person on their behalf. Some firms try to make a secret of their system, and object to showing the drawings.

It may appear to you that to accept a plan for floor or roof or wall or column or bridge or water-tank (all matters of construction in which we are supposed to be specially skilled) by making ourselves acquainted with what is to be done is dangerously foolish; and, if so, your opinion may have sufficient weight to settle that question. Captious interference we should all deprecate of course, but the engineer or architect must be in command, and must know, not only what is proposed to be done, but how it should be done.

We can still leave ample freedom to the experts in the design of the work, in the choice of material and method of carrying out the work.

(4) The materials also will no doubt be considered; these are—

- (a) The metal, iron or steel.
- (b) The cement.
- (c) The sand.
- (d) The aggregate, ballast or stone, etc.

For the steel and the cement we shall have the standard specification of the British Engineering Standards Committee, and must inquire if qualities of the standard kinds are suitable for reinforced concrete work.

As to the sand, you know how universally the qualities of good sand are given as *clean* and *sharp*. We have to review all that in the light of recent knowledge. In America many experiments have been made which show that cleanness is not so all-essential as has been supposed, and that washing does not improve every sand. These results were arrived at by experiments on material not only seven days or twenty-one days old, but were made on pieces of various ages up to three years.

Certain work in that way is being done here, and when we have collected and considered the facts our opinion based on knowledge should be of value.

Next as to sharpness. You may find that sharpness is not so important as variety in size of the grains of sand. Compactness and freedom from voids appear to play a most important part in the strength of mortar, and that freedom from voids may best be obtained by variety of size. These questions we should study with an open mind, free from ancient prejudice.

Then there is the aggregate of stone, gravel, coke-breeze, etc., what proportion to use, what material to use to get the best results in given cases. If we find that washing the sand may be saved, and that concretes of leaner mixture may be used than hitherto with equal safety, we shall have done some good.

Questions arise as to the mixing. We want to know what is the proper way to mix our concrete; how much water to use; whether the sand, gravel, and cement should all be mixed together and the water added, or whether the sand, cement, and water should be made first into mortar and the gravel or stone added, as recommended by some. We want to know the value of mixing machines, and whether it is wise to allow a smaller proportion of cement, say 10 per cent. less, if the concrete is mixed by machinery, owing to the fact that it is better mixed. Into all these we must inquire, so as to be able to advise our brother architects and engineers.

(5) Another subject is the carrying out of the work. Should we require that only skilled men under skilled supervision be employed; that the work be kept wetted, be stopped in frosty weather; how long the centres should be kept up, etc.? All these can only be indicated as matters for your consideration and judgment, and upon which an authoritative pronouncement would be desirable.

(6) One important question which we must consider is what are the safe stresses to allow in various cases. There is apparently no such general agreement upon the safe stresses and

methods of calculation as we find in regard to steel or iron, and it is possible that in the present state of knowledge we cannot tell with sufficient accuracy what are the internal conditions in a non-homogeneous beam, to enable us to determine rules which are not open to criticism or improvement with the advance of experience.

Reinforced concrete is, however, being used, and there is need of rules—tentative though they may be—to guide us until we get formulas which will command general assent. Much has been done in the way of experiment in recent years so that we are in a much better position to test any of our theories by the results of actual work.

It may be found desirable to refer this part of our subject to a Sub-Committee of those amongst us who are specially qualified by reason of their mathematical attainments to pronounce upon it.

Our Commission is limited to preparing suggestions and recommendations, and therefore any report that may be made will be in the way of advice and not as fixed and immutable rules.

How far our Building Acts and By-laws should be altered to permit of the use of reinforced concrete walls may also be considered, because as they stand they interfere with the reasonable use of the material.

There is a general feeling that our regulations as to walls should be relaxed in all buildings, at least in rural districts. The agitation for reform in this respect has not yet spread to urban districts, save in regard to the material we are studying; and it certainly seems that if the strength is increased by the use of a metal skeleton the thickness of a concrete wall may be correspondingly reduced.

We fortunately have with us municipal and county engineers and district surveyors whose experience in the working of these by-laws will be of value in restraining too much reforming zeal should we display it.

All the questions thus briefly reviewed are matters upon which the general body of architects and engineers and others interested would no doubt value the consensus of opinion of skilled and disinterested men who have studied the subject. Such an opinion will help the introduction of the material by giving those who hesitate to employ it through want of knowledge and fear of the responsibility, the assurance of the

conditions under which it may safely be used, and give that confidence which is at present lacking. It will call attention to its advantages where it has any, such as road bridges over railways, which at present deteriorate rapidly with rust.

THE ARCHITECTURAL ASSOCIATION: PENETRATION.

An ordinary general meeting of this Association was held on Friday evening last week at No. 18, Tufton-street, Westminster, Mr. E. Guy Dawber, President, in the chair.

The minutes were read and confirmed, and Messrs. H. S. Watling, E. J. Tanner, and A. R. Ashby were elected members.

It was announced that the first summer visit would take place on May 12 to All Saints' Church, Footing (Mr. Temple Moore, architect), and the second summer visit on May 26 to Marsh Court, Hampshire (Mr. E. L. Lutyens, architect).

It was also announced that on May 8 the Sketching and Measuring class would commence, and that the annual dinner will be held on May 17 at the Georgian Hall of the Gaiety Restaurant. Tickets, price 5s., may be obtained at No. 18, Tufton-street.

The New Officers.

The Chairman then read the scrutineers' report on the election of officers for session 1906-1907. The following is the result of the election—

- President, *R. S. Balfour.
- Vice-Presidents, Walter Cave, 394 votes, and *A. Neefman Wilson, 352.
- Council, *E. Guy Dawber, 346 votes; *Arnold Mitchell, 279; *L. Ambler, 255; *J. B. Fulton, 249; *A. Marjon Watson, 253; J. Murny, 243; W. Curtis Green, 201; Arthur Keen, 193; and E. W. M. Wonnacott, 183.
- Hon. Treasurer, *Henry T. Hara.
- Editor of the A.A. Journal, *Maurice E. Webb.
- Hon. Librarian, E. Gunn.
- Hon. Secretaries, *H. Tanner, jun., and C. Wontner Smith.

Fig. 1. Window at Delhi.

Fig. 2. Ravenna: S. Apollinare in Classe.

Hon. Solicitor, W. H. Jamieson.
Hon. Assistant Librarians, H. J. Worrow and Percy May.

The following were not elected:—

F. D. Clapham, 179 votes; *J. S. Gibson, 171; *J. Maclaren Ross, 149; Theodore Fryc, 119; *E. A. Rickards, 110; R. Douglas Wells, 79; E. F. Wheatly, 70; S. J. Tatchell, 69; and A. N. Peckham, 66.

On the motion of the Chairman, a vote of thanks was accorded to Messrs. T. L. Dale, G. F. Blackburne Daniell, R. A. V. Harrison, and T. J. Wetherall for acting as scrutineers.

Votes of Thanks.

The Chairman said that they would miss their late Treasurer, Mr. F. Hooper, very much. Mr. Hooper had been treasurer for the last five years, and the amount of time, trouble, zeal, and devotion he had given to the Association could not be overestimated. The Association must desire to accord their hearty thanks to Mr. Hooper for all he had done for them during the last five years, and he accordingly moved a hearty vote of thanks to him.

This was unanimously agreed to, and a vote of thanks was accorded to the School of Design Visitors and to the Press.

Mr. Water Cave then read the following paper on "Fenestration"—

Fenestration.

"Fenestration—or the disposition of window-openings in relation to the structure—is a subject which is inseparably connected with the whole history of architecture, and the manner in which light was introduced into buildings has always been one of the most important elements in determining their style.

The influence of climate, the necessity for protection, the manufacture of glass, and the relative positions of buildings have all affected the size and shape of windows; and in the following paper it is proposed to deal with the subject in some sort of chronological order, which will enable the development of

fenestration to be more easily followed, and to show how these various influences in different countries have left their mark on the architecture of the time.

In all the great buildings of past ages, which consist of halls arranged side by side, the method of admitting light was constructionally the same. We find in the vast temples of Egypt the same arrangement of clearstory which the Gothic builders brought to such a pitch of perfection. The central hall, or nave, was taken up higher than the side halls or aisles, and this plan in itself was a determining factor in the design.

In the gigantic temple at Karnac, which may be taken as typical of the Early Hypostyle buildings in Egypt, we find a clearstory which was never glazed; and in the temple at Kalasche, built during the Roman occupation, we find the same system employed to light four successive chambers, one behind the other, each, of course, having the ceiling at a lower level. The introduction of light generally throughout a building was not considered a necessity—partly due, perhaps, to the mysterious rites of the Egyptian religion, and partly, perhaps, due to the wonderfully-brilliant skies of the East, which not only gave the smallest openings their utmost value, but made a cool and dim interior of infinite value in the desert.

In later times there is evidence that the domestic buildings had openings in the front walls over low screens, and in the temples of Edfu and Dendera the same arrangement can still be seen.

But this method of admission of light must not be treated at length in a paper dealing with fenestration, except as an instance of the simplest method; for in reality these openings were only the omission of the wall-screens, either between the columns and the lintels of the clearstory, or between the columns in the façade, and to pursue this subject would partake too much of an archaeological discussion.

Grecian.

When we consider Grecian architecture

and the method in which the interiors of those wonderful temples were lit, we are faced with a greater difficulty and more uncertainty. In the Erechtheum and the great temple at Agrigentum, in Sicily (420 and 480 B.C.), we have, according to the accepted restorations, windows in the side walls, but these are both exceptional instances, and even here the problem of how the central part was lit remains a matter of conjecture.

In the Erechtheum the three windows which appear to have existed are so placed that they seem to have been almost an afterthought. The windows themselves are square-headed, rectangular openings, about two squares in height, tapering towards the top, and placed somewhat uncomfortably as regards their heads which come some distance below the caps of the columns; they were probably fitted with pierced marble screens.

In the temple at Agrigentum the windows appear to have been somewhat narrower in proportion, and the heads so arranged that they more nearly line with the caps, and seem to have formed a part of the original design, but have a very crowded effect.

Both these examples, as has been stated above, are exceptional, and may be taken as proving the rule, that the Greeks did not consider that openings in the screen-walls was the best form of lighting their temples.

All Greek architecture came, we know, from the South, the land of brilliant sunshine, where windows, as we understand them, were either unknown or of quite subsidiary importance.

They were very few in number in all Classical work, and never placed to form more than one tier. We can thus, I think, draw the conclusion that windows, such as we require, are never really successful in columnar architecture. The Greeks felt this, and never developed the scheme, and the modern attempts to combine fenestrated with columnar architecture show the impossibility of making a happy compromise between two totally conflicting styles. Take the instance

* Members of present Council.

of the Royal Institution in Albemarle-street, where we find a single Corinthian order the full height of the façade, in itself well proportioned, but its general effect marred by the introduction of windows, which look mean and squeezed in between the columns, and spoiling the effect of the connecting screen-walls.

If the columns are detached and in their proper proportion, either the windows are darkened and become too small, or the general effect of the façade is weakened by bad intercolumniation if the windows are designed to give their full lighting value to the interior.

That the Greeks had a method for lighting their temples is generally accepted by all archaeologists, and it seems evident that if it was not from the side walls, it was from some form of roof or clerestory window. There is, however, one other theory which has a literary foundation. In the tragedy of Iphigenia, in Tauris, it is actually stated that the intervals between the triglyphs in a certain temple were left open, and were to be utilised as a means for thieves to enter. This is a possible solution; but the evidence of words is apt to be misleading in such a case, and it is more probable that some form of clerestory adapted to a sloping roof, as suggested by Mr. Fergusson in his "History of Architecture," was the real method of lighting these interiors, and in support of this we have the evidence of the Egyptian temples. St. Peter's, Eaton square, is an attempt, and a successful one, to light a church in this method. But, again, the subject becomes of more archaeological than architectural interest, and it is not till we come to the great buildings of the time of the Roman Empire that the admission of light came to be considered as the integral part of the design.

It is thus apparent, and the following remarks will make it more evident, that fenestration became more important as the art of building advanced westward and northward until it reached its most interesting development in our own country, where the necessity for light is of such great importance.

Roman.

The great eye of the Pantheon is a good starting-point for a more detailed consideration of the subject. In this truly remarkable building we have an interior completely and perfectly lit by one central opening in the dome, 27 ft. in diameter. The total cubical contents of the Pantheon represent nearly 2,000,000 cubic ft. (1,934,600), which gives the extraordinary result that each square foot of skylight lights 3,380 cubic ft. of space. This instance has been quoted to show the enormous value of a vertical light, which, according to generally-accepted rules, can be taken as about thirty times as valuable as an horizontal one.

The arch and dome construction of the Romans gave an opportunity for windows, which were introduced high up beneath the vaulting and above the four barrel arches supporting the dome; these were usually great semi-circular openings, and divided by massive mullions into three divisions, finished according to Viollet le Duc, with frames of bronze enclosing panes of glass, alabaster, or simply lattice-work. This, it seems probable to suppose, was the usual way of lighting the great central courts of the Roman buildings, and from their plans we know that the various rooms ranged round this court must have been lit only by borrowed lights from the central court itself.

The Influence of Glass.

We now come to a very important consideration in fenestration, and that is glass. During the Early Eastern work, briefly referred to above, both in Egypt and Greece, there is nothing to lead us to suppose that glass was used in windows. The openings in the Greek temples were almost certainly unglazed or fitted with marble screens, and the position of these, either in the frieze or as concealed dormers, would not make it an absolute necessity. That glass was in use for domestic utensils at a very early date is undoubted, but it is not until the beginning of the Christian era that we have a definite reference to its use in windows. Pliny, who died in 115 A.D., describes, in his "Laurentine Winter Villa," a glass door and curtain, and we may assume that, at least in some

cases, glass was used in screens to light the smaller rooms round the great courts of the Roman buildings. It is interesting to note that the great group of the Laocoon was found in one of these inner chambers with no external opening.

Thin slabs of alabaster were, no doubt, used in some instances, similar to those still to be seen at Orvieto Cathedral, and pierced marble screens, like those from the Taj Mahal (built by Italian workmen in 1630), Agra and Delhi, India (Fig. 1); and plates of glass, 7 in. by 9 in., cast in marble frames, are still to be seen at St. Sophia, at Constantinople, which probably date from the building of the church by Justinian, A.D. 540.

Bede mentions that in 680 A.D. Abbot Biscop sent to Gaul "manufacturers of glass for windows," which shows that the habit of glazing windows was by no means common in the west of Europe at that time. Even in England during the 11th century glass was not in common use, for there are instances of church windows, which were closed by shutters of wood or stone, which were unglazed.

Roman Client and Architect.

But to return to the Roman buildings; it is of importance to note that great regard as to aspect was observed. In the Baths of Caracalla—a typical building—the lights beneath the domes opened towards the most

favourable points of the compass. Vitruvius, in discussing this subject of orientation, says that "due regard should be had to climate (i.e., latitude), for the same arrangement will not suit in Egypt and Spain, and it must be different in Pontus and in Rome. In northern countries the buildings should be vaulted, well closed in, and their openings small facing a warm aspect. On the other hand, in southern countries, subject to the burning heat of the sun, the openings should be large and face the north and north-east."

In Cicero's letter to Atticus we have a very interesting passage where he quotes his architect's reasons (which seem to be somewhat modern!): "Know that in blaming my windows as too narrow you are finding fault with my architect, Cyrus—happily it is only with the architect. When I was saying the very same thing to him he pointed out to me that wide windows looking into a garden did not offer a prospect so agreeable to the sight. For let A be the eye of the spectator, B and C the object he sees, D and E the rays proceeding from the eye to the object—you understand what follows!" This unfinished demonstration, is not in itself particularly convincing, but may be taken as an instance of mystifying the client—which is not entirely confined to the time of the Roman Empire. He further adds, "If you find anything to criticise in other parts, I shall always be prepared with a

Fig. 3.

Fig. 4.

tolerable justification, unless I can make a change for the better at a smaller cost!"

The true Roman architecture was based on the use of the Greek lintel construction combined with the Etruscan arch, and, without going into the details of the origin of the latter, it is sufficient for our purpose to note that this combination gave an opportunity of lighting buildings from the side walls. The intercolumniation of the Greeks, as has been pointed out, precluded a satisfactory form of fenestration, but, with the pillars placed at a distance from one another equal to their own height, the intervening screen-wall was well adapted, if not obviously intended, for window-openings. In later times by superimposing one order above another, giving a series of stories, the opportunity for systematic fenestration was attained, and the windows thus became an integral part of the design. This plan ultimately led to the very elaborate wall arcading, which is seen in so many buildings from 500 to 1200 A.D.; but its use as a means of systematic fenestration was rare, and, as a rule, was a mere necessity of construction.

Early Christian Architecture.

In many of the Early Romanesque buildings in Italy we find a curious arrangement of windows. For instance, in the great basilica of S. Apollinare in Classe (Fig. 2), at Ravenna, begun in 538 A.D., the window-openings are very small, and made quite subordinate to the wall arcading on the exterior; but from the inside the spacing of the windows is most thoughtfully carried out, as in the case of the sister church of S. Apollinare Nuovo.

This system of designing the window-openings from the inside with little regard to exterior is typical of a people who were developing a style of architecture suited to their western requirements based on the eastern tradition; and it is highly probable that the Early Christian antagonism to all the heathen practices may have led them to ignore their exteriors, on which the Greeks spent so much thought and labour.

In the Byzantine style the same remarks, to a certain extent, hold good, but it is now proposed to leave the eastern architecture and follow the progress of fenestration westward, and see how the Gothic builders treated their window-openings.

It would take too long to enter into a comparative detailed account of the various national styles in Europe, and we will at once proceed to the English Gothic buildings.

English Gothic Windows.

The first thing to be noticed is the same arrangement of subordinating the windows to the external wall-decoration, as has been described at Ravenna. These windows in our Early Norman work were small, and their size was due to various causes; the desire for protection against enemies in these troubled times when churches (and especially their towers) were used as places of defence and refuge; the difficulty and expense of obtaining glass, resulting in their generally being unglazed, and only a shutter of stone or wood used to keep out the weather; and, as has been before mentioned, the form of window itself came from the East, or the land of sunshine.

The treatment of the window-openings in the early church towers is very effective. In most cases they were small, and arranged in groups high up, with a baluster-shaft dividing the lights; the main part of the tower was left plain, and great dignity is thus produced. With the advent of the pointed, or lancet, windows of the XIIIth century a real attempt was made to make a design in fenestration both from the inside and out. In the lofty square-ended fronts of the Cistercian buildings we find the windows ranged in deeply-set arrays of varied arcading. But, as a rule, the Early Gothic windows in the arcades were subordinated to the general wall scheme, and at Crowland, Durham, and Ely (Fig. 3), the Benedictine monks built tier upon tier of arcaded galleries, with occasional windows, which reminds one of the Romanesque work at Pisa.

Towards the end of the XIIIth century came a most remarkable change in the window treatment of our great Gothic buildings, "which," as Mr. Prior says in his valuable work on Gothic Art, "must be judged as no mere freak of a designing architect, but as a revolution worked by Gothic creativeness in some thirty years, such as the centuries of Egyptian or Greek art did not accomplish."

Inventors are rarely theorists; the invention must be suited to the necessity, before everything, and the theory may follow if anybody cares for it—for a theory is nothing

but an attempted explanation, and the fact must exist before it can possibly need explaining.

The history of the development of tracery is so well known that I do not propose to dwell on it now. In its earliest and best stages it was always treated as a part of the whole design, and the masons used their stonework with a due regard for its constructive possibilities. The development of glass-painting in connexion with window-tracery is a branch of this subject on which a whole paper might be written.

The lancet windows, especially those on such a grand scale as Chartres and Paris, measuring 6 ft. or 8 ft. across, made a magnificent field for the glass-painter such as he did not get again till the end of the XVth century, when homogeneous Gothic art was a thing of the past. The increasing richness of glass was for a long time only a part of the general scheme of enrichment, and the development of tracery was really due to the mason; but with the rise of individualism, which was one of the main causes of the decadence of Gothic, the extremely decorative character of this form of ornamentation called for wider fields for its display. At Selby the combination of tracery and glass reached such a pitch that the tracery practically becomes the cloissons of a great masoned enamel.

With the introduction of the transept to divide these great windows into tiers—each division fitted with niched saints—we seem to feel the desire to recall the great sculpture galleries and fronts of Wells, Lichfield, and Exeter. Gradually the glass-painter exercised more and more influence over the mason, and thus we find, at Gloucester and King's College Chapel, Cambridge, windows of such a size that the intervening wall spaces are only piers to carry the lofty stone vaults, and these windows, fitted with the magnificent glass of the period, reach the utmost limits of engineering skill in this direction.

It is, perhaps, scarcely fair to notice here a modern parallel, but, in studying these wonderful examples, one cannot help thinking of the modern plate-glass windows of our streets, where the visible means of support are reduced to a minimum, and all the skill and knowledge of material we have at our disposal is utilised to obtain the greatest possible amount of glass space.

There is, however, a lesson to be learnt

from the two cases which may, for practical purposes, be taken as parallel.

With the Gothic builders the glass itself was set back at a considerable distance from the wall-face on the exterior, and, though the mouldings themselves had become comparatively shallow with the growth of the Gothic style, still they were not ineffective, and served to give a certain amount of shadow.

In too many instances the exact reverse is the case to-day, and if the great sheets of plate-glass in our modern shop-fronts were recessed, their hopelessly bald effect would, to a certain extent, be minimised. It may be taken as a broad rule that the larger the window the more the glass should be recessed from the outer wall.

With the decay of Gothic, which, for purposes of classification, may be taken as about 1500, a foreign influence began to make itself felt in England, and the interest in the national style, which had been mainly confined to the ecclesiastical structures, was transferred to the domestic buildings after the dissolution of the monasteries under Henry VIII.

The Tudor Period.

Italian art was first of the long series of outside influences which affected English architecture. The great Renaissance in art and letters may be said to have begun with the fall of Constantinople in 1453, which Mr. Gough says "flooded Western Europe with Greek scholars and Greek literature. Italy was the centre of the new movement which eventually reached the distant shores of England, but, as the stream flowed across Europe, it became tinged with the peculiarities of the various lands over which it passed." But before the classical traditions had really been thoroughly assimilated by the English builders there arose, under Queen Elizabeth, a marvellous growth of stately country houses, in which the followers of the fast-perishing Gothic style made their last effort to accomplish something new. The great country houses of the XVIth century, with their stone-mullioned windows in many divisions, fitted with well-proportioned leaded

glazing, are to be found scattered up and down the length and breadth of the country. The wonderful ease with which this form of fenestration was adapted to the great façades of Kirby and Montacute, as well as to the modest gables of the Cotswold manors, took such a hold on the national mind that this style of window may be said never to have completely died out. The Gothic origin of these windows is obvious, and at Cowdray House, in Sussex (Fig. 4), the growth is well exemplified.

The necessity for a defensible house had by this time disappeared, and the reaction was, like all reactions, inclined to the opposite extreme; and we find, in cases like Astley Hall, Lancashire, and Little Moreton, a range of windows practically dividing the façade into alternate horizontal bands of glass and solid wall surface.

The development of the bay window is also one of the striking characteristics of these times, and they are to be found in all kinds of buildings. From the earliest date we see them almost invariably on the dais of the great halls, and in later examples, as at Bradford-on-Avon (Fig. 5), they become the most important feature in the whole composition.

The proportions of these mullioned windows is worthy of careful consideration. The single transom was generally placed so that its lower line was nearly in the centre of the window. The proportion of glass to mullion was usually one of mullion to two and a half of glass. The glass line took the centre of the mullion, and the face of the mullion, if not flush with the external wall, had only a small member beyond it. The mullions were about twice as deep as they were wide. Where more than one transom was used the divisions became less, towards the top—with some curious exceptions, as at Kirby Hall. The proportion of the lead-glazing varied considerably.

In the earlier type of houses, and in the smaller examples—as, for instance, in the Cotswold district—the windows were small, and the amount of plain wall surface thus produced made up a composition in

fenestration which can hardly be equalled for its dignity and sense of repose.

In many instances we find that the windows decreased in size, and in the number of lights, as they ascended the gable, and were kept a long way from the angles. This satisfies the eye—as a logical arrangement—for the mind easily follows the relative size and proportions of the rooms within, and it also gives that peculiar conviction that the house has an inside, much as we can distinctly feel by a glance at a face whether there is really a mind behind it.

As a contrast to the diminishing number of lights as seen in the gables of the Cotswold manors, it is of interest to notice the arrangement of the window-openings in the towers of many of the Lombard churches. At the Cathedral of Sienna we see the exact reverse of this treatment, and from the single light on the lowest stage of the tower we find an additional light added at every step till at the top there is a range of seven lights, the object probably being not only to produce an effect of lightness, but actually to diminish the amount of masonry.

Small windows, well placed, undoubtedly make for good architecture, and it is not always possible to convince those concerned that a room can be overlit; the modern building requirements seem especially framed to prevent good proportion, both on account of the placing of the windows in relation to the floor and ceiling and as to their size in proportion to the room itself.

These regulations may be of use for ignorant builders in crowded towns, but are sadly hampering in the country.

But the classical ideas which had, by the end of the XVIth century, gained a firm foothold in the interior of the house, at last showed themselves both in the arrangement and details of the windows, and the outer member of the jamb developed into the architrave, though the mullion and transom held its ground. Woolaton Hall is typical of the transitional period, but the effect of the fenestration cannot be considered entirely satisfactory. It has all the defects of proportion and misuse of classical detail

Fig. 5. Kingston House, Bradford-on-Avon.

inseparable from the attempt to combine an imperfectly-understood style with our own traditional methods. But if we consider what a revolution was taking place in all matters connected with art, we cannot fail to pay a tribute to the builders of these great country palaces, which are not only stately and picturesque, but essentially English.

[Owing to pressure of other matter, we are compelled to divide our Report of the meeting. The conclusion of the paper and some notes of the discussion which followed will appear in our next issue.]

THE ARCHITECTURAL ASSOCIATION SPRING VISITS:

VII.—SOUTH-EASTERN HOSPITAL.

AN additional spring visit was arranged for Saturday, April 28, so that an opportunity might be taken of inspecting the reconstructed South-Eastern Hospital, which will shortly be ready for patients. This institution, which belongs to the Metropolitan Asylums Board, is situated in the Old Kent-road, S.E., and is intended for the treatment of scarlet and enteric fevers and diphtheria. Four hundred and eighty-eight beds are provided in ten pavilions and two isolation blocks, each building having two stories, and the whole is sited to advantage upon a site measuring 11 acres, representing approximately forty-four beds to the acre.

The hospital now completed is a reconstructed scheme, with the exception of the administrative block (which has been rearranged and enlarged) and two pavilions built in 1896 and two nurses' homes in 1894. The wards in the pavilions contain eighteen to twenty-four beds, and each block has additional separation wards of one or two beds. The isolation blocks have wards of varying sizes from one to six beds.

Messrs. T. W. Aldwinckle & Son, the architects, have made a very successful reconstruction, and have introduced many interesting and new matters of detail. We see, for instance, that the sanitary annexes are situated in the centre of the length of the wards instead of at the far end, thus adding to the convenience of working whilst outweighing certain objections to the change of position.

The floors of the wards are finished with mosaic paving for cheapness, durability, and facility of cleaning compared with wooden floors. The wards are 28 ft. wide, and have a lineal measurement of 11 ft. per bed, instead of the customary dimensions of 26 ft. and 12 ft.; this arrangement gives greater working space in the centre of the ward and allows the beds to stand farther from the outside walls. A cubic air space of about 2,000 ft. is secured for each bed. The sashes and hopper lights have two thicknesses of glass, all angles are rounded, including the terrazzo skirting, and all the subtle, yet important, details down to the removable traps to the scullery sinks have received most careful study.

The warming of the wards is well considered, and a somewhat lower temperature is designed than is usually found. A low-pressure hot-water system, with augmented circulation, supplies warmth to radiators placed below the windows in the wards. Air is admitted behind the radiators, each of which has a metal inclosure with brass hit-and-miss gratings at the top and folding-doors to the fronts, so that the heat may be utilised to suit the open or closed position of the sashes. Foul air is extracted from panels in the ward ceilings by the agency of electric fans, and the proportions of inlet and exhaust have been suitably arranged.

The contractors are Messrs. Godson & Sons, of Kilburn, and the total cost of the work is about 123,000. The work is full of intricate detail too extensive to deal with at the present time. The attendance of the architects at the visit added materially to the success and interest of the occasion.

A GARDEN CITY IN KENT.—Proposals are being formulated under the superintendence of Sir Robert R. Wilnot, Chairman of British Garden Cities, Ltd., for laying out the Wigmore estate, near Chatham, as a garden city. The projected plans provide for a public park and large gardens for all the houses, and the public buildings include a hall, a library, and schools.

THE LONDON COUNTY COUNCIL.

THE first meeting of the London County Council after the Easter recess was held on Tuesday in the County Hall, Spring-gardens, Alderman E. Spicer, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Camberwell Borough Council 1,818*l.* for street improvement; Kensington Royal Borough Council 3,355*l.* for street improvement; Poplar Borough Council 1,670*l.* for sewer and paving works; St. Marylebone Borough Council 44,850*l.* and 12,000*l.* for electric lighting purposes; and Shoreditch Borough Council 14,905*l.* for electric lighting. It was also agreed to sanction the borrowing by Lambeth Borough Council of 35,000*l.* for municipal offices.

Vauxhall Bridge.—The Improvement Committee reported as follows:—

"The Council, on May 19, 1903, upon the recommendation of the late Bridges Committee, approved the design, then submitted, of the new Vauxhall Bridge, and the proposed architectural and artistic treatment of the same, but reserved for future consideration the question of erecting propylæa on the abutment piers. Models have been prepared and designs submitted to us for propylæa which are suitable for erection on the bases as now constructed. With regard to the question whether any artistic treatment at all of the abutments should be attempted, we think that, unless something be done in this direction, the bridge will appear in every respect incomplete and unsatisfactory. The alternatives are, therefore, presented, either of erecting propylæa on the abutments, or of covering them with large groups of statuary. There will be little difference in the cost of the two schemes, and as, in our opinion, the erection of propylæa will produce a much better effect than groups of statuary, we think the Council should sanction the erection of propylæa. We have caused models of the propylæa, and copies of a statement describing the same, to be placed in the lobby of the Council chamber. One of the models (No. 1) is square and of plain design; the other (No. 2) has rounded ends and some decorative treatment of the sides. The total estimated cost of erecting, in granite, propylæa for both approaches to the bridge, in accordance with design No. 1, would be 22,600*l.*, while if design No. 2 be adopted, the cost would be 15,120*l.* We think that design No. 1 would be in greater harmony with the general features of the bridge than No. 2, and we propose that it should be adopted; but we would ask the Council to authorise us, if necessary, to introduce some slight modification on the Lambeth abutment. We have also considered the arrangements to be made for the erection of suitable figures on the summits of the propylæa. Mr. Alfred Drury, A.R.A., has been engaged, in collaboration with Mr. E. W. Pomeroy, A.R.A. (Mr. Drury being the contracting artist), to model and cast the panels for the piers of the bridge, and we consider that he should also be engaged to design and provide the figures for the propylæa. He is prepared to provide four subjects, different in design, but in harmony with each other, in a composite material, for a total sum of 2,800*l.* The material, which we are advised is an excellent one, has been used, in most other works, for the fountains at Versailles, and for work at Hampton Court. We think that Mr. Drury's offer should be accepted, but that Mr. Bertram Pegram, who was originally suggested by the Bridges Committee to collaborate in the work, should be associated with him in the provision of two of the groups. The unexpended balance of the several votes passed by the Council for the construction of the bridge is only sufficient to cover the cost of the works proposed, and we recommend:—

(a) That expenditure on capital account not exceeding 15,400*l.* be sanctioned for the erection of propylæa, with suitable groups of statuary thereon, at both approaches to Vauxhall Bridge. (b) That granite propylæa be erected at both approaches to Vauxhall Bridge, in accordance with design No. 1 submitted to the Improvements Committee on March 22, 1906; and that the Committee be authorised to arrange for minor modifications of the design of the structure on the Lambeth abutment, and for the execution of the complete work. (c) That the solicitor do prepare and obtain the execution of an agreement with Mr. Alfred Drury, for the modelling and casting, at a total cost of 2,800*l.*, of four groups of statuary, to be placed on the propylæa; that Mr. Bertram Pegram be associated with Mr. Drury in the case of two of the groups; and that the agreement of the Council be affixed to the agreement (in duplicate)."

Mr. Leven Sharp moved that the matter be referred back, because he did not think the architect should have his own way entirely in the matter of the design of the propylæa. Quite apart from the question of expense, he also thought that the work should be worthy, not only of the Council, but of the City, and the best art of the present time. He thought that the design of the bridge was satisfactory, but he did not approve of this large expenditure for the purpose of making decorative additions, which, perhaps, might be one day carried out by a private citizen at his own cost. He thought that a group of statuary would be better than these huge pylons.

Sir Melville Beachcroft seconded, and said that he had often remarked that matters of this kind ought to be considered by some

Architectural Authority or Committee of Taste, but unfortunately there did not exist such an authority. He could not see any justification for an expenditure of 15,000*l.* on this work. It was supposed that the figures to be erected on the bridge were to be symbolic or decorative, or both, but he was inclined to think that in the course of a year or two they would be neither the one nor the other, but a mere smutty representation of goodness knew what.

Mr. Penn Gaskell contended that these propylæa would be a useless expense, and would utterly destroy the artistic appearance of the bridge.

Mr. Straus, M.P., said he regretted that the name "propylæa" had been substituted for "pylon." Propylæa originally meant an entrance to a sacred place, and he did not think that Vauxhall Bridge could be called a sacred place. He thought it was absurd to suppose that any private individual would come forward and pay for the work proposed, and he reminded the Council that the Alexander III. Bridge, Paris, which was much smaller than Vauxhall Bridge, cost about three times as much.

Mr. A. Smith said he did not think that the Bridges Committee should be responsible for deciding such questions.

The Chairman of the Committee then agreed to take the report back.

The Aldwych Site.—Mr. Hubbard, the Chairman of the Improvements Committee, in reply to Sir M. Beachcroft, stated that he was unable to say anything with reference to the progress of the negotiations for the leasing of the Aldwych site to a syndicate at a rental of 55,000*l.* a year, but he hoped next week to make a definite report.

Cost of Gas Fittings.—Mr. Cyril Cobb called attention to the fact that during the first four months of the year the Council had spent in the elementary schools 1,333*l.* 8*l.* 3*d.* on repairs to gas-fittings, 645*l.* 2*l.* 8*d.* in rearranging gas-fittings, 1,222*l.* 17*l.* 5*d.* on new gas-fittings, 147*l.* 8*l.* 5*d.* on gas-globes, and 669*l.* 8*l.* 7*d.* on mantles, a total of 3,018*l.* 5*l.* 4*d.* on fittings alone. It would probably astound members to hear that during these four months no fewer than 40,166 mantles had been used in the schools, and he thought the Council was entitled to know whether these mantles were brought on contract or otherwise, and whether any proper means were taken to check the accounts.

Lord Welby replied that the figures were new to him, and he could not give any answer until he had consulted the responsible officials, which he promised to do.

Public Baths and Washhouses.—The Education Committee reported, and it was agreed:—

"That the amended drawings submitted to the Education Committee on April 25, 1906, by Mr. James F. Franck on behalf of the Hammersmith Metropolitan Borough Council, of the public baths and washhouses proposed to be erected on the site adjoining the London County Council Hammersmith Technical Institute, be approved, subject to the solicitor advising that such drawings are in legal conformity with the agreement entered into between the Council and the borough council, and subject to the express condition that such approval shall not interfere with the operation of the provisions of the London Building Act."

Fire Brigade Inspection.—The following recommendations of the Fire Brigade Committee were agreed to:—

"(a) That the resolution of November 8, 1904, approving the proposal to form an inspection department in the fire brigade, and instructing the Fire Brigade Committee to consider and report what arrangements should be made therefor, be rescinded.

(b) That, without express instructions from the Council, requests that advice may be given by the fire brigade, as to the fire arrangements of buildings other than places licensed for public entertainment, common lodging-houses, and Government buildings, be not acceded to.

(c) That the authorised strength of the fire brigade be increased by one district officer and decreased by one station officer, and that an additional clerk be employed at the chief station of the fire brigade in a temporary capacity, at the rate of pay of 30*l.* a week."

Catford Bridge.—The Improvements Committee recommended, and it was agreed:—

"That, notwithstanding the fact that the estimated net cost of reconstructing the bridge carrying Catford Hill over the South-Eastern and Chatham Railway, should be 57,500*l.* instead of 33,900*l.*, the application in the present session of Parliament for authority to reconstruct the bridge be proceeded with on the basis that the Lewisham Metropolitan Borough Council be not required to contribute towards the cost a larger sum than 25,500*l.*, and that, in the event of the net cost of the work being less

than 55,000l., the difference shall be deducted equally from the respective proportions of the cost to be borne by the Council and the borough council."

The Council, having transacted other business, adjourned.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Erection of Buildings on the Site of Nos. 247 to 267, Fulham-road.

Chelsea.—Buildings on the site of Nos. 247 to 267, Fulham-road, Chelsea (Messrs. Elms & Jupp for Mr. R. C. H. Sloane-Stanley).—Consent.

Lines of Frontage and Projections.

Hammersmith.—Buildings on the southern side of Bulwer-street, Wood-lane, Hammersmith (Messrs. Macintosh & Newman for Mr. E. J. Clayton).—Consent.

Paddington, South.—One-story shops in front of Nos. 119 and 112, Westbourne-grove, Paddington (Mr. J. A. L. Gimblett).—Consent.

Strand.—A fascia addition to the projecting shelter in front of the Tivoli Music Hall, Strand (Mr. H. Tozer).—Consent.

Dulwich.—Bay windows, porches, wooden eaves, and sham half-timber work to ten semi-detached houses on the north side of Burbage-road, Dulwich (Mr. W. Griffiths for Mr. J. Watson).—Consent.

Greenwich.—Half-timber work and a projecting porch to a house on the northern side of Liskeard-gardens, Blackheath (Mr. A. M. Torrance for Mr. N. McDougal).—Consent.

Kensington, South.—That the application of Messrs. Millard & Pryce, for the Royal Exchange Assurance, for an extension of the period within which the erection of buildings on a site on the south side of Kensington-road, Kensington, to be also upon Palace-gate, was required to have been completed, be granted.—Agreed.

Lewisham.—Additions in front of Nos. 4, 6, 8, and 10, Loanpit-oval, Lewisham (Mr. J. Webster for Mr. A. E. Woollett).—Consent.

Strand.—A deviation from the plan approved, for the erection of a projecting flue on the eastern side of the Savoy Hotel extension to project in Savoy-buildings, so far as relates to the erection of an additional flue (Messrs. Colclutt & Hamp).—Consent.

Islington, North.—That, at the request of the Holloway Press Company, the Council do permit the retention of a show-case on the forecourt of No. 449, Holloway-road.—Consent.

Norwood.—A covered way in front of No. 160, Knight's-hill-road, Norwood (Messrs. Hammond & Son for the Colour Type Company, Ltd.).—Refused.

Lines of Frontage, Projections, and Construction.

Finsbury, Central.—Three external iron gangways, affecting the first, second, and third floor levels of Nos. 9 and 10, Lendsen-place, Finsbury, an external iron staircase at the eastern end of No. 8, Lendsen-place, and two external iron staircases and landings connecting Nos. 8 and 9, Lendsen-place, at the first and second floor levels (Messrs. L. Tubbs & Welch).—Consent.

Width of Way and Lines of Frontage.

Hackney, North.—Buildings on the site of Nos. 34 to 40 (even numbers), Boleyn-road, Kingsland (Mr. F. J. Staines).—Consent.

Hackney, South.—Buildings on the eastern side of Mare-street, Hackney, to abut upon Tudor-road (Messrs. Crossman, Pritchard & Co. for Mr. J. King).—Consent.

Camberwell, North.—An addition to a factory building on the north-western side of Leppis-road, Camberwell (Mr. E. J. Stevens for Captain Wood).—Refused.

Width of Way and Space at Rear.

Haggerston.—Buildings on plots Nos. 8 and 9, Goldsmith's-row, Haggerston, to abut upon Goldsmith's-row, Dove-row, and Hay-street (Messrs. Woodrow & Helsing for Mr. D. Dear).—Consent.

Width of Way and Construction.

Islington, North.—Two external iron and concrete balconies at workshop premises on the north-west side of George-street-messers, Holloway (Mr. J. Farrer for Messrs. Foxton Brothers).—Consent.

Rotherhithe.—A wood and urinalie addition to a saw mill, Rotherhithe-street, Rotherhithe (Messrs. Burt, Boulton, & Haywood, Ltd.).—Consent.

Width of Way and Temporary Buildings.

Rotherhithe.—Wood and iron buildings of a temporary character at Lower King and Queen Wharf, Rotherhithe-street, Bermondsey (Messrs. J. R. Wood & Co., Ltd.).—Consent.

City of London.—The retention of a covered way of a temporary character over a portion of Capel-court, Bartholomew-lane, City (Messrs.

Joseph & Smithem for the Alliance Assurance Company).—Consent.

Formation of Streets.

Lewisham.—That the Council do consent to the application of Messrs. Eastman Brothers for an extension of the period within which a new street for carriage traffic, to lead from Dartmouth-road to Sydenham Hill-road, Lewisham, was required to be clearly defined throughout by posts and rails or so otherwise as the Council might permit and thrown open to the public as a highway.—Consent.

Lewisham.—A dwelling-house on the eastern side of an extension of Oaksford-avenue, Wells-road, Sydenham (Mr. W. Wilkinson for Mr. T. Covel).—Consent.

Dulwich.—That an order be issued to Messrs. Worsfold & Hayward sanctioning the formation or laying out of a new street for carriage traffic, to lead from Peckham-rye to Dewar-street, Camberwell.—Consent.

Lewisham.—That an order be issued to Mr. G. A. Lansdown sanctioning the formation or laying-out of new streets for carriage traffic to lead from Manor-park to Manor-lane, Lee, Lewisham, and in connexion therewith the widening of a portion of Manor-lane (Messrs. W. J. Scudamore & Sons).—Consent.

Hampstead.—That an order be issued to Mr. R. J. Worley refusing to sanction the formation or laying-out of a street for carriage traffic to lead out of the eastern side of West End-lane, Hampstead (for the Midland Railway Company).—Refused.

Space at Rear.

Kensington, South.—A deviation from the plan approved in connexion with the erection of a building known as Thorney Court, Palace-gate, Kensington, so far as relates to an alteration in the position of the building (Messrs. Millard & Pryce).—Consent.

St. George, Hanover-square.—A modification of the provisions of sect. 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a building on the southern side of Oxford-street, to abut also upon Davies-street, with an irregular space at the rear (Messrs. W. A. Lewis for Messrs. Perry Brothers).—Consent.

Kensington, South.—A modification of the provisions of sect. 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a building to abut upon Silver-street and Edge-street, Kensington, with an irregular open space at the rear (Mr. W. G. Hunt).—Refused.

Paddington, South.—Buildings on the eastern side of Richmond-road, Paddington, on the space at the rear of No. 112, Westbourne-grove (Mr. J. A. L. Gimblett).—Refused.

Alteration of Buildings.

Kensington, South.—The retention of openings uniting Nos. 4 and 6 to No. 8, Lexham-gardens, Earl's-court (Mr. E. L. Wratten for the Misses Brown and Charles).—Consent.

Strand.—The uniting of No. 45, Piccadilly, with a building on the eastern side of Albany-courtyard (Mr. G. D. Martin).—Consent.

Conversion of Buildings.

Lambeth, North.—The conversion of No. 27, Belvedere-road, Lambeth, into two separate tenements (Mr. P. N. Gilman for the Works Committee of the Council).—Consent.

The recommendation marked † is contrary to the views of the local authorities.

Architectural Societies.

MANCHESTER SOCIETY OF ARCHITECTS.—At the annual general meeting of the members of this Society, held on the 26th ult., the following officers and members of Council were elected:—**President**—Mr. J. H. Woodhouse; **Vice-Presidents**—Messrs. J. W. Beaumont and Edward Hewitt; **Hon. Secretary and Treasurer**—Mr. Paul Ogden; **Assistant Hon. Secretary**—Mr. George Brown; **Members of Council**—(Fellows) Messrs. John Ely, J. B. Gass, W. C. Hardisty, C. H. Heathcote, J. D. Mould, F. P. Oakley, Isaac Taylor, G. H. Willoughby, and P. S. Worthington; (Associates) Messrs. Godfrey Colles, A. E. Corbett, and J. H. Gibbons.

NORTHERN ARCHITECTURAL ASSOCIATION.—The forty-seventh annual Report of this Association records that the total number of members is now 253, as against 220 in the previous year. The Report refers with deep regret to the death of Mr. Francis Edward Caws, who was elected a member in July, 1893, since which time he had held office on the Council as Vice-President, etc., and as President in 1901 and 1902. The Report alludes with regret to the death of Alderman W. H. Dunn, of Gateshead, who had held every office in connexion with the Northern

Architectural Association, having been President, Treasurer, and Hon. Secretary, etc.

CARDIFF, SOUTH WALES, AND MONMOUTHSHIRE ARCHITECTS' SOCIETY.—The annual dinner in connexion with the Cardiff, South Wales and Monmouthshire Architects' Society was held on the 27th ult. at the Royal Hotel, Cardiff. The President (Mr. J. H. Phillips) presided, and amongst those present were Principal Griffiths, Messrs. E. Seward, E. J. Williams, David Morgan, Cholton James, C. L. Wilson, H. Teather, E. H. Fawcner, C. H. Priestley, Edgar G. C. Down (Hon. Secretary), etc., the company numbering about forty. The Chairman submitted the loyal toasts, and Mr. E. Seward proposed that of "Our Pastors, Legislators, and Defenders," to which the Rev. J. Baker, Councillor Lewis Morgan, and Capt. E. H. Fawcner responded. The toast of "The Royal Institute of British Architects" was given by Mr. D. Morgan and responded to by Mr. Seward, in the absence of Mr. Dare Bryan, of Bristol. Mr. Seward dwelt upon the need for steps being taken to protect legitimate members of the profession, and for the establishment of a defence fund for architects, subjects which he said were well worthy their attention. Mr. Ernest Buntz (London) proposed the "Cardiff, South Wales, and Monmouthshire Architects' Society," and said such a body was of great service to the Institute in London. Suggestions from the provinces obtained far more attention in London than suggestions from members of the London body itself. He urged them to lay their views before the Institute, and said he was strongly in favour of some measure of legislation if they were to keep their status and improve the condition of building in this country. As regarded Cardiff, he trusted that the local Society of Architects would do their utmost to see that the extension of the city was carried out on artistic lines, and follow the example set in their new town hall, which he had seen and admired. The Chairman replied, remarking that the Society had been in existence about twelve years, and had done really good work. He acknowledged the valuable work done by Mr. Edgar Down on behalf of the Society. Mr. G. H. Birkenhead proposed the toast of the "Master Builders," and Mr. W. Thomas returned thanks after which Mr. C. James submitted that of "Local Governing and Educational Bodies," and observed that the County Council did not altogether treat architects as they should do. The members of the Corporation had acted in quite a different way, and wisely. It might be well for the Glamorgan County Council to take a lesson from their Corporation. He suggested that the chairman of the Education Committee should convey to the Corporation the advisability of submitting all plans of proposed buildings in Cathays Park to a committee of qualified architects before they were erected. Principal E. H. Griffiths said, in response, that after a study of other university colleges, he thought they would have in Cardiff one of the most perfect university colleges in the kingdom. He could not judge of the artistic exterior, but he said, unhesitatingly, as regarded the internal arrangements, that he would not exchange it for any other that he had seen. Mr. E. J. Williams proposed the last toast of "The Visitors," to which Mr. C. H. Priestley replied.

RURAL BUILDING BY-LAWS.—The Public Health Acts (Amendment) Bill, introduced by Lord Hylton, came before a Committee of the House of Lords, Lord Balfour of Burleigh presiding, on the 1st inst. The object of the Bill is to amend building by-laws in many particulars in England and Wales, exclusive of the Administrative County of London. Earl Carrington remarked that he had a number of amendments, but with the exception of these the Government had no objection to the Bill. One provision was that "two dwelling houses separated by a party division of fire-resisting material shall be deemed to be a single building," but Earl Carrington asked that the division should be "not less than 9 in. in thickness." Lord Hylton entered a plea for more elasticity in building by-laws, and asked if the words proposed by Lord Carrington were absolutely necessary. Lord Carrington said there had been much discussion about this, especially on the London County Council, but as this Bill was practically confined to rural districts he thought he could properly give way. The amendment was therefore withdrawn, and the Bill was ordered to be reported with amendments.

THE SURVEYORS' INSTITUTION: PROFESSIONAL EXAMINATIONS, 1906.

The following student candidates have passed the Intermediate Examination:—

England and Wales.

- J. C. C. Affleck, High Wycombe.
H. J. Amore, Hanwell.
W. H. Baines, Burslem.
C. A. Balcumb, Boscombe.
S. W. Bettridge, Croydon.
A. G. Bird, Kensington.
H. S. C. Bishop, London.
W. L. Bosker, Clapham.
W. A. Bott, Burslem.
B. Bradley, Worcester.
G. L. Broad, Lewes.
C. G. Brown, Herefield.
H. I. Brown, Tottenham.
H. H. Buckmaster, West Hill-road, S.W.
G. S. Chiff, West Ealing, W.
W. J. Carlisle, Bayswater.
E. P. Canon, Sheffield.
H. Chatley, Holloway-road, N.
P. C. Crimes, Lawton, Kildgrove.
A. G. Culme-Seymour, Wye.
A. H. Davis, Ladbroke-grove, W.
F. L. Elmes, Canterbury.
C. England, Bourne-mouth.
E. H. Ewin, Sharnbrook.
A. E. B. Fielding, Cardiff.
D. L. Ford, Upper Tooting, S.W.
B. Francis, Southend-on-Sea.
L. P. Gale, Wallingford.
G. H. Garrad, Wye.
H. Gawith, Southport.
R. A. Godin-Austen, Great Missenden.
L. B. Gumbrell, Kingston-on-Thames.
A. L. Hicks, Egham Hill.
S. G. Hine, Harpenden.

Ireland.

C. J. Dunlop, Bray, Co. Wicklow.

The following non-student candidates have also passed the Intermediate Examination:—

England and Wales.

- A. Abbott, Totnes.
A. Anderson, Wye.
S. H. Anstead, East Ham E.
H. B. Archer, Sheffield.
S. H. Ashton, North Shields.
A. Askwith, Newcastle-on-Tyne.
C. C. Atkinson, Headingley.
E. G. Bagnall, Ashford.
G. C. Bailey, Clifton.
J. R. Ball St. Albans.
H. C. Barrett, Harringay, N.
W. T. McN. Barrett, Brixton, S.W.
R. D. Bartlett, Cornwall-gardens, S.W.
A. R. A. Bates, King's Cross, N.
W. M. Bax, Catford, S.E.
E. Bayden, New Cross, S.E.
H. C. Bell, Grantham.
H. J. Benjamin, Maiden Vale, W.
O. P. Devan Carleton, E. Bevington, Stroud Green.
M. A. Bing, Richmond.
C. V. Bisley, Rotherhithe, S.E.
B. F. Blois, Bourne-mouth.
D. Bloxham, Bide.
C. H. C. Bond, Backingham Gate, S.W.
H. J. Bouwick, Crouch End, N.
D. Bradford, London.
A. M. Bramall, Highbury New Park, N.
C. B. Britton, Oxford.
A. E. Bridger, Winchfield.
B. F. Bristol, East Finchley, N.

* Penfold Silver Medal. † Institution Prize. ‡ Special Prize.

- R. J. Forge, Twickenham.
T. P. Frank, Leeds.
H. J. Franklin, Wealdstone.
C. W. Giffin, Westminster, S.W.

W. D. Jenkins, Carmarthen.
H. de B. Wilmet, Watlington.
H. A. Wright, London, then.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XVII. DECIMAL LOGARITHM TABLES AND THEIR APPLICATION.

Now come to the very useful and convenient form of logarithmic tables comprising four-figure logarithms and four-figure antilogarithms, which are natural numbers corresponding to a given series of logarithms.

Tables of the kind are to be found in several pocket-books and appended to various scientific treatises, but as usually arranged they exhibit the disadvantage that the logarithms extend over two pages and that the antilogarithms extend over two other pages, thus making it necessary for the user to keep turning one leaf of the book backwards and forwards. This drawback constitutes one of those small hindrances that are better avoided if possible, and it is aggravated to a considerable extent when books are used where the two tables extend over eight pages.

In cases such as the latter the loss of time involved in the performance of numerous short calculations becomes a serious item, and it happens occasionally that isolated calculations can be done by ordinary arithmetic in less time than would be occupied by the acts of taking down the book, finding the place, extracting and writing the logarithms, and finding the natural numbers at the end of the calculation.

Waste of time in this way can be avoided by obtaining two copies of any inexpensive book in which the tables are printed, and pasting them in convenient form on a piece of cardboard for office use.

We give in Tables XIV. and XV. extracts from complete series of four-figure logarithms of numbers from 1 to 9999, and four-figure

* Penfold Gold Medal. † Crawford Prize. ‡ Gaisworthy Prize. § Such as the "Mechanical World Pocket Diary and Year Book," price 6d.

antilogarithms corresponding to the mantissa of logarithms from 0.00 to 0.9999.

Table XIV. gives under the column headed "No." the first two figures of various numbers from 100 to 9999; the next figure is given at the top of the first group of columns headed 0 to 9, extending the range to 100 to 999; and the last figure is given at the top of the second group of columns similar headed, extending the range to 100 to 9999.

Notes.—In what follows we use the abbreviation "log." to denote the mantissa of a logarithm, and "complete log." to denote the mantissa with the addition of the proper characteristic.

To Find the Logarithm for any Given Number.

Rule (1).—The log. of a one-figure number is found in column (0) on the line opposite the given number multiplied by 10.

Example (1): Log. 8 = 9031; Complete log. = 0.9031.

Rule (2).—The log. of a two-figure number is similarly found in column (0).

Example (2): Log. 25 = 3979; Complete log. = 1.3979.

Rule (3).—The log. of a three-figure number is found in the column of the first group, having at the top the same figure as the third figure of the given number.

Example (3): Log. 459 = 6618, the log. being found in the column (9) of the first group on the line opposite the number 45. Complete log. = 2.6618.

Rule (4).—The log. of a four-figure number is found by taking the logarithm of the first three figures as in Rule (3), then adding the difference stated in the second group of columns for the fourth figure of the given number.

Example (4): Find log. 3,494. Here 3494 = 3490 + 0004, log. 349 (first col. 9) = 5428, add diff. for 0004 (second col. 4) = 5 5433

Therefore the complete log. = 3.5433.

Rule (5).—The log. of a number containing more than four figures can be obtained approximately by discarding the excess figures, at the same time adding 1 to the fourth figure if the fifth figure has the value of 5 or more.

Example (5): Find log. 34,945. Here 34,945 = 34900 + 00045 (say 0005) log. 3490(0) (1st col. 9) = 5428, add diff. for (0005) (2nd col. 5) = 6 5434

Then the complete log. = 4.5434.

Rule (6).—A more accurate method is to calculate the proportional part of the difference as explained in connexion with seven-figure logarithms.

Example (6): Find log. 34,945. Here 34,945 = 34900 + 00045, log. 349(00) (1st col. 9) = 5428, log. 350(00) (col. 0) = 5441, diff. = 13 x 45

correction = 585

Therefore, log. 34,945 = 5428 + 000585 = 543385, and the complete log. = 4.543385.

Example (7): Find log. 349,457.

Proceeding as in example (6)—log. 349(000) (1st col. 9) = 5428, log. 350(000) (col. 0) = 5441, diff. = 13 x 45

correction = 5491

Therefore, log. 349,457 = 5428 + 0005941 = 5433941, and the complete log. = 5.5433941.

Note.—In the following rules and examples we employ the abbreviation antilog. to denote antilogarithm, or the significant figures of a natural number corresponding to the mantissa of a logarithm.

To Find the Number Corresponding to any Given Logarithm.

Table XV. gives a selection of antilogarithms corresponding to mantissa from .000 to .9999.

This table is used in the same way as Table XIV., and gives antilogs. to four figures, which may be correct or slightly incorrect as to the fractional inaccuracy of the differences in the second group of columns. Moreover, if the figures in Tables XIV. and XV. are used conversely with regard to identical numbers discrepancies will often appear in the final figure.

Example (8): For the log. .7049 Table XV. gives—antilog. .704 (0) (1st col. 4) = 5058, diff. (.0009) 9 (2nd col. 9) = 5069

while by Table XIV. log. 5,069 = 7050.

Example (9): By Table XIV. log. 5587 = 7471, while by Table XV. antilog. 7471 = 5586.

It does not follow that the usefulness of four-figure logarithms is seriously impaired by slight inaccuracies of the kind mentioned above.

The point may be illustrated by multiplying together the figures of the numbers 5,069 and 5,587 employed in examples (8) and (9), and comparing the result obtained by the use of Tables XIV. and XV. with that given by ordinary multiplication.

Example (10): By Table XIV. log. 5,069 = 7050, log. 5,587 = 7471, 4521

By Table XV. antilog. 4521 = 2832

The same figures multiplied in the ordinary way give the product

5069 5587 35483 40552 25345 25345 28321573

Now inserting decimal points after the eighth, sixth, and fourth, and second figures respectively the same figures give the comparison:—

28320000 and 28320503 283200 and 283205.05 2832 and 2832.0503 28.32 and 28.320503

The two following comparisons have been made by the use of numbers taken haphazard from Table XIV.:

Table XIV.—FOUR-FIGURE LOGARITHMS. A large grid with columns labeled No., 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 1, 2, 3, 4, 5, 6, 7, 8, 9. It contains numerical data for logarithms of numbers from 10 to 99.

Example (11): Multiply 3.209 by 415.6 By Table XIV.

log. 3209 = 5063, log. 4156 = 6186, 1249

By Table XV. antilog. 1249 = 1333, and the complete log. = 3.1249 = 1,333.

By multiplication 3209 x 415.6 = 1,333.6604. Example (12): Multiply 95.43 by 23.48. By Table XIV.

log. 9543 = 9796, log. 2348 = 3707, 3503

By Table XV. antilog. 3503 = 2241, and the complete log. = 3.3503 = 2,241.

By multiplication 95.43 x 23.48 = 2240.6964. Examples (10) to (12) show that the errors caused by the employment of four-figure logarithms are too small to affect the substantial accuracy of most calculations performed in connexion with the ordinary practice of an architect or building contractor.

In addition to tables containing logarithms of numbers, those containing logarithms of special character should be mentioned.

(1) Cologarithms.—These are simply logarithms of the reciprocals of numbers, their chief use being to permit the process of multiplication to be substituted for that of division, in accordance with the rule that multiplication by the reciprocal of any number gives the same result as division by the number itself.

Cologarithms can be obtained by subtracting the mantissa of ordinary logarithms from 0, but making the characteristic negative for whole numbers and positive for fractions.

Thus Complete log. 8,091 = 3.9080, colog. 8,091 = (0 - 3.9080) = 4.0920.

The reason for the reversed sign of the characteristic is made still more clear by finding the cologarithm from the reciprocal of the number 8,091.

Thus 1/8091 = 0.0001236, Colog. = Log. 0.0001236 = 4.0920

In a general way the use of cologarithms is not to be recommended, as reference to two sets of tables means some waste of time and the risk that mistakes may be made inadvertently.

owing to the reversed nature of the rules under which tables of cologarithms are applied.

Example (13): Find the value of $37.5 \times 90 \times 36$
 $3 \times 0.024 \cdot 74$,
 using (a) ordinary logs, throughout, (b) ordinary logs, for numerator, and cologs, for the denominator.

By Table XIV.

	(a)	(b)
log. 37.5	= 1.5740	log. = 1.5740
90	= 1.9542	= 1.9542
36	= 1.5563	= 1.5563
log. 3	0.4771	colog. = 1.5229
0.024	2.3802	= 1.6198
74	1.8692	= 2.1308
	4.3580	4.3580

By Table XV., anti-log. 3580 = 2280, and as char. 4 demands five figures in the product the required value = 22.8.

Gaussian Logarithms.—These are sometimes termed addition and subtraction logarithms, their object being to enable the sum or difference of the logarithms of two numbers to be found when the numbers themselves are not known.

Although the first published table of these logarithms was due to Gauss, of Göttingen, that distinguished mathematician was not the originator of the system which bears his name.

Gaussian logarithms consist of two series, B and C respectively, bearing certain relations to each other and to ordinary logarithms, which we will term Series A.

Thus Series A. = $\log. x$
 „ B. = $\log. \left(1 + \frac{1}{x}\right)$
 „ C. = $\log. \left(1 + x\right)$

Taking $x = 500$ by way of illustration, we have

A. = $\log. 500$ = 6990
 B. = $\log. \left(1 + \frac{1}{500}\right)$ = $\log. 1.002$ = 0008
 C. = $\log. (1 + 500)$ = $\log. 501$ = 6998

As the processes of addition and subtraction applied to ordinary logarithms result in multiplication and division, the convenience of Gaussian logarithms is obvious, but their use is chiefly limited to trigonometrical and actuarial calculations.

Logarithms of Trigonometrical Functions.

Numerous tables have been published giving logarithmic sines, tangents, secants, and other angular ratios.

Such tables published in this country have been derived by adding 10 to the logarithms of the natural functions, the object being to void the use of negative characteristics.

For instance, the natural $\sin. 0^\circ 1' = 0.0002909$, log. $0.0002909 = 4.4637261$, and adding 10, we have $(10 - 4)4637261 = 6.4637261$.

For the sake of uniformity the same treatment is adopted with respect to all trigonometrical ratios, although it is not necessary for any other reason in the case of functions whose values are always greater than unity.

THE LONDON BUILDING ACT.

TRIBUNAL OF APPEAL CASE.

ON Tuesday the Tribunal of Appeal sat at the Surveyors' Institution to hear an appeal by Mr. John W. Watkin, solicitor, on behalf of the South-Eastern and Chatham Railway Company's Managing Committee and others against the certificate of the Superintending Architect of Metropolitan Buildings, dated March 24, 1906, under sects. 22 and 29 of the London Building Act, 1894, defining the general line of buildings on the north-west side of Crystal Palace-parade, Camberwell, between College-road and Farquhar-road. Mr. Frank Mellor appeared for the appellants and Mr. R. P. Mahaffy was for the respondents. Mr. Tagg, Town Clerk, represented the Camberwell Borough Council.

Mr. Mellor, in opening, said he attended for the Managing Railway Committee, the Coal Co-operative Company, and Mr. Stewart, a builder. The Crystal Palace-road was a road between the Crystal Palace and the north-east side of the Crystal Palace High Level Station. The Superintending Architect had defined the general line as being the existing line of the wall of the station itself. The corner where the building was being erected immediately adjoined the exit for the High Level Station, the exit having a covered way to the curb. What the Managing Committee of the railway company contended was that, having regard to sect. 31 of the Act, the laying down of this general line would affect the exercise of their powers. The point was whether or not this particular building was not exempt from the operation of the Act. The railway company was empowered to do what they had done—viz., let a small portion of the corner frontage for a temporary purpose, reserving to themselves the right to resume possession of it if they required it for their own purposes.

Mr. Hudson asked what the company's grievance was.
 Mr. Mellor said that the Superintending Architect had given them notice requiring them to remove the building or proceedings would be taken.

Mr. Hudson asked if the position of the appellants was not that of paying no attention to the notice, and then if the architect proceeded the appellants could state their powers.

Mr. Mellor said that was certainly one position they might have taken up, but he submitted that it was more convenient for them to come there, because should the respondents take police-court proceedings then his clients might be prejudiced by having paid no attention to the Superintending

Architect's notice. This was a general line laid down entirely on railway property.

Mr. Mahaffy said his contention was that the Tribunal had no right to say whether or not the buildings were exempt. It was a matter for the High Court, and several cases of a similar character had been decided.

Mr. Mellor contended that the Tribunal had special power to deal with such cases, and it could not be said that the appellants were not aggrieved.

Mr. Hudson. The question is whether the Superintending Architect has any power to define this general line.

Mr. Mellor: I say he has not.
 Mr. Hudson said if that was so then the appeal must be dismissed. If the architect had no power, then he could not hurt the appellants.

Mr. Mellor said if the Tribunal did a notice. Mr. Hudson said if the architect had no power, then the notice was wastepaper.

Mr. Gruning asked if the appellants said the line laid down was not the general building line.

Mr. Mellor said his submission was that the general building line should be laid along the retaining wall between the road and the railway company's property.

After consultation Mr. Hudson said that apparently the Tribunal had powers to consider whether or not the line proposed to be fixed would affect the railway company's statutory powers.

Mr. Hudson proposed to put in Acts of Parliament and plans showing that the land in question was owned by the companies, and it was within their power to pull down the present station wall and build a platform on the land if they cared to. Consequently he contended that it was within the railway companies' power temporarily to let a portion of the land, as had been done in this case to the Coal Co-operative Society, at one week's notice, for a coal office.

Mr. Hudson asked if Mr. Mellor wished to decide that the certificate affected the exercise of the powers conferred upon the railway company for railway purposes, and, therefore, was invalid. Mr. Mellor said if the Tribunal did that he did not want any further building line fixed.

Mr. Lloyd, engineer, was called to prove that the land was not superfluous land.

Mr. Mahaffy said the London County Council submitted that the case raised a legal issue, and for them to decide the case was usurping the position of the High Court. On the merits of the case he contended that exemption from the Building Act would only apply to land actually used for railway purposes. It was not to be contended that a railway company could hand over their exemption under the general law to other persons.

Mr. Tagg argued that the appeal was against the defining of the building line, and if the building were used for railway purposes then the line would not apply. Under the agreement with the Coal Co-operative Company the company had to pay the rates and taxes, and it could not be said that it was a building erected for railway purposes.

The Tribunal reserved their decision.

Illustrations.

REGENT'S QUADRANT.

THE illustrations in this issue are all portions of what may be regarded as one scheme, from the design of Mr. R. Norman Shaw, R.A., for the rebuilding of the street front of Regent's Quadrant, and for remodelling the site and frontage lines connected with what is at present known as Piccadilly-circus.

The whole scheme is described and commented on in the first article in this issue, to which the reader is referred.

WAR MEMORIAL, CARMARTHEN.—On the 27th ult. Major-General Mackintosh unveiled the monument which has been erected at Carmarthen in memory of the local men who fell in the Boer war. It consists of a massive grey forest stone base, with sub-base of red Aberdeen granite, the whole being surmounted by a rather more than life-size figure of a British officer in white Sicilian marble. The total height of the monument is about 22 ft. The design was prepared by Messrs. Collier & Jencks, architects, Carmarthen.

The T-Square Club was held on Tuesday last at the Galleries of the Royal Society of British Artists. Among the more noticeable items on the long programme were the recitations by Mr. William Poel and Mr. Richard Temple, the singing of Mr. James L. T. Tanner (a daughter of Mr. Augustus Tanner, Clerk of the Bench), and concert by Arthur Grover, the violin playing of Mrs. A. H. G. Patey, and the imitations of actors by Mr. Lewis Benet. Among those present were Sir Aston Webb, who presided, and Lady Webb, Mr. and Mrs. Caröe, Mr. Alexander Graham, and other well-known members of the profession.

COURT OF COMMON COUNCIL.

A MEETING of the City Corporation was held by the Guildhall on Thursday last week, the Lord Mayor presiding.

Street Improvement.—The Improvements and Finance Committee reporting on the references to opening up and improving means of communication in the Parish of St. Bartholomew's—Great and the immediate neighbourhood, also as to the desirability of extending proposed improved means of communication through Fore-street, stated that, on account of the large cost that would be involved, they are still unable to advise that Parliamentary or other action should be taken to acquire property for the purpose of such improvements.

Engineer's Report.—The same Committee omitted the Engineer's Report on the works executed by the Public Health Department during the year 1905.

Windsor-circus Garden.—It was agreed, on the recommendation of the Streets Committee, to close the outer pathway of this garden, and to let it park up at an estimated cost of £20.

Payment of Quantity Surveyors.—A letter was received from the Honorary Secretary of the Quantity Surveyors' Association, forwarding a copy of a scale of charges for payment of quantity surveyors in connexion with public works on an organ in the practice-room of the Guildhall school of Music, at a cost not exceeding £1,000. The Council of the City's cash, such amount to include unusual alterations and all other incidental expenses.

New Organ.—The Music Committee were authorised to give directions for the erection of an organ in the practice-room of the Guildhall school of Music, at a cost not exceeding £1,000. The Council of the City's cash, such amount to include unusual alterations and all other incidental expenses.

The Central Markets.—The Central Markets Committee asked for authority to retain the services of Mr. A. Watson, M.Inst.C.E., to make a thorough examination and full report on the iron and steel work of the structures and structures of the London Central Markets.—The Court agreed.

Competitions.

BARNSELY ELEMENTARY SCHOOL.—In the competition for the elementary school in Bacon-road, Barnsley, the assessor, Mr. W. S. Braithwaite, of Leeds, has made his award as follows:—1st premium, 30*l.*; Mr. E. W. Dyson, C.E.; 2nd premium, 20*l.*; Mr. A. Wilby; 3rd premium, 10*l.*; Mr. E. W. Dyson, C.E. The Education Committee have selected Mr. Dyson's design to be carried out.

GREENWICH BRANCH LIBRARY.—The Libraries Committee of Greenwich Borough Council reported, on Monday, the receipt of communication from Mr. A. W. S. Cross, R.I.B.A., the assessor of the designs submitted for the branch library, asking that, on account of the exceptionally large number of designs submitted for adjudication, and of the amount of work devolving upon him, an addition be made to his fee of 50 guineas. The Committee felt bound to admit that the number of designs submitted (172) exceeded their anticipations. The number on a previous occasion was eleven, and the work falling upon the assessor had therefore been very much greater than had been expected. It was also to be borne in mind that the assessor, in addition to advising the Council as to the several designs meriting the premiums offered, wrote a report criticising each of the 172 designs, and this was highly appreciated, not only by the Committee, but also by the competing architects, many of whom had expressed their appreciation of the manner in which the Council carried out the competition. Further, the assessor advised the Committee as to the site, and upon questions arising in connexion with the proposal to pull down the existing buildings, and as the most suitable general scheme for the branch library. Altogether, in consideration of the extra services performed by Mr. Cross in connexion with the competition, the Committee had decided (subject to the usual action) to offer him 15 guineas in addition to the fee of 50 guineas already paid him.

ALTAR-RAILS, CODFORD ST. PETER, WILTS.—The altar-rails of English oak, have just been dedicated in Codford St. Peter Church, Wilts, in memory of the late Miss Charlotte Anderson, that parish. They are of a Jacobean balustrade pattern, and were designed by Mr. H. A. Bernard, of London.

THE DUST PROBLEM—SOME PRACTICAL PROPOSALS.

SIR,—The inconvenience and the dangers which have been endured this Easter as a result of the manner in which our roads are made are only a foretaste of what will be suffered by the general public during the summer months. The well-being of the population, therefore, demands that very immediate and practical steps should be taken to encourage the local authorities to build the main roads of this country of dustless materials.

Unless the State takes some active steps to encourage the local authorities in the construction of dustless roads there is no doubt that very little progress will be made in this matter.

The Roads Improvement Association are approaching the President of the Local Government Board on the question. They have asked Mr. John Burns to receive a deputation which, among other things, will urge—

(1) That the Local Government Board prepare a return of the steps that have so far been taken by Highway Authorities to construct roads of dustless materials.

(2) That the Engineering Inspectors of the Board investigate these experiments and issue a report for the guidance of Local Authorities dealing with the results so far secured, and giving such guidelines as may be possible as to methods of construction, degree of dustlessness required, durability of materials, and comparative cost.

(3) That the Local Authorities be encouraged to contribute towards the cost of certain experiments with dustless materials about to be made by the Association, and that the Local Government Board appoint a representative to act upon the Committee which has charge of these experiments.

(4) That the Local Government Board represent to the Chancellor of the Exchequer and the Government the desirability of giving effect to the recommendation of the Royal Commission on Local Taxation (Lord Balfour's Commission)—a recommendation subsequently endorsed by the Departmental Committee on Highways appointed by the Board—that a further contribution of One Million sterling should be made annually towards the cost of the maintenance of main roads, and that that grant should be accompanied by conditions calculated to secure efficient maintenance.

(5) That the Board promote legislation empowering County Authorities to fix a minimum width for all trunk roads.

In its attempts to deal with the dust problem on the above practical lines the Association venture to ask for your powerful support.

W. REES JEFFREYS,

Honorary Secretary Roads Improvement Association.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION PAPER ON FERRO-CONCRETE.

SIR,—Two distinct statements were made in the copy of Mr. Bylander's paper which was sent to me.

(1) "It is advisable to use as few bars as possible, in order to simplify the construction."

(2) "The moments on each side of the neutral axis must be equal, and therefore $R_c \times D_c = R_s \times D_s$, and $R_s \times D_s = \frac{M_b}{2}$."

These statements appear to have been either deleted or corrected in the paper as published in the *Builder* of April 21st. I hope you will find space for this explanation of the reason for my remarks, as they appear somewhat unnecessary when read in connexion with the paper as published.

CHARLES F. MARSH.
* * We were not able to print more than a résumé of Mr. Bylander's paper, and we did not notice Mr. Marsh's allusion to the parts omitted.—Ed.

SAN FRANCISCO BUILDINGS.

SIR,—In my letter of last week, which you so kindly inserted, I aimed at brevity at the expense of being sufficiently explicit.

The "Mint" at San Francisco is a building of some forty or more years of age, and consequently has no iron or steel framework and relies solely upon its walls for stability.

Of course, subsequent accounts proved that other buildings escaped with more or less damage.

JOHN J. ROBSON, M.Inst.C.E.

* * This seems to show that stone-built buildings of a really solid structure may sustain earthquake shock successfully, though the general evidence points to ferro-concrete as the most reliable.—Ed.

General Building News.

CHURCH, ASHTEAD.—The new church of St. George at Ashted was consecrated by the Bishop of Dorset (Dr. Boutflower) recently. The building has been erected by Messrs. J. Dorey & Co., Ltd., from the plans of Sir Arthur Blomfield & Sons, at a total cost of about 3,413*l.* The church will consist, when completed by the addition of the south aisle and vestries, of a nave 25 ft. wide with accommodation for 228 persons, two aisles each 12 ft. 7½ in. in width, each accommodating about fifty persons, the length of nave and aisles being 60 ft. The chancel is 32 ft. in length, and has an arch on either side, that on the north leading into a transept capable of seating forty persons and that on the south opening into an organ chamber, below which is situated the choir vestry, with the clergy vestry to the east of it. At the west end is provided a baptistry, below which is the heating-chamber, from which the church is warmed by a low-pressure system of hot water executed by Messrs. R. Crittall & Co. The church is built of red brick, both inside and out. At the east end above the altar is a polished green Devonshire marble retable but the wall and supports on corbels. The roofs are executed in deal and are covered with local hand-made tiles, the bell flèche being covered with oak shingles. The floors generally are laid with pitch-pine blocks, the chancel being laid with Rusts vitreous mosaic to the architects' design. The church is ventilated by iron casements by Messrs. R. E. Pearse & Co., which for fresh air being given by Tolins built into the sills of the aisle windows. The church is lit with gas, the fittings being supplied from the architects' design by Messrs. Hart, Son, Peard, & Co.

PRIMITIVE METHODIST CHURCH, STRETTON.—The foundation-stone of a new Primitive Methodist church was recently laid at Stretton. The building is situated at the north corner of Watling-street and Cross-street, and the total cost will be about 1,300*l.*, and Mr. W. Scott Deakin, of Shrewsbury, is the architect. The materials used are red brick with stone dressings, and red tile roof. The interior will be of pitch pine in the roof and pews, with wood block floor and oak rostrum. Seating accommodation will be provided for about 300. Mr. T. Speke, of Church Stretton, is the builder.

FARNHAM GRAMMAR SCHOOL.—The Archbishop of Canterbury has just opened the new grammar school. The new building is of red brick, with tiled roof, and, with the headmaster's house, which is included, is 160 ft. long and 45 ft. wide. The principal entrance is by an oak door, which opens into a vestibule, from which a hall, with black and white marble tiles, is gained through swing doors. Beyond the cloak-room on the left is an art room. On the other side of the building is a laboratory. The whole of the fittings have been designed by Professor Armstrong, and have been supplied by the Bennett Furnishing Company. On the ground floor there is also a dining-hall, which will enable ninety boys to take their mid-day meal at the school. From the hall a stone staircase, with balusters and panelling of British oak, leads to the upper floor. Leading from this are four classrooms, each with a movable class partition, so that they may be thrown into the big school. On the landing is another classroom, which will be used as a boarders' common room, and beyond, over the headmasters' quarters, are two dormitories, accommodating from twenty to twenty-five boys. One will be for junior and the other for senior boys, but for the latter including an assistant master's cubicle. Crowning the roof of the school is a bell turret, with oak columns and copper-covered dome and weather vane. Away from the main building is a manual instruction-room, and adjoining are latrines, etc. The architects were Messrs. Jarvis & Richards, London, architects to the Surrey Education Committee, the contractors being Messrs. Crosby & Co., of Farnham. The total cost, inclusive of site, furnishing, etc., will, we understand, be about 13,000*l.*

Y.M.C.A. BUILDING, LEEDS.—New premises for the Leeds Young Men's Christian Association are being erected at the junction of Albion-place and Albion-street, Leeds, from the designs of W. H. Thory. The building will consist of five floors, including the basement. The basement will contain a gymnasium, about 20 ft. high, with the necessary dressing and other rooms. There will also be a still-room and cycle store, as well as showrooms connected with the shops above. The ground floor is to comprise an entrance-hall and lounge, with various staircases, as well as five shops and several offices. The lecture-hall, with gallery equal to accommodating 450 persons, will be on the first floor, and will be available for public meetings, chamber concerts, or other purposes. A reception-room, with buffet, reading-room, lavatories, and offices, will also be on this floor. The second floor will be devoted to the library, meeting, writing, and committee-rooms, and provides access to the gallery of the lecture-hall, whilst on the floor above will be found

classrooms, photographic and work rooms, and the caretaker's apartments.

INSTRUMENT FOR THE BLIND, SHEFFIELD.—Mr. S. Roberts, M.P., opened the new West-street premises of the Sheffield Blind Institution on the 20th ult. The original building was erected from plans prepared by Messrs. Gibbs & Flockton about twenty years ago at a cost of about 3,500l. Owing to the widening of West-street by the Corporation, 10 ft. of the original building was required, which necessitated the taking down and rebuilding on the new frontage line. The new erection now covers the site enclosed by West-street, Carver-street, West-street-lane, and Holly-lane. The new front is in the Renaissance style, freely treated, the other elevations being carried out to suit the existing building. The contract has been executed by Messrs. Daniel O'Neill & Son, from plans prepared by Mr. Edmund Winder, architect, at a cost of 4,610l. The premises consist of two lock-up saleshops, with cellaring, in addition to the Institution, and comprise the following:—Ground floor: Two lock-up saleshops, large retail shop, warehouse, basket-makers' department, good side main entrance, small yard, spacious hall, and stone staircase up to the top of building, also iron emergency staircase. First floor:—Caretaker's house, committee room, dining-room, meeting-room, and workmen's workroom. Second floor: Two large workshops, store warehouse, foremen's office, and store. Third floor: Brush-making department and stores. The buildings are lighted by electric light. The basement consists of large, lofty, and well-lighted cellaring.

LIBRARY, ABERYSTWYTH.—The new buildings, situate in Alfred-place, were opened recently by Mrs. Vaughan Davies. The building was designed by Mr. Walter G. Payton, Birmingham. The ground floor is divided into a reading-room, with papers on stands, the library, reference library, and a private room for the librarian, which can also be used for committee meetings. The buildings have been erected by Messrs. Edwards Bros., with Mr. Savage as clerk of the works.

LIBRARY, WEST BROMWICH.—The foundation-stone of a new public free library, adjoining the existing library premises in High-street, West Bromwich, was laid on the 27th ult. The architect is Mr. S. J. Holliday.

CONVALESCENT HOME, HUNSTANTON.—The Hunstanton Convalescent Home for the accommodation of children, the foundation-stone of which was laid on the 26th ult., faces south and west; the general design harmonises with the present buildings. The main entrance leads immediately to the centre of the block of the new wards, and a corridor gives direct access to the girls' and boys' sides. Separate staircases are provided near the garden doors. The kitchen and offices are placed centrally, and with top light and ventilation to the former. The architect is Mr. A. P. MacAlister, of Cambridge; Messrs. G. Clark & Sons, of Cambridge, are the contractors.

SCOTTISH TEMPERANCE LIFE ASSURANCE COMPANY BUILDINGS, BELFAST.—The new building which has been erected by the Scottish Temperance Life Assurance Company, Ltd., at the corner of Donegall-square South and Bedford-street was opened on the 27th ult. The new building is designed in the Scottish Baronial style, and the architect was Mr. Henry Seaver. The outer walls are built of sandstone from the Ballochmye quarries, Scotland, and the main piers are of dark green Swedish granite, and the roof is covered with green Welsh slates. At the entrance from Donegall-square South the walls are covered with Italian marble, and the floor inlaid with Roman mosaic. Access to the different floors is obtained by means of two electric hoists which run side by side. The company will occupy a suite of offices on the ground floor—fitted up with polished teakwood panelling, counters, etc. The staircase is of cut-stone from Robin Hood quarries, Yorkshire. Almost the whole of the top floor has been taken by a group of Masonic lodges. The building has been heated throughout by Messrs. Musgrave, Ltd., on the low-pressure system, with radiators in all the ninety rooms. The electric lighting is taken from the Corporation mains, and the installation was carried out by Messrs. W. Coates & Son, Ltd. Mr. John Woodside, A.M.I.E.E., was the consulting engineer for this portion of the work. All the corridors, which are paved with mosaic, are fireproof, and each suite of offices is provided with a strong room, situated in the round turret, which are a feature on the main elevation. At the rear a warehouse has been erected. Messrs. James Henry & Son were the contractors for the entire work. Messrs. John Dowling & Son, Queen-street, had charge of the plumbing contract; the hoists and enclosures were erected by Messrs. A. & R. Stevens, Glasgow; mosaic and terrazzo flooring was laid by Messrs. Ebner & Co., London; the lead lighting was carried out by Messrs. Ward & Partners, Belfast; Messrs. Shaw & Co. had charge of the wall tiling; Messrs. Purdy & Millard, Belfast, were contractors for the lining of marble in entrance-hall; Messrs. Milner & Co., Ltd., built all the fireproof

doors; and Messrs. Henry Hope & Son constructed all the steel window casements.

A CONCRETE DOME in Granolithic Stone Company have just shipped off, in numbered sections, a ferro-concrete dome made for Sir Aston Webb's new Law Courts at Hong-Kong. The dome has a base diameter of 50 ft., and a rise of 37 ft. to the lantern base, thence to the pinnacle of the lantern 19 ft. The stones going to make this dome are prepared in curved segments, having a surface varying from 6 ft. 6 in. by 2 ft. 5 in. to about 18 in. at the top. Their average thickness may be put at 1½ in. They are all rebated and checked at the joints, so as to interlock into each other, and with raised dovetailed flanges. The roll covers are shaped to the detail drawing and are also rebated for interlocking into the raised flanges. Round the dome base is a circular gutter in granolithic. Besides the dome there are the pediment roofs, which were treated in a similar manner, only that the stones or tiles are straight. We had an opportunity of seeing a part of the work before it was shipped; it makes a very light dome, and the use of ferro-concrete in this manner promises an opportunity of forming a dome with a weather-proof structural exterior which will be independent of the requirement of less durable materials for covering it.

Sanitary and Engineering News.

SEWERAGE SCHEME, PLYMOUTH.—The Plymouth main drainage scheme is, with the linking up of the first section of the old sewers of the borough with the new system, practically completed. Except the linking up now in progress, the whole of the main drainage work has been carried out under the personal supervision of Mr. H. Victor Prigg, as resident engineer for Messrs. Mansergh. The cost of the whole of the work will not fall far short of 300,000l. There were eight contracts. No. 1 contract, which related entirely to the drainage of the Avenue at Laira, was carried out by Mr. Laug, of Liskeard, and No. 2 contract, for the supply of pumps and engines at Laira, was executed by the Campbell Gas Engine Company, Halifax. No. 3 contract, for the outfall at Rusty Anchor, was entrusted to Messrs. Pethick Bros. and No. 4 contract, for the storage tanks at West Hoe, and the main intercepting sewers and its branches, was undertaken by Mr. Abram Kellett, of London. Mr. Laug also undertook No. 5 contract, for the Western low-level district; Messrs. Shiellbear & Sons No. 6 contract, for the storm-water outfall and sewer along the foreshore at West Hoe; Messrs. Neal, Ltd., No. 7 contract, for the storm sewer at Cattedown, and sections at Laira and St. Jude's; and Messrs. S. Pearson & Son No. 8 contract, for the reconstruction of the Rusty Anchor outfall. By agreement with the Corporation Messrs. Mansergh have undertaken the supervision and management of the new drainage system for the first two years.

TRANSFORMER STATION, STONE NEWINGTON.—A new transformer station has been erected by the Stoke Newington Corporation in Church-street. The building was designed by the Borough Surveyor (Mr. W. F. Loveday), and the station equipment was supplied by Messrs. Talbot & Stevenson, and erected under the supervision of the Borough Electrical Engineer (Mr. S. Hann) and Mr. A. R. Ashmore. The total cost was over 18,000l.

BLACKFRIARS BRIDGE.—If the Bill for the widening of Blackfriars Bridge passes into law, it is proposed to enlarge the steps and construct a causeway at the lower side of the bridge on the Surrey side, the steps on the upper side being absorbed in the widening. A letter to this effect from the City Surveyor was before the Thames Conservancy at their meeting on the 30th ult., and the proposals were approved, subject to the condition that the causeway extended to low-water mark, and that the old stairs were not removed until the new ones were opened for use.

Foreign.

NOTES FROM PARIS.—On the 27th ult. was inaugurated the statue of Benjamin Franklin presented to Paris by Mr. John Hayes. The sculptor is Mr. J. Boyle, who has represented Franklin seated, on a pedestal designed by an American architect, Mr. Knight, and decorated with bas-reliefs representing the reception of Franklin by Louis XVI., and the signing of the articles of peace between England and the United States. The Musée des Arts Décoratifs has opened the first of its temporary loan exhibitions. The present one includes various examples of XVIIIth century art lent by M. Doisteau, and the collections of M. Franck and of M. Gosson. The Ecole des Beaux-Arts will open in a few days a collection of the works of Fantin-Latour. There is also to be opened

shortly, at the Georges Petit Gallery, an exhibition of the works of Gustave Moreau. The "N. 2 Sud" line of the Metropolitan has been opened to the public. It goes to Passy by the Arc de L'Étoile, to the Place d'Italie, and proceeds by the quarters of Grenelle, Necker, Montparnasse and Salpêtrière. From Passy it crosses the river on a fine bridge, and at the Rue de Vaugirard enters a tunnel, reappearing on a viaduct as far as the Place d'Italie. Subsequently it will be prolonged, by way of the Gare d'Orléans, as far as the Place de la Nation, crossing the Seine again on a steel bridge. One can then make the complete circuit of Paris for the modest sum of 2½d. first class, and 1½d. second class.

A GREAT HYDRO-ELECTRIC POWER SCHEME FOR INDIA.—An important work which it is proposed to execute in Kashmir, is the establishment of a hydro electric power station on the Jehlam river. The available supply of power is very large, and it is stated that the works will be able to supply current at such prices as to reduce the cost of power to less than one-half that of steam power. Among other directions in which the projectors of the scheme hope to utilise the power generated are: the operation of an electric railway, 200 miles long, to connect Abbottabad and Srinagar; the provision of motive power for a fleet of large electric dredgers to be used for flood prevention and reclamation works; the supply of power to textile factories, local tramways, light railways, engineering works, and mines; and the supply of current for lighting purposes and driving pumps in the large military cantonments of Northern India. The project is an ambitious one, and if carried out will probably be the largest of its kind in the world.

LABOUR AND HOUSING QUESTIONS IN STOCKHOLM.—Mr. Consul Magretson, in his annual report, states that according to some recent statistics the number of workmen employed by the city authorities of Stockholm varies from about 2,500 in the winter to 2,900 or 3,000 in the summer. During 1904 the average yearly wages were as follows:—Ground labourers, 58l. 10s.; blasters, 73l. 18s. 1d.; stonecutters, 61l. 8s. 10d.; masons, 73l. 31s. 4d.; carpenters, 66l. 15s. 6d.; bricklayers, 71l. 5s. 6d.; suitors and plumbers, 72l. 5s. 6d. Through an agreement made between the city authorities and their workmen, which first came into operation in September, 1905, wages have already risen, and the corresponding figures for the present year (1906) are expected to show a considerable increase. The wages per hour for the town workpeople have ranged from about 4½d. to 8d., the average being between 6½d. and 6½d. While the city authorities have been obliged to make allowance for the increased cost of living, private employers of labour have, of course, been obliged to pay still more. Brick carriers, who receive 10½d. per hour, and masons and carpenters, who earn 11s. 1d. to 16s. 8d. a day, are by no means uncommon, and it is pointed out that if the workpeople have not a comfortable existence it is not the fault of their wages, but of the present enormously high house rents and the ever-increasing prices demanded for the necessaries of life in Stockholm. The rents of labourers' houses in 1903 were for one room and a kitchen from 13s. 6d. to 14l. 13s. 4d., and for two rooms about a kitchen, 20l. 13s. a year; the houses in question being in the property of the city and the tenants the town workmen. Private owners' houses were still dearer. The average rent for one room and a kitchen in Stockholm in 1905 was 16l. 6s. 11d. But accommodation for people in general is also very expensive. Flats, of which the city mostly consists, if they are good now come to 33l. a room. In a city of only this size (Stockholm contains at present about 330,000 inhabitants) such rents are very remarkable. It must, however, be admitted that better-class flats here are exceedingly well built, and often beautifully fitted up—double stone stairs (one of them often of marble), parquet floors, and sleekly finished and quite common features in them. With such demands for elegance buildings cannot be done economically. The "own home" movement is going on steadily outside the city, but is said to be unfavourably influenced by the new zone tariff.

EXPORTS OF WOOD FROM SWEDEN.—According to the annual report of Mr. Consul Magretson, the beginning of the year 1905 hopes were entertained at Stockholm that the prices, which then ruled low, might fall no further, and during the course of the season these hopes were justified, except as regards redwood deals. In their case the demands did not correspond with the supplies, and the third and fourth qualities of 3 in. by 9 in. redwood from the middle and East Norland went as low as 7l. 3s. and 6s., respectively. For other kinds of wood an improvement in prices took place at the end of summer or beginning of autumn—a time when prices often show signs of weakness, whereas in 1905 they manifested a tendency to rise. This was chiefly due to orders received from Germany. Even before the shipping season was at an end buyers there paid for

delivery during 1906 10s. more per standard for battens and white and redwood boards, these being the goods most in demand in the German markets. The strong impetus thus given by these buyers soon showed its effects in other quarters. As a result the importers from various other countries began to send in their orders. At this time Scotch firms bought what they needed for immediate use, whereas other firms in the United Kingdom appeared at first disinclined to pay the prices charged by the Swedish exporters. The approaching season is looked forward to with much hope. According to the report of the Swedish Saw Mill and Wood Exporters' Association the export of deals, battens, and boards, planned and unplanned, from the whole of Sweden was:—

Year.	Quantity.	Standards.
1901	903,787	
1902	1,004,666	
1903	1,039,462	
1904	915,390	
1905	973,076	

THE REBUILDING OF BALTIMORE.—Mr. Fraser, British Consul, reporting on the trade, commerce, and navigation of the States of Maryland, Virginia, West Virginia, and Kentucky for the year 1905 makes the following observations:—“Too great praise cannot be given to the people of Baltimore for the energy they have shown in the rebuilding of the city after the great conflagration of February 7, 8, and 9, 1904. It was estimated that the damage to that occasion amounted to 25,000,000, and in the past twenty-two months the former buildings have been replaced to a great extent by some of a more substantial character, with a great improvement architecturally. Advantage has been taken to widen and straighten the streets in the burnt areas of the city, but much has yet to be done in laying down the roadways which are in some cases in bad condition. This will no doubt soon be done, as it is intended to spend about 1,000,000 (5,000,000 dol.) for paving purposes. It is observed that most of the bank buildings and those of other financial institutions have not been rebuilt by the high structures they formerly had, but by buildings of from two to three stories, as the experience of the fire proved that the latter were not so liable to destruction. Ferro-concrete, or concrete reinforced with steel, has entered largely into the erection of buildings in Baltimore, with, it seems, considerable satisfaction. The concrete used is usually composed of one part best quality Portland cement, two and a half parts clean sharp sand, and five parts 1½ in. stone, either granite or trap rock. The walls of a building are made by packing the concrete in wooden boxes while the material is in a plastic state. In these boxes have been placed vertical and horizontal pieces of steel, and when the cement has set the walls become very strong; the same general method is used in the construction of floors, ceilings, roofs, etc., and it is claimed that as the metal is perfectly embedded in the concrete it is absolutely protected from atmospheric action and against intense heat. An interesting test of its strength was made a few weeks ago in a building in course of construction. A weight of 25,400 lb. was placed on a sq. ft. of the second floor and on a slab of concrete 4½ in. thick, the slab being supported on a beam 8 in. by 8 in. This weight was allowed to remain for twenty-four hours, and after it had been removed the beam only showed a deflection of ¼ in. The cleaning of buildings of the effects of the fire by the use of steam and high pressure water has been used to a considerable extent, and it certainly has been very efficacious. It is said, however, that it has the effect of opening the face of the material treated and makes it more liable to the reception of deposits of smoke, etc., and also to decay. Perhaps it may be said that the fire was “a blessing in disguise,” for it has certainly stirred up the authorities to making some very much-needed improvements, such as the construction of sewers at a cost of 2,000,000 (10,000,000 dol.).

Miscellaneous.

PROFESSIONAL AND BUSINESS ANNOUNCEMENT.—Mr. W. DUNCAN TUCKER, timber merchant and builder (Bristol), has formed his business into a private limited liability company, in conjunction with his two sons. The style of the firm in future will be “Wm. Duncan Tucker & Sons, Ltd.,” the management remaining the same as before.

INTERNATIONAL ASSOCIATION FOR TESTING MATERIALS.—This Association, which holds its congresses about every three years in industrial centres in various countries, will meet this year in the Academy of Science at Brussels, from September 3 to 8. The programme of excursions includes visits to the Harbour Works at Brussels and at Antwerp, the Steel Works of the John

Cockerill Company at Seraing, the Arsenal at Mechlin, and the Harbour Works at Zeelbrugge. Among the papers to be read will be one on the “Industries of Belgium,” by Baron E. de Laveleye and M. Camerman. It is expected that a considerable number of members and delegates from this country will be present at the Congress. Mr. J. E. Stead, F.R.S., Middlesbrough, is the English Secretary of this Institution.

THE NEW COUNTY HALL.—A Select Committee of the House of Commons, under the presidency of Mr. Bilton, have considered the London County Buildings Bill. This is the measure promoted by the London County Council, for the purpose of obtaining power to acquire a site in Lambeth fronting the Thames on the down-stream side of Westminster Bridge, and erect on it a county hall and offices. Only two opponents—the Lambeth Borough Council and Messrs. Holloway Brothers—appeared before the Committee. The Hon. J. D. Fitzgerald, K.C., with whom Mr. Vasey Knox, opened the case for the London County Council. He said the present county hall and offices were inherited from the Metropolitan Board of Works, and were wholly inadequate. As the business of the Council kept increasing fresh buildings had to be acquired. The state of the County Hall, which the Bill was spread over seven buildings, and the staff of the Controller was in three buildings. Obviously that was an intolerable position. It was productive of delay, considerable inconvenience, and increased cost. Several sites had been considered, and the present one had the advantage of providing the largest area at the smallest cost. The site was close to the Houses of Parliament and the public offices, and was easily accessible from all parts of London. Including the amount of foreshore which was to be taken for the purpose of forming an embankment in front of the new buildings, the area of the site was five and four-fifths acres. At present the officials of the London County Council numbered 1,909. The Committee approved the bill.

FIRE TESTS WITH STEEL SHUTTERS.—Messrs. Arthur L. Gibson & Co. write that they do not think our paragraph (page 473) on the tests of their shutters by the British Fire Prevention Committee conveys a correct impression. Our remarks were entirely based on the Official Report of the Committee, but we did not mention that the single shutter had been classed as “Fully Protective—Class A” and the double shutter as “Fully Protective—Class B” because the statement was not included in the published Report; it would be better if the classification made by the Committee were included in these cases. Into several other points mentioned by Messrs. Gibson we have not space to go, but we fully recognise that their single shutter is a better protection than most other single doors; only our conclusion from the Report is that a double shutter is much preferable, and that the single one is only a partial protective.

COMPANY OF PLUMBERS.—At the meeting of the Quarterly Court of the Plumbers' Company at the Guildhall last week it was reported that steps were being taken in Leeds to obtain statutory powers in strengthening the position of the authorities in regard to the registration of plumbers. In a report on the same subject from Hull, Mr. Gilbert Whyatt, Borough Engineer, Grimsby, referred to the King's Speech, promising that something should be done to codify and extend the Public Health Acts, and stated that a local authority had no powers to make by-laws for plumbing work in a house, and a plumber might put in almost anything he pleased, so far as by-laws were concerned. In a report from Birmingham, Mr. E. Antony Lees, Secretary of the Birmingham Water Department, stated that the movement for the national registration of plumbers was started in Birmingham in 1890. The initiatory stage had been passed by allowing sufficient time for those practicing the trade to become registered. The public now recognised the importance of the movement from a sanitary point of view, and the registration of plumbers should be taken up by the new Government. In a report from Norwich, remarks by the Mayor supported this opinion, and reference was made to plumbing work being undertaken by such firms as Whiteley and the Hutches' Stores, and others, emphasising the necessity for apprenticeship and training of the men who had actually to execute the work.

INCORPORATED CHURCH BUILDING SOCIETY.—This Society held its usual monthly meeting on Thursday, the 26th ult., at 7, Dean's-yard, Westminster, the Rev. Canon G. E. Norman in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Hasbury, S. Margaret, near Halesowen, Wores., 1500; Miskin, S. Barnabus, near Llantaisant, Glam., 1000; Thornham, S. John, near Manchester, 1000; for the first portion, and Forest Gate, S. Edmund, Essex., 250, making in all 2750; and towards the plugging or otherwise improving the accommodation in the churches at Buncton, All Saints, Sussex, 150; Dauntsey, S. James, near Chippenham, 250; Ivychurch, S. George, near Folkestone, 750; Upleadon, S. Mary, Glos., 150; Llantwit Major, S. Iltyd,

near Cardiff, 250, making in all 750, and Wakefield, S. John, 750, in lieu of a former grant of 600. A grant was also made from the special Mission Buildings Fund towards building the Mission Church of S. Paul, Camelsdale, near Haslemere, Sussex, 200. The following grants were also paid for works completed:—Alwinton, S. Andrew, near Peterborough, 200; Stonebridge, S. Michael and All Angels, Middlesex, 700; Hilton, S. Mary Magdalen, Hants., 150, on account of a grant of 260; Field Dalling, S. Andrew, near Holt, Norfolk, 100, on account of a grant of 300, and Barnes, S. Mary, Surrey, 750, on account of a grant of 1000. In addition to this, the sum of 5600, was paid towards the repairs of thirty-eight churches from Trust Funds held by the Society. The Annual General Court of the Society will be held at the Church House, Dean's-yard, Westminster, on Thursday, May 17, at 3 p.m., when the chair will be taken by the Archbishop of Canterbury, President of the Society.

COMMITTEE OF INDUSTRIAL EDUCATION.—The Committee appointed by the recent Conference at the Guildhall met at the House of Commons on the 26th ult., Dr. T. J. Macnamara, M.P., in the chair. Reports on education and apprenticeship in the printing machine managers' trade, by Mr. W. H. Howes, also on apprenticeship in New Zealand, were discussed. The Committee also considered information on the co-operation of employers in the technical training of apprentices, furnished by Mr. A. S. Biggart, of Glasgow. Dr. Crawford gave particulars of the conduct of trade classes at the Glasgow and West of Scotland Technical College under committees of management, consisting of the employers and workmen, and the governors of the college, and the system of grants made by the Scotch Education Department. Sir Henry Hibbert, Chairman of the Lancashire Education Committee, stated that similar arrangements for the conduct of trade classes in Lancashire had been adopted with extremely successful results, and the authorities carried with them the full support and co-operation of the masters and men in the trades concerned. He urged the necessity for more systematic apprenticeship. Sir Horace Plunkett said that the Department of Agriculture and Technical Instruction for Ireland were endeavouring to arrange for the more harmonious co-operation of the trade unions, the employers, and the technical instruction authorities. Communications regarding apprenticeship were received from the trade unions of carpenters and joiners, boiler-makers and iron and steel slip-builders, operative house and ship decorators, boot and shoe operatives, and the Scottish Typographical Association.

GUYVER'S HOGE MEMORIAL.—The Works Committee of the Marylebone Borough Council have agreed to allot a site in Langham-place for the proposed memorial of the late Mr. Quintin Hoge, who, after the closing of the Polytechnic (1831-81) as a place of scientific entertainment, took over the buildings for a young men's Christian Institute. The statue will be sculptured by Mr. G. J. Frampton, R.A.

WHITECHAPEL ART GALLERY.—Under the presidency of Earl Carrington and his co-adjutors Canon Barnett, Mr. Mead, and Mr. W. M. Webb (of the Selborne Society) a novel kind of instructive exhibition will be held in Whitechapel Art Gallery in the course of July. One section of the exhibits will exemplify building material and appliances; another section will comprise models to show the planting of streets and open spaces, as well as of children's playgrounds and gardens, railway embankments, town and suburban gardens, and so on. It is also intended to exhibit plans for the improvement of some areas in London, to illustrate domestic life in foreign cities, and to show specimens of plants that might still be cultivated in London, together with vivaria, aquaria, and bee-hives.

ENDICLIFE HALL, SHEFFIELD.—At the invitation of Mr. C. B. Flockton (of Messrs. Gibbs & Flockton, architects) a meeting was held a few days ago in Cutlers' Hall of those who are interested in the preservation of Endcliffe Hall, and what is left of the grounds. Since the death of Sir John Brown, who erected the Hall in 1863-5, the property, upon which he expended 100,000, was bought by a local syndicate for entertainments, receptions, etc., but as the venture did not prosper they decided to dispose of the estate for building purposes, and a large portion of the land has already been sold. As Chairman of the meeting, Mr. S. J. Robinson, Master Cutler, stated that the existing property, 5 acres, could be purchased for 10,000, and that it had been proposed to convert it into a country club. Mr. Flockton said the place could be improved at a small outlay and that the income now about 7850 per annum, could be greatly increased. The meeting passed a resolution in favour of the purchase and nominated a committee for the formation of a small limited company in that behalf. We may add that the land which has been sold, with the exception of the portion which faces Endcliffe Woods, realised 2,000,000 per acre, whilst the portion facing the

Woods realised 1,500l.; in 1885-96 the Corporation bought an aggregate of 73 acres of Endcliffe Woods and the adjoining property for a total sum of 19,000l. as a place of public recreation and resort, and they have since enlarged the pleasure grounds with a further plot of 6 acres at Whiteley Woods.

GOVERNMENT CONTRACTS.—In the Parliamentary Papers Mr. Keir Hardie asks the Secretary to the Treasury whether there are any granite or macadam contracts with Messrs. Mowlem & Co., contractors, and if so, whether the fair wages clause is in force in the granite quarries of the firm at Guernsey from which the material is obtained.—In reply, Mr. McKenna states that the Government have contracts with the firm. In the case of granite paving and macadam the fair wages resolution is attached to the contract. In the case of granite macadam ordered for the roads in the royal parks in and around London the fair wages clause has not hitherto been attached, but arrangements will be made for this to be done in the future. Messrs. Mowlem pay the current rate of wages for the district in their quarries in Guernsey.

ARBITRATOR.—The arbitrator's award has just been received in the dispute, recently heard at Plymouth, between Mr. Henry Kerswill, contractor, of Plymouth, and the Secretary of State for War, in reference to the building of barracks and recreation block for the Royal Artillery at Plymouth Citadel. Mr. Kerswill's case was that he had been made to do a quantity of work not set out in the contract, and that, and other work, which, it was contended, might be said to be in the quantities, but was not fairly or properly and adequately described therein. The claim amounted to about 9,000l. Mr. Kerswill's tender was for 22,844l. Mr. A. R. Stenning, sitting as arbitrator; Mr. H. Holman Gregory and Mr. B. Murphy (nominated by Watts, Ward & Anthony) acted for claimant, and Mr. S. A. T. Rowlett and Mr. Micklethwait represented the Secretary of State for War. The case was heard at Plymouth on March 1 and 2, and subsequently adjourned to London. The arbitrator awards Mr. Kerswill 3,017l. 4s. 8d., and directs each party to pay his own costs of the petition of right, reference, and arbitration, and that the War Office pay the arbitrator's costs of the award, amounting to 219l. 3s.

MANCHESTER BUILDING TRADES EXHIBITION.—A building trades exhibition was opened recently in the St. James's Hall, Manchester. The exhibition has attracted a large number of exhibitors, with the result that the goods displayed are greatly varied. A central stall is occupied by the Manchester School of Technology, with a display of materials used in connexion with sanitation and a selection of drawings from the engineering, surveying, sanitary inspection, and plumbers' work sections. In the gallery is a selection of architectural drawings. Mr. J. H. Woodhouse, President of the Manchester Society of Architects, took the chair at the opening of the exhibition, and Alderman Sir James Hoy performed the formal opening ceremony. The exhibition closes on May 5.

MEMORIAL CROSS, SOUTH CROYDON.—A memorial cross has just been erected in St. Peter's churchyard, South Croydon, to the memory of the late Rev. John White. It takes the form of an old style Runic cross, 7 ft. in height, standing on a massive die and base, with bevelled kerbing surrounding the grave. The whole is in red Cheshire stone, and the design and execution are the work of Messrs. G. Maile & Son, of London.

MEMORIAL TABLET, WINCHESTER CATHEDRAL.—Dr. Warre recently unveiled in Winchester Cathedral a memorial tablet to the late Canon Huntingford, D.C.L. The tablet was designed by Mr. C. E. Kempe to fit into the stone panelling, being executed in simple characters upon a groundwork of gilded copper and green marble.

MINERALS OF SOUTHERN NIGERIA.—There have just been presented to both Houses of Parliament reports on the mineral survey of Southern Nigeria for 1903-4 and 1904-5 by Professor Wyndham Dunstan, F.R.S., Director of the Imperial Institute, who states, *inter alia*, that limestone of excellent quality for the manufacture of mortar and cement has been discovered, a matter of the greatest importance to the Protectorate, especially as some of the limestone occurs in the river banks and could, therefore, be readily transported. Between Awi and Odukpani sedimentary rocks were met with, as on the Kwa and Akpa Iyefe rivers. They consisted of sandstones, shales, and limestones, but the limestones which appeared to be available for burning for lime were only a few feet in thickness. Limestones suitable for burning and for building stones were found in the neighbourhood of Eki quarry, near Vwet. The limestone was not very satisfactory, but sandstone suitable for building purposes was met with, and on the opposite side of the river an excellent face of granite was uncovered. The minerals collected included limestones containing fossils. The results of the analyses showed that several produce excellent lime, suitable for building purposes.

CHEAP HOUSES NEAR SHEFFIELD.—Dr. Alexander Anderson, medical officer of health for Wortley Rural District Council, commenting on the housing question in his annual report, points to cottages erected just outside the Sheffield boundary as an illustration of the best class of cottage of a cheap type. These houses were sold for 150l. They are built in blocks of four, the front walls being of stone with ashlar dressings, and the other walls of brick. They face a street 36 ft. in width, and the distance from the back of the house to the outer wall of the plot is 35 ft., there being an open space at the rear free of building of about 500 sq. ft. Each block has a central passage, 3 ft. 6 in. wide, for access to the rear, and built over so as to afford larger bedrooms to the houses adjacent. In the basement is a cellar for coal and provisions, on the ground floor are two rooms each 12 ft. square, on the first floor are two bedrooms, and above them an attic bedroom. There is a waste water closet, but no bath. The space at the rear is occupied with a small garden, and the paths and footways are asphalted. All have gas and water laid on. They let at 6s. 9d. per week, free of rates, in the neighbourhood of the Wortley. Other houses, built in similar style, but provided with bath (hot and cold water) and scullery, have been sold for 178l.

HOUSEHOLD FIRE PRECAUTIONS.—Under this title a most useful sheet has been published by Messrs. Unwin Bros., consisting of suggestions for guarding against fire in private houses, and for the immediate proceedings to be taken if a fire breaks out, drawn up by Captain Sheau, consulting fire-brigade engineer. The sheet is sold at 6d., and if studied and acted on, it will be a sixpence very well laid out.

BESSEMER MEMORIAL FUND.—The Memorial Committee, of which Sir Wm. H. Preece and Sir J. Wolfe Barry are the Chairman and Vice-Chairman, have framed their scheme which had been postponed pending the final report of the departmental committee to inquire into the working of the Royal College of Science and the Royal School of Mines. They recommend that the Sir Henry Bessemer memorial fund should be applied to (1) the endowment of open international scholarships for post-graduate practical work, to be of such value and to be awarded "under such conditions that they will be regarded by students of any nation as a prize worth striving for, and as an incentive to the highest scientific attainment," and, with the exception of those allocated to certain approved British institutions, to be tenable in any part of the Empire, in the United States, and in Europe; (2) the equipment of mining and metallurgical memorial laboratories in the Royal School of Mines at South Kensington as the centre of the memorial, the land and cost of the new buildings and maintenance of the school being provided from Government and other sources; and (3) the erection of a statue of Bessemer in the new Royal School of Mines, S.W.

TRANSVAAL MAGNETITE CEMENT.—About two years ago an extensive deposit of magnetite was opened out in the Transvaal, at a point between Kaapmuiden and Malalane stations on the Johannesburg Delagoa Bay Railway, and about 90 miles distant from Delagoa Bay. The deposits are located in a range of hills which run parallel with the main railway, and the area covered by the formation is roughly about 8 miles long by 1½ miles wide. As a rule the magnetite exists in aggregated veins of varied thickness, in many places being more than 100 ft. in width; but the central hills near Salt Creek appear to be one vast deposit of about 2,000 ft. long by 200 ft. wide, and upwards of 300 ft. high. At this particular point it is estimated that the deposit of magnetite exceeds 1,000,000 tons. The magnetite is equal to the best quality obtained in Greece; it is pure white, and breaks with a conchoidal fracture. It is hard and fine grained, resembling unglazed porcelain in texture, and is unusually pure, being fractionally free from lime, alumine, and iron, while the proportion of silica is almost a minimum. The nature of the deposit is such that the whole of the hills can be quarried at a very low cost, and the necessary fuel for calcination is readily obtainable.

Capital and Labour.

RULES FOR THE PLASTERING TRADE.—We are glad to be able to state that a new code of working rules has been agreed upon between the London Master Builders' Association and the London District of the National Association of Operative Plasterers. We are informed that the rules will be printed and circulated in the course of a few days.

BUILDING TRADE CONCILIATION.—The scheme for closer union between master builders and operatives in England, which had its origin in the Yorkshire Federation of Master Builders, has now become an accomplished fact. It is a scheme having as its primary object the avoidance of disputes and lock-outs, and the bringing about of a better feeling between master and operative. The parties to the agreement are

the National Association of Master Builders (which is federated, through the Yorkshire Association, the Bradford Master Builders' Association), the Amalgamated Society of the General Union, and the Associated Societies of Carpenters and Joiners, the London and Manchester Societies of Bricklayers, and the National Society of Stone Masons. In whatever district the masters and the operatives have an association a local Conciliation Board is to be formed with a view to settling any trouble or misunderstanding that may arise from time to time, and in case of the parties not being able to come to an amicable settlement the matter in dispute is to be brought before the Northern Centre Board, and if necessary the National Board. The pleasing feature of the arrangement is that work in the meantime is going on. The first meeting of the Bradford Conciliation Board, which consists of six representatives on each side, took place recently at the Building Trades and Stone Exchange, Bradford, when the following officers were appointed for the coming year.—Mr. T. E. Taylor, Chairman; Mr. W. C. Harclaire, Vice-Chairman; Mr. Albert Hammond and Mr. J. H. Hopkins, Joint Secretaries.—*Yorkshire Observer*.

Legal.

THE ACTON ANCIENT LIGHT DISPUTE.

The hearing of the case of Kine v. Jolly commenced in the House of Lords before the Lord Chancellor and Lords James of Hereford, Robertson, and Atkinson, on the 3rd inst., on the defendant's appeal from the judgment of the Court of Appeal from a decision of Mr. Justice Kekewich in the Chancery Division. (The case was reported in the issue of the *Builder* of July 23 and 30, August 6, December 17 and 24, 1904.)

The action was brought by the plaintiff, Mrs. Sarah Kine, the owner of a house and premises known as "Woodthorpe," Acton-road, Acton, against the defendant, Dr. Jolly, the owner of neighbouring premises, for a mandatory injunction, and alternatively of damages in respect of the alleged obstruction of the ancient lights of the plaintiff. It appeared that the ground floor of the plaintiff's house, which was built about twenty-two years ago, had on the west side two windows, lighting respectively the drawing-room and a smaller sitting-room, and a door with glass panels, and a window or fanlight over it lighting the entrance-hall. The defendant began to build his house about the latter part of 1902. The plaintiff alleged that in spite of remonstrances made on her behalf, the defendant had erected a high building so near to the plaintiff's windows, glazed panels, and fanlight, as to materially obstruct the light entering the said dwelling-house, and so interfere with her use and enjoyment of the premises. The case had been twice before Mr. Justice Kekewich. On the first occasion he granted the plaintiff a mandatory injunction, which was before the House of Lords in the *Colls* case. On appeal from that decision of his lordship to the Court of Appeal it was admitted on behalf of the plaintiff that the judgment could not stand as it was, and by consent the lord judge's order was discharged, and the case sent back to him for a re-trial. The plaintiff took place before the lord judge in July, 1904, and on August 2 he delivered a considered judgment. He then came to the conclusion that although there had been interference by the defendant's building with the light of the plaintiff's drawing-room, he could not, in accordance with the rule laid down by the House of Lords in the *Colls* case, deem the obstruction of light to that room to be actionable. He also held that taken alone there had been no actionable obstruction of the light coming to the plaintiff's hall by reason of the defendant's building. The great cause of complaint was as to the obstruction of light to what had been called the morning-room in the plaintiff's house, and with regard to that he came to the conclusion that the obstruction of light to that room was a nuisance within the meaning of the authorities on the subject. His lordship thought that he must treat the obstruction as to the morning-room plus the obstruction of light to the hall and should grant a costs of this action. From this decision the defendant appealed to the Court of Appeal, when Lords Justices Vaughan Williams and Cozens-Hardy held that applying the principle laid down by the House of Lords in the *Colls* case to the findings of fact of Mr. Justice Kekewich there was a good cause of action by the plaintiff. They differed, however, from Mr. Justice Kekewich in thinking that the remedy ought to be damages and not a mandatory injunction. Lord Justice Romer, however, dissented, being of opinion

that by applying the law to the facts as found by Mr. Justice Kekewich, the plaintiff had failed to prove that the defendant had committed a nuisance. By a majority of the court, therefore, the judgment of Mr. Justice Kekewich was varied by the order for a mandatory injunction being discharged and an inquiry as to damages being directed—hence the present appeal.

Mr. Hughes, K.C., and Mr. Vernon appeared for the appellant, and Mr. P. Ogden Lawrence, K.C., and Mr. Cann for the respondent.

The arguments of counsel were proceeding when we went to press.

NEWCASTLE ANCIENT LIGHT CASE.

In the Court of Appeal, composed of the Lord Chief Justice and Lords Justices Vaughan Williams and Stirling, on the 1st inst., the hearing was resumed of the case of Cowper and Steel, Coulson, & Co., Ltd., v. Milburn and others on the plaintiffs' appeal from an injunction of Mr. Justice Buckley in the Chancery Division. There is also a cross appeal by the defendants from that part of his lordship's judgment refusing the defendants an inquiry as to damages. (The case was reported in the *Builder* of June 18, 1904, and March 25, 1905.)

In this case Cowper, the freeholder, and the plaintiff company, the lessees of Dean Inn, No. 20, Dean-street, Newcastle-on-Tyne, brought the action against the defendants for an injunction to restrain them, their servants and agents, from continuing the erection of certain buildings of moderate height, and they had been accepted by the plaintiffs' ancient lights as the same were enjoyed previous to the removal of the buildings formerly standing on the site of the defendants' premises. Until comparatively recently on the west side of Dean-street there were certain buildings of moderate height, and they had been accepted by the defendants had erected buildings far exceeding the height of the old buildings. The defence was a denial of liability, and in the result Mr. Justice Buckley held that there had been no nuisance on the part of the defendants and dismissed the action with costs. From this decision the plaintiffs appealed. At the conclusion of the arguments of counsel on March 21, 1905, the Lord Chief Justice said he was of opinion that there must be a report made by someone who would report to the Court whether there had been an obstruction of the lights, assuming the old windows in the plaintiffs' building were still there, and when that had been received the Court would give judgment on the appeal.

Mr. Ralph Neville, K.C., Mr. Astbury, K.C., and Mr. Mangham appeared for the appellants (the plaintiffs); and Mr. Warrington, K.C., Mr. Buckmaster, K.C., and Mr. O'Leigh Clare for the respondents (the defendants).

At the sitting of the Court Mr. Astbury said he had seen a copy of Mr. Chadwyck Healey's report on the matter, and having regard to what appeared in that report, he had nothing further to say on behalf of the plaintiffs.

The Lord Chief Justice, in giving judgment on the plaintiffs' appeal, said that as the finding of Mr. Chadwyck Healey was to the effect that, even taking the plaintiffs' lights as they existed before 1877, the defendants' building would not have obstructed those lights, having regard to the use of the neighbourhood, he (the Lord Chief Justice) was of opinion that Mr. Justice Buckley had proceeded on a right basis. The consequence was that the appeal would be dismissed and the action dismissed with costs.

The Lords Justices concurred.

Mr. Warrington then proceeded to open the cross appeal of the defendants. He said that during the course of the proceedings the plaintiffs had applied for an interim injunction, and on January 11, 1904, an order was made, whereby upon the plaintiffs giving the usual undertaking in damages the defendants undertook until judgment not to further build so as to interfere with the plaintiffs' lights. Early in May, 1904, the Colls case was decided in the House of Lords, and on May 3 the plaintiffs applied to Mr. Justice Buckley to be relieved of their undertaking in damages. The interim injunction stood from January 11, 1904, to May 3, 1904. On June 14 the action was tried before Mr. Justice Buckley, and when his lordship gave judgment for the defendant he was asked but refused to grant the usual inquiry as to damages. He (counsel) now asked their lordships to say that there should be an inquiry as to damages.

Mr. Astbury, on behalf of the plaintiffs, asked their lordships not to disturb the order of the learned judge. He said the action was set down for trial on February 18, and the case was in the paper ready for trial early in March. On March 12 Mr. Justice Buckley intimated that he would rather not try the case until the House of Lords had delivered judgment in the Colls case. Both sides agreed to that. The moment judgment was given in the Colls case plaintiffs applied to vary the undertaking as to damages so that it should not be said that they had given a wider undertaking than was justified by reason of the Colls case. He asked their

lordships to affirm the discretion Mr. Justice Buckley had exercised in the matter.

In the result their lordships held that there must be an inquiry as to damages, and therefore allowed the cross appeal.

NUISANCE FROM SEWAGE WORKS: ALLEGED STATUTORY PROTECTION UNDER THE PUBLIC HEALTH ACT.

The hearing of the case of the Attorney-General v. the Dorchester Corporation was commenced in the Court of Appeal, composed of the Master of the Rolls and Lords Justices Romer and Cozens-Hardy, on the 24th ult., on the appeal of the defendants from a judgment of Mr. Justice Kekewich in the Chancery Division.

This was an action by the Attorney-General at the relation of Mr. E. R. Talbot and by Mr. Talbot against the defendant Corporation, in which the Attorney-General claimed an injunction to restrain the defendants from so maintaining and carrying on certain sewage works as to cause a public nuisance, and from conveying or permitting to be conveyed, untreated or improperly treated sewage from the works into the river Frome in alleged contravention of sect. 17 of the Public Health Act, 1875. The plaintiff, Mr. Talbot, also claimed an injunction to restrain the defendants from carrying on the works so as to cause a private nuisance to him as owner and occupier of property in close proximity to the works, and damages.

The short facts of the case were as follows:—The works in question were constructed on a site containing 19½ acres of land, of which 3 acres were within the borough boundaries and the remainder was outside the borough. The 3 acres were acquired by the Corporation for the purpose of sewage disposal works in 1884 under a provisional order made under the Public Health Act, 1875, and duly confirmed, giving the Corporation compulsory powers for the acquisition of the land. The works contemplated when the 3 acres were acquired were never actually carried out, but in 1899 the Corporation decided upon the construction of sewage disposal works upon a site consisting of the 3 acres in question and 7 acres of adjoining land outside the borough boundaries, the latter being part of the 19½ acres forming the site of the works ultimately constructed and complained of in the present action. The Corporation acquired the 7 acres without obtaining compulsory powers.

The works upon which the Corporation determined in 1899 were to be for the treatment of the sewage on the International system. The Corporation applied to the Local Government Board for their sanction to the raising of a loan for the purposes of the works, and on December 7, 1899, the Board issued an order allowing the construction of the works described in the notice given by the defendants, but subject to the following modification, viz.—That the works should be in accordance with a plan sealed with the official seal of the Local Government Board, and marked "Dorchester Sewerage Plan Showing Works Outside Municipal Boundary," and which had been deposited in the office of the Local Government Board, a duplicate of such plan, sealed and marked, being deposited at the office of the Town Council of the Borough of Dorchester. The Board, on December 30, 1899, gave their sanction to the raising of loans to the amount of 17,000l. by the Corporation for the purposes of the proposed works. In 1900 the borough boundaries were extended by a provisional order made by the Local Government Board under the Local Government Act, 1888, and the order was duly confirmed and came into operation on November 9, 1900. The added area did not include any portion of the site of the sewage works.

In 1900 the Corporation resolved to abandon the International system of treatment of the sewage and to adopt the bacterial or septic system, and requested the Local Government Board to hold a local inquiry on the matter. On December 4, 1901, the Local Government Board, by letter, approved of the proposed alteration in the system of sewage disposal, subject, however, to the Town Council acquiring such an additional area of land as was necessary to provide an area of not less than 10 acres for the irrigation of the effluent, and they decided to comply with the application for sanction to a loan of 3,000l. The Corporation then applied to the Local Government Board for a provisional order giving them compulsory powers to acquire additional land for the works, and on April 10, 1902, the provisional order was made and subsequently confirmed. Some time prior to May 6, 1902, the Corporation applied to the Local Government Board for their sanction to the raising of a further loan of 7,500l. for the purposes of the sewage disposal works. The Local Government Board, after an inquiry, allowed the construction of the works described in the notice, subject to the following modification, viz.—"The portion of the land coloured green on the plan which lies to the north of the line marked A B C on the plan shall, by excavation or otherwise, be so lowered or prepared that the surface of such portion shall not in any part thereof be at a greater elevation than the height of

173-00 ft. above ordnance datum. The plan referred to is a plan which has been sealed with the official seal of the Local Government Board and marked "Borough of Dorchester Sewerage Disposal Works," and which has been deposited in the office of the Local Government Board, a duplicate of such plan, sealed and marked in like manner, being deposited in the office of the Town Council of the Borough of Dorchester."

Shortly after this order, which was made on September 15, 1902, the Board sanctioned the raising of the proposed loan of 7,500l. On February 25, 1903, a local inquiry was held into an application by the Corporation for sanction to a further loan of 2,550l. of which 1,600l. was required for the purchase of the additional 9½ acres under the provisional order of 1902, and the rest for the purchase of certain other land to the west of the works through which the outfall sewer was to be carried, and these loans were sanctioned in March and June, 1903, and the works were opened in March, 1904. In the main, the works constructed were in accordance with the plan and specifications which were before the Board when the letter of December 4, 1901, was written and the order of September, 1902, was issued, but certain modifications and alterations had been made afterwards. Before the defendants' sewage works were constructed the sewage of the borough had been discharged in a crude state into the river Frome at a point a little higher up the river than the point of discharge of the outfall sewer in question. Mr. Talbot's house and ground at the nearest point was about 600 ft. from the centre of the sprinkles distributing the sewage over the secondary filter beds. The plaintiff alleged that there had been negligence on the defendants' part, both in the construction of the works and in the method of working them. Mr. Justice Kekewich held that the existence of a nuisance had been proved, and that such nuisance was due to the sewage brought by the defendants to their works. He found, however, on the evidence, that there was no proof that the defendants had been guilty of negligence, he being satisfied that the defendants had done their best to construct the works according to competent advice, and having constructed them, to make them operate efficiently so far as circumstances permitted. His lordship, on the question of nuisance, granted declarations in the language of the claim for injunctions and injunctions in like terms, and directed a reference for the purpose of assessing the damages (if any) Mr. Talbot had suffered. With regard to the claim under sect. 17 of the Public Health Act, 1875, he made a declaration to the effect that the defendants had conveyed sewage and filthy water into the river Frome, but as regarded that he declined to grant an injunction, being satisfied that the effluent was now open to no objection on that ground. His lordship further ordered the defendants to pay the costs of the action, and suspended the operations of the injunctions and the inquiry as to damages pending the present appeal.

Mr. Danckwerts, K.C., Mr. Stewart Smith, K.C., and Mr. C. H. Sargent appeared for the appellants; and Mr. P. Ogden Lawrence, K.C., Mr. Macmorran, K.C., and Mr. Longstaffe for the respondents.

Mr. Danckwerts, on behalf of the appellants, said the appeal mainly turned upon a point of law. Mr. Justice Kekewich had found, in effect, that there had been no negligence in the construction of the works or in the user of them after construction. He had even gone further, and said he was satisfied that the Corporation had done everything that could be suggested to keep the beds as free from objection as possible. Defendants' case was that the nuisance which had occurred was inevitable from such works as these, and the effect of it was that, having regard to the local extension order, people must put up with the result. Where the Legislature authorized a local authority to do a particular thing, and the authority by doing that particular thing did cause mischief, the authority, being guilty of no negligence in exercising the power given them by the Legislature, no action, he submitted, would lie against them, either by an individual or by the Crown through the Attorney-General.

In the result, their lordships affirmed the decision of Mr. Justice Kekewich, holding that the defendants could not plead immunity from an action for nuisance.

The appeal was accordingly dismissed with costs.

TARMAC ROAD PAVING: PROCEEDINGS AGAINST THE BRIGHTON CORPORATION.

The hearing of the case of the King v. the Mayor and Corporation of Brighton concluded in a Divisional Court of King's Bench, consisting of the Lord Chief Justice and Justices Ridley and Darling on the 30th ult. In this case the defendants appeared to show cause why a writ of *certiorari* should not issue to remove into the Court orders or resolutions made by the Council of the borough in July and August, 1905, whereby it was ordered that the treasurer of the borough

should pay to the Public Works Committee two sums of 2,500, and 500, upon the grounds that the expenditure was unnecessary and illegal, and that the Corporation had no jurisdiction to make such orders.

Sir Robt. Finlay, K.C., Mr. J. Eldon Banks, K.C., and Mr. E. E. Humphreys appeared for the Corporation to show cause against the rule. Mr. Montague Lush, K.C., Mr. Ernest Pollock, K.C., and Mr. Casson appeared in support of the rule; while Mr. Dunkels represented the Public Works Committee.

Sir R. Finlay, in opening the case, said he appeared to show cause against a rule nisi for a writ of certiorari granted to quash orders on the Borough Treasurer, one for 2,500, and the other for 500, for certain tarmac works on the Madeira-road at Brighton. The Corporation were said to be acting *ultra vires* in laying this road with tarmac for the purpose of motor competition speed trials. The fact, however, was that the laying of this road with tarmac was, as he should show upon the affidavit, a most excellent way of paving the road. It was perfectly true that the immediate occasion of adopting this form of road paving was that an automobile competition was in view, but it was also the fact that the question of paving this road with tarmac had been brought before the Corporation many years before; that it was an excellent and economical way of paving the road; and that in adopting this process the Corporation were acting strictly within their powers as the highway authority.

The learned counsel then read an affidavit made by Mr. F. T. Wilson, Chairman of the Works Committee, who stated that the object of the Corporation in paving the road with tarmac was to produce the best possible surface for motor speed trials and to effect an improvement to the Madeira-road for the benefit of all classes of persons and of all descriptions of traffic using the road. In his opinion the carriage traffic on the road was greater than when the new paving was laid, and there had been a very marked increase in the pedestrian traffic, while the continuation of the footpath on the south side which was included in the contract, had proved a great attraction. The almost entire absence of dust and mud and the rapidity with which the surface dried after rain caused the road to be especially agreeable to invalids.

The Lord Chief Justice said he supposed there was nothing illegal in a Corporation encouraging motor trials on their roads.

Sir R. Finlay said there was not, and that the trials were very beneficial to the town.

The Lord Chief Justice: Tar macadam in order to stop dust is being tried everywhere.

Sir R. Finlay: Yes, and such a roadway is of enormous advantage. There is no dust and it is much more healthy.

The learned counsel then read an affidavit by Mr. May, the former Borough Surveyor of Brighton, in which he said that as far back as 1897 he made a report to the Works Committee recommending the experiment of laying Madeira-road with tar macadam.

The Lord Chief Justice said he thought that when the rule was asked for it was suggested that the tarmac was put down solely to get the automobile meeting.

Mr. Lush said that that was so, and would be proved.

Sir R. Finlay said it was impossible to come to that conclusion. If it had not been done *bona fide* the Mayor and Corporation would have to pay the cost. He then read an affidavit by Mr. Weller, the present Borough Surveyor, to the effect that as against the first cost of laying the tarmac road there must be set off the saving in the cost of repairs and watering, due to its substitution for ordinary macadam. He estimated the cost of necessary repairs to the tarmac at 50 per cent, less than to ordinary macadam roads. Further, the tarmac road did not require watering, and he estimated the saving in that respect at 84. per annum.

After further affidavits had been read, the Lord Chief Justice said he thought it would be extremely difficult for the Corporation to justify expending money on a public highway simply to have motor trials.

Mr. Justice Darling: During which it could not be used as a highway.

Sir R. Finlay said that the tarmac road would be there and last ten or fourteen years, with all the advantages related in the affidavits. He submitted that if this was a form of paving elected *bona fide* in the exercise of their discretion as the highway authority, it did not matter that the immediate occasion which called their attention to the desirability of laying it was this proposed automobile competition. He contended it was established that the Corporation acted perfectly *bona fide* and well within their powers.

Mr. Dunkels, on behalf of the Public Works Committee, adopted the argument of Sir R. Finlay.

Mr. Lush, in support of the rule, submitted that the Corporation had not expended this money acting within their powers at all, but in

excess of their powers. That Court, he submitted, sat as a Court of Appeal against any wasteful expenditure in such a case; indeed, the only way of surcharging a Corporation was by coming to that Court. His two contentions were, first, that the Corporation had in fact exceeded their powers, and, secondly, if they had not exceeded their powers there had been a wasteful expenditure, and the Court had power to consider if that was so, and to quash the orders for payment if they found it was. What had been done here by the Corporation was not in the exercise of their powers as a Corporation, but as an Urban Authority under the Public Health Act. The Act protected a Corporation from being interfered with by auditors, but left it to the Court to say whether it was wasteful or not. It was clear that the Court had the right to over-ride wasteful expenditure. The case was of supreme importance, because if the contention of the Corporation was sound there was no power in any auditor or tribunal to prevent the most wasteful extravagance on the roads. The Corporation were only authorised to repair the roads as occasion might require, and they must show reasonable ground for saying the occasion required the spending of money for the repair of the road. The Corporation had to show that the time had come when the road needed repair, and they did not pretend that was so, even in their own affidavits.

At the conclusion of the arguments of counsel the Lord Chief Justice, in giving judgment, said the case was one of great importance because the Court was asked to quash an order for the payment of a considerable sum of money. Speaking for himself, if there had been evidence to show that the Corporation were acting *bona fide* under their statutory powers, he thought the case of "West street" v. the London and North-Western Railway" showed that the expenditure ought not to be reviewed, although there might be cases where the expenditure was so unreasonable as to be *ultra vires*. It was not disputed that the section under which the Corporation purported to act was sect. 149 of the Public Health Act, 1875, which empowered the authority to alter and repair streets "as occasion might require." He was of opinion that the beginning and end of the matter was the desire of the Automobile Club to hold their meeting at Brighton and the desire of the Corporation that the meeting should be held there. He came to the conclusion that the Corporation desired to have the automobile trials at Brighton, and that that desire was the only motive which prompted them to make the expenditure complained of. The fact that the motion for a rule was not made until December was not sufficient to enable the Court to say that the order ought not to be quashed.

Justices Ridley and Darling concurred, and the rule was accordingly made absolute.

Patents of the Week.

APPLICATIONS PUBLISHED.*

172A of 1905.—A. BRUCE: *Siphon Cisterns*. This relates to a siphon cistern, and is characterised by a siphon having an inner tube and an outer tube, the inner tube having a lateral branch provided with a valve which can be operated by the pull cord, and the outer tube having at its upper end an air-tight connection which automatically, by means of a float and lever arrangement connected to the valve spindle, said valve having preferably a pipe connexion, which is led out at the roof or elsewhere.

6,848 of 1905.—W. JAMESON: *Machines for Clamping together Pieces of Wood or other Material*.

This relates to a machine for clamping wood or other material, and consists in the arrangement of a presser bar worked by a crank and connecting rod through a lever having a fixed or immovable fulcrum, and the work of which is measured by the strength of a spring to which it is attached.

6,953 of 1905.—F. S. FIELDS and E. S. FIELDS: *Geysers or Apparatus for Rapidly Heating Water*.

This relates to a geyser or water heater comprising inner and outer sheet metal cylinders, plain, corrugated, or indented, concentric with each other, and producing a narrow or annular space between them, a plate closing in the upper end of the inner tube within the said depending tube forming a flue, a conical and cylindrical baffle, hollow or solid, suspended below and around the lower ends of the tube and flue, and with or without water-way connexions, and means for conveying the water into and out of the geyser.

10,719 of 1905.—A. FULLERTON: *A Machine for Moulding Artificial Stone or Concrete Blocks or Slabs*.

This relates to a machine for moulding artificial stone or concrete blocks or slabs, consisting of the moulding-box, provided with hopper and rear

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

opening for the introduction of the concrete matter and means for forcing it into the moulding-box aforesaid, a hinged cover lid designed to be raised at will in order to introduce a coating of coloured material or the like, lowered or locked in position by clamping devices, a movable bottom capable of being raised by the intervention of rotatable screws or by means of a piston and rod actuated by steam hydraulic or other means.

11,996 of 1905.—H. MACFARLANE: *A Method of Manufacturing Sheet Steel or Iron in Imitation of Earthenware Tiles or Bricks*.

This relates to a method of manufacturing enamelled sheet-steel or iron in imitation of earthenware tiles or bricks. The metal sheets are first grooved or marked so as to represent tiles or bricks, and this grooving or marking is accomplished by means of suitable dies, stamps, rolls, or the like. After the plates have been suitably grooved or marked they are then cleaned and enamelled in the usual manner.

14,508 of 1905.—M. J. ADAMS: *Baths*.

This consists in forming a bath with a slope in such a way that a satisfactory wash can be got with little water, because one end will be comparatively deep, and this end the bather will use. There is also formed a lavatory support upon the bath, discharging the waste of the same by the bath waste, and, where desired, one set of taps is caused to feed the bath and lavatory, and in some cases the water passes through the lavatory itself to the bath.

14,603 of 1905.—G. B. SMITH, JUNR.: *Transit and Lake Covered Structures*.

This relates to a transit shed having its roof formed in telescopic sections, which may be rolled or slid one within another to uncover part of the shed, and having fitted in conjunction therewith an overhead Goliath or other crane or cranes for removing goods through the opening or openings formed in the roof.

18,537 of 1905.—J. BRETHERTON: *Bricks, Blocks, and Tiles for Buildings*.

This relates to bricks, blocks, and building tiles of glass, constructed in such a manner that when they are laid or put together in the ordinary process of building construction all the mortar and cemented joints between the bricks are entirely covered by suitably shaped interlocking or engaging ledges or projections and recesses formed on the face surface of each of the bricks. The above-mentioned interlocking or engaging parts are so constructed as to come into contact with each other when the bricks or body portions of the bricks are separated by the mortar or other binding cement, consequently all the mortar or cement joints between the bricks are covered, and water or rain is prevented from soaking into and penetrating the mortar or cement, and in consequence pointing or repointing of the joints between the bricks is entirely done away with and rendered unnecessary.

22,727 of 1905.—C. TIMME: *Flooring Slab for Laying Directly on Masonry*.

This relates to a flooring slab for direct application to masonry by means of mortar or other adhesive material, consisting of an artificial stone mass with wooden facing and an intermediate isolating layer provided between the wooden and stone layers, held together in the usual manner by elastic connecting members, of an isolating mass, which is compressed between the layers and remains elastic and soft even on the upper surfaces, and follows all movements of the wood due to contraction or warping, and therefore presses tightly everywhere against the wood.

675 of 1906.—W. MANLEY: *Lavatory Basins, Baths, and the like*.

This relates to lavatory basins, baths, and the like, and consists in providing a lavatory basin superposed above the bath at the foot and mounted in a frame fitted upon the edge of the bath. The basin is provided with a supply of hot and cold water, which may be conveniently admitted through a geyser, or it may be admitted through hot and cold taps provided upon the basin. The outlet from the basin, when the basin is used, may be closed by a plug, the waste water from the basin flows through the trap, the tap under the basin being turned off or shut, while, when the bath is required, the water flows through the basin by taking out the plug and turning on the tap. It will be understood that when the bath is required the water flows through the tap underneath the basin, thus filling the bath.

1,111 of 1906.—L. PIRSOUL: *Manufacture of Tiles and the like*.

This relates to a method of manufacturing glass and tiles or the like with attachment projections, and consists in forming the tile or the like in a suitable mould and introducing into the still plastic or fluid mass in the mould a die provided with recesses, for the purpose of producing corresponding projections in the back of the mass when solidified. If desired, deforming or undercutting said projections and finally filling up the back with sand or other material.

PATENTS.—Continued on page 506.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv; Contracts, iv, vi, viii, x.; Public Appointments, xix.; Auction Sales, xxvii.

Certain conditions, beyond those given in the following information, are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bonâ-fide tender unless stated to the contrary.

Form, etc., may be obtained on application to Mr. H. G. Keywood, surveyor, Town Hall, Holyland Nether, near Barnsley. Sealed tenders, endorsed "Tender for—" addressed to the Chairman of the Highways Committee, must be delivered not later than May 19.

May 21.—STEVENAGE.—GRANITE.—Stevenage U.D.C. invite tenders for the supply of 1,000 tons (more or less, as may be required) of 1½ in. to 2 in., 1½ in. to 1½ in., and 1 in. to 1½ in. broken Guernsey, Leicester, or other granite for the repair of the roads in the district to be delivered at Stevenage Railway Station and sidings (G.N.R.) as and when required up to March 31 next. Sealed tenders, endorsed "Tender for Granite," accompanied by samples, must be delivered to Mr. Wm. Onslow, Town Clerk, to the Council U.D.C. Offices, Stevenage, not later than 4 o'clock on May 21.

May 22.—SCUNTHORPE.—GRANITE.—Scunthorpe U.D.C. invite tenders for the supply of granite, 1½ in. and 1½ in. gauge, and slag, 1½ in. and 2 in. gauge, and slag screenings, free to Scunthorpe or Gunhouse stations of the Great Central Railway, to be forwarded to either station, and in such quantities as may from time to time be ordered by the Council. Probable quantities, granite, 800 tons; slag, 1,100 tons; and slag screenings, 20 tons. Particulars to be obtained from Mr. W. F. Bickford, Surveyor to the Council. Tenders, with samples, to be sent in not later than 6 o'clock in the evening of May 22, to Mr. Frank C. Heit, Clerk, at the Council's Offices, No. 2, Trafford-street, Scunthorpe.

PATENTS.—Continued from page 502.

1,210 of 1906.—R. WAKE: Fastening for Doors and the like.

This relates to a fastening for doors and the like, consisting of a bar or bolt of any suitable shape and section, having one or more slots in it, which are designed to fit over or on to lugs or clips fastened in any suitable manner to the door or the like or its frame, said clips being bevelled or sloped and engaging with the ends of the said slots, which are also sloped for the purpose of drawing the bar or bolt and the lugs tightly together to lock the door, the edge of the bar or bolt alongside the said slots being of such a shape, and fitting in the said clip, as to form a pivot or hinge for the bar or bolt, which can be thrust up to release the said bevelled or sloped parts, and can then be turned on the clips away from the door, leaving it free to be opened, said clips and bar being always in engagement with each other.

2,214 of 1905.—M. FAWCETT: A Coupl for Chimneys, Ventilating Shafts, and the like.

This relates to the construction of cowls for chimneys, ventilating shafts, and the like, consisting of a lower truncated cone part inclined upwards and inwards, provided with projecting V-shaped ribs extending inwards and supporting a cover disposed on the upper side and flat on the underside, leaving lateral passages for the

ingress and egress of wind across the mouth of the chimney.

14,709 of 1905.—G. H. WALDEN: An Asphaltic Cement.

This relates to an asphaltic cement manufactured by mixing 10 grains of mass, 2 grains of coal, 4 grains of shale, and 10 grains of freclay, or any other quantity of these materials in the same proportions, intimately together, drying this mixture well over a slow fire, grinding it into a fine powder, adding to this powdered mixture the necessary quantity of gas-tar, and stirring and mixing the whole together so as to form a paste, which is ready for use, to cover stone, wood, or brickwork.

21,527 of 1905.—F. MELLAUN: Method of Producing Openings in Concrete or like Pavement.

This relates to a method of producing holes or channels in concrete pavement, by applying compressed air chisels in such a manner that the holes or channels, even when of small size, present sharply outlined sections and plain sides, and that destruction of the concrete over a larger surface than is necessary is avoided.

1,325 of 1906.—A. A. V. POULSEN: Preservation of Wood.

This consists in the method of preserving wood consisting in loosely applying to its surface or

driving into it pieces or nails of a metal which, under the action of the atmospheric or other moisture, will be transformed into a soluble metallic salt which will soak into the wood.

AN EDITION PRINTED ON THIN PAPER, FOR FOREIGN AND COLONIAL CIRCULATION, IS ISSUED EVERY WEEK. READING CASES { By post (carefully packed) 1s.

TO CORRESPONDENTS

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, for or of models or samples, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it, if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. The Editor cannot undertake to read and consider articles for publication unless they are type-written.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other commercial matters to the advertiser; and those to THE PUBLISHER, and not to the Editor.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 4 P.M. on Thursdays, 1 N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is stated, nor any list in which the lowest tender is under 100L, unless in some exceptional cases and for special reasons.

The Royal Academy.

AS far as the paintings are concerned, we fear it is impossible to call this a remarkable year at the Royal Academy. The sculpture, which we usually consider

separately, has apparently the best of it, as has usually been the case for some years back, and there can be little question that Sir W. Richmond's Gladstone monument in the Lecture Room is the most important work of the year. Mr. Sargent's portrait group of four professors of the Johns Hopkins University at Baltimore, hung in the position in Gallery IV, which has been for some years devoted to his large portrait groups, is of course a fine thing, in which the difficulty of treating pictorially four figures in black professional robes is surmounted with great skill; but it is not, as a picture, by any means equal in effect to some of its predecessors. The place of honour at the top of the large room is given to Mr. Abbey's painting of "Columbus in the New World," he and some of his followers kneeling, like good Catholics, to plant their standard on the new soil. The picture strikes us as having been painted as a decorative picture; there is a background of rather wooden-looking flamingoes all flying in level lines across the picture, which reminds one of the background of sloped red spears in the

far more dramatic picture of Gloster and Lady Anne; but these decorative birds are puzzling to the eye, and at first sight look like a number of red flags strung up one cannot tell how: it is an unrestful picture, and does not convince one of the reality of the scene. A prominent place is given, in Gallery VIII, at the centre of the vista, to another work which must be classed as a decorative picture, inasmuch as it is painted in a flat style which is one remove from realism; this is Mr. Brangwyn's "A Venetian Funeral," a work of much greater power than Mr. Abbey's, but which, owing to its flat treatment and crowding together of detail, is almost a puzzle to the eye at first; it is only after some consideration that it resolves itself into a boatload of figures in the foreground and a many-coloured but indistinct crowd of boats and figures in the sunlit perspective of the canal beyond. It is a very remarkable painting, full of vigour both of design and colour, but too confused to be satisfactory to the eye. Among other pictures of ambitious scale and aim, Mr. Christie's "The Secret—Decorative panel," in Gallery X, a very large upright composition of three ladies in dresses of brilliant hues beneath a mass of tree, is not decorative in the sense in which the last two works named may be called so; it is in fact almost realistic in character, though it has a claim to decorative character as a matter of forcible colour and agreeable composition; we cannot however feel that its interest is in any sense commensurate with the wall-space it occupies. Mr.

Draper's "Day and the Dawnstar," in Gallery VIII, as an allegorical composition, one might like better if he had not quoted for it two lines of Tennyson which suggest something far more intense and more full of beauty than we can find in these figures, and he is not the only artist this year whose poetical quotations are too much for his pictures. Sir L. Alma-Tadema's "Ask Me No More" is in a pictorial sense one of the most beautiful and successful of his Hellenic rhapsodies of draped figures and marble, and violet sea beyond; a man and woman are seated on a marble seat on a terrace, he kissing her hand, she turning her head away; the figures are finely contrasted, the delicate harmony of the draperies is perfect; but, though the head of the female figure is charming, there is nothing in her expression to answer to the deep feeling of the five noble and pathetic lines quoted from "The Princess," and one is brought up by the feeling of the inadequacy of the picture, with all its technical beauty, to express the idea of the poet. Mr. J. W. Waterhouse, in a picture hung a few feet from this, is another painter who takes a great subject and falls below it; his "Danaides" is a group of quiet maidens, mediæval rather than Greek, beautiful and harmonious in their colouring and grouping, perfunctorily pouring water into a curiously designed brass vessel from which it quite obviously runs out before their eyes; they are all quite calm and unconcerned, their terrible sentence produces no effect on their feelings; they are only playing

at being Danaïdes. It is a very pleasing picture, but it is absurd to take a great antique legend as a subject and reduce it to prettiness. Mr. Hacker's "The Hours," in Gallery V., is an allegorical group more on a level with its subject, and finely composed in line, though the central figure is somewhat affected in pose and expression. By one of the dramatic contrasts which the Academy has in store for us, this allegory is overhung by an immense portrait group of a family engaged in getting into a large motor-car which fills the whole canvas; thus are we hurried from poetry to prose; one would have thought we had enough of motor-cars in the streets, without bringing a life-size one into the Academy. Realism of another kind is shown in Mr. G. Henry's fine picture, "The Blue Gown" (Gallery III.), where a lady in a blue dress and with a finely-painted and expressive head stands in the centre of the picture against a background of dark panelling; various accessory objects are all painted with brilliancy and effect; the whole is an arrangement of figure and accessories so as to produce a striking pictorial effect. We have already noticed Mr. Henry's fine picture, "The Hourglass," in the New Gallery; equally a painter's picture, a work showing an artist's sense of composition and colour, without pretending to any meaning beyond that. We do not say this is the highest theory of painting; but it is far more satisfying than a picture with a professedly poetic aim which it fails to rise to.

Among smaller pictures in which figures are the principal subject the exhibition has brought out a new painter of no little power, Mr. Frank Craig, whose picture, "The Heretic," has been bought for the Chantrey Bequest, a choice which will not be disputed. This is a small picture crowded with figures in medieval costumes, in which every separate face is a study in character; and that of the young woman who is the heretic, and who seems to be catching sight with dismay of the preparations for her doom, is a most remarkable effort in concentrated force of expression. All the details are very carefully executed, and the artist has made a position for himself, if his future productions are on the same level of intelligence and conscientious execution. Among other works on a comparatively small scale that are worth special notice are Mr. Young Hunter's "A Song Without Words," in which the figure of the lady in crimson dress curtsying to her lover is admirably realised; Mr. Sims's very pretty fancy of children in "The Land of Nod," a sort of dream picture of children on their way to bed; and Mr. A. Fahey's "The Conception of the Cross," which explains itself better than it can be explained in words, and is a rather remarkable little picture both for composition, colour, and mystical significance. Mr. Collier's lady seated in brilliant array before a fire, to the title "Indeed, indeed, Repentance oft I swore," is one of the pictures in which the expression is hardly equivalent to the subject. Mr. Tuke, in "Pearls," has taken to painting female nudes instead of his former favourite subject of youths bathing, and we hardly like his girls as well as

boys. Mr. Melton Fisher's "La Belle au Bois Dormant," a nude figure asleep in a wood, has beauty and poetic significance, and Mr. Mount Loudan's lady about to bathe in a garden pond—

"Oh world, as God has made it!
All is beauty."

is a really beautiful work which might have been more advantageously hung.

It is curious how little is seen now of what used to be called "Historical Painting." Mr. Seymour Lucas's "Burning of Luther's Works outside Old St. Paul's" represents the old style of picture of this class; a kind of portrayal of facts which appeals to the popular mind, but we cannot find it very interesting. There are two Napoléon pictures, one as poor and commonplace as the other is fine and real; the latter is Mr. Crofts's "Near La Belle Alliance at Dawn, June 18, 1815"; one of the best things of the kind he has done. Napoléon is seated on his white horse with his back to the spectator, but his profile is seen as he addresses questions to the same peasant looped to the stirrup of a dragoon whom we have seen in a former picture by the same artist. The contrast between Napoléon's stern and searching face and the profile of the terrified peasant, cap in hand, struggling to satisfy the imperious emperor, is admirable; the emperor's staff and some of the soldiers occupy the foreground; in the distance is the line of camp fire of the allies. The picture is a distinct success, and adds one more to Mr. Crofts's remarkable series of military paintings.

Then we have the type of pictures representing real life of the humbler class, in which Mr. La Thangue and Mr. Stanhope Forbes are predominant. Mr. Forbes's principal picture, "Preparing for Regatta Day" by repairing one of the flags, is simply a study of figures characteristic of a seafaring neighbourhood; a piece of the prose of real life, very well painted but not much of a composition. His smaller work, "Evening in the Village," a seaside village, is more of a picture. Mr. La Thangue makes his rustic scenes subservient to studies of the effect of sunlight; his "Carting Bracken" is a powerful and brilliant work in this way, remarkable also for a donkey admirably foreshortened; a better piece of drawing could not well be seen. His two scenes in Liguria, in Gallery XI., are perhaps even better in the treatment of sunlight; his portrait of a child sitting in a hammock is hardly a success, and seems as dull and heavy in effect as the others are brilliant.

There are a number of good portraits this year, among which Mr. Oulless's of the Master of Clare College is one of the most powerful and lifelike of the class of portraits which aim simply at portraiture without any special pictorial effect; the head is splendidly painted both in regard to colour and force of expression. Mr. Herkomer's "Mrs. Leopold Albu" is a fine example of the class of what may be called sumptuous portraits, painted to be effective in a large gallery, and is a noble and dignified work. So is the President's seated portrait of "The Duchess of Northumberland," a little hard perhaps, but most learnedly drawn, and with all the rich details and accessories painted with the

most conscientious elaboration. Among other portraits in the large room may be mentioned Mr. Bacon's original and effective portrait of "Lady Gelder," though the strong red background does not altogether improve it; a charming if rather sketchy half-length of a very pretty girl, by Mr. Sargent; and Mr. Shannon's broadly executed and effective group of "Mrs. Herbert Sears and her Daughters."

Landscape is comparatively speaking strong this year. Sir E. Waterlow's landscapes are always notable for their careful composition, but his "Dorsetshire Uplands" is particularly excellent in this respect, and in the beauty of the distance and the fine sweep of line of the foreground hill. Mr. Peter Graham, in "Morning," has got something new out of his old subject of seaweed-covered rocks and a restless sea; it is far less hackneyed in colour than some of his works of this class (which had come to resemble each other rather too much), and the effect of the morning light catching the upper surface of the rocks is very powerfully given. The two landscapes which stand out from the rest to our thinking, are Mr. Annonier's "The Top of the Common," in Gallery IV., and Mr. David Farquharson's "Eventide" in the next Gallery. These show the power and breadth of treatment which are characteristic of the best French landscape. The failing of English landscape, in comparison, in spite of much beauty to be found in it, is to be too pretty, and too neglectful of composition. In this sense Mr. D. Farquharson's larger picture, "Birnam Woods," though it may count as a more important or at any rate more ambitious work than "Eventide," is not equal to the latter; there is just a touch of scenic effect in it from which "Eventide" and Mr. Annonier's landscape are entirely free. Mr. Clausen's small landscape "A Winter Morning" is a remarkable piece of realism without being realistic.

We have only mentioned here the prominent works which go to make the general character of the exhibition. We may be able to refer to other more or less interesting pictures on another occasion.

ARCHITECTURE AT THE PARIS SALON.

THE change of atmosphere from the architectural room at the Royal Academy to the architectural galleries at the Salon is curious. On the one hand there is a far greater thoroughness of illustration of work in the way of complete and large-scale plans, such as the Royal Academy would give no space for; on the other hand the collection has so little relation to the architectural practice of the day. At the Academy nearly all the drawings represent buildings executed or intended to be executed; at the Salon, out of 240 exhibits (it must be remembered that each number covers all the drawings, perhaps a dozen or more, representing one subject) we could only recognise twenty-five as representing actual commissions, and even in some of these it is left doubtful whether it is an executed building or only a *concours*. The title of one work, "Un Château-d'Eau en

Espagne." might be applied to a good many others which have the proverbial character of "châteaux en Espagne." Not all of these are uninteresting; some of them contain ideas which are suggestive; for instance, M. Boileau's immense set of drawings for "Une Eglise Catholique pour une Grande Ville" is a rather remarkable study for a cathedral of Gothic type and composition with classic detail; an idea which might bear fruit. Other schemes have an Oriental magnificence of conception which suggests the Arabian Nights; indeed, their authors seem rather inclined to suggest sites in "the exhaustless East," by way of an excuse for a riot of architectural imagination. "Un Gare Maritime en Asia Mineur," for instance; who can set realistic bounds to a scheme under such a title? No special locality is suggested; the whole historic seaboard of Asia Minor, with all its romantic associations, is at your service. Railway stations seem indeed to set the French architectural fantasy going; we have "Projet de Gare Maritime entre Kadikeni et Scutari"—here a locality is given, but the wings of fancy are not thereby clipped; and "Une Gare Maritime sur le Bosphore." Evidently the development of railways in the East is expected to proceed on a gigantic scale. Akin to these is a scheme by M. Ebrard for a "Monument à la Mer," which shows a seaport where the sides of the high cliffs at the back of the port have been shaved down to a vertical face on which are developed friezes and bas-reliefs and great panels with inscriptions, all relating to the sea and its glories; really rather a fine idea, but who shall realise it in these days of economics? A pretty idea too is that of M. Thiers, "Ensemble décoratif au Confluent des Deux Fleuves," where the meeting of the waters is solemnised by the erection of a great stone or marble exedra with ranges of stepped seats in a concave curve, interrupted at intervals by rows of clipped trees, a combination of architecture and greenery: it might serve for the background of a river regatta on a very grand scale. The incident of the meeting of two rivers seems to have an attraction for the French artistic mind; the junction of the Rhone and the Saône has inspired, to our recollection, not a few decorative pictures; and this is a similar celebration in architectural form.

The learned restoration of some antique monument, expressed in a series of sumptuous drawings, which usually forms the *pièce de résistance* of the architectural gallery, is wanting this year; the nearest thing of the kind is M. Le Tourneau's set of drawings of the Church of St. Demetrius at Salonica, which gives the complete plans and sections, with some large pencil drawings of the various interesting and curious capitals, a large coloured drawing of a mosaic, and a bold water-colour view of a corner of the church, showing the effect of the time-worn coloured marbles in the spandrels of the nave arcade, and the short columns of the triforium gallery, with the pierced marble balustrade between. The largest space occupied by any one exhibit is this year, for a wonder, claimed for an actual building, M. Godefroy's "Préfecture de la Haute

Vienne" (the catalogue does not state in what town), which fills a whole bay with a splendid set of drawings, the cost of producing which must have taken a good piece out of the architect's commission. This is a large collection of buildings, the two principal blocks of which, one of them a richly-treated set of state apartments, the other a plainer business block, stand at different angles, and are hinged, as it were, by a circular building with a decorative tower. The large circular-headed portal of which, in the perspective view, forms a terrible warning of the bad effect of arched openings on a circular plan. Except for this, the boldly-executed view, in sharply foreshortened perspective, of the principal block, with its coupled columns, lofty flight of steps, and flanking sculptures, has a very fine effect; the interiors are handsome rooms, though the detail is of an ultra-modern French neo-classic which we love not, and the grand staircase is all built in the form of arch, rather flat three-centred, which the French architects seem to be fond of in their Hôtel de Ville interiors, and which we think one of the least beautiful forms. Another important public building illustrated is M. Malgras-Delmas' theatre at Calais; the principal front is rather rampant with ornament, especially in the attic; it has an order in coupled columns, not close together, but leaving space between for a niche and a statue below and a circular medallion with a bust above, which has a fine and rich effect. The long flank is treated in a more sober style, and the whole building is a creditable one. We should mention also M. Payen's "Préfecture d'Agen," a quietly treated classical building surrounding three sides of a quadrangle, the fourth side having a columned gateway in the centre, connected with the wings by a lofty grille. This is a very simple piece of architecture with hardly any decoration, but it is dignified and suited to its purpose. The plan, it may be observed, does not entirely agree with the perspective view.

There are two or three public improvement schemes of some interest. M. Deverin exhibits his sketch for the improvement of the Palais Royal, the point of which is that the *place* requires to be opened out more fully by a public road instead of being entered merely by *guichets*; he proposes to drive a new road through from west to east, passing a little south of the Banque de France, which is to be extended and brought south to the road line; the entrance of the new road on the *place* to be marked by new angle pavilions to the existing buildings, and the *place* between the Conseil d'Etat and the Direction des Beaux-Arts laid out with an ornamental pond and fountain. It appears to present a very sensible and desirable public improvement. So, as far as we can judge, is M. Rémaury's scheme for providing a public garden and promenade for Rouen, by laying out the "Île Lacroix," at present (according to the statement on his drawing) partly occupied by dilapidated house property, and connecting it by sufficient bridges with the town on the banks; but do the "vieilles mesures" referred to include any of the picturesque old houses of Rouen? If so, there may be two ideas

on the subject. A less practical and more extravagant scheme is that of M. Coutan's for "Le Parlement, par rapport à la Place de la Concorde." He proposes to do away with the Pont de la Concorde, and to continue the Place de la Concorde across the river its full width, only leaving a large oval opening in the centre over the river—in other words, making what are really two bridges instead of one, only that they are not treated so as to convey that impression. Opposite this extended Place de la Concorde the two Houses are to be combined in a great building presenting a vast colonnade, concave on plan, facing the *place*; so far this is a fine idea, but it is spoiled by the immense and ill-designed centre feature, which completely crushes the colonnade. Otherwise, the general idea is worth consideration, though we do not suppose there is the least probability of its being seriously entertained.

Two or three of the recent competition designs for the Rothschild Foundation of artisans' dwellings are among the exhibits, including the selected set by M. Rey, of which we published illustrations in our issue of October 14, 1905, and which, besides being in the main very well planned, form a really admirable illustration of the treatment of buildings of this class so as to give them a pleasing appearance with due regard to economy. M. Rey does not do this, as is too often done, by getting in as many commonplace features of detail as possible—bits of ornament, keystones, etc.; he has done it by shaping necessary features, such as balustrades, pierced ventilated openings, etc., in a manner at once pleasing and practical. Some of the other plans show how much behindhand the French architects still are in their notions of hygienic planning. In an otherwise well-planned set we see the water-closet in each tenement opening direct out of the very small kitchen, and only to be reached by going through the kitchen; it is amusing, in connexion with such a plan, to read in the catalogue "projet des habitations salubres et économiques!"

There is not much to be seen of modern church architecture, but there is one rather remarkable building, shown in a coloured perspective without plan, M. Gosset's "Basilique Sainte-Clothilde, à Reims," a modern Byzantine church, described as "Monument du Centenaire de la conversion des Francs, 496—1896," which we should have taken to be merely one of the numerous "projets," but for a little photograph stuck in the corner of the mount, and obviously taken from the actual building, which appears to stand in the fields outside the town. This is a church on a Greek cross plan with a central dome and semi-domes over the transepts; it represents that form of Byzantine architecture in which lofty narrow windows are carried right up to the exterior springing of the dome, the extrados of their arches forming a serrated line of finish round the base of the dome. The portals at the west front are grouped under a great pointed arch, the extrados of which gives the line of the leaded roof over the nave. As a modern adaptation of Byzantine principles it is a rather remarkable production. There are some interesting drawings of church restoration. Among these is a set of

drawings by M. Deverin (the author of the Palais Royal plan already mentioned) of the restoration of the Church of "Saint-Jouin-de-Marnes (Deux-Sèvres)." This is shown in a very complete set of drawings illustrating, in perspective as well as in geometrical drawings, each aspect of the church as it was before restoration and as it is now—or as it is intended to be, for it is not positively stated that the restoration has been actually carried out, though we conclude that it has. Though the church was considerably dilapidated, it seems to have been in a sufficiently complete state to leave little to conjecture in the restoration; the most important alteration is that the cloister walk on the north of the nave had been built upon with a utilitarian building with square windows and a lean-to roof against the nave; this has been removed and the cloister restored. There are two curious points in the architecture of the church; one is the projection of large flying buttresses from the end walls of the south transept, apparently with the object of getting a walk past this end of the transept without having any wall-buttresses cutting into it; the other is, that this same transept is finished at the top by machicolations and a battlemented parapet, like a castle, a feature which is ancient, existing nearly intact in the pre-restoration drawing, but does not appear in the corresponding part of the north transept. M. Haubold exhibits a fine perspective section of the proposed restoration of the Abbey Church of Fontevault, with its stone arched principals and domical roofing; it is satisfactory to observe that M. Haubold does not propose to rebuild the arched principals in a circular arch, as an architect of the "Monuments Historiques" has, we believe, restored them at Périgueux, on the plea that the original builders would have built them circular if they had had more constructive skill in masonry. M. Coile exhibits some fine illustrative drawings of Saint-Julien-le-Pauvre, showing the construction in a perspective-section. A design for a proposed Synagogue at San Francisco is exhibited by M. Lansburgh; whether an actual commission is not apparent; it is a clever design in a nondescript style which may be intended as a revival of ancient Jewish architecture, but is not very convincing.

Among the designs for private houses there are some of those dreadful things, all points and elbows of roofing, which French architects (or many of them) seem to regard as peculiarly picturesque and suited to rural scenery; as if the country were a quarter from which all architectural repose and simplicity were to be banished. M. Gérard exhibits what seems to be his notion of an ideal villa, the home of happiness—"c'est là que je voudrais vivre, aimer, aimer et mourir," he quotes in the catalogue. The plan has an idea, no doubt; it has an unequal-sided octagon as a centre hall, from the longer sides of which branch out, cross fashion, the principal salon on the right, the dining-room on the left, the kitchen department at the back, and a "salon d'été" in front, next the garden, to which there are entrances from two of the smaller faces of the octagon. So far it is

a very nice scheme, but the architectural treatment, with its *bizarre* details and the hideous spiked timber roof over the centre, is enough to make an Englishman's hair stand on end. M. Polart's "Hôtel Particulier," a corner house in the Avenue des Ternes, Paris, though there is not much to be said for its external architecture either (except that it is tolerably inoffensive), is very interesting in its plan. It is apparently built for a client of aesthetic tastes. The drawing-room and dining-room are on each side of the entrance-passage, which leads straight through a large roof-lighted central hall of Greek cross plan, and with Moorish stalactite pendentives (rather out of keeping with the rest of the architecture), at the further side of which, up a broad flight of steps, is a wide opening giving access to a "Salon de Repos" on the higher level, out of which in turn opens the library to the right, and a vestibule with a garden entrance to the left; the point of all this is that the Salon de Repos, as is noted on the plan, can be used as the stage of a theatre when desired; the large hall forming the auditorium, and the library and garden vestibule furnishing all the necessary convenience for green-room and entrance of actors. It is apparently a house where there is no "family," as the upper floors shows only two bedrooms, larger and smaller, planned with the accessories of "toilette" and bathroom on the most liberal scale; altogether an interesting study of a house-plan of a special and unusual type. Another interesting plan is that attached to one of the four elevations for "Habitations Bourgeoises et Maisons à Rapport à Tourcoing," by MM. Bourgeois, *père et fils*. The street fronts are not worth much architecturally, but the plan of one of them, that of a narrow street house running far back, is admirably managed. The small entrance lobby gives access to one end of a small hall in the shape of a parallelogram with the corners cut off; in these four canted angles are doors to salon and bureau in front, and dining-room and offices at the further sides; while on the long sides two large arches open to the stairs on one side and smoking-room (between salon and dining-room) on the other side: for in a French house, where cigarettes rule more than cigars, it is not considered necessary to shut off the "funoir" from the sitting-rooms so religiously as would be required in an English house. Beyond the Salle-à-manger and opening from it is a long room marked "Salle de Famille," with a large window looking on the garden. We have nothing to learn from the French in house architecture on a small scale, as far as exterior treatment is concerned; but there are very good suggestions in their house plans for the union of compactness with variety and novelty. The only two examples we noticed where the treatment of small houses fell in at all with English ideas of the picturesque were M. Danis's "Habitation d'Été à Plombières," built on the side of a steep slope with a lofty basement wall of random masonry rising from the lower level; and M. Lefort's "Villa à Larcouest," a seashore house treated with the same kind of random masonry and with very simple detail, its high-pitched roofs contrasting effectively with the square thatched

stable building near it; it looks quite the type of a seashore house.

Those who like to look at fine and elaborate illustrative drawings of ancient work will find plenty of them, executed on a scale and with a finish to which we are little accustomed in England. On the other hand, in small sketches of a picturesque type English architects' work is for the most part superior to French; they have a lighter touch and more sense of effect. But we have not dwelt particularly on the numerous illustrations of ancient work, except in a few instances, having been more desirous to notice work bearing on modern architectural practice.

NOTES.

In reference to the statements which have appeared in the Press as to the condition of the foundations of Exeter Cathedral, we understand that, acting on the advice of the Cathedral surveyor, the Chapter decided to have a thorough examination made of the foundations of the south tower, in which for the last fifty years, and probably for a much longer period, there has been a crack. This crack was dealt with by Sir Gilbert Scott when the Cathedral was under restoration in the seventies. It has not increased nor spread, but nevertheless the Chapter thought it prudent to order a thorough examination of the foundations. This is not yet completed, but, so far as it has gone, it has not caused any anxiety as to the state of the foundations.

Applied Geology VALUABLE as adequate knowledge of geology is to the architect and the civil engineer, it is to be feared that insufficient attention is devoted in technical colleges and schools to the teaching of the science in a manner calculated to impress its practical bearing upon the minds of students other than those who propose to make mining in some form the object of their future career. The architect especially ought to possess a good working knowledge of geology if he is to be in a position to deal confidently with the varied problems encountered in constructive work, and particularly in connexion with foundations. Similarly, the civil engineer will frequently find familiarity with the nature of rock structures to be a valuable safeguard against costly errors, and the surveyor will derive much assistance in delineating external land forms if he possesses an intelligent understanding of what lies beneath the surface. We do not mean to imply that the study of geology is neglected altogether in architectural and engineering courses of instruction, but rather that the practical aspects of the subject have not received quite so much attention as they merit, and that abstract principles taught are insufficiently illustrated by actual cases showing the benefits obtained by their application and the failures following their neglect.

The proceedings of the Select Electric Supply Committee of the House of Commons which is considering the Loudon County Council Electric Supply Bill are being followed with the

greatest interest by electricians. The County Council point out that they have already a very large generating-station at Greenwich admirably situated so far as facilities for coal conveyance and water for condensing purposes are concerned. They also propose building another large power-station at Battersea. As they will shortly be supplying power to over 300 miles of tramway lines they will be able to have a sufficiently diversified load to make certain of a high "load factor." They do not propose entering into competition with any of the present trading companies or municipalities, so far at least as distributing electricity retail is concerned. They are asking, however, for power to revise the prices charged by authorised distributors every five years, provided that the Board of Trade find on inquiry that the prices are too high. This clause has apparently excited strong opposition not only from the trading companies chiefly concerned, but also from many borough councils. The prices the Council propose to charge are very much smaller than present prices, and there is no doubt that an unlimited supply of cheap power would be a great boon to London. In particular it would give rise to many new industries, and would ameliorate the conditions under which many labourers have to work. On the other hand, it will be a hardship to many of the able engineers who have shown how electricity can be supplied in bulk to have to compete with a municipality which is able to borrow money at such a low rate of interest and has benefited so largely by their pioneer work. Apart from the question of the ethics of municipal trading, we think that the County Council have made out a strong *prima facie* case for their Bill. We shall follow the proceedings of the Committee with interest.

The Powers of Corporations. An instructive case for Corporations to consider is that of *The King v. Mayor, etc., of Brighton*, in which certain orders and regulations made by the Borough Council were brought before the Court for review. The Corporation had voted and expended two sums of 2,500*l.* and 550*l.* respectively on laying the Madeira-road, Brighton, with tarmac at a time when an automobile competition was in contemplation; and the road was, in fact, used for this purpose. It was contended that they had acted *ultra vires*, and that the expenditure was wasteful and unnecessary, and that the ratepayers were therefore not liable. The Corporation, on the other hand, contended that they were acting within their powers under sect. 149 of the Public Health Act, 1875, and *bona fide* for the public good. Sect. 149 gives the local authority power to make up the streets "as occasion may require," but the Court in this case came to the conclusion that the Corporation had undertaken the work not in the interest of the road, there being no evidence that it required repair, but with the sole object of preparing for the automobile races and having the competition held there, and, acting under sect. 141 of the Municipal Corporations Act, 1882, the Court disallowed the order for the payment of the above sums from

the borough funds. This decision should be carefully studied by local authorities, as there is a tendency to expend the ratepayers' money on objects not to the interests of the ratepayers of the district, though *bona fide* to attain other ends, and it is well that the authorities should bear in mind the limits of their statutory powers.

Nuisance in Sewage Disposal.

THE case of the Attorney-General v. Corporation of Dorchester, commented upon by us, August 5, 1905, has been carried to the Court of Appeal. The action was brought by the Attorney-General at the relation of the owner and occupier of a certain dwelling-house to restrain the defendant corporation from committing a nuisance in carrying out sewage works for the treatment and disposal of the sewage of Dorchester. The defendants contended that the works were carried on under statutory authority, and that therefore no action would lie. The nuisance appears to have been the discharge of sewage not properly treated into a certain river, in breach of sect. 17 of the Public Health Act, 1875. It appeared that pressure had been brought to bear upon the corporation by the Local Government Board to establish an extended drainage system, and eventually a Provisional Order had been drawn up and confirmed by Act of Parliament, under which the corporation were to carry out certain works for the disposal of the sewage which had been approved by the Local Government Board, and this Order contained a proviso that if the corporation did not proceed with the works with due diligence, then the requirements of the Order might be enforced by the Local Government Board, under sect. 299 of the Public Health Act, 1875. The Court held that the effect of this Provisional Order was simply to apply the machinery provided by the Public Health Act, 1875, but did not prevent the application of sect. 27 of that Act, which provides that in the disposal of sewage no nuisance must be created. A subsidiary point raised was that the Attorney-General could not sue, because no public right was threatened, but this point was overruled on the authority of *Attorney-General v. Cockermouth Local Board*.

Caissons in Bridge Building.

AN illustration of one direction in which the work of professions, apparently having nothing in common, may proceed side by side with the utmost advantage, is afforded by the use of caissons in bridge building, tunnelling, and subaqueous operations generally. Engineers have pointed the way by which physical difficulties may be overcome, and physiologists, working with them hand in hand, have shown how operations conducted under conditions inimical to the human economy may be performed with safety to the workmen employed. In a particularly instructive paper read before the Society of Arts on Wednesday, Professor Thomas Oliver, M.D., of Newcastle-on-Tyne, considered the question of compressed-air disease in the light of personal experience gained during structural alterations to one bridge, and the construction of the new *hump-level* bridge at Newcastle, and compared some of his

conclusions with observations made in connexion with the execution of various important works in Great Britain, on the Continent, and in the United States. The paper is one that should be read and preserved for future reference by every civil engineer, contractor, foreman, and workman engaged in work where the use of caissons is necessary. In it will be found a clear exposition of the precautions best calculated to secure immunity from the special disease considered, and the best methods of treating those by whom it has been contracted. Of the various conditions to be observed, the most important are a plentiful supply of pure air to the working chamber, and very gradual relaxation of pressure in the air lock. Engineers may be glad to learn, on the authority of Professor Oliver, that if plenty of pure air is supplied to the men, and the shifts are not too long, work in compressed air could be carried on at greater depths and under higher pressures than have hitherto been attempted, so that if necessary engineering operations of even greater difficulty could be undertaken and carried to a successful issue, without prejudicing the health and safety of the workmen engaged therein.

Bacterial Tank Operations.

AT the commencement of his paper, read before the Civil and Mechanical Engineers' Society last week, Dr. W. Owen Travis quoted some remarkable extracts from the patent specification of Dr. Müller, of Berlin. This document, dated December 11, 1878—seventeen years before the introduction of the septic tank—accurately describes the essential character of biological sewage purification as practised in the present day, so far as concerns the capacity of the tank in relation to the daily flow of sewage, the formation and influence of scum, the production of septic gases, and the existence of sludge in the tank and filters, as well as the necessity for sludge removal from both these receptacles. Moreover, nine years before the commencement of experiments in Massachusetts, and fourteen years before those at Barking, Dr. Müller recognised the necessity for zoetic nitrification on well-aerated filter-beds composed of coke breeze, sand, and kindred substances. As Dr. Rideal remarked in the discussion of the paper, this is truly a wonderful find. The main object of the communication of Dr. Travis was to describe in detail the results obtained with the hydrolytic tank in operation at the Hampton sewage works. As the meeting showed last week, the general subject is one which distinctly encourages discussion, but the experiments at Hampton appear to emphasise the importance of a systematic withdrawal of sludge, of submitting the liquid to the attractive influence of suitable surfaces, and of protecting the suspended and depositable solids from the agitation effects of gases generated. They appear to prove also that by such treatment 90 per cent. of the solids in suspension, a large proportion of the solids in solution, and about 60 per cent. of the albuminoid nitrogen can be eliminated from the sewage in an area little larger than that required for the settlement of chemically precipitated sewage.

Steam Turbines. WHILE there is not the least indication at present that a genuine gas turbine will ever become a practical reality, or that turbine locomotives are likely to displace the existing type of engine, there is abundant evidence that in many directions the steam turbine is pursuing its victorious career with undiminished energy. In illustration of this point Mr. Parsons remarked on Friday last week, at the Royal Institution, that to-day 2,000,000 horse-power of turbines are at work on land, and 800,000 horse-power at work on, or being built for work on, sea, as compared with 65,000 horse-power on land and 25,000 horse-power on sea six years ago. Of course, the conditions under which the steam turbine can be adopted with economy have always to be borne in mind, yet subject to due consideration of this point we feel sure there are many places where such motors could be applied advantageously in substitution for reciprocating engines as part of the mechanical equipment of public and other buildings designed by architects.

Smoke from Engines. An important point to railway companies was raised in the case London County Council v. Great Eastern Railway Company. A summons had been taken out against the railway company in respect of one of their engines which had emitted a dark smoke. The magistrate had found that the engine was properly constructed, and that the coal was a good hard steam coal, the normal locomotive coal used in the district, and that there was no negligence in the management of the engine, but the Council contended that the company were bound to use a particular Welsh coal, which would have caused less smoke. In certain districts the company were under obligation to use this special coal by express agreement, but it is far more costly. The Divisional Court held that the magistrate had rightly dismissed the summons. They considered sect. 114 of the Railways Clauses Consolidation Act, 1845, and sect. 19 of the Regulation of Railways Act, 1868, and held that the effect of these sections was not to compel a company to use the best possible coal.

War Office, Pall Mall. It is anticipated that the executive staff will migrate to Whitehall in two or three months' time. Their present quarters consist of a group of four distinct buildings. The principal house, having a forecourt, was formerly occupied by the Ordnance and Transport Departments, for whom William Atkinson either rebuilt or greatly altered, before 1839, what had been the Albion Hotel, a "subscription house," and, it appears, the successor of the Union Club established in 1801. The members of the Union Club took over Cumberland House, which was originally built for King George III.'s brother Edward, Duke of York, and was afterwards inhabited by another brother, Henry, Duke of Cumberland. The design of Cumberland House is ascribed to Matthew Brettingham. Next, west, is the block built by Pennethorne, and illustrated in the *Builder* of August 16, 1851. For that block Pennethorne pulled down the east wing of (old) Schomberg

House, whereof the middle portion and the west wing form the third of the four buildings mentioned. For the fourth we turn eastwards, passing by the courtyard, to what was at one time Buckingham House, which Soane built in 1794, for the Marquis of Buckingham, upon the site of a house built by R. Furze Brettingham. Old Schomberg House was erected at the close of the XVIIIth century for the third and last Duke of Schomberg; Peter Berchett painted the staircase. John Astley, artist, sub-divided the house into three, set up a bas-relief of Painting over the middle portico, and built a studio on the roof. Contemporary with Astley was Gainsborough, who lived in the west wing from 1777 until he died in 1788. Cosway, R.A., miniature painter, tenanted the middle portion after Astley's death; the Polygraphic Club succeeded Cosway; sixty years ago the house was occupied by Harding & Co., silk-mercers (east wing), and Payne & Foss, dealers in old books. No. 78, now known as Schomberg House, is a grace and favour residence appertaining to the Crown.

Hampton Court Palace: The Great Staircase. DURING the past five or six months some artists have been employed upon the restoration of the paintings upon the walls and ceiling of the King's, or Great, staircase in Hampton Court Palace, and in carrying out sundry repairs there under the superintendence of H.M.'s Office of Works. The more important part of their work has consisted of the careful cleaning and revarnishing of the paintings executed by Antonio Verrio, the Neapolitan, whom Charles II. invited to this country and employed in a similar capacity at Windsor. The Hampton Court paintings delineate Jupiter, Juno, with gods and goddesses, Apollo and the Muses, and kindred subjects. Pope had them in mind when in the fourth epistle of his "Moral Essays" he satirised the abuse of riches, and, descending upon false taste in the arts, wrote:—

"On painted ceilings you devoutly stare,
Where sprawl the Saints of Verrio or Laguerre
On gilded clouds in fair expansion lie,
And bring all Paradise before your eye."

All the paint has been stripped off the oak panelling at the foot of the staircase; the woodwork was found to be in a good state of preservation, its great age notwithstanding.

Doulton Pottery at the New Dudley Gallery. THE New Dudley Gallery is in Piccadilly, at the bottom of Bond-street, and at the present time Messrs. Doulton are holding an exhibition of pottery there. The exhibition is remarkable for the effects that have been obtained by the use of crystalline glazes on pottery of various shapes and sizes. The effect is obtained in the firing with very beautiful results; the colour and the crystalline pattern are both accidental, it being impossible, apparently, to predict either. The shape of the vessels is kept severely plain, the better to show the gossamer-like pattern of the crystals, some having the effect of powdered flowers, others of butterflies; the colours, too, are very soft and beautiful. Another class of exhibits of interest is a pottery of a wonderful red colour, some

of them having pictures of figures in black upon them. There is a good deal of Japanese influence evidenced in the form of many of the pieces shown, an influence which has been all to the good in English pottery of recent years. Examples of the "Nouveau Art" shapes and patterns are distinctly less in evidence than formerly, though the ill-effect still remains here and there in pieces lacking any other claim to distinction. Clever miniature busts in white porcelain of Sir Henry Irving and Miss Ellen Terry are shown, as well as exhibits reminiscent of Copenhagen ware.

Dowdeswell Galleries. On Monday last an exhibition of water-colour landscapes painted in Sussex, by Mr. Fred Stratton, was opened at the Dowdeswell Galleries. Mr. Stratton's work shows a good deal of individuality, his colour is good, and, where necessary, he spares no labour to obtain the effect desired. It is perhaps a pity that all of the drawings are mounted and framed in gold—for the sake of uniformity it is supposed—as in several instances the expense of gold next the picture spoils the otherwise successful colour effect. There is much to be said in favour of the old-fashioned white mount for water-colours. Both "After the Storm" and "Village Homes" suffer from the framing; the former, as well as others in the room, has a pastel-like effect, probably due to overmuch stippling on very rough paper. "Village Homes" and "Summer Moonlight" are clever drawings of moonlight effects. "After the Storm" is a good piece of composition with wind-swept clouds, a characteristic also of "The End of the Day." Sunlight and shadow are well rendered in "Returning to the Meadows," and the coolness of a fresh spring morning in "An Early Spring Day." "In the Meadows" is a good study of cattle. Other drawings show typical Sussex scenery which is as beautiful in its way as any of the home counties.

The Leicester Galleries. At the Leicester Galleries there is a collection of pictures of the Thames by Mr. Mortimer Menpes; of which the largest, "Streatley Mill" (50), is the best; and "Wallingford" (51), with its picturesque stone bridge, is well treated, and very like the place; but this class of scenery does not suit Mr. Menpes so well as Eastern and Japanese subjects, they seem a little heavily treated and want the true Thames atmosphere. In "Boulter's Lock (Ascot Sunday)" (52) he has got, in this crowd of boats with gaily-dressed passengers, just the kind of subject that suits him—a medley of brilliant colours, and the picture is very effective. Among the others we like "The Red Lion, Henley" (34); "Clifton Hampden" (30); "The White Hart Hotel, Dorehester" (20); and "The Mill at Abingdon" (12). In another room is a collection of water-colour landscapes by Mr. Mark Fisher. A good many of these are from the neighbourhood of Antibes, which have a great deal of local character. Among the other subjects "The Thames at Bourne End" (29); "A Sluice" (30); "The Rick-yard" (9); "A Cool Spot" (67), a pond with trees

overhanging; and one, No. 75, without a title, show the qualities of light and atmosphere which we are accustomed to associate with this artist's work, the last-named especially; but we prefer his treatment of landscape in oil painting to these water-colours.

At the Modern Gallery there is an exhibition of Irish landscapes by Mr. Alexander Williams. It is an exceptionally large collection for the work of one man, and contains some very charming sketches. In most cases we like the grey, rainy effects best, for instance "The evening beam that smiles the clouds away" (22) is a lovely representation of a soft grey sky with faint golden sunshine breaking through the clouds, giving one a pleasant impression of the lamp atmosphere of Ireland. The artist's attempts at sunlight, however, are not so successful; the sun shines to the extent that there are shadows, but yet there is no feeling of warmth or brightness. There are several pictures of flat bog or common in which the treatment of the heather and bracken is very satisfactory; for example, "A Roscommon Moor" (150) and "Glenariff Glen, Co. Kerry" (129) are very effective paintings of heather. We do not always like the treatment of water; in "The Upper Lake of Clonee, Kenmare Bay" (68), and in some of the other paintings, the water is rather heavy, though in a few of the sketches it has been treated better. However, it is in sky effects that Mr. Williams really succeeds; all his skies are beautifully soft and clear, and there are many fine cloud effects. Though his painting can not perhaps be called masterly, it is at all events decidedly pleasing.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A SPECIAL general meeting of the Royal Institute of British Architects was held on Monday at No. 9, Conduit-street, Regent-street, Sir John Taylor, Vice-President, in the chair.

The Chairman moved that the President and members of the Council for the current session do retain office until the conclusion of the Seventh International Congress of Architects to be held in July, and that, in order to give legal effect to this resolution, the provisions of by-law 50 affected thereby be temporarily suspended.

The motion was agreed to. The annual general meeting was then held, and the Report of the Council for the official year 1905-1906 was adopted. From the Report we take the following paragraphs:—

Obituary.—The losses by death have been as follows:—Fellows—William Gibbs Bartlett, Hyman Henry Collins, Colonel John Eaton, Charles Forster Hayward, Zephaniah King, Thomas Edward Knightley, John George Luff, Robert Alexander Bryden, Henry Pollard Seddon, Alfred Waterhouse, James Weir, Joseph Wood; Retired Fellow—Charles Henry Howell; Associates—William Goldsmith, Richard Groom, Charles Grayson Maynard, Hedley John Price, William Moss Settle, Robert Phillips Whellock; Hon. Corr. Members—Charles Lucas, Conte Giuseppe Sacconi.

Membership.—The following tabular statement shows the present subscribing membership of the Institute, compared with that at the two preceding quinquennial periods:—

Year.	Fellows.	Associates.	Hon. Members.	Total.
1887	402	880	35	1,317
1904	621	1,028	46	1,695
1906	719	1,177	46	1,942

During the official year since the last annual

general meeting ninety-one Fellows have been elected, sixty-six Associates, and three Honorary Associates.

Examinations.—The progressive examinations were held in June and November, 1905. The preliminary was held in London, Belfast, Birmingham, Bristol, Cardiff, Glasgow, Leeds, Manchester, and Newcastle-on-Tyne; the intermediate in London, Bristol, Glasgow, Leeds, Manchester, and Newcastle-on-Tyne. The final and special examinations were held in London, and special examinations for colonial candidates were held in Durhan and Sydney, when two candidates were examined and passed. The results are shown in the following tabulated form:—

	Ex-empted.	Exam. insed.	Passed.	Rele-gated.	Total.
Preliminary Ex-amination	110	355	245	110	465
Intermediate Ex-amination	2	238	153	135	290
Final and Special Examinations	—	171	66	98	171

The total number of candidates was 926. The number of probationers now stands at 2,507, and of students at 757. The Council again have occasion to regret that so large a number of students remain on the list without proceeding to the final examination. The authority given to the Institute of Architects of New South Wales, to exempt properly-qualified candidates from the preliminary examination of the Royal Institute, has been extended to the Royal Victorian Institute of Architects. The special examination for colonial candidates will be held this year in Toronto and Melbourne. The statutory examinations, qualifying for candidature as District Surveyor in London and for candidature as Building Surveyor under local authorities were held in London in October. Certificates of competency to act as District Surveyors in London have been granted to Albert Anthony Fillary, Edgar Walsh Knight, Edwin Palsler, Harry Tom Boden Spencer, and Alexander Lionel Woodward; and a certificate of competency to act as Building Surveyor under local authorities to William John Stainton.

Annual Dinner.—This year the annual dinner will be replaced by the farewell banquet of the Seventh International Congress, on Saturday, July 21.

Institute Premises.—At a general meeting held on January 8 the Council were instructed to enter into negotiations concerning a site for new Institute premises, and to report to a general meeting. The Council, therefore, continued negotiations begun by the President concerning the purchase of the freehold garden site between Nos. 11 and 13, Portland-place. Owing, however, to the impossibility of settling questions of ancient lights in a satisfactory manner, the Council have been obliged reluctantly to abandon the project.

The London Building Act.—As mentioned in the last annual Report, the London County Council abandoned their Bill for amending the Building Act with the exception of the clauses relating to the prevention of fire, which they submitted as a separate Amendment Bill. This was opposed by the Institute, which was represented by counsel, Mr. Penhroke Stephens, K.C., and Mr. H. Courthope-Munroe. The Bill, as amended, ultimately passed as the London Building Acts (Amendment) Act, 1905. With regard to the heavy expenditure in connexion with this matter, the Council have passed a resolution to the effect that, in view of the large outlay incurred in opposing a Bill in Parliament, grave consideration should be exercised before again embarking on such an undertaking.

New County Hall for London.—The Council, feeling it to be a matter of vital importance that the County Hall which the London County Council propose to erect on the south side of the Thames, at a cost of 1,000,000, should be a building worthy of the greatest city in the world, addressed, last July, a letter to the London County Council, in which they offered the assistance of the Institute in their efforts to secure a design for such a building. The Establishment Committee of the London County Council, having intimated their desire to receive the suggestions of the Institute, the Council, after obtaining the report of a special Committee on the subject, have advised them to institute a combined open

and invited competition, to be judged by a jury of assessors.

Habon to Strand.—The recommendations made in the Report of the Royal Commission on London Traffic led the Council again to approach the London County Council with a view to the remodelling of the line of frontage on the north side of the Strand between the churches of St. Mary-le-Strand and St. Clement Danes. The London County Council again declined to reconsider their determination; but, subsequently, owing to a renewed agitation in the Press and elsewhere, the Council once more laid their views on the subject before the London County Council.

London County Council By-laws with Respect to Drains.—With reference to the new London County Council by-laws as to drains, the Council much regret that that authority have declined to accept the suggestions made by the Council of the Institute for modification of the stringent requirements as to drawings to be supplied.

Board of Architectural Education.—The Board of Architectural Education, in pursuance of their scheme, have appointed members to visit the various schools of architecture and report on their working. Such reports have been made with reference to the architectural schools of Liverpool University, University College (London), King's College (London), and the Architectural Association Day School; and the Board propose in due course to grant their certificates, under certain conditions, to students who have satisfactorily completed the various courses conducted by those bodies. The Board have had under consideration a proposal from the University of Liverpool for conferring degrees in architecture, and have made certain recommendations thereon.

Registration.—The Registration Committee, as existing at the time of the issue of the last annual Report, drafted a Bill and issued a report. The Registration Committee, as constituted after the elections in June last year, appointed a Sub-Committee "to take evidence for and against the principle of registration, and to suggest the course of procedure to be adopted at the general meeting when the present scheme of registration comes up for discussion." The Sub-Committee sat almost weekly for the purpose set forth in the reference, and took the evidence of twenty-four witnesses from London and the provinces. The Registration Committee, after having all the evidence before them, submitted a report to the general body at a special general meeting, held on Tuesday, April 3, and the resolutions then proposed were adopted unanimously.

Joint-Committee on Reinforced Concrete.—At the request of the Science Standing Committee, the Council issued invitations to various bodies to appoint representatives on a Joint-Committee to draw up rules for the guidance of architects in the use of reinforced concrete. The Committee has been constituted as follows:—Chairman—Sir Henry Tanner; representing the Royal Institute of British Architects—Messrs. T. Walmisley, William Dunn, Max Clarke, H. D. Searles Wood (Hon. Secretary to Committee); District Surveyors' Association—Messrs. T. H. Watson, E. Dru Drury; Institute of Builders—Messrs. Benjamin I. Greenwood, Frank May; Incorporated Association of Municipal and County Engineers—Messrs. A. E. Collins, J. W. Cockrill; War Office—Colonel C. B. Mayne, Major E. M. Paul, R.E.; other Members—Professor W. C. Unwin, Charles F. Marsh.

Fellowship.—As the Fellowship will be closed after the end of 1906 to all candidates who are not already Associates or have passed the examinations qualifying for Association, the Council, in compliance with the instructions of the general body of the Institute given at the business meeting of February 29, 1904, sent a circular letter to the Allied Societies, in which they suggested that architects of high standing in the various provinces who were not members of the Institute should be approached with a view to their joining. A great number of candidates both from London and the provinces came forward, and those whom the Council found eligible from their work and position were nominated for membership. Twenty-eight candidates were nominated for election at the business meeting of March 5, of whom six were Associates. A poll was

demanding by private members of the Institute, and resulted in the rejection of the twenty-two non-Associate candidates. As most of these non-elected candidates are by their age and position precluded from sitting for an examination, they are thus debarred from membership. The Council cannot but regard such a result as unjust to candidates and most detrimental to the interests of the Institute. At the general meeting of March 5, when the result of the poll was declared, a resolution was passed appointing a Committee of the Institute to consider the form of voting papers, the method of election of Fellows, and other matters connected therewith, including any revision of the by-laws on the subject if necessary, and to report to a general meeting as soon as possible.

Appointments, &c.—Sir Aston Webb, R.A., has been appointed to represent the Institute on the Court of Sheffield University. Sir William Emerson has been reappointed for a further term of three years to represent the Institute on the Court of the Liverpool University. Messrs T. W. Cutler and C. H. Outley have consented to represent the Institute at the Royal Sanitary Congress to be held in Britol in July. It has been decided that one of the Vice-Presidents of the Institute shall be *ex officio* a member of the Council of the Architects' Benevolent Society. Sir Aston Webb having retired from the competition for the Carnegie Foundation, "The Palace of Peace," at The Hague, Mr. H. T. Hare has been invited by The Hague Committee to represent Great Britain in his stead. The President is the other British representative.

Donations, Bequests, &c.—A sum of 775*l.* 18*s.* 10*d.*, bequeathed to the Institute for charitable purposes on the death of a Miss Moore, who was to enjoy the income during her life, has now come into the possession of the Institute. Since the issue of the last annual Report the Council have made the following grants:—The Cretan Exploration Fund, 25 guineas; the Artists' Benevolent Fund, 20 guineas; the Edinburgh Architectural Association, towards the funds of the Exhibition of Mr. Goodyear's Architectural Refinements, 10 guineas; Architects' Benevolent Society, 20 guineas; British School at Athens, 20 guineas; Architectural Association, 100*l.*; Royal Architectural Museum, 20 guineas.

Seventh International Congress.—The Council have the pleasure to inform members that satisfactory progress is being made in the organisation of the Congress. The total membership up to date, only counting those from whom subscriptions have been received, is 672, of whom 188 are ladies. As it is yet nearly three months before the Congress, the Executive Committee regard this as a sign that the movement will be largely supported. The Council, however, would urge members who have not yet joined, but intend to do so, to send their donations or subscriptions at once, as the work of organisation is enormously facilitated by a knowledge of probable numbers. The general outline of the proceedings has been issued to members in the form of a circular letter. Over 20,000 of these circulars have been sent to architects at home and abroad. The response from foreign countries is most encouraging. In addition to the grant of 500*l.* mentioned in last year's Report, the Council have decided to give an invitation garden party to the Congress at the Royal Botanic Society's Gardens. The Society of Architects has generously made a donation of 100*l.* to the Congress funds, and the Architectural Association one of 25 guineas. The Council venture to express the hope that all members of the Institute will join the Congress, even though they may not be able to be present, and thus enable the Executive Committee to carry through their task in a manner befitting the dignity of our country and our national art of architecture.

Competitions.—The following have been the President's appointments to assessorships during the official year:—

Bangor	Free Library	Mr. Philip C. Thicknesse.
Bristol	Church	Mr. W. J. Tapper.
Cheesnut	Library	Mr. James S. Gibson.
Greenwich	Library	Mr. A. W. S. Cross.
Hackney	Library	Mr. John W. Simpson.
Handsworth	Church	Mr. W. J. Tapper.
Hastings	Hospital	Mr. Edwin T. Hall.
Johannesburg	Technical Insti-	Mr. Thomas E. Collcutt.

Lytham	Schools	Professor Beresford Pite.
Newquay	Church	Sir Charles Nicholson.
Perth	City Hall	Mr. John J. Burnet, A.R.S.A.
Plymouth	Schools	Mr. H. Dare Bryan.
Rochester	Technical Insti-	Mr. Frank T. Baggalute.
St. Marylebone	Western Oph-	Mr. Edwin T. Hall.
Stockport	Schools	Mr. Leonard Stokes.
Stowmarket	Schools	Mr. Maurice B. Adams.

Finance.—In presenting the statement of income and expenditure, the Council regret that the balance to the good is not as large as it has been in recent years. A glance, however, at the extraordinary expenditure of 785*l.* 5*s.* 8*d.* in connexion with the Institute's opposition to the London Building Acts (Amendment) Bill, 1905, and of 318*l.* 15*s.* 6*d.* in connexion with the drafting of the Architects' Enrolment Bill, will show that this diminution is due to abnormal circumstances, and not to any lack of financial prosperity. On the contrary, the Council regard it as a proof of prosperity that the Institute has been able to meet these enormous charges and still show an excess of income over expenditure. As a natural consequence, however, there has been no addition to the amount of the invested capital of the Institute, which still remains, as at the time of issue of the last annual Report, at 18,000*l.*

The Report includes the Reports of the various Committees:—

During the session the Art Standing Committee held four meetings, and have had under consideration the following subjects:—New County Hall for the London County Council, Clock Tower (St. George's circus), Wood Pediments and Dome (Somerset House), Strand Improvement Scheme, Restoration of Nottingham Castle, Charing Cross Station Roof, Location of Peace Palace. The erection of a new County Hall by the London County Council was regarded by the Committee as a favourable opportunity to endeavour to secure the best architectural talent of the country being employed upon its design, and the Committee recommended the Institute Council to suggest to the London County Council the desirability of securing this result, and offering to assist them in any steps which they might take to obtain it. The removal of the Obelisk standing at St. George's-circus, S.E., and the substitution of a clock tower was considered by the Committee a very undesirable proceeding; but the matter was brought before the Art Committee at too late a date for any effective steps to be taken to retain the Obelisk. Since the date of the former correspondence with H.M. Office of Works with respect to the wood dome and pediments of Somerset House, and the suggestion of the Committee that these should be carried out in stone so as to give them a permanent character, the Committee have to report that a further communication has been received from H.M. Office of Works that it was undesirable at the present time, on the score of cost, to ask Parliament to sanction such a large expenditure as this would entail, and the Committee, in acknowledging this letter, expressed the hope that it might be possible to effect this improvement in the future. The line of frontage on the north side of the Strand between St. Clement Danes and St. Mary-le-Strand Churches was again considered by the Committee, and the Council of the Institute were asked to make a representation to the London County Council that it was desirable to set back the eastern end of this frontage so as to obtain a wider street at that end, and secure a better view of St. Clement Danes Church than would be obtained by the proposals of the London County Council; more especially as the Royal Commission on Traffic has also made recommendations dealing with the widths of streets in the central parts of London, which recommendations are similar to those of this Committee. The Committee referred to this matter in last year's Report. The matter of the restoration of Nottingham Castle was very carefully considered, and representations have been made to the Town Council of Nottingham, that if any works are necessary to be done to this structure they should be carried out under the supervision of an architect experienced in dealing with historical buildings, and who might safely be trusted to preserve their best features. The Town Clerk of Nottingham

has replied that if any works are to be done a competent architect will be consulted. The proposals of the engineers dealing with the Charing Cross Station roof were very courteously laid by them before the Committee, and Mr. Flockhart kindly undertook to make some sketch suggestions dealing with the ends of the side walls, which it was considered very desirable should be treated in an architectural manner, and also the wind screen, formed of steel and glass, suggested between these end walls at the Embankment end. These suggestions have been forwarded to the engineers, with a strong recommendation of the Committee that, if possible, the railway company should adopt them, and a conference has taken place between Sir Benjamin Baker, K.C.B., and Mr. Tempest on behalf of the company and the Art Committee.

The Literature Standing Committee report that the Committee, having referred to them "the matter of revising the lists of books recommended to probationers and students in the Royal Institute of British Architects' calendar with a view to making suggestions thereon to the Board of Examiners," have appointed a small sub-committee, whose recommendations have been considered on several occasions, and the Committee hope shortly to be in a position to make useful suggestions to the Board of Examiners. The Librarian reports to the Committee as follows:—

"During the twelve months ending on March 31 of the present year 211 volumes and thirty-two pamphlets have been added to the Library of the Royal Institute, exclusive of periodicals, reports, and transactions of societies, and parts of works issued in serial form. The number of works presented to the Reference Library was sixty-two volumes and twenty-one pamphlets. The works purchased comprise 116 volumes, out of which sixty-four volumes were added to the Loan Library. There were also thirty-two volumes presented to the Loan Library. The attendance of readers in the Reference Library numbered 5,521 (last year, 5,577). The number of works issued on loan was 3,486 (last year, 3,405). The number of books issued through the post was 121 (last year, ninety-eight). The number of tickets issued for admission to the Library, other than to members of the Institute or to students and probationers, was 131."

The Practice Standing Committee report that the Council referred to the Committee the revision of the phraseology of the Institute scale of charges, particularly with regard to the question of the ownership of drawings. The Committee are still engaged in the consideration of this matter. Inquiries and references to the Committee upon points of professional etiquette, disputes under building contracts, charges for architects' services, and similar matters have considerably increased, and the time of the Committee has been much occupied with their consideration. With regard to those dealing with architects' charges, however, the Committee, with a view to limiting the interruption of their ordinary work, have asked the Council to consider the advisability of appointing a Special Committee to deal with such matters, to whom they could be referred as a tribunal, under a scale of charges.

The Science Standing Committee have drawn up a short description of the tests to be applied to Portland cement for insertion in specifications where only small quantities of cement are to be used. The inquiry into the present method of applying Dr. Angus Smith's solution and other preparations for protecting iron has been carried on, and a series of experiments with iron drain-pipes treated with different preparations is now being conducted. A Joint Committee, representing the Royal Institute of British Architects, the Royal Engineers, the Institute of Builders, the District Surveyors' Association, the Association of Municipal Engineers, and several engineers, has been formed to draw up a series of suggestions for the use of reinforced concrete, as has been done in other countries, and the Committee are now collecting information. Some experiments have been made by Messrs. Cubitt on reinforced concrete beams. Members of the Science Committee attended when the beams were in the process of formation; the experiments are not yet completed. The Committee have reverted on the draft specification for structural steel drawn up by the Standard Committee. The Committee have also been represented on the Standard Committee dealing with the subject of cast-iron pipes for heating and ventilating. The

Committee have revised the list of books on science subjects recommended to probationers and students preparing for the examinations. The Brickwork Tests Reports have been published, and the work forms a valuable book of reference.

Messrs. Perks and Webb were reappointed as Auditors for the ensuing year of office, and the present Statutory Board of Examiners under the London Building Act, 1894, and other Acts of Parliament, was re-appointed, with the addition of Messrs. W. Hilton Nash and W. Henry White.

THE ARCHITECTURAL ASSOCIATION : FENESTRATION.

The following is the conclusion of Mr. Walter Cave's paper on "Fenestration," read at the last ordinary meeting of the Architectural Association, as mentioned last week:—

The Italian Renaissance.

Before we proceed to follow the treatment of windows in the great period of the English Renaissance, it will help us to glance for a moment at the architecture of the country in which this great revolution was proceeding. Throughout Italy, during the XVth century, vast palaces were being built by a people full of character and imbued with a love for the fine arts based on the rich inheritance of Imperial Rome, each city or state developing an individual style which reflected the life of the people. It is quite impossible here to enter fully into the various differences of these famous buildings, and two examples must suffice to illustrate our subject.

Florence and Venice.

The palaces at Florence are distinguished by their bold, massive character and the extreme plainness of the lower story. Taking, as an instance, the Ricardi Palace (1430), we find that up to a height of 11 metres from the ground there are, excepting the doorways, only very small rectangular barred openings, and the real window treatment does not begin till the first floor. The desire for protection is obvious in this arrangement, and the architect (Michelozzo) seized the opportunity of contrasting a massive rusticated lower stage with a double row of delicate and refined windows above. The design of these semi-circular-headed windows, divided by slender shafts under a single arch, retains many details of the mediæval Tuscan style, and helps to link the chain of tradition with Rome. The proportion of window-opening to wall-surface is interesting, and works out at about one of window to thirteen of wall, and gives a remarkable sense of solidity.

The Strozzi Palace, where the design is very similar, gives a proportion of one in twenty-one.

These examples may be compared with the Vendramini Palace at Venice, built by Lombardo in 1461, fifty years after the Ricardi Palace of Florence. Here the difference in the general treatment is particularly marked in the number and arrangement of the windows. Individually the double lights beneath a single semi-circular arch are much the same, but, instead of being isolated openings pierced in the great mass of stone, they are connected throughout the front by pillars and pilasters and a wealth of ornament, which gives an impression of lightness and grace entirely absent from the stern, forbidding façades of the Early Florentine builders. The proportion here of window to wall is one to three.

These two instances will be sufficient for the purpose of illustrating the effect of local conditions on fenestration.

The Florentine palaces were built in narrow streets, and liable to sudden attacks, hence the protective lower story and the principal rooms on the first floor. They were also built, as a rule, round a spacious courtyard, from which a great deal of light was obtained, so it was unnecessary to have a multiplication of windows towards the streets. Again, they were built on a solid foundation of rock.

The Venetian palaces were built facing waterways, and unexpected attacks were improbable. Thus we rarely find that absence of windows on the lower story, and the general plan did not, as a rule, include a central court. Thus the principal windows faced the canals, and, as the foundation was a matter of great difficulty and expense, the

spreading out of the plan (except in the very largest buildings) was avoided, and the great proportion of opening to solid wall diminished the weight, and was a very important and determining factor in the design of the fenestration.

Again, in Florence, the whole family, including married sons and daughters, lived in the palace, which, in those turbulent times at the end of the XVth century were practically fortresses, and the civic life of a free and factious Republic is represented by the heavy walls and narrow windows of Florentine dwelling-places, while a more sumptuous and secure mode of life finds expression in the graceful buildings with their many balconied windows which overhang the Grand Canal of Venice, exactly fitted to an oligarchy sure of its own authority and loved of its people, and representing the centre of European commerce.

The introduction into England not only of a foreign style but of foreign workmen has been so well described by Mr. Blomfield and Mr. Gotch and other writers on the Renaissance that it is quite unnecessary to enter into it here, and every student of architectural history is familiar with the wonderful revolution in design which is inseparably connected with the name of Inigo Jones.

The English Renaissance.

The Banqueting House in Whitehall, finished in 1622, marks the beginning of a new era in English architecture. As has been pointed out, one of the characteristics of the great Tudor buildings was a long and low proportion produced by strongly-marked horizontal lines of windows with no studied architectural effect. But in the fragment of the palace in Whitehall we are face to face with a great, and successful, attempt to create a building, full of the subtle proportions and use of purely architectural forms which Inigo Jones had studied in Italy under the influence of the great architects of the Renaissance.

The window treatment is of exceptional interest. The proportion of voids and solids is well balanced, and works out at about one to three and three-quarters—that is to say, only slightly less window space than in the Vendramini Palace at Venice. But the façade of the Banqueting House gives a far greater sense of dignity and strength on account of the plainer treatment of the wall surfaces between the windows, only broken by the columns and pilasters without the panelling and more restless ornament of the Venetian example.

The proportions of the windows themselves work out at rather under two squares in height, which is somewhat wider than is usual in most of the Italian square-headed lights, which are generally about twice as high as their width—for example, the Palazzo Zecca at Venice, the Palazzo Uggiogioni at Florence, and the Palazzo and Villa Farnese at Rome, to which latter building it bears some resemblance.

The fenestration has been criticised as giving an effect of two stories to a building, which, in reality, was one lofty room. But the Banqueting Hall was only a part of an immense scheme in which, if it had been completed, this fragment would have balanced another wing of the same proportion, but containing two floors of state apartments.

The great difficulty of adapting this new architecture to the requirements of the day was felt from the first. A style of building which depended for its effect on well-judged proportion and a systematic arrangement of windows presented immense difficulties to the architects of the late Tudor buildings, whose art was, to all intents and purposes, unconscious, and in no way scientific. But architecture had suddenly become a science as well as an art—a science of proportion, and a knowledge of the great buildings in Italy was essential for those who embarked on the new undertaking. The older English tradition of planning survived for a much longer period, but the attempt to combine it with the hard-and-fast rules of classical architecture eventually produced the main features of the Italian house plan.

Change in the Planning of Buildings.

In most of the great domestic buildings in England of the Tudor period the

essentially English characteristic was the plan, and following as a natural result with an indigenous style, the internal arrangements found an expression on the outside—in short, the buildings were designed from the inside to the outside. But, with this new and wonderful architecture borrowed from a distant country, this was reversed, and too often everything was sacrificed to the proportion and treatment of the façade. Thus we find English country-houses following in all respects the villas and palaces of Italy—buildings designed by Italians for Italy, which were in many ways quite unsuitable for our northern climate.

Philibert de l'Orme.

One of the most thoughtful and capable of the French architects of the Early Renaissance has left behind him in his writings a strong protest against the indiscriminate use of Italian forms in the buildings of his time. Philibert de l'Orme, in his book on Architecture, published in Paris in 1567, gives advice to his readers, which is more than ever applicable at the present day. He says:—"The ornaments and decorations of façades should be appropriate and correspond with the interior of the building; the divisions of halls and rooms and the openings of windows and casements should not produce a repulsive effect on the exterior of the building." By this I understand him to mean that, though the building should be designed from the inside, it is necessary to have a very distinct and well-balanced scheme for the exterior. "Truly," he continues, "it is far more honourable and useful to know how to plan a habitation well, and render it healthy, than how to cover it with embellishments without reason." Although it is open to question whether De l'Orme really grasped the true spirit of classical architecture, as Mr. Blomfield says in his essay on this architect, the feelings which prompted the above extract from his writings were those of a man with the courage of his opinions in the face of the vast change in ideas with which, perhaps unconsciously, he was not altogether in sympathy.

These defects are chiefly noticeable in the more ambitious buildings of the XVIIIth century, but in the more modest domestic work we find evidence of the growth of a distinctly English adaptation of the Renaissance, and the window treatment of the quiet red-brick fronts, which are to be found almost everywhere, is altogether satisfactory in its proportion and its sense of fitness for its purpose.

The effect of this revolution in architecture on the fenestration of our English buildings was very marked; for a long time the mullion and transom was still used, and with good effect—for instance, at the Ashmolean at Oxford and Wolvesey Palace at Winchester. But the sash-window, divided by the heavy bars, became the accepted type to the purist, and the difficulties of the adaptation of the Roman architecture produced much defective lighting of interiors.

Such defects as the inevitably dark windows under the vast porticoes at Prior Park, near Bath, and Amesbury Abbey, Wiltshire, were inseparable from the use of a huge order, magnificent though the effect might be from the outside. The use of a colossal order running up the entire height of a façade would be dignified enough in itself if there was only one lofty room inside the full height of the building, but when there are several floors to be lit, either the windows become out of proportion with the order, or, if the windows are treated on the same colossal scale, they must be cut up by the floors which cross them, producing anything but a pleasing effect from the inside and outside. This is the inevitable result of the neglect of true principles, and the adoption, without knowledge, of a style of architecture out of harmony with practical requirement. And the Mansion House, and, later still, the Royal Institution in Alhambra-street (already referred to) show the difficulties of these ambitious attempts.

The use of blank windows to produce symmetry in a design cannot well be defended, though adopted in many fine architectural compositions.

Again, with a regular range of windows in small houses, it is inevitable that, without the greatest skill in planning, some rooms must be too dark and some too light.

Fig. 6. Batemans, Burwash.

Wren, Hampton Court.

To return to a more detailed account of the window treatment of the XVIIth and XVIIIth centuries, I propose to take two typical and familiar buildings as representing the leading tendencies of those times, and to give a short analysis of their fenestration. After the Banqueting House in Whitehall, which clearly marks the introduction of an entirely new element in design (in 1622), I propose next to take the east, or garden, front of Hampton Court, begun by Wren in 1689.

The internal arrangement is at once seen from the elevation; the ground-floor rooms are not of first-rate importance; and the windows are subordinated to the great range of state chambers on the first floor, the "piano nobile" of the Italian palaces. These lofty windows have a proportion which is extremely dignified, and the divisions of the sash-bars work out at 20 in. high to 14 in. wide. The window-openings, 13 ft. high to 5 ft. wide—a far narrower proportion than is usual in Italy, and one that Wren was particularly fond of (as, for instance, in the orangery at Kensington Palace, where the end-square windows are 5 ft. wide by 13 ft. 6 in. high)—roughly speaking, two and a half times the width.

The circular windows give a most interesting note to the façades at Hampton Court, and the division of the bars is most ingenious; above the secondary cornice the windows are practically square, and the sash-bar divisions of the same proportion, but on a much smaller scale than those below.

It would seem that Wren's idea was to produce an effect of height, and at the same time to indicate the relative importance of the rooms within. The circular windows in the Fountain Court are much more elaborately treated, and are really windows of small rooms; but on the external faces of the façades these small rooms do not always exist, and some of the windows are dummies, and only occur at intervals to help the whole design and to break up the wide spaces above the window-heads of the state chambers

occupied by the deep-coved ceilings inside. At Greenwich Hospital Wren has combined the circular and rectangular form in one composition with a very pleasing result.

One of the great difficulties of dealing with a classic order on a lofty façade is that the columns and entablature become so large as to be unmanageable unless the upper-floor windows are put above the cornice, and if these are not treated as dormers behind a parapet, the windows are liable to be too small, or, if of the proper size to light the rooms, they ruin the whole proportion. Wren has avoided this by introducing a complete order only as a central incident in the design and subordinated it to the main crowning cornice and balustrade, which gives ample room for the upper-floor windows.

It is by expedients of this description that Wren showed his originality and his mastery over the forms of Renaissance architecture. His power of adapting it to his requirements made it a living art in his hands, and one that was essentially English. His early training, as Mr. Blomfield points out, was rather French than Italian, but throughout his career and his various styles his strong individuality is clearly apparent. His work shows more independence of the accepted architectural forms than any of his contemporaries, but it is noticeable that, as his life and work advanced, he approached more nearly to the Italian manner, as exemplified by Inigo Jones.

The Horse Guards and Home Office.

The next example, which is instructive as illustrating a different form of window, is the Horse Guards, in Whitehall. We find here that the whole composition is more broken up than is usual in a Palladian design by the varied heights and planes of different parts of the building. The main part of the building was designed by Kent, in 1742, with the exception of the attic story on each angle of the central part and the clock turret, which were added by Vardy some ten years after his death.

The composite windows under a single semi-circular arch are here used with considerable effect, and give the necessary importance to the larger rooms on the first floor, while the second floor is entirely subordinated, and the window-openings kept as plain as possible. These rooms are really treated as a mezzanine floor, and it is interesting to compare the arrangement with the Home Office on the south side of the parade ground, also probably by Kent, where the mezzanine windows are omitted in the front, and only show on the ends. The result is that a fine solid-wall effect is produced with a complete entablature, but, at the sacrifice of the interior lighting to these rooms, this is again repeated on the floors above.

This plan of disguising the real arrangement of the interior can never be considered as satisfactory, and an angle view, where both faces can be seen simultaneously, gives an unpleasant sensation of something wrong and the feeling that the interior has been sacrificed to the exterior.

In the main façade of the Horse Guards the eye is at once satisfied, but on the end wings the same defect is seen, and the frieze and architrave of the cornice have to be stopped short on the return ends to allow for the windows on the mezzanine floors.

The proportions of the windows themselves are interesting, and their relative value to the solid wall surface represents one to three and a half, or rather more window than Inigo Jones' Banqueting Hall, and rather less than the Vendramini Palace at Venice. But from the greater variety of the shape of the openings the effect produced is very different. The combination of small and large windows is evidently intended to emphasise certain rooms, and in the whole of the fenestration of the Horse Guards and the Home Office Kent made an attempt to give an effect of size to buildings which did not really contain any fine rooms, and, though he certainly produced a very pleasing building, the fact that the exterior does not give a true

indication of the internal arrangements, as Mr. Bloufield says, savours of affectation.

I began this paper by saying that the subject of fenestration was practically a history of architecture, and with this last period of the English Renaissance the history of architecture as a living art can be said to cease. All XIXth-century architecture was a series of revivals, producing little or nothing that was new, and adding no fresh chapter to our subject.

We have seen that in all the great periods architecture was indicative of the life and manners of the people. The Egyptians were a theocratic race, and their temples and courts were closed in, with the chief ornamentation inside, and dimly lit to suit their religious mysteries. The Greeks were typically republican, and their chief effects were reserved for the exterior where all might see. The Romans, true monarchists, built princely palaces, and the plans of their buildings show a degree of luxury and refinement never approached before or since. The Italians of the Renaissance erected palaces which were typical of the life of the time, and in the Gothic Period of our own country the great monastic buildings were just as truly characteristic of the life of the people.

Sincerity in Architecture.

In all these great epochs one great principle governed the buildings—namely, they were sincerely designed to suit their purpose as the first consideration. The art may be said to have been an unconscious one—it strove after no effects which were not legitimate, and, though the growth of each detail may be traced backwards to a foundation on something gone before, it was only adopted to suit a requirement of the day, and became inseparably a part of the style. With the facility of travel, the spread of knowledge, and rise of individualism, foreign elements in design appeared, which were at first imperfectly assimilated, and, as we have seen, in later times produced insincerity in architecture. Thus one of the great principles was violated, and the lesson to be learnt from the study of our subject to-night is, I think, briefly this:—

Let the plan of a building be fully considered and designed from the first with due regard not only for the requirements but for the exterior, and let the window treatment bear on the exterior its proper relation to the internal arrangements. If the plan is faithfully designed to meet the given conditions it must of necessity reflect the life and habits of those for whom it is intended, and if the window treatment is also faithfully designed to suit the rooms, the result will be *sincerity* in the fenestration."

Mr. Edward Warren said that the paper was scholarly, lucid, and most interesting. The subject of fenestration was one of the most important subjects for an architect, because the windows of a building had almost more to do with the general effect of a façade than any other feature. There were more windows than doors, and second to the roof there could hardly be a feature which had a greater effect upon the external presentation of a design than the windows. Mr. Cave had taken them a long distance—from Egypt 3,000 years ago to the present day—and there was no question but that the history of windows was a history which was peculiarly interesting, not only to the architect, but to everyone who considered philosophically the subject of building, because it was the history of the gradual striving for and appreciation of light in dwellings. That connected other things. The desire for light inside a building might seem natural enough, but it was not so in primitive states of civilisation, when people could not read and did not write or draw, and did not do much that required light in a building; but as the spread of learning grew there was a spread chronologically for an increased desire for window light. Another reason for windows was the decrease of defensive buildings; in any system of military arrangement which had to depend on its walls for defence against enemies the windows must be reduced to the least possible area, but it was not only military buildings—castles, etc.—where the early windows were reduced to a minimum, it was seen in the ecclesiastical buildings, too. He had asked himself why that was so, and the answer was

easy in regard to the early structures, because the ecclesiastical buildings, as well as the fortresses, were fortresses as well as sanctuaries. The earliest churches in this country were essentially fortresses, but in some, as in some of the Norman churches in England, the windows were larger than they were at a succeeding period—say, sixty years later, when the defensive need, it would have been thought, would have diminished rather than increased; the round-topped Norman windows were wider than the succeeding lancet ones. One thing to account for the smallness of early windows in Europe was that European architecture came from the East, and the windows were adopted at first without discrimination, and that would account for the extreme smallness of the early windows. It was interesting to observe that in the north-west of Europe, in England and France, as architecture progressed and perfected itself, from the XIIIth century upwards, the windows gradually increased in size and in beauty of treatment, and, one might say, in conscious acceptance of the importance of an architectural feature. At first the building was regarded without much thought as to the windows; they were put where they were wanted, and were not much cared about; but in XIIIth century buildings the window was accepted as a most important feature, and led to the subdivision of a building. In the bays of a church, for instance, the adjustment of windows frequently influenced the disposition of the bays and columns and the whole effect of arcuation and arrangement. As the process of widening windows grew with the method of fine tracery and as the windows expanded, the arcades expanded also, and later on arcades were provided of such great width that it was found necessary to have the three-centred or four-centred arch to accommodate the window required; the window reacted on the whole architecture. A remark Mr. Cave made in regard to columnar architecture, *i.e.*, that it was, architecturally, almost incompatible with the arrangement of windows, one agreed with in the main, but not entirely. The main reason for the failure in England and the North of Europe generally in the acceptance of the Roman method of colonnaded façades interspersed with windows was because it had been invariably accompanied by a horizontal course—a string course, running behind and apparently through the columns. As he had said, in the East generally the allowance of window was small on account of the intense sunlight, and that was observable as one travelled in Europe south. In Spain the amount of window necessary was extremely small for ecclesiastical buildings, but the Gothic architecture of Spain, adopted almost entirely from France, was at first adopted wholly, until the people found they did not want the amount of window

space, and churches designed on the French plan had two-thirds of the windows blocked up with brick or stone and only small openings were left. At Barcelona he saw an extraordinary effect one October in the cathedral where almost all the windows were blocked. High up, in the clearstory on the south side, however, one window was left unblocked, and it was in such a position that the sun worked round to it by twelve o'clock, when a shaft of light came in and struck upon the high altar and the gilded retable. The effect was wonderful, the shaft of light being as clear and sharp as a sword-blade. He also remembered a little church in Spain in which there were no windows at all; when the door was open there was light enough, but at other times it was pitch dark, and no doubt the desire for the effect of mystery was responsible for this. As to vertical light, we could not light our buildings up with open circles in the roof, owing to rain and snow, but we have in England a system of vertical lighting which had been well known for 150 years. In a great many Georgian buildings there was a skylight treatment, and in some earlier buildings in the time of Charles the same treatment was adopted. In the Georgian domes the light was nearly vertical, and the effect most valuable, as the steady light was the unimpeded light. As to windows in towers, bell-towers were outside the usual rules which would guide the position and proportion of most windows. The principal windows in bell-towers were not intended for light, but for the emission of sound, and that had something to do with the Campanile of Siena Cathedral, with the windows increasing in number upwards. In the Magdalen tower at Oxford the great windows on the four sides which formed the upper stage were enormous compared with the very small windows to be found on the lower stages, but they were not windows for the admission of light, but for the emission of sound. That was typical of a common arrangement in bell-towers in England since the middle of the XIVth century; the topmost windows were made as beautiful as possible, but they were not for the admission of light. One did not often have to build towers in which the emission of sound was the chief point, but occasionally one had to do so, not only in churches, but in other buildings, and then one rejoiced in seeing a window formed without any glass and with deep shadows produced by louvres. Mr. Cave was interesting on the subject of the development of tracery through the desire for stained glass, and probably the XIVth century desire for stained glass had more influence on the form of tracery than anything else, for the defensive period of building had passed, and there was no reason why people should not have

Fig. 7. South Wrawall.

larger windows, and the desire for larger windows was increased by the increased production, in larger pieces, of glass. One thing which struck him was that in England we had not paid much attention to the evolution of a feature which in other countries—most northern countries of Europe—had attracted considerable attention, i.e., the dormer window. Since the end of the XVth century the dormer had been a plain affair on the whole, though there were dormer windows charming and elaborate in a sense, but, generally speaking, in England up to the end of the XVIIIth century the dormer was soberly and plainly treated as a mere adjunct of practical utility in the roof; but in France and Belgium, Holland and Germany, the dormer was always, from the XVth century upwards, used with great affectation, and had been very much elaborated—too much sometimes. For instance, in the façades of the Louvre the dormer windows were so extraordinarily complicated that they seemed to leave very little roof between them, and that was an unpleasant result. As an instance of charming dormers, soberly treated, he knew nothing more satisfactory than those on the bridge gallery at Chenonceaux by Philibert de l'Orme, who seemed there partly to have carried out his own advice, but which he did not do in his design for the Louvre, which was intensely complicated. In England, in the colonies, and in the United States there was more or less an intense desire for the sash window. He did not profess to have much enthusiasm for the sash window. It had certain advantages, but compared with contemporary casements, especially in France, it suffered from a lack of dignity. Take the instance of some of the older sashes, and compare them with the contemporary casements of France—the fact that the casement was on one plane was to give it greater dignity and a more distinguished effect. There was something bourgeois about the sash window, and it seemed to lack distinction, and his instinct was to avoid it, although he had occasionally to adopt it, as other architects had. One objection to it was that when the window was open one part of the sash covered the other part, and it was rather curious that, although we got the sash from Holland, in modern buildings in that country it was now never seen, although it was so in old buildings. Mr. Cave said that blank window panels were indefensible, but with that he joined issue. If one had a series of panels for fenestration, it was allowable to have blank panels for the sake of balance. If one made a sham window, as was done in the days of the window-tax, that was deliberate falsification; but to put a blank panel for the sake of architectural effect where one did not want a window, and to balance the live window, seemed perfectly allowable. But, after all, in discussions of this kind one only got to the conclusion that if one did the thing well one succeeded, but if one did not succeed one had better not to do it at all.

Mr. Alan Potter seconded the vote of thanks.

The Chairman then put the motion, which was carried heartily, and Mr. Cave briefly replied.

Annual Excursion.

The Chairman said that it had been decided to select Stamford as the headquarters for the annual excursion this year. The meeting then terminated.

SURVEYORS' INSTITUTION JUNIOR MEETINGS.—At the meeting held at the Surveyors' Institution on Monday, May 7, a paper was read by Mr. Cyril H. Donne upon the "Fiscal Burdens on the Land and Taxation of Site Values," and there was a very large attendance. The members of the Law Students' Debating Society were invited to attend the meeting, and the Society was well represented. The paper was followed by a keen discussion in which members both of the Law Students' Society and of the Surveyors' Institution took part. The reader of the paper replied to the criticisms and the chairman (Mr. J. H. Sabin) addressed the meeting. At the conclusion of the evening a special vote of thanks in appreciation of his services was accorded to Mr. Sydney A. Smith, the retiring hon. sec. At the annual general meeting held prior to the ordinary meeting Mr. C. H. Dinwiddie was appointed to succeed Mr. Smith as hon. sec. The dinner will be held on May 16.

GREEK AND ROMAN ANTIQUITIES AT THE BRITISH MUSEUM.

The third general meeting of the Society for the Promotion of Hellenic Studies was held at the rooms of the Society of Antiquaries, Burlington House, on Tuesday, when Mr. Cecil Smith gave an account of the recent acquisitions in the department of Greek and Roman antiquities at the British Museum.

Mr. Smith said he had felt for many years that the public had perhaps hardly adequate means of knowing what were the acquisitions to his department of the British Museum. After all, the public had to provide the money, and they really ought to know. Consequently, since his appointment as keeper of the department he had adopted two plans to give better information. First, he had arranged that a series of cases in one of the rooms should be reserved for recent acquisitions. They remained there for one year, and were then incorporated with their classes. Secondly, he thought those who took a special interest should have the opportunity of knowing of the recent acquisitions, and the authorities of their Society allowed him that opportunity that night. If it was approved, he proposed to give an account annually of what he had acquired during the preceding year. Of course, in the objects he was going to show them only a portion of what had been acquired was represented. As a matter of fact, since he had been in office, for the best part of three years, he had thought it better to include the most important of those objects which had come to them in the preceding two years. It was possible that some people might think the collection was but a small amount to acquire in three years, and as a matter of fact the department had been subjected to criticism in the Press lately; but if the public only knew how extremely inadequate their funds were, he was sure they would be lenient. Most people would think, seeing that Greek and Roman antiquities had in the last few years become more and more scarce and more costly, and that the competition, especially from America, had been growing keener, that the British Museum would be allowed a larger grant than used to be the case. On the contrary, the amount he had to spend for his department was more than one-third less than it was fifteen years ago. People might suppose that searching for antiquities was an amusing and pleasant occupation, and so it was, but the difficulty was the inadequacy of the funds. He did not know how this was to be remedied. Of course, there was the National Art Collections Fund, but that Fund could not spend 40,000£. every year, and probably the "Rokeby Velasquez" would cripple them for many years to come. At the present time there was a large collection of objects which it would be a great disaster to lose, but which could not possibly be purchased with the funds at the disposal, and if any members of the Society had any means of influencing millionaires to provide him with 10,000£. a year he could promise them that no important works of art would leave the country in the way of Greek and Roman antiquities. Mr. Smith then proceeded to illustrate some of the recent acquisitions to his department by means of lantern slides. Dealing first with vases, he described a painted vase seen in fragments twenty years ago in Asia Minor by Professor Ramsey. Two years ago he acquired it, and it was absolutely unique in character; it dated probably about the middle of the VIIth century B.C. A second vase was representative of the dedication of the flute-player; another one had painted black figures on a white ground of Peleus grasping Thetis, and two of the peculiar transformations of Thetis had been painted; and another represented a sacrifice to Athena. A further vase of Athenian workmanship, acquired in Thessaly, represented a scene unique of its kind, and was probably of the VIIth century B.C. It depicted a renal-looking lady sitting on a throne and holding a sceptre, and she was being approached by a figure undoubtedly that of Dionysus. There was an Eros with a box of jewels, and another with a sash, and on the other side one of the winged divinities. It was the ordinary type representing the marriage vow. The only other example they had of the wedding of Dionysus was of the scene which took place

in the festival of flowers at Athens. Mr. Smith next showed two ivory plaques, which he said a few years ago would have been said to be Etruscan, but which were undoubtedly Ionic. The plaques represent a lion attacking a goat. Ivories were extremely rare and very difficult to get hold of. They had acquired three ivory statues, one representing two boys quarrelling, the second depicted a boy tired out, and the third, which showed a boy in a graceful attitude under a tree, was probably from a group. Coming to the recent acquisitions of gems, one represented a nude figure, probably of Apollo, which was to be attributed to the IVth century B.C.; another was a girl of Eros, and a third was a figure of Aphrodite at Paphos. Of Greek gold-work, which was extremely rare, they had two specimens. One was a gold diadem with a frieze, and two victims seated beside the column. The second was a band with a central knot. Of terracotta they had acquired two statuettes, known as Tanagras, but personally he did not think that such statues could have been made by the provincial people at Tanagra. Another statue was a seated Madonna, and in the back was inscribed the name of the maker. Then they had three Aphrodites of the kind generally found in Asia Minor, and the entire contents of a girl's tomb. The arms of the girl's figure in the tomb were movable, and he believed that this was done so that the figure could be dressed. The inference was that the statue represented the dead girl herself. In marbles Mr. Smith first described a stele head taken from one of the funeral monuments, and then a little statuette of a woman, whose breasts were pierced and whose body was really a reservoir. He believed that this must have been used to produce miracles, and the only other example of such a thing he knew was the Leclercq statue. They had also acquired a marble relief of a well-known type—that of a warrior leaning in rather a sad way on his spear. The explanation was known from another one in the British Museum, which showed that it was a monument erected to commemorate warriors who had fallen in battle. The details in this relief were extremely well rendered. Of bronzes they had acquired a statue which was perhaps hardly one for the department, and which came from Badajoz, in Spain. It certainly, however, had a great deal which suggested the Greek style when translated to a region like Spain. Then they had an Apollo of the regular VIth century archaic style, and the arm of a woman holding a little Eros by the wing. This latter was presented by the Egypt Exploration Fund. They had also a bust of Artemis; an ape carrying a lantern, and probably meant to depict a quail-catcher; an ape as a jug-handle, and other similar statuettes, which belonged to the Alexandrian school of grotesques. One of the finest objects they had acquired was what was described as a Paramythian mirror. The Paramythian bronzes had been known for the last century, and ten of them were in the British Museum. The one they had now acquired was not a mirror, but had had a pendant to it. They had been presented by Mrs. Hawkins with a statuette of Hermes, probably produced 400 B.C., and with a helmet found at Paramythia. One of the best archaic bronzes they had come across was that of a man riding a horse, which he thought dated from the first half of the VIth century B.C., and bronzes of that date were extremely rare. In conclusion, Mr. Smith described the two half columns of the Treasury of Atreus at Mycenae presented by the Marquis of Sligo. This showed a downward tapering, which had become familiar by the excavations of Mr. Evans at Knossos. Views were shown of the restoration of the capitols and of the restoration of the whole doorway.

ELECTION OF AN ARCHITECT TO THE CORPORATION OF THE CITY OF LONDON.—Mr. H. P. Monkton, architect and surveyor, has been elected a member of the City Corporation. He represents the Ward of Walbrook.

MANCHESTER CHURCHES BILL.—The Lord Chairman of Committees has reported that the opposition to this Bill has been withdrawn. The Bill authorises the closing and demolition of the Churches of St. Peter, Mosley-street, St. Simon and Jude, Granby-row, and St. Martin, Oldham-road.

THE LATE MR. THOMAS GARNER.

The following article has been sent to us by a pupil of the late Mr. Garner. Some information not given here relating to the work and life of the deceased gentleman will be found on another page:—

The sad and unexpected death of Mr. Thomas Garner, which took place on the last day of April, at his beautiful old house, Fritwell Manor, in Oxfordshire, has brought to a close the career of a distinguished architect whose unflinching industry, conspicuous talent, and single-minded devotion to his art merit something more than the passing notice which they have so far received.

Born in 1839, at Wasperston Hill, in Warwickshire, and reared amidst the old-fashioned and simple surroundings of a remote rural district, Thomas Garner imbibed the natural hearty country instincts which became a part of his nature, and were never blunted or diminished during many years of residence in London, and before the long-hoped-for return to the country was realised by his establishment in the fine Jacobean manor-house at Fritwell. To his country education he owed the love of riding and the excellent horsemanship which he retained to the last.

Mr. Garner was articled to Sir Gilbert Scott at the early age of seventeen, and served, with the energy and enthusiasm that never left him, as one of the many pupils of that gentleman. Amongst his contemporaries in Sir Gilbert's office many have risen to distinction; we may instance Mr. T. G. Jackson, R.A.; Mr. Micklethwaite, architect in charge of Westminster Abbey; and Mr. Somers Clark, who has the care of St. Paul's Cathedral. Mr. G. F. Bodley, R.A., whose partner he was destined to become, just preceded him at Scott's office, but a warm friendship was soon established between the senior and junior. On the completion of his articles Mr. Garner returned to Warwickshire, and was responsible, in his first few years of practice, for various works on his own account or as representative of Sir Gilbert Scott. Mr. Garner returned to London about the year 1868 to assist his friend Mr. Bodley, who was rapidly coming into, and who found himself somewhat overburdened with work.

The assistance soon grew into the partnership, which was to last for over twenty-five years, and which ceased by the friendly dissolution of a friendly bond about the year 1897. For a time the collaboration of the partners was actual and close, but, as work increased upon their hands, it became their habit to individualise, each partner assuming the entire and separate responsibility for definite work. The earlier period of close collaboration produced some remarkably successful results, none, perhaps, more notable than the fine churches of the Holy Angels at Hear Cross, Staffordshire, and of St. Augustine at Pendlebury, near Manchester. The succeeding period of dual practice under partnership allotted most of the civil or domestic work entrusted to the firm to the almost undivided initiation and control of the junior partner, while his senior devoted himself more especially to ecclesiastical work and to decoration. Mr. Garner was almost entirely responsible for the design and supervision of much of the firm's work at Oxford, such as St. Swithin's Quadrangle at Magdalen and the Tower at Christ Church, and entirely so for the President's lodgings at Magdalen. He designed, while his partner was busy with other work, Hewell Grange, Lord Windsor's Worcestershire mansion, with all its elaborate and costly details, the well-known reredos in St. Paul's Cathedral, and several sepulchral monuments, such as those of the Bishops of Ely, Lincoln, and Chichester, and that of Canon Liddon.

Of his work subsequent to the dissolution of partnership it is sufficient to mention Yarnston Manor, Oxon., the Slipper Chapel at Houghton le Dale, Moreton House, Hampstead, the Empire Hotel at Buxton, and the crowning work of his arduous life, the beautiful chancel of Downside Abbey, near Bath, beneath whose roof his body now reposes. Mr. Garner was of a shy and modest disposition, and less known to his contemporaries than his most unusual abilities, scholarship, and attainments would have allowed a less retiring character to remain.

As an instance, however, of contemporary estimation we may state, upon the best

possible authority, that when Mr. Bentley, stricken by the fatal paralytic stroke, was asked by Cardinal Vaughan what architect he would choose to carry on his work in Westminster Cathedral, he answered "Garner, for he is a man of genius."

Mr. Garner was an admirable and rapid draughtsman and an untiring student. He will long be remembered by his friends for his warm heart, his ardent enthusiasm, his minute and scholarly knowledge, and his unceasing energy. His book upon English Domestic Architecture chiefly of the Tudor Period will be published by Mr. E. T. Batsford, but the first of six parts is not likely to appear for some months.

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

An eastern counties district meeting of the Association of Municipal and County Engineers was held at the Town Hall, Newmarket, on Saturday last week. The meeting was the first of the present season, and brought together a large gathering of members. Mr. A. E. Collins, of Norwich, President, was in the chair, and there were also present Messrs. W. Weaver (London), Norman Scorgie (Hackney), T. W. A. Hayward (Battersea), J. P. Norrington (London), J. J. Jenkins (Finchley), E. J. Silcock (Leeds), J. Julien (Cambridge), J. W. Walshaw (Peterborough), A. M. Foulter (Manchester), R. S. Scott (Bishop's Stortford), A. T. Blood (Hitchin), A. Gladwell (Eton), W. R. Locke (Hemel Hempstead), and others.

Mr. C. E. Griffiths, Chairman of the Urban District Council, offered the members of the Association a hearty welcome to Newmarket, and expressed the opinion that the meetings of the Association must be of the greatest benefit not only to the towns visited, but to the members of the Association.

The President, in acknowledging the welcome extended to the Association, said it was a record to have two meetings in East Anglia in one year.

Mr. Norman Scorgie (Hackney) proposed the re-election of Mr. J. W. Cockrill (Great Yarmouth) as Hon. Secretary for the Eastern Counties District, which was seconded by Mr. A. T. Blood (Hitchin) and adopted. Mr. Cockrill briefly acknowledged his re-election.

Municipal Work at Newmarket.

Mr. W. Metcalf, Assoc.M.Inst.C.E., surveyor, read a paper on "Municipal Work at Newmarket." He said the town was formerly governed by a local board of health, consisting of twelve members, which was formed in 1850, with an area of 540 acres.

In September, 1885, the urban district was, by an order of the Local Government Board, extended by an area of 5,640 acres, divided into five wards, with three members for each ward, or a total of fifteen members. This extension became necessary in consequence of building operations just outside the fringe of the old urban boundary in the rural district of Newmarket, which necessitated works of sewerage, paving, lighting, etc. These advantages were not obtained, owing to the rural authority having in view its ultimate inclusion in the Newmarket urban area. Several attempts were made to include only the built-up portion on the outskirts, but the Local Government Board insisted on the whole of the parish of Exning being included in the extension, and it had now an area equal to many large towns.

The present population was 11,500 and the rateable value 79,417.

The Council's indebtedness up to March 31, 1905, was 83,745*l.*, and the average general district rate for the last few years had been 4*s.* in the pound. A special rate of 4*d.* in the pound was levied on the old urban area, producing about 750*l.* per annum; this was for the repayment of old loans under the order of the Local Government Board.

Although thirty years ago the town was visited with an epidemic of small-pox, it had since been remarkably free from the various infectious diseases; in 1903, however, small-pox was introduced in the centre of the town, but prompt isolation and other measures were immediately taken with the

result that no spread took place. This he regarded as satisfactory, seeing that they had a large floating population during the racing season.

The death rate of 1905 was a remarkably low one, being only 9 per thousand.

The total average death rate for the past five years had been 12*·*05 per thousand, and the average zymotic 1*·*55 during the same period.

In the years 1891 to 1893 a very large number of the footpaths were laid down with artificial paving, 2 in. thick Victoria stone, for which loans were obtained for a period of twenty years; the cost was 5*s.* 6*d.* per super. yard laid complete.

At the present time there were twenty-four miles of district roads dedicated to and repaired by the authority. Leicestershire broken granite was chiefly used, with a small quantity of local chalk flints for the outside district. The cost of granite averages about 11*s.* 6*d.* per ton delivered at the station. The railway carriage was accountable for about half this sum, and consequently the heavy cost necessitated a sparing use of the material.

During recent years several streets 36 ft. wide had been made up under sect. 150 of the Public Health Act, 1875, the cost per lineal of frontage, including sewerage, being from 11*s.* to 13*s.*; the kerbs were 10 in. by 4 in. blue Pennant, channelling 12 in. by 3 in.

One street, with moderate traffic only, was made up nine years ago with limestone tar macadam on a rough cement concrete foundation, eight to one, 6 in. thick; the tar macadam was 4 in. thick, in two layers, the bottom layer 2½ in. gauge, and the topping 1 in. The cost per foot frontage was 6*s.* 8*d.*, exclusive of sewerage, this being a general charge on the rates. For streets of moderate traffic this kind of material was, in the author's opinion, both economical and in every way satisfactory; during frosty weather, however, it required more attention in sanding, but this was more than compensated for by the minimum of scavenging required, no mud being created in winter, and very little watering necessary during the summer.

The district was supplied with water by the Newmarket Waterworks Company from the chalk, and, although somewhat hard, was regarded as very pure.

A weekly collection of house refuse was made by the Council's carts, and in the more densely populated parts of the town more frequent visits were made; the total quantity collected per annum was about 2,000 tons. Trade refuse was not collected by the Council.

Two private fire brigades existed in the town—the Volunteer and the Trainers and Owners. These were now being taken over by the Council and reorganised. Additional fire-hydrants were being fixed for the better protection of the town, and a fire-escape and other appliances were under consideration. A good pressure of water was available, the head being about 200 ft. in the centre of the town.

In the year 1875 Mr. Baldwin Latham, M.Inst.C.E., designed and submitted a scheme of sewerage and water supply for the old local board area, having its sewage outfall a little lower down the valley than the present sewage farm. The sewerage scheme was revised and carried out by the late Mr. John Francis Clark, of Newmarket, having its outfall on 9 acres of land, the site of the present works, the area of the land which could be irrigated being about 5½ acres, and this continued in operation until the urban district was extended in the year 1885, when it became necessary for the authority to consider the question of a comprehensive system of sewerage and sewage disposal for the whole of the district.

Mr. F. Beesley was appointed engineer for the scheme, and was instructed to prepare another to include the provision of a refuse destructor, and a pumping scheme became necessary. After careful consideration, the Council decided to enlarge the present sewage farm, and a Provisional Order was sought to acquire an additional 4 acres of land from the Jockey Club; this was obtained, and a further 4 acres taken by agreement, making the total area of the Newmarket outfall site 17 acres. The sewage

was collected and conveyed to this site, which was a distance of about a mile below the town, reaching the works at a level of 67.50 O.D. Commencing at the outfall, a culvert 4 ft. internal diameter, for night storage, was constructed, having a capacity of 30,000 gallons, from this point up to the centre of the town; the main sewer was 18 in. in diameter. The tributary sewers were of glazed, socketed pipes, and varied in size from 15 in. to 7 in., and comprised about fifteen miles.

All the new sewers were laid in straight lines at self-cleansing gradients, with man-holes at changes of direction and at all junctions, generally not more than about 100 yds. apart, the foul sewers being laid on a bed of cement concrete, and wherever practicable tested with water test, the old sewers being retained as far as possible, and utilised for storm water diverted to the natural main water-course.

The house drains, hitherto connected to old sewers, were disconnected and joined up to the new sewers, taking the drain back to the building as far as necessary to make a good connexion, owing to the difference in the levels. This disconnecting trap was always put in new drains, and where practicable a chamber was built for purposes of access to the trap.

The ground at Exning was waterlogged, and much difficulty was experienced in laying these sewers. The ejector station in particular was a very costly item, on account of continuous pumping.

The sewage was delivered from the rising main into the screening chambers, which were in duplicate, where it passed through a 1-in., $\frac{1}{2}$ -in., and $\frac{1}{4}$ -in. mesh screen, and from thence into the upper main carrier. Every week the sludge which collected in these chambers was lagooned to a depth of about 3 in. on well-drained land, the Council using a portion for manuring the crops, the surplus being easily disposed of to farmers at 1s. per load at the farm. The coarse beds, which were ten in number, were filled from the upper main carrier by means of Messrs. Adams & Co.'s automatic filling apparatus, the sewage flowing along grips formed in the surface of the filling, which was a hard clinker obtained from gas-works. The beds averaged 4 ft. depth of material, and a fall of 6 in. was given in floor towards the outlet.

The under-drains were formed of 4-in. agricultural pipes. The sewage was held up in these beds by means of timed siphons for a period of two hours, when it was discharged on to the fine beds, where it was again held up for two hours in a similar way. The filling of the fine beds was coke breeze, and the average depth 4 ft., the beds having a fall and under-drained in the same manner as the coarse beds. The effluent was discharged into the lower main carrier, from which it run over the land.

The Newmarket beds were constructed of cement-concrete, six to one chiefly, and faced with cement-concrete blocks, two to one, facing $\frac{3}{4}$ -in. thick of $\frac{1}{4}$ -in. granite chips, the backing six to one, properly bonded together; the blocks were 14 in. long by 7 in. and 6 in. thick. Local gravel was used for the concrete, which cost about 6s. per cubic yard delivered on the site.

The Exning beds were constructed of cement-concrete six to one throughout, faced with blue Staffordshire bricks and coped with blue Staffordshire hull-nosed coping.

The crops grown were chiefly for the Council's horses, and included mangel-wurzel, kohlrabi, sainfoin, lucerne, and oats, in the usual rotation. Any surplus beyond the requirements of the Council was sold to farmers and trainers at the usual market rates. The land had not been recently under-drained, although some of the old drains still exist, and were working; but the Local Government Board considered that the under-draining was not necessary at present, and therefore the work originally proposed was not carried out. At Exning no under-drains exist, and therefore they were not troubled with any effluent discharge into the stream.

The buildings comprised an engine-house, containing 15 h.p. horizontal engines in duplicate, working under a steam pressure of 90 lb. per square inch, having a steam cylinder 10 in. diameter and 20 in. stroke,

fly-wheels 7 ft. in diameter; each engine drives a 10-in. centrifugal pump, capable of raising 1,600 gallons of sewage per minute a height of 23 ft.

There were two steam air-compressors, one provided for raising the sewage at the Exning outfall, two miles away, by means of 200-gallon ejectors. The compressors were horizontal, high-speed, non-condensing air-cylinders, water jacketed, air inlet and outlet valves of the Corliss type; they worked under a steam pressure of 120 lb. per square inch, and raised the sewage a height of 35 ft.

The external walls of all the buildings were of heather-pressed bricks, the engine-house having a salt-glazed brick dado internally. The destructor-house, which was 46 ft. by 45 ft., contained a two-cell refuse-destructor by Messrs. Manlove, Alliott, & Co., with a Babcock & Wilcox water-tube boiler between; a Cornish boiler, 16 ft. long, 4 ft. 6 in. diameter, was also provided for stand-by purposes. The building was made large enough for an extension of two more cells. The chimney-shaft was 120 ft. high above ground level, octagonal in shape, with a circular fire-brick lining to a height of 70 ft., and rested on a foundation of concrete 20 ft. by 20 ft. by 10 ft. thick.

Stores, offices, and three workmen's cottages were also provided. The cost of the whole of the works was 81,500l. Mr. F. Sanderson-Robins, Assoc. M. Inst. C.E., carried out the duties of resident engineer.

The bacteria beds at both outfalls were carried out by administration under the author's supervision, assisted by Mr. W. J. Tait (now Surveyor of Sudbury).

The President said the Association was indebted to Mr. Metcalf for a paper full of most valuable details. The ratable value of 7l. per head of population was very high, and was about double that of the city of Norwich. As a result of their low assessment, the rates of Norwich seemed very high, whereas they were reasonable, and about the same per head as Newmarket. The town was to be congratulated on its very favourable health statistics. A death rate of only 12 per thousand for five years was very satisfactory, and one very few towns could approach. With regard to tar macadam, it was only good for medium traffic; it was no good for very heavy or very light traffic. He wished to know whether the Local Government Board insisted upon the provision of intercepting-traps on the house drains, or whether it was done of their own volition.

Mr. T. W. A. Hayward (Battersea) proposed a hearty vote of thanks to Mr. Metcalf for his paper. He congratulated Newmarket on the splendid health statistics. He did not remember seeing a lower death rate in any other town. With reference to tar macadam roadways, his opinion was that the roadways of the future would be made of that material. He could not agree with the President as to its unsuitability for very light or heavy traffic. He had one road which had been made for two years, and was subjected to some of the heaviest traffic in London, and to-day it was as good as when put down. He had also streets with very light traffic, which were also as good as when made. He hoped that the President, if he had not experience of tar macadam for very light and very heavy traffic, would be converted that day fortnight.

Mr. A. M. Fowler (Manchester) said that tar macadam roads as made at Scarborough and Buxton gave most excellent results. He did not think there was any better mode of road-making than tar macadam when done in a scientific manner.

Mr. Norman Scorgie (Hackney) agreed with the President as to tar macadam. If granite would not stand the heavy wear of London traffic, he did not think that a mixture of slag and tar would do so. He hoped the members when they visited Battersea a fortnight hence would be converted to a greater extent than he was when he was there some months ago. He must admit that some of the roads were very good, but others had a scabby appearance.

Mr. E. J. Silcock (Leeds) thought the sewage scheme more expensive than was necessary. In a town like Newmarket, with a high ratable value, perhaps the Council

were justified in going to an expenditure higher than would be justifiable in a town of lower ratable value, but they must bear in mind that it was the population, and not the ratable value, which made the sewage. The dry weather flow appeared to be about 300,000 gallons a day, and the total area of the beds was 7,110 sq. yds., which seemed unduly large. Having regard to the fact that the sewage had to be pumped, and these beds were each 4 ft. deep, he was of opinion that equally good results could have been obtained by placing the beds one on top of the other, 8 ft. deep, and working them continuously, instead of as contact beds. If that had been done, 2,000 yds. of beds would be sufficient, which would have been equivalent to 4,000 yds., as against 7,000 yds. in the present works. The cost would then have been considerably less. At the time these works were made the Local Government Board were very severe in their requirements, particularly as to contact beds. He must say that the position taken up by the Local Government Board had been largely justified by the results. Contact beds required a large area, because the quantity of water which could pass through was limited by the capacity of the bed itself, and they were compelled to provide a certain time for the contact, otherwise purification did not take place. With filters they could deal with a larger quantity, and the same result could be obtained, because they were able to run them at a much higher speed than contact beds. Then there was the sludging up of contact beds, which was a very important item to bear in mind. Making a deduction on a high scale for the destructor, it left the cost of the sewage works at 75,000l., or about 6l. per head of the population, which was a very high figure.

Mr. Jenkins (Finchley) pointed out that, as they were pumping water from a similar strata to that on which the sewage works were placed, there might be a risk of contamination of the water supply. He did not know whether the chalk was sufficiently solid to prevent any connexion between them.

Mr. Gladwell (Eton) also thought the cost of the sewage works as excessive. The area of the coarse beds he regarded as sufficient for a population of over 19,000 persons. He also agreed that continuous filters would have been better than contact beds. But probably where these works were designed contact beds were more popular than filters. With regard to main roads, he said the local authorities up and down the country were suffering from a very bad attack of county councils, and, so far as he was concerned, he would like to see their wings clipped considerably, and greater responsibilities and duties placed upon the local authorities, who were quite as capable of looking after this work as county councils were for them.

The vote of thanks was passed, and Mr. Metcalf briefly replied to the discussion.

Councillor Shepherd, Chairman of the Sewage Committee, said they were pioneers in this method of sewage purification, and the Local Government Board forced them to spend more money than they would have to do if they were carrying out the works to-day.

Mr. O. E. Griffiths, Chairman of the Council, entertained the members to luncheon at the Victoria Hotel, and the afternoon was devoted to visits to the electricity works, the sewage disposal works, and the water-works. On returning to Newmarket Mr. Metcalf entertained the members to tea at the Town Hall.

APPOINTMENT OF SANITARY OFFICERS.—The Local Government Board has sanctioned the appointment, in the place of Mr. A. E. Powell, resigned, of Mr. W. H. Draper, as sanitary inspector in the Metropolitan Borough of Finsbury, as from April 5, and the appointment of Miss A. M. Dick as sanitary inspector in the City of Westminster, as from March 4. The Local Government Board has sanctioned increases in the salaries of sanitary inspectors as follows:—Metropolitan Borough of Hamstead; Mrs. Fisher, Mr. P. A. Heath, Mr. J. Grimsey, and Mr. F. H. Hudson; Metropolitan Borough of Lewisham; the salaries of Messrs. R. White, E. T. Pidwell, B. A. Knappett, J. Dalry, J. A. K. Cooper, H. King, and H. L. Hyde on reaching the present maximum of 180l. a year to be increased by annual increments of 5l. to a maximum of 260l. a year each.

THE ROYAL SANITARY INSTITUTE.

THE DUKE OF NORTHUMBERLAND presided on Wednesday evening at the Langham Hotel over the annual dinner of this Institute. Amongst those also present were Colonel J. Lane Notter (Chairman of the Council), Messrs. Evan Spicer (Chairman London County Council), Sir Alex. Binnie, Messrs. H. F. Hepburn and A. Wynter Blyth, Sir F. Sharp Powell, Bart., M.P., Sir R. Melville Beachcroft (Chairman, Metropolitan Water Board), Messrs. E. T. Hall, J. Osborne Smith, T. W. Aldwinckle, A. Saxon Snell, A. J. Martin, E. White Wallis (Secretary), etc.

In proposing the health of the King, the Chairman referred to the fact that His Majesty had consented to be President of the forthcoming International Congress on School Hygiene.

The toast of "The Navy, Army, and Auxiliary Forces" having been honoured, Sir R. M. Beachcroft, in proposing "The Houses of Parliament," said he supposed the reason he was asked to propose the toast was that he belonged to a municipal body, which was not exactly the real thing, but was almost the real thing. During the last twenty years there had been a remarkable advance in those laws which dealt with sanitation. Parliament had dealt during that period with questions of the housing of the working classes, the food laws, the protection of children, and the building laws; and much had been done to improve the health of their great cities. So much so, indeed, that the only two rates which had gone down were the birth rate and the death rate.

Sir F. S. Powell, M.P., in reply, said he believed the present Parliament was fully alive to the objects of the Sanitary Institute, and they had many Bills before them dealing with the well-being of the people, both as regards their housing and as regards their conditions of life.

The Duke of Northumberland, in proposing "The Royal Sanitary Institute," said they were a successful body of men; the Institute went on from year to year doing its useful work without any very marked incidents. The Institute had attempted to find fresh quarters, but so far that effort had not been crowned with success. He was not going to condole with them on that circumstance, for he thought in some respects it was a good thing, because he was quite sure that when either an individual or a public body changed its habitation it was a good thing to do it deliberately. The Institute was accumulating funds, and had received much encouragement from various quarters, and he was particularly glad to see that some public bodies, notably the Corporation of Wigan, and no less than some half a dozen of the City companies of London had come to their support. That showed, he thought, in a very marked way that the value of the Institute was recognised by those who had charge of the public welfare, and he did not lament that their progress was slow, because, if slow, it was sure. They would, however, keep that object before them, and he trusted that before very long the Institute would find a habitation worthy of its aim and of its work. They had heard something that night of the condition of the Houses of Parliament, but he did not know whether he could congratulate them altogether upon the attention which Parliament appeared to be giving to sanitary matters. In one respect he was sorry to see that they had had rather a cold water douche put upon them mainly in the matter of vaccination. In another matter, however, they had received encouragement. He need only mention one matter, and that was the Public Health Act Amendment Bill, which was a most sensible Bill. He spoke with some experience as a landed proprietor. It was a most sensible Bill, calculated very greatly to assist them in the proper housing of the population. He was very glad to see that that Institute had petitioned in its favour, and he trusted that those who wished to see the population better housed than now would do all they could to promote some legislation in that direction. Last year they had an exhibition at the Garden City to teach proprietors how to build their houses. He applauded the intention and the effort, but he was very much disappointed with the

result. He went down there himself with some advisers, who were well qualified to advise him, but he could not say that on the whole they were very greatly assisted in solving the problem. It would be ungrateful and unjust to say that no hints were given to them. Certainly some valuable hints were given, but he was afraid that until they had some legislation for the amendment of the present by-laws of local bodies they would not be able to solve that important problem of how to house the population. An institution of that importance ought not to be parochial. It was their boast that they were told to think impartially, and he was especially glad to think that the Institute was thinking imperially, and were spreading their work and trying to teach their lessons in our possessions all over the world. He saw from the Report that there were several colonies in which they were doing work, by instituting examinations or otherwise, and so trying to press forward sanitary questions, and he was delighted to see that they were advancing in every direction, and were not confining their attention simply to this country. They were thinking more and more of their colonies and of the great dependencies which England boasted of, and he would remind them of the growing interest in what was termed tropical medicine. This would have an important effect on the sanitary condition of their colonies, and they were grateful to the colleges of Liverpool and London, who were working to improve the sanitary conditions of the colonies, and who were in that way assisting the Institute in its efforts.

Col. J. Lane Notter, in reply, said that their principal desire had been to provide a new place for the Institute in order that it could fulfil the increasing demands made upon it. They had the option of a new site, and they solicited subscriptions, but, unfortunately, the subscriptions received did not allow the Council to go forward with the project. The Council had now under its consideration a further scheme, which they hoped would be an advantage to the Institute. The Institute had carefully analysed the several Bills of a sanitary character which had been brought forward, and had petitioned in favour of those which they considered most helpful to the mass of the people of the country. The examinations of the Institute had also of late years been revised, and he would call particular attention to the fact that the candidates who came up for these examinations were obliged to go through practical tests. This they considered to be of the greatest possible importance. The University of Liverpool and the Technical Schools of Manchester and Leeds had taken this up, and were helping the Institute in its work. During the year they had had many examinations abroad. All the examination papers were submitted to the Council here, and the Council approved of them before certificates were granted. The Bristol Conference was proceeding satisfactorily, and they anticipated an exceedingly good meeting. He was glad also to say that the exhibition space had been almost taken up, and everything went to show that the Congress would be an exceedingly successful one. They had had two conferences during the year—one in anticipation of the International Congress on School Hygiene and the other on Smoke Abatement. The latter conference was well attended, but he was afraid that the result, so far as the smoke of London was concerned, had not yet been satisfactory. He hoped, however, that they had been able to diffuse a certain amount of knowledge on the subject, and that it would bear fruit in due season. With regard to the Institute itself, they were rapidly progressing, and they had 135 members more this year than last year. Their funds were also in a satisfactory condition, inasmuch as they carried forward a small balance to their credit. He could not conclude without thanking the municipal authorities of the country for the great interest they had taken in their sessional meetings. These meetings had been of great value, and they had brought together men who had been able to discuss local questions from a large point of view, and they had greatly assisted the local municipal authorities. The work of the Institute was a single-minded one, for they only wished to do the public good irrespective of political or any other motives. They

wished simply to advance the health of the people, and that was a work which ought to appeal to everyone.

Sir Alexander Binnie proposed the health of "The Visitors," and the toast was acknowledged by Mr. Evan Spicer (Chairman of the London County Council).

The health of "The Chairman," proposed by Colonel J. Lane Notter, concluded the proceedings.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Alderman Evan Spicer, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend Islington Guardians 17,500l. for poor law purposes, and Paddington Guardians 8,541l. for poor law purposes.

Equalisation of Rates.—A long discussion took place on the scheme brought up by the Local Government Committee for the further equalisation of rates in London, and ultimately, on the motion of Lord Welby, the subject was referred back in order that the Finance Committee might be consulted in the preparation of an amended scheme.

Louisiana Purchase Exhibition.—The General Purposes Committee reported as follows:—

"We reported on May 1, 1906, that the International Jury of the Louisiana Purchase Exhibition had awarded the Council a gold medal and a silver exhibit of a model of the Blackwall Tunnel shield. The description of the medal, which has since been received, is as follows:—'In the composition of the obverse of the medal are shown two figures, one of which, Columbia, tall and stately, is about to envelop the youthful maiden by her side, typifying the Louisiana Territory, in the flag of the Stars and Stripes, thus receiving her into the bosom of the States. The other figure is depicted in the act of divesting herself of the cloak of France, symbolised in the emblem of Napoleon, the busy bee, unadorned thereon. In the background is shown the rising sun, the dawn of a new era of progress to the nation. The reverse of the medal shows an architectural tablet bearing an inscription giving the grade of the medal. Below the tablet are two dolphins symbolising our eastern and western boundaries, the whole surmounted by an American eagle spreading his wings from ocean to ocean. The medal was designed by A. W. Weinman. The design was approved by a committee composed of J. Q. A. Ward, Daniel C. French, and Augusta St. Gaudens.'

Piccadilly Widening.—The Improvements Committee recommended, and it was agreed—

(a) That the estimate of expenditure on capital account of 30,450l., submitted by the Finance Committee in respect of the widening of Piccadilly to the west of St. James's-street, as shown upon the plan (registered) of property included in such estimate, be approved.

(b) That expenditure not exceeding 30,450l. be sanctioned in respect of the widening of Piccadilly, as provided in resolution (a), the Westminster City Council having agreed to contribute one-seventh of the cost of the improvement; and that the Improvements Committee be authorised to arrange for the said widening."

By-laws for the Good Rule and Government of the County of London.—The Local Government, Records, and Museums Committee recommended—

(a) That the following by-laws for the good rule and government of the County of London be made by the Council in pursuance of the provisions of sect. 23 of the Municipal Corporations Act, 1882, and sect. 16 of the Local Government Act, 1888; that the seal of the Council be affixed to three copies of the by-laws; and that, in accordance with the statute, a sealed copy be sent to the Secretary of State for the Home Department:—'No person shall (1) sweep or otherwise remove from any shop, house, or vehicle into any street any waste paper, shavings, or other refuse, or being a cestermer, newsvendor, or other street trader, throw down and leave in any street any waste paper, shavings, or other refuse; (2) throw down and leave in any street the purser of advertising, any bill, placard, or other substance; (3) throw down and leave in any street any bill, placard, or other paper which shall have been torn off or removed from any bill-posting station. No person shall deposit in any street or public place, to the danger of any passenger, the rind of any orange, banana, or other fruit, or the leaves or refuse of any vegetable. No person shall throw, place, or leave any hotte or any broken glass, nail, or other sharp substance (not being road material) on or in any street, or public place in such a position as to be likely to cause injury to passengers or animals, or damage to property. In these by-laws the expression "street" includes any highway, and any road, bridge, lane, path, footway, news, square, court, alley, or passage to which the public have access for the time being. Any person who shall offend against any of these by-laws shall be liable, for each offence, to a fine not exceeding 6s.'

(b) That the by-laws made by the Council on May 12, 1903, relative to the throwing down in streets of refuse, paper, refuse, advertising bills, broken glass, etc., be repealed as from the date on which the above by-laws come into force."

Victoria Embankment Gardens and the

Metropolitan District Railway Company.—The Parks and Open Spaces Committee recommended (a) that 1,600l., instead of 1,700l., be accepted from the Metropolitan District Railway Company in respect of an easement acquired by the company under the Victoria Embankment Gardens and the Villiers-street approach adjoining, and that the opposition be dropped; (b) that no opposition be offered by the Council to the company hereafter obtaining Parliamentary sanction to the use of the easement acquired by it.

London County Buildings Bill, 1906.—The Parliamentary Committee reported as follows:—

"The London County Buildings Bill came before a Select Committee of the House of Commons, presided over by Mr. Bilson, on April 30, 1906. Mr. J. W. Cleland, M.P., the chairman of the Establishment Committee, was the principal witness on behalf of the Council, and the Council's Architect, the Chief Engineer, and the Valuer gave evidence on technical matters. The only opponents who appeared in support of their petition were the Lambeth Borough Council, who objected to the proposed exemption of sect. 133 of the Lands Clauses Consolidation Act, 1845, which section provides that, where the promoters of an undertaking acquire lands charged with land tax or liable to be assessed to the poor rate, they shall make good any deficiency in the tax or rate until the works are completed; and Messrs. Holloway Bros., who objected strongly to the acquisition of their premises, alleging that there was sufficient space for the new county hall and offices without interfering with their property. The opposition of the borough council was met by striking out of the Bill the exemption from sect. 133 of the Lands Clauses Consolidation Act. The Committee unanimously found the preamble of the Bill proved, and the Bill has been reported to the House."

Resignation of District Surveyors.—The Building Act Committee reported that Mr. Hugh McLachlan and Mr. Charles James Badger, District Surveyors for the western division of the City of London and the district of Lewisham respectively, have resigned their appointments.

The Council, having transacted other business, adjourned.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

THE London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

St. George, Hanover-square.—The enclosing of a portico in front of No. 21, Hill-street, Berkeley-square (Messrs. Keeble, Limited, for Captain H. S. Clay).—Consent.

Battersea.—A porch to a proposed new church on the eastern side of Altenburg-gardens, Clapham-common (Messrs. Kelly & Dickie for the Rev. G. Grady).—Consent.

Hampstead.—Bay windows at Block B, The Pryors, East Heath-road, Hampstead (Mr. J. E. Yerbury).—Consent.

Hampstead.—A pair of semi-detached houses on the southern side of Netherhall-gardens, Hampstead, with projecting bay, porch, and pent roof (Mr. C. H. Saunders for Dr. J. R. Whit).—Consent.

Kensington, North.—A one-story addition at the rear of the entrance lodge to St. Joseph's Home, Portobello-road, Notting-hill (Mr. W. Daniell for the Sisters of St. Joseph's Home).—Consent.

Lewisham.—Porches in front of Nos. 159, 161, 163, 165, and 167, Hazelbank-road, Hitler Green, Lewisham (Messrs. Norfolk & Prior for Mr. W. Rolfe).—Consent.

Marylebone, East.—Four projecting stone balconies at a building abutting upon Wigmore-street, Welbeck-street, St. Marylebone (Messrs. Wallace & Gibson for Messrs. Debenham, Limited).—Consent.

Northwood.—Six houses on the eastern side of Knight's Hill-road, West Northwood, at the corner of Rothschild-street (Messrs. Hall & Jacobs for Mr. P. Stock).—Consent.

Strand.—Retention of a projecting balcony in front of Nos. 3 and 4, Sherwood-street, Piccadilly (Mr. J. H. Smith).—Consent.

Strand.—The retention of a projecting iron sign in front of the New Theatre, St. Martin's-lane, Strand (Mr. W. C. R. Sprague for Sir Charles Wyndham).—Consent.

Wandsworth.—A one-story shop in front of No. 12, Bective-road, Wandsworth (Mr. H. J. Cadwell).—Consent.

Whitechapel.—That the application of Mr. F. Selby for an extension of the period within which the erection of additions in front of Nos. 49, 51, 53, and 55, Munsell-street, Whitechapel, was required to be commenced and completed, be granted.—Consent.

Chelsea.—Buildings on the south-eastern side

of Fulham-road, Chelsea, to abut also upon College-street and Kimbolton-row (Messrs. Elms & Jupp for Mr. E. Birmingham and Messrs. T. Crapper & Co., Limited).—Refused.

Fulham.—The erection of projecting steps and balconies in front of St. Clement's parish room, Fulham Palace-road, Fulham (Messrs. E. Monson & Sons).—Refused.

Greenwich.—An advertisement board in front of the Greenwich Central Hall, London-street, Greenwich (Mr. G. G. Woodward for the Rev. W. Spencer).—Refused.

Hampstead.—An iron and glass covered way in front of Block B, The Pryors, East Heath-road, Hampstead (Mr. J. E. Yerbury).—Refused.

Marylebone, West.—Buildings on the north-eastern side of Maida-vale, St. Marylebone (Mr. V. S. Galsworthy for the trustees of Harrow School).—Refused.

Stepney.—A one-story building at the Stepney Jewish School, Stepney-green (Messrs. Joseph & Smith).—Refused.

Wandsworth.—A building on the eastern side of Gwendolen-avenue, Putney, adjoining the Putney Wesleyan Church (Messrs. Thomson & Pomeroy for the trustees of the Putney Wesleyan Church).—Refused.

Width of Way.

Whitechapel.—Retention of a roof over a yard at Messrs. Potter & Clark's premises, Artillery-line, Whitechapel, to abut upon Bell-lane (Mr. H. Line for Messrs. Potter & Clarke).—Consent.

Fulham.—Houses on the northern side of Fane-street, North End-road, Fulham (Mr. J. T. Brown for Mr. W. Haxley).—Refused.

Width of Way, Lines of Frontage, and Projections.

St. George, Hanover-square.—The retention of an iron and glass shelter in front of the Adlington-socket entrance to the Ritz Hotel, Piccadilly (Mr. J. P. Bishop for the Building and Vendor Company, Limited).—Consent.

Brixton.—A one-story addition at the rear of the Plough public-house, No. 66, Coldharbour-lane, Brixton, at less than the prescribed distance from the centre of the roadway of Denmark-road (Messrs. F. J. Eddle & Meyers for Mr. C. Martin).—Consent.

Lewisham.—The retention of a wood and iron porch at Netherleigh, Manor-road, Forest Hill, abutting upon Pearcefield-avenue (Mr. F. Penfold).—Refused.

Width of Way and Space at Rear.

Whitechapel.—Buildings on the site of No. 68, Spelman-street and Nos. 76, 78, and 80, Pelham-street, Whitechapel (Mr. J. R. Moore Smith for Mr. J. Donn).—Consent.

Lines of Frontage and Space at Rear.

Hammersmith.—A building upon a site abutting on Blythe-road and Addison-gardens, West Kensington (Col. E. Clarke for Mr. F. Smith).—Consent.

Space at Rear.

Brixton.—A modification of the provisions of sect. 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a building on the south-west side of Camberwell-New-road, Camberwell, adjoining the Athenaeum public-house, with an irregular open space at the rear (Messrs. Barlow, Roberts, & Thompson).—Consent.

Brixton.—A modification of the provisions of sect. 41 with regard to open spaces about buildings, so far as relates to a building on the north-eastern side of Lilford-road, Camberwell, with an irregular open space at the rear (Mr. E. E. Bird for Messrs. L. Whitehead & Co., Limited).—Consent.

Clapham.—A modification of the provisions of sect. 41 with regard to open spaces about buildings, so far as relates to two buildings erected on the southern side of Battersea-rise, Westward of No. 89, with irregular open spaces at the rear (Mr. H. Bignold).—Consent.

Formation of Streets.

Lewisham.—A deviation from the plan sanctioned for the formation of a new street to lead out of the south side of Sydenham-road, Lewisham, so far as relates to an alteration in the position of the boundary at the north-eastern corner of the street (Mr. R. Appleby).—Consent.

Kensington, North.—Further deviations from the plans approved for the formation of new streets on the St. Quintin estate, St. Quintin-avenue, so far as relates to a slight deviation in the direction of street No. 1 (Highlever-road), and in the position of the boundaries of street No. 4 (Messrs. Trant, Brown, & Humphreys).—Consent.

Cubical Extent.

Hackney, North.—Deviations from the plans approved in connexion with Block 2 of a factory building on a site on the west side of Tyssen-street, Dalston-lane, Hackney (Mr. T. B. Whinney for the Marconi Wireless Telegraph Company).—Consent.

Buildings for the Supply of Electricity.

Wandsworth.—The construction of a new roof over the switch room at the County of London Electric Supply Company's generating station, The Causeway, Wandsworth (Mr. C. Thompson for the Company).—Consent.

Working-Class Dwellings.

Limehouse.—A deviation from the plans approved for the erection of dwelling-houses, to be inhabited by persons of the working-class, on a site to the northward of the Rothchild-tunnel approach, between Rose-lane and Butcher's-row, so far as relates to an alteration in the setting out of certain of the blocks (Mr. R. Robertson for the Housing of the Working Classes Committee of the Council).—Consent.

Conversion of Buildings.

Finsbury, Central.—The conversion of No. 158, Farringdon-road, Finsbury, into a warehouse and stables without complying with the provisions of sect. 41 of the said Act (Mr. J. B. Pinchbeck for Mr. J. May).—Consent.

Alterations of Buildings.

Islington, North.—An addition to No. 13, Highgate-hill, Highgate, without the provisions of sect. 74 of the said Act being complied with (Mr. C. W. Calcott for Mr. J. W. Galton).—Refused.

Sealing.

Fulham.—That the seal of the Council be affixed to a duplicate of the order sanctioning the formation or laying out of a new street for carriage traffic to lead from Fulham Palace-road to Colehill-lane, Fulham.—Consent.

The recommendations marked † are contrary to the views of the local authorities.

Illustrations.

DESIGN FOR A STEEPLE LEADED.

HIS fine and picturesque drawing, which is exhibited in the architectural room at the Royal Academy, was made by Sir Charles Nicholson to illustrate Mr. Weaver's paper on "Leadwork" read before the Institute of Architects on March 19. It shows a decorative steeple faced with leadwork, rising above the crossing of a church.

No particular description is needed of it beyond what the drawing itself furnishes; it is a fine piece of architectural suggestion for the use of a special material.

HOUSE, NEAR GODSTONE.

THIS house is to be built on a site about two miles from Godstone.

The walls will be built of Sussex bricks, with angles of Pasca's hand-made Wrotham bricks. The stonework is Portland. The roof will be covered with deep red, hand-made Wrotham tiles. The cupola is connected with the bachelors' quarters.

Messrs. Trollope & Sons and Colls & Sons are the contractors for the whole work. The architect for the house and gardens is Mr. Ernest Newton, of Raymond-buildings, Gray's Inn, London.

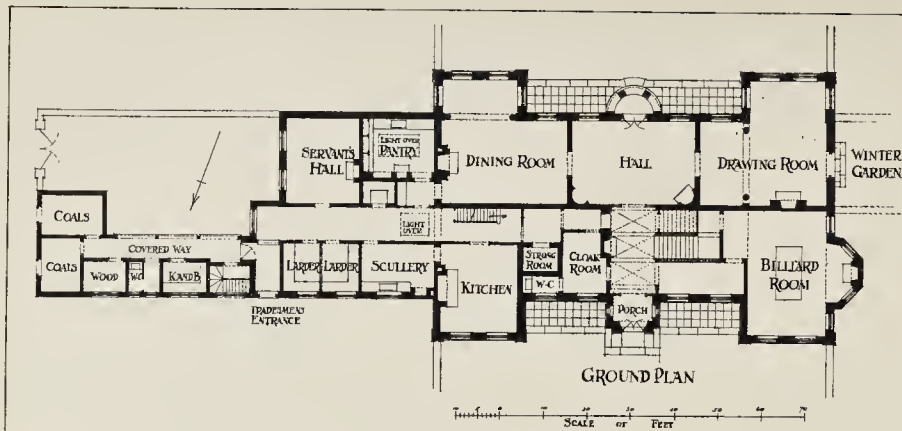

SCULPTURE GROUPS FOR HYDE PARK CORNER.

THIS illustration is from a photograph taken in the sculptor's studio, which shows the work at a certain disadvantage owing to incongruous background of window frame; it would have been hazardous to attempt stopping this out in the photograph, with the risk of encroaching on the outline of the small figures. The model itself is at present in the exhibition at the New Gallery. Those who cannot see it there (as well as those who can) must endeavour to imagine the effect of these groups, in gilt bronze, as they would appear if placed on the well-known Hyde Park screen.

The aim of the artist, Mr. G. Natrop, was to design something absolutely in keeping with the architecture of the screen, as well as to stimulate public interest in the decoration of various bare pieces of architecture, such as the Constitution Hill arch and the Marble Arch, in conspicuous places in London.

The suggestion is an admirable one, and we desire to give our full support to it, and hope that it may receive consideration in official quarters; we do so the rather because we have observed that it has been the object of stupid deprecatory remarks in the press from so-called art-critics who evidently do not understand the relation between sculpture and architecture in works of this kind. Decimus Burton, who designed both the screen and the Constitution Hill arch, specially designed the latter to be crowned by a quadriga group, which has never to this day been carried out; and though we are

IN THE NEW GALLERY EXHIBITION.

not aware that he left any sketch for the same kind of termination to the screen, we are satisfied that he would have approved of it, and that it would be a very great improvement to the effect of Hyde Park Corner.

"YOUTH'S DREAM OF JOY."

"Youth's Dream of Joy" is intended for an allegory. The boy in the shell-shaped boat is seeing a vision of joy, and is being wafted along on the wings of his dream or fancy. It is only in the coloured plaster, as it has not yet been carried out.

ESTHER M. MOORE.

THE SANITARY INSPECTORS' ASSOCIATION.

On Saturday evening last Mr. W. G. Ker-shaw, of Hampstead, read a paper before the south-eastern centre of this Association at Carpenters' Hall, London-wall, on the "Sanitary Inspector as a Specialist."

The lecturer said that we live in an age of advancement, and the progress made in sanitary science and administration had undoubtedly been one of the most remarkable features of the last half century. They could recall the time when anyone was thought good enough to fill the office of sanitary inspector, and persons were often appointed who had devoted a considerable part of their lives to vocations in no way connected with public health administration. Now none might aspire to the position of sanitary inspector unless qualified by examination at least, and generally by previous training as well. A review of the syllabus of the lectures and demonstrations for the training of officers given by the Royal Sanitary Institute served to convey some idea of the many different matters with which an inspector was called upon to deal, and he was expected to possess a knowledge sufficient to enable him to act promptly and to form a judgment which he might afterwards be called upon to defend under cross-examination, and which might ultimately be the subject of review by the highest tribunals of the land. He was constantly called upon to meet men who were experts in some one or other of the various matters with which it was his province to deal. Thus he might have to discuss with an architect or builder whether an insanitary house was capable of being made fit for human habitation, or whether demolition alone would meet the case. It frequently fell to his lot to instruct and supervise plumbers and other craftsmen in the work of their respective trades, and a Court of Summary Jurisdiction might direct him to say what faults of omission or commission had given rise to a nuisance set up by some complicated trade process, and to specify the steps that must be taken to abate it and prevent recurrence. It need not be wondered at that the question as to what trade, business, or occupation best fitted a man to fill the post should arise; nor need it be a matter for surprise if the average inspector fell short of the ideal. In all the older professions, such as law and medicine, architecture and engineering, it would be found that as the scope of each had extended, so had the tendency for certain members to take up one particular branch increased. Such men had invariably secured for themselves higher remuneration, and had raised the status of the profession to which they belonged. What had taken place with other professions must, he thought, take place in that of the sanitary inspector. The chief aim of every sanitary officer was to arrive at an ideal state of affairs in the shortest possible time, and in his opinion the road lay in the direction of specialisation. He meant that an inspector should devote himself especially to one or the other of the many branches of the work. In London, at least, the tendency to appoint special inspectors for special work was on the increase, and in almost all cases it would be found that those inspectors were in receipt of higher salaries than those who were doing general work. Quite apart from that, however, he thought there could be no question but that the work in those cases was more thoroughly done, and that a higher standard of efficiency prevailed than previously existed.

Replying to questions raised in the dis-

ussion which followed the paper, Mr. Ker-shaw said that it was certainly necessary for an inspector to know something of everything, but that did not preclude him from specialising in one direction. As to the training of youths for taking up the work, he thought it would be desirable that they should have some business training before they entered on the work. There ought not to be specialisation at the expense of the general inspector, but there was no reason why the general inspector should not be in a position to take up special branches of the work.

Architectural Societies.

NORTHERN ARCHITECTURAL ASSOCIATION.—The following is the list of officers and Council of the Association for the session 1906-1907.—*President*—Mr. J. T. Cockett; *Vice-President*—Mr. G. T. Brown; *Hon. Secretary*—Mr. A. B. Plummer; *Hon. Treasurer*—Mr. R. Butts Dick; *Hon. Librarian*—Mr. H. C. Charlewood; *Hon. Solicitor*—Mr. H. C. Harvey; *Council*—Messrs. J. Bruce, J. W. Dyson, C. S. Errington, W. Milburn, J. Oswald, C. E. Oliver, T. Reay, J. Walton Taylor, J. W. Boyd, M. G. Martinson, A. K. Tasker, R. P. S. Tyzack, H. A. Wilson, H. Barnes (Hon. Local Secretary for Hartlepool), F. Clark (Hon. Local Secretary for Darlington), J. Spain (Hon. Local Secretary for Sunderland), and J. H. Morton (Hon. Local Secretary for South Shields).

EDINBURGH ARCHITECTURAL ASSOCIATION.—By permission of Lord Playfair, the members of this Association visited Newbattle Abbey on Saturday last. Mr. A. Hunter Crawford acted as leader, and the members were also accompanied by Mr. Ramsay, clerk of works, under whose supervision the restorations of late years have been carried out. The leader pointed out the position and extent of the abbey before its destruction, and then conducted the party over the crypt and other parts of the abbey which still survive. The members had also the opportunity of seeing the more modern parts of the abbey, in which are some noted paintings. On the motion of the President, Mr. H. O. Tarholton, Mr. Hunter Crawford and Mr. Ramsay received a vote of thanks.

Engineering Societies.

SOCIETY OF ENGINEERS.—At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, Mr. Maurice Wilson, President, in the chair, a paper was read on "The Chemistry and Bacteriology of Potable Waters" by Dr. David Sommerville, B.A., M.D., D.P.H., M.R.C.P., Lecturer in Public Health, King's College, London, and of the which the following is an abstract:—The author introduced his subject by pointing out that it touched intimately at many points the profession of engineering. After defining normal and polluted waters, he discussed sources of supply, and laid it down as essential that, owing to the frequently intermittent nature of pollution, systematic and numerous chemical and bacteriological examinations were necessary, and that no report on the safety of a water supply could be considered complete that did not include a careful examination of its source. He proceeded to deal with rain water, surface waters, ground water, and deep wells, dwelling at some length upon the factors which governed the character, and rate and direction of flow, of the ground water. In connexion with the pollution of shallow and deep wells, Dr. Sommerville deplored the fact that too frequently, even on large estates, where the excuse of limited area could not obtain, the well and cesspool were constructed close together. He referred to the fallacious belief that if the well was placed in higher ground than the cesspool, pollution must be out of the question, whilst the only factor of importance in the problem was not the location of the outlet of the well, but the relative position of the cesspool and the point where the water entered the well. Landowners, he said, should not lose sight of the fact that they could only control the

disposition of the surface of their properties. Water examinations were next dealt with, and of four methods at present in use—physical, chemical, biological, and bacteriological—the greater portion of the paper was naturally devoted to the chemical and bacteriological. It was pointed out that where pollution was so gross as to be easily detected by a physical examination, the routine chemical analysis was not only useless, but absurd. A critical examination of some of the more important items in the chemical analysis was made, and the necessity for uniformity of procedure, in certain instances, emphasised. The author pointed out that the consideration of nitrogenous matter had its value, not from the standpoint of absolute amounts, but through the daily relations and variations which appeared in the analytical series. Inorganic constituents should be uniformly expressed as positive and negative ions. Reference was next made to iron and lead in waters, and plumbo-solvency was treated at some length. Chlorine, nitrates, and nitrites were discussed, and nitrification and denitrification fully studied. Hardness was briefly treated, and a ready method for the estimation of carbonates and bicarbonates noticed. The interpretation of the results of the chemical examination was very fully dealt with. It was shown that it was impossible to erect water standards, and that the value of each water must be intelligently estimated on its own merits. The importance of liability to sewage pollution was enforced, as also the fact that positive results in the search for bacteria were much more easily dealt with than negative. In the section treating of the bacteriological examination attention was focused on a few pathogenic bacteria. Three diseases were stated to be almost wholly water-borne—typhoid, cholera, and dysentery. Typhoid touched us most nearly, and although its micro-organism could not usually be isolated from water supplies, bacteriological evidence of its possible presence was derived from the discovery of bacteria characteristic of sewage, especially the *B. coli communis*. The comparative values of the chemical and bacteriological examinations were fully considered, and it was concluded that both had their limits of usefulness, that neither was infallible, that each was assisted by the other, and that the value of either lies in that judgment and skill put into the interpretation of the results which arose only from an intelligent use of a wide and varied experience. Domestic filters were then considered, and, lastly, filtration on the large scale. In conclusion, Dr. Sommerville stated that the ideal treatment of a water supply was thorough protection at its source, continued protection throughout its after-history, and efficient sand filtration prior to distribution.

Competitions.

MUNICIPAL OFFICES, COVENTRY.—It is announced that in the competition, limited to local architects, for new municipal offices on a central site in the city, the premium of 50l. has been gained by Mr. T. F. Tickner. The new site has been acquired at a cost of nearly 60,000l., but the question of proceeding with the premiated designs is, it appears, still under consideration.

PRINCE ROCK SCHOOL COMPETITION, PLYMOUTH.—This competition was confined to architects practising in Plymouth, and sixteen sets of drawings were received. The assessor nominated by the President of the Royal Institute (Mr. H. Dare Bryan, F.R.I.B.A., of Bristol) reported to the education authority placing scheme No. 10 first and bracketing Nos. 4 and 11 for second place. The assessor's report was subsequently unanimously adopted by the education authority, and it was found that Messrs. Thornley & Rooke, of 11, The Crescent, have received the first premium, and that their alternative design also, shared with Mr. A. S. Parker, of 20, George-street, the second premium. Messrs. Thornley & Rooke were in accordance with the assessor's recommendation appointed architects for the new schools. The design of Mr. Priestley Shires was placed third.

HACKNEY PUBLIC LIBRARY.—The Public Libraries Committee reported on Tuesday

that the architect had drawn attention to the following paragraph in the conditions relating to the supply of plans, etc., in connexion with the library competition:—"The architect selected to carry out the work is to supply, for the remuneration aforesaid, a complete set of copies of the contract and all detail drawings, and a copy of the specification, drawings, and quantities for the use of the Council before the building is commenced. He is also to supply copies for the builder, the district surveyor, and (if required) for the London County Council, and on the completion of the building, he is to furnish the Council with a full set of detailed plans, showing the work as executed." He pointed out that this, if carried out to the letter, would mean the preparation of an unnecessarily large number of drawings before the completion of the buildings. The Committee felt that it was not necessary for the Council to insist upon the preparation of the drawings referred to, and had decided to strike out of the paragraph the words, "and all detail drawings."

NORTH WALES COLLEGE, BANGOR.—The selected competitors for the North Wales College, Bangor, are, we understand, Messrs. H. T. Hare, W. D. Carbe, A. Marshall Mackenzie, Arnold Mitchell, and Francis Doyle.

THE SAN FRANCISCO REBUILDING SCHEME.

SIR.—It occurs to me in connexion with your remarks (page 456) on the plan for rebuilding San Francisco, that your objection to diagonal roads as producing many triangular sites awkward for building upon might perhaps be met by devoting all those sites to form a diagonal chain of parks or open spaces similar to that which it is proposed to provide as a zone.

I send two rough diagrams to indicate the sort of thing to be aimed at. In these the diagonal

and zonal roads are black, the gridiron roads indicated by double lines and the open spaces are hatched in, while squares for building blocks are left white. If it should be found that such a scheme provided too much open space, the triangular sites would form, if made large enough, suitable open sites for detached buildings, whether public or private, set well within and so largely unaffected by the triangular bounding lines.

Of course it can only be seen whether the idea has any value by taking an actual set of circumstances and endeavouring to apply it.

W. B. HOPKINS.

KERSWILL v. THE WAR OFFICE.

SIR.—The paragraph in your issue last week (page 500) is accurate, but incomplete, and has

the effect of making the award as to costs seem remarkable. The bulk of the "award" of 3,017, 4s. 8d. had been paid to Mr. Kerswill a considerable time before the arbitration. The result of the proceedings before Mr. Steming was an additional payment of 317, 4s. 8d. only. K.

The Student's Column.

SOME MATHEMATICAL METHODS AND USEFUL DATA FOR ARCHITECTS.—XVIII.

LOGARITHMIC CALCULATIONS.

IN Article XIV., page 412, we gave a tabular statement showing the manner in which the proper value of the characteristic of any logarithm can be assigned without hesitation. The general rules for *positive* and *negative* characteristics are:—

Rule (1).—The characteristic of any number greater than unity is *positive*, and its numerical value is 1 lower than the number of figures to the left of the decimal point.

Rule (2).—The characteristic of any number less than unity is *negative*, and its numerical value is 1 higher than the number of ciphers to the right of the decimal point.

The addition and subtraction of characteristics is sometimes a stumbling-block to those who are not familiar with the use of logarithms, and the association of *negative* characteristics with *positive* mantissae is also a little confusing at first.

In dealing with characteristics, it is important to bear in mind the rules of algebraic addition and subtraction, which are repeated here as a matter of convenience:—

(1) To add two positive quantities, take their sum and make it positive.

(2) To add two negative quantities, take their sum and make it negative.

(3) To add a positive and a negative quantity, take their difference, and give it the sign of the greater quantity.

(4) To subtract a negative quantity, change the sign and add.

(5) To multiply a negative quantity, follow the ordinary rule and make the product negative.

(6) To divide a negative quantity, follow the ordinary rule and make the product negative.

In addition to these simple rules, it is necessary to bear in mind that the effect of adding together two or more mantissae is to increase the value of the final characteristic when the addition provides a figure to be carried to the left of the decimal point, and that the effect of subtracting mantissae one from another is to decrease the value of the final characteristic when a figure has to be borrowed from the left of the decimal point.

The following examples will make clear the method to be adopted in dealing with the characteristics of logarithms:—

Example (1): Addition with two positive characteristics.

$$\begin{array}{r} 1.8470 \\ 3.8774 \\ \hline 4 + 1.7244 = 5.7244 \end{array}$$

Example (2): Addition with two negative characteristics.

$$\begin{array}{r} 1.8470 \\ 3.8774 \\ \hline \bar{4} + 1.7244 = 3.7244 \end{array}$$

Example (3): Addition with one negative and one positive characteristic.

$$\begin{array}{r} 1.8470 \\ 3.8774 \\ \hline \bar{2} + 1.744 = 1.7244 \end{array}$$

Example (4): Subtraction with two positive characteristics.

$$\begin{array}{r} 1.8470 \\ 3.8774 \\ \hline 1 - (3 + 1)9696 = 3.9696 \end{array}$$

Example (5): Subtraction with one negative and one positive characteristic.

$$\begin{array}{r} (a) 1.8470 \\ 3.8774 \\ \hline 1 - (\bar{3} + 1)9696 = 3.9696 \end{array}$$

$$\begin{array}{r} (b) 3.8774 \\ 1.8470 \\ \hline 4-0304 = 4-0304 \end{array}$$

Example (6): Multiplication with a negative characteristic.

$$\begin{array}{r} \bar{3}.8774 \\ 4 \\ \hline \bar{12} + 3.5096 = 9.5096 \end{array}$$

Example (7): Division with a negative characteristic.

$$\begin{array}{r} 3)9.5096 \\ \underline{7.1698+} \end{array}$$

In a case like that in example (7), where the negative characteristic happens to be a multiple of the divisor, the ordinary mode of procedure gives the result without any difficulty, but if, as frequently happens, the negative characteristic is not exactly divisible, some expedient must be employed to obviate the necessity for carrying a *negative* remainder to the first figure of the *positive* mantissa.

The method to be adopted is expressed in the rule given below:

Rule (5).—To divide a logarithm having a negative characteristic which is not a multiple of the divisor, add such a negative number to the characteristic as will make it a multiple of the divisor, and prefix to the mantissa a positive integer of equal value. Then divide separately the increased negative characteristic and the other part of the logarithm, and the first quotient so obtained, with negative value, will be the characteristic of the mantissa, represented by the second quantity.

Of course, the addition of a *minus* quantity to the characteristic, and the preposition of an equivalent *plus* quantity to the mantissa, makes no alteration in the value of the logarithm, for such factors neutralise each other.

Example (8): Division with a negative characteristic which is not a multiple of the divisor.

$$9.5096 \div 4.$$

Here 3 must be added to the characteristic, so that the sum 12 may be divisible by 4, and at the same time 3 must be prefixed to the mantissa. Thus

$$\begin{array}{r} 9.5096 \div 4 = \bar{12} + 3.5096 \div 4 \\ 4)\bar{12} + 3.5096 \\ \hline \bar{3} + 0.8774 = 3.8774. \end{array}$$

The succeeding examples are intended to make clear the application of logarithms to practical calculations, and the immense saving of time to be effected by their employment.

In order to facilitate comparison of logarithmic computations with those performed by the ordinary rules of arithmetic, some of the examples involve the same factors as were used in previous examples, and as a matter of general convenience to the reader, we have employed *four-figure* logarithms and antilogarithms throughout, of which examples are given in Tables XIV. and XV. More accurate results can be obtained if desired by using logarithms carried to more places of decimals.

Although we have given the characteristic in every instance, the rule in practice is to write the logarithms from the table without stopping to add the characteristics, as these can be dealt with more expeditiously at the end of any given calculation. The only exceptions to this rule occur in connexion with involution and evolution, where the characteristics have to be multiplied and divided, respectively.

Multiplication.

Example (9): Multiply 58.45 by 8.7341 (Ex. (1), p. 147).

$$\begin{array}{l} \log. 58.45 = 1.7682 \\ \log. 8.734 = 0.9412 \end{array}$$

$$\begin{array}{l} \text{antilog. } 2.7094 = 512.2 \\ \text{Result, correct to four figures.} \end{array}$$

Example (10): Multiply 67.5941832 by 9.315764 (Ex. (2), p. 147).

$$\begin{array}{l} \log. 67.60 = 1.8299 \\ \log. 9.316 = 0.9692 \end{array}$$

$$\begin{array}{l} \text{antilog. } 2.7991 = 629.6 \\ \text{Result, correct to four figures.} \end{array}$$

Example (11): Multiply 83641253 by 4657

(Ex. (3), p. 147).

$\log. 8364 = 7.9224$

$\log. 4657 = 3.6682$

antilog. $11\ 5905 = 389,500,000,000$
Result, correct to four figures.

Division.

Example (12): Divide 512.2122945 by 58.645

(Ex. (1), p. 206).

$\log. 512.2 = 2.7095$

$\log. 58.64 = 1.7682$

$0.9413 = 8\ 736$

Result, correct to three figures.

This is a case where the divisor evidently should be increased, and by taking its *log* as 1.7683 the result is given correct to four figures.

Example (13): Divide 6843580648 by 7324

(Ex. (4), p. 203).

$\log. 6843 = 9.8353$

$\log. 7324 = 3.8647$

antilog. $5.9706 = 934.600$

Result, correct to three figures.

In this case the figures suggest that a more correct result should be given by increasing the dividend to 6844. But this would not be so. Comparison of *log.* 7324 and *antilog.* 8647 indicates the reason.

Approximations.

Example (14): Find the cost of 12.184 tons of steel bars at 7.5212l. per ton (Ex. (1), col. 3, p. 267).

$\log. 12.18 = 1.0856$

$\log. 7.521 = 0.8763$

antilog. $1.9519 = 91.6 (l.)$

Result, correct within about sevenpence.

Example (15): Find the value of 0.5387376 acre at 670l. per acre (Ex. (2), p. 267).

$\log. 0.5387 = 1.7314$

$\log. 670 = 2.8261$

antilog. $2.5575 = 361 (l.)$

Result, correct to within elevenpence.

Example (16): Find the cost of 54.6 tons of Portland cement at 2.125l. per ton (Ex. (3), p. 238).

$\log. 54.6 = 1.7372$

$\log. 2.125 = 0.3273$

antilog. $2.0615 = 116.0 (l.)$

Result, correct within sixpence.

Proportion.

Example (17): Find the value of *x* in the proportion 634.6 : 0.03435 :: 795.8 : *x*.

$\log. 0.03435 = 2.5359$

$\log. 795.8 = 2.9008$

1.4367

$\log. 634.6 = 2.8025$

antilog. $2.6342 = 0.04307$

Result, correct to five places.

Involution.

Example (18): Find the squares of 0.0156, 0.7854, 1.424, and 23.750.

Logs.

Squares.

$0.0156 = 2.1931 \times 2 = 4.3862 = 0.0002433$

$0.7854 = 1.8951 \times 2 = 3.7902 = 0.6169$

$1.424 = 0.1535 \times 2 = 0.3070 = 2.028$

$23.750 = 1.3756 \times 2 = 2.7512 = 563.9$

Find the values of 2.913³, 0.8749³, 1.004365³.

Logs.

Powers.

$2.913 = 0.4643 \times 3 = 1.3929 = 24.71$

$0.8749 = 1.9419 \times 5 = 9.7095 = 0.5123$

$1.003 = 0.0012 \times 365 = 0.4380 = 2.742$

Evolution.

Example (19): Find the square root of 62.09645.536 (Ex. (1), p. 296).

$\log. 62.09645 = 7.7981$

divided by 2 = 3.8990

antilog. 3.8990 = 7925

Result, correct to four figures.

Example (20): Find the square root of 168,558,289 (Ex. (2), col. 2, p. 296).

$\log. 168558289 = 8.2269$

divided by 2 = 4.11345

antilog. 4.11345 = 12,985

Result, correct to four figures.

Fig. 1. Logarithmic Diagram.

Example (21): Find the value of
 $\sqrt[3]{\frac{0.5 \times 43560}{3.1416}}$ (Ex. (4), col. 2, p. 297).
 log. 0.5 = 1.6990
 log. 43560 = 4.6391
 4.3381
 log. 3.1416 = 0.4971
 2)3.8410
 1.9205 = 83.28
 Result, correct to three figures, or within 0.02.
Example (22): Find the cube root of
 823128.75 (Ex. (1), p. 325).
 log. 8231+ = 5.9155
 divided by 3 = 1.9718
 ant log 1.9718 = 93.71
 Result, correct to four figures, or within 0.004.
Example (23): Find the cube root of 175616
 (Ex. (3), p. 326).
 log. 1.756+ = 5.2445
 divided by 3 = 1.74816 (say 1.7482)
 antlog. 1.7482 = 56

Example (24): Find the value of $\sqrt[3]{\frac{2 \times 32.1}{3 \times 3.1416}}$

Numerator.	Denominator.
log. 64.2 = 1.8075	log. 4 = 0.6021
less denom. log. 0.6221	log. 3 = 0.4771
divide by 3)1.1854	0.2350
0.3951	log. 3.1416 = 0.4971
	0.6221

 ant.log. 0.3951 = 2.484.
Example (25): Find the 54th root of 30,985
 log. 30.98(5) = 4.4912
 divide 4 by 54 = 0.0831(7)
 antlog. 0.0831(7) = 1.211+
Example (26): Find the value of
 $\sqrt[3]{\frac{7648^2 \times 1.025 \times 36}{4376 \times 3600 \left(\frac{180}{13}\right)}}$

Numerat.	Denominator.
log. 7648 = 3.8836	log. 180 = 2.2553
multiply by 2.5	log. 13 = 1.1139
194180	divide by 2)1.1414
77672	0.5707
9.70900	log. 3600 = 3.5563
log. 1.025 = 0.0107	log. 4376 = 3.6411
log. 36 = 1.5563	7.7681
11.2760	
less denom. log. 7.7681	
divide by 3)3.5079	
1.1693	
antlog. 1.1693 = 14.77.	

Miscellaneous Calculations.
Example (27): Find the breaking weight in tons of a round steel strut 3 in. diameter by 8 ft. long, both ends being jointed, employing Gordon's formula $P = \frac{fS}{1 + 4a\left(\frac{l}{d}\right)^2}$ with the values:
 $f = 30$ tons, $a = \frac{1}{1400}$, $S = (0.7854 \times \pi^2)$,
 $l = 96$ in., $d = 3$ in., $\frac{l}{d} = 96 \div 3 = 32$.
 $P = \frac{30 \times (0.7854 \times \pi^2)}{1 + 4 \times \frac{1}{1400} \times 32^2}$

Numerator.	Denominator.
log. 30 = 1.4771	log. 32 = 1.5051
log. 7854 = 1.8951	multiplied by 2
log. 9 = 0.9542	3.0102
2.3254	log. 1400 = 3.1461
less denom. log. 0.5938	1.8641
1.7326	log. 4 = 0.6021
	0.4692
	antlog. 0.4692 = 2.925
	add 1 1.000
	3.925
	log. 3.925 = 0.5938

 Antilog. 1.7326 = 54.03, and the required breaking weight = 54.03 tons.

Example (28): Find the discharge of water in gallons per minute by a 7-in. diameter pipe, 3,797 yds. long, with 45-ft. head of water in feet, using the equation
 $G = \sqrt{\frac{(3 \times 7)^3 \times 45}{3797}}$
 log. (3 x 7) = 1.3222
 multiply by 3 = 3.9666
 log. 45 = 1.6532
 5.6200
 log 3797 = 3.5794
 divide by 2)1.6848
 2.3424
 antlog. 2.3424 = 220 (gallons).

Logarithmic Diagrams.
 Another illustration of the uses to which the principle of logarithms may be applied is given in Fig. 1, by which the powers and roots, from 0.1 to 3, of any natural number can be obtained without calculation of any kind. The great advantage of logarithmic paper is that hyperbolic and parabolic curves of all degrees may be very readily drawn, because all such and many other curves occurring in practical work become straight lines when plotted on paper so ruled. Only two co-ordinate points have to be found, and when connected by lines all intermediate values are correctly given.

Logarithmic paper can also be applied with advantage in preparing diagrams of variation of bending moment, shearing stresses, and deflection in beams; curves giving loads for different spans of girders and joists; curves for the discharge of water in pipes and channels, for loss of head due to friction in pipes; and various other diagrams useful in connexion with architectural and engineering practice.

As Fig. 1 can be used for the multiplication and division of any numbers, as well as for involution and evolution, it is available for finding without calculation the value of any expression where these processes are indicated; but for very accurate results the diagram would have to be drawn larger and the spaces further subdivided.

The following rules explain the manner in which the diagram can be used. For convenience the horizontal scales are here termed "A" and the vertical scales "B":—

Rule (1).—Multiplication.—Set the L.H. point of a pair of dividers at 1 on A, and the R.H. point at the multiplicand; set the R.H. point of the dividers at 1 and the L.H. point on a continuation of the horizontal line. Open the dividers wider so that the R.H. point reaches the multiplier; then set the L.H. point at 1, and read the answer at the R.H. point on A.

Rule (2).—Division.—Set the R.H. point of the dividers at the dividend on A and the L.H. point at the divisor; then set the L.H. point at 1, and read the answer at the R.H. point on A.

Rule (3).—Involution.—Find on B the number whose power is required; follow the corresponding horizontal line to the point of its intersection with the required curve, and read the result on A.

Rule (4).—Evolution.—Find on A the number whose root is required; follow the corresponding vertical line to the point of its intersection with the required curve, and read the answer on B.

*Example (29).—*Find the value of
 $(2) \sqrt[3]{1.5 \frac{3.142 \times 80}{0.3551^{1.20}}}$
 (1) Find the value of 5.142⁸⁰ by Rule (3) open the dividers to the corresponding length measured from 1 on A. (This value reads 7.85.)
 (2) Find the value of 0.3551^{1.20} by Rule (3), and note the position on A. (This value reads 0.46.)
 (3) Divide 5.142⁸⁰ by 0.3551^{1.20} by Rule (2). (The quotient reads 17.)
 (4) Multiply the quotient into 1.5 by Rule (1). (The product reads 25.5.)
 (5) Find the cube root of the product by Rule (4). (The cube root reads 2.95.)
 (6) Multiply the cube root into 2 by Rule (1).
 The answer read at the R.H. point of the dividers on A is 59 = 5.9.

SALE OF BOOKS ON ARCHAEOLOGY, ARCHITECTURE, AND THE FINE ARTS.

The following were amongst the lots disposed of at a four-days' sale last week by Messrs. Sotheby, Wilkinson, & Hodge, at their rooms in Wellington-street, Strand:—
 "The Illustrated Handbook of Architecture," by J. Ferguson, 1859, and "Domestic Architecture in England," by T. H. Turner, Oxford, 1851, 1l. 10s.; "History of the Modern Styles of Architecture," by J. Ferguson, 1862, Handbook of the Arts of the Middle Ages and Renaissance," by J. Labarte, 1855, and "Cleanings from Westminster Abbey," by George Gilbert Scott, 1863, 1l. 9s.; "Domestic Architecture of the XIVth and XVth Centuries," by J. H. Parker, 3 vols., Oxford, 1853-9, 1l. 18s. (Bumpus); "Brick and Marble in the Middle Ages," 1855, and G. E. Street's "Account of the Abbey of St. Albans," by Rev. P. Newcome, with plates, 1795, and M. Archdall's "Monasticon Hibernicum," with map, 1784, 1785, 1l. 6s. (Sotheby); "Treatise on Chancel Screens and Rood Lofts," by A. W. Pugin, with plates, 1851, and "Illustrations of Medieval Costume in England," by Day & Dives, 1l. (Thorpe); J. Rutter's "Delineations of Fonthill and its Abbey," 1823, and G. Petrie's "The Ecclesiastical Architecture of Ireland," 1844, (Commins); "The Churches of London, Yorkshire, and Lancashire," 3 vols., 1718-23, 2l. 14s. (Miss Ram); "The Mansions of England in the Olden Time," by J. Nash, 4 vols., with lithographic plates, 1839-49, 8l. (Sotheby); "Excavations in Cranborne Chase, near Rushmore, Bokerly and Wansdyke, Dorset and Wilts., etc.," by King John's House, Jollard Royal, Wilts., and "Antique Works of Art from Benin," all by Lieut.-Gen. Pitt-Rivers, privately printed, 1887-1900, 5l. (Quaritch); "Ancient Crosses in East Cornwall," by J. T. Bilgitt, 1858, "Designs for Church Embroidery," 1894, "On Chancel Screens and Rood Lofts," by A. W. Pugin, illustrated, 1851, and "Notable Churches of London, Yorkshire, and Lancashire" (no date), 19s.; "History and Antiquities of St. David's," by W. B. Jones and E. A. Freeman, with plates, 1856, and "Wells Cathedral: its Monumental Inscriptions and Heraldry," by A. J. Jewers, 1892, 1l. 5s. (Edwards); "Ancient Sepulchral Monuments," by W. Brindley and W. S. Weatherley, 21s. plates, 1887, 1l. 15s. (Hill); John Brown's "History of the Metropolitan Church of St. Peter, York," with plans, sections, and engravings, 2 vols., 1847, 13s.; "Memorials of English Medieval Churches," by Charles Wickes, 37 large plates, 1857, 6s.; "A History of the Gothic Revival," by C. L. Eastlake, with plates and illustrations, 1872, 2s.; "Westminster Abbey," by Fulleylove & Smith, 21 coloured plates, 1904, and "Reliques of Old London," by Way & Wheatley, 24 plates, 1896, 1l. 1s. (Edwards); "Illustrated History of Furniture from the Earliest to the Present Time," by Fred. Litchfield, numerous illustrations, 1892, 9s.; "Westminster Abbey Historically Described," by Fenese & Micklethwaite, 75 plates, 1899, 1l. 16s. (Edwards); "Oxonia Antiqua Restaurata," by J. Skelton, 2 vols., 170 engravings of the buildings in Oxford, 1823, 10s.; "Venus and Apollo in Painting and Sculpture," by W. J. Stillman, 1897, 18s.; "English Interior Woodwork of the XVth, XVIIth and XVIIIth Centuries," by H. Tanner, 60 plates, 1902, 1l. 5s. (Parsons); "Etchings of Old London," by Ernest George, 1884, 17s.; "Anecdotes of Painting in England," by Horace Walpole, with considerable additions by the Rev. J. Dallaway, including catalogue of engravings, 1826-28, 4l. 18s. (Edwards); Ruskin's "Lectures on Architecture and Painting," and "Pre-Raphaelitism," first editions, 5s.; "Watteau's Ornamental Designs. Collected from his Works," by W. Nichol, Edinburgh, 1841, 1l. 8s. (Sotheby); "Architectural Remains of the Reigns of Elizabeth and James I.," by C. J. Richardson, 1840, with 30 tinted plates, 15s.; "History of Woburn Abbey, Hardwicke Hall, and Hatfield House," by P. F. Robinson, fine plates on India paper, 1827-35, 1l. 8s. (Luceok); Spitzer Collection—Antiquité, Moyen Age, Renaissance—6 vols., printed on vellum, paper, coloured, and other plates, imperial folio, Paris, 1890-2, 32l. 10s. (Edwards); "Architecture of the Renaissance in England," by J. A. Gatch, six parts, numerous plates, 1891-4, 4l. 14s. (Quaritch); "The Ancient Stone Implements. Weapons and Ornaments of Great Britain," by J. Evans, 1872, and Dr. C. Schuchhardt's "Schillerhans's Excavations," 1891, 12s.; "Stained Glass as an Art," by H. Hollis, 1896, 10s.; "The History of Modern Painting," by R. Muther, 3 vols., 1895, 2l. 12s. (Hill); "A History of Greek Sculpture," by A. S. Murray,

17s.; "Treasures of Art in Great Britain," by Dr. Waagen, 4 vols., 1854-7, li 12s. (Sotheman); "Sculptured Tombs of Hellas," by P. Gardner, 1896, and "The Bible of St. Mark, St. Mark's Church, The Altar and Throne of Venice," by A. Robertson, 1898, li (Bull); "Man in Art, Studies in Religions and Historical Art, Portrait and Genre," by P. G. Hamerton, 1892, 12s.; "Histoire de l'art pendant la Renaissance Italique," by E. Müntz, 2 vols., Paris, 1889-95, 6l. 5s. (Rimell); "Leonard da Vinci: l'Artiste, le Penseur, le Savant," by E. Müntz, 28 plates, 1899, li. 1s. (Rolandi); "History of Painting," by Woltmann & Woermann, edited by Sidney Colvin, 2 vols., 1890-7, li. 6s. (Rimell); "Pictures in the National Gallery," by Sir C. L. Eastlake, 2 vols., plates, 1845-7, 10s. (Gages); "British Miniature Painters and Their Works," by J. J. Foster, 59 plates (only 125 copies printed), 1898, li. 1s. (Halewood); "Great Masters—the Finest Works of the Finest Painters," with introduction and descriptive text by Sir Martin Conway, in 25 parts, with photographic reproductions, by G. Piranesi, 4 vols., 1880, 2l. 14s. (Edwards); "Landscape," by P. G. Hamerton, 43 etchings and other engravings, 1885, li. 11s. (Rimell); "Greek Vase Paintings," by Harrison & MacColl, 1894, 15s.; "Lo Antichità Romane," by G. Piranesi, 4 vols.; "Rome, 1764 and two other wars, by the same author, 12, 10s. (Young); "Picturesque Views in England and Wales," by J. W. M. Turner, with descriptive and illustrative illustrations, by H. E. Lloyd, 2 vols., 1838, 9l. (Young); "Masterpieces of Industrial Art and Sculpture at the International Exhibition of 1889," by J. B. Warren, 4 vols. (Hunt); "Nice Gallery of Marbles"—engravings of the statues, busts, bas-reliefs, gems, bronzes, urns, etc., in the Collection of H. Blundell, 2 vols., nearly 100 plates, 1809 (only 50 copies privately printed), 5l. 12s. 6d. (Gaston); "Antiquities of England and Wales," by Francis Green, 8 vols., plates, 178, li. 15s. (Sotheman); "Environns of London," by D. Lysons, 5 vols., maps, portraits and plates, 1790-1800, 2l. (Edwards).

LONDON COUNTY COUNCIL DRAINAGE BY-LAWS.

The following joint report from the Borough Engineer and the Medical Officer of Health for Southwark upon the suggestion that by-law No. 5 of the series of by-laws made by the London County Council under sect. 202 of the Metropolitan Management Act, 1855, should be repealed, was issued on Tuesday:—

"With reference to the construction of by-law 5 the question of the advisability of amending this law so as to do away with the intercepting-trap is one which must be approached with great care, although there are a great many points in favour of abolishing the interceptor. One of the most important of these is that freer ventilation would be possible, and secondly the question of the intercepting-trap in connection with sewers and decomposing to take place. Both these are important factors, and there is no doubt that under perfect conditions of drains and sewers, with perfectly sound drains and sewers and guaranteed construction, theoretically it would be an advantage to have a free flow of air from the sewer passing up through the outlet or ventilation of the drains. If these conditions are not possible, it would be, in our opinion, a great risk to do away altogether with the interceptor. It is impossible that all sewers and drains shall be absolutely perfect, for, however well constructed in the first place, the work is bound to deteriorate and defects will arise whereby the sewage is held and allowed to decompose and give off dangerous gases which would find their way into private premises. Again, the time for sewage to pass from some distant parts of London to the outfall is such that the sewage must have decomposed when passing through the sewers of other districts. With those unavoidable circumstances, this is one of those unfortunate double arrangements which so often occur in the London County Council by-laws, and which have tended in the past to so many failures in litigation and so much expense to local authorities. The latter part of the section does not explicitly say what is required. In sect. 4 of the London County Council by-laws in the Clapton Buildings, it is stated 'Means of access must be provided at each end of a drain beneath a building.' When this access does not provide adequate means of access to the trap it is stated in sect. 5 'A separate manhole or other separate means of access to such trap for the purpose of cleansing the same shall be provided.' As the by-law does not state it is not compulsory to provide a manhole near the interceptor provided the means of access to the trap is proved adequate, in the opinion of the magistrate, for its cleansing. In places where a number of branch drains concentrate at the front, or where the outlet of the drain is 9 ft. to 10 ft. deep, we think, must be provided to give adequate access to the drain and trap. Differences of opinion exist as to whether

a manhole should be provided in all cases at the outlet of the drain near the interceptor. In the Paddington cases, where a vertical plunging arm was provided on the house side of the trap, it was held by the magistrate that the adequate means required by the by-law had been provided. The practice in Southwark has been on the side of providing a manhole at the front and back of the building in all cases. In all newly-built houses no difficulty whatever has been experienced in obtaining them. In reconstructing drains of old houses, we always demand in our notices these two manholes, but we are frequently met by a refusal on the part of the owner to provide the one at the outlet of the drain near the intercepting-trap, the owner providing in lieu thereof a vertical plunging arm on the house side of the trap and a raking arm to the outgo of the interceptor. We consider that such access to the trap and drain by these two arms is a makeshift arrangement and is quite inadequate when the interceptor is plugged by such things as milk-trins, or where, as we have before stated, many branches concentrate in the front, or where the trap is 9 ft. or 10 ft. below the surface. We have always considered a manhole near the interceptor as absolutely necessary. Our conclusion, therefore, is that while the intercepting-trap should remain, additional powers should be provided for its being constructed in a proper chamber."

Obituary.

MR. GARNER.—We regret to announce the death, on April 30, at his residence, Fritwell Manor House, Oxfordshire, of Mr. Thomas Garner, late of No. 7, Gray's Inn-square, aged sixty-six years. Mr. Garner was a pupil of Sir G. G. Scott, and in 1869 became partner of his fellow-pupil, Mr. G. F. Bodley, R.A. Amongst Mr. Garner's more important architectural works are the following: Churches at Bedworth; Peasdown; and Camerton; additions to Bosworth Hall; a house at Hampstead for Mr. Sidney; a house at Godden Green, Kent; Hewell Grange, co. Worcester, for Lord Windsor; St. Catherine's College, Cambridge—reconstruction of the ante-chapel, repair of the carved woodwork, decoration of the chapel, and designs for the stained glass windows in the chapel; memorial monuments—to the late Bishop Durnford in Clement's Chapel, Chichester Cathedral (February 25, 1899*); the Bishop of Ely, in Ely Cathedral; and the Bishop of Winchester, in Winchester Cathedral; Marlborough School—reading-room and class-rooms, 1898-1900; restoration of Fritwell Manor House, Oxfordshire, for his own occupation; an altar for St. John's, Cambridge; the Empire Hotel, Buxton, at a cost of about 125,000l.; and the chapel and other conventual buildings, Convent of the Visitation, Sudbury-hill, Harrow, after the XVth century Gothic style, 1902. Mr. Garner made designs for the copy of the charter of Archbishop of Canterbury in the coronation of King Edward VII. After the death of Mr. Edward Hanson Mr. Garner was appointed architect for carrying on the building of Downside Abbey Church, near Bath, for which he built the new choir and chancel that were blessed and dedicated in September of last year. Of works by Mr. Garner, Messrs. Bodley & Garner were the architects of St. John's Church, The Brook, Liverpool; River House, Tite-street, Chelsea, completed in 1879; the Master's Lodge, University College, Oxford, 1876-9; the Cathedral, Hobart Town, Tasmania; St. Michael's Church, Camden Town, N.W., begun in 1876 and completed in 1894; restoration of part of the great quadrangle, Christ Church, Oxford, with the Bell Tower, parapet adjoining the Hall, and new entrance from Tom Quad into the Cathedral, 1872-8; Church of the Holy Angels, Hoar Cross, Staffordshire, begun in 1871 (January 6, 1877, two views*); Church of St. Augustine at Pendlebury, begun in 1873 (June 23, 1877*); St. Peter's Church, Harrogate—three windows in the south transept, and the carved and painted rosettes, 1884; New Chapel, Marlborough School (October 16, 1886, interior view, with plan*); reredos and screen, St. Mary's, Nottingham, 1887; Bishop Wordsworth's monument, Lincoln Cathedral (May 12, 1888*); restoration of the chancel, Stratford-on-Avon parish church (September 10, 1892, and the Clapton Chapel*); Medalen College, Oxford—new buildings in St. John Baptist's quad with entrance from High-street, and the new western quod, St. Swithin's, 1889-90 (August 9, 1890*); reredos, St. Paul's, whereof we believe the design is due to Mr. Garner; triptych, St. Albans, Holborn, of which the design is preserved in the Clapton Chapel*); St. John the Baptist, parish church, Epping, 1890-1; decoration of St. Mark's Church, Coventry, and renovation of the interior, 1895; St. Luke's Church, Warrington, for a congregation of 520 persons, 1893; restoration of the interior of Ham House, Petersham, 1889-90; enlargement of the chancel, already long mentioned by R. J. Withers, in 1890; the new east end of St. Paul, Knightsbridge, and the new east-end

five-light window (Messrs. Lavers & Westlake); Gothic reredos, St. Barabas, Pinlick; restoration of Laughton Church, Gainsborough, 1896; restoration of the chancel and the Jesus private Chapel, Wilmslow parish church, Cheshire, 1898; and decoration of G. E. Street's Church of St. John the Divine, Kennington. Messrs. Bodley & Garner and Mr. James Murray were architects, jointly, of All Saints' Church, Embsay, Warwickshire. In our numbers of January 9, January 30, February 13, and February 27, 1886, is published a complete set of illustrations of Messrs. Bodley & Garner's competitive designs for Liverpool Cathedral.

MR. WOODTHORPE.—We have also to announce the death, on May 3, at his residence, "Grey shoot," Ferncroft-avenue, Hampstead, of Mr. Edmund Woodthorpe, M.A., Oxon., aged forty-seven years. Mr. Woodthorpe was the only son of the late Edmund Woodthorpe, of Greyshot House, Liphook, Hants. He was elected an Associate in 1882, and in 1892 a Fellow of the Royal Institute of British Architects. In 1881 he was elected a member of the Architectural Association; and he was a Fellow of the Surveyors' Institution. Mr. Woodthorpe was Architect and District Surveyor for the northern division of the City of London; in February last the Court of Common Council appointed him to act as surveyor for the eastern division, vice H. H. Collins, deceased. He was elected a member of the Practise Standing Committee of the Institute for the sessions 1896-7, 1900-1, 1902-3, 1903-4, 1904-5, and 1905-6; a member of the Science Standing Committee, 1904-5; a member of Council, 1904-5 and 1905-6, and a Fellow and auditor, 1896-7. He served for a while on the Executive of the British Fire Prevention Committee, resigning that position in July, 1903; and he gave a liberal subscription to the New Premises Building Fund of the Architectural Association.

MR. LOW.—The death, on May 2, at his residence, No. 17, Upper Park-road, Hampstead, is announced of Mr. George Low, of No. 10, Basinghall-street, E.C., in his eighty-second year. Mr. Low was a pupil of George Smith, and made the plans and designs, after the Early Decorated style, for the Church of St. James, in Knatchbull-road, Canterbury, 1869-70. He was elected an Associate in 1856, and in 1860 a Fellow of the Royal Institute of British Architects.

General Building News.

NEW CHURCH, HORSNEY.—Lady Donaldson recently laid the foundation-stone of a new church in Priory-road, Horsney, destined to be a chapel-of-ease to the parish church. The total cost of the complete church will be 8,000l., but only the western portion is now being erected, and this will cost 5,500l. The building, when completed, will consist of nave 81 ft. long and 27 ft. wide, aisles of same length and 12 ft. wide, terminating eastwards by transepts, chancel 42 ft. long and 24 ft. wide with apsidal east end, morning chapel 40 ft. long by 14 ft. wide, and a room suitable for parish meetings, etc., 41 ft. long and 18 ft. 4 in. wide, divisible by movable screen into clergy and choir vestries, and with an outside entrance on south side. The style of the building is Early Decorated Gothic, and the material principally used red brick, with which the walls are to be faced outside and inside, relieved by Weldon stone dressings. The stone for the pillars and arches, etc., will be Guiting stone. The roofs of nave, chancel, and chapel will be of arched form, with tie-beams and curved braces to the nave principals, and covered with red tiles outside. The floors will be of wood blocks under seats, and marble mosaic in chancel and passages. The portion now in course of erection will comprise the nave, and aisles with transepts, providing accommodation for over 500 persons. The completed church will provide for about 750 persons. The architect is Mr. J. S. Aldrich of London, and the builders are Messrs. C. Miskin & Sons, of St. Albans.

BAPTIST CHURCH, ABERTILLY.—The dedication services of the new Blaenau Gwent Baptist Church, Abertillery, took place on Sunday last. The new church is of Gothic design. The front elevation is faced with pitched-face shoddes, and the windows of the dressing to the windows, steps, etc., are of grey Forest of Dean stone. The chief feature externally is a seven-light tracery window, with turrets right and left, rising 45 ft. above the ground. Access to the ground floor of the church is obtained through four entrances into lobbies. A church parour has recently been provided with a separate entrance from outside. The baptistry is placed in the rostrum, from which direct access to two special vestries can be gained by candidates after immersion. There are three separate entrances to the galleries. The chapel floor has a fall of 18 in. from vestibule entrance to sacristy. The internal dimensions on the ground floor of the chapel are 66 ft. by 51 ft., and the total seating accommodation is about 1,200. The pews have been specially designed by the architect, Mr. N. Gasenius, Lwis,

* Illustrated in the Builder.

Aberlilly. The whole of the interior wood-work is pitch-pine, and the roofs are partly open and boarded. Mr. W. A. Linton, Newport, has carried out the work of erection under the personal supervision of the architect.

PRESBYTERIAN CHURCH, NEWCASTLE.—The foundation-stone of new Presbyterian church buildings, which are to be erected in Wingrove-road, Newcastle, was laid on the 2nd inst. The new buildings are part of a scheme at the corner of Wingrove and Hadrian roads. The buildings consist of a church hall, small hall, church officer's house, and other rooms. Seating accommodation will be provided for over 400 in the large hall, and for about eighty in the smaller hall. Externally, the building is of stone, with a large tracery window in the front gable. The contractor for the work is Mr. Thos. Weatheritt, of Newcastle; and the architects, Messrs. Cockett & Burns Dick. The cost of site, buildings, and furnishings, etc., will be about 4,200.

CONGREGATIONAL CHURCH, LONGTON.—A new church has been erected by the Congregationalists of Longton at a cost of 2,500, on a site in Caroline street. The new buildings have been erected by Messrs. Tompkinson & Bettelley, to the designs of Mr. E. Forshaw, of Uttoxeter. The main frontage is of Ruabon brick, relieved with buff dressings. In the church and all rooms on the ground level the floors are laid with pitch-pine blocks. Chairs will be used in the church instead of pews. The open roof design is adopted with the main spans resting on carved corbels. For the schools there is classroom accommodation, and two halls. The whole of the buildings are heated with a low-pressure system of hot water pipes, and the artificial light is incandescent gas.

CHURCH RESTORATION, MARTON, LINCOLNSHIRE.—St. Margaret's Church, at Marton, Lincolnshire, is to be restored. A scheme has been prepared, and the work entrusted to Messrs. Harold Bailey & Wood, of London and Newark.

CHURCH ENLARGEMENT, STRETFORD.—Some time ago a scheme providing for the enlargement of All Saints' Church and school, Stretford, was agreed on. The school has been completed, and now the tender has been let for the enlargement of the church by the construction of a south aisle terminating in a chapel with clergy and choir vestries. Accommodation will be increased from 330 to 520, and the cost of the addition and furnishing will be about 1,500. The architects are Messrs. J. Gibbons & Son, Manchester, and the contractor Mr. W. Thorpe, Old Trafford.

CHURCH RESTORATION, BISHOP MIDDLEHAM.—On Saturday last the parish church of St. Michael's at Bishop Middleham was re-opened by Dr. Moule, Bishop of Durham, after having been renovated and restored. The total cost of the renovations is about 1,300. Messrs. Stephen Wilkinson & Crowley, Newcastle-on-Tyne, were architects for the alterations, the work being done by Messrs. G. Graddon & Son, Durham.

BAPTIST CHAPEL, DONCASTER.—A new Baptist chapel, erected in Chequer-road, Doncaster, was opened on the 3rd inst. by his Honour Judge Willis, K.C. The chapel, which is in the Perpendicular style with a tower and spire, was erected by Messrs. H. Arnold & Sons, of Doncaster, from designs by Messrs. J. Willis & Sons, of Derby, the amount of the contract being 3,132.

SECONDARY SCHOOL, BAINTREE.—A new secondary school is being built at Baintree. The work is being carried out from plans prepared by Mr. Wylseham Chancellor, architect, and the builder is Mr. J. McKay.

COUNCIL SCHOOLS, HUNTINGDON.—New schools have been erected by the Huntingdon County Council at Huntingdon. They will accommodate 310 in the mixed department and 140 in the infant department. The cost has been about 5,000. The designs were prepared by the County Surveyor, Mr. Leete, in conjunction with the Organising Secretary, Mr. Cook. The work has been carried out by Messrs. Thackray & Co., Ltd.

SCHOOL ADDITIONS, STRATFORD.—On the 25th ult. the opening of the manual and cookery centre and additional wings at the Bridge-road schools took place. The plans of the whole schools were prepared by Mr. C. M. Shiner, architect, of Grays, under the old School Board, but only a part of the building was erected, at a cost for land, buildings, and furnishing, of 9,985, and it was opened about eight years ago. The present addition completes the original plans together with a centre for manual training and a centre for cookery, at a cost as per contract of 4,488. The whole building has been carried out by Mr. H. J. Carter, of Grays. The school now contains six classrooms and hall on each floor, with teachers' rooms and cloak-rooms for each department, and provides accommodation for 420 girls on the ground floor and 420 boys on the first floor. The manual training-room will be fitted up with benches for twenty boys, and the cookery-room will accommodate fifty-four girls for demonstration and eighteen for practice. The building is now lighted by electricity from the town supply, the work being carried out by Messrs. Pinching & Walton.

SCHOOLS, GAINSBOROUGH.—On the 2nd inst. Mr. James Marshall, J.P., formally opened the

first of the two sets of County Council Schools with which Gainsborough is to be provided. The schools, which were built by Messrs. Moss, of Loughborough, from the plans of Messrs. Gamble & Scorer, of Lincoln, are to accommodate 934 children at the south end of the town. The cost of the schools will amount to 8,700, exclusive of site and furniture.

COUNCIL SCHOOL, BROOKWOOD.—The new school at Brookwood was built to accommodate 150 mixed scholars and 100 infants. It consists of five classrooms for fifty children each, 20 ft. wide by 25 ft. long, leading out of a central hall 47 ft. long by 21 ft. wide. The girls' and infants' cloakrooms are at the west end of the building, that for the boys at the east. The school is heated throughout by radiators, and the floors are of wood blocks. The classrooms are separated from each other and from the central hall by glazed screens. The first floor consists of two teachers' rooms and store and cistern room. The buildings are built of red brick with tiled roofs, the exterior of the first floors being in rough cast. The architects are Messrs. Jarvis & Richards, Architects to the Surrey Education Committee, and the work has been carried out by Messrs. T. J. Hawkins & Co., Westminster.

CONVALESCENT HOME, HARGRATGE.—The new convalescent home of the Durham County Hospital was opened at Hargrattge on the 25th ult. The building is of red brick with stone facings, and apart from the basement, in which are the kitchens, etc., is two stories high. On the ground floor is a sitting-room and smoke-room for men, and sitting and workroom for women, dining-room, dispensing-rooms, matron's sitting-room, and other accommodation. On the first floor are three sleeping wards for females and two for males, also two bath-rooms, and the rooms, the accommodation being adequate for upwards of a score of patients. Mr. W. T. Jones was the architect, and Mr. F. Caldwell the clerk of works. The cost was about 7,000.

COUNCIL OFFICES, PONTYPRIDD.—The new public offices erected by the Pontypridd District Council, at a cost of about 6,000, have been opened by Sir Alfred Thomas, M.P. The building is situated in Gelliwasl-oad-road. The frontages are faced with native stone, with Forest of Dean dressings, and the roof is tiled with Precely slates. The building is fireproof. The windows are fitted with iron casements, glazed with leaded lights, whilst those in the council-chamber are of stained glass bearing various coats of arms. The corridors and main staircase are paved with Hopton Wood stone, and the floor of the ante-room is of black-and-white marble. The building is lighted throughout by electricity, the fittings in the principal rooms having been specially designed. Heating is by the low-pressure system. Mr. Watkin Williams is the contractor, and the architect is Mr. Henry T. Hare.

PUBLIC LIBRARY, BEVERLEY.—A new public free library has just been completed at Beverley and will shortly be opened. The work has been carried out under the supervision of Mr. John Cash, architect, of London. The building contractor is Mr. G. Pape, of Beverley, and the sub-contractors are Mr. Robert Pape, Beverley (stonework), King & Co., Beverley, and Darlington School Furnishing Company (fittings), Robert Canby, Beverley (painting).

HOSPITAL EXTENSION, PORTSMOUTH.—The Mayor of Portsmouth recently laid the memorial stone to the additions that are being made to the Royal Portsmouth, Portsea, and Gosport Hospital. Messrs. Young & Hill are the architects, the builder being Mr. H. Jones.

MECHANICS' INSTITUTE, PONTARDULAI.—Sir John T. D. Llewelyn, Bart., on Saturday last opened a new Mechanics' Institute at Pontardulais, which has been erected at a cost of 2,000. The institute is to replace the old reading-room erected many years ago by the tin-plate workmen. A competition for designs was advertised about two years ago, and the plans of Mr. W. Beddoe Rees, architect, Cardiff, were accepted. On the ground floor is provided a meeting-hall, capable of seating about 250, as well as a reading-room fitted up with newspaper stands, etc., and a lending library. Both rooms are provided with old-fashioned angle fireplaces. On the first floor are arranged the committee-room, entrance to gallery of hall, and a billiard or recreation room, opening from which is a small coffee-bar. On the top floor are the caretaker's rooms. The work has been carried out by Mr. Daniel Jones, Pontardulais, under the supervision of the architect.

CHURCH, MAESTEG.—At a cost of 8,500, the Roman Catholic congregation at Maesteg are erecting a church and schoolroom. The church will seat 450. The turret will be 50 ft. high, with a porch on each side; all the dressings will be Bath stone, and the facings composed of Port Talbot blue. The interior is to be finished with Early Gothic design, with two main entrances in Garv-road and Rock-street. On the north side will be the dome, which will contain the entrance to the gallery, organ loft, and baptismal font. The main nave will be about 60 ft. in length and 34 ft. wide, and the chancel about 24 ft., with room for three aisles to be erected. The architects are Mr. Powell Pugin, of Messrs. Pugin & Pugin, London, and the contractor Mr. John O'Brien, Maesteg.

Stained Glass & Decoration.

CHOIR-STALLS, ST. CUTHBERT'S CHURCH, CARLISLE.—New choir-stalls have been placed in this church. They are of solid mahogany, and contain a series of carved panels, the work of Mr. Knox, of London, which run round them; whilst at each corner of them, at the entrance to the chancel, is the figure of an angel. The work was designed by Mr. J. H. Martindale, architect, and carried out by Mr. George Black.

MEMORIAL WINDOW, CHADDLEWORTH.—A window has been erected in memory of Christopher Chardin Wroughton, in the parish church at Chaddelworth. The window is from the design of Mr. Westlake. It is at the west end under the tower, and is in four panels, the upper two depicting angels in the presence of God. The two lower panels represent Christ calling and blessing little children and the mothers parting with their little ones to go to Him.

Appointments.

COMMISSION OF WORKS, SUEZ CANAL.—The election is announced of Mr. Anthony G. Lyster, Engineer-in-Chief to the Mersey Docks and Harbour Board, as a member of the Consultative International Commission of Works of the Suez Canal, vice Sir John Wolfe Barry, retired.

NATIONAL GALLERY.—The appointment of Sir Charles Holroyd as Director of the National Gallery is announced. Sir C. Holroyd, who thus succeeds Sir Edward Poynter, P.R.A., was knighted in 1902, and has been keeper of the Tate Gallery, Millbank during some years past.

Sanitary and Engineering News.

NEW DOCKS ON THE TEES.—Two graving docks are about to be constructed at Cargo Fleet by Smith's Dock Company, who intend to remove their ship-building works from North Shields to Teesside. The new docks will be both 25 ft. deep, and will be 550 ft. long by 66 ft. entrance, and 450 ft. long by 60 ft. entrance, respectively; whilst the plans will provide for the enlargement of the docks hereafter should occasion arise in view of increased traffic in the river.

A NEW NIAGARA BRIDGE.—As part of a scheme for a double-track express railway line, to be worked by electricity, from Buffalo to Toronto, and passing through Hamilton and Port Dalhousie, a Bill will be introduced in the Albany Senate and Assembly by the International Railway Company of Buffalo and the Toronto Railway Company, for the incorporation of the Trans-Niagara Bridge Company, with a capital of 1,000,000 dol., with the object of constructing a bridge across the Niagara river below the falls.

SEWERAGE SCHEME, PENISTONE.—Penistone's main sewerage scheme, estimated at a cost of about 9,200, has just been opened. Altogether about four miles of sewers, with nearly 100 manholes, flushing tanks, and storm overflows, have been constructed. The total cost of sewers is about 6,200. The district is sewered by gravitation, and in order to make this possible it has been divided into drainage areas, each by its own main sewer, one of which takes the part known as Cubley Brook. The second drains High-street, Market-street, and Sheffield-road, and the third drains the Bridge end district. The main sewers are all brought to one point near the river Don at Spring Vale, where the sewage works are constructed. The sewage disposal works have been designed to treat daily 120,000 gallons of sewage or twice the daily dry weather flow from the district. The works are on the bacterial system, consisting of open septic tanks, capable of holding one day's dry weather flow. From these the sewage passes by way of an open channel into a chamber, where the mechanical works distributes it intermittently on to three circular percolating filters by means of revolving sprinklers at the rate of 168 gallons per cubic yard of filter per day. The filters consist of shells of honey-combed brickwork, filled with screened clinker obtained from the local steel works. The automatic distributing apparatus was made and manufactured by Messrs. Mather & Platt, Manchester. A filter has also been constructed for dealing with the storm water when the volume of the flow exceeds twice the dry weather flow. This is of concrete filled with clinker, and the sewage is distributed by means of stationary automatic distributing apparatus per square yard. There are also filters provided for draining the sludge from the septic tank, the liquid being pumped back for retreatment. Two acres of land have been provided for further treatment of the effluent by natural filtration if it is found to be necessary. The cost of the disposal works is about 3,000, making, with the 6,200 for sewers, 9,200, altogether. The engineers are Messrs. Spinks & Pilling, Leeds.

The case was reported in the issues of the *Builder* of July 23 and 30, August 6, December 17, 1904, and May 5, 1906, and the facts of the case have been sufficiently stated.

Mr. Hughes, K.C., and Mr. Vernon appeared for Dr. Jolly; and Mr. P. Ogden Lawrence, K.C., and Mr. Cann for Mrs. Kine.

At the conclusion of the arguments of counsel judgment was reserved.

DISPUTE AS TO THE APPROVAL OF PLANS.

The case of the King v. the East Stonehouse Urban District Council came before a Divisional Court of King's Bench, consisting of the Lord Chief Justice and Justices Ridley and Darling, last week, for argument on a rule nisi for a mandamus granted at the instance of the Plymouth Mutual Co-operative Society, calling upon the Urban District Council to show cause why they should not be ordered to approve of certain plans submitted by the Society for the erection of a slaughter-house on the Society's premises in Water-lane, East Stonehouse.

It appeared that for the purposes of its business the Society had, since November, 1900, used a slaughter-house in Water-lane within the Urban District Council of East Stonehouse, and in April, 1903, Mr. H. J. Snell, a Plymouth architect, prepared plans for the erection of an abattoir, to be constructed in modern fashion, the structure to be used for the treatment of tripe and other animal fat of beasts slaughtered on the premises. The machinery was designed by Messrs. Wm. Douglas & Co., of Putney, and the plans were presented to the Council for approval. The Council, however, refused to approve the plans, and the Society agreed to certain conditions which included arrangements as to the height of the chimney so as to guard against nuisance and the surrendering of certain land without compensation. These conditions were modified in certain respects, the modifications being accepted mainly in reference to the structure itself, but the Society refused to surrender the land without compensation. A rule was obtained in July last calling upon the Council to show cause why the plans should not be approved on the grounds that there was no proof that any existing by-law would be infringed thereby; and also that the conditions imposed were *ultra vires*.

Mr. Danckwerts, K.C., on behalf of the Local Authority, submitted that owing to the time that had elapsed—1903 to 1905—the Society was not entitled to take these summary proceedings. The Society, he said, was not disinclined properly and fairly to consider any plans that might in future be submitted to them by the Society. He contended that the Court ought not to interfere with the administration of the District Council's affairs which was carried out purely in the interests of the local public.

Mr. Macmorran, K.C., in support of the rule, said the reason for the delay in taking proceedings was the fact that negotiations had been going on between the parties from 1903 up to the time the rule nisi was granted. He contended that as the Society's plans did not break any of the regulations prescribed by the by-laws, the District Council had no power to refuse its approval of the plans.

The Lord Chief Justice, in giving judgment, said the District Council and the Society had been considering the matters in question from 1903 to 1905, and, so far as any complaint as to nuisance went, the Society had tried to meet the District Council. The negotiations showed that it would be unfair and unwise to deal with the matter in respect of what was proposed in 1903, but he had come to the conclusion that there was not sufficient grounds for asking them in 1905 to deal with the plans submitted in 1903. He thought that the rule for a mandamus should be discharged, but without prejudice to any future application which might be made by the Society. He thought that some of the conditions sought to be imposed might be open to objection, but owing to the fact that a long period had been allowed to elapse, he was of opinion that the rule should be discharged without costs.

Justices Ridley and Darling concurred, and the rule was accordingly discharged without costs.

ACTION AGAINST THE SOUTHEAST CORPORAION.

It is the Court of Appeal, before Lords Justices Vaughan Williams, Stirling, and Moulton, on the 8th inst., the hearing of the case of Hobart v. Mayor, etc., of Southend-on-Sea, was concluded on the defendants' appeal from a judgment of Mr. Justice Buckley.

The action was brought by Mr. A. J. Hobart for an injunction and for damages in regard to the pollution of the plaintiff's oyster-beds at Hadeligh, near Southend, by reason of sewage coming from the defendants' outfall sewers. Mr. Justice Buckley held that the plaintiff's oyster-beds had been polluted by the sewage and that the defendants had no right to discharge sewage into the estuary in question, so as to cause a nuisance by polluting the plaintiff's oyster-beds. His lordship accordingly gave judgment for the

plaintiff for an injunction and for 1,500*l.* damages. From this decision the defendants appealed.

In the result, the parties settled the litigation by agreeing that the injunction should be discharged, but that the judgment of the learned judge as to damages should stand. It was also agreed that the plaintiff was to have his costs both in the Court below and in the Court of Appeal. The settlement in question comprised all causes of action between the plaintiff and the defendants up to the present time.

Mr. Lush, K.C., Mr. Herbert Smith, and Mr. Fletcher appeared for the appellat Corporation; and Mr. Macmorran, K.C., Mr. G. A. Scott, and Mr. Wallace Atkins for the respondent.

THE LONDON BUILDING ACT.

MR. ROBERT HODGKIN, of London Wharf, Ratcliff, appeared before Mr. Dickinson, at Thames Police Court, on the 4th inst., to answer an adjourned summons, taken out at the instance of the London County Council, for neglecting to comply with the requirements of the London Building Act, by allowing a boundary fence to be at a less distance from the centre of the roadway than required by the said Act.

Mr. Ryland Atkins, barrister, represented the London County Council; and Mr. Cranston, barrister, defended.

It was stated that Narrow-street, Linchouse, was a thoroughfare of considerable length, and was crossed in three places by docks or waterways. At Dowson's Dock, belonging to the defendant, there was a swing bridge, and during the last fifty years it had been usual when the bridge was open to make other arrangements for the traffic; but Dowson's Dock had now fallen out of use and been filled up. Four or five years ago the defendant put up a notice that it was a private bridge; and he was now building on the south side a warehouse, which was the subject of that summons.

Evidence was called showing that it had been a highway from time immemorial, and the bridge, which was a part of the public highway, had been uninterruptedly used for years; therefore, it was contended, the Council was entitled to see no fence was erected within 20 ft. of the centre of the roadway.

The defendant gave evidence, and stated that in July, 1903, he purchased the dock in question; and the bridge was his own property. His land extended from the river Thames, right under the bridge, to Northley-street. When he took possession of the property the boarded fence on the north side was the same as at the present time, and on the south side were iron railings. With regard to the latter, he had them taken away, and a hoarding substituted, because there was a danger to the people who were in the habit of congregating on the bridge. Every part of the boarded fence rested on the bridge. The Stepney Borough Council were engaged in widening Narrow-street, and the frontages had been put back on the north side. His bridge was 11 ft. or 12 ft. wide, and was over 70 ft. in length. He had agreed to sell to the Borough Council the bridge in question, and some of the land on the north side. He was to be paid 1,500*l.*, but the County Council stopped him building, and subsequently he had notice to remove the fence.

By Mr. Adkins: The public had the right to use the bridge under certain conditions.

Mr. Adkins: The Council were not unreasonable in the matter.

Mr. Dickinson: We can form our own opinion about that matter.

Mr. J. Knight, surveyor, having given evidence, respecting the negotiations, said he had known the bridge for fifty years. The fence on the south side was a part of the bridge, and the street was to be widened on the north side.

Mr. Dickinson said he was prepared to give his decision at once, but suggested the matter should be adjourned in order that the Stepney Borough Council might reconsider Mr. Hough's offer with regard to the amount of compensation to be paid him.

The case was accordingly adjourned.—*Morning Advertiser.*

Patents of the Week.

APPLICATIONS PUBLISHED.*

5,051 of 1905.—A. KNOX: *Window Sashes.*
This relates to window sashes in which the sashes may be arranged upon a pivoted holder, the arms of which holder may, if desired, differ in length, and the pivot may be disposed centrally in relation to the sashes or above or below the centre or meeting rails of the said sashes. The upper rail of the upper sash and the lower rail of the bottom sash are each provided with laterally projecting pins adapted to slide in grooves formed in the styles pertaining to the respective sashes, the said sashes being separated by a central strip or fillet. In order to provide for the turning of the upper

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

sash the styles are formed in a second groove arranged diagonally or transversely to the before-mentioned groove. The diagonal or transverse groove is bisected by the central separating strip or fillet which may be rendered detachable by any suitable means, such as a thumb screw or the like. The lower sash may be similarly arranged so as to be capable of turning. The thumb screw may consist of a screw stem having a collar locked or held in a fixing plate adapted for being carried by the strip or fillet, the screw working in the style and effecting the displacement of the fillet without resulting in the detachment of the screw from the fillet.

8,102 of 1905.—L. P. FRIESTEDT: *Metal Sheet Piling.*

This relates to metal sheet piling, and consists of a wall structure composed of a series of I-beams sections joined together edgewise, the face sides of the cross-flange abutting, and angle clamping irons rigidly mounted on alternate sections and overlapping the flanged edges of the joining sections.

18,418 of 1905.—J. BOARD & CO., LTD., and C. J. GOODLAND: *Roofing Tiles.*

This relates to roofing tiles of the kind having a longitudinal groove and flange lip along the underside of one of its edges and a similar groove and flange or lip along the upper side of the opposite edge, the grooves and lips being designed for enabling the edges of adjacent tiles to interlock. There is provided on the top and bottom faces, ridges, these ridges being four in number on each face, that is to say, one on each meeting edge thereof, and two in the middle so as to furnish three recesses on either side of the tile, the ridges on the end surfaces of the tile being intended to fit into the recesses of the top part of the tile.

22,571 of 1905.—A. WATTS: *Construction of Buildings as used for Sanitoriums, also Applicable in the Construction of Coops, Kennels, and the like.*

This relates to a building or structure for use as a sanitorium or the like with the upper portions of its walls formed with boards arranged at a slight distance apart in two or more rows and those in one row coming opposite the openings in the other row, and said structure also provided with a sloping roof of corrugated iron which at its apex is covered by a ridge.

22,883 of 1905.—G. W. MACKENZIE: *Apparatus for Raising Water.*

This relates to an apparatus for raising water, comprising a tank connected with a source of water supply, a separate vacuum chamber provided with air compressing means, a pipe connecting said vacuum chamber with the tank, and means for preventing entrance of water into the vacuum chamber.

1,777 of 1906.—O. WILHELM: *A Device for Ascertaining the Position of Joints in Dwelling or Other Rooms.*

This relates to a device for ascertaining the positions of joints in the walls of dwelling and other rooms, the distinguishing feature being the arrangement in certain places on the wall of marks or of fillets, strips or the like, provided with marks which indicate the positions of the joints, so that by joining two corresponding marks, which can be effected by means of string, wire, or the like, the position of the joint at a place in the wall lying between these marks can be ascertained.

1,896 of 1905.—A. F. DUTTON and R. H. DUTTON: *Fastener for Windows, Fanlights, Doors, Drawers, and the like.*

This relates to a fastener for windows, fanlights, doors, drawers, and the like, of the kind which automatically comes into action to fasten, and is characterised in that the action of opening the said window or the like automatically operates upon the fastener to set it, so that the closing of the window or the like again brings about the automatic operation of the fastener to lock or fasten the windows.

2,370 of 1906.—S. W. WINGFIELD: *Brick for Building Short Walls and Cutters.*

This relates to an angle brick, comprising parts constructed integrally in one piece adapted to form portions of two adjoining walls which meet at an angle in which the surface of connexion with other bricks are at portions of their length chambered for the insertion of dowels.

25,829 of 1905.—F. C. SUSTINS: *Laying of Wood Floors.*

This relates to floor boards provided with dovetail, ogee, or equivalent interlocking edges for the purpose of locking such boards closely together laterally when laid.

25,352 of 1905.—A. P. BOSSERT: *Floors, Ceilings, and Walls Constructed of Artificial Stone and like Materials, Reinforced with Metal.*

This relates to a method of constructing reinforced floors, ceilings, or walls, wherein hollow blocks, tiles, or the like, forming the said floors,

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this list, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv; Contracts, iv, vi, viii, x; Public Appointments, xix.; Auction Sales, xxx. Certain conditions, beyond those given in the following information, are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

Competitions.

JUNE 30.—WENNSY.—SCHOOL.—The School Board of Wennsy invite competitive plans for the erection of an elementary school of East Wennsy, to accommodate not less than 600 senior pupils. The school to be erected on the site presently occupied by the infant department of the present school. Plans to be lodged not later than June 30 with Mr. A. Watson Taylor, Clerk to the Board, East Wennsy, from whom any additional information may be had.

*** JULY 2.—LIVERPOOL.—SCHOOL.**—The Liverpool Education Committee invite plans and designs from architects for new secondary school for girls at Alchurch Vale. Applications for conditions of competition (with particulars of premiums offered, etc.) should be made to the Town Clerk, Municipal Offices, Liverpool, with deposit of 1l. 1s. Plans to be submitted on or before July 2.

*** JULY 4.—WARRINGTON.—SEWERAGE WORKS.**—The Warlington U.D.C. invite schemes (with plans, specifications, and estimates) for main sewerage and sewage-disposal works for the parish of Warlington (including the town of Emsworth, Hants). Premium of 100l. is offered for the scheme and estimate selected as first, if approved by the Local Government. In the event of the scheme being carried out the premium will form part of the engineer's commission; 50l. is also offered for the scheme selected as second. Plans, specifications, and estimates to be addressed to the Clerk, Council Offices, Queen-street, Emsworth, not later than July 4.

Contracts.

BUILDING.

MAY 12.—CWOUD.—CHURCH BUILDING.—For rebuilding the nave and restoring the tower of Parish Church of St. Michael, Cwoud, near Chirkhowell, in the parishes of East and West Cwoud, to Messrs. Hunt & Baldwin, architects, 4, Warren-street, Stockport, on or before May 12. Quantities supplied.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters,
and papers read at meetings rests, of course, with the
authors.
We cannot undertake to return rejected communica-
tions, and the Editor cannot be responsible for
drawings, photographs, manuscripts, or other docu-
ments, or for models or samples, sent to or left at this
office, unless he has specially asked for them.
Letters or communications (beyond mere news items)
which have been duplicated for other journals are NOT
DESIRED.
All communications must be authenticated by the
name and address of the sender, whether for publica-
tion or not. No notice can be taken of anonymous
communications.
We are compelled to decline pointing out books and
giving addresses.
Any commission to a contributor to write an article,
or to execute or lend a drawing for publication, is given
subject to the approval of the article or drawing, when
received, by the Editor, who retains the right to reject
it if unsatisfactory. The receipt by the author of a
proof of an article in type does not necessarily imply its
acceptance. The Editor cannot undertake to read and
consider articles offered for acceptance unless they are
type-written.
All communications regarding literary and artistic
matters should be addressed to THE EDITOR; those
relating to advertisements and other exclusively busi-
ness matters should be addressed to THE PUBLISHER,
and not to the Editor.

MEETINGS.

FRIDAY, MAY 11.
Royal Institution.—Professor J. H. Poynting on "Some
Astrophysical Consequences of the Pressure of
Light." 9 p.m.

Essex, for inspection of a wharf being constructed in
ferro-concrete. Train leaves Fenchurch-street (London,
Tilbury, and Southend Line) at 2.40 p.m.

PRICES CURRENT OF MATERIALS.

* * Our aim in this list is to give, so far as possible, the
average prices of materials, not necessarily the lowest.
Quality and quantity obviously affect prices—a fact
which should be remembered by those who make use of
this information.

BRICKS, &c.	
Hard Stocks.....	1 8 0 per 1000 alongside, in river.
Rough Stocks and Grizzles.....	1 5 0 " " "

The Paris Salons.

EITHER of the two Salons can be said to be at its best this year; in the New Salon especially the works that are of any real interest are few and far between,

and in the Old Salon there cannot be said to be any work which in importance and excellence combined is of the highest rank; many of the best things, artistically speaking, are to be found among the smaller paintings which, though admirable in themselves, do not come into the most important class of pictures of the year. Yet, for a visitor who has the patience to pick them out from among the crowd of exhibits, there are plenty of good pictures to be found.

The large room (L)* at the top of the second staircase contains, as usual, two or three immense decorative paintings which are commissions for the decoration of public buildings. The most important of these is M. Roussel-Géo's painting of a street scene in Paris the day after the taking of the Bastille, intended for the Council-room of the Hôtel de Ville of Ivry. It represents a joyous crowd, with the street architecture as a background, running, shouting, waving flags and

emblems, etc.; it is entirely realistic as to drawing, but is kept in a very low and light key of colour, which removes it from realism, and the whole effect is sufficiently bright and decorative. M. Delacroix' long pastoral picture for the Salle des Fêtes of the Hôtel de Ville of Solesmes has a fine restful effect, and the groups are interesting in themselves; it is in fact a long harvest field, the horizon marking a level line along the centre of the composition, and occupied by separate groups designated (from left to right) "Fiançailles," "La Moisson," "La Voiture" (the hay-cart), "Les Glaneuses," and "Sérénité"—the last represented by a shepherd, with his sheep folded, watching the rising moon. There is both decorative effect and poetic suggestion in this. But the most important decorative exhibit is that of M. Henri Martin, who has a whole long room (XVI.) to himself for his decorations for a gallery in the Capitol of Toulouse, together with 87 small figure and landscape studies which went to the making of the two large pictures. These occupy the two long sides of the gallery, painted in M. Martin's well-known *pointilliste* manner, the paint laid on in thick ridges (no wonder the colour-shop trade is said to be a prosperous one in Paris). One side represents the river with the town on the further bank, in a glow of rich colour; in the foreground the nearer bank is peopled with various promenaders whose costume is not of a decorative character, but the whole effect of colour and sunlight is very fine; and the other picture, which represents the fields and reapers, with wooded hills

beyond and the long shadows of the trees across the foreground, is beautiful both in general effect and in the design of the figures and groups. The whole is a really great achievement in decorative painting. M. Quost's "Panneau Decoratif" for the Ministry of Public Instruction (XXXIII.) is not symbolical of public instruction but is simply decoration—a long panel broken by a pilaster near each end, in which groups of flowers spring up along the front in one plane but of irregular heights; garlands are festooned along the top of the canvas, and in the rear is a faint hazy background of woodland, with an architectural balustrade curving out on each side to the centre of the picture—all this kept in faint and delicate tones; the result, as a wall decoration, is exceedingly pretty; two smaller panels of the same type are exhibited in the same room. The Old Salon also contains two or three of the class of designs to be executed in Gobelins tapestry which the French artists, or some of them, understand so well. The most important of these is M. Cormon's Jean de Berry buying objects of art at Bruges, only the landscape background is too pictorial in character for tapestry; it was probably considered necessary to show the town as a background; but the foreground, with its assemblage of rich detail, presents work admirably suited for translation into tapestry.

Two of the largest and most prominent pictures of the year are mistakes; both by eminent painters, one of them pre-eminent, if we may put it so. M. Gervais, who has painted finely some

*The numbers in brackets throughout this article represent the number of the room in which the work mentioned is to be found, which may be useful to any of our readers who intend to visit the Salon. To give the catalogue number of a work is useless, as the numbers follow no order, and the finding of them is a mere matter of chance.

great subjects of antique legend, has chosen this year to represent the ill-behaviour of the Centaurs, at the marriage of Hippodamia (XVII.), when, having drunk too freely, they seized on the ladies and carried them off. The picture is, of course, a tumult of galloping and overthrown figures, hard in execution and too grotesque to be agreeable; drunken and shouting Centaurs come out too realistically in painting, they do better in sculptured metopes, where there is no attempt at illusion. The other picture referred to, by M. Rochegrosse, is a production one regrets to see from a man who has done some really fine things: it is entitled "La Joie Rouge" (XXXIII.), and appears intended to symbolise the outbreak of the savage instinct in human nature; a horde of furious figures surging from the back of the scene and trampling over and killing women and children in wanton slaughter. As a work of art it has nothing to recommend it; it is violent, coarse, and exaggerated both in action and colour; but this offensive production is labelled "Acquis par l'Etat"; why, it is difficult to understand. The State and municipal purchases out of the Salon seem to be in general prompted by the desire to secure pictures which point a moral suitable for the instruction of the crowd in public galleries—at least, that is the only way to account for most of them; but what moral is to be pointed by M. Rochegrosse's fantasia of slaughter is a mystery.

Having noticed some of the principal large decorative works, we may now take the rooms of the Old Salon in their order of numbering, just pointing out what is best worth looking for in each, so as to render this article something of a practical assistance, to any of our readers who may be visiting the exhibition, in finding out the best works with less trouble than they might otherwise have, among the crowd of pictures which are of but mediocre interest. In the large (room L.) at the head of the staircase, hang the two large landscapes by M. Didier-Pouget, one of them a repetition of what he has often painted—a high foreground of heather and a valley partly in mist behind it. He has done this as often and as regularly as Mr. Peter Graham has done his Highland hills and cattle, but it is so well done that one can hardly complain of the repetition. His other landscape, a moonrise effect, is rather hard and precise. An interior by a Dutch artist, Herr Pieters, a *genre* picture on a large scale, is worth looking at. Room III. contains two or three good landscapes, and M. Brispat has made an interesting little picture (IV.) out of the readers at the bookstalls on the Quai Voltaire, a little bit of Paris life which was worth preserving. In Room V. we come on one of the most perfect works in its way of the year, M. Bail's interior, "La Laiterie," just a painting of a dairy and its customers, but as perfect in style and execution as any example of the Dutch school in the National Gallery, and yet not so merely realistic; there is a certain breadth of style about it which we do not find in the Dutch School. M. Brouillet's picture of the return of Quinet and Michelet to their lecture-room at the Sorbonne in 1848, and the

cheers of their listeners, after being expelled through political clamour, is a State Commission for the decoration of the Sorbonne, interesting as a historical record, and with plenty of vigour in its representation of the scene, and as such not to be passed over, though not of the highest pictorial value. This room contains two of the best nude studies in the exhibition, by M. Benner and M. Bérond, the latter of whom, by an odd fancy, has grouped a lion with the lady. M. Clairin's "Ame Vivante des Siècles Mortes" is a curious and interesting picture, a kind of allegory; the idea seems to be that of the survival of the spirit of ancient Egypt, above the modern personages sleeping in the foreground; winged visionary figures flutter about, like the ghosts of the past; it is a fanciful and poetic work.

The portrait of M. Injalbert (VII.), the eminent sculptor, by M. Calbet, is one of the most straightforward and unpretending portraits in the exhibition, where the tendency is to over-elaborate portraits with a profusion of ornamental accessories; one can pardon this, however, in such a work as M. Chartrain's sumptuous portrait of the Maharajah of Kapurthala (IX.); the richness of a magnificent oriental costume and equally magnificent throne were too tempting to a painter; and after all, what is an Oriental potentate without his blaze of ornament? M. Injalbert, member of the Institute, may be painted in a quiet grey coat, but an Eastern potentate must have his exterior splendour. But we have passed over the two charming works of M. Paul Chabas (VIII.), of which "La Nagense," a young girl swimming in the sea, no one should miss, the whole thing is so fresh and charming, and so perfectly carried out, even to the effect of refraction on the part of the body that is under water; it is not an intellectual picture, but it is full of the joy of health and beauty. Mme. Demont-Breton's child on the seashore, "Le Coquillage," is in the same room; not quite equal to some of her former works of the same kind.

M. Debat-Ponsan's large picture symbolising two torrents leaping down the rocks (XI.), in the shape of two exceedingly robust young women, is too large to pass over, and the painter has a good name, but his work here is rather amusing than anything else. Far more satisfactory are M. Dupré's two quite small pictures of rural landscape and figures in the same room, which might easily be missed if not looked for, but are quite perfect in their unity of style. A landscape by M. Maurice Chabas, in the same room, is an interesting example of the effect of *pointilliste* execution; it is called "La Rayons Dorés à Port Maneck"; on a near view it looks perfectly dead in surface, like worsted work; but look at it from the other side of the room, and the effect of the light on this ridged surface of pigment gives the effect intended—that of a southern landscape in exceptionally strong sunlight. It is curious to contrast this with M. Biva's two pond and woodland scenes (XII.), which represent the most absolute and uncompromising realism—so real that it is almost optical illusion; not of course the highest form of landscape painting,

but yet if a man has a special talent for this particular kind of effect, it is better he should use it than do something else not so well. A decorative picture for a room in M. Rostand the poet's house, in the same room, should be looked at for its fine colour.

We may skip several rooms now (M. Martin in Room XVI. we have already paid our respects to) till we find in Room XVIII. a landscape of another type from those last mentioned. M. Harpignies' one contribution, "Le Ruisseau," an upright forest landscape with an open distance. Style in landscape painting can reach no greater perfection than this; it is not realistic, it is nature translated into painting, omitting some detail only to get greater unity of effect, and yet the feeling of nature is entirely preserved. If M. Harpignies recalls Constable—a Constable with somewhat more self-restraint and a tenderer feeling for colour, M. Humbert, in his portrait of a lady (XXI.) recalls Gainsborough, and is equal to Gainsborough too. This is a somewhat interesting room in its varieties, for here we have M. Hébert producing a modern Virgin and Child picture almost in the manner of a *primitif*—a beautiful work of its kind both in colour and in its spiritual expression, and a few paces from this we find him exhibiting one of the brightest and most characteristic little portraits of a modern lady to be found in the exhibition, and which should by no means be overlooked, as it easily might be; it is a small picture in one corner of the room, a cabinet portrait. It is rather distressing, after looking at these beautiful and refined works, to see in Room XXIV., one of the angle octagon rooms in which, it must be admitted, the best things are never put, a specimen of what French art of the day can degrade itself to, in M. Gorguet's big ceiling picture for one of the Paris Mairies, representing a sort of Pierrot and Columbine group; a man in a fancy dress with a tall hat, others in fantastic dresses carrying Chinese lanterns; and this seriously and permanently to be painted on the ceiling of a public building at the expense of the Municipality! It is really melancholy; a whitewashed ceiling would be preferable, for it would at least be inoffensive.

Sea-painting is not a strong point with the French; they do not like the sea well enough; but M. Jamar's "L'Océan" (XXVI.) is a really good sea; a coast scene on a cold day grey with a long stormy swell rolling in; and, by the way, the artist is not a Frenchman after all, but a Belgian both by birth and residence. M. Tattégain, who is French to the backbone, also relies this year mainly on a sea-painting, showing a coasting craft, "Désenparé" in a tremendous sea—"désenparé" is a mild way to put it, for she will be swamped by the next wave; but the sea is really fine, and far superior to most storms in French seas, for we do not imagine their sea-painters rough it at sea as ours do, and hence when they imagine a gale they are apt to overdo the sublime; but still, this is a grand and effective painting. We have passed over, in coming to it, one of the most remarkable works of the year, M. Robert-Fleury's painting of Marie Antoinette waking in prison on the day fixed for her execution.

It seems almost too cruel a subject to choose, and yet it is as well that the present generation of Frenchmen, who for the most part glory in the Revolution, should be reminded of the way a high-minded though misjudging queen was hounded down and trampled on. The picture is painted with simplicity and with no striving after dramatic effect; the mere facts as portrayed are enough; the queen in her shabby dress and looking almost old with misery, the female guardian who has a sort of half pity for her, and the warring lot of a sentinel stretching himself in his chair by the window—these look real, and the reality is enough; it is a very impressive bit of historical painting.

M. Zwiller's homage to Henner (XII.) is one of the noteworthy works of the year; it is a very clever imitation of Henner's style, representing the mild and dreamy nymphs whom Henner painted coming to mourn over his tomb. A picture belonging somewhat to the same class is to be found in the large gallery (I.), M. Bérout's imitation of the composition of Veronese's Marriage of Cana, the personages who fill the scene being composed of figures from well known Renaissance paintings, as well as some of the figures of the painters themselves. The idea is well carried out and the picture (not on a large scale) is rich and pleasing in colour, but it is rather a question whether it was a fancy worth the talent displayed over it.

As the Salon authorities profess to have rather made a move lately in the direction of recognising applied art, we may direct the visitor's attention to the case of M. Lalique's work in the middle of Room IX (one of the corner octagon rooms) as an example of the "French taste" which we hear critics belauding so at present. The principal object in this case is a large silver bowl or urn, entirely decorated with, or rather composed of, huge metal lizards, by no means well or delicately modelled, which crawl up the sides, while others form a radiating pattern at the top. Anything more hideous or more detestable in taste it would be impossible to see, and the only thing one would like to do with it would be to treat it as Hezekiah treated the brazen serpent—stamp it down and grind it small to powder. And this is the French taste in decorative work, which our silly newspaper critics talk about and applaud!

The immense array of sculpture in the central court is not, taken as a whole, as remarkable as in some previous years, but it contains some very fine works, of one or two of which we may be able to give illustrations. M. Dubois's monument to Fromentin, to be erected at La Rochelle, is the best of the central series of monuments or memorial works on a large scale; the bust of Fromentin, to which the treatment of the drapery gives great sculptural breadth, is on a lofty stele, beside which an Algerian cavalry soldier rears his horse (Fromentin's life and art were much connected with Algeria). Among the best of the leading works is M. Cordier's fine group "Le Doute," a youth whom a lean sarcastic-looking old man is plying with sceptical criticism; as a piece of expression in sculpture it is remarkably powerful. M. Frémiet exhibits a realistic portrait statue of

Rude, the great sculptor, seated and contemplating a model of his winged figure on the Arc de l'Etoile. M. Michel, a classical sculptor *par excellence*, has a fine figure representing "Autumn"; M. Peyre's group, in one alcove, entitled "Offrande à Venus," is a fine composition; and M. Guilloux has a fine and interesting work entitled "La Nouvelle Muse"; the muse of antique art is seated on a fragment of a Doric column, the new muse (apparently Music) standing by and over her with a countenance expressive of energy and aspiration; it is not only a fine composition but expresses a new idea. There are many other things worth looking at in the vast collection of sculpture, including some powerful and successful treatment of subjects bearing on modern life, in which the sculptor's art is used to express a moral meaning, in some instances with great success and in a manner not at variance with artistic conditions, though this cannot be said in all cases.

The New Salon is a very poor collection, only relieved here and there by a few fine things, such as M. Lhermitte's landscapes (XIII.), M. Iwill's Venetian scenes (X.), some good portraits by MM. Carolus-Duran, Besnard, Gervex, and others. M. Béraud has painted a scene of the expulsion of nuns from a convent (XVII.), which has a present-day interest as a subject picture. Among the large decorative pictures M. Auhurtin's "Orphée" (purchased by the State) is the only real success, but architects may find some interest in M. Koos's ideal picture of building operations, under the significant title, "Mens agitât Molem." Among other things worth looking at are M. Berton's "Femme et Fleurs" (XIV.), a whole room (XVIII.) filled with works by the late M. Carrière—ghosts of pictures, we call them; M. Guillaume's little picture, "Le Reveil" (X.); M. Lerolle's "Femme dans les Fleurs" (VI.); M. Le Sidaner's contributions (XV.) in his usual style of artificial light effect; M. Morissot's "Le Repos" (I.), a fine nude study in a rather unusual style; M. Picard's "Femme dans un Loge" (XI.); and M. Roll's life size "Dragon" and his little idyll "Journée d'Été" (VI.); his "Après la Douleur" one had better turn one's back upon. Some of the things that are hung are beyond belief in their crudeness, ugliness, and absurdity, and lead to the conclusion that it is high time the New Salon were abolished, if it is reduced to filling up its walls in this way.

LIABILITIES OF TRADE UNIONS.

 HE case of Denaby and Cadeby Main Collieries, Ltd., v. Yorkshire Miners' Association, in which the House of Lords have affirmed the judgment of the Court of Appeal, is one of interest when the liability of trade unions is under consideration. The strike, which was the cause of action in this case, commenced in June, 1902, and was advocated by certain branch officials. The men engaged in it were under fortnightly contracts, and those they broke, and in consequence the Supreme Council of the defendant association refused to grant strike pay, and advised the men that the strike was illegal. When, in

July, 1902, the men offered to resume work, they were required to enter into new agreements, which said agreements contained some regulations as to timbering which had been issued by the Home Office. The men objected to these agreements and continued the strike, and in this action they were supported not only by the branches but by the Supreme Council, and the defendant association granted strike pay. It was subsequently held by the House of Lords, in the case of Howden v. Yorkshire Miners' Association, at the suit of one of the members of the association, that this payment of strike pay was not authorised by the rules of the association, and he was granted an injunction to restrain them from further paying it.

The present action, shortly stated, was brought against the association and certain of its members for having instigated the strike and encouraged the men to break their contracts; the jury had found against the defendants on a long series of questions left to them by the judge at the original trial. The facts of the case are too complicated to be entered into in detail here, but the Lord Chancellor carefully considered the relationship of the central authority to the branches and the rules regulating strikes as made by the association; and the House of Lords unanimously came to the conclusion that liability for the action of the branch agents had not been brought home to the central authority, and that the action against the association failed. It is to be observed that no strike pay was authorised until after the period when the contracts between the men and their employers had terminated.

This case having been decided in favour of the Trade Union under the law of agency as it at present exists, may well raise the question as to how far any alteration in that law is really a necessity. If the central authority acts lawfully, and endeavours to restrain its members within the limits of the law, this case shows that its funds are abundantly protected by the law as it stands.

NOTES.

 AN important extension of the scope of the Workmen's Compensation Bill was made in Committee last week. The Bill, as originally drawn, excluded from its provisions employers of less than five men. In other words, the small jobbing builder or plumber was to a considerable extent allowed to be outside its provisions. This limitation has been struck out in Committee, and the Bill when it becomes law will, therefore, apply to workmen of every employer. It would unquestionably be a hardship on a workman that he should not be able to obtain compensation because his master has not half-a-dozen workmen. It is said that the small employer has to pay a much larger premium than the more important employer. It is impossible, however, to say that this is a good reason for excluding his workmen from the benefit of the Bill. If the small employer is liable to pay compensation he is more likely to have sound materials, such as scaffolding, and

if he cannot afford to pay the necessary premium he had better not be in business at all. But, as a matter of fact, the premium will, in one form or another, be paid by the customer. Any such exclusion as first appeared in the Bill could only be temporary, and it is best that the new Act should settle the law for some time to come.

Smoke
Abatement.

MUCH credit is due to the Coal-Smoke Abatement Society for their efforts to dissuade manufacturers and others from the habit of presenting fuel to the inhabitants of London in the unusable and inconvenient form of smoke. In the annual report of the Society presented last week it is pointed out that, during the past year, 1,057 cases of smoke pollution were reported by the society's inspector, and that 1,000 complaints relative to the constant emission of black smoke were forwarded to local authorities. In spite of this, however, only fifty-five summonses were issued, a fact which shows how reluctant public bodies are to perform their duty, in respect of smoke abatement, to the people whose representatives they are. If these lagging councils would take a proper view of their responsibilities, owners of factory chimneys would soon realise the practical economy attending the complete combustion of fuel, and the people of London would have reason to rejoice. It is really a scandal that the most important work of the Society should be the arousing of local authorities to a sense of their responsibilities in this matter.

Preferential
Railway Rates.

THE opinion expressed in these columns when this vexed question has been more than usually prominent, that the evil was rather exaggerated, seems to be borne out by the report issued this week by Lord Jersey's Committee. This body was appointed in response to strong complaints of a general nature to the effect that home industries were being prejudiced by preferential rates enjoyed by foreign competitors, with a view to ascertaining how far these complaints were warranted by actual facts and figures. The conclusions arrived at by the majority of the committee were that the evidence failed to show that the railway companies are giving undue preferential treatment to foreign and colonial produce as compared with home produce, contrary to existing legislation, and that there has been a marked absence on the part of complainants to avail themselves of the existing remedies in the case of any infringement of the law. The latter, they add, is sufficiently strong and effective to justify them in declining to recommend any further legislation—in which they confirm our own impression.

East London
Water Supply.

FROM the proceedings at the last meeting of the Metropolitan Water Board it seems that a serious hitch has arisen with regard to such parts of the Metropolitan Water Board (Lea Valley) Bill as relate to the scheme for the construction of intercepting sewers, sewage disposal works, and a new intake at Feilde's Weir. This is a very important scheme

for the improvement of supplies drawn from the River Lea, and it is to be regretted that the Board have resolved to withdraw it for the present. The fact is that the local authorities in the valley are not willing to co-operate without placing excessively onerous conditions on the Water Board, the War Office have come forward with demands in respect of their works at Waltham Abbey, and numerous petitions have been lodged against the project. As we understand the matter, the new works are only necessary because the local authorities and the War Office have chosen in the past to pollute the river instead of making provision for sewage disposal in a proper manner, and these delinquents now hope to saddle the Water Board with an excessive proportion of the outlay necessary for restoring the river to its original state, so far as practicable, and for giving the inhabitants of East London the opportunity of drinking water instead of sewage solution. We fully sympathise with the anxiety of the Local Government Board that the Bill should proceed, and hope that they will put pressure on those who are responsible for its temporary withdrawal. We all know that district councils object to expend money on such prosaic objects as drainage systems while there is a chance of wasting it upon ambitious undertakings such as council halls, electricity supply works, and tramway systems, but they must be taught their duty to the public, and there is reason for hoping that assistance in this direction will be forthcoming as a result of the new régime established at the Local Government Board.

The
San Francisco
Disaster.

WHILE the amount of damage caused at San Francisco by the recent earthquake is sufficient justification for the prominence given to the subject in the European press, it is worthy of note that similar results followed the convulsion throughout an extensive region along the Pacific Coast. The actual centre of disturbance was near San José, some 50 miles south of San Francisco, where the business portion of the city was wrecked and many lives were lost. No injury was sustained, however, by the buildings or instruments of the Lick Observatory in the same neighbourhood—a fact which speaks well for the shock-resisting qualities of high-class masonry. At Leland Stanford University, 34 miles south of San Francisco, the memorial church, library, gymnasium, power-house, and other buildings were demolished, but the Encina Hall, the chemistry building, and the inner quadrangle remain practically uninjured. At Santa Cruz, 121 miles south of San Francisco, various public and other buildings were destroyed, but no lives were lost. To the north of San Francisco, Santa Rosa and other towns in the Sonoma Valley suffered severely, but others seem to have escaped almost entirely. Owing to the strict rules of martial law in San Francisco no unofficial examination has been made of the buildings in that city and no detailed particulars are available as to the condition of buildings in other places along the Pacific seaboard, but sufficient information is forthcoming

from various sources to show that substantial masonry buildings, as well as steel-frame structures, offered successful resistance to earthquake and fire. The greatest trouble at San Francisco after the first shock was, as already observed, the lack of water owing to the breakage of the mains, and it would certainly be a wise precaution for the authorities to insist upon the provision of a large tank on the top of every building, so as to establish an auxiliary supply of water for the use of the fire department in case of need.

LESSEES of old houses should
Old Houses, note the decision in the
case of *Torrens v. Walker*.

The plaintiff had in 1890 taken a lease of the first, second, and third floors of a house in Glasshouse-street for eighteen years, the lease containing a covenant on the part of the lessor to keep the outside of the house in good repair. In 1905 the walls of the premises, which were some two hundred years old, were found to be so worn as to be dangerous, and the County Council served a notice under the Building Act requiring the owner to take down the front and back walls as being dangerous. The lessee communicated this notice to the lessor, and vacated the premises. The Court, in an action by the lessee for breach of the covenant, held that as there is in law no breach until notice has been given, and the first notice was that above given when the premises were pronounced to be dangerous and irreparable, the lessee had no ground of action for breach of covenant, since the house by that time was impossible of repair. Whether the lessee apart from the covenant has any remedy against his landlord it is not for us to say, but the lesson to be derived from the case is that lessees should not delay in giving their landlords notice of want of repair until the house has ceased to exist as a house.

QUESTIONS arising out of
Drain or Sewer? the distinction between
"drains" and sewers have
not recently been so much before the Courts, but the point arose once more in the case of *Harvey v. Busby* (May 2). The case turned upon the effect of the Metropolis Management Act, 1855, which gives the local authority power to make orders as to the combined drainage of contiguous houses, and which by sect. 250 enacts that drains so combined by order shall be drains and not sewers. In 1878 the owner of three houses in Hackney, numbered 21, 23, and 25, had obtained an order for the combined drainage of these houses. In 1879 an order by the same owner was obtained to drain four other houses by combined drain, these houses being numbered 27, 29, 31, and 33. The plan attached to the application showed that the intention was to drain these into the pipes at the rear of the other houses, which formed part of their combined drainage system. This apparently was never carried out, for it was found that 27 alone was drained with 21, 23, and 25, whilst the remaining houses drained elsewhere. This deviation from the order as approved has had the effect of converting the system behind the houses 21, 23, 25, and 27 from a drain into a

sewer, and a nuisance having occurred by a defect in the pipes behind No. 25, the local authority failed to make the owner liable. The case at present is only shortly reported, and it does not appear what the present ownership of the houses is or who was responsible for this deviation from the order for combined drainage. The addition of one house to the original houses has nullified the effect of both orders, since the houses are differently grouped.

The Surface Finish of Concrete Structures. WITH the object of securing a uniform colour and surface for the exterior of concrete buildings, a mixture of cement mortar and crushed stone is very frequently applied to the outer mould before the concrete proper is deposited. In this way a perfect bond between the facing and the body of the work is assured, and by careful selection of the sand and stone it is not difficult to obtain a finish of satisfactory colour and appearance for concrete work, providing the outer film of cement is washed out before it has thoroughly hardened, so as to leave the sand and stone exposed. The necessary removal of the planks forming the side of the mould can easily be effected by situating the uprights a few inches away from the face of the work, securing the planks by cleats and wedges. In order to prevent the joints between successive layers of concrete from showing, triangular beads are sometimes employed, leaving an imprint along each joint, and relieving surfaces which would have a somewhat dreary aspect if left perfectly plain. This method of treatment has been largely adopted in the United States, and a recent example of it in this country is furnished by the new concrete-steel bridge built by Mr. S. S. Platt, M.Inst.C.E., over the canal at Rochdale.

The Cooling of Cast-Iron. THE changes of volume that take place during the solidification and cooling of metals and alloys, are of much practical importance, and it is to be regretted that the general subject has been so little studied in Great Britain. The paper, therefore, read last week by Professor Thomas Turner, of Birmingham University, to the Iron and Steel Institute should be received with welcome by those who make and use castings—especially iron castings. In American iron-foundries different forms of apparatus have been adopted for measuring the changes of volume of cast-iron from the moment it begins to solidify until it reaches atmospheric temperature, and in this way it has been shown clearly that iron expands before shrinking to its final volume. Professor Turner now gives some results of the experiments conducted at Birmingham University upon iron and other metals, by the aid of very simple and inexpensive apparatus. From the diagrams presented in his paper it is seen that the curves obtained may be divided into four classes, according to the number of arrests observed in the normal rate of contraction. Thus, the curve given by pure electrolytic copper is uniform and there is no arrest of volume as the metal cools; the curve given by white iron exhibits one retardation

during contraction which may or may not lead to actual expansion; and the curves given by grey hematite and Northampton iron show two and three expansions respectively. Of course, other curves than those of the sharp and definite character indicated in these diagrams are obtainable when different mixtures of iron are under examination, and for this reason the method adopted by Professor Turner affords the iron-founder a ready means of checking and controlling his foundry mixtures, and if intelligently interpreted the curves obtained furnish reliable information as to the chemical composition, the hardness, and the strength of the metal.

Wireless Telegraphy. IN the *Journal of the Institution of Electrical Engineers*, published last week, there are two papers of great interest on Wireless Telegraphy by Dr. Erskine-Murray and Lieutenant Tissot respectively. The former describes some of the recent advances that have been made in the application of electromagnetic waves to industrial purposes, and also elaborates a theory to account for some of the recently discovered phenomena. In the first place he accounts for the fact that the intensity of the signals received diminishes inversely as the distance instead of inversely as the square of the distance by making the supposition that the rarefied air in the upper layers of the atmosphere is conducting. Hence the waves, instead of spreading into space, are confined to the lower layers of the atmosphere. It will be remembered that Mr. Tesla made a similar supposition several years ago in order to account for the propagation of signals across the Atlantic. Dr. Murray also accounts for the fact that it is easier to signal at night time than during the day by supposing that some of the radiations from the sun make the air a better conductor for electricity, and so the waves are damped out more readily. He mentioned that on H.M.S. *Vernon* signals had been received from Poldhu at a distance of 180 miles by a wire down one mast, whilst at the same time signals were sent to another ship 50 miles away by a wire from another mast. It appears to be easy to arrange so that many stations can send signals simultaneously without interfering with one another, but it would be easy for an expert to time his receiver so as to intercept any of the signals being sent. At present secrecy can only be obtained by using a code for the signals. It is interesting to notice that the power required for the new Machrihanish station in Cantyre for signalling to America is about 70 horse-power, whilst it is rumoured that Marconi will use 200 horse-power in his new Transatlantic stations.

The Growth of Wiesbaden. FEW places in Germany increase more than the town of Wiesbaden. It was only three or four years ago that the fine theatre and opera-house, with its magnificent foyer, was opened. Now the Kurhaus is being rebuilt. When completed it will be a large building, with a central block surmounted by a dome, and with two long wings. The lake in

the grounds has been drained, and will be laid out as gardens and shrubberies. When this building is completed there will be few places in Europe with a finer *ensemble* than this part of Wiesbaden. There will be the theatre, the Kurhaus, and opposite it the Kaiser Friedrich platz, with its fine hotels. The number of these, too, has within the last two years been sensibly increased, and fine buildings they are. Internally, as the phrase is, may be found every modern convenience; externally the designs, if somewhat florid, are in keeping with the general character of the architecture of Wiesbaden—a garden city of the best kind.

St. Marylebone Court House and London Watch-Houses. It is stated that proposals are entertained for the building of municipal offices for the Borough of Marylebone, in place of the inconvenient and wholly inadequate quarters now supplied by the Court House at the south end of Marylebone-lane, near Oxford-street. The present building embodies one of the few watch-houses now remaining in London. Above the east door is a finely-modelled achievement of what we take to be the coat-arms of Harley, with a difference, with an angel and a lion rampant for supporters, and a coronet; beneath is "A.D. MDCCXXXIX." A lower tablet bears the inscription—

ST. MARYLEBONE WATCH HOUSE
REBUILT A.D. MDCCIV.

Lady Margaret Cavendish Harley, only daughter and heir of Edward, second Earl of Oxford, brought the Marylebone estate in marriage to William, second Duke of Portland, in 1734; but the Portland property passed some years ago to Lord Howard de Walden. Of the old parish watch-houses which have survived to our own time may be mentioned the (later) St. Giles's Round House in the Coal-yard—now Goldsmith-street—which was taken down in 1884 for the erection of new almshouses adjoining Barley-court; one in a corner of St. Botolph's churchyard, Bishopsgate Without, built, as its tablet records, in 1771, but latterly converted into a shop in the main street; and that in the churchyard of St. Anne's, Soho, adapted as a mortuary. The watch-house adjoining the east end of St. Sepulchre's, Holborn, was built in 1791, close to the site of St. Stephen's Chapel of that church. The "Watch and Engine House" in Collingwood-street, at the south-west side of the churchyard of Christ Church, Blackfriars-road, bearing an inscription stating it was built in 1819, was converted into a mission-hall; another is that of St. Botolph's, Aldgate, in Houndsditch.

The Modern Gallery.

At the Modern Gallery there is a small exhibition of oil sketches of Natal by Miss Percival-Clark. The colour in most of the sketches is rather curious; we suppose that the effects of mauve sky and pink distance are a peculiarity of the country; they are certainly un-English, and very effective. The interest of many of the pictures is a good deal enhanced by association. One of the best sketches is of "Spion Kop" (16), in which the dark foreground and hazy pink distance make a very striking contrast. "The Tugela, near Harts Hill Station" (18) and the

same from Pieters Hill (26) are also very successful paintings. Miss Percival-Clark's skies are as a rule very good; "A Summer Morning at Hilton Road" (2) is a very nice open-air effect with a clear sky.

At the French Gallery in Pall Mall there is on view a rather heterogeneous collection of works by artists living and dead, among which we notice two really fine though small examples of Troyon, a small study of a stag by Rosa Bonheur, and an excellent pastel landscape by M. Lhermitte. The feature of the exhibition is a collection of the works of Herr Tholen, which are good work, but not specially remarkable.

AT THE CHÂTEAU DE BAGATELLE.

On Friday last week was the private view of a small loan exhibition of pictures and a few works in sculpture organised by the Société Nationale des Beaux-Arts at the Château de Bagatelle in the Bois de Boulogne, now, as our readers are probably aware, the property of the Paris Municipality, who purchased it two years ago from the heirs of Sir Richard Wallace, whose property it was previously. The Château, which is a pretty long walk or drive from the barrier at the Porte Maillot, is reached *en* the "Porte de Madrid" and the Boulevard Richard Wallace, and turning to the left out of the latter into the drive leading to Longchamps, a little on the left stands the small Château. This is really the back entrance to the grounds near the stables; the principal entrance is at the other side of the estate, by a drive entered through a handsome iron gateway; but it is the entrance easiest of access from the city, and the best for driving, as the gate here is close to the house; the other one is a long way off, and vehicles (apparently) are not allowed inside the park.

The exhibition now open is, we believe, the first successfully organised one in this building, which was bought, as already mentioned in one of our Letters from Paris, with the intention of making the house the scene of various special exhibitions, a matter which seems to have been mismanaged so far. The present exhibition is one of the works of deceased French artists, and is not of the highest interest; but the Château and park (now open to the public) are well worth a visit on their own account, in summer weather at all events, for it is essentially a summer residence.

The property of Bagatelle consisted, originally, of a small "Pavillon de Chasse" belonging to Mlle. de Charolais, daughter of Prince Louis de Condé. It subsequently became the property of Comte d'Artois, brother of Louis XVI., who afterwards reigned under the title of Charles X. This prince built, on the site of the Pavillon de Chasse, a small Château at first known as "La Folie d'Artois," but which subsequently took the name of Bagatelle. This building, very rapidly executed, cost 600,000 francs. After a number of vicissitudes it became the property of Sir Richard Wallace, who built the one-story pavilion at the side of the forecourt, in which the exhibitions are now to be held. The chateau, the new pavilion, and the park were sold by Sir Richard Wallace's representatives to the municipality of Paris in 1904, for six and a half million francs.

On entering the grounds and turning to the left, you find yourself in a large oblong forecourt to the right of which is the one-story pavilion in white stone, standing on a terrace with a recessed portico with Ionic columns, containing a suite of rooms which form the exhibition galleries. Although this building is larger on the ground plan area than the principal Château, and carried out in the same style of graceful classic architecture, it is obviously only an annexe to the Château proper, which faces the visitor at the further end of the forecourt, and is an exceedingly graceful two-story classic house in white stone, decorated with an order nearly the full height

of the building, and with busts in circular medallions, and the motto "Parva sed Aptata" in raised letters on the attic over the centre. On the other side of the house, on the same axis as the forecourt, is a terrace and a long lawn with raised walks at the sides and a fountain basin in the centre, and opening on the terrace on this side is a small but beautiful circular salon, projecting as a semi-circular bay on to the terrace, the interior going up both stories and finishing in a gracefully decorated domed ceiling. It is an ideal residence *de luxe* on a small scale, as far at least as the ground floor suite of rooms is concerned. The house is open to the public, and contains some works of art which are there permanently; but the chief interest is in the suite of rooms and the exterior and surroundings of the house itself.

As to the loan exhibition in the other house, it contains a good many works by well-known painters and sculptors, both living and dead, the definition of it as an "exposition retrospectif" only signifying that it does not include new works first exhibited. A good many of the works are studies and sketches by eminent painters; but the collection also includes finished pictures by MM. Roll, Carolus-Duran, Gervey, Lerolle, etc., among living artists, and by Boudin, Cazin, and J. Lewis Brown among deceased artists, and studies and sketches by Meissonnier, Puvion de Chavannes, Burne-Jones, and others. There are some rather noteworthy works in sculpture by Mme. Marie Cazin (chiefly in the forecourt outside), and a curious essay in what may be called *genre* sculpture by M. Bartholomé in the shape of a portrait statuette of a lady, in modern costume, seated on a sofa.

In the bright weather of Friday the 11th at Paris (almost like a June day) the real attraction was not so much the pictures as the park, a perfectly beautiful sylvan retreat, apparently pretty fairly kept up, at all events it has not been open long enough to the public for them to have spoiled it much yet. On a public holiday it would very likely be crowded, otherwise it is too much off the general public routes to be much frequented. As we have said, the place is well worth a visit, independently of any exhibition, when the weather is such as to show it at its best.

MAGAZINES AND REVIEWS.

The *Quarterly Review* contains a very judicious article on "The Pre-Raphaelite Brotherhood," ostensibly a review of Mr. Holman Hunt's autobiography and of some other books bearing on the subject. The general conclusions of the writer as to the bearing of Pre-Raphaelitism on modern art are exceedingly just. As a matter of detail, we quite agree with him that in the "Lorenzo and Isabella" Millais was consciously painting a picture in early Italian style. At that date, as the author remarks, Millais was a consummate master, and could give to his paintings any look he liked. The entire difference of style in the picture which shortly succeeded this, "Christ in the House of His Parents," is a sufficient proof that Millais was merely, in the "Lorenzo," making a kind of excursus into the primitive style as an artistic exercise. "Trade Unions and the Law" is an able summary of the situation from the point of view of common sense and logic, which under present conditions are unhappily little consulted in connexion with such questions.

To the *Art-Journal* Mr. Bernard E. Ward contributes an article on the fascinating subject of brush-work drawing, which is such an admirable medium for teaching firmness and sweep of line in drawing. Besides some practical examples, a fine coloured design by Mr. J. W. Nicol, based on the tulip, illustrates the article. Mr. Claude Phillips is continuing his series of articles on the pictures in the Wallace collection. An article on "Art Handiwork and Manufacture" contains, among other things, some charming examples of modern lace made at the Royal Irish Industries Association.

The *Architectural Record* (New York) has an article by Miss Katharine Budd on Saracossa, illustrated with a number of sketches. The sections of some of the wide-spreading wood-hull cornices are very interesting. We cannot say that the architectural treatment of "The Griswold—a Study in Hotel Building"

seems worth the long article bestowed on it; the description of the planning and construction is of some interest. The Morgan Library and Art Museum, New York, by Messrs. McKim, Mead, & White, is a fine building, treated exactly in the right manner externally, for an art museum. A chapter on some of the Baldwin pianos, which looks rather like an advertisement of a piano-making firm, serves to introduce some designs for pianofortes, of which the "grand" at the head of the article is a fine and artistic specimen. The materials used were stinn-hued wood, and the floral marquetry is executed in holly, maple, redwood, walnut, and prima vera, "shaded to resemble natural flowers by means of hot sand." We do not like that last item, but the whole design seems to be one that would have been worth detailed illustration on a larger scale. Of the two upright pianos illustrated, that in a kind of "art nouveau," with legs that look as if they were of some substance half melted down, is hideous, the more so in contrast with the clean lines and refined appearance of the design described as "Sheraton."

In the *Burlington Magazine* Mr. Weaver's article (No. 6) on "Some English Leadwork" deals with the subject of leaden portrait statues, of which some illustrations are given. Mr. Yates Thompson contributes an article on "The Romance of a Book," the French illuminated MS. of Josephus, in the Bibliothèque Nationale, a page of which is reproduced in black and white, as well as some others of its pictorial decorations. "The Development of Rembrandt as an Etcher" is the first instalment of a serious critical essay by Mr. C. J. Holmes, who treats the subject not only in reference to Rembrandt himself but in reference to the development of the capabilities of etching as illustrated in his work, which Mr. Holmes considers to be a remarkable instance of the truth of Reynolds's celebrated and often-contested dictum that "genius" was largely the result of intelligent labour—that Rembrandt obviously acquired his final power as an etcher by a long struggle with the difficulties of this form of art.

The illustrations in the *Berliner-Architekturwelt* show that the evolution of grim tower monuments in honour of Bismarck is still exercising the minds of German architects in competition designs, three of which are illustrated. They were probably submitted in a competition instituted by some municipality which desired to be in the fashion by having its own "Bismarckthurm"; no information on the subject is given. They are, however, rather fine conceptions of a gloomy ideal architecture. They are all by one architect, Herr Breunin, and have a strange pre-historic appearance, as if they might have been built in the Stone Age.

Public Works includes, among other interesting papers, one by Mr. Tullis on "Belt Engineering," the making, fitting, and management of belting for conveying engine power. Readers who are not conversant with the subject may think that belt-working seems a very simple matter; as it does when you see the belts in operation; they may be surprised to learn how many points have to be seen to and how many causes of failure guarded against, before the satisfactory working of belting in a large mill can be secured. M. Cotfancini, perhaps one of the best authorities on the subject included in his title, contributes an article on "Reinforced Concrete Theatre Construction in France."

The May issue of *Concrete* is full of useful information; we may mention particularly an article, under the heading "New Uses for Concrete," on reinforced concrete chimneys. After mentioning brick and steel as two suitable materials for tall chimneys, and the drawbacks to both—the friction from the joints in a brick chimney, and the expense of maintenance and shortness of life of a steel chimney, the writer proceeds, under the heading "Monolithic Chimneys"—

"The third form seems to meet the requirements to a far greater extent. Monolithic concrete is smooth on the surface, a non-conductor of heat, requires no lining to resist any temperature, at least up to 1,500 deg. F., requires no expense for maintenance, and, because of its inherent properties, becomes stronger and better with age. As to first cost, the three usually rank—steel, concrete, and brick. As to final cost, they almost invariably shift

this order to concrete, brick, and steel. The difference even in first cost between concrete and steel is rarely so great as to warrant the use of steel for this reason for any but temporary purposes. The ground space, which is often very important, is economised to the greatest extent by the use of reinforced concrete—the saving over brick being about one-third. Until the development of a suitable system of reinforcing concrete it is impossible to use it in chimneys, where the tensile strength of concrete being insufficient to economically resist the wind stresses.

A section and plans of a reinforced concrete chimney are given, which, from the photographic view appended, appears to have been actually erected, though the locality is not mentioned. It is a very ugly thing, looking like an immense narrow tube set on end, and we should be sorry to see the type come into general use unless its economic and structural advantages are great and uncontested. It is possible to make a large brick chimney a rather fine thing, but evidently this cannot be the case with a concrete-steel one, except by adopting proportions which would be wasteful.

The *Art-Workers' Quarterly* is largely occupied with criticisms on and illustrations of work at the recent Arts and Crafts Exhibition. Mr. Alan S. Cole contributes an article on some "Phases of Old English Embroidery." The volume is full of interesting illustrations of applied art design, including a coloured plate of a charming wall-paper designed by Mr. Walter Crane.

Mr. Julius M. Price writes an article in the *Fortnightly Review* on "The Cradle of Modern British Art," which, interestingly written as it is, shows a most extraordinary perversion of view as to facts. The writer andes to himself an old Paris artist-stand, and his "Cradle of Modern British Art" is France; the advance of British art to-day being stated to be largely due to French influence. It is absurd to say so; certain painters are obviously influenced by French methods and study, and if there were more of French influence in our landscape-painting it would be better; but the advance of English painting as a whole is due more to the Pre-Raphaelite movement and the influence it left behind it than to anything over the Channel. He laments the possible downfall of the "English school" under French influence, while the very complaint of French critics is that the English have no "school," only individual painters with individual methods. As to the "cradle" question, why, the cradle of the present great school of French landscape painters was actually in England; they are the descendants of Constable. Best of all, he asks us to believe that the improvement of English taste in applied art of late years is due to French influence! Why, English applied art at the present moment is as far superior to French as light to darkness, and its great advance in recent years is due wholly to influences within this country—to William Morris more than to anyone else. Our conclusion is that Mr. Price must be an American.

In the *National Review* an article by Mr. J. R. Macdonald, M.P., on "The Ethics of the Trade Disputes Bill," is an amusing, or should we rather say an unblushing confession of the views of the Labour party as to the respective rights of Trade Unions and employers. A great part of the paper is of course employed in showing the enormity of the idea of making Trade Unions peculiarly liable for injury and loss caused by their action or that of their agents. The following quotation is sufficient to indicate Mr. Macdonald's ideas of logic and of the rights of man—

"A Union in dispute with an employer pickets his premises, drives away his customers, damages his trade. The loss is assessed, and has to be made good from the union funds. The employer in dispute with his workmen locks out his men, prevents them from finding work elsewhere till peace is restored, hurls them down from a tolerably secure footing upon the cliff face of life into the depths of poverty and debt below. How can the victimised workman pursue his employer for damages? But such a claim on the part of the workman is the counterpart of the claim for compensation for injury to property and profits on the part of the employer.

That the Union is interfering with another man's business, while the employer is dealing with his own, is of course a trifling difference which it is not worth while to take into consideration. According to the writer's logic, it would seem that a man who is employing and paying labourers is *ipso facto* under a moral obligation to go on employing

and paying them, whatever demands they make on him, and they are to claim compensation because he refuses to do so. It is something beyond comment!

In the *Contemporary Review* Mr. L. March-Phillips writes a most able article on "Pre-Raphaelitism and the Present." His main point is that the Pre-Raphaelites, after having started with the profession of going straight to nature and putting nothing between that and art, really became medievalists who entirely separated art from life as it is; and that Morris was the only one of the band who really took the practical view of seeing what could be done with the art of the present (though, in our opinion, he was not quite practical enough).

"While Holman Hunt retired to Palestine to foster his devotional instinct, while Rossetti ranged all history like a wild beast in search of the choicest morsels of sentiment, while Burne-Jones covered in his studio, dreamer of things that had never happened in a world that had never existed, while Ruskin raved of cusps and crockets, and cursed modern architecture, the Western Railway—in a word, while, in one way or other, all the leaders of the movement seemed to have made up their minds to cut their own ears and their own country; Morris alone, divining more truly what the medieval spirit consisted in, had flung aside all æsthetic and other squeamishness, and turned to help English craftsmen and English craftsmanship to regain what they had lost."

Blackwood contains a long and interesting article on "The Early Royal Academy." It is a review of Messrs. Hodgson & Eaton's recent book "The Royal Academy and Its Members," but introduces a good deal of the personal opinion of the writer. His estimate of the character of Reynolds, and of the worldly wisdom and tact which assisted the great President in founding the Academy on a strong basis, is good, and emphasises a side of Reynolds's character sometimes overlooked. We note with sympathy also the dry remark in the first column, that while the writer has views, which a Panhard should not drag from him, on the Academy's administration of the Chantrey Trust, "we have also had visions, which shall be equally uncommunicated, of that Trust administered by some of its critics." So have we.

We recommend these who want to understand what "peaceful picketing" really means or may mean to read the examples cited by Sir Herbert Maxwell, from his own experience, in his eloquent and forcible article in the *Nineteenth Century* under the title "Why Lift Trade Unions Above the Law?" the whole of which is a protest of the most forcible kind against the mob tyranny of the working man and his allies with which we seem to be every day more and more threatened.

The *Century* has an article on "The Gardens of Cornwall," a small new Hampshire town in which there seems to be a great interest taken in the development of the beauty of gardens; the illustrations, however, do not indicate much in the way of the artificial treatment of gardens. A short paper on "The Architectural Treatment of a Small Garden," by the late R. Riordan, forms a further comment on the subject, which seems to condemn the Cornish gardens, as the writer says (truly) that the smaller a garden the more necessity is there for treating it with a certain architectural severity. We see no trace of this in the illustrations of the Cornish gardens.

Scribner contains an article on "The Railways of Africa" by Colonel Girouard, with some illustrations of some of the bridges and other works. The author remarks on the fact that the one-metre gauge has been chosen for the British-made Uganda railway, in spite of the fact that the 3 ft. 6 in. gauge was already established for most of the railways of Africa, some 4,000 miles of 3-6 gauge being already in existence when the Uganda railway was projected. It certainly seems unfortunate that a hindrance should thus have been thrown in the way of establishing a universal though rather small gauge for the South African railway system. Under "The Field of Art" Mr. Russell Sturgis contributes a second article on "Colour Prints," illustrated by a frontispiece to the magazine of a moonrise scene, which is successful in effect, but in a very simple scheme of colour.

The *Cornhill* contains an article on "Pre-historic Man on the Downs" by Dr. Hubbard and Mr. G. Hubbard, which is

apparently practically an embodiment of the two lectures of which a report is published in this issue; but it is accompanied with sectional diagrams and a plan, which are useful in elucidating the subject. "Carbon and the Shores of Atoms" is the subject of the fourth of Mr. Shenstone's series of articles on "The New Chemistry"; and Mr. G. D. Hogarth contributes an interesting article on "Chimera and Phaselis" in *Asia Minor*.

The *World's Work* prints three articles under the heading "Shall there be a Channel Tunnel?"; of course in favour of it. We agree that the old scare as to danger of invasion through a tunnel had little in it, the protection of the exit on this side would be so easy, and the immediate destruction of its continuity, in case of necessity, still easier. But we suspect the engineering difficulties, and especially that of adequate ventilation, are being much underrated. The great use of such a tunnel would be for goods traffic, as doing away with the necessity for trans-shipment on each coast. Even if made, we should question if it would ever be popular for passenger traffic. The risk of sea-sickness is a trifle compared with the risk of being choked.

The *Antiquary* contains a detailed account of the steps which have been taken by the Hertfordshire County Council, at the instigation of the East Heris Archaeological Society, to take under their charge and to safeguard the archaeological relics of Hertfordshire. It is stated that Hertfordshire is the only county which has so far availed itself of the permissive Act of 1900 to undertake the care of ancient monuments; if so, it has set an example which it is to be hoped that other county authorities will follow. The Rev. A. H. Collins contributes an article on the carvings at Barreston Church, with illustrations of some of them.

In *School* Mr. Sydney F. Walker, whose articles on the hygiene of school buildings we have before noticed, devotes his chapter on "The Ventilation of School Buildings" mainly to the description of several methods of ensuring ventilation, giving a large space to a description of the "plenum" system, without expressing an opinion on it, contenting himself with giving the main facts as to the working of such a system, and a statement in a short concluding sentence of the advantages and disadvantages attributed to it. The summary is correct and useful.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The fourteenth general meeting (ordinary) of the session will be held on Monday, May 21, at the conclusion of the special general meetings announced below, when a paper will be read by Mr. Paul Waterhouse on the "Report of the London Traffic Commission." The special general meeting summoned by the Council under by-law 60, on the requisition of Messrs. Alfred W. S. Cross, Max Clarke, C. H. Brodie, George Hubbard, C. P. Francis (members of the Fellowship Procedure Committee), Ernest George, Alfred B. Yeates, Edmund Wimperis, T. W. Cutler, Mervyn Macartney, William A. Forsyth, and J. R. Best, will be held to receive the Report and recommendations of the Fellowship Procedure Committee appointed at the meeting of March 5.

The Fellowship Procedure Committee recommend:—(1) That the regulation under by-law 9 be amended by omitting all the words after "respective proposers" and adding the year in which the candidate was articulated, and in the case of a candidate for Fellowship the year in which he commenced practice; the regulation further to state that the voting papers shall be in the form of the papers issued for the election of the Council. (The present regulation under by-law 9 reads as follows:—"The voting papers shall state the name and address of every candidate, with the names of his respective proposers, and be divided into columns for affirmative and negative votes, such votes only to be counted as are marked in such columns.")

The Committee also recommend:—(2) That the direction to voters printed at the foot of the voting paper should read as follows: "1. The voter (Fellow or Associate) is to strike out in ink the name of any candidate for whom he does not wish to vote. All

names not so struck out will be counted as voted for."

The Committee further recommend:—(3) That a notice be printed in bold type at the head of the voting paper urging the importance of the papers being returned.

The Chairman will move, in accordance with recommendation 1, that the regulation under by-law 9 be amended so as to read as follows:—"The voting papers, which shall be in the form of the voting papers issued for the election of the Council, shall state the name and address of every candidate, with the names of his respective proposers, the year in which he was articulated, and, in the case of a candidate for Fellowship, the year in which he became engaged as a principal in the practice of architecture."

The Chairman will further move that recommendations 2 and 3 of the Fellowship Procedure Committee be adopted.

A special general meeting, convened by the Council under by-law 60, will then be held for the following purpose:—The Chairman to move that the resolution passed at the special general meeting of May 7 be confirmed, as required by clause 53 of the Charter. The resolution is:—"That the President and members of the Council for the current session do retain office until the conclusion of the Seventh International Congress of Architects, to be held in July, and that, in order to give legal effect to this resolution, the provisions of by-law 30 affected thereby be temporarily suspended."

THE SURVEYORS' INSTITUTION: THE EFFECT OF FIRE ON BUILDING STONE.

An ordinary general meeting of the Surveyors' Institution was held on Monday, at No. 12, Great George-street, S.W., when Mr. W. R. Baldwin-Wiseman, M.Sc., read a paper on "The Effect of Fire on Building Stones."

In the course of his remarks he said that the temperature and destructiveness of any conflagration were so entirely dependent upon the plan of the building, the nature and disposition of the material used in its construction, the nature of its contents, the time, location and cause of the fire, and other incidents, as to preclude all possibility of reduction to any standard formula, and a study of the stresses which a building had to withstand during and after a severe conflagration was also so complex a problem as to be practically indeterminate if viewed as a whole; but if one resolved it into separate considerations of design and material, it was brought more within the bounds of solution and the range of every-day practice in design. For this reason he regarded as practically valueless all experiments which involved the construction of, say, a model room, and its destruction by fire, when, in many cases, the building material of which it was composed was comparatively fresh, the wall and floor stresses were trivial, and the internal space was utterly inadequate for the generation of a really serious fire. Far more profitable experience would result from a careful inspection of all interiors after the extinction of a fire, for much information as to the temperature of the fire could be obtained by a careful examination of the condition, fused or otherwise, of the metallic fixtures, and by tabulating the records of the intensity and destructiveness of fires in various buildings of similar plan, structural arrangement, and trade, one would create an almost invaluable record for reference, from which much good must eventually result.

The purpose of the author's research was not so much to determine the design of a building for fire resistance as to estimate the ultimate stability of an edifice after subjection to a severe conflagration, and to afford some small assistance to those who might be called upon to decide whether demolition or reconstruction should succeed the wrecking influences of a big conflagration. The following points were considered:—

"First.—The transverse and crushing strength of stone, (a) when thoroughly dried in the steam oven so as to expel all absorbed water held in the pores, but not the water of crystallisation; (b) when thoroughly soaked in water; (c) when subjected for various definite periods to constant temperatures ranging from 500 deg. C. to 650 deg. C., and either slow cooled in air or suddenly cooled by immersion in cold water, immediately upon removal from the furnace, the latter case being intended to somewhat imitate the conditions when a jet of water was directed upon a burning building. Second.—The

expansion of the stone with increase of temperature from 20 deg. C. to 300 deg. C., and the permanent alteration in dimension on subsequent cooling."

For the whole of the data of that part of the research bearing upon expansion and permanent swelling the author acknowledged his indebtedness to Mr. O. W. Griffiths, B.Sc., A.R.C.S., with whom he is collaborating in another research on the physical properties of concrete and ferro-concrete, and who had specially devised a delicate extensometer for the determination of the data on expansion recorded in tables given in connexion with the paper.

In heat resistance or the depreciation in strength of stone after subjection to high temperatures, there was not so far as he was aware any statistical table whatever, and, in fact, the only tabular statement at all on this question known to him was that of Dr. Cutting, giving the order of resistance in decreasing ratio of fire-resisting material, when water was not applied, viz.:—(1) Marble, (2) limestone, (3) sandstone, (4) granite, (5) conglomerate. The accuracy of this table was not at all borne out by the data derived from his (the author's) research, and from this tabular arrangement he most strongly dissented, since the physical structure of each class and subclass of stone varied so considerably as to preclude any generic grouping such as this list presumed. There were doubtless many isolated examples in personal experience of the relative effects of fire on different stones in the same edifice, but these were unfortunately not readily available. In 1878 the granite body of the Church of St. Peters, Laverton, was demolished whilst the freestone tower stood intact, although the heat was sufficient to destroy the granite sills and jambs in the tower, and to melt the bells in it, the temperature being, say, about 850 deg. C.

The stones tested by the author were selected to be as representative as possible of the geological formation and geographical distribution of those more commonly used in construction in this country; in all, twenty-four classes of stone were experimented upon, of which six were sandstones, nine were limestones and calcareous freestones, six were marbles, and three were of igneous origin.

The author then briefly described the stones, after which he gave a description of the apparatus and methods of making the tests. All the test-pieces were dressed to strips 6 in. by 1 in. by 1 in., excepting the marbles, which were 6 in. by 2 in. by 2 in., the red granites 6 in. by 1 in. by 2 in., and the quartzites 6 in. by 1½ in. by 1½ in. The granites and marbles were also polished upon one face. All the test-pieces were carefully inspected to insure that they were free from flaw or crack. Each stone was placed in the electrical furnace, and its temperature regulated and maintained constant throughout the experiment, which usually lasted from three to four hours. It was then allowed to cool, and the permanent swelling observed after twelve hours' cooling.

Discussion of Observed Data: A. Structure and Appearance.

Considering first those experiments for the determination of the strength of the stone, there were several phenomena worthy of recording. Many of the Douling, Portland, and Bradford test-pieces emitted a peculiar crackling noise during the first few minutes after insertion in and removal from the furnace; the York stone changed in colour from a straw yellow to a terra-cotta red, due possibly to a chemical change in the composition of the iron oxide in the cementing material of the grains of the stone. The diabase changed from a dark greenish black to a dirty yellowish green; the Monks Park, Portland, Hopton Wood, and Boxground stones became chalky in appearance and somewhat lighter in colour; the Hopton Wood stone became internally mauve-grey in colour, and developed brown stains here and there; the Bradford and Bath oolites lost their fresh crisp appearance, became more or less earthy, and developed irregular red stains round some of the larger grains. The Aspatria test-pieces, soon after their insertion in the furnace, gave off a dense smoky cloud, which soon after faded and burnt steadily, with a smoky yellow flame for about a minute. By titration of some of the crushed stone with alcohol and subsequent

distillation of the alcohol, a viscous amber-coloured combustible oil was collected. Several stones, such as Douling, disintegrated in the furnace or immediately after removal therefrom. Others, such as Douling or Daresbury, disintegrated immediately on immersion in or removal from the water; and one Daresbury retained its form during cooling, and carried its own weight upon the supports, but broke when the stirrup, weighing only two pounds, was carefully placed upon it, and fell as a mass of incoherent sand to the floor. Some, such as Douling, Carrara marble, the red and, in a less degree, the grey granite, the Bradford and Bath oolites, and the Daresbury sandstone, had but little cohesion, and crumbled to powder when touched, or when more or less coarsely rubbed with the hand. Several Carrara marbles warped upon cooling, arching slightly; others, such as Hopton Wood, Monks Park, and Boxground stones, retained a sharp arched shape, but the sides caved in, and cracks more or less deep developed at right-angles to the direction of the greatest length of the test-piece.

B. Strength.

All the bars tested transversely failed, as one would expect, in tension—i.e., broke on the under surface immediately after developing cracks running from the underside upwards. If one considered a rock mass as an aggregation of similar or dissimilar interlocking grains or crystals, then, when this mass was subjected to a high temperature, each of these grains expanded, or tended to expand, with varying amount, in different directions. To permit of this individual expansion of the grains or crystals, each and all would move outward; but upon subsequent cooling they would not move back to the positions they originally occupied, but each would contract along its own axes about its own individual mass centre, resulting in a less intimate interlocking of the crystals or grains and a consequent diminution of the strength of the mass as a whole. If, on the other hand, the temperature be suddenly reduced through a considerable range, as when cold water was brought into contact with the heated stone, then the molecular stresses set up by this sudden change of temperature, coupled with the disruptive tendency of the heated and expanding water which had obtained access to the innermost pores, tended to a further reduction of its strength. The strength of the stone in some cases was insufficient to maintain its own outward form, or so slight as to carry no load of even moderate magnitude; whilst, in other cases, the original strength was materially reduced when heated and slowly cooled in air; and still further depreciated, with exceptions, when suddenly cooled in cold water. There was a still greater diminution of strength with increase of the temperature, or of the period of exposure to the same high temperature. This question of diminution of strength was not at all one of heat decomposition of the calcareous constituents of the stone. Care was taken that all the test-pieces of the same stone were of similar dimensions, so as to be readily comparable, and that all were tested when resting upon their natural bed.

The ratios have been calculated to the third place of decimals, but, as stones in the same geological formation might vary in structure and chemical composition from point to point, and from district to district, similar experiments might produce results differing in the second or third place of decimals. Considering his Tables 2 and 3 as a whole, it was evident that there could be no class grouping into sandstones, limestones, etc., of the fire-resistance of stones, such as Dr. Cutting presumes in his classification.

Taking the several items in detail, and taking the resistance to crushing and transverse loads when dry, in tons per square foot to the nearest ten tons, as the standard of comparison, one saw that York stone, which had a crushing strength of 550 tons per square foot, and a transverse strength of 70 tons a square foot, or a strength only 1/8 of that in compression, deteriorated after subjection to high temperature, so that its resistance to crushing was only 36 per cent. of its original crushing strength when slowly cooled in air, or 40 per cent. when suddenly cooled in water, whilst its transverse strength was only 65 per cent. and 27 per cent. respectively, of its initial transverse strength when slow and fast cooled, so that

of a fairly high factor of safety had been chosen in the original design, a structure built of this stone might yet be serviceable, with certain safeguards, after a serious conflagration. The red Mansfield stone had a crushing strength of 160 tons per square foot and a transverse strength of 40 tons, or a transverse strength only quarter of that in compression; its crushing strength after subjection to a high temperature and the two modes of cooling was 100 per cent. and 37 per cent. respectively, whilst in cross-breaking the strengths for the corresponding conditions of cooling were 62 per cent. and 50 per cent., so that, although the deterioration in resistance to cross-breaking was material, it was not of such magnitude as to seriously impair the utility of a well-designed edifice, still less was this the case in regard to compressive stresses.

The Aspatria stone was somewhat similar to the red Mansfield stone, in that its resistance to crushing and transverse stresses was 160 and 30 tons respectively, a ratio of 5 to 1, and the post-conflagration crushing strengths are 100 per cent. and 99 per cent. respectively, but it differed from the red Mansfield stone in that there was a more marked depreciation in its resistance to transverse stresses, to 20 per cent. and 15 per cent. respectively, so that if this material had to withstand crushing stresses only, its deterioration may under ordinary circumstances be negligible, but its depreciation in transverse strength was so material as to necessitate grave consideration in the matter of its replacement.

The Quartzite, which had the moderately-high crushing strength of 240 tons per square foot, and the phenomenally high transverse strength of 150 tons, over twice the transverse strength of the York stone and five times that of the Aspatria stone, had a ratio of crushing to transverse stress of 8 to 5. It depreciated in compressive strength to 71 per cent. in both cases of slow and fast cooling from high temperature and in transverse stress to 89 per cent. and 93 per cent. respectively. The comparatively moderate diminution of its strength in compression and cross-breaking made it a valuable stone, and as it was possessed of a good colour and appearance, especially when polished, it should command an extensive market, not only for building purposes but also as road metal for which its hardness and the clearness of its surface especially commended it.

The soft Daresbury sandstone, with but little natural cementing material, had the comparatively low-crushing and transverse strengths of 60 tons and 10 tons per square foot respectively, a ratio of 6 to 1; its resistance to crushing after both modes of cooling was practically nothing, as was likewise its resistance to transverse stresses when fast cooled; when slowly cooled, however, its resistance to transverse stresses was about 48 per cent. of its original strength. It was possible that some small, but purely academic, values could have been obtained for the depreciated crushing strengths, but it was not possible with his apparatus, since one was unable to apply the first 100 lb. or 200 lb. with any reliable degree of accuracy.

The hard Daresbury sandstone being more coherent offered a greater resistance to crushing and cross-breaking than the soft Daresbury sandstone, the breaking stresses being 130 tons and 20 tons per square foot respectively, a ratio of 6 to 1; but after subjection to high temperatures its resistance to crushing, when cooled in any manner, was so trivial as to be negligible; so also was its resistance to transverse stresses when fast cooled. When slowly cooled, however, its transverse strength was 24 per cent. of the maximum, so that, although initially twice as strong as the soft Daresbury sandstone, its depreciation of strength was twice as great, and both broke under practically the same load; or, in other words, the heat had the effect of entirely breaking down the efficiency of the cementing material, on which its greater initial strength depended.

Turning to the consideration of the calcareous freestones, one found almost as varied a diversity of strengths as among the sandstones. The Douling stone, which had a crushing strength of 80 tons and a transverse strength of 20 tons per square foot, a ratio of 4 to 1, offered little or no

resistance to crushing after subjection to high temperatures, for in most cases it fell into an incoherent mass of shelly fragments and sand, in the furnace, or whilst cooling, or soon after placing on the table of the crushing machine. Under transverse loads its resistance fell to 2 per cent. and 7 per cent. respectively of its maximum strength, so that at a moderately high temperature it had no fire-resistance value whatever.

The Portland base bed stone, the strongest of all the calcareous stones which he tested, had a crushing strength of 260 tons and a transverse strength of 90 tons per square foot, a ratio of 3 to 1. This subsequently depreciates after subjection to high temperature to 60 per cent. and 51 per cent. in crushing strength, and to 66 per cent. and 14 per cent. in transverse strength respectively, when slow and fast cooled, so that one saw that the local action of the water in suddenly cooling the stone materially depreciates its strength under both conditions of loading.

The Monks Park stone, with a compressive strength of 100 tons and a transverse strength of 40 tons per square foot, a ratio of 10 to 4, depreciates in compression to 82 per cent. and 74 per cent. respectively, and in transverse strength to 45 per cent. and 37 per cent., so that, in sustaining crushing loads, it might within certain limits be trusted after a conflagration to perform its office, but could not be trusted to sustain any severe transverse stresses.

The Boxground stone, with crushing and transverse strengths of 60 and 30 tons per square foot respectively, a ratio of 2 to 1, depreciates in compression to 49 per cent. and 54 per cent. of its original strength, when slow and fast cooled, and depreciates in transverse strength to 2 per cent. and 24 per cent. respectively; so that, whilst it might, with due precautions, serve again in compression, it could not be trusted to bear any transverse loads whatever.

The Bradford stone, with crushing and transverse strengths of 60 tons and 30 tons per square foot, a ratio of 2 to 1, deteriorates so that its strength, after subjection to high temperature, was 50 per cent. and 40 per cent. of its initial compressive strength, and 34 per cent. and 23 per cent. of its initial transverse strength.

The Bath stone, with slightly greater resistances to crushing and transverse stresses of 70 tons and 40 tons per square foot respectively, a ratio of 7 to 4, deteriorates similarly to 51 per cent. and 45 per cent. in compression, and to 35 per cent. and 26 per cent. in transverse loading. The depreciation in strength of both the two previous stones was so great as to render them untrustworthy after subjection to a severe conflagration.

The Hopton Wood stone, with crushing and transverse strengths of 190 tons and 60 tons per square foot respectively, a ratio of 3 to 1, depreciates in compression to 57 per cent. and 39 per cent. respectively, and when transversely loaded to 39 per cent. and 29 per cent.

The Chalks, with their low initial strengths of 20 tons and 10 tons per square foot respectively, had no residual strength whatever, after subjection to the high temperature, the expansion set up by the high temperature in all probability serving only to rupture the walls of the pores and break up the material.

The marbles also varied somewhat in the magnitude of the depreciation of their strengths. The Carrara marble, with initial compressive and transverse strengths of 290 tons per square foot, and 50 tons per square foot, a ratio of 6 to 1, depreciates to 55 per cent. and 66 per cent., and to 19 per cent. and 9 per cent. of the respective strengths, when heated and cooled in the two prescribed modes.

The Rouge Royal marble with compressive and transverse strengths of 410 tons per square foot and 120 tons per square foot respectively, deteriorates to 55 per cent. of its initial compressive strength when cooled in either way, and to 35 per cent. and 24 per cent. of its transverse strength when slow and fast cooled.

The St. Anne's marble, with compressive and transverse strengths of 590 tons and 140 tons per square foot respectively, a ratio of 4 to 1, depreciates to 38 per cent. and 45 per cent. in compression, and to

34 per cent. and 27 per cent. in transverse strength; this stone was remarkable in that it depreciates in an almost identical ratio in both strengths when slowly cooled.

The Dove marble, with a compressive strength of 380 tons per square foot and a transverse strength of 140 tons per square foot, a ratio of almost 3 to 1, depreciates in ratios somewhat similar to those for the Carrara marble; its compressive strength diminishing to 50 per cent. and 41 per cent. respectively, and its transverse strength to 8 per cent. and 15 per cent. according to the two modes of cooling.

The Black marble, with an initial resistance to crushing of 430 tons, and to transverse loads of 190 tons per square foot, a ratio of 2 to 1, depreciates in crushing strength to 61 per cent. and 70 per cent., and in transverse strength to 59 per cent. and 14 per cent. This marble and the Portland stone exhibited the most marked depreciation of resistance to transverse loads, when suddenly cooled from a high temperature, and to a lesser extent the Belgian granite displays similar qualities.

The Belgian granite, which had a considerable vogue owing to its uniformity of texture and its comparative cheapness, had a compressive strength of 350 tons per square foot and a transverse strength of 130 tons per square foot, a ratio of about 3 to 1, depreciates to 59 per cent. and 69 per cent. in compression, and to 46 per cent. and 22 per cent. respectively when transversely loaded.

The three types of Plutonic rocks with which he experimented exhibited a greater diversity in the depreciation of their strengths than all the other classes of stone. Thus the red granite with initial crushing and transverse strengths of 350 tons and 90 tons per square foot respectively, a ratio of 4 to 1, depreciates to 8 per cent. and 6 per cent. in crushing strength, and to 10 per cent. and 6 per cent. when transversely loaded; at once indicating the absolute inutility of granite as a fire-resisting medium; comparable only in its utter depreciation with the poorer sandstones and calcareous freestones.

The grey granite, with slightly higher initial crushing and transverse strengths of 380 tons and 170 tons per square foot respectively, a ratio of about 2 to 1, depreciates to 33 per cent. and 51 per cent. in crushing strength, and to 11 per cent. and 1 per cent. in transverse strength, so that this stone, although it greatly deteriorates, did not so utterly fail in compression as the red granite; doubtless owing to the somewhat smaller and more uniform size of its component crystals, giving rise to less internal disturbance during expansion and contraction; and it should be noted that, as with York stone, Boxground, St. Anne's marble, black marble, and the Belgian granite, the crushing strength was slightly increased when suddenly cooled, compared with that when slowly cooled, doubtless, because the sudden cooling at the surface gave rise to an intimately interlocked skin; but the grey granite failed more absolutely under transverse loads than did the red granite, owing to its smaller-sized grains.

Finally the Diabase, with compressive and transverse strengths of 30 tons and 120 tons per square foot respectively, a ratio of 3 to 1, depreciates to 86 per cent. and 50 per cent. of its initial crushing strength and to 24 per cent. and 5 per cent. of its initial transverse strength when slow and fast cooled, so that it might within limits be trusted in compression after subjection to the high temperature of a conflagration, but could not be at all trusted under transverse loads.

The effects detailed at length in the preceding paragraphs were more marked if the period of exposure be prolonged, or if the temperature be materially increased; thus York stone exposed for two hours to a temperature of 618 deg. C. had a residual strength of 43 per cent., which, after six hours at a temperature of 696 deg. C., diminished to 35 per cent., and after twelve hours at a temperature of 728 deg. C., diminished to 28 per cent., so also red Mansfield stone after subjection for similar periods to similar temperatures had residual strengths of 58 per cent., 49 per cent., and 33 per cent. respectively.

Excepting for the relatively non-absorbent marbles, granites, and quartzites, the

more absorbent Hopton Wood stone, the transverse strength of a stone when thoroughly dry was materially greater than that for the same stone when its pores were thoroughly charged with water; whilst the same general rule held for the crushing strength, if to the list of those already enumerated be added the York, Red Mansfield, and Aspatia sandstones, and the Doulting stone. So that a fire in a moderately old building would be productive of more havoc to the structure than in a new one, as the stone would not have the high initial strength of his test-pieces, but would be depreciated to an extent, depending on its relative exposure to diurnal and seasonal variations of temperature, the composition and destructiveness of the atmospheric impurity, the relative porosity of the stone, the inequality of its texture, and the incidence of wind, rainfall, and frost.

c. Expansion.

The sandstones as a class had the greatest coefficients of expansion in the first range of temperature from 20 deg. C. to 100 deg. C., the coefficients varying from 9 millionths for Aspatia stone to 16 millionths for the Quartzite; in the higher or second range of temperature, from 100 deg. C. to 200 deg. C., there was an increase of the coefficient to 15 times that at the lower range in the case of the Red Mansfield as the greatest rate of increase, and 17 times that at the lower range for the Hard Daresbury as the least variable. In the highest or third range of temperature from 200 deg. C. to 300 deg. C., there was a greater variation in the rate of change of the coefficient than in the two previous ranges, the coefficient for the Red Mansfield being 1.9 times that in the first range, whilst that for the Aspatia and the Quartzite remain practically constant at the value for the second range. In general, the sandstones exhibit least variation in their rate of change at the higher temperatures, but the initial mean coefficient of expansion in the lowest range was so high that the uniformity was more apparent than real.

The Oolites exhibit a most marked diversity at all temperatures, the Doulting stone having the greatest coefficients of expansion in all three ranges, the values being 22.4, 26.2, and 26.7 millionths respectively in the first, second, and third ranges.

The Bradford stone had the least coefficient in the first range, the coefficient being only 2.5 millionths, which was the least value in the coefficient of all the stones upon which experiments were conducted, the Monks Park, Boxground, Portland, and Bath stones having similarly low coefficients of 3, 4, 5, and 5 millionths respectively. But with increase of temperature, the diversity was most marked, the coefficient of expansion from 100 deg. C. to 200 deg. C. considered as a ratio of that at the lower range, varying from 1.2 for the Doulting stone to 4.0 for the Bradford stone, with values of 1.6, 2.3, 2.3, and 2.5 respectively for the Portland, Monks Park, Boxground, and Bath stones; in the still higher range from 200 deg. C. to 300 deg. C. the coefficient remained practically the same for the Doulting stone, but increased to 5.4 times the coefficient in the first range for the Bradford stone, with intermediate ratios of 2.9, 3.5, 3.8, and 4.6 respectively for the Portland, Bath, Monks Park, and Boxground stones.

If, instead of the ratios of the coefficients in the several ranges, the coefficients themselves be considered, the diversity was still more apparent; thus, from 20 deg. C. to 100 deg. C. the coefficients had extreme values of 22.4 millionths, and 2.5 millionths for the Doulting and Bradford stones respectively; in the range from 100 deg. C. to 200 deg. C. the coefficients for these two stones were 26.2 millionths and 10.1 millionths, the former being the greatest coefficient in this range; but the least coefficient was now 7.8 millionths, that for the Portland stone. In the third range, from 200 deg. C. to 300 deg. C., the Doulting stone had still the highest coefficient, 26.7 millionths, the least being that of 13.4 millionths for the Monks Park stone, and the coefficients for the Bradford and Portland stones being 13.5 millionths and 14.6 millionths respectively.

The Hopton Wood stone, by its expansion

and also by its geological horizons, belonged more closely to the marbles than to the calcareous freestones, in which, from a desire to avoid too much classification, he had grouped it; but, in the question of expansion, he proposed to consider it with the marbles rather than with the calcareous freestones.

In the case of the marbles, the greatest coefficient of expansion, for the lowest range of temperature from 20 deg. C. to 100 deg. C., is 9.2 millionths for the Dove marble, and the least 4.4 millionths for the St. Anne's marble; in the next range, from 100 deg. C. to 200 deg. C., the extreme ratios of the coefficients to those in the lower range, were 3.7 for St. Anne's marble and 1.8 for the Hopton Wood stone, and in the higher range, from 200 deg. C. to 300 deg. C., the extreme ratios were similarly 4.1 and 2.1 times that of the lowest range for the St. Anne's and Dove marbles respectively.

The igneous rocks in general possessed coefficients similar to those of the sandstones, the coefficients being 10.2 millionths and 9.7 millionths respectively for the Red Granite and the Diabase, but with increase of temperature there was a material increase in the rate of expansion; the Red Granite having coefficients of 17.0 millionths and 21.6 millionths in the higher ranges, from 100 deg. C. to 200 deg. C., and from 200 deg. C. to 300 deg. C., the ratios being 1.7 and 1.7 respectively in the three ranges of temperature; whilst the Diabase had coefficients of 15 millionths and 16 millionths at the two higher ranges, giving corresponding ratios of 1.0, 1.5, and 1.6 respectively in the three ranges.

Stones, which had almost identical coefficients of expansion in one range of temperature, had widely varying coefficients in another; thus, for instance, Aspatia sandstone, Dove marble, Red granite, and Diabase had coefficients of 9.0, 9.2, 10.0, and 9.7 millionths respectively in the range from 20 deg. C. to 100 deg. C., differing from one another only in the ratios of 100, 102, 111, and 108; in the next range, however, from 100 deg. C. to 200 deg. C., the coefficients differed in the ratios of 100, 169, 149, and 132, and in the third range, from 200 deg. C. to 300 deg. C. they differed in the ratios of 100, 168, 188, and 139 respectively, so that if two such stones were bonded together in a structure, and subjected to any considerable range of temperature, the varying expansion at identical temperatures would give rise, not only to severe molecular stresses within the material of the stone, but would also induce a disturbance in the distribution of the external stresses in the structure.

Furthermore, these four stones had coefficients of expansion in the first range of temperature, from 20 deg. C. to 100 deg. C., not greatly differing from those for iron, steel, etc.; but in the higher ranges of temperature there was a great diversity, so that in a combination of, say, granite and steel, as in the modern skeleton steel framework structure, with masonry exterior, most severe stresses must be set up during a fire by the variable expansion of the metal and stone alone, irrespective of the heat distortion of the unprotected ironwork, giving rise to a depreciation of the strength of the stone in addition to that produced by heat alone.

Again, a dissimilar stone, such as, say, the granite forming the sill, etc., in the sandstone tower to which he referred at the commencement of the paper, might by its greater expansion have to carry a greater load at high temperature than that for which it was originally designed, and this load might exceed its ultimate strength at that temperature, and one might presume that the disruptive effect of local cooling, as when a hose plays with some pressure upon one face, was greater than when cooled uniformly and simultaneously over its whole surface. From these considerations it would be at once apparent that, although the incorporation of dissimilar stones in the fabric of an edifice might, by their contrast in colour and texture, materially contribute to the artistic and architectural effects, such a miscellaneous assemblage was not to be recommended from a fire-resistance point of view, and in a less degree this heterogeneity was not, in the strictest sense, advisable, bearing in mind that the diurnal and annual

variations of temperature were not inconsiderable even in these climes. Also, in designing for fire-resistance, no masonry whatever should be carried on the upper boom of a plate girder, for not only were the molecular stresses set up by the variable expansion of metal and stone injurious, but the increased deflection of the beam, under increase of temperature, induced a settlement of the masonry above it, and brought additional lateral stresses upon the masonry.

$$\text{This deflection } D = \frac{W L^3}{8 E I}$$

Where W was the load on the beam,
L was the span of the beam,
I was the moment of inertia of the section,
N was a numerical quantity varying with the type of beam and the incidence of the load,
E was Young's modulus of elasticity.

Since, from the formula, D varied inversely with E, which decreased in an irregular manner with increase of temperature, according to Pisati's experiments, it followed that D must increase with temperature, and the beam failed to support the load it was designed to carry at a time when it was most needed.

Some of the stones had a greater percentage porosity after subjection to high temperatures than they possessed in the normal condition, so that after a conflagration, besides the tendency to distortion of the structure, induced by permanent swelling and the mere heat depreciation of the strength; the stones would take up a larger quantity of water in the pores, which would give rise to a more rapid deterioration by weathering, as well as a further depreciation of strength on account of the presence of the greater quantity of absorbed water.

Fire Statistics.

He had made every effort to obtain information as to the approximate maximum recorded temperatures of conflagrations. These temperatures would, of course, vary within wide limits, according to the local conditions, the trade, plan of the buildings, nature of the contents, etc., and the data was but very scant, for a fire captain's energies were of necessity concentrated on the work of extinction to the exclusion of all else, but much valuable information upon this point could be collected, after the extinction of the fire, by a careful inspection of all the metallic fittings of the interior of the building; there were numerous records of zinc and lead having been melted during the progress of conflagrations, or that temperatures of 415 deg. C. and 326 deg. C. were exceeded. He was particularly indebted to Mr. William Paterson, chief officer of the Glasgow Fire Brigade, who informed him that the slates of a timber shed in a small fire at which he attended melted like soft metal, and had the appearance of lava; and also to Mr. J. G. Lewis, Chief Constable and Superintendent of the Fire Brigade, Blackburn, who informed him that the maximum temperature of a fire in his experience was about 600 deg. C. He (the author) was therefore of opinion that, in experimenting with stones exposed to temperatures ranging up to 800 deg. C. for periods of from two to eighteen hours, he was reproducing conditions as severe as those occurring in the more serious conflagrations.

The relative immunity of a town from serious conflagrations was largely dependent on the ratio of the height of the higher buildings in the town, to the maximum pressure on the mains, or to the greatest pressure which the engines could afford.

General Conclusion.

Finally, he briefly summarised the points of primary importance in determining the most efficient design for fire-resistance:—

1. That the edifice should in no wise be flimsy.
2. That it should be constructed of stone possessing an uniform or fairly uniform coefficient of expansion, and retaining a considerable strength after subjection to high temperatures.
3. That all combinations of different stones should be avoided as much as possible.
4. That combinations of stone and metal should be avoided, especially when the former rests directly upon the latter, even

when the metal was entirely enshrouded in stone, for stone acts as a fairly good conductor of heat.

5. That stairwells and lift-wells should open as little as possible on to the main building, and should preferably be enclosed and glazed with wired glass from basement to roof.

6. That floor areas should not be unduly large nor corridors unduly long.

A discussion followed, and a hearty vote of thanks was accorded to the author.

HOME ARTS AND INDUSTRIES ASSOCIATION EXHIBITION.

PROVIDED one does not set himself too high a standard, a profitable hour can be spent at the twenty-second annual exhibition of this Association; the show is well set out, fills the whole of the upper gallery at the Albert Hall, and will remain open until Monday evening next.

The aim of the Association is the excellent one of reviving and stimulating craftwork in village and rural communities, the initiative coming as a rule from voluntary effort on the part of those who have at heart the welfare of the country worker. In most cases this means that not only the starting of the classes, but much of the subsequent direction, is in the hands of amateurs whose training in design has not been very thorough, with the result that much of the painstaking and really excellent workmanship is thrown away upon trivial and commonplace motives. It is only fair to make this criticism from an artistic point of view, though in other respects the objects of the Association are praiseworthy, and have often resulted in the establishment of self-supporting village industries, animated by a very real feeling for design. This is evidenced by the exhibits from the Lake District centres and from Compton, to mention only a few.

It must be admitted that the most interesting exhibits are those of industries into which art, in the ordinary sense of the word, enters but little, and among these the Irish lace from Moneygynnen, the homespun from the Stonehenge centre, the chairs from Lacock, and the Saxmundham baskets are all charming. Quite a large field should be open for the cottage-made chairs provided they keep to the traditional lines of the Lacock ones, and retain the rough but individual workmanship. Of large constructive work there is, of course, not much, but some softwood stained nursery furniture, made by the Challey section of the Guild of the Brave Poor Things, is remarkably good as the work of crimped boys; in this stall also the toys are again quite a feature.

The woodcarving from Eversley and Fleet is distinctly better than the average of this kind of work shown; a couple of small barge boards, evidently for a porch, boldly carved with a "running vine," stand out from the rest of the carving. Perhaps the most ambitious piece of furniture exhibited is a chest, designed by Mr. F. A. Rawlence, and executed at Ebbesbourne Wake in connexion with the Wilton class by Mr. Foyle and Mr. Young, the village carpenter and blacksmith. The lock-plates and hinges have been decorated in a strictly traditional manner, and are in every way excellent. In other respects the metal-work shown, especially the repoussé copper, is not very satisfactory; the only exhibit in this material worthy of note is from Fivemiletown, in Ireland, some of the pieces having great merit and an original treatment. Among the textiles the Langdale display of embroidery and drawn-thread work is full of good things. Holyhead shows three magnificent panels of silk embroidery, evidently from an old design adapted, and Failand is also to the fore with clever needle-work and an excellent sampler. Why are samplers so rarely worked nowadays?

There is a good deal of pottery. Mr. Howson Taylor makes a large display of "Ruskin" ware, and the Castle Hedingham centre has a stall of pots, which are nice in colour but sadly lacking in good design. A very little skilled direction would set this right; for an example of what it will do one has only to turn to the exhibit of the Birkenhead Della Robbia pottery or to Mr. Ashbee's two cases of silver and jewellery, which are almost in a class of their own.

On the whole, this is an interesting exhibition.

PREHISTORIC LIFE ON THE DOWNS.

ON Thursday evening in last week Dr. A. J. Hubbard and Mr. Geo. Hubbard lectured at the Elmhurst Club, St. James's-square, on "Prehistoric Life on the Chalk Downs." The lecture was illustrated by a series of most interesting lantern slides.

Dr. Hubbard said that he and his brother proposed to consider the manner and conditions of human life during a period the antiquity of which was so great that they were not only without historical records, but could not, with more than a vague approximation, assign either a date or a duration to it. They hoped to be able to show how prehistoric men advanced from a lower to a far higher state of civilisation. In these depths of time to which they must in imagination descend, such a movement must have been, as they judged such things now, almost insupportably slow. Thousands of years were involved. Beginning some 50,000 years before the dynasties of Egypt, they found its culmination in the building of Stonehenge, and perhaps the great pyramid was 2,000 years old when Stonehenge was new. It was spoken of as the neolithic age. The neolithic men were by no means uncivilised, for they co-operated on a vast scale, and some of the works which they had left were stupendous and as permanent as the pyramids, but, nevertheless, not one word of their language had been preserved. Although the works of neolithic men could be traced more or less all over the world, they were nowhere, so far as he knew, better preserved than in the South of England, and to that district they would confine themselves. On examination they found that two stages of culture can be defined, and he called the earlier of these the "Hill Period," and the later the "Plain Period." The men of the hill period were exclusively earth workers. Their settlements were of the earth earthy, and the purpose of every part of them was purely utilitarian. Invariably they were placed upon the hill-tops, and the dominating idea of the hillmen was terror of the plains. On the uplands of the downs man's work was practically everlasting, and there the ever-renewed mantle of short, dense turf spaced itself over the surface, moulded itself to every detail, and reproduced in its green outlines the forms which were graven in the white chalk below. It was the turf which had preserved the record of a forgotten civilisation whose work was to be seen league after league upon the downs. The principal earthworks of the hill period fell into four groups:—(1) The embankment and trench; (2) the cattlesways; (3) the level platforms; (4) the dew-pond. The camps were always on the top of a down, and ranged in size from comparatively small undertakings to the immense and awe-inspiring works at Maiden Castle, near Dorchester. These camps were the forts in which prehistoric man defended himself against the flint-tipped arrows of his human adversaries. The cattlesways, such as at Cissbury Camp, near Worthing, showed that the cattle were herded in the camps. The level platforms, bounded by a deep slope which extended league after league at the base of the downs along the plains which culminated in the gigantic works called the "Shepherd's Steps," at Pewsey, were undoubtedly for the protection of the cattle against wolves, and this was particularly answered by the combination of entrenchment and trench on the level platform at Poundbury Camp, near Dorchester. It was evident that life could only be lived if water for man and beast could be obtained on the top of the springless and streamless downs, and there was a great deal of converging evidence which showed that prehistoric man solved his problem by means of the dew-pond. At Chanctonbury Ring, Worthing, and at Cissbury Camp there were dew-ponds of neolithic origin. Although the dew-pond was one of the most interesting and most ancient structures in this country, so little notice had been bestowed upon it that it was not so much as mentioned in the "Encyclopædia Britannica." A properly-made dew-pond was a complicated structure. It was a circular, saucer-shaped hollow of some 70 ft. or 80 ft. in diameter, and 7 ft. or 8 ft. deep, lined and, as it were, thatched with straw. Upon this straw was superimposed an impervious layer of finely-puddled clay, and this, after being well trampled by horses or oxen, was often charged with water by casting snow upon it.

Mr. Geo. Hubbard, taking up the subject, showed how, as time went on, and the mastery over the wolf became more and more complete, neolithic man could with increasing security descend into the plains. The chief characteristic of the neolithic man's works in the plain was that they were constructed in stone rather than in earth. The stones were often of huge size, and their transport and erection gave evidence of surprising engineering capacity. Amidst the maze of stone monuments of the neolithic period which might be found in many parts one might trace, though possibly incorrectly, an ascending scale in their development. The early habitations of our prehistoric forefathers were extremely small, the internal measurements of the houses sometimes not exceeding 5 ft. or 6 ft., and there was an almost cyclopean massiveness in the unwhim masonry of the external wall, which was probably not more than 3 ft. or 4 ft. high. The doorways were generally clearly marked by the upright impost, and into these huts the people must have crawled. These huge stones must have been brought together with laborious care, and it was a grievous shame to see, as he had seen, these relics of an extinct race being broken up to make road metal. Neolithic man, finding himself free from the instant requirements of self-preservation, appeared to have passed on insensibly to the development of his spiritual nature, for his structures during the plain period assumed a religious significance. Maumbury Rings, he ventured to think, formed a link between the hill settlements and the works of the plain, although it was universally referred to as a Roman amphitheatre. The structure possessed not the characteristics of Roman work, but those which distinguished the labour of neolithic man. The ornamentation of the long axis was carefully determined by his (the author's) brother and himself, and it was found to coincide accurately with that at Stonehenge, and the impression left upon their mind was that, in the earthwork, they probably had one of the earliest temples erected to the sun. Mr. Hubbard proceeded to deal with Scorhill Circle, Fenworthy Circle, the Campstone Circle, and the tall monoliths standing on Dartmoor, and said that these circles and campstones doubtless had a vital interest and a vital meaning to neolithic men who erected them. It was possible to speculate as to their significance, but in order to do so with some probability of accuracy it would be necessary to argue from the known to the unknown. The circles of stones were sometimes found in connexion with stone alignments or avenues of stones, as at Ascombe; sometimes the alignments terminated with a great member; but until these had all been properly mapped out, the first step to the definite solution of their mysteries had not been taken. In Stonehenge they found the culminating structure, and here some authoritative statements might be made. After the full significance of Stonehenge had been realised, it became possible to speculate with more assurance about these earlier structures on Dartmoor and Maumbury Rings. It was obvious that there was some definite intention in the design of Stonehenge, and thanks to the investigations of Mr. Gowland and Sir Norman Lockyer, that intention had been made clear, and a flood of light had been thrown upon the religion of neolithic man. Mr. Gowland had shown that, by standing in the middle of the horseshoe curve at a point once marked by the aperture between the two piers of the central and greatest trilithon, and looking in the direction of the Hele stone, the sun would be seen to rise approximately over the summit of that monolith on a midsummer day. From this and other evidence there could be no doubt but that Stonehenge was a sun temple. When his brother and he looked upon Maumbury Rings and speculated upon it, they felt that, if it were a sun temple, it was of far greater antiquity than Stonehenge, but it lacked a confirmatory piece of evidence. It should have had a great stone at its entrance analogous to the "hele" stone of Stonehenge. They searched for that stone, and failed to find it, but later they found, in John Hutchins' book on the antiquities of Dorset that "Roger Gale derived the name of Maumbury from 'maen,' a great stone which lay at the entrance when he saw it 1719." By another authority they had found it stated that a large stone formerly existed at the entrance, but as this

was found to be an obstacle to the cultivation of the land, a hole was dug and the stone was deposited in it. If at Stonehenge they found circles and a stone having an obvious solar significance, and they found elsewhere circles and stones apparently bearing no such significance, then the question arose as to what change took place in the evolution of the faith of neolithic man which resulted in his becoming a sun worshipper? Here, in England, as in all the world over, the evidence showed that the earliest forms of faith were Phallic. The sun, the giver of life, became no doubt symbolical of the earlier forms of faith, and the symbols of the organs of reproductions which had previously been objects of veneration were still used after prehistoric man had emerged from a state of Phallicism to that of sun worship. In this solution might be seen the obvious answer to the previous question.

THE HISTORY OF SYMMETRY IN ART.

From a circular which has reached us from the Landesgewerbe Museum of Stuttgart it appears that the Central Board of Trade and Commerce in that city propose to hold an exhibition which is to illustrate the progress of the perception of symmetry in art and handicraft. In the words of the circular (as here translated) the Board is planning for the autumn of this year a great and special exhibition, at which it is proposed to trace for the first time the history of an aesthetic principle, viz., the question of symmetry and balance in arts and handicrafts in every direction; to produce examples and counter-examples from all countries and ages, and bring them under discussion; to point out the physiological hypotheses on which they rest, as well as their types and counterparts in nature and in the practice of art. The object, we are told, in view is a double one, viz., theoretic and practical.

"On the one hand, it will be possible to study this important question in the light of the past and of the present; to consider how the conservative and revolutionary schools have dealt with this question of symmetry, or have disregarded it; while on the other hand our modern art-workers and handicraftsmen, who to some extent believe themselves bound to uncompromising symmetry, have been delivered from a chain and have been stimulated to freer creations.

All museums, artists, and art-lovers are hereby invited to co-operate. All works of high art, as well as works from all areas without respect to date or place of origin will be welcomed in so long as they display in a characteristic manner either a scrupulous adherence to axial or central symmetry, or a sovereign disregard of these static requirements. Even counter-examples, in which the obvious laws of equilibrium have been flagrantly transgressed, will be of interest."

We should certainly be rather curious to see the result of this interesting attempt *rerum cognoscere causas*.

THE SOCIETY OF ARTS.

On Monday evening Mr. George W. Eve gave the first of three lectures on "Heraldry in Relation to the Applied Arts." He first expressed the wish for a more sympathetic and broader view on the part of both artist and public, though he feared that good heraldry could not come into general use so long as the present craze for cheapness continued. A knowledge of how and why certain things were done in the past would do much to prevent many of the serious mistakes made by craftsmen through their careless interpretation of even the simplest rules and principles.

The practice of heraldry, which probably began in early times with the use of badges, became important in the XIIIth century when the closing of head armour made necessary some clear means of distinction. First used in fighting only its symbolism was simple and spontaneous, but in later and degenerate days, when it became a vehicle for the exploitation of family, civil, and religious pride, there arose that desire for mystery and complication which caused the almost complete decay of the art.

The lecturer then described the development of the shield, from the long, narrow Norman type, through the later forms suitable for serious work on horseback, to the small and graceful tilting shield of Tudor times. As examples of the practical basis of heraldry, the strengthening metal bars of the early wood-and-leather shield were instanced as determining the general form of the ordinaries, while later, the irregular outline developed by the use of the tilting lance

in tournaments gave rise to the decorative scrolled forms of the XVIIIth century. The great increase of effect gained by retaining the curved surface of the true shield should be remembered when dealing with modern carved work; while important, both from the heraldic and artistic point of view, was the question of raising or incising the charges. He then emphasised the importance of simplicity and unmistakable clearness of form, no system of proportion being necessary if this was kept in view.

Among animals, the lion, though having been the most frequently used in all periods, was of great value in any critical study of development, but, owing to the number of definite poses caused by this constant appearance, care must be taken, when designing, to avoid apparently slight alterations, as of the position of limbs or head, since these might quite alter the heraldic action. In treating animals vigour of action was the first essential, and this might often be attained by setting out skeleton lines before filling in detail.

Mr. Eve then summed up the qualities which make for a good treatment of heraldry as follows: Suitable shape of shield, proportion and clear definition, good distribution, strong characterisation, and utmost vigour.

The lecture was illustrated by a number of lantern slides.

THE LONDON TRIBUNAL OF APPEAL:

CRYSTAL PALACE PARADE.

REFERRING to the appeal heard by the Tribunal on the 1st inst., and reported in the *Builder* of the 5th inst., and at which the Tribunal reserved their decision, the Tribunal have now made an order by which they allow the appeal, on the ground that the certificate of the Superintending Architect, dated March 24, 1906, affects the exercise by the appellants, the South-Eastern and Chatham Railway Companies' Managing Committee and the London, Chatham, and Dover Railway Company, of the powers conferred upon them by the special Acts of Parliament for railway purposes produced to the Tribunal, and, further, they make no order as to costs.

FERRO-CONCRETE.

A JOINT meeting of the Discussion Section of the Architectural Association of the Junior Institution of Engineers was held on Wednesday, at 18, Tufnell-street, when the discussion on Mr. S. Bylander's paper on "Ferro-concrete" (reported in the *Builder* of April 21) was continued. Mr. Wonnacott presided.

Mr. S. Bylander gave a brief *résumé* of his paper, and added that, with regard to columns, the bearing capacity was increased three or four times if they were hooped. As to the testing power of ferro-concrete he thought that Portland cement was a better protection of steel than paint, and therefore they need not have much fear of the steel rusting. He would suggest that they should try and agree upon a method of calculation that would be recognised as sufficiently accurate for ordinary practice, and further a standard of materials as well as construction.

Mr. J. H. Pearson said that the author in his paper did not claim that ferro-concrete was the right material for all constructions, and emphasised the fact that each kind of material should be used to its greatest advantage—the total cost of the structure, its safety, and its duration to be considered. They were warned that ferro-concrete work was dangerous if not carried out well, and that to guard against failure a large factor of safety was employed. Architects therefore would be chary about using it unless there was some special advantage. It was all very well to know how to use it, but it was still more advantageous to know when to use it, and that was the first thing to know from the architect's point of view. This, no doubt, was largely a question of cost. Mr. Pearson proceeded to sketch a plan of a site, and asked Mr. Bylander if he could give some idea of the difference in cost in the erection of a stated building on the site in steel-work and ferro-concrete, particularly with regard to flooring.

The Chairman said that Mr. Adams Hunter, who was unable to be present, had sent some notes as a guide to the discussion. Mr. Hunter pointed out that notwithstanding the extensive use of ferro-concrete it was still regarded as an experimental material, and must be tested by the standard of experience. They were being constantly told that by the use of steel imbedded in cement concrete the steel was sufficiently protected as to render it imperishable, and that the cost of maintenance was reduced to a minimum. Most elaborate formulæ had been devised to determine the stresses of strength of ferro-concrete structures, which appalled one by their elaboration and detail. The author was correct in stating that a large factor of safety was necessary to cover unknown stresses. French engineers had lately conducted experiments in testing bridges to determine the actual stress developed in a member, and found that in few cases did the actual stress agree with that calculated. The expansion of the differences amounted to from 100 to 300 per cent., and if these differences existed in steel bridges it was natural to assume that there would be some differences in the actual from the calculated stresses in ferro-concrete structures. Concrete was a less uniform material than steel, and anyone who had seen iron cramps from old buildings knew how they were corroded, and how in some cases they had caused the opening of the joints by their swelling due to corrosion. In most cases these cramps would be bedded in lime mortar. In general the determination of stresses was based upon certain relations existing between the moduli of elasticity of the steel and the concrete, and this was a variable proportion, depending so much upon the quality of the cement, the age of the concrete, the care in mixing the ingredients, and so on. The expansion of cement in setting set up initial stresses in the steel reinforcing rods, and there were also the stresses due to the slight differences in the thermal expansion of the two materials. It was calculated that steel, amounting to 0.8 per cent. of the sectional area of the beams was required for resisting these stresses alone. Mr. Considère, whose authority on ferro-concrete was undisputed, assumed that the concrete took up some of the tensile stresses even beyond the elastic limit of the concrete, but the experiments made by Professor Turneaure, of Purdue University, U.S.A., clearly demonstrated that the concrete would take its share of the tensile stresses up to its elastic limit, after which the steel reinforcement must take the whole of the tensile stresses. Hair cracks were a source of weakness, as they would allow moisture to get in and corrode the bars, and the ferro-concrete piles at Southampton jetty showed the rust through the concrete. It was very important to remove all mill scale from the rods before using them, and the simplest way was to allow them to rust. It was not necessary that the rods should be free from rust when they were embedded in cement of first-class quality, as the chemical action of the Portland cement on the rust formed a new compound, and arrested further corrosion. Round rolled bars were more suitable for reinforcement than expanded metal. The most suitable use of ferro-concrete seemed to be in floor systems for buildings, the main columns and girders being of steel, and the secondary girders and floor slabs of ferro-concrete. Its use in foundations did not seem advisable, as it had not yet had the practical test of age. A foundation was covered up, and inspection was impossible, and any failure involved great cost to remedy. It was difficult to give comparative costs of ferro-concrete and other similar materials and similar structures, as local conditions affected prices to a large extent. There was not much difference in cost between a well-designed ferro-concrete building and a similar building of steel-frame construction with brick walls and fire-proof floors.

Mr. Rugg said he saw a building about three months ago being erected at the Royal Oak by the Great Western Railway. It was being constructed on the Hennebique system, and the remarkable fact was that, owing to the London Building Act, they had to construct the walls about 20 in. thick at the bottom, which was a sheer waste of money. He thought they ought to pass some resolution asking that Parliament should look into

the Act. With regard to ferro-concrete, he thought the whole question depended on whether the iron was going to rust in the concrete. He believed that Mr. Hennebique had constructed these ferro-concrete buildings in France for the last twenty years, while in America they had been using the material for five years. In England, however, they were frightened of doing anything, and asked if the iron was going to rust and if the adhesion was strong enough. He believed it was granted now on the Continent and in the States that no trouble had been experienced as to rust. A good deal was to be said about adhesion, but there were a number of bars now on the market which provided for a mechanical bond between concrete and steel. He would like to know the minimum distance to the edge of concrete for reinforcement. It was said that round bars were preferable to expanded metal, but they did not get so many cracks in expanded metal as with round bars.

Mr. D. Forster said he would like to emphasise what Mr. Bylander had said as to the necessity for an accurate and sufficient quantity of drawings. His experience of carrying out actual building work on the site made him feel very strongly that sufficient and proper drawings were required, no matter if it was a ferro-concrete or any other kind of building. It was known that steel exposed to air would degenerate, and he would like to know if it would degenerate when embedded in concrete. As to the thickness of walls, the prevention of fire was one reason for keeping them thick. He would like to know something about the materials in the composition of the concrete, for he knew that serious trouble had arisen from the expansion of concrete. Particularly he would like to know if coke breeze was a reliable material to use.

Mr. R. Marshall remarked that, with regard to the question of the corrosion of iron and steel work embedded in concrete, that was not positively settled. Mention had been made of Southampton jetty, but, on the other hand, he believed it was the fact that in many cases where old stanchion work was pulled down the base blades had been found in an almost perfect state of preservation. In the case of high buildings and buildings required for carrying great weight, the air cracks which had been alluded to were of great importance. Granted that it was impossible to guarantee that ferro-concrete work should be airtight, might it not be advisable to treat the structure with a preservative compound. In the case of a water-tower particularly they might treat it with a wash of preservative paint.

Mr. P. Waldram added to his remarks made at the previous meeting, and pointed out that Hennebique's formula, assuming that the compression on concrete was distributed equally, could not be a correct assumption. Before any responsible architect or engineer adopted a particular system he ought to be in a position to calculate it himself, and he thought the general principles could be so calculated. The question which mostly troubled people was that of shearing, but if the shear was considered simply as the inner link between vertical forces coming on the beam and the horizontal tension by which they resisted these forces, the subject was absolutely simple. A ferro-concrete floor should be solid, or, in other words, the aggregate should be carefully ascertained before mixing, and enough sand must be put in to fill up the voids in the large aggregate, and then the lime would distribute itself through the sand, and they would get a solid concrete. Ferro-concrete had been used in foundations for many years, and no failure had resulted so far.

Mr. J. E. Conzelman thought that an agreement of formulae and a uniformity as to the factor of safety was greatly required. The question of the distribution of shear had puzzled a great many people, and had not been settled yet. Where they had horizontal shear they had also vertical shear. The durability of concrete had been settled by the engineers of the United States and France. Steel was practically protected for all time as long as there was a coating of cement around it.

Mr. Eade believed there was such a

diversity of opinion with regard to formulae that it would be necessary in the case of a very large work to have some full-sized beams made and tested on the site. It was true this would add to the cost of the building, but there seemed to be a large variation between the calculated strength of a beam and the actual strength, and it would be well to make beams of the actual materials to be employed and test them.

Mr. Keevil observed that the great advantages of ferro-concrete was its fireproofness when the rods were properly embedded and the increased floor space it gave for a certain site. He also thought the ferro-concrete lent itself very easily to architectural beauty, and, in addition, speaking more particularly of places abroad, the materials were very easily obtained. As to formulae, it was very well understood on the Continent and in America that a concrete of one in twenty-four was strong enough to take shearing up to 50 per cent. for a load up to 50 lb. per square inch for a load of vibration, and up to 80 lb. per square inch for a steady load.

Mr. Tennant said that mention had been made to the deterioration of iron cranes taken out of concrete walls, but in all probability, when these were put in, no special precautions were taken to preserve them, whereas, in ferro-concrete construction, the first consideration would be given to the preservation of the reinforcement from the access of air or water. They heard at the last meeting a great deal about the position of the neutral axis, but it could not be too clearly insisted upon that the position of the neutral axis had nothing whatever to do with the ultimate strength of the material, but it had very much to do with the elastic resistance of the material, which was quite another thing, for its strength. In ferro-concrete there was a great difference in the elasticity of the materials employed, and therefore they got a neutral axis shifted out of the geometrical position. He could not help thinking that the recent earthquake at San Francisco and the Baltimore fire ought to give experience as to the behaviour of ferro-concrete which would be distinctly profitable.
